71. Gaske appears to conclude from these tests that his 13.5 percent cost of capital, derived from DCF results, is quite conservative relative to these benchmark results. King argued that these comparisons are irrelevant. King argued that these results should be disregarded, because their conceptual basis is fatally flawed and the risk premium observations are without value statistically.

72. Gaske's risk premium analysis purports to measure the required return to equity by adding the historical difference in experienced earnings from stocks and bonds to the current levels of bond yields. These historical differences, as measured by Ibbotson Associates, go back to 1926. The theory is that over a long enough period, actual return differentials between stocks and bonds will equate to required or expected return differentials.

73. King observed that this theory is a statement of faith, not experience, and it defies logic. If investors' short term expectations are continually being frustrated (as has been the case during the last year), what logic supports the proposition that the sum of those failed short-term expectations represents a valid long-term representation of their expectations? King further argued that it is untrue that the differential in required returns between bonds and stocks is fixed and unchanging, as this theory postulates. The perceived safety/risk relationship of bonds differs from stocks, and their relative desirability as investment vehicles changes continually depending on such factors as inflation, economic growth, and the capital structures of the enterprises issuing the securities.

74. King stated that quite apart from this conceptual failing, the theory fails statistically. King referred to Exhibit 34 introduced by Gaske which shows annual returns to large company stocks, small company stocks and long-term corporate bonds, and it also shows their differences. King pointed out that the standard deviation of every one of these series is greater than the mean of the observations. King argued that the means therefore lack statistical significance and are useless as a predictive tool.

75. Gaske purports to demonstrate under his alternative equity investment analysis that MDU should be allowed a high return by observing that the returns to book equity on the S&P 500 companies from 1977 to 2000 have averaged 21.47 percent. He also observes that the book equity returns to 746 industrial, retail and transportation companies included in The Value Line Investment Survey have ranged from 27.57 percent to 31.75 percent over the five years 1996-2000. He argues that the average of 29.4 percent, along with the return of 21.47 percent experienced by S&P's 500 companies, suggests that the 13.25 percent he proposes for MDU is quite low.

76. King argued that these comparisons are irrelevant. He pointed out that investors in unregulated industrial, retail and transportation firms have no access to book equity value. The only value that is meaningful for investors in such firms is the market value. That is what an investor must pay to acquire the stock, and conversely, the value an investor will receive by selling the stock. Book equity value in an industrial firm is a purely historical number representing the dollars of original investment in equity capital contributed to (or retained by) the company. It has little relevance to the current market value, even for fairly capital intensive firms. Since most stocks sell well above their book value, the return that is accessible to investor is considerably less than the 20 to 30 percent noted by Gaske.

77. King noted that book values are relevant for regulated utilities because regulation makes them so. Regulation sets the earnings allowance for such companies relative to a rate base reflective of the book value of the capital invested utility operations. This condition does not apply to industrial firms.

King's Risk Premium Test

78. King did not attempt to find any absolute value of equity return using the risk premium approach. He agreed that equity investment, being inherently more risky than debt, requires a higher return. But rather than attempt the difficult (and arguably impossible) task of measuring that risk premium, he looked to the trends in bond yields in comparison to past North Dakota Commission findings of equity return to gas companies. King stated that if it appears that bond yields have increased, but he has recommended a reduced return to equity, then there may be reason to question his finding. On the other hand, if his proposed equity return tracks with the changes in bond yields, then there is at least a "sanity check" on the propriety of his finding.

79. King identified three gas cases during the past 12 years in which the Commission had found a rate of return to equity. He compared those rates of return with the then-current yields on 10-year Treasury bonds and Aaa Corporate bonds. He then identified the current (that is, August 2002) bond yields. The results of his research are as follows:

Case	**Utility**	**Date**	**ROE Allowed**	**10-Yr Treas.**	**Aaa Corporate**
399-90-820	MDU	July 30, 1991	12.0%	8.27%	9.00%
400-95-559	NSP	June 7, 1996	12.0%	6.91%	7.71%
400-00-521	NSP	June 27, 2001	11.5%	5.28%	7.18%
399-02-183	**MDU**	August , 2002	**10.5%***	4.35%	6.45%

80. We find that, while King's recommended equity return is lower than any that have been approved for gas utilities in the past 12 years, the evidence of lower overall capital costs justifies this result. Those lower capital costs are demonstrated by a dramatic reduction in bond yields relative to their level when the previous gas rate cases were decided. For this reason, we find that King's recommended equity return of 10.5 percent is reasonable.

Depreciation

81. Staff has determined that test year depreciation expense should be reduced by $2,172,000. MDU's current depreciation expense is based on rates developed in a 1991 study performed by Stone & Webster. Staff witness Michael J. Majoros performed a series of studies that suggested MDU's depreciation rates are excessive. First, he found that annual depreciation accruals during the past five years have exceeded utility construction and acquisition by $28.5 million. When common plant construction and acquisition is added, the five-year accruals still exceeded expenditures by $409,000. While it is not the purpose of depreciation to fund construction, this comparison indicates that MDU has obtained substantial cash flow from depreciation. Majoros noted that in *Lindheimer v. Illinios Bell Telephone Company,* 292 U.S. 151 (1934), the

Supreme Court found that excessive depreciation results in the extraction of capital from ratepayers.

82. Majoros next observed that as of the end of 2001, the ratio of depreciation reserve to the original cost of distribution plant came to 70.7 percent. Based on his experience, this level of depreciation reserve is extraordinarily high and suggests that prior depreciation rates have been excessive. Majoros stated that the likely source of these excessive rates is the 140 percent negative salvage adjustment for Account 380 – Services.[6]

83. Majoros adjusted MDU's salvage factors based on an obvious inconsistency between the net salvage assumed in the Stone and Webster study and actual net salvage that MDU has experience during the past five years. The Stone & Webster study developed depreciation rates that resulted in a large recovery of "negative salvage," that is, cost of removal. Specifically, its depreciation rates were designed to recover total gas plant of $102.5 million plus negative salvage (removal) costs of $46.9 million.

84. Majoros found that MDU's actual net salvage experience has been positive. In every year since 1997, MDU has received more in salvage value for its retired gas and common plant than it has paid in removal cost. The total cumulative 5-year net positive salvage receipts for gas plant have amounted to $1,444,452. For common plant, net positive salvage receipts have come to $5,529,260.

85. We find that MDU has experienced positive net salvage.

86. To correct for over-recovery of net salvage, Majoros proposed to adopt the Stone & Webster lives and survivor curves for each account with no net salvage overlay. The account-by-account depreciation rates would thus represent pure depreciation, that is, solely the recovery of original cost. To recognize net salvage, Majoros proposed to deduct from total annual depreciation the average annual amount of net positive salvage for gas plant, plus the net positive salvage of common plant distributed between gas and electric operations based on their respective net salvage amounts. Total depreciation of test year plant would be $1,937,000. The annualized positive salvage offset would be $848,000, for a net test-year depreciation expense of $1,089,000.

87. Majoros noted that, in addition to matching net salvage accruals with actual net salvage experience, his treatment of removal costs conforms with Generally Accepted Accounting Principles ("GAAP") as recently refined in Statement of Financial Accounting

[6] Late Filed Exhibit 1 explains the source of the 140% negative salvage for the Service account. It compares the original cost of retired services with the cost of removal. The composite ratio of original cost to removal cost for all Services removed between 1996 and 2000 is 138%. The removed services date back to 1926, but all of the removal costs were incurred since 1996. The ratio is so high because it compares dollars spent up to 75 years ago with dollars spent only since 1996. The result is a ratio that captures the inflation that has taken place over the past 75 years. When that ratio is then applied to current plant balances to calculate depreciation expense, it effectively projects that same rate of inflation to the end of the current plant's life. Ratepayers are thus being forced to pay for future inflation that presumably will match past inflation. By charging ratepayers now for inflation in the future, this practice fails to recognize the much higher present value of current ratepayer dollars over the Company's future removal cost dollars.

Standards No. 143 ("FAS 143"). That standard, which MDU must adopt this year, requires companies to determine whether they have a legal obligation to retire property and incur the cost of removal or dismantlement. If they do, they must declare the present value of the future "asset retirement obligation" costs as a liability on their books to be amortized over the remaining life of the asset. If they do not, then the American Institute of Certified Public Accounts' Statement of Position on Property, Plant and Equipment would require that these costs be expensed as they are incurred.

88. Majoros testified that MDU has not determined whether it has asset retirement obligations, or what the present value of those obligations might be. For this reason, Majoros' adjustment reflected net salvage experience as a rolling five-year average of actual net removal costs.

89. In rebuttal, MDU witness John A. Jeter, a retired accountant from Arthur Anderson & Co. argued that Majoros had not done a depreciation study, that his review of the current depreciation rates is superficial and contains many errors, and that he has no basis for proposing changes in depreciation rates. According to Jeter, the current depreciation rates are based on a comprehensive study prepared in 1991 and used beginning 1994. He argued that no adjustment of depreciation rates should be entertained until the current depreciation study is completed and an appropriate review has taken place.

90. Jeter asserted that the 1991 depreciation study by Stone & Webster is a much more reliable source of information regarding net salvage than a cursory look at net salvage for all accounts over a five year period. Jeter did not explain the reason, nor did he refute Majoros' observation that the Stone & Webster study had recommended large negative salvage allowances, while MDU's actual net salvage experience has consistently been positive.

91. Jeter's principal response was to attack Majoros' net salvage proposal to adjust overall depreciation by $848,000 based on the past five years' actual experience. He argued that the net salvage amounts used by Majoros varied from year to year and that they reflected the sale of an office building for approximately $4.6 million. Jeter also noted that the electric net salvage amounts – not at issue in this case -- included an insurance adjustment.

92. Jeter also argued that Majoros has allocated common property net salvage based on the direct net salvage amounts of the gas and electric operations, which is not the basis used by MDU. He failed to mention how MDU does allocate these common net salvage amounts. He concludes, "the proposed adjustment is not supported by any evidence and should not be approved."

93. The variability of net salvage from year to year is the very reason Majoros used a five-year average of net salvage experience. Jeter never explained why it should be the basis for rejecting Majoros' adjustment.

94. Jeter's statement that the Majoros depreciation adjustment is "not supported by any evidence" is incorrect. During his re-cross examination, Jeter read the following passage from the NARUC Public Utilities Depreciation Manual, dated August 1, 1996:

> When estimating future net salvage, every effort should be made to ensure that the estimate is as accurate as possible. Normally, the process would start by analyzing past salvage and cost-of-removal data and by using the results of this analysis to project future gross salvage and costs of removal.

95. Majoros analyzed past salvage and cost-of-removal data and found that over the past five years salvage has consistently been greater than cost of removal for both gas plant and common plant. His adjustment reflects that finding.

96. MDU urges the Commission to defer any consideration of depreciation until its new depreciation study, currently being conducted by AUS Consulting, is completed by the end of this year.

97. The Commission believes that no element of MDU's revenue requirement should be exempted from this proceeding. MDU has specifically included depreciation expense in its application and has the burden to prove its case. Therefore, we reject the suggestion that we should decide all issues of MDU's applications with the exception of depreciation. Under N.D.C.C. § 49-05-06, the Commission must decide on the evidence before it by December 12, 2002. MDU's request to defer any consideration of depreciation until the new depreciation study is completed is denied.

98. MDU should not be permitted to continue to charge ratepayers depreciation expense that is excessive. A new depreciation study will not alter the fact that in recent years net salvage has consistently been positive, while the current depreciation rates incorporate a very large allowance for negative salvage.

99. MDU contends that over-depreciation is good for ratepayers. Had Majoros' adjustment been implemented in 1995, MDU's revenue requirement would be higher than it is now. MDU argues that the cumulative effect of overcharging depreciation is to reduce the rate base to the point where the reduction in return and income allowances exceeds the overstated depreciation expense. Jeter multiplied Majoros' $2.172 million depreciation expense reduction by the 8 years since 1995 to derive a presumed increment in the rate base of $17.376 million. He then calculates that at MDU's proposed 11.044 percent return and 39.61 percent tax rate, the revenue requirement increase from this rate base increment would be $3.2 million, which is more than Majoros' depreciation expense reduction of $2.172 million.

100. On cross-examination, Jeter admitted that MDU's plant in 1995 was smaller than it is now, so Majoros' depreciation adjustment would have been smaller if applied in 1995. Therefore, Jeter's calculation of the impact of over-depreciation is likely incorrect. Nevertheless, we find there is no justification for charging ratepayers depreciation in

excess of that determined under regulatory depreciation practices. Over-depreciation results in the extraction of capital from ratepayers and is improper from a legal, a regulatory, an economic, and an accounting standpoint.

101. We agree with staff's proposal for depreciation expense and its impact on test year rate base.

Operation and Maintenance Expense

Bonuses and 2003 Labor Expenses

102. Staff witness Majoros proposed to eliminate bonuses from the forecast test year and to hold test year labor costs to their 2002 levels. MDU included average bonuses for the years 1999-2001 in the amount of 6.1 percent of labor costs. Applied to the $8,239,000 in labor costs in 2002, the bonus elimination comes to $503,000. The 2003 labor cost increase eliminated by Majoros amounts to $236,000. These direct labor cost adjustments reduce payroll taxes by $40,000 in 2002 and $60,000 in 2003. [7]

103. Majoros testified that given the state of the economy and the fact that MDU is requesting a rate increase, it would be unreasonable to include bonuses in the revenue requirement.

104. Majoros accepted the 2002 labor cost increase, but objected to extrapolating that increase through 2003. Majoros charted the overall pattern of operating and maintenance costs since 1996 and found that these costs remained relatively stable through the year 2000. Since that time they have since taken a sharp upturn, and MDU projects a 5.7 percent increase each year from 2000 through 2003. This rate of increase exceeds predicted inflation of 2.8 percent annually.

105. MDU witness, Richard D. Spratt, MDU's Vice President – Human Relations, testified on rebuttal. Spratt argued that bonuses are an integral part of overall compensation philosophy to remain competitive with other employers. Part of that compensation is intentionally put at risk in the form of bonuses that are paid on the basis of various goals, including the MDU's overall profitability. Spratt presented the results of an industry survey that showed most utilities pay bonuses not only to management employees, but to salaried and hourly employees as well. Spratt stated that the elimination of bonuses would risk rendering MDU uncompetitive relative to other employers.

106. The issue before the Commission is not whether MDU should pay bonuses or increase salaries. The issue that the Commission must decide is whether such bonuses and raises properly should be included as elements of a rate increase.

[7] Calculated from the data presented on Exhibit 19, MJM-9, pages 1 and 2.

107. C. Wayne Fox, President of MDU Utilities Company, stated that from 1994 through 2001 the Consumer Price Index has risen nearly 20 percent, and in spite of that increase MDU has been able to hold the line on gas rates by finding ways of operating the business more efficiently and taking advantage of new technology. MDU even reduced its rates in 1999, and it did this through improved efficiency. Fox testified that MDU has reduced its employees by 30 percent since 1994. In that year there were 248 customers per MDU employee. In 2001, one employee was serving 370 customers. Then suddenly, beginning in 2001, MDU lost its ability to stay ahead of inflation. MDU's rate increase application not only implies but asserts that this loss of efficiency will continue through 2003. MDU witness, Rita Mulkern testified that while all the past employee reductions are reflected in the 2001 base period data, no further reductions are forecast for 2002 and 2003.[8]

108. During her examination of Mulkern, Commissioner Wefald alluded to the possibility that the Commission might want to give MDU an incentive to practice savings and to find ways to achieve new savings.[9]

109. We find that MDU's rate increase application provides no incentives to improve efficiency. The deterioration in productivity improvement during the years 2001 and 2002 is simply extrapolated into 2003. MDU should not be encouraged to perpetuate its own loss of efficiency. While the 2002 increases in labor costs should be allowed because they have already happened, no further deterioration of labor productivity should be built into the revenue requirement imposed on ratepayers. For this reason, the 2003 labor cost increase are disallowed.

110. The same objective of incentivizing MDU to regain its previous levels of productivity improvement applies to bonuses, only here the incentives apply directly to employees. Apparently, a significant portion of MDU's bonuses is granted on the basis of MDU's overall profitability. Spratt testified that two years ago, presumably in 2000, 75 percent of MDU's employees received 7 percent bonus. Last year, 2001, their bonus was 0.6 percent.[10] Presumably, these bonus levels reflected the fact that in 2000, MDU earned 11.96 percent on its North Dakota Gas Operations, but in 2001, it earned only1.6 percent.

111. If profitability drives bonuses, as it appears, then it is altogether inappropriate to include bonuses in a revenue requirement that drives a rate increase. The reason MDU needs the rate increase is that it is not profitable. If it becomes profitable as a result of a rate increase, that profitability will not have come about because the employees have performed particularly well. To the contrary, it will be because the employees have not performed well, and MDU needs rescue from the Commission.

112. We find that the revenue requirement imposed on ratepayers should not include rewards for poor performance. For this reason, bonuses should be disallowed.

SISP Costs

113. The Supplemental Income Security Plan ("SISP") is a plan that provides supplemental pension benefits to key employees. "Key employees" are officers, directors and senior managers of MDU Resources and MDU Utilities. The plan is expected to cost $259,000 in 2002 and $265,000 in test year 2003.

114. SISP was initiated in 1982, but MDU never sought its inclusion in revenue requirement until Case No. PU-399-01-186. In its April 24, 2002 decision in that case, the Commission accepted Staff's observation that this plan benefits only the top few employees, those that are already quite well paid. The Commission concluded that it is inappropriate for ratepayers to bear the expense of the SISP costs.[11]

115. MDU witness, Richard A. Espland, acknowledged that his testimony was essentially the same as it was in Case No. PU-399-01-186.[12] Espland acknowledged that SISP benefits only MDU's high salaried employees with income ranges from a low of $75,000 to its president at around $250,000 to $300,000.[13] Espland also agreed that none of the Public Utility Commission's in the jurisdictions where MDU provides natural gas utility services have approved a ratepayer funded SISP program.[14] The Commission took administrative notice of the Findings of Fact, Conclusions of Law and Order in Case No. PU-399-01-186.

116. We find that the exclusion of SISP was appropriate in Case No. PU-399-01-186, and the exclusion of SISP is even more appropriate in this case. Case No. PU-399-01-186 was a Staff-initiated proceeding to reduce MDU's electric rates. This case is a MDU-initiated rate increase proceeding. As noted earlier, one of the reasons MDU seeks to increase rates after an eight-year period of price stability is a result of management's failure to maintain its previous rate of productivity improvement. The management personnel who are most responsible for this failure are the very employees who benefit from SISP. This is not the time to reward them at ratepayers' cost. For this reason, the SISP expense should be disallowed again in this case.

Rate Case Expense Amortization

117. MDU proposes to amortize $168,000 in rate case expenses over three years at $56,000 per year. Staff witness Majoros proposes to amortize the same amount over five years at $34,000 per year, for a difference in annual cost recognition of $22,000. Mulkern suggested that if the five-year amortization is adopted, the unamortized balance should be included as a rate base addition.

---

[11] Case No. PU-399-01-186, Findings of Fact, Conclusions of Law and Order, April 24, 2002, ¶68.
[12] Tr. Oct 7, page 148
[13] Tr. Oct 7, page 151
[14] Tr. Oct 7, pages 151-152

118. The basis of Majoros' proposal is the historical period between rate cases. Fox stated in his direct testimony that MDU's last rate increase, in Case No. PU-399-94-297, was decided in 1994, and a rate reduction occurred in 1999 in Case No. PU-399-96-325. This represents two rate cases in eight years, or one every four years. MDU has rounded down to three, and Staff has rounded up to five.

119. We find that there is an important reason for adopting a longer, rather than a shorter amortization period for rate case expenses. Once an amortization becomes embedded in the revenue requirement, it remains there until a new revenue requirement has been calculated resulting in the very real possibility that MDU will over-collect its rate case expenses. MDU is protected from under-recovery of rate case expenses in the event it has another rate case in less than five years, because the amortization can be continued in the new rate case so that MDU ultimately recovers its costs, but only its costs. We find that 5 years is the appropriate amortization period for rate case expenses.

General Inflation Adjustment and Other Unadjusted O&M Expenses

120. In 2001, MDU incurred $89,780,000 in O&M expenses, of which $76,842,000 represented the cost of acquiring gas. Of the remaining $12,938,000 O&M cost relating to distribution, MDU developed specific forecasts for $9,249,000 based on projected changes for various categories of costs, e.g. labor, benefits, insurance, advertising. This left a catch-all category of $3,689,000 of "other" O&M costs, which MDU assumed would increase between 2001 and 2003 by 2.8 percent annually, the assumed rate of general inflation.

121. Majoros noted that the Commission had never previously allowed this sort of inflation-based adjustment, and he recommended that it not start now. The elimination of this adjustment reduces test-year expenses by $209,000.

122. Of the $3,689,000 in 2001 costs within the "other" O&M category, $1,709,000 is non-labor Administrative and General costs. The second largest component of the "other" O&M category, accounting for $981,000 in 2001, is Customer Accounts, a portion of which is accounts receivable.[15] We find that accounts receivable should not vary by general inflation, but rather by the overall size of the total amount billed to customers, including the cost of gas. As demonstrated graphically in Mulkern's rebuttal exhibit RAM-2, gas prices spiked in the last months of 2000 and the first months of 2001, but have since moderated, falling to levels equal or below their 1999 values.[16]

123. MDU's proposal to increase "other" O&M costs at the rate of inflation through 2003 is rejected.

[15] Tr. Oct 8, page 469.
[16] Exhibit 25, RAM-2.

Earnings

124. The Commission finds the following summary of fair and reasonable test year revenue and expenses:

Description	(ND Thousands) 2003 Test Year
Sales	$67,962
Transportation	900
Other	287
Total Revenues	$69,149
Cost of Gas	$50,072
Other O & M Expense	$13,109
Total O & M Expense	$63,181
Depreciation	$1,089
Taxes Other Than Income	$1,292
Current Income Tax Expense	($529)
Deferred Income Taxes	$1,612
Total Expenses	$66,645
Net Regulated Income	$2,504
Income Tax Calculation:	
Net Income Before Taxes	$3,587
Less Interest Deduction:	
Rate Base	$20,767
Weighted Cost of Debt	3.081%
Calculated Interest Deduction	$640
Other Tax Adjustments	$4,282
Taxable Income	($1,335)
Combined Tax Rate	39.61%
Income Tax Expense	($529)

125. The Commission finds that for the 2003 test year, MDU has excess revenue of $1.402 million as follows:

Description	(ND Thousands) 2003 Test Year
Average Rate Base	$20,767
ROR Required	7.979%
Return Required	$1,657
Return Earned	$2,504
Return (Excess) Deficiency	($847)
Tax Factor	1.656
Revenue (Excess) Deficiency	($1,402)

Cost Allocation and Rate Design

Class Cost of Services Study

126. A class cost of service study is an analysis of the embedded or incremental costs of providing utility services to the customers or classes of customers that either cause these costs, or to whom these costs can reasonably be allocated. The purpose of a class cost of service study is to provide an indication of what it costs to provide utility service to each customer class. In prior rate applications the Commission has used class cost of service studies as guidelines for rate design and as one of the factors in setting rates for the respective classes of customers.

127. MDU Witness Tammie Aberle sponsored an embedded cost of service study for the year ended December 31, 2001. This study allocated all of MDU's recorded distribution, general and gas-related common plant among seven categories of customers:

- Residential
- Firm General
- Air Force
- Small Interruptible Sales
- Small Interruptible Transport
- Large Interruptible

128. The costs allocated to the respective customer classes were in turn subdivided into three categories:

- Capacity related costs that vary with the amount of gas sendout on the peak days of the year. Examples include the sizing of distribution mains and meters to account for the maximum volume of gas handled on any one day.

- Throughput related costs that vary with the total amount of gas distributed throughout the year. Uncollectible accounts is a good example of this type of cost.
- Customer related costs that vary with the number of customers. Examples include the cost of meters, services and billing.

129. The only controversy relating to this cost of service study concerned the allocation of the cost of mains. Mains constitute 39.1 percent of MDU's gas distribution plant, but their relevance exceeds even this percentage. That is because general and common plant, which account for another 20 percent of total plant, are allocated as overheads to the direct investment, of which mains are the largest component.

130. In its initial cost of service study, Statement M of Exhibit 2, MDU allocated mains 64 percent on the basis of peak two-day throughput during the year and 36 percent on the basis of the number of customers.

131. King objected to the allocation of a portion of mains costs on a customer count basis. The arguable justification for doing so is that the purpose of the mains system is to reach customers, and that when more customers are added, the mains system has to be extended. King argued that this is true only at the very edges of the system, where gas mains are being extended to serve new developments in previously unserved areas. Even then, the added cost of mains for new customers can vary dramatically depending on the location of those customers.

132. King testified that another purpose of mains is to deliver gas. He argued that the value derived and the benefits received from the mains system are more related to the amount of gas delivered than to the number of customers. One customer receiving twice as much gas as another customer enjoys exactly twice the BTU heating content. The two cannot be equated in terms of benefit received, yet that is what a customer allocation of mains does. He illustrated his point by using the example of a section of main that changes the number and makeup of customers over a period of several years, but the amount of gas delivered remains the same. The weighting of that main in the cost of service study would change under a customer allocation, but it would remain the same (although shifted among customer classes) if the allocation were made on the basis of annual throughput.

133. King therefore asked that MDU conduct an alternative study to allocate half the mains cost according to the classes' two-day peak throughput and half on the basis of annual throughput.

134. On rebuttal, Aberle objected to King's revisions, arguing that main additions are not made only on the edges of the system to provide new service to developments, but are also required to enhance system integrity and maintain pressure throughout the system as customer additions are made. She objected that heating content has no impact on the cost of the mains system. She also objected to the use of a peak-day allocator that assigns costs to the interruptible class and a throughput allocator that

assigns costs to the transmission customers. She argued that both of these allocations violate practices previously approved by the Commission. She submitted yet a third cost of service study, one which allocates mains based 50 percent on throughput at the distribution level and 50 percent on peak day use by firm customers.

135. The results of the three cost of service studies show the rate of return from each customer class as follows:

	MDU Statement M	**King CWK-7**	**Aberle TAA-4**
Residential	3.083%	7.731%	6.367%
Firm General	3.998%	2.161%	1.106%
Air Force	50.281%	3.502%	69.369%
Small Interruptible Sales	83.992%	38.040%	40.905%
Small Interruptible Transport	169.437%	48.490%	57.738%
Large Interruptible	78.644%	-0.673%	27.320%
Total North Dakota	6.439%	6.442%	6.442%

136. As noted earlier, the Commission has used class cost of service studies as guidelines for rate design and as one of the factors in setting rates for the respective classes of customers. We appreciate the information provided by each of the studies because it quantifies the impact that a change in allocation factor has on the rates of return from customer classes. The studies also show that, regardless of the allocator used to allocate mains to customer classes, some customer classes are providing a much higher return on MDU's investment to serve than are other customer classes. In all three studies, the small interruptible customers generate a much higher than average rate of return.

Rate Design

137. In its initial application, MDU made a number of rate design proposals, as follows:

- Increase residential and firm general service rates by 4.6 percent, reduce the small interruptible class rates by 4.1 percent, and leave the Air Force and large interruptible rates unchanged;
- Separate the commodity rate into a Distribution Delivery Charge and a Cost of Gas charge, eliminating the Purchased Gas Cost Adjustment;
- Eliminate the declining block rate form from the commodity charges and substitute a flat per-dekatherm ("dk") rate;
- Change the customer, or "Basic Service Charge" from a monthly to a daily charge;
- Increase the Basic Service Charges by very large percentages, for example, the residential charge increases from $6.50 to $11.70, the small firm service charge from $8.50 to $24.00 and the large firm service charge from $17.00 to $51.00.
- Eliminate the residential seasonal rate;

- Increase the penalty for failure of interruptible customers to interrupt from $10 to $50 per dk;
- Increase the return check fee to $20;
- Increase the reconnection fees for seasonal customers to match the avoided Basic Service Charges;
- Increase the reconnection charge for disconnected customers for nonpayment to $30;
- Modify the Firm Gas Extension Policy Rate 120 and 124 to reflect MDU ownership of all prospective service lines.

138. King recommended that the Commission accept a number of these proposals regardless of whether MDU's overall revenue is increased, decreased, or remains unchanged. These consensus proposals are as follows:

- The commodity rate should be separated into two clearly distinct rates, the Distribution Delivery Charge and the Cost of Gas Rate.
- The declining block rates should be eliminated, and the revenue collected through the higher initial block rates should be reallocated to the Basic Service Charge.
- The residential seasonal rates should be eliminated, since there are no customers on these rates.
- Penalties for failure to interrupt should be increased, since MDU apparently believes that the current penalties are not sufficient to ensure that interruptible customers respond to their calls for interruption or curtailment.
- The reconnection charges for seasonal customers should be adjusted to match the higher Basic Service Charges resulting from the elimination of declining commodity blocks.
- MDU's proposed modifications to the line extension policy should be adopted.

139. King supported MDU's proposal to eliminate declining block commodity rates on the grounds that this rate structure implicitly encourages customers to use more gas, and it thereby discourages conservation. To the extent that it collects fixed customer costs in the commodity rate, it misstates the cause of the costs. Declining block rates also allow customers who use minor amounts of gas for non-heating purposes to escape the cost of providing the basic elements of service to them. We find that the declining block rate should be eliminated to eliminated to more closely reflect cost causation in rates to customers.

140. Using MDU's billing unit counts for the year 2001, King calculated the revenue-neutral increase in monthly customer charges that would result if the present declining block rate structure were eliminated from each rate schedule, as follows:

	Present	Proposed
Small Residential	$6.50	$8.43
Large Residential	$13.00	$15.31
Small Firm Service	$8.50	$14.34
Large Firm Service	$17.00	$45.16

141. The Commission finds that, at a minimum, the monthly customers charge level should be at the amounts shown in the previous table to produce revenue-neutral levels for eliminating the present declining block rates.

142. King also recommended that the Commission consider MDU's proposal to convert the customer charges from monthly to daily charges. This proposal simplifies the calculation of the charge when customers are taking gas for only part of a month. We agree that MDU's monthly customer charge should be converted to a daily customer charge as proposed.

143. King recommended that the Commission reject MDU's proposal to increase the reconnection charge for discontinued service to $30. While MDU claimed that this is a cost-based rate, King suggested that there is a legitimate public policy reason for not increasing this rate. The customers to whom this charge applies are almost certainly the lowest income customers. Otherwise, they would not have been disconnected. Since they have to pay their arrearages anyway, they are likely to be suffering some difficulty getting reconnected. To impose on them yet more cost, such as an increase in the reconnection fee, might prevent some of these customers from obtaining vital utility service. MDU did not respond to King's recommendation. We find MDU's proposal to increase the reconnection charge should be denied.

144. MDU proposed that residential and firm general service customers receive a rate increase of 4.6 percent, that the Air Force and large interruptible customers receive no increase, and that the small interruptible class receive a reduction of 4.1 percent. King pointed out that the Commission's past practice has been to recognize differences in class rates of return by approving lower rate increases to classes with the highest rates of return. It has not approved rate reductions to some classes when most customers are suffering rate increases. We find that all classes, regardless of their rates of return, should receive some rate increase if overall revenues are increased and a rate reduction if overall revenues are reduced.

145. King had similar misgivings about MDU's proposal to increase customer charges dramatically, even for the classes for which it was proposing rate reductions or no rate increases. MDU witness Russell Feingold argued that shifting revenue recovery from the commodity to the customer component allows MDU to recover much more of its fixed costs on a non-weather sensitive basis. He asserted that this shift also protects customers from the volatility in their gas bills caused by variations in weather.

146. King was concerned with the issue of rate continuity. The sort of changes proposed by MDU would result in dramatically different bills for different types of customers. Very low-use customers might find the increases in their average monthly bills extortionate. Customers accustomed to low gas bills in the summer, that possibly offset high electric bills, could be surprised by the sudden jump in their gas invoices.

147. King was concerned that customers may also resent high monthly customer charges. When most of the cost of gas is based on the level of gas consumption, customers can avoid high gas bills by conserving gas. But no amount of conservation permits a customer to avoid a monthly customer charge. As long as this charge is not a major portion of the bill, it is likely to be acceptable to most customers. But if it looms as a major element in the cost of gas, customers will come to regard it as a tax from which there is no escape.

148. King recommended that customer charges should not be increased by more than twice the overall increase. This ceiling on customer charge increases would be in addition to the increases in customer charges that result from the flattening of the declining block rates. If rates are reduced, the reductions should be flowed entirely into the commodity component of each rate schedule. Customer charges should not be increased when rates are reduced, except to eliminate the declining block feature of the rate schedules.

149. The Commission agrees with King's recommendation concerning customer charges.

Distribution Delivery Stabilization Mechanism

150. If the Commission disapproves of MDU's dramatic increases in customer charges, MDU proposes that, as an alternative, the Commission adopt a Distribution Delivery Stabilization Mechanism ("DDSM"). As described by Feingold, the DDSM would modify the effects of weather variations by adjusting bills for the difference between the actual heating degree days and heating degree days under normal weather. Following a cold winter, the excess in each class's revenue from the greater number of heating degree days would be divided by the projected annual sales volumes in that class and credited to all customers over the following year on a per-dk basis. The revenue shortfall from a warmer than normal winter would similarly be collected through a surcharge to all customers during the subsequent year.

151. Staff has gone part of the way toward MDU's objective of increasing customer charges. Staff has recommended that the commodity rates be flattened, and the revenue previously collected in the high initial blocks be recovered through increased customer charges. Staff has also recommended that any overall revenue increase be tilted toward the increased customer charges, and any overall rate decrease be flowed through entirely to the commodity charges. At the hearing, Aberle, MDU's rate design witness, could not say whether these concessions to MDU's target of increasing

customer charges relative to commodity charges were sufficient to persuade MDU to withdraw the DDSM proposal.

152. King testified that the value of a weather normalization adjustment should be to ameliorate the volatility in customer bills caused by variations in weather, and particularly the effect of unusually cold winters. In such winters, ratepayers typically experience a "double whammy." First, they consume more gas than usual, which increases their bills even if the price of gas remains the same. Then, because cold winters are usually a widespread phenomenon, the demand for gas is higher across the continent, which means that the price of gas is higher. The result is a further inflation in their bills. Just this sort of inflation occurred across the country during the winter of 2000-2001.

153. King suggested that MDU's proposal could result in a "triple whammy." If North Dakota experiences an unusually warm winter, and it is followed by an unusually cold winter, ratepayers during the cold winter, already hard-hit, would find themselves paying a surcharge to make up for the shortfall in revenue collections in the previous year. The effect of MDU's program could be to increase, not decrease the volatility in customers' bills from year to year.

154. The Commission finds that MDU's proposal should be denied because of its delayed effect. For a weather normalization adjustment to be beneficial to ratepayers and not just the utility, it must affect their bills when the unusual weather is occurring, not after it has occurred.

From the foregoing Findings of Fact, the Commission makes its:

Conclusions of Law

1. The Commission has jurisdiction over the parties in and the subject matter of this proceeding.

2. MDU is entitled to rates and charges necessary to provide it an opportunity to earn a reasonable rate of return on its North Dakota electric property, used and useful, for the service and convenience of the public in North Dakota.

3. MDU's existing natural gas rates yield excess revenues of $1.402 million per year.

From the foregoing Findings of Fact and Conclusions of Law, the Commission makes its:

Order

The Commission orders:

1. MDU shall implement a rate reduction sufficient to produce a total annual rate revenue decrease of $1.402 million.

2. MDU shall file revised tariff sheets reflecting the rate reduction to be effective for natural gas service rendered on and after January 1, 2003.

Case No. PU-399-02-183

STAFF RESPONSE TO COMPLIANCE FILING

August 15, 2003

On August 8, 2003, Montana-Dakota Utilities Co., a Division of MDU Resources Group, Inc., (MDU) filed tariff changes to comply with the Order of the Commission dated July 31, 2003. The Commission's Order adopted a Settlement Agreement by which MDU is to implement a rate decrease sufficient to provide a total annual revenue decrease of $362,085 effective for service rendered on or after September 1, 2003. The Settlement Agreement indicated that the rate reduction is to be applied to the rate classes in the same manner as the increase that was effective with rate change granted December 12, 2002. Settlement Agreement indicated that the rate change is to be implemented as a reduction to the distribution delivery charge.

MDU's compliance tariffs provide a total annual revenue decrease of $361,426. The rate reduction is split between the Residential and Firm General Service classes in approximately the same proportion as the rate change granted December 12, 2002, that is 61.3% of the decrease is allocated to the Residential customers and 38.7% is allocated to the Firm General Service customers. This results in a 0.55% reduction to each class of customer.

The rate reduction was applied to the Distribution Delivery Charge per dekatherm. The Residential distribution charge was reduced from $0.669 to $0.641 which results in a reduction in annual revenue to MDU of $221,196. The Firm General Service distribution charge was reduced from $0.498 to $0.473 which results in a reduction in annual revenue to MDU of $140,231.

Staff believes that MDU's compliance filing satisfies the Commission's Order.

Re: Case No. PU-399-02-183
Compliance Tariffs –
Depreciation Settlement

Montana-Dakota Utilities Co. (Montana-Dakota), a Division of MDU Resources Group, Inc., herewith submits an original and seven copies of revised natural gas tariff sheets and supporting workpaper in compliance with the Settlement Agreement approved by the North Dakota Public Service Commission (Commission) on July 31, 2003.

The rates set forth on the revised tariff sheets will result in a reduction in annual revenues of $362,085. The rate reduction was applied to the distribution delivery charge component in a manner consistent with that of the increase authorized on December 10, 2002. The overall affect is a decrease in authorized revenues of .55% for the residential and firm general customer classes.

Montana-Dakota hereby requests that the change to the distribution delivery charges reflected on the tariffs attached hereto be approved in conjunction with the implementation of the September 2003 Purchased Gas Cost Adjustment (PGA) on a bills rendered basis September 1, 2003. The Rate Summary Sheet reflecting the revised distribution delivery charge rates and the September PGA items will be filed in conjunction with the Company's PGA filing.

Please acknowledge receipt by stamping or initialing the duplicate copy of this letter attached hereto.

Sincerely,

Donald R. Ball

ORDER APPROVING SETTLEMENT AGREEMENT

July 31, 2003

Appearances

Commissioners: Tony Clark, Leo M. Reinbold, Susan E. Wefald

William W. Binek, Chief Counsel, Public Service Commission, State Capitol, 600 East Boulevard, Bismarck, ND 58505, appearing for the Public Service Commission advocacy staff.

Daniel S. Kuntz, Attorney at Law, 316 North Fifth Street, PO Box 1695, Bismarck, ND 58502-1695 appearing for Montana-Dakota Utilities Co.

Allen C. Hoberg, Director, Office of Administrative Hearings, 1707 North 9th Street - Lower Level, Bismarck, ND 58501-1882, presiding Administrative Law Judge.

Preliminary Statement

On December 18, 2002, the Public Service Commission issued its Corrected Findings of Fact, Conclusions of Law and Order resolving all issues in this proceeding except depreciation. The Commission accepted a proposal by the parties to continue the issue of depreciation pending completion of a depreciation study. The Commission required that Montana-Dakota Utilities Co. (MDU) file its depreciation study by January 31, 2003, which would then be subject to Commission Staff (Staff) review including discovery, testimony and hearing. MDU's depreciation study was to include natural gas and common plant facilities. Any resulting change in depreciation expense ordered by the Commission at the conclusion of the review would be reflected in rates on a prospective basis.

On January 31, 2003, MDU filed its depreciation study.

On March 12, 2003, the Commission issued a Notice of Hearing and Procedural Schedule, scheduling a public hearing to begin on April 22, 2003, subsequently rescheduled to July 1, 2003, at the Commission Hearing Room at the Commission's

154 PU-399-02-183 Pages: 21
Order Approving Settlement Areement
by Public Service Commission
07/31/2003 CC: Comm Legal Illona, Pat, Jerry Mike .

offices in Bismarck. The notice identified the following issues to be considered in this proceeding:

1. What is the value of MDU's property, used and useful, for the service and convenience of the public in North Dakota?

2. What is the appropriate treatment of plant retirement costs?

3. What rates and charges are necessary to provide a just and reasonable rate of return on MDU's property, used and useful, for the service and convenience of the public in North Dakota?

On July 1, 2003, a hearing was convened as scheduled. A motion for continuance to an informal hearing on July 9, 2003 was immediately granted to allow time for the parties to finalize a settlement agreement.

On July 8, 2003, the parties filed a Settlement Agreement intended to resolve all issues in this proceeding.

On July 9, 2003 the Commission discussed the Settlement Agreement with the parties at an informal hearing.

Settlement Agreement

The Settlement Agreement is a negotiated settlement, subject to Commission approval, and does not establish any principle or precedent, except as expressly provided therein.

Attachment 1 to the Settlement Agreement is a schedule by functional plant categories and accounts of existing and agreed upon depreciation rates and the annual system-wide depreciation expenses based on depreciable plant in service on December 31, 2001. The Settlement Agreement provides an effective date of September 1, 2003, for the proposed new depreciation schedules and resulting retail rates.

The parties agree that the rate impact of the depreciation schedules agreed to in attachment 1 decreases MDU's annual revenue requirement by $362,085. The Settlement Agreement provides that MDU file revised tariff sheets not less than ten days prior to the effective date and proportions the revenue decrease among the customer rate classes in the same manner as prescribed for the increase authorized by the Commission in its order of December 18, 2003.

Having reviewed the testimony and other information provided by the parties, the Commission finds the Settlement Agreement is a fair and reasonable resolution of the remaining issues in this Case. The resulting rates and charges for retail natural gas service will provide a just and reasonable rate of return on MDU's property, used and useful, for the service and convenience of the public in North Dakota. The Commission

concludes that the Settlement Agreement is in the public interest and should be approved.

Order

1. The attached Settlement Agreement is approved.

2. The depreciation rates for natural gas and common utility plant agreed to in Attachment 1 to the attached Settlement Agreement are approved.

3. MDU shall file revised tariff sheets as agreed to in the attached Settlement Agreement effective for service rendered on or after September 1, 2003.

Re: Montana-Dakota Utilities Co. Depreciation Study – Case No. PU-399-02-183

Dear Mr. Mielke:

Enclosed for filing are the original and seven copies of the a Settlement Agreement entered into by Montana-Dakota Utilities Co. and the Staff of the North Dakota Public Service Commission. Acceptance of this Settlement Agreement by the Public Service Commission would resolve all outstanding continued issues in this case. The parties to the Settlement Agreement request that the Agreement be brought to the attention of the Public Service Commission for consideration at the informal hearing on this matter scheduled for July 9, 2003.

Please contact me or Bill Binek if you have any questions regarding this Agreement.

Sincerely,

Daniel S. Kuntz

SECRETARY

STATE OF NORTH DAKOTA

PUBLIC SERVICE COMMISSION

Montana-Dakota Utilities Co.	)	Case No. PU-399-02-183
Depreciation Study	)	

SETTLEMENT AGREEMENT

This Settlement Agreement is entered into by and between Montana-Dakota Utilities Co. ("Montana-Dakota" or "Company") and the Staff of the North Dakota Public Service Commission ("Staff"). This Settlement Agreement resolves all outstanding continued issues in this case in a manner consistent with the public interest and will result in just and reasonable depreciation rates and expense accruals for the Company's natural gas distribution operations in North Dakota.

PROCEDURAL HISTORY

1. On April 12, 2002, Montana-Dakota filed an application for an increase in its North Dakota retail natural gas rates based on a 2003 projected test year. The North Dakota Public Service Commission ("Commission") suspended Montana-Dakota's rate filing and set the matter for investigation and hearing. The disputed issues between Montana-Dakota and the Staff included the proper depreciation rates and depreciation expenses for the test year. The Staff's witness recommended that the test year depreciation expenses proposed by the Company be reduced. The Company's witness maintained that no depreciation rate adjustments should be entertained until a depreciation study being conducted by the Company was completed and reviewed.

Settlement Agreement
by Montana-Dakota Utilities Co., a Division of MDU R
07/08/2003 CC: Comm Legal Illona, Pat, Jerry Mike

Montana-Dakota asked the Commission to defer any consideration of the depreciation issue until Montana-Dakota's new depreciation study was complete, Montana-Dakota agreed to submit the new depreciation study for review by January 31, 2003 as a continued issue in this proceeding subject to the standard and customary contested case process with all parties having rights of discovery, testimony, rebuttal testimony, hearing and briefing.

2. In its Order issued December 18, 2002, the Commission approved continuation of the depreciation issue. Montana-Dakota was directed to file its depreciation study as soon as possible but no later than January 31, 2003. Any resulting changes in depreciation expense ordered by the Commission at the conclusion of the review of the depreciation study would be reflected in rates on a prospective basis.

3. On January 31, 2003, Montana-Dakota filed depreciation studies prepared by AUS Consultants related to Montana-Dakota's common and gas division utility plant.

4. On March 12, 2003, the Commission issued a Notice of Hearing and Procedural Schedule setting the following issues for consideration on Montana-Dakota's depreciation studies:

1. What is the value of Montana-Dakota's property, used and useful, for the service and convenience of the public in North Dakota?
2. What is the appropriate treatment of plant retirement costs?
3. What rates and charges are necessary to provide a just and reasonable rate of return on Montana-Dakota's property, used and useful, for the service and convenience of the public in North Dakota?

A hearing on the above issues was scheduled for April 22, 2003. On April 23, 2003, the Commission rescheduled the hearing to July 1, 2003.

5. The Company's depreciation studies indicated the Company's existing depreciation rates, applied to total system-wide depreciable gas division utility plant in service as of December 31, 2001 resulted in an annual depreciation expense of $7,694,754. In comparison, application of the study's proposed depreciation rates to the same depreciable plant in service as of December 31, 2001 would result in an annual depreciation expense of $8,010,389; an increase of $315,635 from existing rates. The composite annual depreciation rate under the existing rates is 4.52% while the Company's study recommended a proposed composite depreciation rate of 4.70%.

6. For common utility plant, the studies indicated the application of existing rates to total system-wide depreciable common plant in service as of December 31, 2001 resulted in an annual depreciation expense of $2,167,043. Application of the proposed depreciation rates to the total system-wide depreciable common plant in service as of December 31, 2001 would result in an annual depreciation expense of $2,666,460; an increase of $499,417 from the existing rates. The composite annual depreciation rate for common plant under the existing rates is 5.84%, while the studies proposed composite depreciation rate for common plant would be 7.18%.

7. On April 7, 2003, the consultant for the Staff, Charles W. King, filed direct testimony reviewing and critiquing the depreciation study prepared by AUS Consultants. Mr. King also recommended alternative depreciation rates for the gas division and common utility plant of Montana-Dakota. The following is a comparison of the Company's existing

depreciation rates as well as those recommended by the Company and the Staff:

Plant Category	Existing Composite Rate	Existing Annual Expense	Company Proposal Composite Rate	Company Proposal Annual Expense	Staff Proposal Composite Rate	Staff Proposal Annual Accrual
Gas Distribution	4.46%	$6,758,717	4.01%	$6,082,611	2.33%	$3,535,250
Gas General	4.98%	$ 936,037	10.25%	$1,927,777	5.27%	$ 990,871
Common	5.84%	$2,167,042	7.18%	$2,666,459	5.27%	$1,955,583

8. On April 28, 2003, the Company filed rebuttal testimony of Earl M. Robinson responding to the testimony and recommendations of Mr. King.

9. Following the analysis of the depreciation studies and the testimony of the parties respective witnesses, settlement discussions were held between the Staff and Company representatives in accordance with the Commission's proposed settlement guidelines (July 1994). As a result of those discussions, the parties have reached this Settlement Agreement. The parties agree the Settlement Agreement resolves all issues in the proceeding in a manner consistent with applicable law and the settlement guidelines.

10. The Settlement Agreement is supported by the administrative record. Accordingly, the parties jointly recommend the Commission issue an Order: (a) approving this Settlement Agreement in its entirety, without conditions or modifications; (b) approving the depreciation rates for the Company's natural gas distribution and common utility plant; and (c) directing the Company to file revised rate schedules reflecting the impact of the proposed depreciation rates on the Company's existing natural gas retail rates in North Dakota and implementing changes in its natural gas retail rates consistent with this

Settlement Agreement.

TERMS OF SETTLEMENT AGREEMENT

Attachment 1 is a schedule by functional plant categories and accounts of the existing and agreed depreciation rates and the annual system-wide depreciation expenses based upon depreciable plant in service at December 31, 2001. A comparison of the existing rates and expenses, the Company proposal, the Staff proposal, and the recommended depreciation rates and annual expense accruals based on December 31, 2001 system-wide plant in service is shown in Attachment 2.

Staff and Montana-Dakota agree and recommend that the Commission approve the recommended depreciation rates on Attachment 1.

The recommended depreciation rates were arrived through negotiations based upon the studies and testimony provided by the expert consultants for the Staff and the Company. Although the Staff and the Company agree and recommend the depreciation rates set forth on Attachment 1, the parties do not adopt or recommend as part of this Settlement Agreement the amount or a methodology for determining net salvage and average service lives for the various plant accounts. Nothing in this Settlement Agreement shall limit the authority of the Commission to establish, or the Staff and the Company to advocate, in future proceedings, the appropriate methodology or the appropriate amounts of net salvage and average service lives for the various plant accounts.

EFFECTIVE DATE OF REVISED RATES

Subject to approval by the Commission of this Settlement Agreement, the revised depreciation rates and the resulting retail rate change will become effective September 1,

2003.

RETAIL RATE ADJUSTMENT

Upon approval of the Settlement Agreement by the Commission, the Company shall file revised tariff sheets reflecting changes to its North Dakota retail natural gas rates based upon the depreciation rate changes which is a reduction in annual revenues of $362,085. Attachment 3 shows the calculation of the North Dakota natural gas retail rate reduction to reflect the recommended depreciated rates and expense accruals. The rate reduction shall be applied to the rate classes in the same manner as the increase that was effective with service rendered December 12, 2002. The applicable change will be implemented as a reduction to the distribution delivery charge component of the rate. The revised tariff sheets shall be filed not less than ten (10) days prior to the effective date.

OTHER TERMS AND CONDITIONS

A. Basis of Settlement.

It is agreed this Settlement Agreement contains negotiated depreciation rates and accrual amounts subject to approval by the Commission. The Settlement Agreement does not establish any principle or precedent regarding the methodology for establishing depreciation rates.

B. Effect of the Settlement Negotiations.

It is understood and agreed that all offers of settlement and discussions related to this Agreement are privileged and may not be used in any manner in connection with proceedings in this case or otherwise, except as provided by law. In the event the Public Service Commission does not approve this Settlement Agreement, it shall not constitute

part of the record in this proceeding and no part thereof may used by any party for any purpose in this proceeding or otherwise.

C. Applicability and Scope.

This Settlement Agreement shall be binding on the parties hereto, and their successors, assigns, agents and representatives. Consistent with the Commission's 1994 proposed settlement guidelines, this Settlement Agreement does not set policy or overturn precedent.

D. Effective Date.

This Settlement Agreement shall be effective on the date of final Commission Order approving the Settlement Agreement with the revised depreciation rates and corresponding revised retail rates effective on the dates specified herein. If the Commission Order modifies or conditions approval, this Settlement Agreement shall be deemed terminated if either party files a letter with the Commission within 3 (three) business days of notice of such Order stating that a condition or modification to the Settlement Agreement is unacceptable to such party.

Dated this 8th day of July, 2003.

Summary of Settlement Agreement
by Montana-Dakota Utilities Co., a Division of MDU R
07/09/2003 CC: Comm Legal Illona, Pat, Jerry Mike .

Net Negative Salvage Issues –

- MDU witness applied an inflation factor to estimate future removal costs in determining net negative salvage ratios.

- Staff witness applied a discount factor to current removal costs in determining future net negative salvage costs.

  - Both methodologies depart from "conventional approach" of determining net negative salvage.

Settlement Position –

- Used "conventional approach" in calculating net negative salvage based on current costs.

- Conventional approach has traditionally been used to determine net negative salvage for depreciation rates approved or accepted by NDPSC.

- Settlement does not establish precedent and preserves the right of both parties to advocate, and for the Commission to consider, appropriate methodologies for determining net negative salvage in future proceedings.

Average Lives Issues –

- Accounts having the greatest $$ impact are:

	MDU Proposed Lives	Staff Proposed Lives	Settlement Position
Mains	45	58	54
Services	40	55	40

- Differences reflect professional differences of opinion.
- Settlement lives for Mains and Services are consistent with industry averages.

Settlement Impact –

TOTAL COMPANY

Re: Montana-Dakota Utilities Co. Depreciation Study – Case No. PU-399-02-183

Dear Mr. Mielke:

Enclosed for filing are the original and seven copies of the a Settlement Agreement entered into by Montana-Dakota Utilities Co. and the Staff of the North Dakota Public Service Commission. Acceptance of this Settlement Agreement by the Public Service Commission would resolve all outstanding continued issues in this case. The parties to the Settlement Agreement request that the Agreement be brought to the attention of the Public Service Commission for consideration at the informal hearing on this matter scheduled for July 9, 2003.

Please contact me or Bill Binek if you have any questions regarding this Agreement.

Sincerely,

Daniel S. Kuntz

STATE OF NORTH DAKOTA

PUBLIC SERVICE COMMISSION

Montana-Dakota Utilities Co.) Case No. PU-399-02-183
Depreciation Study)

SETTLEMENT AGREEMENT

This Settlement Agreement is entered into by and between Montana-Dakota Utilities Co. ("Montana-Dakota" or "Company") and the Staff of the North Dakota Public Service Commission ("Staff"). This Settlement Agreement resolves all outstanding continued issues in this case in a manner consistent with the public interest and will result in just and reasonable depreciation rates and expense accruals for the Company's natural gas distribution operations in North Dakota.

PROCEDURAL HISTORY

1. On April 12, 2002, Montana-Dakota filed an application for an increase in its North Dakota retail natural gas rates based on a 2003 projected test year. The North Dakota Public Service Commission ("Commission") suspended Montana-Dakota's rate filing and set the matter for investigation and hearing. The disputed issues between Montana-Dakota and the Staff included the proper depreciation rates and depreciation expenses for the test year. The Staff's witness recommended that the test year depreciation expenses proposed by the Company be reduced. The Company's witness maintained that no depreciation rate adjustments should be entertained until a depreciation study being conducted by the Company was completed and reviewed.

Settlement Agreement
by Montana-Dakota Utilities Co., a Division of MDU R
07/08/2003 CC. Comm Legal Illona, Pat, Jerry Mike .

Montana-Dakota asked the Commission to defer any consideration of the depreciation issue until Montana-Dakota's new depreciation study was complete, Montana-Dakota agreed to submit the new depreciation study for review by January 31, 2003 as a continued issue in this proceeding subject to the standard and customary contested case process with all parties having rights of discovery, testimony, rebuttal testimony, hearing and briefing.

2. In its Order issued December 18, 2002, the Commission approved continuation of the depreciation issue. Montana-Dakota was directed to file its depreciation study as soon as possible but no later than January 31, 2003. Any resulting changes in depreciation expense ordered by the Commission at the conclusion of the review of the depreciation study would be reflected in rates on a prospective basis.

3. On January 31, 2003, Montana-Dakota filed depreciation studies prepared by AUS Consultants related to Montana-Dakota's common and gas division utility plant.

4. On March 12, 2003, the Commission issued a Notice of Hearing and Procedural Schedule setting the following issues for consideration on Montana-Dakota's depreciation studies:

1. What is the value of Montana-Dakota's property, used and useful, for the service and convenience of the public in North Dakota?
2. What is the appropriate treatment of plant retirement costs?
3. What rates and charges are necessary to provide a just and reasonable rate of return on Montana-Dakota's property, used and useful, for the service and convenience of the public in North Dakota?

A hearing on the above issues was scheduled for April 22, 2003. On April 23, 2003, the Commission rescheduled the hearing to July 1, 2003.

5. The Company's depreciation studies indicated the Company's existing depreciation rates, applied to total system-wide depreciable gas division utility plant in service as of December 31, 2001 resulted in an annual depreciation expense of $7,694,754. In comparison, application of the study's proposed depreciation rates to the same depreciable plant in service as of December 31, 2001 would result in an annual depreciation expense of $8,010,389; an increase of $315,635 from existing rates. The composite annual depreciation rate under the existing rates is 4.52% while the Company's study recommended a proposed composite depreciation rate of 4.70%.

6. For common utility plant, the studies indicated the application of existing rates to total system-wide depreciable common plant in service as of December 31, 2001 resulted in an annual depreciation expense of $2,167,043. Application of the proposed depreciation rates to the total system-wide depreciable common plant in service as of December 31, 2001 would result in an annual depreciation expense of $2,666,460; an increase of $499,417 from the existing rates. The composite annual depreciation rate for common plant under the existing rates is 5.84%, while the studies proposed composite depreciation rate for common plant would be 7.18%.

7. On April 7, 2003, the consultant for the Staff, Charles W. King, filed direct testimony reviewing and critiquing the depreciation study prepared by AUS Consultants. Mr. King also recommended alternative depreciation rates for the gas division and common utility plant of Montana-Dakota. The following is a comparison of the Company's existing

depreciation rates as well as those recommended by the Company and the Staff:

Plant Category	Existing Composite Rate	Existing Annual Expense	Company Proposal Composite Rate	Company Proposal Annual Expense	Staff Proposal Composite Rate	Staff Proposal Annual Accrual
Gas Distribution	4.46%	$6,758,717	4.01%	$6,082,611	2.33%	$3,535,250
Gas General	4.98%	$ 936,037	10.25%	$1,927,777	5.27%	$ 990,871
Common	5.84%	$2,167,042	7.18%	$2,666,459	5.27%	$1,955,583

8. On April 28, 2003, the Company filed rebuttal testimony of Earl M. Robinson responding to the testimony and recommendations of Mr. King.

9. Following the analysis of the depreciation studies and the testimony of the parties respective witnesses, settlement discussions were held between the Staff and Company representatives in accordance with the Commission's proposed settlement guidelines (July 1994). As a result of those discussions, the parties have reached this Settlement Agreement. The parties agree the Settlement Agreement resolves all issues in the proceeding in a manner consistent with applicable law and the settlement guidelines.

10. The Settlement Agreement is supported by the administrative record. Accordingly, the parties jointly recommend the Commission issue an Order: (a) approving this Settlement Agreement in its entirety, without conditions or modifications; (b) approving the depreciation rates for the Company's natural gas distribution and common utility plant; and (c) directing the Company to file revised rate schedules reflecting the impact of the proposed depreciation rates on the Company's existing natural gas retail rates in North Dakota and implementing changes in its natural gas retail rates consistent with this

Settlement Agreement.

TERMS OF SETTLEMENT AGREEMENT

Attachment 1 is a schedule by functional plant categories and accounts of the existing and agreed depreciation rates and the annual system-wide depreciation expenses based upon depreciable plant in service at December 31, 2001. A comparison of the existing rates and expenses, the Company proposal, the Staff proposal, and the recommended depreciation rates and annual expense accruals based on December 31, 2001 system-wide plant in service is shown in Attachment 2.

Staff and Montana-Dakota agree and recommend that the Commission approve the recommended depreciation rates on Attachment 1.

The recommended depreciation rates were arrived through negotiations based upon the studies and testimony provided by the expert consultants for the Staff and the Company. Although the Staff and the Company agree and recommend the depreciation rates set forth on Attachment 1, the parties do not adopt or recommend as part of this Settlement Agreement the amount or a methodology for determining net salvage and average service lives for the various plant accounts. Nothing in this Settlement Agreement shall limit the authority of the Commission to establish, or the Staff and the Company to advocate, in future proceedings, the appropriate methodology or the appropriate amounts of net salvage and average service lives for the various plant accounts.

EFFECTIVE DATE OF REVISED RATES

Subject to approval by the Commission of this Settlement Agreement, the revised depreciation rates and the resulting retail rate change will become effective September 1,

2003.

RETAIL RATE ADJUSTMENT

Upon approval of the Settlement Agreement by the Commission, the Company shall file revised tariff sheets reflecting changes to its North Dakota retail natural gas rates based upon the depreciation rate changes which is a reduction in annual revenues of $362,085. Attachment 3 shows the calculation of the North Dakota natural gas retail rate reduction to reflect the recommended depreciated rates and expense accruals. The rate reduction shall be applied to the rate classes in the same manner as the increase that was effective with service rendered December 12, 2002. The applicable change will be implemented as a reduction to the distribution delivery charge component of the rate. The revised tariff sheets shall be filed not less than ten (10) days prior to the effective date.

OTHER TERMS AND CONDITIONS

A. Basis of Settlement.

It is agreed this Settlement Agreement contains negotiated depreciation rates and accrual amounts subject to approval by the Commission. The Settlement Agreement does not establish any principle or precedent regarding the methodology for establishing depreciation rates.

B. Effect of the Settlement Negotiations.

It is understood and agreed that all offers of settlement and discussions related to this Agreement are privileged and may not be used in any manner in connection with proceedings in this case or otherwise, except as provided by law. In the event the Public Service Commission does not approve this Settlement Agreement, it shall not constitute

part of the record in this proceeding and no part thereof may used by any party for any purpose in this proceeding or otherwise.

C. Applicability and Scope.

This Settlement Agreement shall be binding on the parties hereto, and their successors, assigns, agents and representatives. Consistent with the Commission's 1994 proposed settlement guidelines, this Settlement Agreement does not set policy or overturn precedent.

D. Effective Date.

This Settlement Agreement shall be effective on the date of final Commission Order approving the Settlement Agreement with the revised depreciation rates and corresponding revised retail rates effective on the dates specified herein. If the Commission Order modifies or conditions approval, this Settlement Agreement shall be deemed terminated if either party files a letter with the Commission within 3 (three) business days of notice of such Order stating that a condition or modification to the Settlement Agreement is unacceptable to such party.

Dated this 8th day of July, 2003.

Rebuttal Testimony of Earl M. Robinson
by Montana-Dakota Utilities Co., a Division of MDU Re
04/28/2003 CC: Comm Legal PUD (3) Mike ALJ

REBUTTAL TESTIMONY OF EARL M. ROBINSON

Q. STATE YOUR NAME, OCCUPATION AND BUSINESS ADDRESS.

A. My name is Earl M. Robinson. I am President & CEO of the Weber Fick & Wilson Division (WFW) of AUS Consultants - Utility Services. WFW is a public utility consulting firm specializing in the performance of various financial studies including depreciation, valuation, cost of service and other analysis for the utility industry and regulatory agencies. AUS Consultants provides a wide spectrum of consulting services through its various affiliated groups that include Utility Services, Valuation Services, ICR Survey Research, and Marketing Systems. WFW is located at 1000 North Front Street, Suite 200, Wormleysburg, Pennsylvania 1704

Q. WHAT IS YOUR EDUCATIONAL BACKGROUND?

A. I am a graduate of Harrisburg Area Community College with an Associate of Arts Degree in Accounting and have completed additional courses at University Center of Harrisburg. I have also successfully completed numerous programs related to service life and salvage estimation, forecasting, and evaluation sponsored by Depreciation Programs, Inc., as well as training programs presented by the Society of Depreciation Professionals. In addition, I have completed cost of service seminars sponsored by the American Water Works Association.

Q. PLEASE DESCRIBE YOUR PROFESSIONAL QUALIFICATIONS.

A. I have been employed by WFW as a public utility consultant from 1971 to 1975 and 1977 to date. During these periods, my responsibilities have included the supervision of analyses and completion of studies related to depreciation, valuation, original cost, trended original cost, cost of service and bill analysis, as well as analyses of expenses, revenues, accounting adjustments for various municipal and investor-owned utilities. Studies prepared have required the review of company records, inspection of property, the preparation of property inventories and original costs, preparation and review of mortality studies, selection of proper service lives and life characteristics, analysis of salvage and analysis of the capital recovery impact of changing depreciation methods. Other areas of responsibility have included the preparation and selection of indices, development of rate base elements, development of data for cost of service studies and testing of consumption and revenue data in the preparation of bill analyses.

From 1975 to 1977, I was employed by Gannett, Fleming, Cordry & Carpenter, Inc. as a valuation analyst. My responsibilities included the classification, analysis and coordination of data in the development of depreciation rates for various companies including telephone, gas, water and electric utilities. During the years 1966 to 1971, I was a staff member of the Plant Accounting Department of United Telephone Company of

Pennsylvania (now Sprint-Eastern Group Headquarters). My responsibilities included the preparation of various plant accounting ledgers and unitization of property accounts, as well as special studies related to insurance and tax valuations. In summary, I have more than thirty (30) years experience in the public utility field.

As a member of the AGA Depreciation Committee (a predecessor to the current AGA Accounting Services Committee), I am a past Chairman of the Statistics, Bibliography, Court and Regulatory Sub-Committee. During my years of membership of the prior organization, as well as the present committee, I participated in many conferences that have incorporated research, analysis, and discussions of numerous depreciation issues and topics. In addition, as a member of the AGA Depreciation Committee, I co-authored a manual entitled *"An Introduction to Net Salvage of Public Utility Plant"* which is used as reference material in AGA/EEI training seminars.

Q. PLEASE STATE ANY ADDITIONAL DEPRECIATION QUALIFICATIONS.

A. I am a Certified Depreciation Professional. The certification is issued by the Society of Depreciation Professionals and is received upon successful completion of an extensive written examination covering all aspects of depreciation. I completed the examination during October 1996.

Q. ARE YOU A MEMBER OF ANY PROFESSIONAL SOCIETIES?

A. Yes, I am a member of the American Gas Association, the American Water Works Association, the Pennsylvania Gas Association, an associate member of the American Gas Association (AGA) Accounting Services Committee (past Chairman of the Statistics, Bibliography, Court and Regulatory Sub-Committee), and a member of the American Railway Engineering Association. I am also a founding member of the Society of Depreciation Professionals. As part of that organization, I held numerous positions including President.

Q. MR. ROBINSON, HAVE YOU PREVIOUSLY SPONSORED TESTIMONY BEFORE A REGULATORY BODY?

A. Yes. I have testified in numerous proceedings before numerous regulatory agencies concerning telephone, gas, water and electric utilities. I have presented testimony to the Alberta Utilities Energy and Utilities Board, Arizona Corporation Commission, the Connecticut Department of Public Utility Control, the Delaware Public Service Commission, the Public Service Commission of the District of Columbia, the Federal Energy Regulatory Commission, the Illinois Commerce Commission, the Massachusetts Department of Public Utilities, the New Hampshire Public Utilities Commission, the New Jersey Board of Public Utilities, the New Mexico Public Service Commission, the New York Public Service

Commission, the North Carolina Utilities Commission, the Pennsylvania Public Utility Commission, the State of Rhode Island Public Utilities Commission, the Public Service Commission of South Carolina, the Virgin Islands Public Services Commission, the California State Board of Equalization and several Valuation Boards with the State of Florida. A list of those prior appearances is set forth in Appendix A of this testimony.

Q. HOW DID YOU FAMILIARIZE YOURSELF WITH THE COMPANY'S PROPERTY, WHICH IS THE SUBJECT OF YOUR ANALYSIS?

A. To obtain an overview and knowledge of the Company's facilities, I met with Company representatives to discuss its general scope of operations, which could have a bearing on the service lives of the Company's property. In conjunction with the management meetings, I performed a physical plant inspection of a representative portion of the Company's above-ground facilities. Likewise, the Company's financial management provided detailed information related to each of the Company's plant investment and net salvage databases. Accordingly, my study involved a detailed analysis of the historical accounting data obtained from the Company's continuing property records.

Q. WHAT WAS THE SOURCE OF THE DATA, WHICH YOU UTILIZED AS A BASIS FOR THE DEPRECIATION RATES YOU ARE RECOMMENDING PER YOUR STUDY?

A. All of the Company's historical data utilized in the course of performing the detailed service life and salvage study was obtained from the Company's books and records. The historical vintaged data (additions, retirements, adjustments, and balances) were obtained for each of the Company's depreciable property groups.

Q. WHAT IS THE PURPOSE OF YOUR REBUTTAL TESTIMONY?

A. I have conducted the depreciation studies of the natural gas and common plant in service of Montana Dakota Utilities Co. (Montana-Dakota, or the "Company") as of December 31, 2001. The depreciation study reports are entitled Montana Dakota Utilities Co. Gas Division Depreciation Study as of December 31, 2001 which is identified as Exhibit No.-___ (EMR-1). The Common Plant study is entitled Montana Dakota Utilities Co. – Common Plant Depreciation Study as of December 31, 2001 and is identified as Exhibit No.-___ (EMR-2). Accordingly, I am providing rebuttal testimony relative to statements made and positions taken by Mr. Charles W. King who filed direct testimony on behalf of the Consumer Advocate Staff of the North Dakota Public Service Commission in this case.

Q. WHAT COMMENTS DO YOU HAVE RELATIVE TO MR. KING'S OPENING SUMMARIZATION OF HIS DEPRECIATION PROPOSAL (PAGE 3 OF HIS TESTIMONY)?

A. On page 3 of his testimony, Mr. King sets forth the impact of his depreciation proposal as it relates to the Company's current level of depreciation and as compared to the recommendations set forth in the Company's Gas Depreciation study. With regard to the Company's gas distribution plant (the primary operating component of the Company's overall investment) Mr. King is proposing approximately a 50% percent reduction in depreciation rates and expense from the current going level and more than a 40% reduction from the depreciation rates set forth in Company's filed Gas depreciation study. While Mr. King's depreciation recommendation relative to the General Plant component is generally similar in level to the present depreciation rates for that function, his proposal does not give recognition to the dramatic changes that have occurred with regard to those property groups. Lastly, Mr. King's depreciation proposal relative to the Company's Common Plant results in a 10% reduction in depreciation from the Company's current depreciation level and a nearly 30% reduction from the depreciation rates set forth in the Company filed Common Plant depreciation study. All of Mr. King's proposed depreciation deductions are unjustified and inappropriate, but his radical proposed reduction to the Company's Gas Distribution function

depreciation rate is particularly disconcerting. The depreciation rates set forth by Mr. King for the Company's distribution plant are clearly not reflective of the capital recovery requirements for this plant. Furthermore, Mr. King's recommendations are dramatically far removed from any normal depreciation level within the gas industry, and equally important, would no doubt result in financial harm to the Company's operations. That is, such a reduction in depreciation expense for the Company property will serve to reduce cash flow and potentially impact the Company's overall capital costs.

The bottom line of Mr. King's proposal is simply one of deferral, and then deferring some more, the true total cost of providing service to the Company's customers. Mr. King's selection of estimated service lives and his proposed use of the SFAS method (a discounted cash flow approach) to define the current period's appropriate share of the future retirement cost (cost of removal) are inappropriate. The method grossly understates the current apportionment of those total life costs. The use of Mr. King's proposed net salvage approach is akin to the sinking fund depreciation method that was used long ago by some regulatory agencies to calculate depreciation rates, but was discarded as not being appropriate to set just and reasonable depreciation rates.

Q. ON PAGE 5 LINES 24 & 25 OF HIS TESTIMONY MR. KING STATES THAT "THE ONLY PARAMETER THAT IS ABOSLUTELY REQUIRED (TO CALCULATE A DEPRECIATION RATE) IS AN ESTIMATE OF THE SERVICE LIFE....". DO YOU HAVE A RESPONDING COMMENT?

A. Yes, while in absolute terms of being able to mathematically calculate a depreciation rate Mr. King may be generally correct, however, he is incorrect in not recognizing the critical importance of net salvage. That is, it is "equally imperative" that the calculation include recognition of the net salvage relative to the plant being recovered. It is not just an after thought of "oh, maybe we should consider net salvage"—it is a key component in the development of the depreciation.

Q. ON PAGE 8 OF HIS TESTIMONY, MR. KING STATES THAT THERE WERE PROBLEMS WITH THE HISTORICAL DATA. DO YOU HAVE AN EXPLANATION RELATIVE TO THIS ISSUE?

A. On page 8, Lines 14 to 19 Mr. King discusses issues he has with the basic historical data. Unfortunately, in the assembling the basic historical data the Company was unable to retrieve historical information relative to additions and retirements prior to January 1, 1948. Notwithstanding, the fact that the account balance of the Company's plant in service as of January 1, 1948 was only approximately 6% of the current balance, the life analysis process uses information relative to additions and retirements

available since the inception of the property groups. While this earlier data does not influence the results to any significant degree, an attempt was made to recreate the information as best as possible through the inclusion of estimates. To estimate the additions and retirement activity for the years 1946 to 1948 the amounts were estimated as being equal to the 1949 amounts. With regard to the War years 1941 through 1945, which Mr. King discussed in his testimony, no amounts were included for either additions or retirements. The decision not to include activity for the war years was based upon experience from reviewing numerous other utility reports during those time periods. Given the limitation of the available (and rationing of) materials during the war years little activity occurred within most utilities. For years prior to the war year's gross additions were generally reduced by 2.5 percent for each prior year's activity to give recognition for plant growth over time. The level of annual retirements was based upon a ratio of each year's gross additions. Again while the level of plant activity is quite modest as compared to current plant and produces only a limited impact on any study results, an attempt was made to estimate values for those years as best as possible.

Q. ON PAGES 12, LINES 24 TO 29 AND PAGES 13 TO 16 OF HIS TESTIMONY, MR. KING DISCUSSES HIS RECOMMENDATIONS OF AVERAGE SERVICE LIFE PARAMETERS FOR A VARIETY OF THE

COMPANY'S PLANT ACCOUNTS. ALSO MR. KING STATES THAT YOUR PREPARED SPR ANALYSIS (RESULTS) DO NOT SUPPORT THE SERVICE LIFE PARAMETER RECOMMENDATIONS SET FORTH IN THE COMPANY'S DEPRECIATION STUDY. WHAT IS YOUR RESPONSE?

A. First. I will respond with regard to Mr. King's criticism that my SPR analysis results do not support the "average service life parameter" recommendations contained in the Company's Gas Depreciation Study Exhibit No.-___ (EMR-1). In response to Mr. King's statement, a discussion of the basic concepts and underlying reasons for historical life analysis is required, and then, secondly, the general assumptions and range of considerations that enter into the estimation of the proposed average service life parameters is also required. The historical data and related life analysis is a basic depreciation study tool which is assembled to enable the depreciation professional to determine (estimate) forward looking service life and salvage parameters used in completing a comprehensive depreciation study. That is, the data base is a source from which to prepare historical analysis, make assessments and judgments concerning the life and salvage factors being achieved. **The historical life analysis procedure and indicated service life parameter results is a tool not an end in and by itself**. In the process of assessing the service life analysis results, one must consider not only the results of the historical analysis, but also must give recognition to the general life characteristics of utility

property when selecting the survival characteristic (i.e., the Iowa Curve that goes along with the average service life.) Simply said, utility property is generally placed into service with the expectation that it will remain in service for some time before it is removed from service. That is, there is not a general expectation that significant levels of property retirements will occur shortly after the property is placed into service. In that regard, in estimating survival characteristics (Iowa Curves) for the various plant categories, a somewhat greater focus is placed on more Right Mode Iowa Curves (R Curves as opposed to O and L Curves); as well as higher subscript Curves, 2.5 and 3 curves as opposed to 1 and 2 Curves). In his life parameter selections, Mr. King has generally focused on the more left mode and lower subscript Curves simply because they met "some of his other criteria and conceivably indicated a better arithmetic fit of the available historical data. The impact of his selection process is to estimate average service lives that are, 1) longer than appropriate and, 2) do not generally represent the characteristic of the property being studied. Standard service life depreciation analysis processes were utilized along with the Company's developed depreciation data base compiled through December 31, 2001 to develop property life indications. Likewise, the net salvage data base was used as a basis to identify historical experience and trends and to determine each property group's recommended net salvage factors. This process is used as a benchmark, together with professional

analysis and consideration, to estimate future lives and salvage factors over which to recover the Company's un-depreciated fixed capital investments. It is not a process of simple arithmetic calculations and accepting whatever is generated from the "Computer Analysis" to estimate the future parameters, but one of clear and deliberate consideration of all factors impacting the Company's property.

I will now respond to various specific account criticisms made by Mr. King.

Account 375 - Distribution Meas. & Reg. Structures and Improvements. This class of property contains investments relative to structures which tend to be placed into service followed by somewhat limited subsequent activity. Mr. King's selection of an S1 curve implies that greater levels of young aged retirements (mortality) than the proposed R2.5 curve contained in the Company's depreciation study Exhibit No.-___ (EMR-1). Even a somewhat limited change to a more right mode or higher subscript curve would have altered his conclusion. For example, even if Mr. King had selected an S2 or S3 curve, which demonstrates fewer early aged retirements (rather than simply the historical arithmetic best fit curve of an Iowa S1 Curve) his resulting average remaining life recommendation would have been shorter (which translates into a higher depreciation rate) than my proposed remaining life using the R2.5 Iowa Curve.

Account 376 – Mains. While Mr. King has selected an "R" mode Iowa curve for this property group, he has again selected a relatively low

subscript curve, an Iowa R1.5 Curve as opposed to an Iowa R3 Curve recommended per the Company's Gas depreciation study Exhibit No.-___ (EMR-1). Conversely, the use of the estimated R3 Curve, within the Company's Depreciation Study, recognizes that a greater frequency of retirements will occur later in life as opposed to earlier in life. These estimated later in average life retirements is generally consistent with that anticipated by operating personnel for gas mains throughout the utility industry. Using the Iowa R3 curve for Account 376-Mains and Mr. King's own analysis per CWK-2 identifies that the indicated average service life of the Company's Main's investment should be 44.7 years (which is consistent with the life proposed by the Company's depreciation study). Also following Mr. King's own general criteria for estimating the applicability of a service parameter within the life analysis process, the Retirement Experience Index for an Iowa 44.7-R3 Curve is at 100 (higher is better) as opposed to the 57.6-R1.5 Curve which has a Retirement Experience Index of 87.5. Furthermore, as a general check on the reasonableness of the estimated Iowa 45-R3 service life parameters estimated per the Company's depreciation study report Exhibit No.-___ (EMR-1), the AGA depreciation survey indicates that nearly one-third of the reporting companies are utilizing a service life in the range of 45-52 years. However, in reviewing such statistics one must recognize that segments of this industry data are being influenced by sizeable investments related to Cast Iron Main dating

back to the 1800's which has routinely experienced a substantially longer average service life due to operating at far lower operating pressures, etc. The Company does not have Cast Iron Mains. Absent that service life information relative to cast iron main property, the overall average of the industry service lives is most likely years shorter.

Finally, Mr. King states that he is recommending the use of a Whole Life based depreciation rate as opposed to a Remaining Life based depreciation rate for this asset categories. This approach of switching to a different depreciation technique for this account and one other account is apparently an effort to offset some of the impact of his inappropriately proposed depreciation parameters and procedures which produce results that even Mr. King recognizes as totally irrational.

Account 378 – Measuring & Regulating Station Equipment. Again, Mr. King has selected an average service life parameter (an SC Curve which is a constant retirement percent dispersion) indicating that from day one after the property group investment is placed in to service the property group will experience continuous and ongoing retirements. Such a service life parameter is not anticipated and/or realistic for this class of property. Conversely, the Company's filed Gas depreciation study Exhibit No.-___ (EMR-1) recommends an Iowa R1 Curve for this property category. While the Iowa R1 curve recognizes that various levels of retirements will occur throughout the property's life, the anticipated retirement levels are not

nearly as accelerated as that indicated under Mr. King's recommendation. Furthermore, in reviewing Mr. King's Exhibit CWK-2 it is further noted that the Company recommended Iowa R1 curve has a superior Retirement Experience Index (Mr. King's selected criteria) of 99.5 versus a Retirement Experience Index of 82.2 for Mr. King's selected SC Curve.

Account 379 – Measuring & Regulating Station Equipment – City Gate. For this account Mr. King states that he picked the best SPR result with a Retirement Experience Index of greater that 75. His statement is incorrect; the Retirement Experience index is only 67.36 as shown by his Exhibit CWK-3. The important factor however is that he again selected an Iowa Curve (an S1) that experiences higher levels of retirements earlier in life than the Iowa R2.5 Curve incorporated into the Company's study for this property group. In general City Gate stations tend to be constructed to service a selected community and/or service territory. They are typical designed for the larger area as compared to a district regulator station and therefore tend to be less prone to changes earlier in life. Conversely, district regulator stations (Account 378) are more influenced by changes of demand within a given neighborhood and therefore would likely experience a somewhat greater level of retirements early in life (and thus would demonstrate a lower subscript curve). Again using Mr. King's own measurement criteria the Iowa 33.2-R2.5 (from Mr. King's Exhibit CWK-3) produces a Retirement Experience Index of 93.96 (higher is better) as

opposed to Mr. King's recommended curve of an Iowa S1 curve which produces a Retirement Experience Index of only 67.4.

Account 380 – Services. Mr. King has recommended a service life for the Company's Services account that is inconsistent with the general range of data he reviewed. As with essentially all previous accounts studied, his primary stated measurement criteria is that the recommended service life parameters historically generated a Retirement Experience of greater than 75. In addition he has referenced that a life in the range of 60 to 80 years might be justified by the study data, even without giving consideration to the survivor life characteristics indicated by those life indications (extremely left modal Curves being mostly O mode curves and a low subscript (R1) curve). Furthermore, Mr. King quotes that the maximum life used by any AGA reporting Company is 63 years and that the average service life reported by the industry for Services is 40 years. All this data referenced by Mr. King better supports the Company's proposed service life of 40 years (per Exhibit No.-___ (EMR-1)) as opposed to the extremely long and irrational life of 55 years recommended by Mr. King. Also, the Iowa R2.5 recommended per the Company's Gas depreciation study produces a Retirement Experience Index (Mr. King's preferred measurement) of 100 versus Mr. King's recommended R1 Curve which produces a Retirement Experience Index of 83.9.

As with Account 376 – Mains Mr. King states that he is recommending the

use of a Whole Life based depreciation rate as opposed to a Remaining Life based depreciation rate. Again, this approach of switching to a different depreciation technique for these accounts is apparently an effort to offset some of the impact of his inappropriately proposed depreciation parameters and procedures which produce results that even Mr. King recognizes as totally irrational.

Account 381 – Meters. Mr. King's schedule on Page 15 of his testimony indicates that he recommended an Iowa R1.5 curve for this property group, however, his text on Page 14 of his testimony and his Ehibit CWK-1 Schedule 2 identifies that an Iowa R2.5 Curve was utilized as the applicable depreciation parameters. The Iowa R2.5 curve is the same as recommended by the Company's Gas depreciation report.

Account 383 – Service Regulators. This property investment is related to house regulators that are installed on the Customer premise to reduce the pressure from the distribution level to the lower pressure that is utilized by the customer's gas appliances, etc. This category of property experiences only minimal levels of early retirements given that the drivers for retirement tend to be generally physical in nature and/or could be the product of a pressure change with district service area. Accordingly, there is absolutely no justification for estimating an Iowa R1 Curve as the applicable service life parameter for this asset category. Reviewing Mr. King's curve fitting analysis (Exhibit CWK-2) for this account identifies that the Iowa R3 Curve

recommended per the Company's Gas depreciation study produces an indicated average service life of 32.4 (which is less that the 35 years recommended per the Company study report). Likewise the R3 Curve produces a Retirement Experience Index of 100 (higher is better) as opposed to Mr. King's recommended R1 Curve which has a Retirement Experience Index of 80 and an average service life of 38.7 years. Mr. King proposed a 40 year life for the account.

Account 385 – Industrial Measuring & Regulating Station Equipment.

Counter to Mr. King's statement that he is not surprised that Service Regulators and Industrial M&R Equipment would have the same life, these two categories of property are dramatically different classes of assets. The service regulator is a very small unit used for providing relatively small volumes of gas to residential and/or commercial customers. Conversely, Industrial Measuring & Regulating Station Equipment is typically a relatively larger regulator set used to provide large volumes of gas to industrial customers. These Industrial M & R facilities are more akin to District Regulator Stations but more susceptible to life limitations do to changing individual business operations. While the Company's Gas depreciation study recommended relatively similar depreciation parameters for Service Regulators and Industrial Measuring & Regulating Station Equipment it is not for the same reason as indicated by Mr. King. Even according to Mr. King's analysis the Iowa R2 Curve recommended by the Company's Gas

depreciation report produces a Retirement Experience Index of 95.8 while Mr. King's recommended R1 Curve produces a Retirement Experience Index of 78.4. Likewise Mr. King's R1 curve indicates greater levels of retirements earlier in life than does the Company's study recommendation of an R2 Curve.

Account 386 – Miscellaneous Equipment. As Mr. King stated, a larger portion of this property group's investment is related to CNG Refueling Station equipment. Due to the lack of historical retirements, the historical data does not produce applicable service life indications. This class of plant is an evolving technology which relies on various levels of cascading equipment that is upgraded over time. Also this is somewhat of an unproven product with regard to whether there is real long term viability for this asset class. Lastly the Investment in the class is relatively modest; accordingly, a 15 year life with an R3 Curve was deemed the most appropriate service life parameters for this asset class.

Account 387.10 – Cathodic Protection. Cathodic Protection is a technology driven asset group that does experience various levels of somewhat gradual and earlier in life retirements than represented by the Iowa L4 Curve proposed by Mr. King. Accordingly, the R1.5 Curve as recommended by the Company Gas depreciation study Exhibit No.-___ (EMR-1) is deemed as a superior life recommendation as opposed to Mr. King's proposed L4 Curve.

Q. MR. KING, ON PAGE 16, OF HIS TESTIMONY DISCUSSES YOUR DISAGGREGATION OF SELECTED ACCOUNTS. WHY DID YOU DISAGGREGATE THE INVESTMENTS IN VARIOUS ACCOUNTS?

A. In completing depreciation studies, it has been my practice, as well as the practice of various other depreciation professionals, to segment various larger plant accounts into more homogenous types of property groups. It is noted that the Company's investment in Account 376 - Mains comprises more than 45 percent of the Company's depreciable plant while Account 380 – Services comprises more than 18 percent of the depreciable plant. The segmentation of these assets and the calculation of individual sub-account depreciation rates provides the opportunity to look at separate types of property individually and then subsequently composite those rates together into a total account depreciation rate. It is not necessary that the Company accrue depreciation on the separate categories only that the depreciation professional consider the possible/probable differences between the facilities when developing depreciation rates. Conversely, relative to Mr. King's reference to Account 387, that property group was not disaggregated in performing the depreciation study. The Company maintains investment information in this manner on it books and records, therefore a depreciation rate was developed for each property category.

Q. ON PAGE 18 LINES 13 TO 19 OF HIS TESTIMONY MR KING DISCUSSES THE DATA THAT HE RECEIVED RELATIVE TO ACCOUNT 391 AS WELL AS HIS ANALYSIS AND RECOMMENDATIONS FOR THIS PROPERTY CATEGORY. WHAT COMMENTS DO YOU HAVE IN THIS REGARD?

A. Mr. King states that he included computers with office furniture into a composite analysis because he did not have the separated data. Mr. King was provided all the detail in electronic form in response to Staff DR1.1. In fact, the combined Account 391 data "was not" provided inasmuch as the Company only maintains the information on an individual sub-account basis. The only way that Mr. King could have obtained the total combined Account data would have been to physically add the sub-account related data together. Counter to Mr. King's rebuttal testimony concerning his statement that "he is not persuaded that the separation results in a more accurate picture", real life facts demonstrate a far different picture. The life of office furniture in no way has any relationship to the life expectancy of computer (PC) equipment. Mr. King's estimated life of 17 years for the overall account which is comprised of nearly 60 percent PC related equipment is totally unrealistic. In fact it is very routine for company's to experience 15 years as an average service life for non-computer related furniture and office equipment. Applying a 17 year life to Account 391.3 - PC Computer related equipment investment is another clear example

where Mr. King is proposing to defer recovery to future customers. With the ongoing radical and dramatic changes to PC and related software (which drives much of the equipment replacement) there is a never ending revolving door of PC equipment. The 15 year amortization period for Office Furniture & Equipment and the Iowa 5-R2 service life parameter recommended by the Company's Gas depreciation study report are justified, reasonable, and extremely well supported by extensive experience through the utility industry.

For example, of the various Companies reporting within the AGA/EEI depreciation statistics the mean average service life relative to Furniture and Equipment for 98 Gas Companies is 14 years while the median service life is 13 years. Similarly for 52 entities with Common Plant the reported mean average service life for Furniture and Equipment is 14 years while the median service life is 11 years, and for 168 electric reporting companies the mean average service life is 14 years while the median service life is 12 years. Within the above referenced reporting groups, for the single largest group, 31 of 98 reporting Gas companies, the average service life fell in the range of 2 to 8 years. By comparison, for 26 of 52 Common Plant reporting, the average service life was in the range of 5 to 10 years. Lastly, for 62 of 168 reporting electric companies, the average service life was in the range of 5 to 10 years. This information recognizes that the useful life of Furniture and Equipment is being significantly influenced by a short life

for Computer Equipment. Given that the AGA statistics report does not specifically separate depreciation lives between office furniture and equipment and PC Computer equipment, specific listings of the average service lives for PC's is not available from this source. Nevertheless there is extensive anecdotal evidence concerning the rapid changes and limited life of PC Equipment, however, the actual empirical evidence is somewhat more limited.

With regard to specific empirical evidence related to the average service of Computer Equipment, based upon the available actuarial data for the Company's Common Plant investments, a historical life analysis produced an average service life indication of 6 years for PC Equipment. Likewise, similar studies performed on Computer Equipment for several other entities including California-American Water, Illinois-American Water, and Northern Indiana Public Service produced life indications for Computer PC and Peripheral Equipment in the range of 5-8 years as shown on the accompanying data and curve plots (Exhibit No.-___ (EMR-3)). A curve plot for Montana-Dakota is also included in the exhibit. This information demonstrates that historically, the life being achieved for this asset class(PC's & Peripheral Equipment), is substantially shorter than that indicated by Mr. King. Furthermore, it is highly likely that sizable portions of the PC equipment remaining on the various Company's books and records is subject to increasing levels of obsolescence and is awaiting replacement

in the near term.

Q. ON PAGE 18 AND 19 OF HIS TESTIMONY MR. KING DISCUSSES VARIOUS LIVES RELATIVE TO AMORTIZATION PERIODS WHICH THE COMPANY HAS REQUESTED FOR SELECTED GENERAL PLANT ACCOUNTS. WHAT COMMENTS DO YOU HAVE IN THIS REGARD?

A. Mr. King states that he has performed life analysis on various of these accounts and/or retained the current life for others, namely 393, 394.1,394.2 394.3, 394.5, 397, and 397. The real issue is simply that the items in these accounts tend to be numerous and minor in nature which makes detailed record keeping administratively burdensome. Accordingly, this is the specific reason for the Company requesting to amortize these limited asset investments over a pre determined useful life. The proposed useful life was the product of the available historical data from Company as well as industry data along with input from Company management concerning the likely useful life of such property classes. To base the estimated amortization periods simply on the existing depreciation period and/or the life indication generated from questionable historical data alone is totally inappropriate. Accordingly, the amortiziation periods set forth on Table 2 (and as contained in the following list) of the Company's Gas depreciation report (Exhibit No.-___(EMR-1)) are the appropriate lives to use.

Acct. No.	Account Description	Amortiz. Period (Yrs)
391.10	Office Furniture & Equipment	15
393	Stores Equipment	35
394.10	Tools, Shop & Garage Eq. (Non-Unit)	18
394.20	Tools, Shop & Garage Eq. (Unitized)	18
394.30	Vehicle Maintenance Equipment	20
394.40	Vehicle Refueling Equipment	15
395	Laboratory Equipment	20
397.10	Radio Comm. Equip (Fixed)	15
397.20	Radio Comm. Equip (Mobile)	15
397.30	General Tel. Comm. Equip.	10
397.50	Supervisory & Telemetering Equip.	10
397.60	SCADA Equipment	8
397.80	Network Equipment	5
398	Miscellaneous Equipment	20

Q WHAT COMMENT DO YOU HAVE REGARDING MR. KING'S ESTIMATED AMORTIZATION PERIOD'S FOR COMMON PLANT ACCOUNTS AS DISCUSSED ON PAGE 19, LINES 29-31 AND PAGE 20 LINES 1-12 AND AS INCLUDED IN HIS EXHIBIT CWK-1 SCHEDULE 4?

A. As with his recommendation concerning the amortization of the Company

Gas Plant General Accounts the real issue for Common Plant is also simply that the items in these accounts tend to be numerous and minor in nature which makes detailed record keeping administratively burdensome. Accordingly, this is the specific reason for the Company requesting to amortize this limited asset investments over a pre determined useful life. The proposed useful life was the product of the available historical data from Company as well as industry data along with input from Company management concerning the likely useful life of such property classes. To base the estimated amortization periods simply on the existing depreciation period and/or the life indication generated from questionable historical data alone is total inappropriate. Accordingly, the amortization periods set forth on Table 2 (and as contained in the following list) of the Company's Common Plant depreciation report (Exhibit No.-___(EMR-2)) are the appropriate lives to use.

Acct. No.	Account Description	Amortiz. Period (Yrs)
391.10	Office Furniture & Equipment	15
393	Stores Equipment	30
394.10	Tools, Shop & Garage Eq. (Non-Unit)	18
394.30	Vehicle Maintenance Equipment	18
394.40	Vehicle Refueling Equipment	15
397.10	Radio Comm. Equip (Fixed)	15
397.20	Radio Comm. Equip (Mobile)	15

397.30	General Tel. Comm. Equip.	10
397.50	Supervisory & Telemetering Equip.	15
397.80	Network Equipment	5
398	Miscellaneous Equipment	20

Q. DO YOU HAVE A COMMENT CONCERING MR. KING'S ESTIMATED AVERAGE SERVICE LIFE FOR THE COMPANY'S COMMON PLANT PC EQUIPMENT?

A. Mr. King is recommending a 15 year average service life relative to the Company's Common Plant Account 391.3 PC Computer Equipment. Similar to Mr. King's position for Gas-General Plant, to even consider applying a 15 year life to PC Computer related equipment investment is totally beyond belief. With the ongoing radical and dramatic changes to PC and related software (which drives much of the equipment replacement) there is a never ending revolving door of PC equipment. The Iowa 5-R3 service life parameter recommended by the Company's Common Plant depreciation study report is justified, reasonable, and extremely well supported by extensive experience through the utility industry as I previously discussed for gas general plant. I would again refer you to Exhibit No.-___(EMR-3).

Q. LIKEWISE, MR. KING IS RECOMMENDING THE USE OF AN IOWA 13-L1 LIFE AND CURVE FOR THE COMPANY'S COMMON PLANT ACOUNT 392.2 –CARS AND TRUCKS INVESTMENT. WHAT COMMENT DO YOU

HAVE CONCERING THIS RECOMMENDATION?

A. Suggesting that, on average, the Company's Cars and Trucks would ever last 13 years is just not realistic. Such a recommendation is just simply wrong. Secondly, Cars and Trucks are routinely placed into service and continue to be utilized for a typical life period. While there may be some limited circumstances where vehicles are involved in accidents, etc and taken out of service early in their service period that is far from the norm. Mr. King's estimate of an L1 curve along with a 13 year average service life suggests not only do the Company vehicles last, on average, an extremely long period of years, but also that relatively sizeable portions of the property is taken out of service over the entire service period from zero age to maximum life. This recommended service life parameter is simply illogical. Mr. King's recommendation is even more irrational due to the fact that the Company has been purchasing increased amounts of (previously owned) "Program Vehicles." These vehicles, while new to the Company, already have been used for a period of time. Conversely, the Iowa 7-R3 Life and Curve recommended via the Company's Common Plant depreciation study for the Company's Account 392.2 – Cars and Trucks is supported, rational, and reasonable.

Q. ON PAGE 21 OF HIS TESTIMONY MR. KING SUMMARIZES AND HIGHLIGHTS THE NEGATIVE SALVAGE FACTORS INCLUDED IN THE COMPANY'S DEPRECIATION STUDIES. WERE THERE POSITIVE NET SALVAGE FACTORS ESTIMATED FOR VARIOUS OTHER ACCOUNTS?

A. Yes, while Mr. King focuses only on the negative net salvage factors there were, likewise, positive net salvage estimated for various accounts. The net salvage summaries, and analysis included within the Company's depreciation studies were handled consistently for all the property groups studied.

Q. WITH REGARD TO THE CURRENT WORK EFFORT AND RELATED COSTS ATTRIBUTABLE TO THE COST INCURRED IN RETRING PLANT, IS IT ANTICIPATED THAT IN FUTURE YEARS, THE REQUIREMENT UPON THE COMPANY WILL BECOME MORE OR LESS STRINGENT?

A. As with all operations and related regulations, it can only be anticipated that with the passage of time such government regulations and other requirements upon the Company will be more stringent thereby increasing effort and resulting cost incurred in conjunction with retirements. That is, not only will future costs likely increase as a result of future labor cost increases, etc but the level of requirements and related costs are also anticipated to increase.

Q. ON PAGES 21-23 OF HIS TESTIMONY MR. KING DISCUSSES THE APPROACH THAT WAS USED TO ANALYZE NET SALVAGE WITHIN THE COMPANY'S DEPRECIAITON STUDY. IS HIS DISCUSSION CORRECT?

A. Mr. King's initial discussion about how the calculations were prepared are

essentially correct, however, once he begins his discussion of how the data analysis results were interpreted and incorporated into the recommended depreciation rates, he is incorrect.

First, as previously noted in this testimony during discussions related to average service life analysis, " **the net salvage data base was used as a basis to identify historical experience and trends and to determine each property group's recommended net salvage factors. This process is used as a benchmark, together with professional analysis and consideration, to estimate future lives and salvage factors over which to recover the Company's depreciated fixed capital investments. It is not a process of simple arithmetic calculations and accepting whatever is generated from the "Computer Analysis" to estimate the future parameters, but one of clear and deliberate consideration of all factors impacting the Company's property."**

For example on Page 23 Lines 1 to 7 and later on Page 24, Mr. King discusses as some length the fact that the linear trend analysis produces negative gross salvage percent. He expounds in great volumes about the absurdity of the calculation of negative gross salvage percents. I agree wholeheartedly that there is absolutely no justification for incorporating the **negative "gross salvage percents"** into the recommended annual depreciation rates. In fact, no such data was incorporated in the annual depreciation rates recommended per the Company's depreciation studies.

However, as previously indicated in the discussion above, the same consistent calculations were utilized for all of the accounts studies. The bottom line is that the linear analysis of the gross salvage trend shows that there is a likelihood that such accounts that trend to "negative gross salvage percents" will experience little or no gross salvage irrespective of the fact that on an overall historical basis those accounts demonstrated (in some circumstances) relatively significant levels of positive salvage. Again the information is calculated consistently for all accounts, and is available for professional analysis and interpretation.

Q. ON PAGE 23, LINES 28-31 AND PAGE 25 LINES 1-13 OF HIS TESTIMONY MR. KING LAMENTS THE INCORPORATION OF THE COST OF REMOVAL ADJUSTMENTS INTO THE COMPANY'S FUTURE COST OF REMOVAL ESTIMATES. WHAT IS YOUR RESPONSE?

A. First, just because Mr. King has not seen such a presentation does not make the process invalid. In fact the very textbook that Mr. King references in his testimony, "The NARUC Public Utility Depreciation Practices", references age sensitivity in salvage and cost of removal in its discussion on net salvage on pages 158-161. Furthermore on page 288 of that same textbook, listed as a bibliography is an AGA/EEI paper by a well recognized expert Mr. John Ferguson on the subject of "Influence of Aged Net Salvage on Depreciation Rates." Furthermore there is a 1989 AGA/EEI treatise

entitled "An Introduction to Net Salvage of Public Utility Plant" which discusses the subject of age sensitivity of gross salvage and cost of removal.

Q. DOES THE INCLUSION OF THE AJUSTMENT TO THE COST OF REMOVAL PERCENT RESULT IN DOUBLE COUNTING INFLATION AS SUGGESTED BY MR. KING ON PAGE 25, LINES 1 TO 17?

A. Absolutely not. The whole process is quite easy to understand. First, one must remember that for each property group an average service life has been estimated. That average service life of say 30 years indicates that the entire current investment within the property account, on average, will be retired at that age to attain an average service life of 30 years. Secondly, historical retirements have occurred to date. Those retirements have been analyzed to both identify the average retirement age to date (lets assume 10 years) at which the retirements have occurred, and in addition what percent of the original costs of retirements was experienced by the Company for Cost of Removal. That is, relative to the cost of removal percent if the Company had historically booked retirements with an original cost of $1,000 and it incurred $500 of cost of removal to retire the asset it is said that the cost of removal percent is 50% ($500/$1,000) (that also being 50% negative net salvage, if there was no corresponding gross salvage in conjunction with the retirement). Lets also estimate that the overall long run

inflation rate is 2.75%.

Next, now that it is known that the retirements that generated the 50% cost of removal occurred at 10 Years, the average service life of the property within the asset group is 30 years, and that the long run inflation rate is 2.75%, one can readily estimate the anticipated future cost of removal percent at the end of the property's average life. That is, it can be readily extrapolated that the average retirement age will need to increase, on average, another 20 years (30 Yrs ASL-10 years average retirement age) before the property is retired, on average, at an age of 30 years.

In simple, non-compounded terms a 2.75% cost increase per year for 20 additional years is 55%. For this example, the original 50% cost of removal plus the additional 55% totals to 105% cost of removal.

As one can easily see, counter to Mr. King's testimony, there is no double counting of inflation. The initially experienced 50% cost of removal is attributable to the actual cost of removal incurred through the 10 year average age, while the additional 55% cost of removal is attributable to the increased cost of removal during the subsequent additional 20 year period (required for the property to be retired, on average, at average service life).

Q. ON PAGE 26 OF HIS TESTIMONY, MR. KING STATES THAT EMPIRICALLY, THERE IS NOT A SHRED OF EVIDENCE THAT OVER TIME POSITIVE GROSS SALVAGE RATIOS DECLINE AND NEGATIVE

REMOVAL COST RATIOS INCREASE. WHAT IS YOUR REACTION TO THIS STATEMENT?

A. There is an unlimited number of examples where the age sensitivity of gross salvage and cost of removal can be illustrated. In its simplest form I doubt that anyone would be willing to pay me as much for a similar model of a 5 year old used computer as a 2 month old used computer. Similarly if I had a 6 year old used van, I wonder if anyone would pay me equally as much for that vehicle as for a 2 month old van of the same type.

The same concept can be identified for cost of removal. As time passes all employees seek and desire to have a higher salary, plus other costs also increase. Hence as time passes the level of cost to complete a similar task will increase. Working from the assumption that we are discussing removing the same item that has the same original cost at different points in time (at age 5 as opposed to age 1) the percent level of cost of removal clearly will increase.

In his discussion on page 26 lines 8 to 13, Mr. King argues that the cost of removal percent, as shown on his Exhibit CWK-6, supports his statement that the cost of removal does not increase with age. Mr. King does not understand. The reason that age sensitivity is not discernable within the summary salvage data provided in Section 8 of the Company's Gas & Common Plant depreciation studies is the fact that the retirements that

generated the net salvage is a mixture of various vintages of property. Furthermore, the average age of retirements, in aggregate, that have been occurring over time have not changed that significantly. If one were to disaggregate such activity into separate vintage data it is clearly obvious that both gross salvage and cost of removal would reflect levels of age sensitivity.

Furthermore, counter to Mr. King's discussion at the bottom of Page 26, Lines 24 to 31 where he argues that Company annual retirements, on average and in aggregate, will not trend towards average life, this is simply a non issue. It is not about whether in any one year, on average and in aggregate, the retirements reach average service life. The bottom line is that those individual retirements will have to occur at old ages if the average service life is to occur. If, for example, Mr. King is arguing that the average age of retirements will, in total, occur at younger ages, then the estimated average service life for each of the property groups is far too long.

Q. AT THE BOTTOM OF PAGE 27 OF HIS TESTIMONY MR KING SUMMARIZES WHAT HE INDICATES ARE HIS ESTIMATED NEGATIVE NET SALVAGE RATES BASED UPON HIS ANALYSIS AND WHAT HE REFERS TO AS THE "CONVENTIONAL PROCEDURE". WHAT ARE YOUR COMMENTS?

A. In developing his negative net salvage on what he calls a conventional

procedure for 3 of the 4 accounts listed he simply bases his estimate on the average of 33 years historical experience irrespective of the fact that many of the earlier years experience significantly lower levels of negative net salvage while more recent years experience higher levels of negative net salvage.

One must recognize that with regard to estimating future net salvage for the average remaining life depreciation rate, it is not about what has occurred in the past, but what will occur in future years. That is, the development of the average remaining life depreciation rate is based upon recovering the un-recovered original cost adjusted for the estimated future positive or negative net salvage over the average remaining life.

Q. ON PAGES 28 AND 29 OF HIS TESTIMONY, MR. KING ESSENTIALLY DISCUSSES ANALYZING COST OF REMOVAL ON A CONSTANT DOLLAR BASIS, THAT IS, ELIMINATING ANY INCREASES IN COST OVER TIME CAUSED BY INFLATIONARY PRESSURES. IS HIS CALCULATION CONCEPT RATIONAL, AND/OR IN ANY WAY ACCEPTED OR SUPPORTED BY DEPRCIATION PROFESSIONALS, ACADEMIA, OR REGULATORS?

A. Absolutely not. We do not live in a constant dollar world and it is extremely unlikely that we ever will. It will essentially always cost more to remove facilities from service 30 or 40 years hence than it would today because,

among other reasons, labor rates increase inasmuch as all employees seek to obtain a higher level of pay with the passage of time. Also, by the very nature of the property, retirement cost (cost of removal) must occur at the end of life. Therefore the cost of removal, which is an end of life cost, must be added to the initial installed cost to define the true total life cost of property which must be recovered ratably over the life of the asset from the customers receiving service from the property's use. The combination of the initial cost and end of life cost is no different than having constructed an initial facility (say a structure) during 1950; then adding to that structure during 1960, 1970, and 1980 and finally retiring the facility in 1990. The sum of all those costs along with any cost of removal must be recovered ratably over the life of the property.

The method utilized in the development of the Company current estimates of negative net salvage and resulting depreciation rates is consistent with standard practices and procedures within the depreciation profession, their development is consistent with basic accounting matching principles and follow the long time and well founded practices of ratemaking principles. Conversely, Mr. King is advancing a new theory of cost recovery that clearly results in inappropriate deferral of cost recovery.

Q. ON PAGE 30, LINES 11 TO 21, MR. KING ASSERTS THAT IT IS CHEAPER TO THE CUSTOMERS TO DEFER THE RECOVERY OF THE RETIREMENT COST. IS HE CORRECT?

A. No. Anytime recovery of plant related costs are deferred, the net embedded costs remain at a higher level than otherwise would be the case. Accordingly, as a result of such a practice, additional carrying costs to finance the investments as well as return is required while those costs are retained on the Company's books and records for longer periods of time. The bottom line is that the deferral of cost recovery costs the ratepayer additional amounts in customer rates.

Q. ON THE BOTTOM OF PAGE 30 TO 33 OF HIS TESTIMONY, MR. KING DISCUSSES THE USE OF THE SFAS 143 APPROACH TO RECOVER RETIREMENT COSTS (COST OF REMOVAL). DO YOU HAVE A RESPONSE TO THIS PROPOSAL?

A. Mr. King goes on for several pages to espouse the supposed virtues of the SFAS 143 procedure (which is generally equivalent to a sinking fund approach). There are numerous fallacies with Mr. King's proposed adoption of the SFAS procedure. First, in developing the applicable recovery of the retirement cost one is not seeking to define the current value of the future expenditure, but instead the task is to define the allocable portion of that cost of removal that should be charged to the current rate payer.

Secondly, if one were to use the SFAS procedure, the methodology produces an added level of complexity into the calculation. Under such a scenario not only does the amount of end of life costs need to be estimated but also the applicable discount rate must be determined.

Next, given changing financial conditions, it is extreme likely that the discount rate would vary widely during the property's life adding significantly to the level of recovery variation throughout the life of the property.

Furthermore, there is an added fallacy with using a discounting approach for capital recovery. For example, the SFAS procedure states that the calculation should be prepared with the Company's risk free rate. This type of calculation has little or nothing to do with the possible discount rate attributable to the many diverse customers that the Company serves. Also, it seems rather odd that a higher risk company (or an individual, if an individual discount rate were utilized) with a higher return rate would allocate less to recover future retirement costs than a lower risk Company. There is simply no valid basis for giving Mr. King's proposed SFAS approach any consideration for capital recovery purposes.

Q. ON PAGE 34, LINES 13 TO 31 AND PAGE 35, LINES1 TO 12 OF HIS TESTIMONY, MR. KING DISCUSSES ADDING THE COST OF REMOVAL TO THE NEW CONSTURCTION COST OF THE REPLACMENT PLANT. HE ALSO DISCUSSES CURRENT EXPENSING OF COST OF REMOVAL

FOR PLANT NOT REPLACED. DO EITHER OF THESE TWO PROPOSALS HAVE ANY MERIT?

A. Absolutely not. First, the proposal to charge the cost of removal to the cost of the new construction has no rational basis, is counter to any and all accounting matching principles, and is not in compliance with the Uniform System of Accounts. As can be seen in my Exhibit No.-___(EMR-4), which is a page from the FERC Gas Uniform System of Accounts, it states equivocally on Page 529 that "cost of removal" shall be charged to the depreciation (reserve) account.

Mr. King's proposal to add the retirement cost (cost of removal) attributable to the current plant in service to the next generation of replacement plant fails any test of reasonableness. The retirement cost (cost of removal) relative to the current plant in service has absolutely no connection or nothing to do with the next generation of plant in service. In this regard, Mr. King's proposal fails the most basic of accounting tests (the matching principle). He is proposing to add the cost from one generation of asset and push its recovery off onto the customers who use the next generation's assets. This is simply an effort to defer cost recovery. The cost recovery system (depreciation) should capture, and appropriately and fairly apportion the total capital cost ratably over the useful life of the asset to the customers benefiting from the service provided by those assets.

Likewise, the proposal to currently expense cost of removal at the end of life for assets not replaced is simply another attempt to defer the appropriate recovery of the estimated cost of removal rather than recover the cost on a time basis from the appropriate customers who benefit from the use of the property.

Q. WHAT STATEMENT DO YOU HAVE REGARDING MR. KINGS POSITION ON PAGE 35, LINES17 to 31 OF HIS TESTIMONY IN WHICH HE STATES THE EXISTENCE OF CURRENT FERC RULES SUPPORTING HIS PROPOSAL TO INCLUDE RETIREMENT COSTS (COST OF REMOVAL) WITH THE NEW REPLACMENT PLANT?

A. Mr. King's testimony in this regard is in error. Within his testimony, Mr. King states that FERC has instituted an accounting change to incorporate retirement cost (cost of removal) into the cost of the new replacement facilities. Furthermore, in his testimony he quotes a definition from the FERC Uniform System of Accounts (USOA), Paragraph 32 of the GAS USOA: **"Replacing or replacement, when not otherwise indicated in the context, means the construction or installation of gas plant in place of property retired, together with the removal of the property retired."**

Exhibit No.-___(EMR-4) is all the selected pages that could be found within the USOA that make any reference to the terms "Replacing or Replacement". I have highlighted the area in each of the included USOA pages where the applicable reference occurs. It is rather obvious from

even a quick review of the applicable pages that Mr. King's assertion and interpretation is incorrect.

Mr. King goes on to infer, and actually states "**if the definition of replacement provided above applies, the addition of a replacement unit should include the cost of removing the property retired.**" Mr. King's statement is totally incorrect. A search of the USOA to view the context in which the words 'Replacing" and "Replacement" are used in the USOA clearly reveals that in no way does FERC state that "retirement cost (cost of removal)" should be charged to the costs of the new plant that is replacing the retired plant. In fact "Paragraph 10 of Page 529 of the USOA specifically states "When a retirement unit is retired from gas plant, with or without replacement, the book cost thereof shall be credited to the gas plant account in which it is included.....If the retirement unit is of a depreciable class, the book cost of the unit retired and credited to gas plant shall be charged to the accumulated provision for depreciation applicable to such property. "**The cost of removal and the salvage shall be charged or credited, as appropriate, to such depreciation account.**"

It could not be spelled out any clearer; the cost of removal is to be charged to the depreciation reserve, not to the replacement property's original cost as indicated by Mr. King.

Q. DO YOU HAVE ADDITIONAL COMMENTS REGARDIGN MR. KING'S POSITION AND STATEMENT CONCERNING FERC'S ALLEGED

SUPPORT OF HIS PROPOSAL TO CHARGE PLANT RETIREMENT COSTS (COST OF REMOVAL) TO THE COST OF THE NEW REPLACEMENT PLANT?

A. Yes. In the recently released FERC Final Rule in Docket No. RM02-7-000, Order No. 61 (Issued April 9, 2003) concerning changes enacted to the FERC (Gas) Uniform System of Accounts, FERC specifically indicated in Paragraph 36 that removal cost that are not asset retirement obligations are included as a component of depreciation expense and recorded in accumulated depreciation. Furthermore FERC noted in Paragraph 36 that one (1) commenter, the National Association of State Utility Consumer Advocates (NASUCA) recommended that "the Commission exclude costs of removal that does not qualify as a legal retirement obligation from the depreciation accrual and instead capitalize any removal cost related to the asset replaced as part of the costs replacing the utility plant and if no plant replacement occurs, the cost of removal for non-legal retirement obligations should be expensed in the income statement."

FERC rejected that request in saying that the Commission did not propose any changes to its existing accounting requirements for cost of removal for non-legal retirement obligations. FERC went on to say that "the purpose of this rule is to establish uniform accounting requirements for the **recognition of liabilities for legal obligations** associated with the retirement of long lived assets."

This FERC rule is simply a mechanism for defining the liabilities associated with future legal retirement obligations and in no way supports Mr. King's

proposal. In fact, as noted above, a mirror image of his proposal was specifically rejected.

Q. WHAT STATEMENT DO YOU HAVE REGARDING MR. KING'S POSITION (PAGE 36) THAT THE COMMISION SHOULD CHANGE ITS PRACTICE TO ADOPT HIS RECOMMENDATION?

A. Mr. King's SFAS 143 (cost of removal recovery) proposal is unsupported by basic accounting and ratemaking concepts and procedures. Furthermore, Mr. King's proposal to charge removal cost to new construction is in direct conflict with and is specifically inconsistent with the Uniform System of Accounts as just previously discussed.

Q. DOES THAT CONCLUDE YOUR REBUTTAL TESTIMONY?

A. Yes, it does.

. . . CHAPTER I--FEDERAL ENERGY REGULATORY COMMISSION, DEPARTMENT OF
ENERGY

PART 201--UNIFORM SYSTEM OF ACCOUNTS PRESCRIBED FOR NATURAL GAS COMPANIES SUBJECT TO THE PROVISIONS OF THE NATURAL GAS ACT

AUTHORITY: 15 U.S.C. 717-717w, 3301-3432; 42 U.S.C. 7101-7352, 7651- 7651o.
SOURCE: Order 219, 25 FR 5616, June 21, 1960.
EDITORIAL NOTE: For Federal Register citations affecting part 201, see the List of CFR
Sections Affected in the Finding Aids section of this volume.
EFFECTIVE DATE NOTE: At 58 FR 18006, April 7, 1993, part 201 was amended by redesignating definitions 31 through 39 as 32 through 40 and adding new definition 31; Accounts 182.3 and 254 were added under Balance Sheet Accounts; and Accounts 407.3 and 407.4 were added under Income Accounts. The information collection provisions, will
not become effective until approved by the Office of Management and Budget. A notice will be published in the Federal Register once approval has been obtained.
NOTE: Order 141, 12 FR 8504, Dec. 19, 1947, provides in part as follows:
Prescribing a system of accounts for natural gas companies under the Natural Gas Act. The Federal Power Commission acting pursuant to authority granted by the Natural Gas Act
(58) Stat. 821, as amended; 15 U.S.C. and Sup. 717 et seq.), particularly sections 8(a), 10(a) and 16 thereof, and finding such action necessary and appropriate for carrying out the
provisions of said Act, ordered that:
(a) The accompanying system of accounts, entitled ``Uniform System of Accounts Prescribed for Natural Gas Companies Subject to the Provisions of the Natural Gas Act," and the rules and regulations contained therein, be adopted;
(b) Said system of accounts and said rules and regulations contained therein be and the same are hereby prescribed and promulgated as the system of accounts and rules and regulations of the Commission to be kept and observed by natural gas companies subject to
the jurisdiction of the Commission, to the extent and in the manner set forth therein;
(c) Said system of accounts and rules and regulations therein contained as to all natural gas companies now subject to the jurisdiction of the Commission, became effective
on January 1, 1940, and as to any natural gas company which may hereafter become

subject
to the jurisdiction of the Commission, they shall become effective as of the date when such
natural gas company becomes subject to the jurisdiction of the Commission.

Uniform System of Accounts Prescribed for Natural Gas Companies Subject to the Provisions of the Natural Gas Act

Definitions

When used in this system of accounts:

(Non- related Definitions 1-29 deleted to abbreviated content of exhibit)

A. *Production system* shall consist of plant and equipment used in the production of gas. It shall include producing lands and leaseholds, gas rights, other land rights, structures,
drilling and clearing equipment, gas wells, well head equipment, separation and other facilities used in the production of natural gas. The production system ends where the gas enters a gathering system, transmission system or distribution system, as applicable, in accordance with the practices in the pricing area where such system is located.

B. *Transmission system* means the land, structures, mains, valves, meters, boosters, regulators, tanks, compressors, and their driving units and appurtenances, and other equipment used primarily for transmitting gas from a production plant, delivery point of purchased gas, gathering system, storage area, or other wholesale source of gas, to one or more distribution areas. The transmission system begins at the outlet side of the valve at the
connection to the last equipment in a manufactured gas plant, the connection to gathering lines or delivery point of purchased gas, and includes the equipment at such connection that
is used to bring the gas to transmission pressure, and ends at the outlet side of the equipment which meters or regulates the entry of gas into the distribution system or into a storage area. It does
[[Page 511]]
not include storage land, structures or equipment. Pipeline companies, including those companies which measure deliveries of gas to their own distribution systems, shall include
city gate and main line industrial measuring and regulating stations in the transmission function.

C. Distribution system means the mains which are provided primarily for
distributing gas within a distribution area, together with land, structures, valves, regulators,
services and measuring devices, including the mains for transportation of gas from production plants or points of receipt located within such distribution area to other points

therein. The distribution system owned by companies having no transmission facilities connected to such distribution system begins at the inlet side of the distribution system equipment which meters or regulates the entry of gas into the distribution system and ends
with and includes property on the customer's premises. For companies which own both transmission and distribution facilities on a continuous line, the distribution system begins
at the outlet side of the equipment which meters or regulates the entry of gas into the distribution system and ends with and includes property on the customer's premises. The distribution system does not include storage land, structures, or equipment.
D. Distribution area means a metropolitan area or other urban area comprising one or more adjacent or nearby cities, villages or unincorporated areas, including developed areas contiguous to main highways.
30. *Property retired*, as applied to gas plant, means property which has been removed, sold, abandoned, destroyed, or which for any cause has been withdrawn from service.
31. *Regulatory Assets and Liabilities* are assets and liabilities that result from rate actions of regulatory agencies. Regulatory assets and liabilities arise from specific revenues, expenses, gains, or losses that would have been included in net income determinations in one period under the general requirements of the Uniform System of Accounts but for it being probable: 1) that such items will be included in a different period(s) for purposes of developing the rates the utility is authorized to charge for its utility services; or 2) in the case of regulatory liabilities, that refunds to customers, not provided for in other accounts, will be required.

**32. A. *Replacing or replacement*, when not otherwise indicated in the context,
means the construction or installation of gas plant in place of property retired, together
with the removal of the property retired.**

B. *Research, Development, and Demonstration* (RD&D), means expenditures incurred by natural gas companies either directly or through another person or organization
(such as research institute, industry association, foundation, university, engineering company, or similar contractor) in pursuing research, development, and demonstration activities including experiment, design, installation, construction, or operation. This definition includes expenditures for the implementation or development of new and/or existing concepts until technically feasible and commercially feasible operations are verified. Such research, development, and demonstration costs should be reasonably related
to the existing or future utility business, broadly defined, of the public utility or licensee or
in the environment in which it operates or expects to operate. The term includes, but is not
limited to: All such costs incidental to the design, development or implementation of an experimental facility, a plant process, a product, a formula, an invention, a system or

similar items, and the improvement of already existing items of a like nature; amounts expended in connection with the proposed development and/or proposed delivery of substitute or synthetic gas supplies (alternate fuel sources for example, an experimental coal gasification plant or an experimental plant synthetically producing gas from liquid hydrocarbons); and the costs of obtaining its own patent, such as attorney's fees expended in making and perfecting a patent application. The term includes preliminary investigations
and detailed planning of specific projects for securing for customers non-conventional pipeline gas supplies that rely on technology that has not been verified previously to be [[Page 512]]
feasible. The term does not include expenditures for efficiency surveys; studies of management, management techniques and organization; consumer surveys, advertising, promotions, or items of a like nature.

33. *Retained earnings* (formerly earned surplus) means the accumulated net income of the utility less distribution to stockholders and transfers to other capital accounts.

34. *Retirement units* means those items of gas plant which, when retired, with or without replacement, are accounted for by crediting the book cost thereof to the gas plant account in which included.

35. *Salvage value* means the amount received for property retired, less any expenses incurred in connection with the sale or in preparing the property for sale; or, if retained, the amount at which the material recoverable is chargeable to Materials and Supplies, or other appropriate account. 36. Service life means the time between the date gas
plant is includible in gas plant in service, or gas plant leased to others, and the date of its retirement. If depreciation is accounted for on a production basis rather than on a time basis, then service life should be measured in terms of the appropriate unit of production.

37. *Service value* means the difference between original cost and net salvage value of gas plant.

38. *Unsuccessful exploration and development costs*, means exploration and development costs related to efforts which do not directly result in the discovery of commercially recoverable hydrocarbon reserves.

39. *Subsidiary company*, means a company which is controlled by the utility through ownership of voting stock. (See ``Definitions"--item 5B ``Control"). A corporate joint venture in which a corporation is owned by a small group of businesses as a separate and specific business or project for the mutual benefit of the members of the group is a subsidiary company for the purposes of this system of accounts.

40. Utility, as used herein and when not otherwise indicated in the context, means any natural gas company to which this system of accounts is applicable.

FEERC Uniform System of Accounts

[Page 523]]

gas introduced into the utility's system necessary to bring the system up to its designed operating capacity or increases therein and which must be maintained in the system in order
to sustain such design operating capacity.
(21) LNG "heel" is the first cost of that minimum quantity of liquefied natural gas necessary to be retained in holding tanks and other facilities for purposes of temperature and/or pressure maintenance.
(22) "Studies" includes the costs of studies such as operational, safety or environmental studies relative to plant under construction. Studies mandated by regulatory
bodies relative to facilities in service, shall be charged to Account 183.2, Other Preliminary Survey and Investigation Charges.
4. *Overhead construction costs.* A. All overhead construction costs, such as engineering, supervision, general office salaries and expenses, construction engineering and supervision by others than the accounting utility, law expenses, insurance, injuries and
damages, relief and pensions, taxes and interest, shall be charged to particular jobs or units
on the basis of the amounts of such overheads reasonably applicable thereto, to the end that
each job or unit shall bear its equitable proportion of such costs and that the entire cost of the unit, both direct and overhead, shall be deducted from the plant accounts at the time the
property is retired.
B. As far as practicable, the determination of pay roll charges includible in construction overheads shall be based on time card distributions thereof. Where this procedure is impractical, special studies shall be made periodically of the time of supervisory employees devoted to construction activities to the end that only such overhead
costs as have a definite relation to construction shall be capitalized. The addition to direct construction costs of arbitrary percentages or amounts to cover assumed overhead costs is not permitted.
C. The record supporting the entries for overhead construction costs shall be so kept as to show the total amount of each overhead for each year, the nature and amount of each
overhead expenditure charged to each construction work order and to each utility plant account, and the bases of distribution of such costs.
5. *Gas plant purchased or sold.* A. When gas plant constituting an operating unit or system is acquired by purchase, merger, consolidation, liquidation, or otherwise, after the effective date of this system of accounts, the costs of acquisition, including expenses incidental thereto properly includible in gas plant, shall be charged to account 102, Gas Plant Purchased or Sold.

B. The accounting for the acquisition shall then be completed as follows:
(1) The original cost of plant, estimated if not known, shall be credited to account 102, Gas Plant Purchased or Sold, and concurrently charged to the appropriate gas plant in service accounts and to account 104, Gas Plant Leased to Others, account 105, Gas Plant Held for Future Use, 105.1, Production Properties Held for Future Use, and account 107, Construction Work in Progress--Gas, as appropriate.
(2) The depreciation, depletion, and amortization applicable to the original cost of the properties purchased, shall be charged to account 102, Gas Plant Purchased or Sold, and concurrently credited to the appropriate account for accumulated provision for depreciation, depletion or amortization.
(3) The cost to the utility of any property includible in account 121, Nonutility Property, shall be transferred thereto.
(4) The amount remaining in account 102, Gas Plant Purchased or Sold, shall then be closed to account 114, Gas Plant Acquisition Adjustments.
C. If property acquired in the purchase of an operating unit or system is in such physical condition when acquired that it is necessary substantially to rehabilitate it in order to bring the property up to the standards of the utility, the cost of such work, except replacements, shall be accounted for as a part of the purchase price of the property.
D. When any property acquired as an operating unit or system includes duplicate or other plant which will be retired by the accounting utility in the reconstruction of the acquired property or its consolidation with previously

FEERC Uniform System of Accounts

[[Page 524]]

owned property, the proposed accounting for such property shall be presented to the Commission.

E. In connection with the acquisition of gas plant constituting an operating unit or system, the utility shall procure, if possible, all existing records relating to the property acquired, or certified copies thereof, and shall preserve such records in conformity with regulations or practices governing the preservation of records of its own construction.

F. When gas plant constituting an operating unit or system is sold, conveyed, or transferred to another by sale, merger, consolidation, or otherwise, the book cost of the property sold or transferred to another shall be credited to the appropriate utility plant accounts, including amounts carried in account 114, Gas Plant Acquisition Adjustments. The amounts (estimated if not known) carried with respect thereto in the accounts for accumulated provision for depreciation, depletion, and amortization and in account 252, Customer Advances for Construction, shall be charged to such accounts and the contra entries made to account 102, Gas Plant Purchased or Sold. Unless otherwise ordered by the Commission, the difference, if any, between (a) the net amount of debits and credits and (b) the consideration received for the property (less commissions and other expenses of making the sale) shall be included in account 421.1, Gain on Disposition of Property, or account 421.2, Loss on Disposition of Property. (See account 102, Gas Plant Purchased or Sold.)

Note: In cases where existing utilities merge or consolidate because of financial or operating reasons or statutory requirements rather than as a means of transferring title of purchased properties to a new owner, the accounts of the constituent utilities, with the approval of the Commission, may be combined. In the event original cost has not been determined, the resulting utility shall proceed to determine such cost as outlined herein.

6. *Expenditures on leased property.* A. The cost of substantial initial improvements (including repairs, rearrangements, additions, and betterments) made in the course of preparing for utility service property leased for a period of more than one year, and the cost of subsequent substantial additions, replacements, or betterments to such property, shall be charged to the gas plant account appropriate for the class of property leased. If the service life of the improvements is terminable by action of the lease, the cost, less net salvage, of the improvements shall be spread over the life of the lease by charges to account 404.3, Amortization of Other Limited-Term Gas Plant. However, if the service life is not terminated by action of the lease but by depreciation proper, the cost of the improvements, less net salvage, shall be accounted for as depreciable plant. The provisions of this paragraph are applicable to property leased under either capital leases or operating leases.

B. If improvements made to property leased for a period of more than one year are of relatively minor cost, or if the lease is for a period of not more than one year, the cost

of the improvements shall be charged to the account in which the rent is included, either directly or by amortization thereof.

7. *Land and land rights.* A. The accounts for land and land rights shall include the cost of land owned in fee by the utility and rights, interests, and privileges held by the utility in land owned by others, such as leaseholds, easements, rights-of-way, natural gas rights, and other like interests in land. Do not include in the accounts for land and land rights and rights-of-way costs incurred in connection with first clearing and grading of land and rights-of-way and the damage costs associated with the construction and installation of plant. Such costs shall be included in the appropriate plant accounts directly benefited.

B. Where special assessments for public improvements provide for deferred payments, the full amount of the assessments shall be charged to the appropriate land account and the unpaid balance shall be carried in an appropriate liability account. Interest on unpaid balances shall be charged to the appropriate interest account. If any part of the cost of public improvement is included in the general tax levy, the amount thereof shall be charged to the appropriate tax account.

FEERC Uniform System of Accounts

[[Page 526]]

Gas Plant Held for Future Use, or 105.1, Production Properties Held for Future Use, as appropriate.

Note: In addition to the accounting records prescribed herein, supplemental records of land and land rights held for future use shall be kept in such manner as to permit the segregation within a reasonable time of the land and land rights constituting (1) productive but nonproducing fields, (2) unproven or undeveloped fields, and (3) storage fields, and to show the following data with respect to each natural gas lease, regardless of the accounting treatment accorded the lease costs; (a) name of lessor, (b) location of leasehold and number or other identification assigned thereto, (c) date and period of lease agreement, (d) first cost of lease including details of the elements of such cost, (e) annual rental provisions, (f) date and cost of drilling, (g) date gas determined to exist, (h) date of completion of first well drilled by the utility in each pool of gas, (i) royalty provisions, (j) amortization and depletion provisions, and (k) date of abandonment of lease.

H. Provision shall be made for amortizing amounts carried in the accounts for limited-term interests in land, so as to apportion equitably the cost of each interest over the life thereof. For the purposes of amortization of natural gas rights, separate interests in land which comprise an interest in a production area may be grouped to form a depletion unit. (See account 111, Accumulated Provision for Amortization and Depletion of Gas Utility Plant, account 404.1, Amortization and Depletion of Producing Natural Gas Land and Land Rights, account 404.3, Amortization of Other Limited-Term Gas Plant, and account 797, Abandonment, leases.)

I. The items of cost to be included in the accounts for land and land rights are as follows:

1. Bulkheads, buried, not requiring maintenance or replacement.
2. Cost, first, of acquisition including mortgages and other liens assumed (but not subsequent interest thereon).
3. [Reserved]
4. Condemnation proceedings, including court and counsel costs.
5. Consents and abutting damages, payment for.
6. Conveyancers' and notaries' fees.
7. Fees, commissions, and salaries to brokers, agents, and others in connection with the acquisition of the land or land rights.
8. [Reserved]
9. Leases, cost of voiding upon purchase to secure possession of land.
10. Removing, relocating, or reconstructing, property of others, such as buildings, highways, railroads, bridges, cemeteries, churches, telephone and power lines, etc., in order to acquire quiet possession.

11. Retaining walls unless identified with structures.
12. Special assessments levied by public authorities for public improvements on the basis of benefits for new roads, new bridges, new sewers, new curbing, new pavements, and
other public improvements, but not taxes levied to provide for the maintenance of such improvements.
13. Surveys in connection with the acquisition, but not amounts paid for topographical surveys and maps where such costs are attributable to structures or plant equipment erected or to be erected or installed on such land.
14. Taxes assumed, accrued to date of transfer of title.
15. Title, examining, clearing, insuring, and registering in connection with the acquisition and defending against claims relating to the period prior to the acquisition.
16. Appraisals prior to closing title.
17. Cost of dealing with distributees or legatees residing outside of the state or county, such as recording power of attorney, recording will or exemplification of will, recording satisfaction of state tax.
18. Filing satisfaction of mortgage.
19. Documentary stamps.
20. Photographs of property at acquisition.
21. Fees and expenses incurred in the acquisition of water rights, and grants.
22. Cost of fill to extend bulkhead line over land under water, where riparian rights are held, which is not occasioned by the erection of a structure.
23. Sidewalks and curbs constructed by the utility on public property.
24. Labor and expenses in connection with securing rights of way, where performed by company employees and company agents.
8. *Structures and improvements*. A. The accounts for structures and improvements shall include the cost of all buildings and facilities to house, support, or safeguard property
or persons, including all fixtures permanently attached to and made a part of buildings and
which cannot be removed therefrom without cutting into the walls, ceilings, or floors, or without in some way impairing the buildings, and improvements of a permanent character
on or to land. Also include those costs incurred in connection with the first clearing and grading of land and rights-

FEERC Uniform System of Accounts

[[Page 527]]

of-way, and the damage costs associated with construction and installation of plant.
B. The cost of specially provided foundations not intended to outlast the machinery or apparatus for which provided, and the cost of angle irons, castings, etc., installed at the base of an item of equipment, shall be charged to the same account as the cost of the machinery, apparatus, or equipment.
C. Minor buildings and structures may be considered a part of the facility in connection with which constructed or operated and the cost thereof accounted for accordingly when the nature of the structure and facility indicates the correctness of such accounting.
D. Where furnaces and boilers are used primarily for furnishing steam for some particular department and only incidentally for furnishing steam for heating a building and
operating the equipment therein, the entire cost of such furnaces and boilers shall be charged to the appropriate plant account, and no part to the building account.
E. The cost of disposing of materials excavated in connection with construction of structures shall be considered as a part of the cost of such work, except as follows: (a) When such material is used for filling, the cost of loading, hauling, and dumping shall be equitably apportioned between the work in connection with which the removal occurs and
the work in connection with which the material is used; (b) when such material is sold, the
net amount realized from such sales shall be credited to the work in connection with which
the removal occurs. If the amount realized from the sale of excavated materials exceeds the
removal costs and the costs in connection with the sale, the excess shall be credited to the land account in which the site is carried.
F. Lighting or other fixtures temporarily attached to buildings for purposes of display or demonstration shall not be included in the cost of the building but in the appropriate equipment account.
G. The items of cost to be included in the accounts for structures and improvements are as follows:
1. Architects' plans and specifications including supervision.
2. Ash pits (when located within the building).
3. Athletic field structures and improvements.
4. Boilers, furnaces, piping, wiring, fixtures, and machinery for heating, lighting, signaling, ventilating, and air conditioning systems, plumbing, vacuum cleaning systems, incinerator and smoke pipe, flues, etc.
5. Bulkheads, including dredging, riprap fill, piling, decking, concrete, fenders, etc., when exposed and subject to maintenance and replacement.
6. Chimneys.
7. Coal bins and bunkers.
8. Commissions and fees to brokers, agents, architects and others.

9. Conduit (not to be removed) with its contents.
10. Damages to abutting property during construction.
11. Docks.
12. Door checks and door stops.
13. Drainage and sewerage systems.
14. Elevators, cranes, hoists, etc., and the machinery for operating them.
15. Excavation, including shoring, bracing, bridging, refill, and disposal of excess excavated material, cofferdams around foundation, pumping water from cofferdam during
construction, and test borings.
16. Fences and fence curbs (not including protective fences insolating items of equipment, which shall be charged to the appropriate equipment account).
17. Fire protection systems when forming a part of a structure.
18. Flagpole.
19. Floor covering (permanently attached).
20. Foundations and piers for machinery, constructed as a permanent part of a building or other items listed herein.
21. Grading and clearing when directly occasioned by the building of a structure.
22. Holders--Relief.
23. Intrasite communication system, poles, pole fixtures, wires and cables.
24. Landscaping, lawns, shrubbery, etc.
25. Leases, voiding upon purchase to secure possession of structures.
26. Leased property, expenditures on.
27. Lighting fixtures and outside lighting
system.
28. Mailchutes when part of a building.
29. Marquee, permanently attached to building.
30. Painting, first coat.
31. Permanent paving, concrete, brick, flagstone, asphalt, etc. within the property lines.
32. Partitions, including movable.
33. Permits and privileges.
34. Platforms, railings and gratings when constructed as a part of a structure.
35. Power boards for services to a building.

FEERC Uniform System of Accounts

[[Page 529]]

equipment becomes available for service shall be charged to the appropriate expense accounts, except that tests to determine whether equipment meets the specifications and requirements as to efficiency, performance, etc., guaranteed by manufacturers, made after operations have commenced and within the period specified in the agreement or contract of
purchase, may be charged to the appropriate gas plant account.

10. *Additions and retirements of gas plant.* A. For the purpose of avoiding undue
refinement in accounting for additions to and retirements and replacements of gas plant, all
property shall be considered as consisting of (1) retirement units and (2) minor items of
property. Each utility shall maintain a written property units listing for use in accounting
for additions and retirements of gas plant and apply the listing consistently.

B. The addition and retirement of retirement units shall be accounted for as follows:
(1) When a retirement unit is added to gas plant, the cost thereof shall be added to the appropriate gas plant account, except that when units are acquired in the acquisition of
any gas plant constituting an operating sys- tem, they shall be accounted for as provided in
gas plant instruction 5.

(2) When a retirement unit is retired from gas plant, with or without replacement,
the book cost thereof shall be credited to the gas plant account in which it is included,
determined in the manner set forth in paragraph D, below.

If the retirement unit is of a depreciable class, the book cost of the unit retired and credited to gas plant shall be charged to the accumulated provision for depreciation applicable to such property. The cost of removal and the salvage shall be charged or credited, as appropriate, to such depreciation

account.

C. The addition and retirement of minor items of property shall be accounted for as follows:
(1) When a minor item of property which did not previously exist is added to plant, the cost thereof shall be accounted for in the same manner as for the addition of a retirement unit, as set forth in paragraph B(1), above, if a substantial addition results, otherwise the charge shall be to the appropriate maintenance expense account.
(2) When a minor item of property is retired and not replaced, the book cost thereof shall be credited to the gas plant account in which it is included;

and, in the event the minor item is a part of depreciable plant, the account for accumulated provision for depreciation shall be charged with the book cost and cost of removal and credited with the salvage.

If, however, the book cost of the minor item retired and not replaced has been or will be accounted for by its inclusion in the retirement unit of which it is a part when such unit is retired, no separate credit to the property account is required when such minor item is retired.
(3) When a minor item of depreciable property is replaced independently of the retirement unit of which it is a part, the cost of replacement shall be charged to the maintenance account appropriate for the item, except that if the replacement effects a substantial betterment (the primary aim of which is to make the property affected more useful, more efficient, or of greater durability, or of greater capacity), the excess cost of the replacement over the estimated cost at current prices of replacing without betterment shall be charged to the appropriate gas plant account.
D. The book cost of gas plant retired shall be the amount at which such property is included in the gas plant accounts, including all components of construction costs. The book cost shall be determined from the utility's records and if this cannot be done it shall be estimated. Utilities must furnish the particulars of such estimates to the Commission, if

requested. When it is impracticable to determine the book cost of each unit, due to the relatively large number or small cost thereof, an appropriate average book cost of the units,
with due allowance for any differences in size and character, shall be used as the book cost
of the units retired.
E. The book cost of land retired shall be credited to the appropriate land account. If the land is sold, the difference

FEERC Uniform System of Accounts

[[Page 532]]

7. General training and instruction of employees by supervisors whose pay is charge- able hereto. Specific instruction and training in a particular type of work is chargeable to the appropriate functional account. (See Gas Plant Instruction 3(19).)
8. Secretarial work for supervisory personnel, but not general clerical and stenographic work chargeable to other accounts. Expenses:
9. Consultants' fees and expenses.
10. Meals, traveling and incidental expenses.
2. *Maintenance.* A. The cost of maintenance chargeable to the various operating expense and clearing accounts, includes labor, materials, overheads and other expenses incurred in maintenance work. A list of work operations applicable generally to utility plant is included
hereunder. Other work operations applicable to specific classes of plant are listed in functional maintenance expense accounts.
B. Materials recovered in connection with the maintenance of property shall be credited to the same account to which the maintenance cost was charged.
C. If the book cost of any property is carried in account 102, Gas Plant Purchased or Sold, the cost of maintaining such property shall be charged to the accounts for maintenance of property of the same class and use, the book cost of which is carried in other gas plant in service accounts. Maintenance of property leased from others shall be treated as provided in operating expense instruction 3.
ITEMS
1. Direct field supervision of maintenance.
2. Inspecting, testing, and reporting on condition of plant specifically to determine the need for repairs, replacements, re- arrangements and changes and inspecting and testing
the adequacy of repairs which have been made.
3. Work performed specifically for the purpose of preventing failure, restoring serviceability or maintaining life of plant.
4. Rearranging and changing the location of plant not retired.
5. Repairing for reuse materials recovered from plant.
6. Testing for, locating and clearing trouble.
7. Net cost of installing, maintaining, and removing temporary facilities to prevent interruptions in service.
8. Replacing or adding minor items of plant which do not constitute a retirement unit. (See gas plant instruction 10.)
3. *Rents.* A. The rent expense accounts provided under the several functional groups of expense accounts shall include all rents, including taxes paid by the lessee on leased property, for property used in utility operations, except (1) minor amounts paid for occasional or infrequent use of any property or equipment and all amounts paid for use of equipment that, if owned, would be includible in plant accounts 391 to 398, inclusive, which shall be treated as an expense item and included in the appropriate functional account

and (2) rents which are chargeable to clearing accounts, and distributed therefrom to the appropriate account. If rents cover property used for more than one function, such as production and transmission, or by more than one department, the rents shall be apportioned to the appropriate rent expense or clearing accounts of each department on an
actual, or, if necessary, an estimated basis.
B. When a portion of property or equipment rented from others for use in connection with utility operations is subleased, the revenue derived from such subleasing shall be credited to the rent revenue account in operating revenues: Provided, however, That
in case the rent was charged to a clearing account, amounts received from subleasing the property shall be credited to such clearing account.
C. The cost, when incurred by the lessee, of operating and maintaining leased property, shall be charged to the accounts appropriate for the expense if the property were owned. D. The cost incurred by the lessee of additions and replacements to gas plant leased
from other shall be accounted for as provided in gas plant instruction 6.
4. *Training costs*. When it is necessary that employees be trained to specifically operate or maintain plant facilities that are being constructed, the related costs shall be accounted for as a current operating and maintenance expense. These expenses shall be charged

FEERC Uniform System of Accounts

Special Instructions to Accounts 117.1, 117.2 and 117.3

The investment in and use of system gas included in Account 117.1, Gas Stored--Base Gas, and Account 117.2, System Balancing Gas, may be accounted for using either the
``fixed asset'' method or an ``inventory'' method as set forth below. The cost of stored gas included in Account 117.3 must be accounted for using an inventory method.

(a) *Inventory Method*--Gas stored during the year must be priced at cost according to generally accepted methods of cost determination consistently applied from year to year. Transmission expenses for facilities of the utility used in moving the gas to the storage area and expenses of storage facilities cannot be included in the inventory of gas except as may be authorized or directed by the Commission.

Withdrawals of gas must be priced using the first-in-first-out, last-in-first-out, or weighted average cost method, provided the method adopted by the utility is used consistently from year to year and appropriate inventory records are maintained. Approval
of the Commission must be obtained for any other pricing method, or change in the pricing
method adopted by the utility.

Adjustments for inventory losses related to gas held in underground reservoirs due to cumulative inaccuracies of gas measurements, or from other causes, must be charged to
Account 823, Gas Losses. Losses of system gas not associated with underground reservoirs must be charged to Account 813, Other Gas Supply Expenses.

(b) *Fixed Asset Method*--When replacement of the gas is made, the amount carried in Account 117.4 for such volumes must be cleared with a contra entry to Account 808.2, Gas Delivered to Storage--Credit. Any difference between the utility's cost of replacement
gas volumes and the amount cleared from Account 117.4 must be recognized as a gain in Account 495, Other gas revenues, or as a loss in Account 813, Other gas supply expenses,
with contra entries to Account 808.2.

Adjustments for inventory losses related to gas held in underground reservoirs due to cumulative inaccuracies of gas measurements, or from other causes, must be charged to
Account 823, Gas Losses. Losses of system gas not associated with underground reservoirs must be charged to Account 813, Other Gas Supply Expenses. Gas losses must be priced at the market price of gas available to the utility in the month the loss is recognized.

Gas owned by the utility and injected into its system will be deemed to satisfy any encroachment on system gas first before any other use.

STATE OF NORTH DAKOTA

PUBLIC SERVICE COMMISSION

Montana-Dakota Utilities Co.
Natural Gas Rate Increase
Application

Case No. PU-399-02-183

NOTICE OF RESCHEDULED HEARING

April 23, 2003

The hearing in this proceeding that was originally scheduled for April 22, 2003, has been rescheduled to July 1, 2003, beginning at 8:30 a.m. (CDT), in the Commission Hearing Room, 12th Floor, State Capitol, Bismarck, North Dakota 58505-0480.

For more information, contact the Public Service Commission, State Capitol, Bismarck, North Dakota 58505, 701-328-2400; or Relay North Dakota 1-800-366-6888 TTY. If you require any auxiliary aids or services, such as readers, signers, or braille materials please notify Jon Mielke, Executive Secretary.

DIRECT TESTIMONY OF CHARLES W. KING

INTRODUCTION

Q. PLEASE STATE YOUR NAME, POSITION AND BUSINESS ADDRESS.

A. My name is Charles W. King. I am President of the economic consulting firm of Snavely King Majoros O'Connor & Lee, Inc. ("Snavely King"). My business address is 1220 L Street, N.W., Suite 410, Washington, D.C. 20005.

Q. PLEASE DESCRIBE SNAVELY KING.

A. Snavely King, formerly Snavely, King & Associates, Inc., was founded in 1970 to conduct research on a consulting basis into the rates, revenues, costs and economic performance of regulated firms and industries. The firm has a professional staff of 13 economists, accountants, engineers and cost analysts. Most of its work involves the development, preparation and presentation of expert witness testimony before federal and state regulatory agencies. Over the course of its 33-year history, members of the firm have participated in over 500 proceedings before almost all of the state commissions and all Federal commissions that regulate utilities or transportation industries.

Q. HAVE YOU PREPARED A SUMMARY OF YOUR QUALIFICATIONS AND EXPERIENCE?

A. Yes. Attachment A is a summary of my qualifications and experience.

Q. HAVE YOU PREVIOUSLY SUBMITTED TESTIMONY IN REGULATORY PROCEEDINGS?

A. Yes. Attachment B is a tabulation of my appearances as an expert witness before state and federal regulatory agencies.

Q. FOR WHOM ARE YOU APPEARING IN THIS PROCEEDING?

A. I am appearing on behalf of the Staff of the North Dakota Public Service Commission.

Q. WHAT IS THE OBJECTIVE OF YOUR TESTIMONY?

A. The objective of my testimony is to recommend depreciation rates for the gas and common plant of Montana-Dakota Utilities ("MDU" or "the Company"). In the process, I will review and critique the depreciation study submitted by AUS Consultants ("AUS") on behalf of MDU.

Q. PLEASE DESCRIBE THE PROCESS YOU USED IN PREPARING THIS TESTIMONY.

A. I began by requesting the Company to provide me with the same data that it had provided its consultants, AUS. Having reviewed the data, I then input it into our Company's depreciation analysis software to test the validity of AUS' results. I also prepared a number of data requests and carefully read the Company's responses. Independently, I evaluated the approach used by AUS to the treatment of salvage and retirement costs, and I developed the alternatives that I shall discuss in my testimony. I then prepared the schedules found in my Exhibit____(CWK-1). The calculations underlying these schedules are found in my workpapers. The workpapers were prepared and the calculations were conducted either by myself or under my supervision.

Summary of Recommendations

Q. WHAT DEPRECIATION RATES DO YOU RECOMMEND FOR MDU?

A. My recommended depreciation rates and depreciation expense, based on year-end 2001 plant balances, are set forth in Column (f) of Schedules 1 and 3 of Exhibit____(CWK-1) and in the final columns of Schedules 2 and 4. The following table compares the existing composite depreciation rates with those recommended by the Company and by myself on behalf of the Commission Staff:

Table 1
Category Depreciation Rates

Functional Category	Existing	Company Proposed	Staff Recommended
Gas Distribution	6,758,717	6,082,612	3,535,250
Gas General	936,037	1,927,778	990,871
Common	2,167,043	2,666,460	1,955,583

Table 2 summarizes the changes from present accruals proposed by the Company and recommended by Staff:

Table 2
Staff Recommended Changes in Category Depreciation Accruals
Based on Plant Balances on December 31, 2001

Functional Category	From Existing Rates	From Company Proposed
Gas Distribution	(3,223,467)	(2,547,362)
Gas General	54,834	(936,907)
Total Gas	(3,168,633)	(3,484,269)
Common	(211,460)	(710,877)

DEPRECIATION- GENERAL

Q. WHAT IS DEPRECIATION?

A. In 1958, the National Association of Railroad and Utility Commissioners sanctioned the following definition of depreciation:

> "Depreciation," as applied to depreciable utility plant, means the loss in service value not restored by current maintenance, incurred in connection with the consumption or prospective retirement of utility plant in the course of service from causes which are known to be in current operation and against which the utility is not protected by insurance. Among the causes to be given consideration are wear and tear, decay, action of elements, inadequacy, obsolescence, changes in the art, changes in demand, and requirements of public authorities.[1]

The second commonly cited definition of depreciation is that of the American Institute of Certified Public Accountants:

> Depreciation accounting is a system of accounting which aims to distribute the cost or other basic value of tangible capital assets, less salvage (if any) over the estimated useful life of the unit (which may be a group of assets) in a systematic and rational manner. It is a process of allocation, not of valuation. Depreciation for the year is the portion of the total charge under such a system that is allocated to the year. Although the allocation may properly take into account occurrences during the year, it is not intended to be a measurement of the effect of all such occurrences.[2]

If depreciation can be defined in a single sentence, I would say that it is the process of recovering the initial investment in tangible capital assets, adjusted for salvage, in a systematic fashion over the useful service life of the plant, recognizing that utility plant is typically a group of investments.

Q. CAN DEPRECIATION BE CALCULATED WITH PRECISION?

---

[1] *Uniform System of Accounts for Class A and Class B Electric Utilities,* 1958, rev. 1962.

A. No. Depreciation can no more be calculated with precision than can the required rate of return to equity investors. Both are developed from analyses that, while based on quantitative values, require considerable application of judgment. In the case of rate of return, that judgment pertains to the earnings expectations of investors as indicated by the stock market and corporate financial data. In the case of depreciation, the judgment pertains to the estimation of the future surviving life of plant as indicated by past patterns of retirements.

Q. HOW DOES THIS JUDGEMENTAL CHARACTERISTIC OF DEPRECIATION INFLUENCE THE COMMISSION'S APPROACH TO THE SUBJECT?

A. The Commission must recognize that the development of depreciation rates is not a refined science subject to mathematical precision. Because depreciation analysts use judgment in their estimation of depreciation, the Commission must necessarily exercise its own judgment in assessing the rationale and data that underlie alternative depreciation rates. This is why, in this proceeding, the Commission must choose among depreciation rates that yield widely differing annual depreciation accruals.

Q. WHAT ARE THE BASIC PARAMETERS REQUIRED TO DEVELOP A DEPRECIATION RATE?

A. At its simplest level, the only parameter that is absolutely required is an estimate of the service life of the plant. The reciprocal of that number can be used as the depreciation rate.

However, because most utility depreciation is applied to accounts that are multiple units of plant, it is usually necessary to estimate the dispersion of retirements around an average service life. In the gas and electric utility

[2] American Institute of Certified Public Accountants, *Accounting Research and Terminology Bulletin #1.*

industries, this dispersion is usually described in terms of "Iowa Curves," so named because they were developed at Iowa State University. These curves describe how closely the retirements are grouped around the average service life and whether they tend to occur more rapidly before, after or coincident with the average service life.

Another parameter that is typically included in the calculation of a depreciation rate is net salvage. Net salvage is the difference between the positive scrap value of the asset's material and the cost of dismantling and removing the asset when it is retired. It is expressed as a ratio to the cost of the asset and included as a subtraction (when salvage value exceeds removal cost) or an addition (when removal cost exceeds salvage) to the amount to be recovered in depreciation charges. With a few exceptions (e.g. vehicles, work equipment) most gas utility plant has a higher removal cost than its salvage value, so that the inclusion of net salvage in depreciation adds to the amount to be recovered.

Finally, virtually all major utilities, including MDU, employ what is known as "remaining life depreciation." This procedure computes the depreciation rate by dividing the unrecovered net investment, adjusted for net salvage, by the estimated remaining years of the asset (or group of assets). It effectively ensures that any past under- or over-accruals of depreciation are recovered during the remaining life of the asset.

Q. PLEASE ILLUSTRATE HOW THE PARAMETERS YOU HAVE JUST DESCRIBED ARE USED TO DEVELOP DEPRECIATION RATES?

A. Beginning with the simplest example, assume a single asset with a 20 year life. Its depreciation rate is the reciprocal of 20:

$$1/20 = 5\%$$

Now, let us assume that the asset is expected to have salvage value equivalent to 5 percent of its investment value. The depreciation rate declines:

$$\frac{1-.05}{20} = \frac{.95}{20} = 4.75\%$$

Assume next that the cost of removing this asset amounts to 15 percent of its value. The depreciation rate increases:

$$\frac{1-.05+.15}{20} = \frac{1.10}{20} = 5.55\%$$

This is called a "whole life" rate because it is based on the whole life of 20 years. To develop the remaining life rate, we must identify some additional items of data: the original investment, the depreciation reserve (the amount of depreciation that has already been recovered), and the remaining life of the asset.

In this illustration, let us assume that the asset originally cost $1 million and that past depreciation charges have recovered $400,000. This means that we have yet to recover $600,000 in original cost, plus a negative net salvage (i.e. net cost of removal) amounting to 10% of the original cost, or $100,000. The total amount yet to be recovered is thus $700,000. Let us further assume that the asset is 10 years old, leaving 10 years of remaining life. In remaining life depreciation, the unrecovered amount is divided by the remaining life years:

$$\frac{\$700,000}{10 \text{ years}} = \$70,000 \text{ required annual accrual}$$

The depreciation rate is then calculated by dividing the annual amount to be recovered by the gross investment, in this case:

$$\frac{\$70,000}{\$1,000,000} = 7.0\%$$

SERVICE LIFE ESTIMATION

Q. WHAT INFORMATION DID YOU RECEIVE FROM MDU TO ASSIST YOU IN YOUR STUDY OF PLANT ACCOUNT SERVICE LIVES?

A. I received the record of plant additions, retirements, transfers, adjustments, and balances for each account each year as far back as 1920. This information I refer to as "vintage data." I also received a record of plant retirements by year of placement for most of the major plant accounts for each year since 1977. I refer to this information as "actuarial data."

Q. WERE THERE ANY PROBLEMS WITH THESE DATA?

A. Yes. During the World War II years, the data show zero additions and zero retirements. Either plant records were not maintained in those years, or there actually was no plant activity due to the war. In either case, the effect is to distort the pattern of plant activity, that is, the typical rate of additions and retirements. Unfortunately, the Simulated Plant Record procedure requires data from the inception of each account, so I have left these zeros in the record.

Additionally, there have been a number of transfers and adjustments to the plant balances over the years. To adjust the data to reflect these changes requires knowledge of the source of the inward transfers and the destination of the outward transfers. It also requires knowledge of the basis for each of the adjustments. Aside from "Crookston Adjustment" for plant transferred out in 1985, I do not have the required information to correct the data for these transfers and adjustments. Accordingly, with the exception of 1985, I have accepted the year-end balances as though they were the result solely of additions and retirements since the previous year end.

Finally, for many of the smaller accounts there was insufficient plant activity, that is, additions and retirements, to perform reliable statistical studies. For most of these accounts, I accepted the either the existing life estimates or those made by AUS Consultants, who prepared the Company's depreciation study.

Q. WHAT LIFE STUDIES DID YOU PERFORM?

A. I performed two types of life studies for each account for which there were sufficient data, Simulated Plant Record ("SPR") studies and actuarial studies.

Q. IS THERE A SOURCE WHERE THE COMMISSION COULD FIND DETAILED EXPLANATIONS OF THESE STUDY METHODOLOGIES?

A. Yes. The National Association of Regulatory Utility Commissioners ("NARUC") has published a manual titled, "Public Utility Depreciation Practices," the latest edition of which is dated August 1996. This manual provides a full description of the theories behind depreciation, the procedures for studying it, the application of depreciation, and its effect on a utility's financial performance.

Q. YOUR RECOMMENDATIONS SHOW A NUMBER, A LETTER AND ANOTHER NUMBER, WHAT IS THE MEANING OF THESE LETTERS AND NUMBERS?

A. Schedule 2, Column (i) of Exhibit_____(CWK-1) contains entries such as 65 R2.5. The first number is the estimated average service life. The R1.5 is the retirements dispersion curve. There are 31 of these "Iowa" curves, so named because they were developed at Iowa State University.[3] They describe two variables: the dispersion of unit retirements around the average life of the account,

[3] For a complete discussion of Iowa Curves, see Appendix A, part 3 of *Public Utility Depreciation Practices*, National Association of Regulatory Utility Commissioners, August 1996.

and the skewing of rate of those retirements before and after the average service life.

The first variable, dispersion, is reflected in the numerical subscripts, which range from 0 to 6, with 0 representing an almost even distribution of retirements over the account's total life, and 6 representing a very tight grouping of unit retirements at the time that the average service life is reached.

The second variable, the pattern of the rate of retirements before and after the average service life, is represented by the letter prefixes. "S" stands for symmetrical, meaning that the pattern of growing unit retirements before the average service life is repeated by declining unit retirements following the average service life. "R" means right-modal and is typical of plant that experiences relatively little retirement activity in its early years but then retires fairly rapidly once it reaches its average life. Human beings experience a right-modal retirements dispersion. "L" implies the opposite condition – a large amount of "infant mortality," with the survivors by the time the average life is reached living a relatively long time. Automobiles may be a good example of an "L" type retirements dispersion.

There are other letter descriptors: "O" curves refer to exponential retirements, where a percentage of the existing plant retires each year. "SQ" is a square dispersion, where all retirements occur at once. The opposite is "SC," where the same number of retirements occur each year throughout the service life of the plant.

Q. PLEASE DESCRIBE THE SPR STUDIES.

The SPR study procedure is a trial and error mechanism whereby a computer program fits alternative Iowa Curves and average service life combinations to the record of plant additions, retirements and balances.

The SPR – Balances program measures the degree to which various combinations of Iowa curves and service lives applied to the plant additions each year yield the plant balances in subsequent years. The degree of fit is measured by sum of the squared differences between the predicted plant balances and the actual balances. When the square root of those differences is divided into the average of the actual balances, the result is a "conformance index." The reciprocal of the conformance index is called the "index of variation." The lower that index, the better the fit.

Another test of SPR results is the "retirements experience index," which measures the maturity of the account under each curve-life combination. A retirements experience index of 100 indicates that the account has experienced a full life cycle, that is, all of the plant placed in the oldest vintage is now retired. An index of 50 suggests that the account is only half way through its life cycle. In general, SPR results with retirements experience indexes less than 50 are considered to have little value, while those over 75 are considered of significant value.

The output of SPR studies is a listing of curve-life combinations in ascending order of their index of variation. Those results are presented in Exhibit_____(CWK-2) for each account for which data were available.

Q. PLEASE DESCRIBE THE ACTUARIAL STUDIES.

A. Actuarial studies are far more precise than SPRs, but they require considerably more data and, to be effective, the data must be fairly "thick," that is, they must reflect a fairly large number of retirements. Actuarial studies use the record of retirements by date of placement, which means that the age of each retirement must be known. With this knowledge, it is possible to compute the history of retirements at each age, and from that record, to fit Iowa curve and service life combinations that reproduce that history.

Unfortunately, in the case of MDU, the actuarial data runs back only to 1976. The Company was able to estimate the age of retirements from that year on, but not earlier. The result is that we have a record of aged retirements only during the past 25 years, which reduces the "thickness" of the actuarial data, so critical to the effectiveness of this method.

The output of actuarial studies is a fit of an Iowa curve and service life to actual aged retirements that can be displayed graphically. That graphical presentation for the three best fits for the accounts for which there are actuarial data is presented in Exhibit_____(CWK-3). The exhibit also contains the Observed Life Tables ("OLT") for each account.

In many cases the fits show lives in excess of a century, which is totally counterintuitive. The reason for these results can be seen in the OLTs. With a few exceptions, the percent surviving does not decline with age, as intuitively it should. That is because there have been inadequate observations of aged retirements to establish a pattern from which can be drawn conclusions as to the expected life of the surviving plant. As a result, the actuarial data have only a limited value in this analysis.

Q. DID THESE STUDIES YIELD PRECISE INDICATIONS OF SERVICE LIFE?

A. No. In many cases, the best SPR fits were associated with curve and life combinations that had inadequate retirement experience indices. As a consequence, I was required to use judgement and, in two cases, the evidence of other utilities' service lives, to develop my service life recommendations. In those cases where totally inadequate data exist, I have usually adopted either the current life and survivor curves or those chosen by AUS.

Q. WHAT ARE YOUR SERVICE LIFE RECOMMENDATIONS FOR THE DISTRIBUTION PLANT ACCOUNTS?

A. My life-curve recommendations are shown in column (i) of Schedule 2 of Exhibit_____(CWK-1).

For Account 374 – Rights of Way, I have adopted the 65 year R2.5 parameters recommended by AUS. The data are inadequate to propose any alternative parameters for this very long-lived account.

For Account 375 – Distribution Measuring and Regulating Structures and Improvements, I have selected 55 years with a S1.5 Iowa curve. The five best fitting SPR life-curve combinations are arrayed around this result.

For Account 376 – Mains, I have selected 58 years. This is a shorter life than the first nine combinations from the SPR analysis, and it is also less than the results indicated by the actuarial studies. A life in the range of 65 to 80 years might be justified by the study output, but the American Gas Association indicates that 80 years is the maximum life adopted by any gas utility in its survey, and the average is 54 years. Exhibit_____(CWK-4) is a redacted summary of that survey, which covers the Mains and Service accounts. Accordingly, I have selected the best SPR fit that achieves a retirement experience index of more than 75.

The existing depreciation parameter for the Mains account is only 36 years. Because of the very great increase in the service life estimate and the modification to the net salvage ratio that I will discuss shortly, I propose to use a "whole life" rate for this account. This rate does not attempt to recover the past over-accrual of depreciation. Rather, it implicitly assumes that there is no excess or deficiency in the depreciation reserve. By using a whole life rate, rather than a remaining life rate, I ameliorate the effect of the very dramatic change in parameters that I am proposing.

For Account 378 – Measuring and Regulating Station Equipment – General, I have selected 50 years with an SC curve. This is the best SPR result that reflects a retirement experience index greater than 75.

For Account 379 – Measuring and Regulating Station Equipment – City Gate, I have selected a 40 year life with an S1 Iowa curve. Again, this reflects the best SPR result with a retirement experience index greater than 75.

For Account 380 – Services, I have selected 55 years. This is a shorter life than the first six combinations from the SPR analysis, and it is also less than the results indicated by the actuarial studies. A life in the range of 60 to 80 years might be justified by the study output, but Exhibit_____(CWK-4) shows that 63 years is the maximum life adopted by any gas utility in the American Gas Association survey, and the average is 40 years. Accordingly, I have selected the best SPR fit that achieves a retirement experience index of more than 75. Again, as in the case of the Mains account, I propose a whole life rate that does not attempt to recover the past over-accruals in the depreciation reserve.

For Account 381 – Meters, I have selected 35 years with an R2.5 Iowa curve. All of the SPR results indicate a longer life, but the industry standard for this account is approximately 35 years.

For Account 383 – Service Regulators, I have selected 40 years and an R1 curve. The 40 year life is the approximate mid-point of the best SPR results with retirement experience indices in the 67 to 80 range.

Not surprisingly, the SPR results for Account 385 – Industrial Measuring and Regulating Equipment were similar to those for Account 383, so I have recommended the same life and survivor curve parameters.

Account 386 – Miscellaneous Equipment consists mostly of CNG refueling station equipment. The historical record, as disclosed by the SPR study, suggests a very long life, and the high level of the depreciation reserve (70%) indicates that the account may have been over-depreciated. Accordingly, I am selecting 20 year life with an R2 Iowa curve for this account.

For Account 387.5 – Other Distribution Equipment I have selected a 20 year life and an L4 Iowa curve. This combination conforms to the general pattern of SPR results, exclusive of the first two fits, which yield much longer lives but with lower retirement experience indices.

Q. HOW DO YOUR RECOMMENDATIONS COMPARE WITH THOSE OF AUS CONSULTANTS?

A. A comparison of my recommended life and curve parameters with those of AUS Consultants is as follows:

Table 3
Distribution Plant Life and Survivor Curves

		Staff Recommended		AUS Consultants	
		ASL	Curve	ASL	Curve
374.00	Rights of Way	65	R2.5	65	R2.5
375.00	Distr. Meas & Reg. Station Structures	55	S1.5	55	R2.5
376.00	Distribution Mains	58	R1.5	45	R3
378.00	Meas. & Reg Station Eqpt – General	50	SC	40	R1
379.00	Meas. & Reg Station Eqpt - City Gate	40	S1	35	R2
380.00	Services	55	R1	40	R3
381.00	Meters	35	R1.5	35	R2.5
383.00	Service Regulators	40	R1	35	R3
385.00	Industrial Meas. & Reg Station Eqpt.	40	R1	35	R2
386.00	Miscellaneous Equipment	20	R2	15	R3
387.10	Cathodic Protection Equipment	20	L4	20	R1.5
387.20	Other Distribution Equipment	20	L4	25	R3

The most significant differences are those involving Accounts 376 and 380, Mains and Services because these two account together represent 65 percent of

the Company's total gas plant. For this reason, changes in the life assumptions for these accounts have the greatest effect on the Company's overall depreciation recovery. Additionally, I should note that the table simplifies AUS' recommendation, because AUS has disaggregated several of the accounts into sub-accounts, four in the case of mains and three in the case of services. AUS has similarly disaggregated Account 387, Other Distribution Equipment?

Q. WHY ARE YOUR LIFE RECOMMENDATIONS DIFFERENT FROM THOSE OF AUS?

A. I cannot say. Exhibit_____(CWK-5) presents copies AUS' SPR results. They are in virtually identical format as the my SPR results in Exhibit_____(CWK-2). These tabulations, which were not included in AUS' report, do not support the life parameters that AUS selected.

For example, AUS selected 45 years as its service life for the Mains account. AUS' SPR output shows that 45 years is the 20th from the best fit of all the life/curve combinations. The 55 years I recommend is the 11th best fit. Had I applied my criterion of selecting the best fit with a retirement experience index of 75 or greater to the AUS output, my recommendation would have been for a Mains service life of 62 years, the eighth best fit.

A similar result can be seen with respect to Account 380 – Services. AUS' SPR output table shows that the 40 year service life selected for this account is the 14th best fit – all better fits yield longer service lives. The best fit that yields a retirement experience index greater than 75 shows a service life indication of 54 years, one year short of the 55 years I have recommended.

Similar effects can be seen in the other accounts where I have selected shorter lives than AUS: Accounts 383, 385, and 386. The AUS report does not explain why it ignored the results of its own SPR studies.

Q WHY HAVE YOU NOT DISAGGREGATED THE MAINS, SERVICES AND OTHER EQUIPMENT ACCOUNTS, AS AUS HAS DONE?

A. First, I did not have the disaggregated data by which to perform studies of the subaccounts. More important, I do not believe that such disaggregation necessarily adds to the precision of the analysis. The analytical techniques that I have used – and that AUS uses – require density of data, that is, a large number of observations of additions and retirements. By disaggregating the accounts into subaccounts, the efficacy of these analyses is diminished, and the selection of life and survivor curve parameters becomes more subject to judgement, and at times guesswork.

Q. WHAT CHANGES HAS AUS RECOMMENDED IN THE DEPRECIATION PROCEDURES FOR GAS GENERAL AND COMMON PLANT?

A. AUS has proposed that general plant accounts which consist of many small units should be amortized rather than depreciated. Amortization reduces the Company's record keeping requirements by avoiding the need to maintain a record of the units placed each year by location so that they can be retired according to actuarial accounting procedures.

The amortization procedure does not use remaining life. In its simplest form, it uses the reciprocal of the estimated service life as the remaining life. A plant category with a 10-year life has a depreciation rate of 10 percent; one with a 20-year life is depreciated at five percent.

A number of these amortization accounts experience positive salvage, in which case the depreciation rate is calculated as follows:

$$\text{Depreciation Rate} = \frac{1 - \text{Salvage \%}}{\text{Service Life}}$$

Note, however, that it is still necessary to estimate the life of each plant account.

Q. WHAT PLANT LIVES DO YOU RECOMMEND FOR THE GAS GENERAL PLANT ACCOUNTS?

A. The SPR results for Account 390 – General Structures and Improvements indicate that AUS has overestimated the life of this account at 35 years. I recommend 30 years instead.

I have included computers with office furniture in a composite analysis of Account 391 because I do not have the separated data. Even if I did, I am not persuaded that the separation results in a more accurate picture of the overall life expectancy of this somewhat catchall account. I recognize, however, that computers have a relatively short service life, so I am willing to override the results of the SPR studies, all of which suggest approximately 30 years, and adopt the current 17 years as the amortization period for this account.

I have inadequate data for the following accounts:

		Current Life
392	Transportation Equipment	(no data)
393	Stores Equipment	39 Years
394.1	Tools, Shop and Garage Equipment	20 Years
394.3	Vehicle Maintenance Equipment	25 Years
394.4	Vehicle Refueling Equipment	(no data)
394.5	Laboratory Equipment	35 Years
396.1	Work Equipment	(no data)

I have maintained the current service life parameters for those accounts for which they are available. I have accepted AUS' recommendations for the remaining

accounts. For Account 292, AUS recommends 8 years for trailers and 6 years for cars and trucks. It recommends 15 years for Vehicle Refueling Equipment and 10 years for Work Equipment. All of these accounts are subject to amortization, so there is no need to select a survivor curve.

The SPR analyses support only 5-year life for Power Operated Equipment. This short life may explain the extraordinarily high positive salvage value of this equipment, discussed in the next section of this testimony.

I have performed an SPR analysis of all of account 397, Communications Equipment. It shows life indications of 30 to 40 years, well over any of the life estimates used by AUS for the five subaccounts into which it has divided this account. I am, however, familiar with telephone plant lives, and I acknowledge that this range of service lives is much too high given the changing technology of this equipment. For this reason I have accepted AUS' estimate of 15 years for Radio Equipment, and I have retained the current 15 years for General Telephone Equipment and 12 years for Supervisory and Telemetering Equipment. The SCADA equipment account is fully depreciated, but if any further equipment is added, it should be amortized under AUS' 8-year schedule. I recommend that network equipment be amortized on the same 15 year schedule as the bulk of this account.

Finally, I have accepted the 20 year life proposed by AUS for Account 398 – Miscellaneous Equipment.

Q. WHAT ARE YOUR LIFE AND SURVIVOR CURVE RECOMMENDATIONS FOR THE COMMON PLANT ACCOUNTS?

A. Most of the common plant accounts parallel the general gas plant accounts, and their service life expectations are much the same. There are, however, some differences.

The Common General Structures are more substantial than those of the Gas Division, and for this reason, I recommend accepting AUS' 35 year life which, if anything, may be too short.

My SPR analysis of Account 391 – Office Furniture and Equipment shows a much shorter service life than for the corresponding gas plant account. The consensus of the SPR results points to a 12-year life, which I recommend.

The SPR analysis of common Transportation Equipment indicates 14 years as the life of the composite account. This parameter is shorter than the life AUS recommends for trailers and longer than it recommends for cars and trucks.

NET SALVAGE RATIOS

Q. ASIDE FROM SERVICE LIVES AND SURVIVOR CURVES, WHAT ELSE ACCOUNTS FOR THE DIFFERENCES BETWEEN YOUR RECOMMENDED DEPRECIATION RATES AND THOSE PROPOSED BY AUS CONSULTANTS?

A. A major additional difference relates to our recommended net salvage ratios, and particularly the removal cost components of those ratios.

Q. **WHAT DO YOU MEAN BY THE "REMOVAL COST COMPONENT" OF NET SALVAGE?**

A. Removal costs refer to cost of removing, abandoning or dismantling property. When the cost of removal exceeds the revenues from salvage, as it does for the largest gas distribution accounts, the term applied is either "negative net salvage" or "net removal." Net removal ratios are conventionally shown as negatives; net salvage ratios as positive. Net removal costs are recovered by applying the ratio

to the amount of total plant that must be recovered over the service life of the plant removed. For example, if removal cost is five percent of the value of the plant to be removed, then the amount to be recovered is increased by five percent. That five percent factor is referred to as the "net removal cost ratio."

Q. WHAT NET REMOVAL COST RATIOS ARE MDU'S CONSULTANTS PROPOSING IN THIS CASE?

A. Table 4 shows the present net removal cost ratios and those proposed and those proposed by AUS, MDU's consultants.

Table 4
Net Removal (Negative Salvage) Ratios

Acct	Description	Present Ratio	Proposed Ratio
375	Distr. Structures & Improvements	-10%	-50%
376	Mains	-40%	-60%
378	Meas. & Reg Station Eqpt – General	0%	-30%
379	Meas. & Rg. Station Eqpt. – City Gate	0%	-15%
380	Services	-140%	-175%
385	Industrial Meas. & Reg. Eqpt.	+20%	-15%
390	Gas General Plant Structures	-5%	-10%
390	Common Plant General Structures	N/A	-10%
397.1	Common Radio Communications (Fixed)	N/A	-10%

Q. HOW DID AUS ARRIVE AT THESE RATIOS?

A. AUS followed a two-step process. First, they compared the original cost of the plant retired in each account each year since 1968 with the corresponding gross salvage and cost of removal to derive year-by-year positive gross salvage and negative cost of removal ratios. They did this on an annual basis and on a three year "rolling band" basis. Rolling bands means averaging three years starting with 1968-1970, then 1969-1971, then 1970-1972 up to 1999-2001. They then averaged the rolling bands for the entire 33 year period since 1968.

The second step involved two different operations. For gross salvage, AUS performed a standard linear trend analyses of the ratios for the past 5, 10, 15 and 20 years. For each account, they selected the ratio predicted by the final year of the five-year trend analysis. For the cost of removal ratio, they compounded an annual inflation factor of 2.75 percent for the number of years between the average age of retirements and the average service life. This compounding yielded a multiple which was then applied to the historical average removal cost ratio. The final net removal cost ratio is the sum of the gross salvage ratio and the cost of removal ratio.

Q. CAN YOU PROVIDE AN ILLUSTRATION OF THIS PROCEDURE?

A. Yes. Exhibit_____(CWK-6) is a copy of AUS' net salvage data and analysis for several of the MDU's larger gas distribution plant accounts. The exhibt covers accounts 375 – Distribution Structures and Improvements, 376 – Mains, and 380 – Services. There are two pages for each account. The first page is the raw data, which shows for each year since 1968 the original cost of the retirements, the gross salvage, the cost of removal, and the ratios to both salvage and removal cost to original cost.

The second page shows the three-year rolling bands, 1968-1970 through 1999-2001. At the bottom of that tabulation are the totals for the entire period and the average ratios. For Mains, the average positive salvage ratio is 3.12 percent, the average cost of removal ratio is -33.76 percent, and the average net salvage – 30.64 percent. For Services, the ratios are positive .33 percent for gross salvage, negative 134.29 percent for cost of removal, and negative 133.97 percent for net salvage.

AUS Consultants do not use these ratios. Instead, they extrapolate the last five years of positive salvage (1997-2001) out five years into the future. This means

that although gross salvage for Mains has averaged positive 3.12 percent since 1968, AUS uses a negative 2.72 percent ratio. This is because positive salvage was 31.08 percent in 1997 but only 0.41 percent in 1998 and zero since then. This trend indicates to AUS that in 2006, positive salvage will be negative 2.72 percent. The same condition applies to Services. Gross salvage has averaged positive .33 percent for the last 33 years, but AUS extrapolates a negative .07 percent gross salvage ratio for this account based on the trend since 1997.

AUS Consultants do not use the historical cost of removal ratios either. The historical cost of removal ratio for Mains is –33.76 percent. This number is inflated by a factor that reflects the expected inflation of 2.75 percent annually for the next 20 years, which is the difference between the average age of recent retirements and the average service life for the account. That inflation factor is 1.72. The cost of removal ratio used by AUS is 58.09 percent (33.76% x 1.75). For services, the same 1.72 inflation factor is applied to the historical removal cost ratio of 134.29 percent to yield an adjusted removal cost ratio of 231.04 percent.

The netting of these "adjusted" gross salvage and removal cost factors yields a net salvage factor of -60.81 percent for Mains and –231.11 percent of Services. AUS adopted the Mains factor rounded to –60 percent. Apparently, AUS found that negative 231 percent was too high for the Services account, so they recommended a negative salvage ratio of –175 percent.

Q. DOES AUS FOLLOW THE CONVENTIONAL PROCEDURE USED BY UTILITIES FOR CALCULATING NET SALVAGE RATIOS?

A. No. I have participated in dozens of utility depreciation cases, and this is the first time I have ever encountered the adjustments that AUS has applied to the historical gross salvage and removal cost ratios. Neither of these adjustments has any conceptual validity and both should be rejected.

A. AUS' cost of removal adjustment double-counts the effect of inflation. As I will discuss in more detail shortly, the historical ratios of removal costs to original plant cost already include the effect of inflation from the time the plant was installed to the time it was removed. According to AUS, the weighted average age of retired mains has been 25 years. This means that the average dollar of mains investment retired in 2001 was installed in 1976. That dollar reflects 1976 buying power, considerably more than the buying power of a dollar in 2001. The cost of removal in 2001, which is the numerator of the ratio, is expressed in 2001 dollars of considerably less value than the 1976 dollars of the original investment. As a result, cost of removal ratio already incorporates the historical inflation that occurred between 1976 and 2001. As I shall discuss, this inflation effect is the fundamental weaknesses of removal cost ratios as conventionally calculated by utilities.

AUS, however, further inflates the removal cost for yet more inflation. Their adjustment reflects the inflation between the age of recent retirements and the average service life of all units of plant.

Q. DO AUS CONSULTANTS OFFER ANY RATIONALE FOR THEIR ADJUSTMENTS TO THE GROSS SALVAGE AND REMOVAL COST RATIOS?

A. Yes. Page 3-10 of the AUS report contains the following statement:

> ...as property continues to age, gross salvage routinely declines, while with the passage of time cost of removal tends to increase in conjunction with ever increasing labor rates. On an aggregate basis, most historical retirements from each property group, routinely occur at an average age that is less than the average service life of the account. Accordingly, the experienced historical salvage analysis, with regard to gross salvage, will most often be overstated relative to anticipated future gross salvage. By comparison, the historical analysis will typically be understated with regard to future cost of removal. That is, in general terms, it can be assumed that with the increased passage of time, any

Q. WHY DOES THE GROSS SALVAGE ADJUSTMENT HAVE NO CONCEPTUAL VALIDITY?

A. A brief glance at the raw data for gross salvage on Exhibit_____(CWK-6) demonstrates the variability of gross salvage from year to year. I understand that this variability is in part because utilities do not necessarily sell their scrap material each year but sometimes allow it to accumulate before selling it in large lots. Whatever the reason, there is no particular significance to any one year's gross salvage, nor is there any significance to the trend over any given five years. There is certainly no significance to an extrapolation of the most recent five years into the future.

The utter absurdity of this extrapolation is demonstrated by the pages in Exhibit_____(CWK-6) that show the net salvage data for Account 375 – Distribution Structures and Improvements. In 1997, MDU realized $850 in gross salvage for retirements in this account, but has realized none since then. The second page of that account data reveals that AUS has extrapolated this "trend" to result in a negative -23.37 percent gross ratio. First of all, a negative gross salvage ratio is totally counter-intuitive. Over time, all gross salvage should be positive. More specifically, there has been no year in the past 33 when gross salvage for this account was ever negative, as demonstrated on the previous page,

The same observation applies to the Services account. Exhibit_____(CWK-6) reveals that there has never been a year when gross salvage for Services was negative, yet AUS has adopted a -.07 percent gross salvage ratio for the Service account.

Q. WHY DOES THE COST OF REMOVAL ADJUSTMENT HAVE NO VALIDITY?

future positive net salvage will likely be lower, while future negative net salvage will likely be higher than the overall levels experienced in the past.

Q. WHAT IS YOUR RESPONSE TO THIS RATIONALE?

A. This rationale fails on both empirical and conceptual grounds. Empirically, there is not a shred of evidence that over time, positive gross salvage ratios decline and negative removal cost ratios increase. The data in Exhibit_____(CWK-6) show that for Mains and Services, AUS' claimed trend arguably occurred between the beginning of the series, 1968, and the mid-1980s. Since then, however, the trends have generally been inconsistent, moving in the reverse direction for about 10 years, and then only in the past five years moving in the direction asserted by AUS.

The reason why there is no discernable trend in either the gross salvage or the removal cost ratios is that, contrary to AUS' assertion, the average age of retirements does not necessarily increase. It is true that the average age of retirements in any given year is less than the average service life of the entire plant category. This has to do with the fact that plant placed in a given year does not retire all at once. Rather, it retires in a dispersion over a number of years. The average service life is just that: an average. Some units retire sooner, some later than this average.

Given enough time, one might think that retirement the long-lived units would offset the effect of short-lived retirements, and the average age of retired units would trend toward the average service life. This would indeed happen if there were no growth in plant. But the reality is that each new vintage (year of placement) of plant tends to be larger than the previous vintage. Not only is the distribution system growing, but inflation is increasing the dollars required just to place the same amount of plant. As a result, there is always more new plant with its cohort of early retirements than there is old plant with long-lived retirements.

That is why the average age of retiring plant does not necessarily get longer. It is also why there are no discernable trends in gross salvage or cost of removal ratios.

Q. WHAT IS THE CONVENTIONAL PROCEDURE USED BY UTILITIES TO DEVELOP NET SALVAGE RATIOS?

A. Many utilities, although by no means all, use the unadjusted ratios developed by AUS. Those ratios reflect the relationship between the original cost of the plant retired and the gross salvage and cost of removal experience during the year of retirement. Because the booking of the retirements does not always match the booking of the salvage and removal cost, most utilities employing this procedure use "bands" of years such as the three-year rolling bands used by AUS.

Q. HOW WOULD THE NET SALVAGE RATIOS DEVELOPED UNDER THIS PROCEDURE COMPARE WITH THOSE PROPOSED BY AUS?

A. Exhibit_____(CWK-8) presents the net salvage ratios recommended by AUS and those that result from the conventional procedure. When conventional procedures are used, there are only four accounts for which negative salvage is justified, as follows:

Table 5

Net Salvage (Cost of Removal) Ratios
Distribution Plant

Acct	Description	Conventional	AUS
375	Distr. Structures & Improvements	-30%	-50%
376	Mains	-30%	-60%
378	Meas. & Reg Station Eqpt – General	-35%[4]	-30%
380	Services	-135%	-175%

Q. DO YOU RECOMMEND THESE RATIOS?

[4] Based on the past five years' experience

A. No. Although they are certainly better than the ratios recommended by AUS, these ratios are still severely overstated.

Q. WHY ARE THE RATIOS DERIVED BY THE CONVENTIONAL PROCEDURE OVERSTATED?

A. As I have already mentioned, even the conventional procedure for calculating net salvage ratios imputes the inflation experienced between the time of a unit's replacement and the time of its removal. The numerator of the removal cost ratio is expressed in recent dollars, while the denominator is expressed in dollars from many years ago. The value of the dollars in the numerator is much greater than that in the denominator, so that the fraction (i.e. ratio) is overstated.

Q. CAN YOU PROVIDE SPECIFIC EXAMPLES OF THIS CONDITION?

A. Yes. Consider the example of mains retired in the year 2001. Page 1 of Exhibit_____(CWK-6) shows that the original cost of the mains retired in 2001 was $171,124 and that the cost of their removal was $74,110. The conventional treatment is to compare these two dollar amounts, yielding a removal cost ratio of –43.31 percent.

According to AUS, the average age of retiring mains is 25 years, meaning that the average main retired in 2001 was placed in 1976.[5] The Handy-Whitman construction price index for steel mains in the North Central Region was 147 in 1963; in 2001 it was 382.[6] Expressed in 2001 dollars, the $174,124 of original cost of mains retired in that year would be $452,486 ($174,124 x (382/147)). If the removal cost and original cost were expressed in comparable dollars, the

[5] AUS Report, page 8-6.
[6] *Handy-Whitman Index of Public Utility Construction Costs*, Whitman, Requardt and Associates, Bulletin No. 156, 2002.

removal cost ratio would be -16.4 percent ($74,110/$452,486), not –43.31 percent.

The same condition applies to services. The original cost of the services retired in 2001 was $123,831; their removal during that year cost $203,229. The conventional removal cost ratio of these two numbers is –164 percent. AUS indicates that the average retirement age of a service is 20 years, meaning that the average service retired in 2001 was placed in 1981. The Handy-Whitman index for plastic services in 1981 was 185; in 2001 it was 374. Expressed in 2001 dollars, the services retired in 2001 were worth $250,339 ($123,831 x (374/185)), yielding a removal cost ratio, expressed in consistent dollars, of -81 percent, less than half the ratio under the conventional procedure.

Q. WHAT IS WRONG WITH THE CONVENTIONAL PROCEDURE?

A. There are two things wrong with it. First, it requires ratepayers to pay for future inflation in current dollars. This might not be a problem if the ratios developed according to the conventional procedure were applied only to currently retiring plant for purposes of developing depreciation rates. But they are not. They are applied to <u>all</u> plant, including that which was placed just last year. As a result, current ratepayers are obliged to pay for future inflation stretching out over the remaining life of the plant they use.

The second objection is that this procedure fails totally to recognize the present value of cash payments. It is generally accepted in financial, accounting and economic analysis that a dollar paid today is worth more than a dollar paid next year. A dollar owed ten years from now is worth much less than a dollar paid next year. That is because whoever possess the dollar in the meantime can invest it and earn a return during the intervening nine years. Alternatively, he can spend the dollar next year and enjoy the goods or services that it buys until he has to pay the dollar back ten years from now.

The conventional procedure for recapturing removal costs makes no distinction between dollars paid by ratepayers in the current year and dollars spent to remove plant many years from now. For purposes of charging depreciation, they are all of equal value.

Q. BUT DON'T RATEPAYERS RECEIVE THE BENEFIT OF THE RATE BASE DEDUCTION REPRESENTED BY THE ACCRUAL OF THESE RETIREMENT COST ALLOWANCES?

A. No. An argument might be made that inflated depreciation charges build up the depreciation reserve, which in turn reduces the net investment rate base. The reduced rate base lowers the requirement for return and income taxes. Over time, one might think this reduction should cancel out the increase in revenue requirement represented by the excessive depreciation expenses.

Only it doesn't. That is because the dollar value of the Company's plant is always expanding. The Company is growing, but even if it were not, inflation causes the dollars added each year to exceed the dollars retired. There is always more new plant generating higher depreciation charges than old plant that has accumulated depreciation reserve. Ratepayers never catch up.

Q. IS THERE AN ACCOUNTING PROCEDURE THAT RESOLVES THESE PROBLEMS YOU HAVE IDENTIFIED WITH RESPECT TO REMOVAL COST RATIOS?

A. Yes. The Financial Accounting Standards Board has recently published an accounting procedure for dealing with the retirement costs of long-lived assets that must be removed by reason of legal obligations. These procedures were published in 2000 in Statement of Financial Account Standards No. 143 ("SFAS

143"). A summary of that statement is attached to this testimony as Exhibit____(CWK-7)

Q PLEASE DESCRIBE SFAS 143.

A. As I have just noted, SFAS 143 addresses long-lived assets for which there are legal obligations to incur retirement costs. A legal obligation is defined as "an obligation that a party is required to settle as a result of an existing or enacted law, statute, ordinance, or written or oral contract or by legal construction of a contract under the doctrine of promissory estoppel." A good example of such an obligation is the requirement to dismantle, entomb or decontaminate a nuclear generating plant.

When a company finds that it has a legal obligation that fits this description, it must declare the retirement cost as a liability on its balance sheet. That liability is not the ultimate cost of the retirement, but the present value of that cost, using as the discount factor the risk-free interest rate when the liability was recognized.

The annual expense associated with this liability consists of two parts. One is the amortization of the liability, which is the present value of the liability divided by the life of the asset – comparable to depreciation. The second expense is the annual accretion in the present value of the liability.

Q. CAN YOU ILLUSTRATE HOW THIS PROCEDURE WORKS?

A. Assume that MDU installs a gas manufacturing facility that it expects to last for 40 years. It is obligated to dismantle that plant when it retires at an estimated cost of $1 million. MDU would book a liability for this retirement cost, not at $1 million, but at $1 million discounted at the risk-free interest rate. The risk free

interest rate over 40 years is 7 percent.[78] The liability would therefore be booked as $69,118 ($1 mil/1.07^{40})

Each year, MDU would show two items of expense. The first would be the amortization of the liability. In the first year after installation that would be $69,118/ 40 years = $1,728. This item would increase each year as the present value of the liability increases. The second expense would be the annual accretion in the liability itself. In this instance, it would be $1 million times 1.07^{39} - 1.07^{40}. This is $1 million x (0.07395- 0.06911=.00484) or $4,840. As the present value factors increase, that is, as they approach 1.0, this annual amount would also increase. Total expense in the first year of operation would be $1,728 + $4,840 = 6,568.

Q. HOW DOES THE SFAS 143 PROCEDURE RESOLVE THE PROBLEMS YOU HAVE IDENTIFIED WITH THE CONVENTIONAL PROCDURE FOR CALCULATING AND APPLYING NEGATIVE SALVAGE RATIOS?

A. Unlike the conventional procedure for calculating and applying negative salvage, the SFAS 143 procedure recognizes the present value of future costs. It therefore resolves the unfairness of charging present ratepayers with an inflated cost that the Company will not incur until many years from now.

Q DO YOU THEREFORE RECOMMEND THAT THE SFAS 143 PROCEDURE BE APPLIED TO MDU'S RETIREMENT COSTS IN THIS CASE?

A. Yes, but I do not recommend this procedure as the ultimate solution to the problem of gas plant retirement costs. That is because the SFAS procedure still

[7] Seven percent is the rate that MDU is using as its discount factor for the SFAS 143 obligations at its Coyote Station and Big Stone electric generation plants.

requires a forecast of the final, inflated value of future retirement costs. As I will discuss later in this testimony, there are procedures available that avoid this necessity.

Q. HAVE YOU APPLIED THE SFAS 143 PROCEDURE THE RETIREMENT COSTS OF MDU'S GAS DISTRIBUTION PLANT?

A. Yes. That application is presented in Exhibit_____(CWK-9). Page 1 of that exhibit presents the discount factors at seven percent. For this purpose, I use a half-year convention, that is, the average of the discount factor at the beginning and end of each year.

Page 2 of Exhibit_____(CWK-9) develops the negative net salvage ratios reflecting the SFAS 143 discounting procedure. The top line presents the conventional negative salvage ratios. The next three lines reduce those ratios to their discounted present value as of the end of the remaining life of the plant. Line 5 presents the present value increment between the remaining life year and the following year that SFAS 143 requires. The remaining lines calculate the depreciation rate with and without retirement costs included. Line 17 shows the discounted present value of the retirement costs expressed over the entire remaining life of the plant. Finally, line 18 develops the negative salvage ratio reflective of the SFAS 143 procedure. Those ratios are replicated in summary Exhibit_____(CWK-8).

Q. WHAT NET SALVAGE RATIOS ARE YOU RECOMMENDING IN THIS CASE?

A. My recommended net salvage ratios are presented in the final column of Exhibit_____(CWK-8). I have adopted the negative salvage ratios developed in Exhibit_____(CWK-9). With two exceptions, I have adopted the positive salvage

[8] Federalreserve.gov/releases/H15 20 year Treasury bonds, Dec 2002.

ratio developed by the conventional method of comparing actual positive salvage with the value of experienced retirements. The two exceptions are Account 396.2 – Power Operated Equipment for both gas and common plant, where I question the very high levels of gross salvage. In the case of gas equipment, I have adopted the AUS ratio. In the case of common equipment, I recommend a ratio half way between the conventionally derived ratio and that recommended by AUS.

Q. EARLIER, YOU SUGGESTED THAT THERE ARE OTHER METHODS OF TREATING RETIREMENT COSTS THAT DO NOT REQUIRE FORECASTING COSTS INTO THE FUTURE. WHAT ARE THEY?

A. There are two methods of treating retirement costs that avoid the necessity of predicting costs that will not be incurred for years, sometimes decades into the future. The first is to capitalize the retirement costs of plant that is being replaced as part of the cost of the replacement plant. MDU reports that 94 percent of its retiring mains are replaced *in situ* or with parallel pipes and 73 percent of its services are similarly replaced. There are only two reasons for replacing a main or a service. Either the previous pipe has become physically deteriorated or it has inadequate capacity to handle current or forecast loads. In either case, the inadequacies of the old pipe are the cause of the new pipe, so it is not inappropriate to consider that the cost of retirement is a component of the cost of the replacement plant. This procedure avoids the need to predict future inflation, and it ensures that the Company will recover all of its retirement costs, no more and no less.

In the absence of replacement – only 6 percent of mains and 27 percent of services – the appropriate treatment is to develop removal cost allowances within the depreciation rates that reflect recent experience, say, the average of the most recent five years. This treatment is similar to expensing except for two important considerations. First, it does not reflect any given year's activity. As can be seen

from the data in Exhibit_____(CWK-6), removal costs vary from year to year. Second, this procedure retains the tie to depreciation, so that as the plant grows, the removal cost allowance grows correspondingly. Again, it ensure that the Company recovers its removal costs, no more and no less.

The combination of these two procedures would remove altogether the need to predict future removal costs. Because the overwhelming portion of removal costs would be recovered through capitalization in replacement plant, these procedures would not unduly subvert the basic purpose of depreciation rates, which is to recover past investment in a fair, reasonable and systematic manner. I submit that the present procedures for treating removal costs have resulted in just that subversion.

Q ARE THERE ANY REGULATORY PRECEDENTS FOR THE PROCEDURES YOU ARE PROPOSING?

Yes. The practice of incorporating retirement costs into the capital cost of the replacement plant is explicitly recognized in FERC's Uniform System of Accounts ("USOA"). Paragraph 31 of the Electric USOA (Subchapter C) and paragraph 32 of the gas USOA (Subchapter F) contain the following definition:

> *Replacing or replacement*, when not otherwise indicated in the context, means the construction or installation of electric (gas) plant in place of property retired, together with the removal of the property retired. [Emphasis supplied]

Paragraph 10 of both the electric and gas plant instructions covers additions and retirements of plant. It refers to "...additions to and retirements and replacements of electric (gas) plant..." It goes on to provide instructions for the recording of retirement unit additions and retirements. If the definition of replacements provided above applies, then the addition of a replacement unit should include the cost of removing the property retired.

The practice of allowing only current retirement costs to be charged to ratepayers is universally applied to all utilities in Pennsylvania. It is also used by utilities in Missouri, Kentucky and Georgia, including Georgia Power and Atlanta Gas Light Company.

Q. WHY HAVE YOU PROPOSED THE SFAS 143 PROCEDURE IN THIS CASE IF YOU BELIEVE THAT ULTIMATELY, THERE ARE BETTER METHODS FOR DEALING WITH RETIREMENT COSTS?

A. This Commission has approved the remaining life procedure, which develops depreciation rates based on the recovery of the remaining undepreciated plant over the remaining life of each account. Currently MDU has built up very large depreciation reserves not only as a result of having collected future retirement costs, but as a consequence of having used too short service lives in its past depreciation.

The immediate implementation of the practices that I am recommending as the ultimate resolution of the removal cost issue would result in extremely low depreciation rates, much lower than those I have proposed in this testimony. As it is, I have proposed to reduce MDU's gas distribution plant depreciation almost half. Further reductions resulting from a "flash cut" to these ultimate procedures might so reduce the internal cash generation within the Company as to impair its ability to replace plant and expand its system as demand requires.

Q. DOES THIS COMPLETE YOUR TESTIMONY?

A. Yes, it does.

Charles W. King

Attachment A

Experience

Snavely King Majoros O'Connor & Lee, Inc.
Washington, DC

President (1989 to Present)
Vice President (1970 - 1989)

Mr. King, a founder of the firm and acknowledged authority on regulatory economics, brings over thirty years of experience in economic consulting to his direction of the firm's work in transportation, utility and telecommunications economics.

Mr. King has appeared as an expert witness on over 300 separate occasions before more than thirty state and nine U.S. Canadian federal regulatory agencies, presenting testimony on rate base calculations, rate of return, rate design, costing methodology, depreciation market forecasting, and ratemaking principles. Mr. King has also testified before House and Senate Committees on energy and telecommunications legislation pending before the U.S. Congress.

In telecommunications, Mr. King has testified before the Federal Communications Commission on a number of policy issues, service authorization, competitive impacts, video dialtone, and prescription of interstate depreciation rates. Before state regulatory bodies, he has presented testimony in proceedings on intrastate rates, earnings and depreciation. Mr. King recently directed analyses of the prices of services under Federal Government's FTS2000 long distance system.

In addition to his appearances as a witness in judicial and administrative proceedings, Mr. King has negotiated settlements among private parties and between private parties and regulatory offices. Mr. King also has directed depreciation studies, investment cost benefit analyses, demand forecasts, cost allocation studies and antitrust damage calculations.

In Canada, Mr. King designed and directed an extended inquiry into the principles and procedures for regulating the telecommunication carriers subject to the jurisdiction of the Canadian Transport Commission. He also was the principal investigator in the Canadian Transport Commission's comprehensive review of rail costing procedures.

EBS Management Consultants, Inc., Washington, DC

Director, Economic Development Department (1968-1970)

Mr. King organized and directed a five-person staff of economists performing research, evaluation, and planning relating to economic development of depressed areas and communities within the U.S. Most of this work was on behalf of federal, state, and municipal agencies responsible for community or regional economic development.

Principal Consultant (1966-1968)

Mr. King conducted research on a broad range of economic topics, including transportation, regional economic development, communications, and physical distribution.

W.B. Saunders & Company, Inc., Washington, DC

Staff Economist (1962-1966)

For this economic consulting firm, which later merged with EBS Management Consultants, Inc., Mr. King engaged in numerous research efforts relating primarily to economic development and transportation.

U.S. Bureau of the Budget, Office of Statistical Standards

Analytical Statistician (1961-1962)

Mr. King was responsible for the review of all federal statistical and data-gathering programs relating to transportation.

Education

Washington & Lee University, B.A. in Economics

The George Washington University, M.A. in Government Economic Policy

Summary of Statement No. 143
Financial Accounting Standards Board

Summary of Statement No. 143

Accounting for Asset Retirement Obligations (Issued 6/01)

Summary

This Statement addresses financial accounting and reporting for obligations associated with the retirement of tangible long-lived assets and the associated asset retirement costs. This Statement applies to all entities. It applies to legal obligations associated with the retirement of long-lived assets that result from the acquisition, construction, development and (or) the normal operation of a long-lived asset, except for certain obligations of lessees. As used in this Statement, a legal obligation is an obligation that a party is required to settle as a result of an existing or enacted law, statute, ordinance, or written or oral contract or by legal construction of a contract under the doctrine of promissory estoppel. This Statement amends FASB Statement No. 19, *Financial Accounting and Reporting by Oil and Gas Producing Companies.*

Reasons for Issuing This Statement

The Board decided to address the accounting and reporting for asset retirement obligations because:

- Users of financial statements indicated that the diverse accounting practices that have developed for obligations associated with the retirement of tangible long-lived assets make it difficult to compare the financial position and results of operations of companies that have similar obligations but account for them differently.

- Obligations that meet the definition of a liability

were not being recognized when those liabilities were incurred or the recognized liability was not consistently measured or presented.

Differences between This Statement, Statement 19, and Existing Practice

This Statement requires that the fair value of a liability for an asset retirement obligation be recognized in the period in which it is incurred if a reasonable estimate of fair value can be made. The associated asset retirement costs are capitalized as part of the carrying amount of the long-lived asset. This Statement differs from Statement 19 and current practice in several significant respects.

- Under Statement 19 and most current practice, an amount for an asset retirement obligation was recognized using a cost-accumulation measurement approach. Under this Statement, the amount initially recognized is measured at fair value.

- Under Statement 19 and most current practice, amounts for retirement obligations were not discounted and therefore no accretion expense was recorded in subsequent periods. Under this Statement, the liability is discounted and accretion expense is recognized using the credit-adjusted risk-free interest rate in effect when the liability was initially recognized.

- Under Statement 19, dismantlement and restoration costs were taken into account in determining amortization and depreciation rates. Consequently, many entities recognized asset retirement obligations as a contra-asset. Under this Statement, those obligations are recognized as a liability. Also, under Statement 19 the obligation was recognized over the useful life of the related asset. Under this Statement, the obligation is recognized when the liability is incurred.

Some current practice views a retirement obligation as a contingent liability and applies FASB Statement No. 5, *Accounting for Contingencies,* in determining when to recognize a liability. The measurement objective in this Statement is fair value, which is not compatible with a Statement 5 approach. A fair value measurement accommodates uncertainty in the amount and timing of settlement of the liability, whereas under Statement 5 the

recognition decision is based on the level of uncertainty.

This Statement contains disclosure requirements that provide descriptions of asset retirement obligations and reconciliations of changes in the components of those obligations.

How the Changes in This Statement Improve Financial Reporting

Because all asset retirement obligations that fall within the scope of this Statement and their related asset retirement cost will be accounted for consistently, financial statements of different entities will be more comparable. Also,

- Retirement obligations will be recognized when they are incurred and displayed as liabilities. Thus, more information about future cash outflows, leverage, and liquidity will be provided. Also, an initial measurement at fair value will provide relevant information about the liability.

- Because the asset retirement cost is capitalized as part of the asset's carrying amount and subsequently allocated to expense over the asset's useful life, information about the gross investment in long-lived assets will be provided.

- Disclosure requirements contained in this Statement will provide more information about asset retirement obligations.

How the Statement Generally Changes Financial Statements

Because of diverse practice in current accounting for asset retirement obligations, various industries and entities will be affected differently. This Statement will likely have the following effects on current accounting practice:

- Total liabilities generally will increase because more retirement obligations will be recognized. For some entities, obligations will be recognized earlier, and they will be displayed as liabilities rather than as contra-assets. In certain cases, the amount of a recognized liability may be lower than that recognized in current practice because a fair value measurement entails discounting.

- The recognized cost of assets will increase because asset retirement costs will be added to the carrying amount of the long-lived asset. Assets also will increase because assets acquired with an existing retirement obligation will be displayed on a gross rather than on a net basis.

- The amount of expense (accretion expense plus depreciation expense) will be higher in the later years of an asset's life than in earlier years.

How the Conclusions in the Statement Relate to the Conceptual Framework

The Board concluded that all retirement obligations within the scope of this Statement that meet the definition of a liability in FASB Concepts Statement No. 6, *Elements of Financial Statements,* should be recognized as a liability when the recognition criteria in FASB Concepts Statement No. 5, *Recognition and Measurement in Financial Statements of Business Enterprises,* are met.

The Board also decided that the liability for an asset retirement obligation should be initially recognized at its estimated fair value as discussed in FASB Concepts Statement No. 7, *Using Cash Flow Information and Present Value in Accounting Measurements.*

Effective Date

This Statement is effective for financial statements issued for fiscal years beginning after June 15, 2002. Earlier application is encouraged.

(The following proceedings were had and made of record, Monday, October 7, 2002, commencing at 9:00 a.m.)

MR. HOBERG: Let's begin. Let the record show it's approximately 9:00 a.m. on October 7, 2002. This is the time and place scheduled in the Public Service Commission hearing room in the State capital in Bismarck, North Dakota, for the hearing in the matter of the application of Montana-Dakota Utilities for a natural gas rate increase.

In June of this year the Office of Administrative Hearings received a request from the Public Service Commission to provide an administrative law judge to preside in this matter. My name is Allen Hoberg, and I've been duly designated as the procedural hearing officer to preside today.

Let's start with the appearances of the parties for the record in this matter, beginning with the applicant, followed by the Commission staff. Will counsel please state their appearances? Mr. Pearce, please.

MR. PEARCE: Yes. Thank you. William P. Pearce of Pearce and Durick, in Bismarck, appearing on behalf of the applicant, Montana-Dakota Utilities

Company.

MR. HOBERG: And who do you have with you?

MR. PEARCE: With me to my left is Mr. Don Ball, manager of regulatory affairs for the company, and to his left is Mr. Douglas Schulz, who is an attorney with the company, also appearing for the company.

MR. HOBERG: Thank you. You have a number of witnesses today.

MR. PEARCE: Yes. We have nine witnesses altogether.

MR. HOBERG: Thank you, Mr. Pearce. Mr. Binek, please.

MR. BINEK: My name is William Binek. I'm counsel for the Public Service Commission. I'm representing the Commission advocacy staff in this proceeding. Seated to my right is Mr. Charles King, a Commission consultant, and to the right of Mr. King is Michael Majoros, another consultant. And at the end of the table is Patrick Fahn, a public utility analyst with the Public Service Commission.

MR. HOBERG: Thank you, Mr. Binek. Is there anyone else present today who may wish to give testimony, either for or against the application?

Anyone else present? No one else present.

Then, of course, to my left we have members of the Public Service Commission. To my immediate left, Commissioner Leo Reinbold, and then Commission President, Susan Wefald, and Commissioner Tony Clark.

And starting with Commissioner Reinbold, who has the natural gas portfolio, I'll ask for your opening comments, please.

COMMISSIONER REINBOLD: Thank you. Good morning, and welcome. It's good to see so much interest. It's an interesting case. We're here to determine what needs to be allowed and also what must be disallowed. That's our job. We're here to do that by being fair to all parties concerned and get done by Noon because everyone has a plane to catch. Welcome.

COMMISSIONER WEFALD: On Wednesday?

MR. HOBERG: Thank you, Commissioner Reinbold. Commissioner Wefald, please.

COMMISSIONER WEFALD: Good morning. We know that this case is very important, both to the company and to the consumers of North Dakota, and we're looking forward to getting a good record. Thank you.

MR. HOBERG: Thank you, Commissioner Wefald. Commissioner Clark, please.

COMMISSIONER CLARK: Good morning. I look forward to hearing the testimony. Thank you.

MR. HOBERG: Thank you. Just for the record, our court reporter is Linda Gingery today.

Just a very brief summary of the application. It's set out very well in the notice of hearing. On April 12th of this year MDU filed an application to increase its rates for natural gas service by an amount sufficient to provide increased total annual revenue of $2,844,132. And then the rest of the proposals are adequately set forth in the notice of hearing, and I won't go through the rest of those today.

But on June 5th of this year, the Public Service Commission issued a notice of hearing, notice of public input sessions and notice of intervention deadline. And the notice of hearing scheduled a hearing for today and, of course, that's why we're here.

It's my understanding there have been no petitions to intervene in this matter filed with the Commission. However, there were public input sessions held via interactive television on July

15th of this year at Noon, Central Daylight Time, and giving members of the public an opportunity to express their concerns. And those sessions were held at Bismarck State College, Dickinson State University, Minot State University, Lake Region State College, North Dakota State Hospital, and Williston State College.

The issues, according to the notice of hearing, to be considered in this matter include:

Number 1: What is the value of MDU's property, used and useful, for the service and convenience of the public of North Dakota?

Number 2: What is MDU's rate of return on this property, used and useful, for the service and convenience of the public of North Dakota?

Number 3: What is the just and reasonable rate of return on MDU's property, used and useful, for the service and convenience of the public in North Dakota?

Number 4: What rates and charges are necessary to provide a just and reasonable rate of return on MDU's property, used and useful, for the service and convenience of the public of North Dakota?

Number 5: Are MDU's rate schedules

designed in such a manner that they result in a basis of charge to its customers that is just and reasonable without discrimination?

Number 6: Any other relevant information or proposals concerning the proceeding.

The hearing procedure today will be as follows: I'll first call on the applicant to present its case for the granting of the application. And Mr. Pearce has stated that he has nine witnesses on behalf of the company today. Each witness called by the applicant will be subject to cross-examination by Commission staff and by the Commission. And following the direct examination then by Mr. Pearce, cross-examination by Commission staff and questions by the Commission, I'll allow such further questions of the witnesses as are necessary.

Upon completion of the applicant's case, I'll call on the Commission staff to present its case. And Mr. Binek has informed us that he has two witnesses. It will be the same procedure there; direct examination by Mr. Binek, cross-examination by Mr. Pearce, questions by the Commission staff, and then such further questions of the witnesses as are necessary.

I think probably most of the evidence that's being offered today has already been docketed. Probably some additional evidence, too. And that will be offered also, though, and the docket number indicated when it's offered. And we'll mark the exhibits consecutively, 1 through whatever, and also indicate the docket number for those that have already been docketed. If there are additional exhibits being offered, we need seven copies for the record today.

No decision will be reached on this matter today. The proceedings are being transcribed and tape-recorded and will be reviewed by the Commission later. And, thereafter, the Commission will issue findings of fact and conclusions of law and an order as to whether the application should be issued, denied, or as to other appropriate administrative action.

If the party doesn't agree with the final decision of the Public Service Commission, they may have appeal rights or other rights under North Dakota Century Code Chapter 28-32, which is known as The Administrative Agencies Practices Act, or under the Rules of Commission, North Dakota Administrative Code, Article 69-02.

The issues today are as I previously stated. The burden of proof is on the applicant to show by the preponderance of the evidence, also known as the greater weight of the evidence, that it is entitled to a grant of the application it seeks.

Any questions about the procedures today? Mr. Pearce?

MR. PEARCE: No, sir. Except to point out that we will have our rebuttal case basically to put on after the staff's case.

MR. HOBERG: Correct. Thank you. Yes, there will be a rebuttal case presented. Mr. Binek?

MR. BINEK: Nothing.

MR. HOBERG: Just one other housekeeping item. There was a trade secret protection application filed in this matter and an order issued, so I would appreciate it if counsel would keep me apprised of when something that needs trade secret protection is going to be dealt with and we can deal with it appropriately. All right.

Mr. Pearce, do you have an opening statement to make?

MR. PEARCE: Yes, I do. I've got a brief opening statement I'd like to read.

MR. HOBERG: Please proceed.

MR. PEARCE: This case is an application by Montana-Dakota Utilities Company seeking the Commission's approval of an increase in its residential and firm general service gas rates that would generate an additional $2,844,132 in operating revenues, which is about a 4.1 percent overall increase. This increase is required to enable the company to continue to provide safe and reliable service to its approximately 83,500 customers in the state.

As the company's testimony in the case will show, the need for the increased revenue is driven by the necessity of meeting increases in the operating expenses of its gas distribution facilities in North Dakota. The company also needs an adequate permitted rate of return on the company's property devoted to gas distribution operations for it to be able to attract sufficient capital and maintain the quality, reliability and safety of its gas distribution services.

The last general rate increase was authorized by the Commission in November 1994, and it was a decrease in the gas rates as a result of a settlement that took effect in January 1999. This proceeding, of course, does not address the cost of

gas itself which the company acquires for distribution in its system. That's simply a pass-through component of the rates handled by the automatic adjustment procedures.

The list of company witnesses and the areas covered by their testimony will be summarized in the opening testimony of Mr. Wayne Fox, the company president.

One of the major components in the operating expense of the company is the depreciation expense allowance and that is a major factor in this case. The staff has done a curious thing not seen in the normal rate case proceeding. They have taken the depreciation study used in current rates and critiqued a very small portion of it, with the outcome being lower depreciation charges. This is not appropriate to base depreciation on a piecemeal critique of that study. We feel -- the company's position, as will be described by its witnesses, is it's premature at this point to make adjustments to the present depreciation rates which are based on a thorough depreciation study done by Stone & Webster in 1991. And they have been previously recognized by the Commission and applied in the previous rate case. The staff has not prepared a proper

depreciation study and no adjustment of the depreciation rates should be entertained by the Commission in this proceeding.

In addition, the question of the applicability of what's called FAS 143; that is, Financial Accounting Standard 143, will arise in the testimony that's already been filed in this case. This is a new financial accounting standard applicable to North Dakota's public utilities at the end of the year. FAS 143 will require companies to charge -- sorry -- to change the method of accounting for the expected retirement costs of an asset over the asset's useful life. FAS 143 is a very new and untested procedure at this point and the industry is currently engaged in a great deal of analysis and debate as to how and in what manner it should be implemented.

The implementation of 143 in North Dakota is not a matter which should be or reasonably can be addressed as an ancillary matter in a rate case involving a single utility company like Montana-Dakota operating in North Dakota. FAS 143 is a much broader matter than the specific issues in a single company rate case and many decisions need to be made before it can be effectively implemented.

We feel this complex question can only be properly addressed in a generic rulemaking proceeding by this Commission, in which all the utilities operating in North Dakota may participate and present their views on the question. For this reason, our position is that the Commission should not address FAS 143 in this case, but should defer that issue to its proper place in a separate rulemaking proceeding that would involve all the other utilities in which questions relative to the implementation can be addressed in an appropriate setting.

With that background, MDU makes -- moves the Commission to defer any action on FAS 143 in this proceeding and set the matter, that accounting standard for a generic rulemaking proceeding at some appropriate point in the future.

With regard to the design of the proposed rates, the company has proposed changes to accomplish the objectives of providing a measure of stability during periods of admirable weather; being user-understandable for consumers, being simple to administer, and providing for enhanced fixed cost recovery.

We have also included an alternative proposal in the event the Commission finds the

primary proposal unacceptable. The company urges the Commission to accept the primary proposal as it provides the best fit with the objectives. However, should the Commission not adopt the primary proposal, the company urges the Commission to adopt the alternative proposal that will be discussed in the testimony.

MR. HOBERG: Thank you, Mr. Pearce.

Mr. Binek, do you have any opening to make, perhaps in response to the motion to defer in regard to FAS 143?

MR. BINEK: I'd like to make a couple comments.

First of all, I think it's appropriate to consider FAS 143 and its implications to MDU. Secondly, with regard to depreciation, depreciation is a major issue in this case. MDU would like to have the Commission defer any consideration on depreciation until it completes a depreciation study that I understand is presently in progress. The staff's position on that has been and continues to be that if a part of the case, and a very important part of the case, is not -- or should not be considered at this point, none of the case should be considered at this point.

There are other important issues in this case as well, such as the rate of return that the company should be allowed. We are far apart in our recommendations on that. The company is asking the Commission to allow a return on equity that is in excess of anything that we have seen, either in North Dakota or around the country for that matter. On the other hand, the recommendations of the Commission's consultants are in line with what is occurring not only in North Dakota, but across the country as well.

MDU's application is a bit curious because MDU's gas earnings have been very stable and are very reasonable at the present time. And it doesn't appear that MDU is in any need of any increase, but that will be determined by the Commission in this proceeding.

I think that's all I have.

MR. HOBERG: Thank you, Mr. Binek.

Mr. Pearce, I understand your motion to defer is a formal motion?

MR. PEARCE: Yes.

MR. HOBERG: And I would advise the Commission to take that under advisement and I don't know if a ruling on that is necessary right now, but

something to take under advisement as part of this proceeding. You don't expect a ruling?

MR. PEARCE: No, that's what we anticipated.

MR. HOBERG: All right. Thank you both.

Would you like to call your first witness, please, Mr. Pearce?

MR. PEARCE: Thank you. I think I'm going to ask, just for convenience, the application and supporting statements are already filed, but in case they need to be referred to, I'd like to mark those as Exhibits 1 and 2, the two books.

MR. BINEK: Your Honor, the direct testimony is not shown as separate docket entries so perhaps they be should be identified separately as exhibits.

MR. HOBERG: That's what we're going to do, but the application, I believe, is marked as Exhibit 1-Docket 3.

MR. PEARCE: Right.

MR. HOBERG: And what was the other document?

MR. PEARCE: Statements A through O. And that's going to be Exhibit 2 and it's also Docket 2.

MR. HOBERG: Is that all the direct?

MR. PEARCE: That's simply the application and statements. The direct will be, I believe, Exhibits 3, 4, 5, 6, 7, 8, 9, and 10. And it's the seven direct -- prefiled direct testimony. It's all in one, single book there, but I think that will have the next seven exhibit numbers.

MR. HOBERG: Let's go off the record.

(Exhibits 1, 2, 3, 4, 5, 6, 7, 8, and 9 were marked for identification.)

(Discussion off the record.)

MR. HOBERG: Okay. The packet that we have of all of the direct testimony of Montana-Dakota Utilities is marked on the outside as Docket No. 1, and the inside of each of the -- direct testimony of each of the witnesses will be marked consecutively as 3 through 9, and that's how we'll be referring to them during the presentations then.

Mr. Fox is the first witness?

MR. PEARCE: Yes, he is.

MR. HOBERG: Mr. Fox, please.

Please be seated. As you know, I'm required by law to tell all the witnesses at administrative proceedings that the maximum penalty for perjury in this state is a Class C felony, punishable by a maximum five years imprisonment,

$5,000 fine, or both.

Mr. Fox, being advised of the penalty for perjury, do you promise to tell the truth in this matter? If so, answer I do.

THE WITNESS: I do.

MR. HOBERG: Thank you. Mr. Pearce, please.

C. WAYNE FOX,

having been first duly sworn, was examined and testified as follows:

DIRECT EXAMINATION

BY MR. PEARCE:

Q. Would you please state your name and your business address?

A. My name is C. Wayne Fox. My business address is 400 North Fourth Street, Bismarck, North Dakota 58501.

Q. What is your position with Montana-Dakota Utilities Company?

A. I am president of Montana-Dakota Utilities, a division of MDU Resources Group, Incorporated.

Q. What are your duties and responsibilities with Montana-Dakota?

A. I have executive responsibility for the development, coordination and implementation of the

strategies and policies relative to all areas of operation.

Q. Would you please outline your educational and professional background?

A. In 1964 I received a Bachelor of Science degree in electrical engineering from Chicago Technical College, Chicago, Illinois. I received a Master of Arts degree in business administration from the University of Illinois, Springfield, Illinois in 1975. Upon graduating from college in 1974, I joined the Illinois Commerce Commission, the state body regulating public utilities in Illinois, as an electrical engineer.

Upon termination of my employment with the Illinois Commerce Commission in June 1980, I was serving as manager of the public utilities division. In that capacity my duties included testifying in formal cases before the Commission, formulating and coordinating Commission policies on technical and administrative matters, processing formal and informal cases, and advising the Commission on matters related to the regulation of public utilities operating in the State of Illinois.

In June 1980 I joined Montana-Dakota as assistant treasurer, regulatory affairs, retaining

that position until May 1982 when I was elected assistant vice-president, regulatory affairs. In May 1985 I was promoted to vice-president, regulatory affairs. In May 1987 my duties were broadened to include the company's purchasing and general services activities. At that time my title was changed to vice-president, regulatory affairs and general services. I assumed my present position in August 2000.

I also have been involved with the activities of the Electric Power Research Institute, the Edison Electric Institute, and the American Gas Association.

Q. Have you testified before this Commission and other state regulatory bodies?

A. Yes. I have previously sponsored testimony before this Commission, the Montana Public Service Commission, the Wyoming Public Service Commission, Minnesota Public Utilities Commission, and South Dakota Public Utilities Commission. In addition, during my tenure with the Illinois Commerce Commission, I testified in a number of cases before that Commission.

Q. What is the purpose of your testimony?

A. The purpose of my testimony is to provide

an overview of our North Dakota natural gas operations, explain our request for a gas rate increase, and discuss the policies and reasons underlying the major aspects of the request. I will also identify the company witnesses in this proceeding.

Q. Would you provide a summary of Montana-Dakota's gas operations in North Dakota?

A. The North Dakota natural gas distribution system serves approximately 83,500 customers in 76 communities. The customer mix is about 86.5 percent residential, 13.3 percent firm commercial, with the small interruptible and large interruptible customers making up two-tenths percent of customers. In addition, gas is provided to the U.S. Air Force Base at Minot and a location in northeastern North Dakota. The residential, firm commercial, and small interruptible customers use natural gas primarily for space and water heating.

As such, Montana-Dakota's system has a low load factor with peak gas requirements occurring during the winter, with summer loads being small by comparison. The total annual gas used by North Dakota customers is 18.3 megadecatherms as projected for 2003 in this case. Consumption by customer

class is as follows: 43 percent residential, 31 percent firm commercial, 8 percent small interruptible, 12 percent large interruptible, and 6 percent U.S. Air Force.

Montana-Dakota's North Dakota gas service area is divided into two operating regions, with regional offices located in Bismarck and Dickinson. In addition, there are a number of district offices located in communities throughout the state. As of December 31, 2001 the company had 587 full and part-time employees who live and work throughout our North Dakota electric and gas service area.

Q. Mr. Fox, did you authorize the filing of the rate application in this proceeding?

A. Yes, I did.

Q. Why has Montana-Dakota filed this application for a gas rate increase?

A. Montana-Dakota is requesting an increase in general gas rates at this time because the current cost of providing natural gas service to our North Dakota customers is not adequately reflected in the -- excuse me -- is not accurately -- adequately reflected in currently authorized rates. It should be noted that this application does not include any cost changes related to the cost of gas which is

handled through the Commission authorized Purchased Gas Cost Adjustment tariff.

Q. Would you please explain the basic elements that make up the total costs of providing gas service and which of these elements is subject to regulation by this Commission?

A. Yes. The cost of providing natural gas service can be best broken down into two major categories. First, the cost of the gas delivered to the town border station where it leaves the interstate or intrastate pipeline and enters our distribution system. And, second, the cost of delivering the gas from the town border station through our distribution system to the individual customers. We call this portion distribution costs or non-gas costs.

Natural gas purchased from a producer or supplier is a commodity like wheat or corn and prices are not regulated. The charges for moving the gas to our distribution system on the pipeline system are regulated by the Federal Energy Regulatory Commission or other regulatory agencies. These two elements which we call, quote, unquote, gas costs, are passed on to our customers on a dollar-for-dollar basis as specified in the

Purchased Gas Cost Adjustment Tariff, and there is no profit made by Montana-Dakota. This portion currently comprises about 66 percent of a typical residential bill for gas services.

The distribution cost of our rate is regulated by this Commission and is the subject of this proceeding. This portion includes operation and maintenance expenses, depreciation, taxes, and a component for the opportunity to earn a return on the investment we have in facilities to provide natural gas service. The distribution costs are currently about 34 percent of a typical residential bill. The last time this portion of the rates increased was in 1994.

Q. What is the amount of the increase requested?

A. As will be fully explained by other company witnesses, the company is requesting an increase of $2,844,132 based on a projected 2003 test year.

Q. How will the requested increase affect the various classes of customers?

A. The proposed percentage change in rates by customer class is as follows: Residential, 4.6 percent change; firm general service, 4.6 percent; Air Force, zero; small interruptible, a negative 4.1

percent; large interruptible, zero, for a total increase of 4.1 percent.

Q. What are the primary reasons that Montana-Dakota needs an increase at this time?

A. The primary reasons are increased operating expenses, operation and maintenance costs, depreciation and taxes other than income and a higher required return on equity.

Q. When was the last general rate increase for Montana-Dakota?

A. Montana-Dakota's last gas -- I'm sorry. Montana-Dakota's gas rates were last increased in November 1994. The increase was $565,000 annually and was authorized in case No. PU-399-94-297.

Q. Have the gas generates changed since that time?

A. Yes. In case number PU-399-96-325 the gas generates were decreased by $800,000 or about 1.2 percent as a result of a settlement accepted by the Commission with a lower rate becoming effective January 15, 1999.

Q. Would you please explain how Montana-Dakota has been able to hold the gas rates down since 1994?

A. From 1994 through 2001 the Consumer Price Index has risen almost 20 percent. In spite of this

increase, we have been able to hold the line on our gas rates by finding ways of operating our business more efficiently and taking advantage of new technology where it makes economic sense to do so. For example, we have created a customer service center in Bismarck representing a one-stop shop for our customers. And we have installed computers in our servicemen's trucks allowing them to receive orders electronically, resulting in savings of at least one hour per day. We continue to look for opportunities to reduce costs and increase efficiencies. However, we now find ourselves in a position where despite our efforts, our best efforts, we must seek rate relief.

Q. What policy changes are proposed by the company in this filing?

A. We are proposing a change in policy regarding service lines. Montana-Dakota is proposing to own all service lines on a prospective basis. Currently, Montana-Dakota owns the service lines in the communities designated as rate zone 2 in its tariff. The customers currently own the services lines in the communities designated as rate zone 1. We are proposing that Montana-Dakota own and pay for, subject to appropriate extension policy

considerations or conditions, all new and replacement service lines on a prospective basis. This change will remove the distinction between rate zones 1 and 2 and will serve as a uniform policy on a statewide basis for all of our service areas. It will also align the ownership of the service line with the responsibility for ongoing testing and maintenance of the lines, which rests with Montana-Dakota and will avoid customer confusion and frustration in those instances when a replacement is necessary.

Q. Is Montana-Dakota proposing changes in its rate structure in this proceeding?

A. Yes. The proposed changes in the rate structure, which will be fully described by other witnesses, accomplish the objectives of providing a measure of stability for our customers, being simple to administer, and providing for enhanced fixed cost recovery.

I should note that our witnesses also present an alternative proposal in the event that the Commission finds the primary proposal to be unacceptable. The alternative proposal is fully described in the testimony of other witnesses. I would urge the Commission to accept the primary

proposal, as it provides the best fit with the objectives noted above.

Q. Will you please identify the other witnesses who will testify on behalf of Montana-Dakota in this proceeding?

A. Yes, I will. I should note at line 22, Mr. Pearce, that there's a correction. We should strike the word "electric" appearing in the last line thereof and substitute the words "natural gas." I will finish my answer.

In addition to myself --

MR. HOBERG: Mr. Fox, I'm sorry to interrupt you, but just for the court reporter's benefit, all the names, of course, are listed in the prefiled testimony. Please continue.

THE WITNESS: Stephen Gaske, President of Zinder Companies, Incorporated, will testify regarding the appropriate cost to common equity and overall cost of capital for Montana-Dakota's natural gas operations. Mr. Craig A. Keller, vice-president, controller and chief accounting officer for Montana-Dakota, will testify regarding the capital structure and overall debt and preferred equity costs. Ms. Rita A. Mulkern, regulatory analysis manager for Montana-Dakota, will testify

regarding the total revenue requirements necessary for Montana-Dakota's North Dakota gas operations.

Mr. Richard A. Espeland, vice-president, human resources for MDU Resources Group, Incorporated, will testify regarding the supplemental income security plan. Mr. Russell A. Feingold, managing director of Navigant Consulting, Inc., will testify regarding certain rate design policy matters. And Ms. Tamie A. Aberle, pricing and tariff manager for Montana-Dakota, will testify on the specific rate design proposals.

Q. (MR. PEARCE CONTINUING) Mr. Fox, are the rates requested in this proceeding just and reasonable?

A. Yes. In my opinion, the proposed rates are just and reasonable because they are reflective of the total cost being incurred by Montana-Dakota in providing gas service to its customers. The proposed rates will allow Montana-Dakota the opportunity to earn a just and reasonable return on its North Dakota gas operations.

Q. Does this complete your direct testimony?

A. Yes, it does.

Q. And to the best of your information and belief, does the testimony you have just given

coincide with the prefiled direct testimony that's marked as Exhibit A?

A. It does.

Q. Did you prepare that testimony originally?

A. I did.

MR. PEARCE: I'll offer Exhibit A at this time -- Exhibit 3. I have no further questions of this witness.

MR. HOBERG: Any objection to Exhibit 3, Mr. Binek?

MR. BINEK: No.

MR. HOBERG: Exhibit 3 is admitted.

Mr. Binek, do you have any questions on cross-examination?

MR. BINEK: Yes, I do.

CROSS-EXAMINATION

BY MR. BINEK:

Q. Good morning, Mr. Fox.

A. Morning.

Q. Does MDU calculate its earned return each year for its North Dakota gas operation?

A. We do.

Q. What was the company's earned return on its gas operations during each of the years 1998, 1999, 2000, 2001?

A. I don't know right offhand. I can certainly provide that to you. We've filed an annual report with the Commission each and every year. I do know for 2003 without this rate increase, we would be a negative 4 percent.

(Exhibit 10 was marked for identification.)

Q. (MR. BINEK CONTINUING) Mr. Fox, I show you what has been marked as Exhibit 10 and ask if you can identify that exhibit? First of all, I guess I should ask if you've seen that previously?

A. I have not.

Q. Okay. Do you recognize that as an exhibit that has been docketed in an MDU case by the Public Service Commission?

A. I do not.

MR. HOBERG: Mr. Pearce, did you get a copy?

MR. PEARCE: No, I didn't. I'm wondering what it is.

Q. (MR. BINEK CONTINUING) Can you identify what the exhibit is, please?

A. It's a memorandum, internal memorandum, I believe, written by Mike Diller of the Commission staff, and it's written to Commissioners, Illona and Bill. And --

Q. What is the date of that document?
A. September 3rd, 2002.
Q. Okay. And what does it refer to?
A. It refers to 2001 annual reports.
Q. And in that document there are a number of companies listed, including MDU Gas, and it shows returns on equity earned by utilities for the four years that I had asked you about; is that correct?
A. It does.
Q. Do you have any reason to doubt the figures that are shown in that exhibit?
A. I do not.
Q. And would you accept the figures shown on that exhibit subject to check, subject to your own verification?
A. I would.
Q. What is the ROE shown for the year 1998 for MDU?
MR. HOBERG: I think we better have it offered and admitted before we testify.
MR. BINEK: I'm sorry. I will offer Exhibit 10.
MR. HOBERG: Any objection to Exhibit 10, Mr. Pearce?
MR. PEARCE: I guess I'm tempted to object

for lack of foundation since the witness who prepared it is not being offered, but given that Mr. Fox has indicated he would accept the numbers subject to verification, I don't have any objection.

MR. HOBERG: Okay. Exhibit 10 is admitted. Mr. Binek, please.

MR. BINEK: Thank you.

Q. (MR. BINEK CONTINUING) Now, Mr. Fox, would you -- for the year 1998 what is the ROE shown for MDU gas?

A. 14.55.

Q. And 1999?

A. 10.25.

Q. 2000?

A. 11.92.

Q. And 2001?

A. 11.90.

Q. And what is the four-year average?

A. 12.16.

Q. Okay. And it's your position that -- is it your position that an 11.9 return on equity is inadequate?

A. Dr. Gaske in this case has pointed out that because of the risk associated with our gas business, we should be earning considerably higher

than 11.9.

Q. So the earnings that you had in 2001, 11.9 were inadequate; is that your testimony?

A. That's correct.

Q. And the four-year average of 12.16 is adequate; is that also your testimony?

A. Let me explain that. It's inadequate based upon Dr. Gaske's testimony in this case, but keep in mind, that we are dealing with 2002 and 2003 is just right around the corner and we know based upon our rates-of-return analysis that we will be earning a negative rate of return for 2003 without the proposed rate increase. In fact, in 2002 we will be at zero. So we've had a drastic change in the last two years.

Q. Will the 2002 return be influenced by the very mild winter we had last year?

A. This is normalized.

Q. Okay. And what is your predicted return for 2002 under normalized weather conditions?

A. I believe it's zero. We have witnesses here which can attest to that and subject to check. It's considerably lower than what you find here for 2001.

Q. Is it true that you are predicting a

significant decline in your earned return between now and the end of 2003?

A. I am.

Q. Okay. On page 6 of your testimony you mentioned that the last gas rate increase was in 1994, and that that was a relatively small increase, $565,000. What did that amount to in percentage terms?

A. I don't recall.

Q. Okay. In 1999 you had a rate reduction of 800,000. Do you know what the percentage reduction was then?

A. In my testimony I say about 1.2 percent.

Q. Okay.

MR. HOBERG: Mr. Binek, can you bring your microphone over closer? It's on, isn't it?

MR. BINEK: Yeah.

Q. (MR. BINEK CONTINUING) Earlier this year the Commission reduced your electric rates; isn't that correct?

A. It did.

Q. What is it about the gas business that causes it to require an increase when the electric side of your operations justify a rate decrease?

A. Well, they're really two different

businesses. Dr. Gaske, I think in his testimony laid out very well the reasons. You know, we're a small gas utility --

MR. HOBERG: I'm sorry. Mr. Fox, can you bring your microphone a little closer, too? They are having a little trouble hearing both you and Mr. Binek in the back.

MR. BINEK: We're both soft-spoken.

THE WITNESS: Can you now hear me better?

MR. HOBERG: Yes. We can hear you upfront. It's just having trouble back --

THE WITNESS: I'll try to do better. We also have competition for alternate fuels. And, thirdly, we have a rate design that's in effect right now that doesn't allow us to fully recover our fixed cost of operations. And so Dr. Gaske does a good job of looking at that and I happen to agree with what he said. He said, I think, in his testimony that because of the smallness, which means that, you know, small change in one of our expense items or whatever creates a big difference in whether we are able to earn a return or not, an adequate rate or return on our business. And he said that's worth 100 basis point in and of itself simply because we're that small.

Q. (MR. BINEK CONTINUING) You mentioned competition from alternate fuels. What competition do you face from alternate fuels?

A. Propane, coal, and --

Q. How --

A. Excuse me. Gas bypass.

Q. How much competition do you face from coal?

A. Well, I have a neighbor -- I'll be happy to supply some of that, but we do have some competition. In fact, I've got a residential customer in my neighborhood that uses coal.

Q. It's very, very minimal, isn't it?

A. It is from a residential standpoint, but keep in mind that folks like the larger customers, such as out here at the Tesoro -- did I say that correctly? Amoco --

COMMISSIONER WEFALD: Tesoro.

THE WITNESS: Tesoro is, in fact, looking at that very option, whether to burn coal or continue with gas, and we, in fact, have lost a portion of that gas load now to gas bypass.

Q. (MR. BINEK CONTINUING) Propane, aren't you, in fact, putting in -- extending your natural gas delivery systems in the Bismarck area out into areas previously served by propane?

A. We are, but we're not picking up, you know, 100 percent or even 90 percent of that.

Q. But you are picking up a good majority of the customers out there that were previously on propane, aren't you?

A. We're primarily picking up those customers who have yet not committed, picking up the new customers. We're hoping for a conversion rate around 60 percent on propane out there. Certainly not the 100 percent. So how pervasive it is, it's there and continues to be there.

Q. Okay. So you had 100 percent of the customers out there using propane prior to extending your lines, now you're going to -- you're hoping to acquire 60 percent of those people presently using propane, is that --

A. Or said another way, Mr. Binek, we will lose 40 percent of that load out there or not be able to --

Q. Well, you're going to gain load out there that is presently served by propane, right?

A. That's correct.

Q. Okay.

A. My statement is also correct, too.

MR. HOBERG: Mr. Binek, your question -- I

don't know that we sufficiently defined what "out there" means.

Q. (MR. BINEK CONTINUING) I'm thinking specifically about areas north of Bismarck where lines are being -- distribution lines are being extended by MDU gas.

A. For the record I would clarify. We do have a new project. We call it the northeast Bismarck project, where we are spending monies to provide gas service to customers in that area, that hopefully will have some growth, plus pick up some of the ones that are now using propane.

Q. Thank you.

MR. HOBERG: Thank you.

Q. (MR. BINEK CONTINUING) And the other competitive fuel is oil?

A. Could be. For the larger customers you have coal, oil, bypass, primarily.

Q. Okay. The bypass would be served by the Williston Basin Interstate Pipeline?

A. That's one bypass that I'm thinking about. They actually went to Williston Basin.

Q. Okay. And that's an MDU Resources company?

A. It is, but it's money out of my pocket.

Q. Sure. I understand that. Has inflation

accelerated since 1994?

A. Yes, it has.

Q. Do you have any basis for assuming that inflation will accelerate between now and the end of 2003?

A. When you say accelerate, I'm not sure. We know we have inflationary pressures of probably three, three and a half percent per year.

Q. Will it get worse?

A. I have no idea.

Q. On page 7 of your testimony you state that you have so far avoided a rate increase by operating your business more efficiently and taking advantage of new technology. Have you suddenly lost the ability to operate more efficiently?

A. If I may, I'll go back in history a little bit. In 1994 we had our last rate increase application in here. Since that time, our employees -- we've had a decrease in our employees of over 30 percent. And that hasn't come about by huge layoffs. That came about by attrition and finding more efficient ways of doing things. Another statistic that I like to think about is -- let me check my notes here, if I can find it real fast -- is that in 1994 one employee -- I'm sorry --

248 customers was being served by one employee. In 2001 one employee was serving 370 customers. Just means that we've tried to find better ways of doing that.

And we continue to look for that, but I don't foresee us continuing that type of rapid growth in trying to achieve efficiencies that would mark that rate of serving more customers with less employees. In fact, we've kind of flattened in the last year or two. I think there is just so much that you can do. Although, I can tell you we have our employees out there looking for it. And that's where most of our ideas come from, is from our employees. And we have several programs that are geared to do that, to reward and provide some incentive for coming forth with ideas, and most of them are just recognition-type things.

Q. Have you exhausted all possible new technologies that might help you cut costs?

A. Again, probably not, but keep in mind, Mr. Binek, if I may -- can you still hear me all right?

MR. HOBERG: Yes.

THE WITNESS: -- is that we -- and, here again, to give you an example, we are small. And,

again, to give you an example of what that smallness can do for you, we had hoped to automate our meter reading across our entire service area, including that of North Dakota, but we find out with the sparseness of our operation and given that we serve very few so-called large towns, Bismarck, Billings, Montana being the largest ones, Rapid City, we certainly -- we could not commit the monies that would have been necessary to do that. So we went halfway. We decided to upgrade our semiautomatic ICON meter reading system to, again, accord new technology, but certainly not to the point where we would have liked to.

So it's looking, but it's -- you know, you look at all across that business venture, I don't see anything on the horizon other than what we've done today, such as the customer service center, automating and consolidating our meter reading. We do joint trenching. You know, we just keep looking under every little piece of dirt, so to speak, to try to figure out ways of doing it. But when you say "all," no, I wouldn't say all, but certainly we have come a long ways in the last five, six years.

Q. (MR. BINEK CONTINUING) As far as numbers of customers, have you been gaining in customer

count?

A. Not particularly.

Q. You have had some gains?

A. We have had some gains, but nothing materially. We grow about 1 percent or less per year in the gas business. Unless we take on a new project like northeast Bismarck, there isn't a lot of growth other than that.

Q. Could you explain what joint trenching is?

A. That means we get together with telecommunication companies, other utilities, anybody that's putting a hole in the ground and trenching it for a ways, we'd like to drop our underground facilities in there as well and that's worked out very well for us.

Q. So you're doing that right now?

A. We are doing that now.

Q. Are you doing that in northeast Bismarck as well?

A. We are wherever the opportunity comes along, especially with the telecommunications people, but that's slowed down, too.

Q. On page 7 of your testimony you propose a policy change with regard to the ownership of customer services. Does that policy change

influence your need for more revenue and, if so, how?

A. It does. We think we'll spend about -- other witnesses have it. It's about $500,000 a year, and that's included in this case.

Q. On page 8 you mention rate structure changes. Do those rate structure changes influence your need for more revenue and, if so, how?

A. It does not.

MR. BINEK: I have no further questions.

MR. HOBERG: Thank you, Mr. Binek.

Commissioner Reinbold, do you have any questions of Mr. Fox?

COMMISSIONER REINBOLD: A couple. Thank you.

EXAMINATION

BY COMMISSIONER REINBOLD:

Q. First of all, I want to get back to the residential customers burning coal in the City of Bismarck. Do you have any idea the numbers you're talking about, the number of households that are taking advantage --

A. It would be very small for the residential. I happened to use that. I kind of bristle at that every time I go by that person's home. That's the

reason I brought it up. But the coal, the competitive feature of that would be in the large customer list. And the reason for that, if the cost of gas goes up -- and primarily we're talking about the cost of gas that we don't control. We're talking about the wholesale. But if that would go up materially, then those folks start looking at different alternatives. The distribution portion of it doesn't have much influence on this.

Q. The reason I wanted to bring it up again is because it surprised me. I didn't know that happened.

MDU, you have gas operations in other states other than North Dakota. You have Montana?

A. Montana, South Dakota, and Wyoming.

Q. And are they in a similar calendar mode of applying for a rate increase, or don't you know?

A. Yes. In every state we are filing for a rate increase, either have or will. We filed in the State of Montana. We've already received an interim rate increase there. And we expect the process in Wyoming to go rather fast. The idea in most cases, and the other witnesses here will have a better feel for that, but we are hopeful of putting increases on the distribution site, increased rates in effect for

this heating season.

Q. You mentioned your customer service center and we've heard presentations on that. It's fascinating what you're doing. Can you elaborate a bit on what the customer service center does if somebody calls in?

A. Yes. Yes, I can. Am I close enough to this? A few years ago we decided to centralize what we call our customer service point. Historically, we would have a person located in each of our major areas talking to our customers, answering their inquiries, their questions. And we thought that we could consolidate that and still give personalized service to each customer by doing a couple things. One is when they call in, they would get a real person that would be able to meet their needs. And, secondly, through increased training, 8 to 10 weeks of training for each of these people, we thought that they would be able to handle particular questions, inquiries. In fact, they actually dispatch calls to our servicemen, that type of thing, in addition to that.

So we thought we could do that with a decreasing -- without decreasing our request time for service, decrease our customer acceptability. In

fact, I think it's enhanced our customer acceptability since we started that. There are a lot of things that have been very favorable about that and, plus, we've been able to save a considerable amount of money on an annual basis as a result of that.

Q. Better service and save money at the same time?

A. That's correct.

Q. You say when I call in or somebody calls in, you talk to a real person?

A. They do. I say that versus calling, as we sometimes do, call for help and we find that we have to punch one or two or three or four a couple of times in order to get someone to answer our questions and sometimes we never get someone to answer our questions. So we don't do things that way.

Q. Is there any way that you can take your experiences of talking with a real person and teach this to the telephone industry in the state?

A. Well, I didn't mention them by name, but you're right on track.

Q. I could. That's enough insults for now. Next.

MR. HOBERG: Thank you, Commissioner Reinbold. Commissioner Wefald, please.

EXAMINATION

BY COMMISSIONER WEFALD:

Q. You mentioned Tesoro Company. What impact does this one company have on the income of Montana-Dakota Utilities?

A. Well, we have a witness that would have it. Ms. Mulkern has that in her cost of service.

Q. Then I'll just wait and ask Ms. Mulkern. That's fine. And then each one percent -- we received this memo --

MR. HOBERG: Exhibit 10.

Q. (COMMISSIONER WEFALD CONTINUING) Exhibit 10 from staff. And it shows that 2001 11.9 percent rate of return. In your testimony you have said that you anticipate a rate of return of zero in 2002; is that correct?

A. 2003. No, 2002. 2003 would be negative.

Q. So can you share with me the difference in income or the difference in expenses that would relate to a drop from 11.9 percent to zero?

A. I can, but I think what would be best, Commissioner, if you can wait for Ms. Mulkern to come. She has all the full facts in front of her.

Q. Okay. And then in your expansion into north Bismarck, how are costs recovered for that expansion, and are they included in your cost for 2002 when you anticipate a rate of return to be zero?

A. Northeast Bismarck is included in this rate case.

Q. And what are the --

A. That's a 2003 test year.

Q. And that's a 2003 test year?

A. Mm-hmm.

Q. So what are the costs for that expansion, and how are they recovered?

A. Let's see, how are they recovered? They are included in this rate case so it would be recovered through the rates of all the folks, ratepayers in the State of North Dakota.

Q. Do you have an expansion tariff in place so that the customers in those areas pay the bulk of the expansion, or are the bulk of the expansion costs paid by all the ratepayers of the State of North Dakota?

A. There's a policy in place for that and, again, if I may, Ms. Aberle or Ms. Mulkern could answer specific questions on that.

COMMISSIONER WEFALD: Thank you. That's all my questions.

MR. HOBERG: Thank you, Commissioner Wefald. Commissioner Clark, please.

EXAMINATION

BY COMMISSIONER CLARK:

Q. Just one question. Do you have any other major expansion plans outside of northeast Bismarck in your service territory area?

A. In North Dakota, Commissioner?

Q. Right.

A. That's the only one I can think of right now. Like I said, the gas business is very slowly growing. It's less than 1 percent per year.

Q. Okay. And that would include both residential and industrial, you don't have any industrial-type expansion projects on the horizon, at least that would be included in this test year?

A. Nothing that -- nothing that we haven't had in the past.

COMMISSIONER CLARK: Okay. That's all I have. Thank you.

MR. HOBERG: Thank you, Commissioner Clark. Commissioner Reinbold, you have another question?

FURTHER EXAMINATION

BY COMMISSIONER REINBOLD:

Q. One other question. Do you serve the University of Mary with natural gas?

A. Yes.

COMMISSIONER REINBOLD: You do. Thank you.

MR. HOBERG: Thank you, Commissioner Reinbold. Mr. Pearce, anything on redirect?

MR. PEARCE: No. I have no questions.

MR. HOBERG: Thank you. Mr. Binek, anything further?

MR. BINEK: No.

MR. HOBERG: Thank you, Mr. Fox.

Let's take about a -- let's be back at 10 after 10:00, about a nine-minute recess. We'll start at 10 after 10:00.

(A recess was taken.)

MR. HOBERG: We're back on the record after a short recess. And I apologize. I neglected to ask for an appearance by Commission advisory staff, and at this time I will ask Ms. Jeffcoat-Sacco to make an appearance for Commission advisory staff.

MS. JEFFCOAT-SACCO: Commission advisory staff in this case is myself, Mike Diller, and Jerry Lein. And for purposes of this case, if there are

some questions of advisory staff during the hearing, I'd request that Mike be able to ask those, if that's acceptable.

MR. HOBERG: Any objection, Mr. Pearce?

MR. PEARCE: No, that's no problem.

MR. BINEK: No.

MR. HOBERG: Did you have any questions of the first witness?

MR. DILLER: I can ask the question I had of one of the other witnesses.

MR. HOBERG: Okay. Thank you, Ms. Jeffcoat-Sacco and Mr. Diller. You may not be asking questions, as I understand, of every witness, but you'll indicate to me if you have a question?

MR. DILLER: That's right.

MR. HOBERG: Okay. Thank you. Your next witness, please, Mr. Pearce.

MR. PEARCE: Thank you. Before I call the witness, I think there's one matter I'd like to clarify. I'm not quite sure what's the best way to do it. It turns out apparently there's a significant error in Exhibit 10. The 2001 MDU gas return does not correspond to the return that was actually filed with the Commission in the annual report. Apparently, it was mistranscribed when this

exhibit was made up, so I'm not quite sure what's the best way to do that. We can take judicial notice of the report that's on file with the Commission.

MR. HOBERG: This is on file in another matter?

MR. PEARCE: This is the annual report that the company has filed and I think Mr. Diller based his Exhibit 10 on. Perhaps maybe since he's now participating in the proceeding, he could simply clarify that there's apparently a transcription error made in preparing Exhibit 10.

MR. HOBERG: Is there an error, Mr. Diller?

MR. DILLER: Yes. I looked at MDU's annual report for its gas operation. It appears I picked up the 2000 number and put it in 2001. The actual earnings reported by MDU, I believe, is 1.6 percent for 2001, rather than 11.9.

MR. HOBERG: 1.6 percent. Why don't we just make that correction there? Is that sufficient, Mr. Pearce?

MR. PEARCE: Yes, that's fine. The report actually says 1.616, but 1.6 is fine.

MR. HOBERG: And then, of course, that would make a difference on the four average, too,

and make a difference on the average for all. For the purpose of this hearing are we mostly concerned about those four numbers from 1998 to 2001?

MR. PEARCE: That was the point of the exhibit, I think.

MR. HOBERG: Okay. Then that exhibit will be corrected as indicated. Thank you, Mr. Pearce. Your next witness, please.

MR. PEARCE: We'll call Dr. J. Stephen Gaske.

MR. HOBERG: Dr. Gaske's direct testimony does appear as Exhibit 4 in Docket No. 1.

Dr. Gaske, did you hear -- you can sit down.

THE WITNESS: I thought you'd swear me in.

MR. HOBERG: I am going to. You can sit down while you're doing it.

Dr. Gaske, did you hear the admonition I gave in regard to perjury?

THE WITNESS: Yes, I did.

MR. HOBERG: Being advised of the penalty for perjury, do you promise to tell the truth in this matter being heard? If so, answer I do.

THE WITNESS: I do.

MR. HOBERG: Thank you. Mr. Pearce,

please.

J. STEPHEN GASKE,

being first duly sworn, was examined and testified as follows:

DIRECT EXAMINATION

BY MR. PEARCE:

Q. Dr. Gaske, have you prepared and had prefiled in this case prepared direct testimony of J. Stephen Gaske?

A. Yes.

Q. And if you were asked the same questions appearing in Exhibit 4, would your answers be the same today if you gave them live in this proceeding?

A. Yes.

Q. And to the best of your information and belief, is all the information contained in that testimony true and correct?

A. Yes.

MR. PEARCE: I will offer Exhibit 4 at this time and I'm not going to reread the testimony.

MR. HOBERG: Thank you, Mr. Pearce. Any objection to Exhibit 4?

MR. BINEK: No.

MR. HOBERG: Okay. Exhibit 4 is admitted. Are you tendering the witness for --

MR. PEARCE: Yes.

MR. HOBERG: Okay. Thank you, Mr. Pearce. Mr. Binek, do you have any questions of Dr. Gaske?

MR. BINEK: Yes.

CROSS-EXAMINATION

BY MR. BINEK:

Q. Dr. Gaske, on page 2 of your initial testimony, and that is Exhibit 4, at lines 8 to 10, you state that you have filed cost of capital and capital structure issues in six states, including North Dakota.

Was your latest North Dakota appearance in Case No. PU-399-01-186, which was MDU's electric service rate case?

A. Yes.

Q. In that case did you argue for the inclusion of an upward adjustment in the return to equity to account for flotation costs?

A. Yes, I did.

MR. BINEK: Okay. Your Honor, at this time I would like to have Mr. Gaske refer to some findings in this case. Do you wish to have this marked as an exhibit or just --

MR. HOBERG: Let's take official notice of that. I don't think we need to mark it as an

exhibit.

MR. BINEK: I do have copies, if people would like copies.

MR. HOBERG: That may be a good idea to put copies out for us, please.

MR. HOBERG: And, again, for the record, that's Case No. PU-399-01-186. Mr. Binek, please.

Q. (MR. BINEK CONTINUING) Okay. I've handed you a copy of the decision that the Commission issued in that case. The decision is dated April 24, 2002. And I would ask if you would please read paragraphs 14 and 15.

A. (Witness reviews document.)

MR. HOBERG: You don't want him to read them out loud, do you?

Q. (MR. BINEK CONTINUING) Yes, I would like to have you read them out loud.

A. "Under cross-examination, Gaske provided no empirical data to show that disallowing flotation costs would hinder the issuance of stock. On the contrary, Gaske agreed that most regulatory commissions do not allow flotation costs."

"Given that staff has provided evidence based on historical information, we find no need to rely on the theoretical" --

MR. HOBERG: Dr. Gaske, I'm sorry. Can you speak up a little bit, please? We're having a little trouble.

THE WITNESS: "Given that staff has provided evidence based on historical information, we find no need to rely on the theoretical information provided by MDU. In addition, Gaske admitted that most regulatory commissions do not allow flotation costs. The evidence indicates a negligible amount of flotation costs in the instant case. Therefore, the Commission will not include flotation costs in the determination of return on common equity."

Q. (MR. BINEK CONTINUING) Thank you. Your flotation cost approach in this case is essentially the same as your approach in MDU's electric case that was decided on April 24th of 2002; isn't that correct?

A. Yes, it is.

Q. And it's also correct that the Public Service Commission rejected the inclusion of flotation costs in that case --

A. Yes, that's true.

Q. -- is that correct? And it's also true that most state public utility commissions have

rejected the inclusion of flotation costs in determining the cost of common equity; isn't that also correct?

A. Some have accepted it and some have rejected it.

Q. Most have rejected it; would you agree?

A. At this point, yes.

Q. Where in your direct or rebuttal testimony in this case do we find empirical data to show that disallowing flotation costs would hinder the issuance of stock?

A. I never make the claim that it hinders the issuance of stock. What I do say is that without the allowance, an issuance of stock will result in a confiscation of property of the existing investors. So that's a very different claim than the one that you've asked me about. I don't base my claim on empirical evidence that they will be unable to issue stock. They will be unable to issue the stock on reasonable terms.

Q. Aside from North Dakota, what were the other five states where you filed testimony on cost of capital?

A. Let's see. Montana, Wyoming, New York, South Dakota, and actually I've done it in Alaska.

Q. In how many of those states did you recommend a flotation cost adjustment to the return on equity?

A. All of them.

Q. And how many of those states did the Commission accept your recommendation?

A. Actually, I should add I've also testified on flotation cost adjustment in a property tax case in Wyoming and, in fact, testified on that on two occasions.

Q. Okay. But in utility cases you're talking about the previous ones you mentioned?

A. In utility cases, most of those were settled or have not had a decision. The Montana case they did not allow flotation costs. In the Wyoming property tax case they did not allow it the first time, but the second time around I think I did a better job of explaining it and they did agree that a flotation cost adjustment was appropriate in order to be able to issue common stock on reasonable terms. It's an appropriate part of the cost of capital.

Q. Okay. But that was not a utility case?

A. No, it was not. But my point is that Commissions have rejected this issue in the past and

then turned around and realized and understood the issue so that they did allow it. They changed their minds.

Q. What rates of return did the Commissions allow in gas -- let me go back. Were any of these cases that -- the utility cases that you talked about gas utility cases?

A. Yes.

Q. And how many of those were gas utility?

A. I probably -- I don't recall exactly, but maybe about five of them.

Q. What rates of return did the Commission allow in each of those gas distribution cases?

A. To my recollection, the only one that went to a decision was a Montana case and I believe it was 11.7, but I would have to check to tell you.

Q. Okay. None of them have --

A. It might -- it might have been higher than that. I don't recall.

Q. I'd like to have you turn to your Exhibit JSG-2.

COMMISSIONER REINBOLD: What page is that?

MR. BINEK: It's Exhibit JSG-2.

MR. HOBERG: Toward the end of Exhibit 4, his testimony, about two pages before the end.

Q. (MR. BINEK CONTINUING) On page 1 you provide a number of rates of annual change for prices and gross domestic product. They end in 2001.

MR. HOBERG: I'm sorry. I misspoke. I was on page 8 when I said that. It's closer to about 10 pages from the end, JSG-2.

THE WITNESS: I think you're on the right page.

COMMISSIONER CLARK: Schedule 1.

COMMISSIONER WEFALD: Is it in the rebuttal testimony or the original testimony?

THE WITNESS: Original testimony.

COMMISSIONER WEFALD: Thank you. That will help me find it.

MR. HOBERG: Schedule 1, where it says 1 of 3 pages.

THE WITNESS: I think that's what he's referring to.

MR. HOBERG: Does everyone have it?

COMMISSIONER WEFALD: JSG-2, and which page of JSG-2 are we on?

MR. BINEK: Page 1 of 3.

COMMISSIONER WEFALD: Thank you.

MR. HOBERG: Mr. Binek, please.

MR. BINEK: It's Schedule 1, page 1 of 3.

Q. (MR. BINEK CONTINUING) Okay. On page 1 you provide a number of rates of annual change for prices in gross domestic product. They end in 2001, which is now more than nine months ago. What has happened to these indicators since last December?

A. I believe in the early part of the year there was relatively rapid growth in the economy. And I believe it slowed down since then, and I don't know what's going on right now. I do know that right now there's a debate whether we're in or going into another recession, but we really won't know that until the quarter is out.

Q. What about consumer prices, what's happening there?

A. I don't have that information.

Q. On page 2 of that exhibit you show a number of interest rates, but your series end last January. Can you provide the latest interest rates and match these series?

A. Let's see. The last one I had was as of the end of July, the corporate average, which was 7.38 in January, went down 11 basis points to 7.27 percent. The A-rated public utilities, which has been 7.66 percent, went down to 7.31 percent. And

the Baa-rated utilities barely changed at all, went from 8.13 to 8.07 percent. Since that time I don't have the exact numbers. I believe the numbers have gone down some. That, I guess, brings you up another six more months.

Q. Okay. So the interest rates generally have decreased; do you agree?

A. Yes. The Baa barely as much, but it's down.

Q. Do you know whether it's true that interest rates are now the lowest that they've been in decades?

MR. HOBERG: By "decades" you mean what, the last --

MR. BINEK: Last couple, three.

MR. HOBERG: Three decades.

THE WITNESS: It depends on what interest rate you're talking about. One of the things that has occurred in the past year is that investors have been very leery of investing in almost anything that has any risk at all attached to it. So they have been reluctant to be in common stocks or even risky bonds. The treasury bill rates are the lowest they've been in decades. The U.S. Treasury bond rates are also the lowest that they've been in

decades. However, if you look at the Baa public utility bonds, right now they're essentially higher than they were in 1999 or '98. Approximately where they were in '97. Higher than they were in '93. They're about where they've been for the last decade.

So to answer your question, depends on whether you're talking about extremely low-risk instruments. Those are low. Investors want those very badly right now because there's a great deal of uncertainty in the market and the economy, but your question is not true if you're talking about public utility bonds.

Q. (MR. BINEK CONTINUING) On page 3 of that same exhibit, you show average return on the book value of equity since 1977 up through 2001. What has happened to returns on equity during the past nine months?

A. I would imagine that they are pretty abysmal, but I don't know the numbers on that.

Q. Okay. On page 11 of your testimony you present the discounted cash flow formula. Is it true that the only difference between your presentation of this formula and that of Mr. King is that you increase the next year's dividend by a

factor of .625 and that Mr. King increases it by .5?

A. As far as the basic general formula, yes, that's correct.

Q. Is the principal reason for this difference your belief that Mr. King has failed to recognize the present value of future dividends and dividend increases?

A. I think that the best way to describe it is that he's neglected to pay any attention to the time value of money during the initial year.

Q. And that's present value, isn't it?

A. Well, the whole discounted cash flow model looks forward basically into an infinite period of time in the future and is based on discounted cash flow. The portion of the model that deals with that adjustment factor really is looking at the first year of an infinite number of years. That dividend tends to be the most valuable because it's one you get the soonest, and to the extent that you're getting it on a quarterly basis, the first one you get is more valuable than the second, more valuable than the third, et cetera, as long as the dividend doesn't change. And so I think the real difference between the two of us is a relatively small one. I recognize the time value of money and he doesn't.

Q. This really doesn't amount to much of anything as far as this case, does it?

A. No. That's why I was a little bit surprised that he put it in his rebuttal testimony.

Q. I recall an electric case we spent a lot of time on this issue for very little money.

A. Yeah. And I couldn't understand why he kept getting the math wrong and still does.

Q. Perhaps he might not think he's got it wrong.

A. It really goes -- it's not a real big dollar thing. It really goes to a question of whether you can do the math right.

Q. I think we'll let him respond to that one.

A. And that may be something -- well, I'll leave it at that.

Q. Please turn to page 5 of Schedule 2 of your Exhibit JSG-2.

COMMISSIONER WEFALD: Same book?

MR. HOBERG: Yes, same book.

COMMISSIONER REINBOLD: What page?

MR. BINEK: Page 5 of Schedule 2.

COMMISSIONER WEFALD: 5 of 9?

MR. BINEK: Of 2. Oh, 5 of 9, yes.

Q. (MR. BINEK CONTINUING) Is this the page on

which you developed the growth rates you use for your six proxy group companies?

A. These are the factors that I gave the most weight to, yes.

Q. The first column is Zacks five-year growth estimate, and the second column is your retention growth calculation; is that correct?

A. That's correct.

Q. Is it true that for five out of these six companies the Zacks forecast is higher than the retention growth forecast?

A. Yes.

Q. The third column is labeled "weighted average." Is that the weighting of two-thirds Zacks and one-third retention growth?

A. Yes.

Q. On what basis did you decide to make that weighting between the two growth estimates?

A. There were two factors that came into play. One is that I normally think of the retention growth rate as being sort of a baseline, relatively stable number that investors can look at as being a base level of growth throughout the life of the project or the company as long as they maintain that. The Zacks earnings growth estimates take into

consideration a lot of other ways that a company can grow other than by retaining earnings and reinvesting it to increase common equity just through retained earnings. So the Zacks earnings estimates which are put together by analysts and forecasts tend to include the other methods that companies can grow by. For these companies I think people who buy common stock place a fairly good amount of weight on those estimates and stock prices and dividend yields are dictated to a large extent by those analysts' estimates. So I tended to give them a little more weight.

The second reason I used that approach is that it somewhat mimics an approach that the Federal Energy Regulatory Commission actually requires almost as a generic approach where they give two-thirds weight to the Zacks earnings estimates and a one-third weight to the projected growth in the Gross National Product or Gross Domestic Product, rather than retention growth. So to my mind, it's a good way to put together a combination of the two that smooths out aberrations that may occur in one growth rate or the other and get a pretty good estimate of what investors reasonably expect over a long period of time.

Q. Isn't it true that two companies, Keyspan and Laclede Group, account for the highest observations?

A. Yes, highest observed growth rates.

Q. And those high growth rates for Keyspan and Laclede rates carry over to the next page, page 6, to yield the two highest rates of return; isn't that also correct?

A. Yes. Keyspan and Laclede also have the highest dividend yields.

Q. Did Mr. King include Keyspan in his comparable companies?

A. No, he did not.

Q. Do you know why Mr. King excluded Keyspan from his group of comparable companies?

A. He used different selection criteria than I did. Keyspan derives less than 75 percent of its earnings from utility operations or gas utility operations.

(Exhibit 11 was marked for identification.)

Q. (MR. BINEK CONTINUING) Would you please identify what has been marked as Document 11? I guess I also would like to say, would that be the cover page, index page, and page 27 of the 2001 form 10-K for Keyspan Corporation?

A. Yes.

MR. BINEK: I would offer Exhibit 11.

MR. HOBERG: Any objection to Exhibit 11?

MR. PEARCE: No. Assuming it is what it purports to be, I have no objection.

MR. HOBERG: Exhibit 11 is admitted.

Q. (MR. BINEK CONTINUING) Mr. Gaske, I'd like to have you look at the first line of the first column on page 27. Could you tell me what the number there represents?

A. It's the gas distribution revenues of Keyspan during various years in the recent past.

Q. It shows gas distribution revenues in 2001?

A. Yes, it does.

Q. What is that number?

A. 3.6 million.

Q. Now, I'd like to have you drop down a few lines -- is the number billion?

A. Yes. The numbers are expressed in thousands of dollars, so, yes, $3.6 billion.

Q. And now would you drop down a few lines and read the number for total revenue?

A. $6.6 billion.

Q. Would you agree that gas distribution accounts for almost exactly one-half of Keyspan's

total revenue?

A. A little more than that, but, yes. Somewhere in the 50 percent range, 50 to 60.

Q. The other company with very high weighted growth rate on page 5 of Schedule 2 is Laclede? Or I think you refer to as Laclede?

A. Yes.

Q. Okay. Could you explain how Laclede could generate a 12 percent annual growth in earnings when its retention of earnings would allow it to increase by only 4.2 percent?

A. Laclede, at the time that I did my testimony, the most recent Value Line page for them indicates that it had recently formed a holding company and that Laclede was going to begin essentially starting up some new businesses and getting into some other new lines. The Value Line ultimate conclusion was that Laclede's expansion into unregulated industry boosts its long-term earnings prospects.

So although Laclede did not have much in the way of other investments and other lines of business, particularly unregulated ones at the time, and still doesn't have a whole lot, investors were clearly expecting that they would get into some

additional lines of business and that in the long run that they were going to boost their earnings' growth rate above the growth rate that would be sustained by book value growth.

Q. So Laclede's high return is related to unregulated activities; would that be correct?

A. Not the current required return of the company at the time. The high growth rate and perhaps the dividend yield was lower than it might otherwise have been because of that high expected growth rate, but at the time the company was primarily a distribution company.

Q. But the high return that you're showing is due to unregulated activities, isn't it?

A. They didn't have much in the way of unregulated activities at the time. The high growth rate is based on the expectation that in the future they're probably going to make more money than they can make on unregulated operations, but there's a very different question there, because the current return reflects to some degree unregulated operations in the future, but it primarily reflects what they have in place and what their current business is, what their prospects for that business are and the risks attached to it. So you can have

high growth expected in the future without necessarily having a lot of risky investments right now.

In addition, the -- I suspect that at one level it's probably good for the Laclede investors for the company to diversify into a few other lines of business to more or less diversify the company in case something happens with the gas distribution business.

Q. Didn't Mr. King produce as his Exhibit CWK-5 a Zacks report that showed Laclede's consensus growth at 4.25 percent?

A. Yes. Later in the year after I prepared my testimony the projected forecast for Laclede went down. I actually didn't look to see what happened with the other companies, but he did produce the Laclede one and it went down from 12 to 4.

Q. Turning to page 6 of your Schedule 2, would you agree with me that if you left out Keyspan and Laclede, the average return would be considerably less than the numbers you show there?

A. The average for -- if you left the two out, the average cost of capital would be -- instead of 12.83, it would drop to 11.85. The median would drop from 12.51 to 12.4. So your median would drop

about 11 basis point. So, yes, it's a slightly lower number. Not a lot, but it's slightly lower.

Q. I'd like to have you turn to page 7 of Schedule 2, Exhibit JSG-2. Do we find again that Keyspan and Laclede generate by far the highest rates of return?

A. Laclede does. The Keyspan depends on your definition of "by far," but, yes, it is about 80 basis point higher than the next one.

Q. Now, I'd like to turn to your primary DCF analysis. A discussion of that begins on page 20 of your testimony.

COMMISSIONER WEFALD: Which testimony is that -- the original testimony?

MR. BINEK: That's the original.

Q. (MR. BINEK CONTINUING) The growth rate that you use for this analysis as a range --

A. Could I ask you to wait for a moment?

Q. Sure.

A. Okay. Where was it that you were going?

Q. Okay. Page 20.

A. I'm there.

Q. Okay. The growth rate that you use for this analysis is a range, isn't it?

A. Yes.

Q. That range is presented on lines 14 and 15 of page 21 as 6.75 percent to 7.75 percent; is that correct?

A. Yes.

Q. How did you arrive at that range?

A. I considered a variety of factors. I believe that natural gas is going to tend to become a more important fuel source in the future, at least in some places. I also looked at the data that you pointed me to earlier. If you go to Schedule 2 of Exhibit JSG-2 and page 4 of that schedule -- I'm sorry -- page 5 of that schedule at the back, when you put the -- when you just look at the Zacks data, you'll see that companies with projected growth rates above 7 percent or 7 percent above include every single company there, except WGL Resources. So the 7 percent number is towards the middle of that range, of the range that I adopted, 6.75 to 7.75. There's one company that's below that range. Keyspan is just slightly above that range. Laclede's well above the range, but everybody else is grouped right in the middle. They're all in the 7 percent range. I thought that that was a pretty good anchor.

The retention growth I usually think of as

being a base amount that a company can achieve and usually under most circumstances you would expect it to be able to do better than that. And the analysts in this case thought that the company should do better than that, but if you look at the weighted average in the last column, you'll see that you have several companies a little under that range. And, let's see, Keyspan at 7.5 and Laclede at 9.4. So I used -- essentially, after considering other factors other than the simple two-thirds/one-third objective approach, I felt that 6.75 to 7.75 really reflected what investors expected and you can see that from the Zacks forecast where virtually all of my companies are 7 percent or higher.

Q. Okay. Looking at the top range of 7.75 percent, can you show me anywhere on pages 5, 6, and 7 of Schedule 2 where you have developed an average growth for the six companies that is as high as 7.75?

A. Now, the purpose of a range is to more or less put the company within some range around which you think on a normal basis these companies would be. The Zacks 7.6 percent obviously is well above the midpoint of that range. I was trying to establish about a 100 basis point range that would

be reflective overall of the group. So 7.6 would be well above the average in that range and the average for the weighted average would be toward the lower end of the range, but falls within the range.

So using those two numbers as anchors, you can go a little above 7.6 percent on the Zacks average earnings and get to 7.75. You can go a little below the 6.9 percent average and get to 6.75 and that gave me a 100 basis point range.

Q. Again, looking -- I'll repeat the question and please answer the question. Looking at the top of the range, 7.75 percent, can you show me anywhere on these pages, 5, 6, and 7, where you developed an average growth for the six companies that is as high as 7.75 percent? Just yes or no.

A. There's no simple average that does that, no.

Q. Okay. At lines 19 through 21 of page 21 you state that your range of 6.67 percent to 7.75 percent is consistent with the retention growth for the six companies. Please turn to page 5 of Schedule 2 and read to me the average retention growth for the six companies.

A. Would you take me back to the first citation that you had?

Q. Page 5.

A. You were citing someplace --

MR. HOBERG: Page 21.

Q. (MR. BINEK CONTINUING) Pages 19 through 21.

MR. HOBERG: Wasn't it line 19 through 21?

Q. (MR. BINEK CONTINUING) Lines 19 through 21 of page 21. The average retention growth rate for the six companies.

COMMISSIONER WEFALD: Does it start out "in my opinion," is that the line?

THE WITNESS: Okay. I see what you are asking. Page 21, the last three lines.

Q. (MR. BINEK CONTINUING) Starting at line 13 is the beginning of the paragraph.

A. But I believe you asked the question about the last sentence?

Q. Right.

A. And the last sentence says that, "This growth rate range is also consistent with the retention growth rates projected for these companies and their ability to grow by means other than retained earnings," which is what I was talking about earlier, that typically companies have the ability to grow by other means than retained

earnings and that allows them to generally achieve a slightly higher or somewhat higher growth rate than solely with book value growths.

You then asked me to turn to page 5 of Schedule 2 of Exhibit JSG-2 and reconcile the 5.5 percent average shown there with what I said on page 21. And the reconciliation is quite simply that it's -- if a company can have a base growth rate of about 5.5 percent, but investment analysts are projecting an average of 7.6 percent, it's consistent to think that 6.75 to 7.75 is consistent with the idea that book value forms sort of a base and the other methods that they can grow by, including investing in an unregulated operation, comes up with a higher rate of return.

Q. Over the long run how does a utility company do better than the retention growth?

A. There are several ways they can do that. One actually is contained in Mr. King's testimony. Mr. King has a growth rate component -- he calls it SV, issuing stock at above book value. If a company has some unregulated operations and those are doing reasonably well, it will have a book value -- or market value above book value and it's able to grow in that way. I believe Mr. King for his companies

estimated about 1 percent additional kicker to the growth rate from that. I'd have to go back and check his numbers, but it's something in that ballpark.

Another way that they can do that is by essentially borrowing to invest in new assets, that if those assets earn more than the cost of capital, it increases -- the market value of those assets exceed the book value and the company over time can generate retained earnings from these new unregulated assets and essentially build their equity ratio back up again and then repeat the process. And that's a very, very common thing, is that companies borrow because they find that they have a really good investment that will make them better off. They do so, they invest in it, and if it pays off well and it's making a 20-percent rate of return, and they borrowed the money at 8 percent, they get a big kick in their earnings per share. The stockholders get the difference between the 20 percent the operation makes and the 8 percent that they borrowed at.

So those are a few of the ways and I think those are probably the primary ways. I could probably think of a few others that are less

important, but those are big ones. And my 5.5 percent earnings retention growth rate, I should note, is a little bit different from Mr. King's book value growth rate in that I have not included the SV factor in the 5.5. I have assumed that the SV factor -- or actually I should call it a term because it's used as a term, it's an add-on to the retention growth rate -- is encompassed in the Zacks earnings forecast, which are higher, and that the other ways that a company can grow, including the SV term, are in the Zacks earnings growth estimate. So retention growth is sort of a baseline, but you can do all these other things. And clearly investors are expecting some of that to happen.

MR. HOBERG: Dr. Gaske, for the record, what is the SV factor?

THE WITNESS: It's the stock -- the percentage increases in the shares outstanding times the premium over book value that you are able to sell your stock at.

MR. HOBERG: Thank you.

THE WITNESS: And explained in fairly great detail in Mr. King's testimony.

(Exhibit 12 was marked for identification.)

Q. (MR. BINEK CONTINUING) I'd like to refer

you to page 23 of your testimony. On pages 6 through 8 you describe data by Ibbotson Associates on returns to stocks, bonds and treasury bills since 1926. I've handed you a response that Mr. King filed to MDU's September 6, 2002 data request, question 14. And this is marked as Exhibit 12.

Have you seen this response?

A. Yes, I have.

Q. In this response does Mr. King represent that he has supplied the yearly returns to an S&P composite index and S&P utility index, long-term corporate bonds and public utility bonds for every year from 1927 to 2001?

A. Yes.

MR. HOBERG: Isn't it 1928?

MR. BINEK: Or '28.

Q. (MR. BINEK CONTINUING) Now, would you look at the bottom of that sheet and identify what is reported on the last four lines?

A. A geometric mean return for the series and an arithmetic mean return for the series, a standard deviation, and a median.

Q. Are you familiar with those terms?

A. Yes, I am.

Q. Would you please describe your

understanding of the meaning of each of those terms?

A. The geometric mean tells you the average historical rate of return that occurred throughout the period, assuming compounding. And it's a very good indicator of your past historical return that you earned. The arithmetic mean is the average of the return earned each year, year by year. And it's a very good indicator of future expected return.

The standard deviation tells you how much variation there is in a particular series of numbers. And, in fact, what the standard deviation really tells you is that if you assume that the data have what is referred to in statistics as a normal distribution, it's a number that you can add to the mean, the arithmetic mean, plus or minus, to determine a range within which two-thirds of the observations fall or would be expected to fall. In this case I'm not entirely sure whether he had done this as a population mean or sample mean. Usually it's calculated as a sample mean, so I would presume that, but maybe we'd have to ask him which kind of mean he used or rather what kind of standard deviation he used.

And the last number, the median, is the number that half of the observations are above and

half are below.

Q. If the standard deviation is higher than the mean, what does that tell you about the statistical significance of the mean?

A. That there's a high probability that the mean of that particular series is zero, or at least -- let's say the standard deviation is exactly equal to the mean, then there's about a 16 percent chance that the real number would be zero or less.

Q. Please read the arithmetic means and the standard deviations of each of these series.

MR. HOBERG: I think we better have this thing offered first, Mr. Binek.

MR. BINEK: Oh, I'm sorry. I will offer.

MR. HOBERG: Any objection to Exhibit 12, Mr. Pearce?

MR. PEARCE: No. On the assumption that Mr. King prepared this from published data, I have no objection.

MR. HOBERG: Exhibit 12 is admitted. Mr. Binek, please.

Q. (MR. BINEK CONTINUING) Now, would you please read the arithmetic means and the standard deviations of each of these series?

A. 12.33 percent for the S&P composite, and

20.3 for the standard deviation. For the public utility index, 11.11 percent. And 22.65 percent for the standard deviation. The long-term corporate bonds, 6.06 percent, and the standard deviation, 8.76 percent. The public utility bonds, 5.79 percent. The standard deviation, 8.11 percent.

Q. If I buy a share in a company, what price do I pay, the market price of the share or the book value of the share?

A. You pay the market price.

Q. If the market price is twice the book value, I still have to pay the market price, don't I?

A. Yes, you do.

Q. If the company is earning 20 percent on its book value and I pay a market price twice that book value, what is my return?

A. I can't calculate that in my head.

Q. Would it be 10 percent?

A. If there's no growth. Yes, if the company paid out its dividend, everything they make.

Q. What, in general, do you believe to be the relationship between market price and book value of the average company in The Value Line Investment Survey that you cite on page 25 of your testimony?

A. It's quite above book value. I don't recall the composites at this time, but it's probably in the neighborhood of four or five.

Q. Please turn to page 9 of Schedule 2 of your Exhibit JSG-2. We keep going back to that sucker.

COMMISSIONER WEFALD: Would you repeat the number again, please?

MR. BINEK: It's JSG-2, Schedule 2, page 9.

THE WITNESS: Which page now? I'm sorry.

Q. (MR. BINEK CONTINUING) Page 9. There you show debt and equity -- are you there? I'm sorry.

A. Yes, I am.

Q. There you show debt and equity ratios of your six proxy companies. They are all quite close together except one. Which is that one?

A. Keyspan.

Q. Keyspan has an equity ratio of only 38.84 percent. What effect would that have on the financial risk of that company?

A. Other things being equal, that should raise what we referred to as the financial risk. And Keyspan, if you look at page 2 of the same schedule, has an A plus and an A2 bond rating, which gives you a good idea of how investors view the financial risk. It's pretty comparable. Actually, it's the

only one that's identical to the first mortgage bonds of Montana-Dakota -- or MDU Resources that are secured by the public utility assets. So Montana-Dakota -- Montana-Dakota's bonds and Keyspan bonds have virtually the same rating so that the overall risk, that at least bond investors are looking at, is pretty much identical between the two.

Q. On page 7 of Schedule 2, doesn't that show that Keyspan has the second highest DCF return of the six companies?

A. Yes.

Q. Do you think that the low equity ratio of Keyspan might have some influence on the equity risk perceived by investors?

A. Well, two things interrelate in the sense that you can't -- when you look at the return on equity, you have to look at both the business risk of the company and its financial risk. And the two, in a sense, multiply against each other. So undoubtedly part of their rate of return is based on their high financial risk or -- and part of it is based on business risk. When you combine the two things, you come up with an overall risk assessment and, as I said, the bond rating agencies look at Keyspan as a whole as being almost identical to the

Montana-Dakota public utility assets. But both of them are rated -- have bond ratings below the average for that group, so I'm not surprised that Keyspan is above the average. Montana-Dakota Utilities do have low average bond rates for this group.

Q. I'd like to have you turn to page 32. On page 32 you list your costs of capital indications. What is the distinction between investor requirement and cost of capital?

A. The investor requirement is the return investors require on the sunk investment that's there. The cost of capital is what they require in order to be able to track new capital on reasonable terms.

Q. If we ignore flotation costs, we would focus on the first column; is that correct?

A. Yes.

Q. Now, I'd like to concentrate on the second stage retention growth. The number we see there was developed on page 6 of Schedule 2 of your exhibit; is that correct?

A. That's correct, yes.

Q. The growth component of that number was developed on page 5 of Schedule 2; is that also

correct?

A. Yes.

Q. Isn't it true that the retention growth that you used is not all retention growth, but only one-third retention growth, the other two-thirds being Zacks forecast?

A. Right, that's why I referred to it as a second stage retention growth, or it's a weighted average of Zacks and retention.

Q. If we developed a DCF using solely retention growth, would it consist of a growth factor of 5.5 shown on page 4 of Schedule 2 and a dividend yield of 5.14 percent developed on page 3 of Schedule 2?

A. Mathematically that would be correct. It wouldn't mean anything because it wouldn't match up with investors' expectations.

Q. What would the DCF result be?

A. If you add 5.5 and 5.14, you get 10.64 and then, obviously, you would add the flotation cost adjustment.

Q. Okay. Thank you.

MR. BINEK: Can I take a moment, please?

MR. HOBERG: Yes.

(Exhibit 13 was marked for identification.)

COMMISSIONER WEFALD: What number is this exhibit?

MR. HOBERG: Exhibit 13.

Q. (MR. BINEK CONTINUING) Mr. Gaske, does this -- I've handed you what has been marked as Exhibit 13. Do you recognize that exhibit?

A. It appears to be an exhibit you showed me earlier this year. I'm not positive it's the same one, but it looks to be almost identical.

Q. And you see a reference of Exhibit 14 in the right-hand corner of that exhibit and below that a Docket No. 80 under case PU-399-01-186?

A. Yes, I do.

Q. Was that an MDU electric rate case?

A. Yes.

Q. And this was a document that was introduced in that case; is that correct?

A. Yes.

Q. Can you tell me what this document is?

A. It looks to be a survey of rates of return that have been authorized -- or requested and authorized in past rate proceedings. It also shows the dollar amount that the increase or decrease and other information about when these cases occurred.

Q. Okay. And would you agree that -- I'm

referring to the first page of this document in the introduction, that it says that the survey covers orders issued by state regulatory commissions during the period October 1, 2001 through September 30th, 2001; is that correct?

A. I'm sorry. I missed where you were referring.

Q. It's in the first paragraph, about the third or fourth line down, it says that -- it indicates the period covered by the report is October 1, 2000 through September 30th, 2001?

A. Yes.

Q. Okay. And what is the date of this report?

A. It's dated December 15th, 2001.

Q. And it says that it's an annual survey?

A. Yes.

Q. So would it be safe to assume that this is the latest annual survey that has been put out by Public Utilities Reports?

A. That I don't know.

Q. Just assuming an annual survey issued December 15th of 2001.

A. Yeah, I would assume so. I don't know if it's some kind of a mutant average or something like that.

Q. Okay. But there's no exact science to this exhibit as far as use of it, but I'd like to explain to you, if you would look at the following pages, I've highlighted several cases and if you will look at those cases, they are all ones that were decided in the year 2001. I would also like to point out that under North Dakota, Roman numeral VII, in red highlight or red marker is Otter Tail Power Company Gas at 12 percent ROE, and I would ask that all of the parties acknowledge the fact that Otter Tail Power Company does not have a gas distribution company operating in North Dakota and so this is obviously an error. It's just a carryover from their electric case and the same reference is to their electric case, is just a mistake that they made. There are not all that many cases here. I'd like to have you start with the first case.

MR. BINEK: Yes. I was just getting to that. I would like to offer Exhibit 13.

MR. HOBERG: Any objection, Mr. Pearce?

MR. PEARCE: No. It's hearsay, but probably pretty reliable hearsay, so I won't object.

MR. HOBERG: Exhibit 13 is admitted.

Q. (MR. BINEK CONTINUING) Now, I would ask, would you please go through the highlighted cases

and just indicate for us the company name, the order date and the newly authorized rate of return on company equity, starting with Arizona, first of all?

MR. HOBERG: You want him to read these into the record?

MR. BINEK: He can or --

MR. HOBERG: Can't the document speak for itself?

MR. BINEK: That's fine. I have no problem with that.

Q. (MR. BINEK CONTINUING) I would like to have you just kind of peruse these different entries, though, and then I would -- the question I would have for you is, if you would agree with me that the ROE range for the majority of these cases range from 10.7 percent to 11.5 percent?

MR. HOBERG: Do you need a couple minutes to look at that, Dr. Gaske, or a couple seconds?

THE WITNESS: I don't see any that are below 11.7 -- or I'm sorry. I don't see any that are below 10.7. I do see a couple that are 12.25 and 12.1 on the last page.

Q. (MR. BINEK CONTINUING) But my question is, would you agree that the majority of the cases range from 10.7 to 11.5?

A. Well, if you start at the very bottom of the range and count upwards until you get to a majority, that's probably true. If you start at the top and work your way down, you probably get another number.

Q. Okay. Well, would you agree with this statement, that the majority of them range from 11 to 11 and a half percent? If you can't agree, that's fine. The document does speak for itself.

A. I only see five back in that time period were above 11.5.

Q. Okay. And there were several below 11?

A. Yes.

Q. Okay. Would you also agree with me that, according to this report, the highest ROE given in 2001 that was included in the survey was 12.25 percent?

A. Yes.

Q. Would you agree that there have been relatively few gas rate cases reported so far in 2002, reported by Public Utility Reports, if you know?

A. I don't know.

Q. Okay. Are you familiar with a case entitled Re Yankee Gas Services Company, a case

decided by the Connecticut Department of Public Utility Control on January 30th, 2002 and reported at 215 PUR4th, 185?

A. No, I'm not.

MR. BINEK: At this point, I would just like to show a copy of the case. I don't believe it needs to be offered as an exhibit, unless MDU would like to have it as an exhibit. It just refers to the ROE in this particular case, and I would like to have Mr. Gaske look at it.

MR. PEARCE: Well, I certainly would object to it being offered as an exhibit. I don't think that the rate of return on a case last year in the Eastern Seaboard has any relevance whatsoever to the return and costs in this case. So it certainly isn't relevant to this proceeding.

MR. BINEK: The only purpose is to show what is happening from basically the end of 2001 in the PUR report, what is shown up in PUR since then, kind of showing a trend.

MR. PEARCE: Well, that's the issue. Why would that be relevant to this case?

MR. BINEK: I think it is relevant.

MR. HOBERG: Dr. Gaske said he's not familiar with that case. Is there a better witness

to offer this through?

MR. BINEK: No, I don't think so. It's a case that's been reported and it's not a big issue.

MR. HOBERG: Are you withdrawing?

MR. BINEK: Well, my first question is whether the Commission would like to have it offered as an exhibit? I have three cases. I'll offer them as exhibits and if that's the course you would like to pursue and, apparently, based on the objections that Mr. Pearce has indicated, that would be the way to go.

MR. HOBERG: Okay. So you have two more besides this one?

MR. BINEK: Two more cases, yes.

MR. HOBERG: Are they the same relevancy that you're proposing?

MR. BINEK: Right. They're different -- in different jurisdictions. They're cases that have been reported in the year 2002.

MR. HOBERG: Mr. Pearce?

MR. PEARCE: Well, I would object to any such case. I mean, if they're cases reported in some public forum, anybody can look at them, but they certainly have no relevance that I can see to the issues in this case.

MR. HOBERG: Why don't you state them, give us the cites of those on the record, please, Mr. Binek, and we can make them available on an official notice basis, if the Commission wishes to use them, if the Commission believes they're relevant.

MR. BINEK: That's fine with me.

MR. HOBERG: Give Mr. Pearce a copy and perhaps after he has a copy of those, he will be able to make some argument that the Commission shouldn't take official notice of those because they're not relevant. At this point in time, you know, I don't know what the Commission would do with those. Maybe nothing. So let's take official notice of those three and pass them out to the Commission as a possibility that the Commission may take official notice of those in actually making a decision.

MR. BINEK: Very good.

MR. HOBERG: Why don't you read each of them as you're passing them out, what the decision is?

MR. BINEK: The first case is entitled Re Yankee Gas Services Company. It's Docket No. 01-05-19PH01, decided by the Connecticut Department

of Public Utility Control on January 30, 2002. And that is reported in Public Utility Reports 215 PUR4th, 185.

The next case is Re Berkshire, B-e-r-k-s-h-i-r-e, Gas Company. It's Docket D.T.E. 01-56, decided by the Massachusetts Department of Telecommunications and Energy, on January 31, 2002. And pages are eliminated at the bottom. That case is in 215 PUR4th, that's P-U-R, 361.

And the last case is a short one. Re Atlanta Gas Light Company, Docket No. 14311-U, decided by the Georgia Public Service Commission on April 29th, 2002. And that is reported in 217 PUR4th, page 190.

MR. HOBERG: Mr. Binek, you're not offering these for any of the facts contained therein, just for the rulings in these matters?

MR. BINEK: The only purpose for these cases is to show the return on equity that has been authorized by these other public utility commissions.

MR. HOBERG: As part of their orders in those cases?

MR. BINEK: Pardon?

MR. HOBERG: As part of their orders in

those cases?

MR. BINEK: Yes.

MR. HOBERG: Mr. Pearce?

MR. PEARCE: Well, I just want to make sure that my objection stands as to any conceivable relevance of these. He is simply taking three decisions from other jurisdictions based on totally different facts and circumstances. I would hope the Commission would not -- I'm sure they do not simply come to their decision by copying the results from other unrelated cases, so I don't think it will have any undue influence, but certainly it has no conceivable bearing on this case. We don't even know if these are all the decisions from that year. Even if they were, they certainly wouldn't be relevant.

MR. HOBERG: Thank you, Mr. Pearce.

Okay. Mr. Binek, do you have any further questions of Dr. Gaske?

Q. (MR. BINEK CONTINUING) I'd like to focus on some areas where you apparently agree with Mr. King. And this basically is in your rebuttal testimony, I believe.

MR. BINEK: That testimony hasn't been marked yet, has it?

MR. PEARCE: I didn't realize you were asking from rebuttal testimony. That isn't in the record, so we have to wait.

MR. BINEK: Okay. We'll wait. We'll cover it afterwards.

MR. HOBERG: You're bringing Dr. Gaske back on as rebuttal?

MR. PEARCE: Yes.

MR. BINEK: Okay. In the past we've kind of run these altogether. So that's fine. We'll cover him after he gives his rebuttal.

MR. HOBERG: I think that will be better. It will follow more clearly.

MR. BINEK: I have no further questions then.

MR. HOBERG: Thank you, Mr. Binek.

Commissioner Reinbold, did you have any questions of Dr. Gaske?

COMMISSIONER REINBOLD: Not at this time. Thank you.

MR. HOBERG: Thank you, Commissioner Reinbold. Commissioner Wefald, please.

COMMISSIONER WEFALD: None at this time, either.

MR. HOBERG: Thank you. Commissioner

Clark, please.

COMMISSIONER CLARK: I did have a couple.

EXAMINATION

BY COMMISSIONER CLARK:

Q. On page 28 of your testimony --

COMMISSIONER REINBOLD: What page?

COMMISSIONER CLARK: Page 28, lines 18 and 19.

Q. (COMMISSIONER CLARK CONTINUING) In this section you are discussing some of the business risks that you feel are faced by MDU.

A. Yes.

Q. You make a statement -- this follows up on previous testimony earlier this morning talking about the direct competition from propane heating oil. I think coal was used as another example of competition that MDU faces. Wouldn't raising rates be a strange action in response to direct competition?

A. Definitely not, under the circumstances. If you have direct competition, you will lose business, if it's really powerful direct competition. Currently, Montana-Dakota is able to maintain its business. If it has to maintain its rates at a level that it can't recover its costs, it

actually should try to go out of business and let the competitors have the business. So in a very short- run context, usually in markets you see that if there's a lot of competition, people are forced to lower their rates and the one who lowers his rates far enough that he can't recover his costs anymore, he goes out of business.

In Montana-Dakota's case I don't think that the competition at this point in time is so severe that they would go out of business, but if they were not allowed by this Commission to charge rates that would recover their costs, they should think about getting out of the business. Just as in a competitive market, if competition is the regulator that forces the rates to be below cost, a competitive company would after some time exit the market.

Q. Well, I'm asking because it seems counterintuitive that if you're facing competition and you've got potentially some customers who are on the edge, could potentially switch to another, in this case, heating source, that an increase in the rates would cause potentially some of those customers to switch over, and wouldn't that in the end, in fact, just increase the risk that MDU faces?

Wouldn't the better response be to find savings somewhere else, if you are, in fact, facing that competition?

A. Well, I think as Mr. Fox testified earlier, they have tried to find as many savings as possible. What really happens with natural gas is that the cost of the commodity drives the attractiveness to a great deal -- great extent, also. So that's probably a bigger problem for Montana-Dakota in terms of whether they increase the distribution charge by 4 percent or whether the suppliers to the company, whether the natural gas markets are selling gas at $2 or whether it's at $4. That's where they really have to be concerned about such competition. And right now they can compete. If the price of natural gas is driven upwards in the $4- and $5-range, you may see people shutting off their gas service at a fairly rapid rate.

Q. Another question on that same page, talking about kind of the general business climate and risks that MDU faces. On lines 10 through 12 there's a sentence there, On a practical level, MDU's relatively small natural gas distribution operations are heavily dependent on a relatively undiversified local economy.

Could you just expound on that a little bit?

A. Well, you have in their service territory some mining operations, refining operations, a lot of farming and farming-related operations, and they face some risk that some of these kind of operations, manufacturing-type things -- I shouldn't call it manufacturing, but processing foods and things like that, could shut down and they'd lose that business, but, to my mind, a much bigger risk for them is the fact that if operations like that shut down around here, the people who work at those plants and local economies will suffer and people will migrate out of the towns and Montana-Dakota will be sitting there with gas distribution mains in place and yet because of, you know, events in the local economy, they're at risk.

And people who serve larger cities have a much smaller risk in that regard. Most large cities have many, many different kinds of businesses and industries that support the population and when one leaves, usually others are able to expand to take up the slack. I don't see that in the towns that Montana-Dakota serves.

Q. I guess I've -- the reason I ask is, I've

always heard that North Dakota's economy, which would be true of economies of states like ours, is typically more resistant to booms and peaks and valleys. That, in fact, larger states more kind of dynamic economies are much more likely to have the peaks and valleys. And that's what we've seen certainly in this latest recession. We seem to be a little bit more recession proof. We seem to be a little bit less prone to the booms when times are good as well.

How does that fit with the comments in there?

A. As far as short-run booms and busts, I think you probably are pretty insulated from that because of a lot of agricultural-related things, but agriculture booms and busts a little bit. To the extent more energy production occurs in the state, you'll probably be more subject to booms and busts in the energy business.

On a longer-term basis, and Montana-Dakota has to think about longer-term basis, their plant is there for many, many years. They put it in and it will stay there for 30 years or something like that. As businesses shut down and people migrate out of towns, or just the natural change of people's desire

to, say, move to the big cities or whatnot, they can leave the towns, but Montana-Dakota's facilities are still there. They still have to try to recover their costs. To the extent you get some major employers that shut down for whatever reason, it's not a guarantee that the people will stay here or that the people will be able to pay their bills or things like that.

So even if you're resistant to short run year-to-year fluctuations in boom and bust cycles or even on two- or three-year cycles, on a longer run cycle, which really is very important to MDU because it has a lot of fixed costs, they have to worry about the big employers in this area, will they shut down and really dramatically change the economics of their business.

COMMISSIONER CLARK: That's all I have right now. Thank you.

MR. HOBERG: Thank you, Commissioner Clark.

Mr. Pearce, any further questions of Dr. Gaske?

MR. PEARCE: Just one short question, really.

REDIRECT EXAMINATION

BY MR. PEARCE:

Q. Dr. Gaske, there was some discussion on your cross-examination about Exhibit 13, which was a PUR report of decisions ending at a point in 2001. Would it surprise you that the cost of equity capital that you derived for Montana-Dakota for the 2003 projected year would be different from and perhaps more than any of the cases which the last report here seems to end in June of 2001 in this Exhibit 13?

A. No. No. In the last year the stock market has gone down considerably in general. Investors' risk aversions have increased and we've seen some fairly remarkable things happen in the financial markets and not all of them very good for investors.

Q. And the cost of capital is essentially unique to each entity, isn't it, depending on the circumstances and the business and the risk, and so on?

A. Yes.

MR. PEARCE: I have nothing else.

MR. HOBERG: Thank you, Mr. Pearce.

Mr. Binek, anything further of Dr. Gaske?

MR. BINEK: No.

MR. HOBERG: Thank you. Commissioner Wefald, please.

EXAMINATION

BY COMMISSIONER WEFALD:

Q. I just have a question about this risk aversion factor. I can only relate it to my own experiences in the market and --

A. I hope they've been good.

Q. Haven't -- just describe for me this risk aversion factor.

A. Well, one of the things that has happened quite a bit during the last year is that people have been selling off stocks or they really don't want to own common stocks. And they are trying to own short-term investments, things like U.S. Treasury bills, or cash or CDs even though -- and as a result of that, they have driven the short-term interest rates way down. They want to get out of stocks. They want to put their money in the safest place that they can.

And what happens there is that the interest rates on your CD at the bank and/or U.S. Treasury bills or even U.S. Treasury bonds have gone way down. Whereas, in my opinion, the required return on things like common equities has gone way up.

People just don't want to be in equities right now.

Q. That's the part I don't understand. Why would that go up? Why would it just be a certain amount greater than what you can get on a short-term money note, let's say? I mean, I don't understand your conclusion that that would go way up, if I'm only able to return -- get a return of a very small amount on a very short-term equity. Why wouldn't I be pleased if it was 5 percent more, and I could know that it's going to be even 5 percent more, let's say 8 percent rather than 3 percent, or I guess even right now many times in money market it's 1 percent? So why wouldn't I be pleased if I could get 6 percent?

A. The overall return might go up or it might go down some that you require on your common equities, but they won't go down nearly as much as on safer investments. But investors view the market as very risky. If you say -- you think of it in terms of a common equity has five units more risk than a bond, if the market is very risky, that extra five units of risk will be very valuable. If people are very uncertain about the market, they don't -- they're going to want a very high return to take the five units of extra risk.

If the economy is doing very well, things are very stable and people are very confident about the future, the price of risk, what they're willing to spend for -- or what they require for that extra five units of risk will be much lower. So you ask, you know, why don't they want 5 percent more than what they can get on bonds? Over time what they require will go up, the extra amount they require will go up and down. Right now we're in a period where people don't want to own common stocks. They think they're too risky and they do want to own bonds and short-term government bonds and short-term debt.

So the extra units of risk, let's say the five extra units of risk, those become very valuable or very expensive, they just aren't going to buy unless they think they are going to get a very good premium over what they can get on the bonds. So the premiums go up and down over time.

COMMISSIONER WEFALD: Thank you for that analysis.

THE WITNESS: Hopefully, your experiences have been better than mine in the market, but it has been a risky year or a very discouraging year.

MR. HOBERG: Thank you. Commissioner

Clark.

FURTHER EXAMINATION

BY COMMISSIONER CLARK:

Q. I do have a question on that. Is it that investors want to get out of the stock market, period, or does it require maybe a little bit more granular analysis, and that is that certain sectors are just horrendous? For instance, telecom is one of them. Fortunately, we can't invest in the telecom market because we are prevented by state law from doing that. Are certain stocks more attractive because of that, for example, potentially kind of old-fashioned utility companies that are regulated?

A. The utility companies are probably more attractive, much more attractive now than, say, a telecom stock. A lot of people wanted to buy telecom stocks two years ago. But relative to bonds, utilities are less attractive, so the premium that people require on utilities is, I think, higher now and has gone up over the last year. So some people selling telecom will buy utilities. Some people who have utilities will sell the utilities and buy bonds. But if you look at bonds versus utilities, I think that spread is increased. Utilities versus telecom, that spread has really

increased. Nobody wants the telecom stock right now. So all across the board, from the very safest to the very riskiest investment, I think everything is spread out.

Q. Would it follow then when the stock market get on a roll like it did for the past 10 years or so prior to the last few we've had, that utility regulated ROEs should go down then because it's easier to attract capital?

A. The spreads over bond yields should go down, but you can have a very good market, but the interest rates are very high. You can -- so it really depends on a lot more factors.

Q. I'm just wondering if then the argument would be, well, all the peer companies are doing so well, we need to increase our rate of return now to attract capital vis-a-vis the rest of the market?

A. Well, that one depends on -- yeah, how much the individual companies are willing to invest. But it really is a good question about -- people are afraid to invest in almost anything. So the measure, at least that I try to look at is, what kind of spread versus the bond yield, because those are much easier to determine than the equity returns.

COMMISSIONER CLARK: That's all I have. Thanks.

MR. HOBERG: Thank you. Any further questions of Dr. Gaske? Thank you, Dr. Gaske. Take an hour recess here, luncheon recess?

COMMISSIONER WEFALD: Can you tell me, please, the order of witnesses that are going to be followed for this average?

MR. HOBERG: I believe they're in exactly the same order as listed in the direct testimony, is that correct, Mr. Pearce?

MR. PEARCE: Yes, it is.

COMMISSIONER WEFALD: And then we'll go through and then the rebuttal will happen in the same order by those people following?

MR. HOBERG: Then it will be Mr. Binek's presentation of his witnesses after the direct of MDU and then followed by the rebuttal.

COMMISSIONER WEFALD: That's a little unusual, but -- because then what happens you have -- well --

MR. HOBERG: I don't think it's unusual. I think that's the practice we followed in the past.

COMMISSIONER WEFALD: But the thing is, there's a lot of information that has been agreed

upon by the parties by the time we get to the rebuttal. So we're going to have to cover things that perhaps aren't that important because the case -- they have agreed on a bunch of things as they have gone along.

MR. HOBERG: Well, I would assume those things we've agreed upon you're not going to be spending much time on, correct?

MR. PEARCE: No. The rebuttal only touches on points on which there's disagreement still. So the rebuttal -- anything that's been agreed to won't be testified to on rebuttal.

COMMISSIONER WEFALD: Okay.

MR. HOBERG: Is that the order you expected, Mr. Binek?

MR. BINEK: Well, we have done both ways where we've gone with questioning on both the direct and rebuttal testimony initially, and that was what -- kind of the mode I was in. It doesn't matter to me which way we do it, and this seems to be set up to do it the long way.

MR. HOBERG: The long way? I don't know that it's necessarily longer, as long as the parties understand that things that, you know, there's no disagreement about, you don't have to spend any time

on really.

MR. BINEK: Hopefully, it will work out that way.

MR. HOBERG: I think it's sort of six of one and half-dozen of the other, unless you --

MR. BINEK: It's fine to do it that way.

MR. HOBERG: Perhaps we'll reflect on that over the break.

MR. PEARCE: It seemed like it was the usual judicial procedure; plaintiff, defendant, and then plaintiff's redirect, is really the mode we are following, I think.

MR. HOBERG: That's what I thought, too. All right. Let's take a one-hour lunch.

(Lunch recess was taken.)

MR. HOBERG: Okay. We're back on the record after a luncheon recess. And just to kind of rehash maybe the concerns about the procedure today in regard to direct and rebuttal, I think everybody is basically pulling in the same direction and maybe to provide a little bit of consistency and some guidance, it seems like except for perhaps the first witness, Mr. Fox, who you wanted to highlight the direct especially, you're offering the direct, but you're not really asking many questions.

MR. PEARCE: Right.

MR. HOBERG: And maybe that will be the procedure for the whole rest of the direct. It can go relatively quickly, except for the PSC's case, but if you do really have -- if your questions are more along the lines of something for the rebuttal, perhaps you should save them for that, but there may be some questions to highlight or to ask something that somebody neglected to cover in the rebuttal, but, basically, I think the direct should go relatively quickly, at least for MDU's case, and the rebuttal will be where more of the questions are, but I think we'll get to the same place we would have if we had just forgot about the direct and went right to the rebuttal. I think that was a time where there was pretty much agreement in another case where we could just move right to the rebuttal, but that isn't the situation here, as I read it, anyway.

So we'll proceed with the direct and then perhaps move relatively quickly to the rebuttal, except for perhaps Mr. Binek's case. Is that clear? I maybe didn't make it very clear. I hope I did.

Mr. Pearce, do you want to proceed, please?

MR. PEARCE: Yes. I'll call Craig Keller.

MR. HOBERG: Mr. Keller, were you here earlier when I gave the admonition in regard to perjury?

THE WITNESS: Yes.

MR. HOBERG: Being advised of the penalty for perjury, do you promise to tell the truth in this matter being heard? If so, answer I do.

THE WITNESS: Yes, I do.

MR. HOBERG: Thank you. Mr. Pearce, please.

CRAIG A. KELLER,

having been first duly sworn, was examined and testified as follows:

DIRECT EXAMINATION

BY MR. PEARCE:

Q. Mr. Keller, in connection with this case have you prepared or had prepared under your direction and control direct testimony of Craig A. Keller, CPA?

A. Yes, I have.

Q. And if I were to ask you the questions that are in that prepared, prefiled testimony today, would your answers be the same as appear in there?

A. Yes, they would be.

Q. And to the best of your information and

belief, all of your answers contain accurate and correct information?

A. Yes, they do.

MR. PEARCE: I will offer the direct testimony of Mr. Keller. I think it would be Exhibit 14.

MR. HOBERG: Exhibit 5.

MR. PEARCE: I'm sorry. Exhibit 5. I have no further direct questions.

MR. HOBERG: Thank you, Mr. Pearce. Any objections to Exhibit 5?

MR. BINEK: No.

MR. HOBERG: Exhibit 5 is admitted.

Mr. Binek, do you have any questions of Mr. Keller on direct?

MR. BINEK: Yes.

CROSS-EXAMINATION

BY MR. BINEK:

Q. Mr. Keller, would you please turn to your Statement A?

COMMISSIONER WEFALD: Where do we find that?

MR. PEARCE: Exhibit 2.

MR. HOBERG: There's a document entitled Statements A through O. Is that what you're

referring to, Mr. Binek?

MR. BINEK: Yes.

COMMISSIONER WEFALD: And this is Statement F?

MR. BINEK: Statement A.

Q. (MR. BINEK CONTINUING) The first two pages of Statement A present a balance sheet that is labeled MDU Utilities Co. The remaining 27 pages are of notes on the balance sheet; is that correct?

A. Yes.

Q. Those 27 pages are not headed MDU Utilities Co., but rather MDU Resources, Inc.; is that correct? Am I correct that the notes pertain to a different balance sheet than Statement A?

A. I believe the balance sheet is the -- the balance sheet of Montana-Dakota is not the consolidated balance sheet, whereas the statements would be the consolidated -- the statements that are in our consolidated balance sheet of MDU Resources Group.

Q. Do all the notes on pages 3 through 27 apply as well to the first two pages of Statement A?

A. They would apply to the Statement A They may also apply to -- there will be information that will apply to some of the subsidiaries of MDU

Resources Group as well.

(Exhibit 14 was marked for identification.)

MR. BINEK: This will be Exhibit 14.

Q. (MR. BINEK CONTINUING) Now, I've handed you a document that's been marked as Exhibit 14. Can you identify that exhibit?

A. It says $150 million secured medium-term notes, MDU Resources Group, Inc.

Q. I'm sorry. Could you speak up a little bit?

A. It's the prospectus for $150 million secured medium-term notes, MDU Resources Group, Inc.

Q. Okay. And does this prospectus cover the $133.5 million in long-term debt that you list on page 1 of Statement F?

A. I believe it applies to a portion of that. I don't believe it applies to the entire. It would apply to the debt that was issued under this prospectus or under this here arrangement, financial instrument.

Q. Could you repeat your answer?

A. I said I believe it applies to the debt on this schedule of the $133 million that was issued under this financing instrument. So there is -- I believe there's also some debt that we have

outstanding that was not issued as part of this here prospectus here.

MR. BINEK: Okay. At this time I would offer Exhibit 14.

MR. HOBERG: Any objection to Exhibit 14?

MR. PEARCE: No.

MR. HOBERG: Exhibit 14 is admitted.

Q. (MR. BINEK CONTINUING) Who issued this prospectus?

A. MDU Resources Group, Inc.

Q. I'd like to have you turn to page 2 of the prospectus under the section titled "The Company." What company is described there?

A. It refers to the company as being MDU Resources Group, Inc.

Q. Does the company that -- the term "the company" include all subsidiaries under Centennial Energy Holdings?

A. I do not believe so. This states it's for the company's first mortgage bonds that are -- would be issued under our mortgage indenture, so that would apply only to MDU Resources and Montana-Dakota Utilities. It's on the first page, the very front of the prospectus, if you look on the very front of the prospectus. If you read the very first

sentence, it says, MDU Resources Group intends from time to time to offer up to $150 million aggregate principal amount of its secured medium-term notes as an additional series of the Company's first mortgage bonds having maturities ranging from 9 months to 35 years.

The only company that's able to issue notes under our mortgage indenture is Montana-Dakota Utilities or the utility.

Q. Lower down on that page of this, and I'm referring to page 3 now, is a section titled "Use of Proceeds." Would you please read that section?

A. "Unless otherwise set forth in a prospectus supplement, the net proceeds from the sale of the notes will be used to retire certain of the company's outstanding senior securities, including the refunding of outstanding first mortgage bonds, and for other general corporate purposes."

Q. Where in that section is there any specific reference to MDU Utilities Company or MDU Utilities Co.?

A. It doesn't state anything in this right here.

Q. Were those retired senior notes issued in the name of MDU Utilities Company or in the name of

the parent company, MDU Resources?

A. Well, they are one and the same. MDU is not a separate -- Montana-Dakota is not a separate corporation. So I believe all our debt is issued in the name of our legal entity, which would be MDU Resources Group, Inc.

Q. Where in this prospectus do we find a statement that the proceeds from the sale will be used only for MDU Utilities Company?

A. Well, I believe when it's saying -- refers to the company, it's talking about the company, MDU Resources Group, which is that legal entity only, and I think if we go down here --

MR. PEARCE: Could I just ask that we be careful for the record. I mean, there is no MDU Utilities Company. It's Montana-Dakota Utilities Company or MDU Resources Group, and I think we may be getting confused if we keep referring to MDU Utilities Company, which doesn't exist.

MR. HOBERG: Thank you, Mr. Pearce.

THE WITNESS: I guess when it refers to the company, it's talking about the legal entity, MDU Resources Group, and that is the same as Montana-Dakota. They're one legal entity. So when it refers to that, you know, I believe what it's

stating is that it is for the company, Montana-Dakota, MDU Resources Group, which is the same legal entity.

MR. BINEK: I have no further questions.

MR. HOBERG: Thank you, Mr. Binek.

Commissioner Reinbold, do you have any questions?

COMMISSIONER REINBOLD: No.

MR. HOBERG: Thank you. Commissioner Wefald?

COMMISSIONER WEFALD: I have none.

MR. HOBERG: Thank you. Commissioner Clark?

COMMISSIONER CLARK: None at this time. Thank you.

MR. HOBERG: Mr. Pearce, do you have any further questions of Mr. Keller?

MR. PEARCE: No.

MR. HOBERG: Thank you, Mr. Keller. Mr. Keller, do you have the exhibit that was handed to you that was marked? Thanks.

Your next witness, please, Mr. Pearce.

MR. PEARCE: I'll call Rita A. Mulkern.

MR. HOBERG: Ms. Mulkern, did you hear the admonition I gave earlier in regard to perjury?

THE WITNESS: Yes, I did.

MR. HOBERG: Being advised of the penalty for perjury, do you promise to tell the truth in this matter being heard? If so, answer I do.

THE WITNESS: I do.

MR. HOBERG: Mr. Pearce, please.

RITA A. MULKERN,

having been first duly sworn, was examined and testified as follows:

DIRECT EXAMINATION

BY MR. PEARCE:

Q. Ms. Mulkern, did you prepare direct testimony and have it prefiled in this case?

A. Yes, I did.

Q. And if I were to ask you the same questions today, would your responses be the same as in that prefiled testimony?

A. Yes, they would.

Q. If you will look at Exhibit 6, I believe it would be, is that your prefiled testimony?

A. Yes, it is.

Q. And to the best of your information and belief, is the information contained in that exhibit true and correct?

A. Yes, it is.

MR. PEARCE: I will offer Exhibit 6 at this time, and I have no further questions.

MR. HOBERG: Any objection to Exhibit 6?

MR. BINEK: No.

MR. HOBERG: Exhibit 6 is admitted. Thank you, Mr. Pearce. Mr. Binek, did you have any questions of Ms. Mulkern?

MR. BINEK: Yes.

CROSS-EXAMINATION

BY MR. BINEK:

Q. Ms. Mulkern, where in your filings can we find the northeast Bismarck expansion costs for 2003?

A. The northeast Bismarck expansion was included in the capital or the plant additions for 2003. The details of that were provided in data request responses.

Q. Are these costs included in the rate base?

A. Yes, they are.

Q. Are they included in depreciation?

A. The depreciation, yes, they would be.

Q. Are they included in operating and maintenance expense?

A. The ongoing, essentially, yes.

Q. Are they included in the high rate of

return?

A. I guess I really can't answer that one.

Q. Okay. I'd like to now have you turn to Statement I, page 2 of 6.

MR. HOBERG: Exhibit 2, the blue book here.

Q. (MR. BINEK CONTINUING) Do you have it?

A. Yes, I do.

Q. Would you please read that paragraph for the record?

A. "See pages 3 through 5 for Montana-Dakota depreciation rates as set forth in a study performed by Stone & Webster Management Consultants, Inc., as of December 31, 1992 for gas and common plant. See page 6 for internally developed rates as of December 31, 2001 for computer equipment and network equipment."

Q. Now would you please turn to page 5 of Statement I?

A. (Witness complies.)

Q. Did your internal studies result in substantial increases to certain depreciation rates?

A. Excuse me. Could you clarify that?

Q. Well, you listed depreciation rates there. Did these internal studies that you've performed result in any substantial increases to any of those

depreciation rates?

A. I believe that these accounts were ones that were not included in the Stone & Webster study and that's why they were developed internally. So they have not changed.

Q. Okay. I'd like to have you turn to page 4 of 6. Is that the Stone & Webster study?

A. Yes, it is.

Q. Is there an account 391 on that page?

A. There is an account 391, office furniture and equipment.

Q. Is that where computer equipment is supposed to be?

A. No. Computer equipment is contained in various subaccounts under the 391. That account would be just for office furniture and equipment.

Q. Did you do a complete depreciation study as of December 31, 2001 or only a piecemeal study of general and common plant?

A. Can you repeat the question again?

Q. Did you do a complete depreciation study as of December 31, 2001, or did you only do a piecemeal study of general and common plant?

A. We did not do a depreciation study as of December 2001, and these depreciation rates set

forth on page 6 were not done either at December 2001.

Q. I refer you back to page 2 of 6. Your last sentence says, "See page 6 for internally developed rates as of December 31, 2001 for computer equipment and network equipment."

A. That means those are the rates in effect as of December 31, 2001, not that they were developed based on December 31, 2001.

Q. When were they developed?

A. I don't recall the exact date that they were done. They were included or used in the last rate case.

Q. The last rate case for the gas utility?

A. Yes, the last rate case for the gas utility.

MR. BINEK: No further questions.

MR. HOBERG: Thank you, Mr. Binek.

Commissioner Reinbold, do you have any questions of Ms. Mulkern?

EXAMINATION

BY COMMISSIONER REINBOLD:

Q. Ms. Mulkern, how long have you been at MDU? I missed that. How long have you been with them?

A. I started with MDU in 1981.

Q. Okay. In your work with MDU have you testified in other cases before the PSC?

A. I have testified before this Commission and Commissions in Montana and South Dakota and Wyoming.

Q. Okay. I was going to ask about the other states, but you answered before I asked.

COMMISSIONER REINBOLD: I have no further questions. Thank you.

MR. HOBERG: Thank you, Commissioner Reinbold. Commissioner Wefald, please.

EXAMINATION

BY COMMISSIONER WEFALD:

Q. Ms. Mulkern, I'm going to ask you the questions I had asked Mr. Fox because I've been referred to you for those questions. And so I asked him, each 1 percent of each -- I have to get out my notes before me.

Each 1 percent of the rates of return, how many dollars does that represent? So, for example, on Exhibit No. 10 where it showed that MDU Gas, let's say in the year 2000, had 11.12 percent and then it dropped in the year 2001 to 1.6 percent, what does each one percent represent, how many dollars?

MR. HOBERG: Do you have Exhibit 10?

THE WITNESS: No, I don't.

Q. (COMMISSIONER WEFALD CONTINUING) It probably is a different dollar number each year.

A. Yes, I guess in -- I guess to try to clarify, in 2001 we had a rate of return on equity of 1.6 percent. And we're saying in 2003 we're going to need $2.84 million. So, basically, to bring us up from 1.6 up to a 13.25, we would need 2.8 million. That's approximate.

Q. The 1.6 return on equity is in the year 2001. And the 13.25, you would like that in the year 2002?

A. The 13.25 is the equity return that we have requested in this case for 2003.

Q. Yes. So did you say that it would take 2.8 million to bring you that number in 2003?

A. That's right.

Q. So what would it take to bring you to that number in 2002? Is it a different number?

A. Yes. I can give you that. It would take $2.2 million to bring -- for 2002 to achieve a 13.25 percent return on equity.

Q. Okay. Thank you. Then you had answered a question from Mr. Binek, but I needed you to show me where that information can be found. The expansion

into north Bismarck, how the costs were recovered from expansion, are they included in your costs for 2002 when you anticipate the rate of return to be zero or the return on equity to be zero?

A. The costs for the northeast Bismarck expansion are -- in the rate case are the same costs as for any other new customer. The customers in northeast Bismarck will be paying a contribution for any costs over the extension policy, and according to that, they would give a contribution. So the costs in the case are the same as for any other new customer. And, also, the volumes associated with those new customers are also included in the case. Did I not answer your question?

Q. So you gave a dollar figure earlier to how much money. You said something had been returned in discovery. Can you just share that with me, because I haven't seen those discovery?

A. It's included in the discovery response dated July 25, and it is response No. 2.

Q. And do we have that in the materials that have been shared with the Commission?

A. We provided copies to the Commission.

Q. Where would I find that?

MR. HOBERG: Mr. Binek, do you have copies

of those data responses?

MR. BINEK: We should have copies of them.

Q. (COMMISSIONER WEFALD CONTINUING) But I wondered whether they had been provided to the Commissioners as part of your case.

A. They were not part of the case that was filed initially, but they were provided as -- detail provided as a data request. We did give a copy -- sent a copy, I believe, to the Commission.

Q. All right. So I would go back into the record for that.

MR. BINEK: Those are not a part of the record, Commissioner. Data requests are not a part of the record.

COMMISSIONER WEFALD: She told me she sent a copy to the Commission so I'm assuming she sent a copy to us. Is that wrong?

MR. BINEK: To the Commission staff.

COMMISSIONER WEFALD: Then we don't see that.

Q. (COMMISSIONER WEFALD CONTINUING) So I'm asking, is that information confidential, or is it available to the Commissioners?

A. It's available to the Commissioners.

Q. Where would I find it?

A. If someone could provide a copy of the data request response.

MR. HOBERG: Well, you have all of those, Mr. Binek. Do you make those available to the Commissioners?

MR. BINEK: We can make those available to the Commissioners. The consultant -- they were data requests that were made by the consultants.

COMMISSIONER WEFALD: I would like to see it, just that one.

MR. HOBERG: Just the one.

MR. BINEK: Pat said he could find it. Do you want that to be an exhibit in the record, or what?

COMMISSIONER WEFALD: I would prefer if Ms. Mulkern can just tell me the answer, but she's referring me to this exhibit, to this data request, so I would just like to have the information.

MR. HOBERG: Ms. Mulkern, do you recall the question? Can you give the response without looking at the exhibit?

THE WITNESS: If someone would provide me with a copy of the data request responses, I can do that.

MR. HOBERG: Okay.

THE WITNESS: It's been a while. Can you repeat the question?

Q. (COMMISSIONER WEFALD CONTINUING) Thank you. I just wondered, the 500 -- you mentioned a figure and I don't know exactly what it was. You mentioned a figure for the cost for the expansion in north Bismarck.

A. Okay. I think what you might be referring to earlier is Mr. Fox was talking about the service lines, where the company will own the service lines, and that he gave a figure of $500,000 and that was for the total company. For North Dakota for owning the service lines, it's going to be about $184,000. For the Bismarck expansion project we have about $120,000 in for 2002 and about $150,000 in for 2003.

COMMISSIONER WEFALD: Okay. Thank you. That's all my questions.

MR. HOBERG: Thank you, Commissioner Wefald. Commissioner Clark, please.

EXAMINATION

BY COMMISSIONER CLARK:

Q. Looking at that Exhibit 10, which is Mike Diller's memo to the Commission, what was the reason for -- what was the difference in 2001 compared with '98, '99, 2000 that drove the ROE down 10 percent?

A. There were various reasons. One of the main ones was the operation and maintenance expenses.

Q. That would account for how much of that?

A. About $770,000, or the difference in increase in operation maintenance expenses from 2000 to 2001.

COMMISSIONER WEFALD: Are you referring to a specific statement?

THE WITNESS: Not one that is included in the filing.

Q. (COMMISSIONER CLARK CONTINUING) So $770,000 out of -- what would the total be?

A. That was the increase from --

Q. So that would account -- 770,000 would increase the rest. Out of how much of an increase in expenses?

A. Out of 12.2 million.

Q. Okay. So we've got a ways to go there. What's some of the other?

A. Others would be --

Q. I'm just trying to get at what was, you know, so different about that year as opposed to the other years previous to it, the other three years previous.

A. There would be a difference in sales volumes between the two years that would have contributed, and then some of the other reasons we've given in the case that we filed, increases in depreciation and taxes other than income.

Q. Is there, you know, like one document that I can go to somewhere in the testimony or the file exhibits that's going to kind of break that down for me real easily?

A. One place you can look is in the annual report to the Commission that we file. There is a comparison in that report each year comparing to the previous year, so if you look in the report for 2001 there will be a comparison to the year 2002 in there.

Q. Let's go to the 770,000 for operating and maintenance. Could you break that down a little for me?

A. One of the increases would be, of course, due to labor expense.

COMMISSIONER CLARK: Maybe I should do this: Will Ms. Mulkern be available later on after staff?

Q. (COMMISSIONER CLARK CONTINUING) I assume you'll be part of the rebuttal.

A. Yes, I will.

COMMISSIONER CLARK: Okay. Maybe it would be better to delve into some of this more in-depth stuff later on after the staff case and during rebuttal. We can hone in on some of this stuff more specifically.

MR. HOBERG: Any further questions?

COMMISSIONER CLARK: No.

MR. HOBERG: Any further questions by the Commission of Ms. Mulkern? Mr. Pearce, any further questions?

MR. PEARCE: No.

MR. HOBERG: Mr. Diller?

EXAMINATION

BY MR. DILLER:

Q. I'm going to have to help the Commission in the end and to make sense of all this I want to make sure I understand your answer, Rita. You've mentioned a couple of numbers, 184,000 for the cost of the policy change, is that revenue requirements, rate base expense? What is that number?

A. That is the capital investment in plant for service lines.

Q. Just the capital investment. Is it the same answer for the expansion costs, that that's

rate base then?

A. That's right. That's also the capital addition for the plant.

MR. DILLER: Okay. Thank you.

MR. HOBERG: Thank you, Mr. Diller. Anything further then of Ms. Mulkern at this time? Thank you, Ms. Mulkern.

Mr. Pearce, witness No. 7.

MR. PEARCE: I'll call Richard Espeland.

MR. HOBERG: I guess it's not witness 7. Exhibit 7 is his testimony. Witness 5.

Mr. Espeland, did you hear the admonition I gave earlier in regard to perjury?

THE WITNESS: Yes, I did.

MR. HOBERG: Being advised of the penalty for perjury, do you promise to tell the truth in this matter being heard? If so, answer I do.

THE WITNESS: Yes, I do.

MR. HOBERG: Mr. Pearce, please.

RICHARD A. ESPELAND,

having been first duly sworn, was examined and testified as follows:

THE WITNESS: If I don't speak up loud enough, please tell me to try and force it out a little bit more.

DIRECT EXAMINATION

BY MR. PEARCE:

Q. Mr. Espeland, in the course of this case, did you prepare and have filed with the Commission direct testimony of Richard A. Espeland?

A. Yes, I did.

Q. Okay. And looking at Exhibit 7, if you will, is that the same testimony from you that was prefiled?

A. That's correct.

Q. And if I were to ask you the same questions, would you give the same answers today?

A. Yes, I would.

Q. And to the best of your information and belief, is all the information contained in your testimony true and correct?

A. It is correct.

MR. PEARCE: I'll offer Exhibit 7. At this time I have no questions.

MR. HOBERG: Any objection to Exhibit 7?

MR. BINEK: No.

MR. HOBERG: Exhibit 7 is admitted. Thank you, Mr. Pearce.

Mr. Binek, do you have any questions of Mr. Espeland?

MR. BINEK: Yes, I do have some questions.

CROSS-EXAMINATION

BY MR. BINEK:

Q. Mr. Espeland, you will agree that the costs of this plan have never been included in rates in North Dakota, wouldn't you?

A. That's correct.

Q. Why do you contend that the cost should now be borne by ratepayers?

A. When the program was implemented in 1982, it was not as common as they are today. It was more of a visionary plan. And today it's extremely common practice for these type of supplemental retirement plans to be in place. And it's appropriate for them to be in the rate base because it's part of doing business for those types of positions, as part of their total compensation program when you look at all of their compensation and benefits.

Q. Are you saying or suggesting that MDU's shareholders do not benefit from the efforts of these employees?

A. Both shareholders and customers benefit from these employees.

Q. But you're asking the ratepayers to pay

these costs, aren't you?

A. I think it's appropriate for the ratepayers to pay their portion of the cost for those employees, for the value they receive from those employees.

Q. But aren't you asking that the entire cost be on the ratepayers?

A. Yes.

Q. So you believe that the ratepayers are the only ones who benefit?

A. I think the ratepayers are the ones that have direct benefit from efficient, safe, reliable service. But, obviously, the stockholders of MDU Resources also benefits by a company that provides good services and a good rate of return and good customer service.

Q. Isn't one of the primary responsibilities of key employees is to make a profit for the company that in turn provides a dividend to shareholders?

A. That's correct.

Q. Your testimony in this case is essentially the same as it was in the MDU electric case that we heard a few months ago, isn't it?

A. That's correct. Yes, it is.

Q. Earlier I made reference to the findings of

fact, conclusions of law and order in the Commission's decision. In that case, which is PU-399-01-186, that decision issued on April 24, 2002, and the Commission has taken -- I believe has taken administrative notice of that decision.

Do you recognize the document that I've just handed you as a copy of that order?

A. I recognize it as what you referred to. I have not seen it previously.

Q. Would you please read paragraphs 66 and 67?

A. Paragraph 66, "Staff objects to including SISP in ratemaking expense. Diller testified that while the plan has been in effect since 1982, the company has never sought rate recovery in any subsequent electric or gas rate case. Staff opposes spending a million dollars a year on the benefit for a few employees. In addition to SISP, employees that are allowed to participate in SISP are paid very well, minimum of 75 to 80,000 per year, and participate in all other benefits offered to regular employees such as health insurance, life insurance, 401(k) participation, profit-sharing plans, incentive plans, defined benefit plans, Social Security, and discounted gas and electric service for those living in MDU's service territory."

Paragraph 67, "Diller testified that MDU's plan lacks symmetry and pointed out that the SISP benefits are heavily weighted in favor of the high-end salaried employees participating in the plan. For instance, an employee making $50,000 a year would receive a monthly SISP benefit of $1,330 per month, compared to a monthly benefit of $30,000 for an employee making $600,000 a year. In the case of a low-end employee, the monthly benefit calculates to be 2.66 percent of annual salary, compared to the high-end employee who would receive a monthly benefit of 5 percent of annual salary. Diller noted that only 27 employees of MDU's gas and electric employees are considered to be key employees."

Q. Is there anything factually incorrect in this description of Mr. Diller's testimony?

A. His facts and his math is correct to the extent it goes, yes.

Q. Okay. The number of employees, does that differ, the number of employees covered for this company, or is it the same employees basically covered?

A. Same basic group.

Q. And you read the description of benefits that these employees receive. Is that still true,

that they receive the same benefits that were described in the Commission's order in the electric case?

A. That's correct. Receive the same benefits.

Q. Isn't it true that even if this Commission doesn't allow the cost of this plan to be recovered in rates, the shareholders can continue to provide the benefit at shareholder expense? They can continue the plan just as it is right now, right?

A. Certainly they can and they may, because it's a competitive benefit that you need to attract and retain qualified people to run those operations and provide the service.

Q. What are the income ranges of the employees covered by this plan?

A. Montana-Dakota's range would be approximately $75,000 to its president, around 250,000 to 300,000.

Q. Does Montana include SISP as a cost to ratepayers?

A. I would defer to the regulatory staff on that, but I do not believe so.

Q. Does Wyoming include SISP as a cost to ratepayers?

A. The same answer. I would defer, but I

don't believe so.

Q. Same question for South Dakota?

A. And I don't believe so. I defer. At least I'm consistent.

Q. And as we've noted earlier, the North Dakota Commission has not included?

A. Not to this point.

Q. And, again, your testimony in this case and the position of Montana-Dakota Utilities Company is basically the same as it was in the electric rate case; isn't that correct?

A. That's correct. I provided a bit more information in my rebuttal testimony, but the basic facts remain the same.

Q. The electric case, a portion of that decision has been appealed by Montana-Dakota Utilities Company to the District Court. Isn't it true that the decision the Commission made on SISP, on the SISP issue, was not appealed?

A. I believe that is correct.

MR. BINEK: At this time, and I think administrative notice does this, but I just want to make certain that the findings of fact, conclusions of law and order in that electric proceeding would be incorporated into and made a part of this

proceeding.

MR. HOBERG: Yes, official notice would include that.

MR. BINEK: I have no further questions for this witness.

MR. HOBERG: Thank you, Mr. Binek.

Commissioner Reinbold, do you have any questions?

COMMISSIONER REINBOLD: I think I do, a couple of them.

EXAMINATION

BY COMMISSIONER REINBOLD:

Q. A good deal of the questions and the answers were relative to the electric case that was before us and the parallel. How can it be that the electric and the gas case benefits and circumstances are practically the same even though MDU has some areas of the state that are only gas and some that are only electricity? How do you account for the perfect parallel?

A. I'm not sure there's a perfect parallel, but the management group are similar and common. The amount of time they spend in the respective areas are allocated out based on where they spend their time, as would these costs. So we believe,

you know, as a group of costs and group of employees and it's allocated out based on where they do their work. Some may be full electric and some may be full gas, and others are split.

Q. Maybe some are just -- is the company something like Melroe? Is that a parallel in management and management salaries, and so on, to MDU? Do you know anything about Melroe here?

A. That keeps changing, but it's similar for the Bobcat division, so to some extent, but more Ingersoll-Rand would be a parallel to MDU Resources at a corporate level, but we don't pay those kind of salaries or benefits.

Q. And say a few words about MDU employee retention. How does MDU do? And compare it to whatever you want to compare it to. That's a pretty broad question. Take a shot at it.

A. I think retention is one of our goals, because if you want safe, reliable service, you need people that know history and what's been going on in the past, as well as how it all works. So retention is a goal and I think we've been very successful at that, providing a great place to work, providing competitive pay and benefits to the extent we're allowed to, and having them motivated by what they

do, providing a public service. There's a lot of motivation in that. And so I think we are a desirable place to work.

Q. So that's one of your goals you say?

A. Oh, absolutely.

Q. Getting back to the allocation of time and effort and salary because of the natural gas and the electric services, is it conceivable that, for example, somebody like Don Ball would be working 85 percent in natural gas and 5 percent in electricity?

A. Currently, I suppose his current time is spent more on the gas side than electric side because of the rate case, but I think over time that would not necessarily be true, but Mr. Ball would know better how he allocates his time.

Q. Just a curiosity on my part because we do see him a great deal. And nobody was going to catch on the fact that I don't add up to 100 percent here.

MR. HOBERG: Where's the other 10 percent?

THE WITNESS: We consider that overtime and extra effort.

COMMISSIONER REINBOLD: I guess that's all my questions. Thank you.

MR. HOBERG: Thank you, Commissioner Reinbold. Commissioner Wefald, please.

EXAMINATION

BY COMMISSIONER WEFALD:

Q. How many dollars is the company requesting in this case for SISP?

A. For the gas case I believe it's between 250 and $260,000 per year for 2002 and 2003.

Q. Where would I find this information? Where would I find that dollar number?

A. I'm going to defer in part to Rita and Tamie, but I found it someplace.

Q. Just take your time.

A. I believe it's in Statement N, as in November, page 8 of 23.

Q. Thank you. Page 8 of 23. It shows zero for the year 2001?

A. That's correct.

Q. And that's because nothing was allowed by the Commission?

A. Right. It has not been included previously.

Q. And so then you showed in 2002 a number and then 265,000 in 2003?

A. Right.

COMMISSIONER REINBOLD: Okay. Thank you.

MR. HOBERG: Thank you. Any further

questions, Commissioner Wefald?

COMMISSIONER WEFALD: No.

MR. HOBERG: Thank you. Commissioner Clark, please.

COMMISSIONER CLARK: I have no questions. Thank you.

MR. HOBERG: Thank you. Mr. Pearce, any further questions of Mr. Espeland?

MR. PEARCE: Just a couple.

REDIRECT EXAMINATION

BY MR. PEARCE:

Q. Mr. Espeland, I think you've already alluded to this indirectly, but it is true, isn't it, that all of the SISP costs is not assigned to all of the utility operations?

A. Oh, absolutely. Only the portion that would apply directly to the utility.

Q. So SISP is applied to other operations?

A. Yes.

Q. Now, the meter fact that Montana-Dakota Utilities didn't appeal the SISP decision doesn't mean that you've changed your mind, does it, on the value of SISP?

A. Has not changed my mind at all.

Q. And all of the ratepayers benefit from all

of the compensation given to or provided for employees, don't they?

A. That's correct.

MR. PEARCE: That's all I have.

MR. HOBERG: Thank you, Mr. Pearce.

Anything further then of Mr. Espeland?

MR. BINEK: No.

MR. HOBERG: Thank you, Mr. Espeland.

THE WITNESS: Thank you very much.

MR. HOBERG: And your next witness, please, Mr. Pearce.

MR. PEARCE: Call Mr. Russell Feingold.

MR. HOBERG: Mr. Feingold, were you here earlier when I gave the admonition in regard to perjury?

THE WITNESS: Yes, I was.

MR. HOBERG: Being advised of the penalty for perjury, do you promise to tell the truth in this matter being heard? If so, respond I do.

THE WITNESS: I do.

MR. HOBERG: Thank you. Mr. Pearce, please.

RUSSELL A. FEINGOLD,

having been first duly sworn, was examined and testified as follows:

DIRECT EXAMINATION

BY MR. PEARCE:

Q. Mr. Feingold, you were retained in this proceeding by the applicant as an expert outside consultant; is that right?

A. That's right.

Q. And did you prepare or have prepared under your direction and control direct testimony consisting of answers and questions that was prefiled in this case?

A. Yes, that's correct.

Q. Looking at Exhibit 8, if you would, does that contain -- is that a copy of your prefiled direct testimony?

A. Yes, it is.

Q. Do you have any corrections that need to be made in your prefiled testimony?

A. No, I don't.

Q. To the best of your information and belief, is the information in that testimony, Exhibit 8, true and correct?

A. Yes, it is.

MR. PEARCE: I'll offer Exhibit 8. I have no direct questions.

MR. HOBERG: Thank you. Any objection to

Exhibit 8?

MR. BINEK: No objection.

MR. HOBERG: Exhibit 8 is admitted.

Mr. Binek, do you have any questions of Mr. Feingold on direct, please?

MR. BINEK: Yes.

CROSS-EXAMINATION

BY MR. BINEK:

Q. Mr. Feingold, on page 5 at lines 15 through 18 you discuss the wider acceptance of three-part rates for gas distribution service. Do you see that reference in your testimony?

A. Yes, I do.

COMMISSIONER REINBOLD: What number?

MR. BINEK: Lines 15 through 18 on page 5.

COMMISSIONER REINBOLD: Thank you.

Q. (MR. BINEK CONTINUING) Would you describe these rates?

A. Yes. These rates generally consist of tariffs that include a rate structure with multipart components of rates. Typically, there's a -- for gas companies a commodity charge, which would be charged on a variable basis, and then there would be fixed charges, in some cases a demand charge or a capacity charge and then a customer or monthly

service charge.

Q. I take it you believe that these are preferable to the two-part rates now in use by MDU in North Dakota; is that correct?

A. They are preferable from a strict cost recovery perspective. I think I allude in my testimony to the fact that in some cases for smaller customers you may not be able to apply a three-part rate as easily as you would to a larger customer.

Q. Why haven't you proposed these rates for MDU?

A. Well, I think you'd have to ask MDU's company witness, but I can give you my perspective from the standpoint of someone who is commenting on the tariffs. And I believe that with regard to the smaller customers, i.e., the residential customers, there is not metering capability at this point to fairly apply a three-part rate to the smallest customer served on the system. In lieu of that, though, one of the proposals that the company is making is to try to recover a greater component of fixed costs from fixed charges, which is why the company has proposed the monthly service charge proposal it has.

Q. If you were to propose three-part rates, to

what types of customers would they apply?

A. Well, if I look at other utilities in North America, typically the ones that have three-part rates applied to them first and foremost are larger, more sophisticated customers where the economics permit the use of daily demand metering technology or equipment to be able to fairly assess at least the demand or capacity component of the charges.

Q. Do you recommend that this Commission direct its gas utilities to develop three-part gas rates?

A. I think it's something that's worthwhile looking at in the future. I think in response to a data request that was asked of me by staff I alluded to the fact that in Connecticut, for example, the Commission in Connecticut has actually looked at and has approved three-part tariffs for midsize general service type customers.

Q. Much of your testimony is devoted to supporting the company's proposed increases in customer charges; is that correct?

A. Yes. Although, I would say more generally it's to recognize the fact that fixed costs should be recovered from stable or fixed components of the tariff.

Q. Are you familiar with similar proposals in other states?

A. In other states served by the applicant?

Q. By the applicant or in other states in general.

A. Yes.

Q. In both cases?

A. Yes.

Q. Have these proposals encountered much opposition?

A. Well, I'm not sure how you define "much opposition." Certainly, from my perspective, they're eminently reasonable. And in some cases there has been a disproportionate amount of movement toward cost-based fixed charges.

Q. Where there has been opposition, from whom has the opposition been expressed?

A. The opposition has been expressed primarily from consumer advocates, entities that are representing smaller, perhaps lower income customers, because their contention is that perhaps those customers would be experiencing a larger increase than would be warranted at that point in time.

Q. Have Commissions generally supported

efforts to double or triple customer charges as Montana-Dakota Utilities proposes in this case?

A. Well, I think, first, in the case of Montana-Dakota the proposal is to move from a $6.50 per month charge to $11.70, which is 39 cents per day as proposed. I don't think I've seen tripling of proposals as you are suggesting.

Q. What about the large customer?

A. What about large customers?

Q. Have their rates more than doubled or proposed charges, customer charges more than doubled?

A. Yes. However, it's a very different situation with larger customers because the revenues or the billings that are associated with the fixed monthly charge is a much larger -- smaller percentage of the customer's total bill, so they don't see it in the same way that a smaller customer would necessarily --

Q. But would you agree --

A. -- so it is more acceptable to Commissions, in my experience.

Q. I'd like to have you turn to page 8 of your testimony, lines 18 to 19. There you mentioned FERC's straight fixed-variable rate design for

interstate pipelines. Would you please describe that rate design?

A. Yes. Essentially, the FERC fixed-variable rate design is a -- I characterize it as a cost classification and allocation method that recovers fixed costs through a capacity or demand charge and variable costs through a commodity charge.

Q. Isn't the fixed part of that rate design tied to the maximum volume throughput of the customer and not to the customer's existence as a pipeline user?

A. Yes. And rightly so because pipelines don't serve hundreds of thousands of customers as an LDC does so they don't tend to classify and treat those costs in the same way that an LDC does.

Q. Would you agree that the appropriate analogy to FERC's fixed charges at the distribution level would be to a demand charge such as you discussed earlier and not to current customer charge?

A. From a strict rate design point of view, I would agree with you, but we have to recognize that some of the costs that are captured in the pipeline's capacity charge are costs that are appropriately recovered in the monthly customer

charge for an LDC.

Q. From page 12 on in your testimony you discuss the alternative distribution delivery stabilization mechanism which the company is proposing as an alternative to increasing customer charges. Just to refresh the Commission's memory, would you please provide a brief description of this mechanism?

A. Yes. The distribution delivery stabilization mechanism or more appropriately, the acronym DDSM, is a proposal that essentially adjusts the company's non-gas costs or a distribution margin to reflect changes in consumption as a result of changes in weather patterns.

Q. Do other utilities in other states have weather normalization adjustment mechanisms?

A. Yes.

Q. Are you familiar with these adjustments?

A. Yes, I am.

Q. Can you describe some of those mechanisms?

A. I'm not sure what aspect you're actually looking for me to describe beyond the general description I just gave you, which is essentially defining how all of the other mechanisms that I'm familiar with operate generally and what -- their

structure to accommodate.

Q. Do those mechanisms typically have a year's delay in the pass-through of the effect to warmer or colder weather?

A. There are some distribution utilities in North America that do have that feature, yes.

Q. Do most of them?

A. Most of them do not.

MR. BINEK: I have no further questions.

MR. HOBERG: Thank you, Mr. Binek.

Commissioner Reinbold, do you have any questions of Mr. Feingold?

COMMISSIONER REINBOLD: Just a couple of questions.

EXAMINATION

BY COMMISSIONER REINBOLD:

Q. Have you been to North Dakota before this hearing?

A. Yes, I have, but have not testified before.

Q. Okay. Have you ever been to Mandan, North Dakota?

A. Yes, I was, and I think I was lost when I was driving.

Q. Okay. I don't have any real -- well, I've got a couple questions here just to make sure you

earn your money. RAFFCOSNCIFERCDDSMWNADSANUADZCK. What did I just say?

A. You mentioned every acronym that's in my testimony.

Q. Do you believe what I said to be an acronym?

A. It's a pretty long one, but, yes, I do.

Q. Quite technically it's not an acronym, unless it sounds like it might be a word and I can't imagine any of these being a word.

COMMISSIONER REINBOLD: That's all the questions I have at this time, but stay loose.

THE WITNESS: Okay. Thank you.

MR. HOBERG: Thank you, Commissioner Reinbold. Commissioner Wefald, please.

EXAMINATION

BY COMMISSIONER WEFALD:

Q. On page 9 of your testimony -- I have trouble seeing the lines. I think it's 18 through 20 on page 9.

A. Yes.

Q. The proposed basic service charge increases will also ensure recovery by the company of a greater portion of its fixed costs of providing service.

If the higher customer charges were put in place, what proportion of the -- what proportion of the amount of income that MDU wishes to recover would be recovered by the basic service charge?

A. I think the way that I could answer that, Commissioner, is if you turn to page 10 of my testimony --

Q. Okay.

A. -- lines 20 through 23, I try to quantify, I think, the question that you posed, and that is if the monthly basic service charges were increased, and I focused on the residentials and general service customers, I talk about the amount of fixed costs that would be recovered. So, for example -- well, on page 10 in particular I say that there's still roughly $1.5 million of remaining customer-related costs and 3.3 million of fixed demand-related costs represented by 25 percent, so we're saying that roughly 75 percent of the fixed costs for the residential and general are recovered through the customer charge or monthly service charge.

Q. That being the case, would MDU have a greater opportunity to overreturn from those customer -- let's say the residential customer

group?

A. I don't believe so. And the reason I say that is because the costs that would be recovered in those basic monthly service charges represent the non-gas cost margin that would be established as a result of this rate proceeding. So under the assumption that that set number of dollars that represents distribution margin is what the company requires to have the opportunity to earn a fair rate of return, it's entirely appropriate to recover those in the fixed charges of those classes, but it doesn't in any way suggest that there would be the opportunity for overrecovery because of the way that they are being recovered through those charges.

Q. Why wouldn't there be an opportunity for overrecovery? Because in some years even with the present -- even with the present rate structure, if you have a really good year where it's cold and you're selling a lot of natural gas, then you're able to recover more income, and so why wouldn't that just be exacerbated then? I know you're going to be decreasing the cost of the natural gas to some extent for those customers, but still if you have a year where you're selling more than the normal, just explain that to me, why that would be there.

A. Certainly. I mean, if we recognize that the monthly service charges are applied on a customer's bill by essentially a monthly charge, so, in other words, if you have a $10-per-month monthly customer charge, whether you use zero decatherms of gas or 10 decatherms of gas in a particular month, you will be charged $10 because that reflects the recognition that the company incurs fixed costs that don't change whether the customer uses zero gas or 10 units of gas. Okay. So if it's a colder than normal year versus a warmer than normal year, it will not impact that $10-per-month charge applied to the number of customers served by the utility. In fact, it takes weather-sensitivity away from the utility business and instead of exacerbating, actually ameliorates the situation that you talk about with swings because of weather and that's one of the main reasons that this is being proposed.

Q. Are you the person to ask questions about how the rate design was done to establish that this is the correct amount of the residential gas service charge?

A. Well, I think the best person to ask that would be the next witness, Mrs. Aberle, but what I can answer here is that in reviewing the company's

embedded cost-of-service study, I was convinced that the numbers that came out of that study formed the basis for evaluating what rate level should we set in this case, so I'm comfortable with that connection. But I think she can talk to it in more detail.

Q. But it all depends on the assumptions that are put into that gas cost-of-service study as to which things are given to which customer group, correct?

A. That's correct, but I would venture to say based on my review of Mr. King's testimony, that with regard to the customer-related costs that form the basis for the monthly service charges, staff and the company are really not that far apart. It's a matter of how far do you go and how fast to get to cost-based rates.

COMMISSIONER WEFALD: Thank you.

MR. HOBERG: Thank you, Commissioner Wefald. Commissioner Clark, please.

COMMISSIONER CLARK: I have no questions. Thank you.

MR. HOBERG: Any further questions then of Mr. Feingold? No further questions. Thank you, Mr. Feingold.

THE WITNESS: Thank you.

MR. HOBERG: You have one more witness on direct?

MR. PEARCE: Yes. I'll call Tamie Aberle.

MR. HOBERG: Ms. Aberle, were you here earlier when I gave the admonition in regard to perjury?

THE WITNESS: I was.

MR. HOBERG: Being advised of the penalty for perjury, do you promise to tell the truth in this matter being heard? If so, answer I do.

THE WITNESS: I do.

MR. HOBERG: Mr. Pearce, please.

TAMIE ABERLE,

being first duly sworn, was examined and testified as follows:

DIRECT EXAMINATION

BY MR. PEARCE:

Q. Did you prepare the direct testimony of Tamie Aberle that's been prefiled in this case?

A. I did.

Q. Looking at Exhibit 9, is that a copy of your testimony as prefiled?

A. Yes, it is.

Q. And if I were to ask the same questions,

would you give the same answers as are in that testimony?

A. Yes, I would.

Q. And to the best of your information and belief, is all of the information contained therein true and correct?

A. Yes.

MR. PEARCE: I will offer Exhibit 9 at this time, and I have no further questions on direct.

MR. HOBERG: Any objection to Exhibit 9, Mr. Binek?

MR. BINEK: No.

MR. HOBERG: Exhibit 9 is admitted. Thank you, Mr. Pearce. Mr. Binek, any questions of Ms. Aberle?

MR. BINEK: Just a few.

CROSS-EXAMINATION

BY MR. BINEK:

Q. Concerning your proposed distribution and delivery stabilization mechanism that you discuss on page 12 of your testimony, do I understand this mechanism is being proposed only as an alternative to the dramatic increases in customer charges?

A. It is our secondary proposal in lieu of the increased customer service charges that we have

proposed.

Q. Okay. So does this then mean that if the company get the customer charge increase it is seeking in this case, the DDSM proposal is withdrawn?

A. Correct.

Q. What if the company get no rate increase whatever or even a rate reduction, what happens to the DDSM proposal?

A. I'm sorry. I believe I might have misspoken on your earlier question. I was speaking of the increase in the basic service charges, not the overall revenue increase. Our DDSM proposal would apply regardless of the increase or decrease in the overall rates, if we were not to receive the basic service charges that we proposed.

Q. Okay. But if you got the basic service charges, then you're not seeking the DDSM?

A. Correct.

MR. BINEK: That's all I have for right now.

MR. HOBERG: Thank you, Mr. Binek.

Commissioner Reinbold, do you have any questions?

COMMISSIONER REINBOLD: None at this time.

Thank you.

MR. HOBERG: Thank you. Commissioner Wefald, please.

COMMISSIONER WEFALD: No, I have no questions at this time.

MR. HOBERG: Thank you. Commissioner Clark?

COMMISSIONER CLARK: None. Thank you.

MR. HOBERG: Anything further then of this witness at this time?

MR. PEARCE: Nothing.

MR. HOBERG: Thank you, Ms. Aberle.

Let's take a 10-minute recess at this point.

MR. BINEK: Could we take a little bit longer time? I wasn't anticipating that my witnesses would be going up this soon.

MR. HOBERG: Fifteen minutes?

MR. BINEK: I think 15 minutes.

MR. HOBERG: Okay. We'll be back at 25 to 3:00, please.

(Recess was taken.)

(Exhibits 15-48, 16 and 17 were marked for identification.)

MR. HOBERG: We are back on the record

after a fairly short recess.

Before we begin the direct -- or the presentation of the State's case, we perhaps have some unfinished business. We have a couple of exhibits from MDU, is that correct, Mr. Pearce?

MR. PEARCE: Yes. I don't believe that I formally offered Exhibits 1 and 2. That's the application and the book of statements. I'll offer them at this time.

MR. HOBERG: Mr. Binek, any objection to 1 and 2?

MR. BINEK: No.

MR. HOBERG: Okay. Exhibits 1 and 2 are admitted. Thank you. Mr. Binek, please.

MR. BINEK: Thank you. I'll call Charles King.

MR. HOBERG: Mr. King, did you hear the admonition I gave in regard to perjury earlier?

THE WITNESS: Yes, I did.

MR. HOBERG: Being advised of the penalty for perjury, do you promise to tell the truth in this matter being heard? If so, answer I do.

THE WITNESS: Yes, I do.

MR. HOBERG: Thank you. Mr. Binek, please.

CHARLES W. KING,

having been duly sworn, was examined and testified as follows:

DIRECT EXAMINATION

BY MR. BINEK:

Q. Please state your name for the record.

A. My name is Charles W. King.

Q. And what is your occupation, Mr. King?

A. I'm president of the economic consulting firm of Snavely King Majoros O'Connor & Lee.

Q. And what is your address, business address?

A. 1220 L Street N.W., Suite 410, Washington, D.C.

Q. Mr. King, have you -- how long have you been engaged in your present occupation?

A. In the present occupation close to 40 years. Virtually all my professional life.

Q. And you have testified in a number of state utility rate proceedings?

A. Yes. I've distributed a listing of my appearances and if you count them up, they come to over 300.

Q. Okay. And you have also appeared before the North Dakota Public Service Commission, have you not?

A. Yes. I appeared in MDU's electric case earlier this year and last year in Xcel's gas case.

Q. Let's see. Mr. King, I show you what has been marked as Exhibit 15-48. And can you identify that exhibit?

A. That's my testimony. I believe my exhibits are attached to it. Yes.

Q. And was this testimony prepared by you or at your direction?

A. Yes, it was.

Q. Are there any corrections that need to be made to your testimony?

A. No, there are not.

Q. And if I ask you the same questions today that are in your testimony, would your answers to those questions be the same as stated in your prefiled testimony?

A. Yes, they would.

Q. You also have before you Exhibits 16 and 17. Would you identify those exhibits?

A. One of them is a month-by-month statement of MDU's working capital, and the other one is an exhibit from the earlier MDU case, the electric case of earlier this year, and -- which shows the respective revenue sources for a number of

utilities.

MR. BINEK: Okay. At this time I will offer Exhibits 15, 16, and 17.

MR. HOBERG: Mr. Pearce, any objection to any of those exhibits?

MR. PEARCE: No.

MR. HOBERG: Exhibits 15, 16, and 17 are admitted.

MR. BINEK: Thank you.

Q. (MR. BINEK CONTINUING) At this time, Mr. King, I would like to ask you to give a summary of your testimony and also any rebuttal that you -- or any responses that you might have to the rebuttal testimony that has been filed by Montana-Dakota Utilities in this case.

A. Certainly. In the interest of time, I don't think I will go through in detail the portions of my testimony principally relating to rate design where I don't think there is any disagreement between us and the company. Unfortunately, most of my rate-of-return testimony there is disagreement.

The testimony overall deals with four subjects; the rate of return, cost allocation; that is, classed cost allocation, rate design, and, finally, the DDSM proposal. The cost -- I'm sorry.

Cost-of-capital testimony in turn has three parts. One is capital structure. The other is cost of the debt, and the other is cost of equity, and we don't seem to agree with MDU on any of them.

With regard to capital structure, there are two disagreements. One is that I include short-term debt and the company does not. And the other one is I used a historical 2001 capital structure and the company does a projected 2003 capital structure.

With regard to short-term debt, the reason for including short-term debt is that portions of the rate base are financed by short-term debt. If short-term debt were used for things totally out of rate base, such as expenses, then maybe we could exclude it, but, obviously, when you have elements that are in the rate base that vary throughout the year, why the company has to use short-term debt to finance that. And that's why I have my exhibit -- what is it -- 16 or 15? I didn't write it down. Sixteen, and this is taken from the company's Statement E.

And it's -- unfortunately, it is four of the five items that make up working capital. I did not -- I neglected to put in DSM expenses, but it wouldn't detract from what the exhibit shows, which

is throughout the year there is significant variation in the amount of working capital. And when you have that kind of variation, it's necessary to finance it through short-term debt. So I suggest that contrary to what the company says, it does not finance its working capital with long-term debt and equity, that there is an element of short-term debt. To be sure, it is a small amount. And you will find in my capital structure a relatively small amount of short-term debt.

As regards the forecast capital structure, the company's position in this case is considerably different than it was in the electric case. In the electric case the company accepted a historical end-of-year 2000, in that case 2000 capital structure. In this case the company wants a forecast capital structure. And I think it's mid -- it's the average for the year 2003. Now, the reason one uses future test years is to capture exogenous effects or outside effects, such as inflation, and in this case, the necessary expansion of the system into the northern suburbs of Bismarck.

These are things that are objectively determined. They are reasonably knowable. They are reasonably objectively analyzed. The capital

structure of the company is a creation of its own management. If the company says that its capital structure is going to change, there is no way of determining that, in fact, it will change in that manner. For this reason, most Commissions use historical -- recent, but historical capital structures, unless the company can articulate why the capital structure will change. Otherwise, you invite the company to engage in gaming of the regulatory system by projecting a capital structure usually with more equity than debt so that the overcomposite becomes more expensive. And I don't think the company should be permitted to do that in this case.

The debt cost we have a significant difference in. The company is proposing that the debt be limited to first mortgage bonds with a cost of 9.302 percent. I have proposed that we use a parent company's debt cost, which includes 6.167 percent. If -- I don't know if you want to look it up, but if you would want to look it up, Statement A, which is the company's balance sheet.

MR. HOBERG: In Exhibit 2.

THE WITNESS: Statement A in Exhibit 2. And earlier I asked Mr. Keller -- we asked

Mr. Keller whether the first two pages were for MDU Utilities Company. He answered yes. And if the subsequent pages pertain to MDU Resources Group, and the answer to that was yes. If you turn to page 11 of the Statement A, you'll find a list of long- term debt. That list does not begin to match the list that Mr. Keller has presented in Statement F, which is where he proposes his debt costs. The only debt that he shows is the secured medium-term notes, Series A, and then pollution control refunding revenue bonds. These are merely a portion of the parent company's total debt. Not included are -- and he has about 133,000 of first mortgage bonds. Not included are senior notes, $405,000 -- million dollars. Commercial paper, $219 million. Revolving line of credit, $25 million. Term credit agreements of $11 million and pollution control note obligations of $11 million -- I'm sorry -- $2.5 million. The company has reflected only a portion of its total debt.

Now, in rebuttal Mr. Keller has said that that doesn't -- other debt doesn't pertain to MDU Utilities, but you heard a few minutes ago that MDU Utilities Company isn't really a company. It's simply a division of the larger company. The larger

company is the entity that generates the debt, that raises the debt and distributes it to the subsidiaries. What the company has sought to do here is to build a firewall between the debt it wants to assign to the regulated piece and the debt it wants to assign to the unregulated piece. And, surprise, the debt it wants to assign to the regulated piece is 9 percent, and the debt it wants to assign to the unregulated piece ranges all the way down to 2 percent. And it should not be allowed to gain the system this way, by pretending that some debt pertains to the utility operations and other debt pertains to the non-utility operations.

Mr. Keller will tell you that that's how the debt instruments are written. Of course, they're written that way because that was how they were intended to be written so that they would appear that there is a distinction between debt raised for the utility and debt raised for the non-utility. Truth is, debt is all fungible. It could be spent anyplace the company chose to spend it. For that reason I have used the blended rate, debt rate of the entire company, meaning MDU Resources, as the debt cost. And it makes a very, very significant difference in the result. The debt

cost -- let me get my notes here -- again, is 9.3, if you use the company's first mortgage bonds as it proposes. It's 6.2 or 6.167, if you use the parent company's blended debt, which I developed in an exhibit to my testimony.

Now, equity, I have to kind of go through and tick off the items where Dr. Gaske and I disagree. The reality is we agree on a lot of things, specifically the formula for discounting cash flow, but, first of all, Dr. Gaske wants to include flotation costs. We're doing this all over again. In the electric case I demonstrated, and I simply repeat it in this docket, that if you include flotation costs, they come to .1 percent of the cost of the value of the total equity of the company. And I'm game to include that as a component of capital costs, but it would be lost in the rounding. Dr. Gaske seems to believe that it is appropriate to assign the incremental cost of flotation relative to the newly-issued stock and take that percentage and apply it to the entirety of equity. And this is a gross overcompensation of the company, and in the last case the Commission explicitly agreed with me.

Now, selection of comparison companies, Dr. Gaske point out correctly that in the Xcel

case -- I'm sorry -- in the last case. Two things, he points out in the Xcel case that I used a much different and smaller group of companies and I used both gas companies and combination companies. And the answer is I didn't really pick those companies. In that case I was rebutting Dr. Olson, who had made the pick. And rather than fight with Dr. Olson over the pick, I accepted his listing.

In the last MDU case, the electric company case, I took some purely electric companies and some combination companies, and I argued that the combination companies were more representative of MDU's electric service. And I was going to do what Dr. Gaske suggests, which is include full gas companies and combination companies until I looked at what has now been marked Exhibit 17, which is an exhibit that I entered into -- in the MDU case. And it shows the proper portion of the revenue of each of these companies. The companies in boldface are the ones I wound up selecting. If you look at those companies and look at the electric revenue and then look at the gas revenue, what you'll see is in every case the electric revenue is a multiple of the gas revenue. And as a consequence, while one can say that the investors might view these companies as

electric companies that also provide gas service, it doesn't work the other way around. No one views these companies as gas companies that also provide electric service, which is why I did not include these companies in my comparison group this time. Instead, I included purely gas companies.

Now, the other -- well, let's go through what I did that I don't think Dr. Gaske and I disagree with on. I used the DCF formula and I did two -- three versions of it. First, is the so-called classic version, which Dr. Gaske has another name for, and we also used pretty much the same sources; Zacks for the future forecast of earnings growth. And then we did the same development of dividend yield. We had the silly little disagreement over whether the growth factor for next year's dividend should be .5 -- or .5g, g being the growth factor, or .625g. And Dr. Gaske says that I don't reflect the time value of money. And he's right. I didn't. I just took half a year and said, all right, that's the probable time the next dividend increase will occur so we take one-half of growth, which seems logical.

Now, if I were to include the time value of money, I would probably reduce that .5. Why?

Because a dividend increase six months from now is worth less than a dividend increase right now. So I would have to take -- I would have to reduce that .5 by some factor reflecting half a year's loss in value because of the time value of money. So instead of increasing it as Dr. Gaske has done, I would have reduced the factor. But, again, we're talking about peanuts here in terms of impact on the total results.

The other thing I did was similar to Dr. Gaske's formula. I took the retention rate of the respective companies as determined by their dividend payout ratio or their earnings retention ratio times Value Line's forecast of their future return to book equity. And unlike Dr. Gaske, I added a piece for the probable or the likely increase in value that one would get from selling -- or companies would get from selling stock at greater than book value, which would enhance the book value of the shares. And I developed an internal retention growth estimate. And then I used -- I did get out the history of earnings gross and I developed that, and I think Dr. Gaske and I both agree that that probably isn't worth a whole lot.

I then developed what I regarded as the

composite rates of return for each of the 11 companies that I picked, as opposed to I think five or six that he used. And that was a judgment call, and Dr. Gaske is very unhappy with what I did there. But if you look at it, you will see what I have done in each case is taken the classic DCF return, which is probably the best estimator, and then turned and looked at the retention growth method. If the retention growth looks like it's totally out of whack with the forecast, and in some cases they are, simply no way that the company could be growing as fast or as slowly as the investor survey shows, I modified that classic DCF in the direction of the retention growth. And I came up with 11 estimates of the overall rate of return.

Then when I got those 11 estimates, I went through a little analysis of whether MDU is more or less risky than those 11 companies. And I determined a couple things. One is MDU has relatively high equity proportion in its capital structure, which saves it from a lot of financial risk that the other companies have. It was about equal to the best or the highest of the equity ratios. I don't pretend that that is the predictor of relative risk, but it is an element of relative

risk. Another element of relative risk is how much nonregulated activity the company has. In general, it's accepted that unregulated activities are riskier than regulated activities. Why? If your earnings are short, you come into a Commission like this and you get an increase in your rates. You have monopoly power. There is never a question that you're going to collect the money if the Commission let's you do it because you are a monopoly. That's not true of any unregulated activities. By definition, unregulated activities simply don't have the degree of security, the low-risk properties that regulated activities have.

There are a couple of other reasons I didn't mention in my testimony I probably ought to bring up now. Earlier in the day we heard from Mr. Fox that MDU was facing competition from propane and oil. Now, I live in Washington, D.C., and have done a lot of cases involving Washington Gas Light Company and so I'm familiar with competition there. There was no mention of competition from electricity. In Washington, D.C., the -- about two-thirds or three-quarters of the entire commercial load has been lost by the gas industry or the gas company to the electric company. And the

reason is that's a warmer climate. In Washington the climate is warm enough that you can build a compressor in an air-conditioning system that also heats. You can't do that in this climate. It would be ruinously expensive. Residentially you can sell people a heat pump. Heat pumps simply don't work in North Dakota. You freeze to death, along with paying an astronomical electric bill. So the relative degree of competition for gas in North Dakota, I submit, is considerably less than it is elsewhere in the country.

There's another difference. In Washington and even in Spades and Atlanta there is a much more active competitive supplier business. In Atlanta, the other company I'm familiar with, the Commission decided to totally restructure the gas industry. That no one -- the utility would no longer buy gas on behalf of its customers. It would have instead merchants would come in and you would be a customer of the ABC Gas Company, which would buy your gas and pay Atlanta Gas Light to deliver it to your house. So that from 600,000 customers, Atlanta Gas Light went to 11 customers.

That sounded like a wonderful idea, except that one of them with a nice Georgian name of

Peachtree Energy went bust and left Atlanta Gas Light hanging for quite a few million dollars, just stiffed them flat, and the company suffered a very significant loss. And Washington Gas Light has a similar problem. They've lost about two-thirds of their commercial load to competitive suppliers. Now, they still use WGL as their delivery to customers. One of the problems is that they haven't got the transportation capacity locked up that WGL had. And there's a great fear that if we have a cold winter, these people aren't going to be able to get the gas into Washington. Those are risks that larger companies have that MDU doesn't have because MDU does not seem to have anything like the active competition for the gas supply business that you get in bigger places.

So I think that is an important difference between MDU -- those two, the degree of competition and the effect of suppliers, is an important reason why MDU is probably less risky than the average utility, in addition to the point that I make in my testimony. Dr. Gaske says that MDU has the risk characteristics of a small company. Well, he's comparing apples and oranges. He's comparing the gas distribution business of a large company with

the risk properties of a small company, a small stand-alone company. What we're trying to find is not that. We're trying to find the risk characteristics of the gas operations of a large company. A large company gives you the security of financial strength and also diversification of financial resources. You remember where all those extra sources of debt came from, which a small company doesn't have and small companies indeed are more risky, but only when they are stand-alone operations. Principally, because their sources of financing and the support they can put behind that financing in terms of business is much less.

Well, all this comes together on page 34 of my testimony where I present my composite cost of capital and that is -- there I take the proportion of the capital structure, the cost elements, and the weighted costs. I've come up with 10.5 percent as a cost of equity, which is halfway between the average cost of equity of my 11 companies and the lowest cost of equity within that category, that group of 11 companies, reflecting the fact that MDU is less risky than the average for the 11. That's 10.5 and then you get the weighted cost in the final column, overall return to capital is 7.98.

Now, the rest of my testimony deals with capital structure. The only area where I think I seem to hear disagreement from the company pertains to the cost of service study. Where Ms. Aberle says that customers cause most or half the cost or a third of the cost, I believe is their position, of the mains system. And I take exception to that.

And the reason is that the main system may be driven by the addition or -- well, never the subtraction, but always the addition of customers, but only out in the margins. Indeed, they're putting more mains out in north Bismarck, but you heard testimony earlier that they only add 1 percent more customers every year, so that's a negligible impact on the cost of mains. Most of the cost of the mains is what you call an embedded cost. It's there. It's been there for centuries -- I mean, for decades. And it's not going to be affected by any increase or decrease in the number of customers. It's not going to be affected by any increase or decrease in the amount of gas that goes through it. It will be impacted by the maximum amount of gas that goes through in any one day, but we reflect that. We recognize that in allocating a portion of the main's cost to throughput as among the various

classes of customers.

My -- when you can't find causation and that's the case with mains. They are simply there, what I would call an institutional cost. They're not caused by anything. They're there. When you can't find causation, then maybe you should look to value of service as an allocator. And value of service is measured by the amount of gas delivered to each of the three or four various categories of customers, which is what I have done in the alternative calculation that I have presented. And it does change the results some, but not a whole lot. We both agree that the small interruptible customers are being overcharged. We don't agree quite about what to do about it. The company would reduce their rates while increasing everybody else's rates.

I went through a number of previous Commission decisions, not just with MDU, but with all the other gas companies and also electric companies, and it appears to have been this Commission's policy over the years that when there is a rate increase, everybody ought to bear a little of the pain. And if you want to even out differences among the classes, you might change the

percentage increase, but everybody get some increase. And what I have seen is a number of cases where the overcharged class got half the increase that the undercharged class got. And that's what I proposed in this case. If you increase rates, increase everybody but the small interruptible customers and then give them half the increase you get for the rest.

The other rate design issue deals with this matter of customer charge increases. What the company and I agree on is that we should get rid of the declining block commodity rate and take the revenues you get from those high early blocks and put that in the customer charge. So even if we do nothing whatever in terms of overall revenue recovery, we would be increasing the customer charge as the company wishes. And then I agree that probably if we're going to have a rate increase, we might flow more of that increase into the customer charge than into the commodity charge. But nothing like the enormous increases in the customer charge that the company has proposed.

If we have a rate decrease, which is what staff is recommending, I would recommend that that decrease come entirely out of the customer charge --

I beg your pardon -- out of the commodity charge and the customer charge be left untouched. Well, actually they would be increased because we're flattening the rates, but the revenue recovered from the customer charge plus the early block pieces would not be reduced. We would flow all the reductions into the commodity charge.

On the DDSM, I don't even know whether there's a proposal still, but if it is, I think it's one that should be rejected because of the year's deferral. It could really backfire big time and get us all in a great deal of trouble, because if you had a warm winter and you tallied up a whole lot of money that you ought to collect from ratepayers because you didn't pay very much last winter and this winter it's colder than all get-out and everybody is paying enormous gas bills, both because of the amount of gas they're using and because the price of gas usually goes up when you have a cold winter and then on top of that you hit them with a DDSM charge, it will be very, very unpopular.

If you're going to have a weather normalization program -- I think they're not a bad idea. More and more states are using them. -- they have to be maybe not real-time, but they have to be

concurrent. The warm weather charges that you want to collect from customers have to flow to customers during the warm weather and the cold weather charges that you would to subtract from their customer bills have to be during the cold weather. Otherwise, you are losing the effects, the beneficial effects on ratepayers, which is to even out their year-to-year gas charges.

I think I've said quite enough so I'm going to shut up right now. Thank you very much.

MR. BINEK: At this point I tender the witness for cross-examination.

MR. HOBERG: Thank you, Mr. Binek. Mr. Pearce, if you have any questions.

MR. PEARCE: Yes, I do have several.

CROSS-EXAMINATION

BY MR. PEARCE:

Q. This is just a minor point, but turning to page 2 of your testimony, Mr. King, line 23 and line 27, I suppose you mean gas there. You have electric operation there in both cases.

A. Oh, dear. I'm sorry. That part of my testimony I had simply taken and listed from the earlier.

MR. HOBERG: So you would agree that should

be gas?

THE WITNESS: Yes, it should be gas.

Q. (MR. PEARCE CONTINUING) One of the downsides of word processing, isn't it?

A. That's right.

Q. Exhibit 17, I think, was just introduced and it's electric and gas utilities percent regulated revenue?

A. Yeah.

Q. I think you said you introduced that in the electric case. Dr. Gaske tells me that he introduced that as part of his testimony in the electric case. It's not critical, but maybe --

A. Well, I don't care who introduced it. I thought it was mine, but welcome -- nonetheless, it shows what it shows.

Q. Right. We'll both accept that as true. Now, turning to page 28 in your testimony through 29, I just wanted to clarify a point. It's your testimony that by your understanding Dr. Gaske's 1.625g factor there is based on his assumption that the first dividend would be received three months from the date of purchase; is that right?

A. Well, that's how I calculated it, but Dr. Gaske says that isn't so and I'll let him

explain why it isn't so.

Q. Now, have you -- Dr. Gaske's prefiled testimony, rebuttal testimony is in the record, although it hasn't been introduced as an exhibit. I think you said you had read it; is that right?

A. Yes.

Q. If I could just show you one page, although it's not an exhibit yet, but just to make sure we are on the same wavelength. I'm looking at his JSG-4, page 2 of 3 on Schedule 3. It has the -- I believe what's the classic DCF formula. I just wanted to confirm that we agree that that's the --

A. I think it is, yes.

Q. Okay. Now, turning back to page 20 of your prefiled testimony, and this is the testimony right after your table 7 at the bottom of the page. You say -- in fact, it's the last line of that page, line 22. For example, there are no examples of level or declining earnings in the Value Line forecasts. I'm going to show you --

(Exhibit 18 was marked for identification.)

Q. (MR. PEARCE CONTINUING) Exhibit 18 is a packet of six pages, and before I identify it further, could I ask you -- well, let me back up.

Which issue of Value Line did you use for

your analysis? Do you have that there?

A. Mine are all dated June 21.

Q. Of 2002?

A. Yeah.

Q. Okay. Now, looking at what's been marked as Exhibit 18, it is -- and I'll tell you what it is, is sheets from Value Line for six companies of that same date. Would you agree that's what it appears to be?

A. Yeah. None of them are the six companies that I was analyzing.

Q. Right. Right. No.

A. Or the 11 companies.

Q. You make in your testimony a very broad statement about Value Line. I just wanted to lead you over to some other companies that were not in your testimony.

A. Well, I didn't mean to imply that they never, ever predict declining earnings. I was talking about among the 11 companies that I was looking at.

Q. Okay. Just to go through this, looking at these companies, and I realize this is very fine print for a person of my age, but looking at the third line there, earnings per share, and then down

toward the bottom is return on common equity, I think. Would you agree if you have a chance to look at each of these six sheets, that there is, in fact, declining earnings and earnings per share from 2000 -- between 2000 and 2001 and, in fact, out through the 2005, 2007 period?

A. Oh, sure, for these companies. These are in the oil business. I don't know what Holly Corp is. Crude oil. We're looking at oil companies for some reason.

Q. I believe they're all energy companies.

A. Tesoro is one of them.

Q. Right.

MR. HOBERG: Are you offering Exhibit 18, Mr. Pearce?

MR. PEARCE: Yes.

MR. HOBERG: Any objection to 18, Mr. Binek?

MR. BINEK: Well, the only objection I would have is based on the comments that Mr. King has made, that none of the companies that he's talking about are included here, and so I guess I would question the relevance of this.

MR. HOBERG: What is the relevancy, Mr. Pearce?

MR. PEARCE: The way the testimony is written the implication appears to be that all of Value Line's companies that it analyzes are overly optimistic and there's never any report of declining earnings and we simply wanted to show that although -- that without regard just to utility companies, as a general principle, that's not true for Value Line generally.

MR. HOBERG: Do you have any objection for that limited purpose, Mr. Binek?

MR. BINEK: No, I guess that's okay.

MR. HOBERG: I'll admit Exhibit 18.

MR. PEARCE: That's all the questions I have.

MR. HOBERG: Thank you, Mr. Pearce.

Commissioner Reinbold, did you have any questions of Mr. King?

COMMISSIONER REINBOLD: Yes, I do.

EXAMINATION

BY COMMISSIONER REINBOLD:

Q. Mr. King, you said something about heat pumps wouldn't work in this part of the country in North Dakota?

A. That's what I've been told. I'm not an engineer and I can't really testify as an expert on

that subject.

Q. Would it surprise you if I directed you to a window in this room and directed you to look to the northwest and see a brand-new huge church building which is being heated and cooled by 120 wells 160 feet deep in the parking lot?

A. Goodness.

Q. Doing it very efficiently. A young entrepreneur, who was a well driller, got it started and he's worked this type of work as far away as South Carolina. So it may not work everywhere, but it does work over at our church. It's very expensive and it will be expensive for a long time, but it does work.

A. I hope you're comfortable at Christmastime.

COMMISSIONER REINBOLD: That's all I have for now.

MR. HOBERG: Thank you, Commissioner Reinbold. Commissioner Wefald, please.

COMMISSIONER WEFALD: Yes, I have a few questions.

EXAMINATION

BY COMMISSIONER WEFALD:

Q. On page 34. I understand there's a disagreement between the company and the staff about

whether short-term debt should be included and as you've said, it's only 2.78 percent that you've included in your calculations.

A. That's right.

Q. And you're asserting -- my first question is, are you asserting that short-term debt should be included?

A. Yes.

Q. Because you have information on the record and where is that that shows that they're using short-term debt?

A. Well, you never know. You can't trace the source of money from where they get it to where they use it because it all goes in effect into the bank account and then back out again. But the proposition is that when you have expenses that fluctuate -- or capital costs or expenses that fluctuate, particularly capital costs fluctuate month to month, the normal way of financing those would be through short-term debt. Now, they are high in June and low in January and where are you going to get the money to cover those, you go to the bank and borrow it.

Now, in fairness, MDU does not use much short-term debt. And the reason is that the company

generates a lot of internal cash primarily from excessive depreciation charges, but that's what Mr. Majoros is going to talk about. But they do use some, and this is what I reflect here. And the reason I put in this exhibit is to show that there's significant variation from month to month in the working capital.

Q. How did you come up with this?

A. It's from the company's own -- well, the numbers are presented up in the front. Let me find the table for you. It's page 5.

Q. Yes.

A. Table 1.

Q. But I just wondered how you were able to determine it was $9,639,000 --

A. That I think I got from there --

Q. -- if you said it's hard to trace?

A. Oh, you can determine how much short-term debt there is. What you can't do is determine where they spent it. That's what I meant is hard to trace. I believe I got that -- here it is. Look at my Exhibit CWK-1, which is attached to my testimony.

Q. Okay.

A. Go to the last page of that exhibit and

there at the bottom you'll see the 9 million and you'll see the 4.542 percent. That's the source of those numbers. And this is a company data response.

Q. All right. And on page 43 of your testimony you talk about penalties for failure to interrupt should be increased, on line 11.

A. Yes.

Q. Do you have any recommendations about that?

A. Well, I was going to recommend the company's proposal be accepted. And it's the company's judgment as to what it takes to make interruptible customers interrupt, but if they don't interrupt, you could have a disaster. You can have the pipeline suddenly unable to deliver gas to the city gate and everybody goes cold. So if -- and the company isn't planning. They don't make the commitment to the pipelines. They don't build their own main structure to handle the interruptible customers' loads at the peak day. The assumption is when it really gets high gas demand, phone them up, have them cut off. They don't cut off, the company can be in trouble.

Q. Right.

A. So I think it's very important that there be sufficient pricing to persuade those customers

they better interrupt.

Q. Well, what I was wondering is, it says here, penalties for failure to interrupt should be increased since the company apparently believes that the current penalties are not sufficient. So did the company present what you feel is a sufficient penalty then to --

A. Well, I really do have to defer to the company. I guess I accepted their judgment in that regard. Maybe I'm naive, but in this regard I --

Q. You're not disputing what they're proposing?

A. I'm not disputing their judgment on that. But I think if you want to know what is the basis of the exact amount of increase, you better ask Ms. Aberle.

Q. All right. Then my next question was page 44. This is under the question, have you calculated the increased customer charges that would result from eliminating declining block rates. It's my understanding that you think that we should be eliminating the declining block rates. And so is it your recommendation that this size increase that is reflected in paragraphs 19 through 23 is what should be put in place for customers?

A. Well, what I did in my Exhibit CWK-8 was calculate the revenue that is recovered in the high initial blocks of the present rate structure. And then I divided that by the number of customer bills and got the amount of increase you would need in the monthly customer charges in order to recapture that same money in the customer charges instead of in the initial declining block rates. And that's the numbers you see here. This is a totally revenue neutral proposal.

Q. Right. I see. This doesn't reflect any increase that the company may want?

A. No increase, right.

Q. This is just what would occur if you eliminated the declining block rate?

A. Right.

Q. So then this would be the minimal amount -- this would be the bottom amount that we would be looking at --

A. Yeah.

Q. -- for a customer rate increase before you'd --

A. Yeah.

Q. -- project any -- if you were going to do any increase for their rate case?

A. Right. What I'm suggesting is, even if you reduce rates, you ought to keep these customer charges, because I am sympathetic to the company's desire to capture somewhat more fixed costs in the customer charge. So I think if you were to reduce the rates, it would be inappropriate to reduce the customer charge. Reductions ought to come out of the commodities.

Q. Even in this situation for the large customer who goes from $17 to $45, which is a triple increase?

A. It's a big increase, but it is, as I believe an earlier witness pointed out, those customers use so much gas that this is small potatoes in terms of their total bill.

Q. All right. And then on page 45, the question is, are there any other proposals the company has made that you believe the Commission should consider regardless of the change in overall revenues, and your answer is on lines 12 through 19. I recommend the Commission consider the company's proposal to convert the basic service customer charge from a monthly charge to a daily charge. And then you go on and then you say. My only concern is whether it might be accepted by the average customer

as a reasonable way of charging for service.

To me it would be very confusing as a customer to not know every month, not to have the same amount each month on my bill for my customer charge.

A. Yeah, and I'm sympathetic to that. I think that's a legitimate concern and that's why I put that sentence in there. I guess I'm tossing the ball back to you as to whether you think that is something that will go down with the average customer.

Q. Because, otherwise, you might have one rate that would be there for the 28-day month, another one for the 30-day month and another for the 31?

A. You get a lower customer charge in February, right. But I think the virtue from the company's standpoint is it gives them a little more flexibility as to when they send their meter readers out. Now, it's got to be -- I guess I don't know whether they bill by the calendar month or whether they bill -- each customer get from a certain day to a certain day, but whatever it is, they're locked into pretty much a 30-, 31-day interval and this would permit them to alter the interval, if they had to.

Also, we put in a data request asking how many customers did they have that had partial month bills in a given year, and it was a huge number. I don't know why, but it was -- I was surprised by how big it was. And it's one of the reasons that I sort of gave a backhanded endorsement to this proposal. But it's certainly not something that I would insist on.

Q. When you say -- what do you mean by a partial month bill?

A. What we asked was in any given -- I don't have the data response with me. They had said they had a lot of customers who came -- who got on and off during the year. And the consequence of signing on for a part of a month instead of the full 30 days, they had 20 days or 10 days or whatever. And I said, all right, well, how big a deal is that? How often does that occur? And it was in the thousands. It was quite remarkable that it was as much as it was. Evidently, there must be a lot of customers who simply turn off gas service in the course of the year and disconnect. And then reconnect later. It could be vacation homes or people who decide they don't need gas in the summer because they don't need the heat in the summer and

they cancel gas service. You have to ask the company why it's so large, but it was a large number. And this would facilitate dealing with that problem.

Q. I will ask the company a few more questions about this, but then does it also -- in your understanding of this does it reflect -- let's say the company read my meter on January 15 and then they didn't get around to reading my meter again until the 20th of February. So then there might be -- would I get a 30-something day --

A. Thirty-five-day month, it's possible.

Q. And then the next I get a 25-day one if they went back and did it again on the 15th again of the next month?

A. If you're like me, you write your bills once a month when you get paid, and customers could really get messed up if they started changing the -- if they got out of the monthly cycle of billing, which this would permit them to do. So maybe that's a good reason not to permit this change.

COMMISSIONER WEFALD: Who would be the MDU person I would ask these questions of just so I can understand it better?

MR. HOBERG: Mr. Pearce?

MR. PEARCE: I suppose probably Mrs. Aberle.

MR. HOBERG: Tamie Aberle.

COMMISSIONER WEFALD: I do have some questions about that so I will ask Ms. Aberle.

Q. (COMMISSIONER WEFALD CONTINUING) All right. And then, now, this is a bigger, broader question.

A. I like big, broad questions. I give big, broad answers.

Q. So now let's say a hypothetical utility has divisions and one of them makes -- one of these 11 divisions that they have and only one is a utility division, but it's still a -- it's a company with many subsidiaries, and one is the utilities and one of those divisions makes bad business decisions and starts to go into a -- close to a bankruptcy situation. So within the -- it's my understanding what happens sometimes then is that the bond rating of the whole company can get lowered and then a Commission has to worry about what are the -- whether the riskiness of their bond rating at that time is going to be passed on to their customers.

When you're talking about looking at bonds for the whole group of MDU companies, all of these

divisions, if I accept your premise that the bonds are good for everyone and it's the whole, big company that has a bond rating and not just one division, am I setting myself up in the future then to set precedents that if they make a bad decision with one of their divisions, that I'm going to need to accept that bond rating for the utility company as well?

A. Well, you have exactly that situation with your telephone company.

Q. Right.

A. And it's a difficult problem. US West was a thoroughly successful company, but it got bought by this Qwest outfit, which has gone south, and it's junk bond status. And your question is, okay, what are you going to do about assigning a bond yield cost to US West?

Q. Well, and I don't have to worry about that because under price cap, but let's say there's a hypothetical company that's in the same situation, but we know that that's reality in some cases today. And so what I'm concerned about is your --

A. Well, what I would say is that if the utility piece of it is a -- is profitable and would support an adequate bond rating, then for -- but the

rest of the company caused it to go south, I think you would have to impute a bond cost that reflected the utility's performance. Fortunately, for MDU Resources that's not an issue, because not only is the utility profitable, but the parent company is also profitable.

But I think your concern is a very legitimate one, that if the non-utility activities of the company soured the bond ratings such that there were astronomically high debt costs, is it fair to ratepayers to pass those debt costs through to them? And I would say no, because that is a result of -- it's in a way analogous to why we don't use MDU's equity costs because its equity cost is seriously influenced by its nonregulated activities. If you could demonstrate that the bond -- the debt cost is influenced adversely by the nonregulated activities, then I think it's appropriate to impute a different debt cost. Fortunately, I don't think that's an issue here because it's clear that the company seems to have a good debt rating.

COMMISSIONER WEFALD: Thank you.

MR. HOBERG: Thank you, Commissioner Wefald. Commission Clark, please.

COMMISSIONER CLARK: I have none. Thank

you.

MR. HOBERG: Thank you. Any further questions of Mr. King? Mr. Binek?

MR. BINEK: Just one.

REDIRECT EXAMINATION

BY MR. BINEK:

Q. I guess I would like a little bit of clarification about this heat pump business. When you were making reference to the use of heat pumps, you were -- I'm assuming you were thinking about a unit that does both heating and air conditioning, kind of a stand-alone unit, versus something that draws heat off of groundwater?

A. Yeah.

Q. Is that correct?

A. Mr. Majoros can testify about heat pumps. He has one in his house and he says he hates it.

Q. Okay. But there are different kinds of heat pumps?

A. Yes. Essentially, it's an air-conditioner that works two ways, and it only works as an air-conditioner in the reverse direction down, I'm told, to about 45 degrees Fahrenheit. If it get colder than that, you have to supplement with resistance, electric resistance heating, which is

why it becomes very expensive if you have a cold climate, because up here you would have that resistance heating on all the time and that scarfs up an incredible amount of electricity.

Q. These are the kinds of units that we often see in motels; isn't that right?

A. Yeah.

MR. BINEK: Okay. No further questions.

MR. HOBERG: Thank you, Mr. Binek. Mr. Diller, any questions? Okay. Anything further then of Mr. King? Thank you, Mr. King.

Let's take a short break and then we can perhaps take Mr. Majoros and finish off the day that way. Let's be back at -- a five- to seven-minute recess.

(Recess was taken.)

(Exhibits 19 and 20 were marked for identification.)

MR. HOBERG: We're back from a short recess. And, Mr. Binek, you were ready to call your next witness.

MR. BINEK: Yes. I will call Michael Majoros.

MR. HOBERG: Mr. Majoros, you were here earlier when I gave the admonition regarding

perjury; is that correct?

THE WITNESS: Yes, sir.

MR. HOBERG: Being advised of the penalty for perjury, do you promise to tell the truth in this matter being heard? If so, answer I do.

THE WITNESS: I do.

MR. HOBERG: Thank you. Mr. Binek, please.

MR. BINEK: Thank you.

MICHAEL J. MAJOROS, JR.,

having been first duly sworn, was examined and testified as follows:

DIRECT EXAMINATION

BY MR. BINEK:

Q. Would you state your full name for the record, please.

A. Yes. My name is Michael J. Majoros, Jr.

Q. What is your occupation, Mr. Majoros?

A. I'm vice-president of the economic consulting firm of Snavely King Majoros O'Connor and Lee, Incorporated.

Q. And how long have you been at that firm?

A. Approximately 22 years.

Q. What is your educational background?

A. My educational background is in accounting. I've passed the CPA exam, taken courses in the MBA

program at George Washington University, and have taken several continuing education courses.

Q. And you have testified in a number of state commission utility rate cases?

A. Yes, sir.

Q. You have before you documents Exhibit 19-49, I think it is, and Exhibit 20. Could you please identify those two exhibits?

A. Yes. Exhibit 19-49 consists of my testimony, my Appendix A, which is a summary of my qualifications and experience, and my Exhibits MJM-1 through MJM 12.

Q. And what is Exhibit 20?

A. Exhibit 20 is a packet of exhibits I prepared in response to primarily Mr. Jeter's rebuttal to me.

MR. BINEK: At this time I would offer Exhibits 19 and 20.

MR. HOBERG: Mr. Pearce, any objections to Exhibit 19?

MR. PEARCE: No.

MR. HOBERG: How about 20?

MR. PEARCE: No.

MR. HOBERG: Exhibits 19 and 20 are admitted.

Q. (MR. BINEK CONTINUING) I should have asked, if I were to ask you the same questions today that are in your testimony, would your answers be the same?

A. Yes, sir.

Q. Are there any errors in your testimony that need to be corrected?

A. I noted a couple of typos, but the one that I would like to correct is on page 5, line 5. There's a range of years in that sentence, 1996 to 2000. I'd like to change that to 2003.

Q. Any other corrections?

A. No. No, sir.

Q. At this time I would ask that you please provide a summary of your testimony and also provide any response that you may have to rebuttal testimony that has been filed by Montana-Dakota Utilities in response to your direct testimony.

A. Okay. The objective of my testimony is to recommend the appropriate jurisdictional revenue requirements for the North Dakota gas division of Montana-Dakota Utilities, Incorporated. I've attempted to recognize the legitimate needs of the company to recover its costs, but at the same time I've attempted to ameliorate any added burden on

ratepayers from excessive recoveries. Ms. Mulkern proposes a $2.8-million base rate increase using an 11.44 percent rate of return. I recommend a $1.4-million base rate decrease using Mr. King's recommended 7.98 percent rate of return. My adjustments are summarized at page 3 of my testimony.

I propose to reduce the Company's depreciation rates. I propose to eliminate bonuses and commissions from the company's costs and hold the 2003 labor cost levels equal to the 2002 levels. I propose to eliminate the SISP from benefits expense. I propose a five-year rather than three-year rate case amortization period. And I propose to eliminate the general inflation from other unadjusted operation and maintenance expenses.

At pages 4 to 7 of my testimony I've included certain financial analyses. At the top of page 4 of my testimony I demonstrate that the company's gross margins declined from 2001 to 2003. The decline is caused by major increases to operation and maintenance expenses, excluding the cost of gas. Increased O&M expenses is a major driver in this rate case. From 1996 to 2003 O&M expenses, excluding the cost of gas, increased at a

compound rate of 2.5 percent. And that is shown on my Exhibit MJM-2. However, that 2.5 percent is slightly misleading because from 2000 to 2003 the expense is actually ratcheted up and continued on from there. The compound growth rate from 2000 to 2003 is actually 5.7 percent, which, in my opinion, is unreasonable.

I am also recommending a change in depreciation rates. Since depreciation produces cash flow for this company, I conducted certain cash flow analyses. Although depreciation is not intended to finance capital additions, some equate it to additions as if that was its intent. As I stated in my testimony, the purpose of depreciation is not to finance plant additions. Nevertheless, I've determined that this company's depreciation seems to always produce more than sufficient cash flow to cover its additions.

At page 6 of my testimony I've included a table of -- comparing annual depreciation cash flow to annual construction additions at the total company level for the years 1996 to 2002. Mr. Jeter challenged this table so I've provided an expanded table, which is the first page of Exhibit 20. Even with the revisions --

COMMISSIONER WEFALD: Where is Exhibit 20, please?

MR. HOBERG: That's the one that was just introduced, that separate one.

COMMISSIONER WEFALD: Thank you.

THE WITNESS: Even with Mr. Jeter's changes, at the total company level since 1996 this company's depreciation expense has exceeded its capital additions by $409,000. I also -- Mr. Jeter also challenged my Exhibit MJM-3, where I compared the gas utility only depreciation expense to additions. Mr. Jeter claimed that I failed to include common plant depreciation expense in column 2. Consequently, on the third page of Exhibit 20 I've made the adjustment in accordance with Mr. Jeter's testimony. And what this demonstrates is that since 1986 this company's gas company North Dakota depreciation expense has exceeded the additions to gas plants in North Dakota by $8.2 million. In my opinion, this has resulted from excessive depreciation rates which have been charged to ratepayers.

At page 7 of my testimony I cite and quote from what I consider to be a landmark U.S. Supreme Court decision on the subject of depreciation.

COMMISSIONER WEFALD: That's where?

THE WITNESS: Page 7 of my direct testimony.

COMMISSIONER WEFALD: Page 7. Thank you.

THE WITNESS: In that case, which is known as Lindheimer v. Illinois Bell, the Court equated excessive depreciation to the extraction of capital contributions from ratepayers. And it clearly stated in the beginning of the second paragraph, Confiscation being the issue, the company has the burden of making a convincing showing that the amounts it has charged to operating expenses for depreciation have not been excessive. This morning I heard the word "confiscation" from Mr. Gaske, and I understand the company in this case has the burden of proof. And my testimony states that their depreciation expense is excessive, and I provided my reasons for making that claim.

Here's how I arrived at that conclusion. First, I reviewed this company's depreciation reserve levels and that's accumulated depreciation. I have testified or been involved in more than 80 proceedings on the subject of public utilities depreciation. Based on my experience, if you refer to page 9 of my testimony, the 70.7 percent reserve

ratio for the distribution plant is very, very high. And it suggests that prior depreciation rates may have been excessive. I asked the company if it conducted any studies to measure the adequacy of that reserve and it has not. The company's current depreciation rates are based upon an 11-year-old study conducted by Stone & Webster, which does not exist anymore, at least Stone & Webster doesn't, to the best of my knowledge.

That was the next place I looked. I've included as MJM-4 to my testimony the first few pages from that Stone & Webster study. These are also included in the company's Statement I, if I could refer you to those pages. Two things caught my eye in reviewing this. The first thing that caught my eye was the negative 140 percent net salvage ratio for services. That is shown in about the fourth column. It says estimated retirement costs percent amount.

COMMISSIONER WEFALD: Will you just show me what you're looking at?

THE WITNESS: I'm looking at Exhibit MJM-4, page 1 of 2.

COMMISSIONER WEFALD: MJM. Thank you.

THE WITNESS: About halfway down -- well, a

third of the way down the page, account 380, the second number in that line is negative 140. And that's a very, very high negative net salvage ratio. That also suggested to me the possibility the current depreciation rates are excessive.

The next thing that caught my eye, if you come over three columns, the column that starts with the number 39 and then goes to 36, those are average service lives. The average service life for distribution mains, which is the single largest account on the company's books, is 36 years. If you put a circle around that, and then coming down the page, the average service life for services, which is the second largest account, is 34 years. Based on my experience with gas companies, those are very, very short lives. Short lives equate to high depreciation rates. If they're too short, the resulting depreciation rates are excessive.

Consequently, I conducted certain tests of those lives based upon the information available to me. These are called geometric mean turnover analyses. They're included as Exhibit MJM-5. And these two analyses would indicate that overall the average service life for mains is in the 108-year range and the average service life for services is

in the 69-year range. Mr. Jeter, through a data request, identified certain discrepancies in my calculations. So I redid the GMT studies. They're included again with Exhibit 20. And when I make the adjustments identified in the company's data request, the corrected GMT studies would support lives for mains of 116 years and lives for services of 74 years.

At this point I'm pretty convinced that the company's depreciation rates are excessive. I conducted one more analysis based upon the company's data request to me. This, I must admit, was after I had filed the direct testimony. It's contained on page 2 of Exhibit 20. And here I've compared the company's current average service lives to industry statistics.

COMMISSIONER WEFALD: You're on which page?

THE WITNESS: Second page of 20.

COMMISSIONER WEFALD: The second page?

THE WITNESS: Yes. And I obtained these statistics from the AGA/EEI. They are proprietary and confidential so I've only summarized them here. But if you look at, again, mains, the company's average service life is 36 and you look across that line and it's basically much lower than the industry

averages. And services is about five to six years lower than the industry averages. Given all that, I mean, I could have recommended longer lives, but I did not because there's a bigger issue in depreciation.

As I indicated, I'd like you now to go back to 4, Exhibit MJM-4. On that first page you can see at the bottom of the page where it says total depreciable plant, the first column is, of course, the description of the plant accounts. The next column is plant balance, and the next column is the cost of removal or the negative net salvage that's incorporated in the current depreciation rates. And that happens to be $46.5 million. Now, that's the total estimates back at that time. That, again, is about almost 50 percent of the total plant balance. What that means is, that in calculating those rates, those depreciation rates, an additional 50 percent was added to the plant balance in order to collect 150 percent of the plant balance.

So -- and that might be reasonable. I did some more investigation. And what I discovered -- I'm going to point you again back to that 140 percent for services, because that is a huge rate, and the resulting depreciation rate of 8.22 percent

is the highest rate I think I've personally seen for a gas service account. It's way -- very much higher than normal. So I asked for the company's actual net salvage data and what I discovered is shown on my Exhibit MJM-6. And what that shows --

COMMISSIONER WEFALD: Just one moment, please.

COMMISSIONER REINBOLD: What are we looking for?

COMMISSIONER WEFALD: MJM-6.

THE WITNESS: MJM-6. What that shows is that on the gas side, the total net salvage for the years 1997 through 2001 was 1.4 million.

COMMISSIONER WEFALD: Where do you see that?

THE WITNESS: Where it says total under net salvage, natural gas.

COMMISSIONER WEFALD: Okay.

THE WITNESS: But what's really extremely interesting about that number is it's positive and the company is collecting for negative net salvage to the tune of about $2,000,000 a year in its current depreciation rates. Furthermore, in doing this investigation, I discovered that there apparently was a sale of a building in 2001 which

produced about 4.9 million, a 4.9-million gain that was a common plant. And the company included that also as positive salvage.

Now, Mr. Jeter wrote many, many, many pages of testimony rebutting me, but he never addressed this threshold issue, which is that the company's current depreciation rates are charging ratepayers about $2,000,000 a year for negative net salvage when the company normally experiences positive net salvage. And that difference is, in my opinion, even with the lives which I know are much too short, but that overcollection is what produces the excessive depreciation reserve levels.

I talked in my testimony about a certain new accounting requirement, Generally Accepted Accounting Principle. First of all, the acronym for that is GAAP, G-A-A-P. And I readily admit that GAAP does not control ratemaking. But what I find interesting about SFAS No. 143 are the principles which underlie it, and I believe they make sense and I'm just recommending to you to consider those principles. The principles are fundamental. Before you include any cost in today's cost for some future potential expenditure relating to the removal of a plant or mass property plant, you have to establish

a legal obligation to incur that cost. Otherwise, that cost will just be expensed as incurred, rather than used to inflate depreciation rates.

Now, Mr. Jeter has included a lot of testimony about how to implement FAS 143, but he failed to focus again on the fundamental issue, which is does this company have asset retirement obligations, those legal retirements. And the answer is based upon all of the responses that were submitted to me is, the best answer is they don't know, but I think the most likely answer is no, based on what I'm finding out in other states and in other proceedings. The natural gas industry does not have asset retirement obligations for distribution plant. And if they do, they're rare. There are some unique circumstances involved.

So what's going to happen as this company is subject to SFAS No. 143, just like all companies in the country, regulated and unregulated. And what's going to happen is that on their nonregulated books when SFAS No. 143 is implemented, all of that excess depreciation which is included in the distribution plant reserve reflected by that 70 percent is going to be pulled out of that reserve and treated as a regulatory liability to ratepayers.

So the company has said they are going to do -- they recently embarked on a new depreciation study. I don't know how that's going to be treated there. My suspicion is, you know, if I were involved in that study, I'd say for ratemaking purposes, perhaps you ought to use the remaining life method which will amortize that excess back to ratepayers over the remaining life of the existing investment.

But what I've done for the purposes of this rate case, since clearly their current depreciation rates are excessive as a result of this negative net salvage is, I've merely eliminated from the existing depreciation rates. I haven't changed any of the lives or anything like that. I've just stripped out the negative net salvage and said let's collect that, the average of that on sort of a normalized expense basis. This is a procedure that is used in Pennsylvania regularly. It's been recently approved in two cases in Kentucky. In my opinion, it is consistent with the likely result.

COMMISSIONER REINBOLD: With what?

THE WITNESS: It is consistent with the likely result of the implementation of SFAS No. 143, combined with another statement of accounting policy on property plant and equipment. It keeps the

company whole. It keeps ratepayers whole and it removes this excessive recovery from current depreciation rates. I talked a lot about depreciation because, of course, it's the biggest adjustment in my testimony.

I'm also recommending the elimination of wages and bonuses. I'm recommending the elimination of the supplemental security income plan. I'm recommending a five-year rather than three-year rate case amortization period, and the disallowance of inflation to other O&M expenses.

That concludes my summary.

MR. HOBERG: Mr. Binek, did you have some questions?

MR. BINEK: Yes. I just have a clarification concerning the statement about elimination of wages and bonuses.

Q. (MR. BINEK CONTINUING) When you talk about the elimination of wages and bonuses, what -- is it your recommendation that the -- you eliminate the 2003 increases as an expense in this proceeding? You're not telling the company that they can't give raises or bonuses, if they want to, it just should not be charged to the ratepayers?

A. That's correct. Elimination from the rate

case.

Q. Right.

MR. BINEK: Okay. At this time I'll tender the witness for cross-examination.

MR. HOBERG: Thank you, Mr. Binek. Mr. Pearce, please.

MR. PEARCE: Thank you.

CROSS-EXAMINATION

BY MR. PEARCE:

Q. Mr. Majoros, I may have misheard. I was a little alarmed when you said elimination of wages. I don't assume you mean all wages to employees should be taken out of the rate case?

A. Not all.

Q. Now, to clarify a point that may be misleading, you talked about the Lindheimer, Illinois Bell case and cited the Court's reference to confiscation being the issue. What the Court is talking about, isn't it, is that Illinois Bell alleged that its property was being confiscated by exceptionally low rates? It isn't a matter of the other side claiming that the depreciation rates were confiscatory?

A. Well, I believe you're probably correct, but the words stand on their own.

Q. Yeah. It's sort of a pejorative word. I just didn't want it to be taken out of context.

A. But I heard that word this morning. That's the only reason I brought it up.

Q. Turning to your Exhibit 20, and this is page 1 of 4 of MJM-5, which is your geometric mean turnover analysis for the mains account. You described your technique using the geometric mean for a life estimate there and, of course, a geometric mean uses a product of two ratios there, doesn't it? You take the square root, of course, the usual way the geometric mean is done. That technique means -- now, for example, if you -- looking at, say, 1996, for example, if you substituted; that is, interchanged columns C and D, the additions and retirements, you'd have the same result, right, because they both appear as numerators in effect in that calculation so it doesn't matter how you take them? In other words, you would get the same lifetime if you had single-year retirements of 119 -- I mean, single-year additions of 119,000 and single-year retirements of 1,096,000, you interchange columns C and D, is what I'm saying and you get the same number?

A. Yes.

nonexistent. Now, you're not suggesting, are you, that they were not in their day a highly reputable and very large company?

A. I just -- when I talk about them, I'd like to be looking at their study. Yeah, they were a large company in their day.

Q. For whatever reason, I believe they have, in fact, disbanded or disappeared. You have not done an actual depreciation study, a full study comparable to their 1991 study, have you?

A. You know, I'm not really sure of everything they did in that study. I know what they said they did. I've tested the lives of the two largest accounts in the company's books, and if I could refer you to the Stone & Webster study, I have it here before me. I'll just refer you to page 4. I used the geometric mean turnover approach to test that. And in the Stone & Webster study they say in the second paragraph, quote, The turnover testing is a procedure in which the adjusted turnover period, i.e., the number of years it takes an investment in plant to be retired, is determined by aggregating additions from the year 1991 backward until the total is equal to the plant balance in that year and then adjusting for the rate of growth in the

then adjusting for the rate of growth in the account.

So, you know, turnover method is not new. Other firms have used it. And I'm not recommending any changes in service lives.

Q. You're not suggesting the way you characterized it a moment ago that Stone & Webster didn't actually do what they said they did?

A. Well, I don't know how they arrived at the negative 140 percent for services and you can't tell from that study.

MR. PEARCE: Okay. I don't have any other questions.

MR. HOBERG: Thank you, Mr. Pearce.

Commissioner Reinbold, did you have any questions in there?

COMMISSIONER REINBOLD: Just a couple. Thanks.

EXAMINATION

BY COMMISSIONER REINBOLD:

Q. I lost track of something here. The 1991 Stone & Webster survey, what was the point that you were making about that?

A. Well, the first point is it's 11 years old. The second point -- the point I just made was, they

apparently employed one of the very procedures that I've used here to test lives in that study. And the reason I bring that up is because Mr. Jeter and now Mr. Pearce have sort of implied that I haven't done any kind of complete study, whether it's -- you know, given the level of available data, the use of the geometric mean turnover approach is as legitimate as any other approach.

Q. Okay. Turning to your reference to selling a building, can you flesh that out a little bit?

A. Yes. There apparently was a building sold in 2001 and it produced a gain of about $5 million. And the company debited cash, put that money in cash and credited it to accumulated depreciation. Now, if that building was included in rate base, which I imagine it probably was, that gain probably ought to be shared with ratepayers. By using the company's approach here, you would not have known about it until I found it.

Q. I understand now.

COMMISSIONER REINBOLD: That's all.

MR. HOBERG: Thank you, Commissioner Reinbold. Commissioner Wefald, please.

COMMISSIONER WEFALD: Yes.

EXAMINATION

BY COMMISSIONER WEFALD:

Q. On page 5 of your testimony you say the compound growth rate from 2000 to 2003 is 5.7 percent and you have a chart, an exhibit that reflects that. I think it's Exhibit MJM-2.

A. That's correct.

Q. Okay. What specifically do you think is driving this?

A. I think that commissions and bonuses and the SISP and the imputation of inflation in year 2003 are driving this.

Q. On page 10, why are the company's depreciation reserves so high? I need to have you help me with this. It's negative 140 percent factor on line 8, which means that the current depreciation rates for service was substantially increased to recover not only the existing investment, but also another 140 percent for future costs of removal?

A. That's correct.

Q. So I just need an example here. When they put in a gas main, the current depreciation rate is -- according to your understanding, it doesn't recover not only the existing investment to the main, but another 140 percent for future cost of

removal of the main?

A. Here I'm talking about services, which --

Q. Services.

A. -- is from the main to the house. And if it costs $1,000 to put that service in, its depreciation rates were designed to collect $2,400, which was the original cost plus another 140 percent for future cost of removal.

Q. What do you -- if you have looked at other depreciation studies, what would you say would be a more normal future cost of removal?

A. Well, typically, that number is driven, based from my experience, is typically driven by some internal cost allocation policy in which the cost of removal is -- you know, they have to figure -- when they go out and replace a main and a service, they have to figure out how much of that cost they want to assign to cost of removal. So they come up with an allocation factor, which results in that allocation.

I explained in my testimony here about Elizabethtown Gas. This was just, you know, within the last two months where I went out and watched a typical main replacement project for that company. And what I discovered in watching and observing that

project, was that the replacement of an existing service, first of all, is very rare. It's a --

Q. You mean the part from the main to the home?

A. Right.

Q. That's the service?

A. That's the service. Because what they do is, they'll have a main running down a street and want to replace that main. They will trench a couple of feet away and a lot of times they will keep that existing service. They may insert something into it to maintain, but it's rare that it actually gets removed. So the replacement cost is just the cost for disconnecting from the original main and then extending another tap over here.

So, in my opinion, that cost is really a replacement cost and probably ought to be capitalized to the new main or something like that. So it's difficult to answer your question about what is a typical removal cost. It depends on how a given company allocates that cost. What's important to understand about this particular company is they don't record any cost of removal at all for services. They're collecting 140 percent, but not recording any cost of removal, as difficult as that

is to believe.

Q. They're not reflecting any cost of removal where?

A. No cost of removal in their books and records. I went through their summary tables and I can see some cost of removal for mains. I could see -- I was looking for account 380, services, and it's not there. They're not recording any -- as big as that number is, you would think that that would certainly be one of their recurring costs of removal, they would record it, and it's not there.

Q. So does that suggest to you that they're not having any --

A. I don't think they do.

Q. -- costs of removal?

A. I speculated in my testimony and Mr. Jeter took, you know, a shot at me, but what I found out in the Elizabethtown Gas case is that for years and years and years that company and probably most gas companies, the people in the fields never recorded costs of removal. They treated everything as a service transfer expense and just expensed it.

Q. All right. Now I want to go -- all right. Now, I want to understand MJM-4.

A. Yes.

Q. You said another --

COMMISSIONER REINBOLD: What page is it on?

COMMISSIONER WEFALD: MJM-4. It's in the back of his testimony here. Page 1 of 2.

COMMISSIONER REINBOLD: Okay.

Q. (COMMISSIONER WEFALD CONTINUING) Now, on this one you said another 50 percent was added to the total depreciation plant.

A. Yes.

Q. That's down at the bottom.

A. Yes.

Q. I need you to lead me through that again.

A. First, the third column is plant balance.

Q. Right.

A. Okay. I always go back to services because it's the best example of this.

Q. It shows a negative in front of that 46. What is it, 46 million?

A. That's at the bottom. I was trying to lead you to how I got to that number.

Q. Okay.

A. So if we look at services, the plant balance is $200,727,046.

Q. All right.

A. The company applied a negative 140 percent

salvage ratio to that to come up with an estimated future negative -- future cost of removal of $28,101,844. It added that amount to the plant balance to arrive at something called the estimated service value, which is $48,174,590.

Q. Where is that number?

A. That is under a column titled estimated service value.

Q. All right.

A. Okay. It then divided that estimate service value over the estimated remaining life of 21.8 years. That's about the third from the last column.

Q. Yes.

A. To come up with an annual accrual amount of 1.6 million, which in turn produced an annual depreciation rate of 8.22 percent, which is then applied every year to calculate depreciation expense and, in fact, the company applied that rate to services in this case and, of course, the plant balance -- this was the 1989 -- 1991 plant balance. That has increased, I believe, substantially. So in this case, the recovery is more than that.

So, anyway, going back to that column where they've applied the 140 percent, they also applied

negative 40 to mains and then they have some positives offsetting it, but the sum of all those positives and negatives sums to negative 46,495,732, which, again, you can see has been added to the plant balance to arrive at that estimated service value, which is then being depreciated.

Q. All right. Thank you. All right. Then go to MJM-6.

A. Yes.

Q. Now, you made the point and I just -- is this what you said, that MDU is charging customers negative net salvage when the company has a positive salvage value?

A. Yes.

Q. So the $2,733,666, tell me about that number again.

A. What I've done there is you'll notice I've separated the plant into electric, natural gas and common utility.

Q. Yes.

A. The common utility I didn't know exactly how to allocate that back to the electric and natural gas, so what I did was allocate that 5.5 million back to electric and gas based upon the totals right above that, you know, the 1.412 and the

1.44. The sale of the building is included in that common utility plant column. I mean, the gain on the sale of the building.

Q. The sale of the building is included in which column?

A. Common utility. It's the first big number on that, over in the right-hand column, the 4.889 million.

Q. I'm somehow missing that.

A. All the way to the right.

Q. All the way to the right. I'm seeing the number -- am I looking at the correct number under common utility, 5,529,260?

A. Right. At the top of that column.

Q. All right.

A. That's the gain on the sale of the building.

Q. Oh, that 4,889,037?

A. Yes.

Q. Okay. Then I need you to go to MJM-1.

A. Okay.

Q. And this gives -- page 2 of 4.

A. Yes.

Q. This goes over the numbers. You're contrasting your numbers to the company's numbers

and its income statement?

A. Yes.

Q. And at the present time, let's skip over the operating revenues --

A. Okay.

Q. -- because those are the same?

A. Yes.

Q. And then you go down to the operation expense, and there isn't a difference in your cost of gas, there's a slight difference in your other O&M?

A. Yes.

Q. But the big difference then comes when you get to depreciation?

A. Yes.

Q. And the company is projecting in 2001, 2002 and 2003 over $3 million, but let's use the 2003 figure because that's the one you're looking at also.

A. Mm-hmm.

Q. Is that correct, $3,261,000?

A. Yes.

Q. And you're projecting $1,089,000?

A. Yes.

Q. So you're right. This is a big ticket

item. So I need to have you tell me how did you come to that $1,089,000 versus the $3,261,000. Where would I see what you've done to make the difference here?

A. It's in my Exhibit MJM-7.

Q. All right.

A. Page 1 of that exhibit is the company's current depreciation rates without the negative -- without the net salvage built in. I've stripped out, you know, the 140 percent and those numbers we were looking at in that column.

Q. You've stripped out all of that or only the one for the services?

A. All of them.

Q. You stripped out all of them?

A. Yes.

Q. Did the company show any cost for some of those, to remove some of those?

A. Yes. They have costs to remove some, but overall the cost has been positive as shown on Exhibit MGM-6.

Q. And that's because of the building being added in?

A. No. The building is separate. That's in common utility. The natural -- on the natural gas

side, for the last five years, setting aside common, setting aside electric, the actual net salvage experience for the company has been positive every year.

Q. All right. So those positive numbers mean that there's a positive -- that it is a positive cash flow, doesn't mean that its cost -- when the first one says 440,703 --

A. Mm-hmm.

Q. -- in 2001, that means that that's a positive number, there were no costs that the company incurred?

A. That is a net positive number. Net pluses and minuses.

Q. So they had some costs, they had some money that they showed from what? Income from what?

A. I don't know. Probably is some reuse involved in that. Let me see. It seems like the company is obtaining a fair amount of positive salvage on underground conductor and devices, which, you know, I don't know if they are selling them or reusing them. So that's one source. I'm sorry. I'm looking at the records.

Q. Okay. Take your time.

A. I was having a disconnect there. What the

mains. I'm just looking at 2001.

Q. That means they will sell gas mains?

A. I don't know. I don't know what the source is. Power operated equipment could be reused. Bottom line, I don't know all of these things. I do know that it's been positive, net positive.

Q. All right. And so you added up those net salvages on the natural gas and it came to 1,444,452?

A. Yes.

Q. And is that what you subtracted then from -- then we still have a different number from their 2003, 3,261,000 and your 1,089,000. What's the number?

A. I stripped out the negative salvage -- all the salvage ratios from the depreciation rates themselves. And in distribution plant that resulted in a 2.37 percent composite depreciation rate rather than the company's existing depreciation rate. The next thing -- so I applied the rates without the net salvage allowances to the plant balances, which is the way it's done in the rate case, and then to that total I subtracted the average positive salvage that the company has experienced in the last five years, including the gain on the sale of the building. If

the company had regularly experienced negative net salvage, I would have added, you know, one-fifth of that amount to the annual depreciation expense.

And, again, the average net salvage is $848,010 shown at the bottom of MJM-6, page 1.

Q. Right. And then you did what with the sale of the building?

A. I included that in that average annual experience amount.

Q. Over five years?

A. Yes.

Q. To give the ratepayers a credit --

A. Yes.

Q. -- for that? And that's how you came up with the Snavely King $1,089,000?

A. Well, the Snavely King $1,089,000 is shown ultimately on Exhibit MJM-7, page 3.

Q. All right.

A. Up above it says company proposal, 2003. Those numbers show the application of the company's depreciation rates to plant balances of the sum $3,261,000 that they're proposing. And below shows the application of the depreciation rates without the net salvage built into them to the same plant balances. That sums to $1,937,000, from which I

balances. That sums to $1,937,000, from which I subtracted the average annual net salvage of $848,000 to arrive at my recommended $1,089,000.

Q. Thank you. Now, the current income taxes, we haven't heard anything about that and yet I notice that that's also a substantial difference in the amount.

A. Are we --

Q. Page 2 of 4 of MGM-1.

A. Yes. Current income taxes, I've used the same procedure as the company to calculate that amount and that amount -- that calculation is shown on page 3 of 4 of Exhibit MJM-1.

Q. And your calculation shows 500 -- a charge of 529,000; is that what the negative --

A. That's a negative current income tax expense. And the reason for that has something to do with the deferred fuel lag, I think, the lag and the recovery of deferred gas expense resulting from the PGA.

Q. Help me interpret the negative number. I'm sorry. I'm having trouble with that. The negative number means that just -- is that something they will pay or they won't pay? I see a positive number of 4,322,000 in current income taxes that they are

going to pay in 2001. Does that mean they are actually going to pay 4,322,000 in 2001? I'm looking at MJM-1, page 2 of 4.

A. I don't know. My suspicion is they didn't pay that --

Q. All right.

A. -- as a result of all kinds of timing differences.

Q. But the next number means that they would have a credit of $3,067,000, is that what that negative -- is that what the parentheses mean?

A. Yes. And it has to do -- again, it has to do with the interrelationship of the PGA and deferred fuel balance.

Q. And the next number means that they would also have a credit of $1,961,000?

A. That's what -- yes.

Q. So the number that you're showing as a credit of $529,000 is actually less of a credit than what the company is showing to the ratepayers?

A. Yes, because I'm showing more income than they are so I have less of a tax credit than they do.

Q. You're showing more income than they are?

A. Net income before taxes.

COMMISSIONER REINBOLD: Mr. Hearing Examiner, if we are not going to finish off this witness tonight, let's wait until morning.

MR. HOBERG: I think perhaps we're close.

COMMISSIONER REINBOLD: Are we close?

MR. HOBERG: Well, we only have Commissioner Wefald, Commissioner Clark and perhaps not very many questions. Mr. Diller has a couple.

COMMISSIONER REINBOLD: Okay. You're the Hearing Examiner.

MR. HOBERG: I think maybe, if we can, finish it off in just a few minutes.

Q. (COMMISSIONER WEFALD CONTINUING) If I can just understand that number, then I'm done. All right?

A. The negative current tax number. Every time I come to North Dakota I get one of these.

Q. Maybe Mike Diller can explain it to me, but I better ask you. Why you're showing that it should be a smaller credit for the customers than the company does?

A. Because my net income before taxes, what I estimate for 2003, is higher than the company's. That's one reason why my recommendation is for less of an increase. I'm recommending a decrease.

Q. All right.

A. So the more net income before taxes that you estimate, the less current taxes -- no. The more current taxes you would have. And we're dealing with negative numbers here because I'm estimating more net income. I'm estimating more current taxes, which is less of a credit than the company.

COMMISSIONER WEFALD: All right. Thank you.

MR. HOBERG: Thank you, Commissioner Wefald. Commissioner Clark, please.

COMMISSIONER CLARK: Just a couple questions.

EXAMINATION

BY COMMISSIONER CLARK:

Q. The 140 ratio, maybe you mentioned this, but I'm not sure that I picked it up. Now that I understand the math better, again, how is that arrived at for, you know -- and I know you didn't have access to the information that the consulting firm that did it back in the early '90s. But typically how would that be figured and what input would go into figuring that 140?

A. Typically, the way it's done is, in the

depreciation studies that I've been involved in, there are typically tables that show annual retirements by year, then gross salvage by year, and cost of removal by year. And the net of those gross salvage and cost-of-removal numbers are related to the retirements to arrive at these ratios.

Now, there's all kind of problems with that approach to the analysis, but that's the way it's typically done, or has been typically done. I look through the Stone & Webster study and I don't see any of those kind of analysis, so I don't know -- you know, I do know that in that study it said to the extent such data, net salvage data was available. I think it's quite possible that it was an off-the-top-of-the-head estimate because the company doesn't record any net salvage for services.

Q. So your recommendation is because it's a positive number, it should just be sort of zeroed out?

A. No. I'm recommending we abandon the procedure entirely and take -- because the new thinking in the accounting profession is that if you don't have a legal obligation to incur that kind of cost on a long-life asset, you probably should expense it or perhaps, in my opinion, capitalize it

to the replacement. Most of these things -- in this we're dealing with mass property plant here. We're not dealing with power plants or nuclear plants. We're dealing with services and mains that get turned over all the time. There's constant activity. They have blanket work orders to do this kind of work. And that to me looks a heck of a lot more like an annual operating expense than something you should treat as a capital cost to inflate depreciation rates. On the other hand, you treat it as a replacement cost and capitalize it.

Q. Now, that is starting to get into the point about the AROs or asset retirement obligations and that gets into the SFAS No. 143. Okay. Let's assume that in college I was reading about the Civil War --

A. Yeah.

Q. -- as opposed to GAAP. Can you give me some examples of, you know, in a concrete way what this ARO means? I understand it is talking about incurring legal obligations. But what -- kind of lay out a couple of examples of what would be an actual obligation.

A. I think that one that pops in is the retirement to remove a nuclear plant and that's

going to cost some money. So what -- and there may be a legal requirement to remove any kind of electrical plant, although I'm not sure.

COMMISSIONER WEFALD: Or gas plant.

THE WITNESS: Maybe a gas plant, manufactured gas plant or something like that. But if there is, what this thinking says, if there's an obligation -- normally when you buy a gas -- say, you buy a manufactured gas plant and it costs $1,000, you debit gas plant, that's plant in service, and you credit a liability, long-term debt or cash or something, but you have something. So the cost of that plant is $1,000. The rationale that underlies FAS 143 is that if you have a legal obligation to then remove that plant, say you estimate it would cost you $200 to remove it and you have a legal obligation to do that, then that is part of the cost of the plant so it gets capitalized as $1,200. But you don't do that unless you have a legal obligation to incur that cost. If you don't have a legal obligation to incur that cost, and this is just replaced as normal things do, you probably would expense that cost.

COMMISSIONER CLARK: Okay. That's all I have right now. Thank you.

MR. HOBERG: Thank you, Commissioner Clark. Mr. Diller, do you have some questions?

MR. DILLER: I hesitate to ask a question. Commissioner Reinbold looks like he's ready to leave.

COMMISSIONER WEFALD: We could maybe wait until tomorrow morning.

MR. DILLER: I don't have that much. It's real general.

MR. HOBERG: Any further questions then of Mr. Majoros?

COMMISSIONER WEFALD: I don't want Mr. Diller to not ask questions.

MR. BINEK: I'm going to have a couple of short questions. I mean, they shouldn't take but a couple minutes.

MR. HOBERG: Is yours pretty short, Mr. Diller?

MR. DILLER: Yes, it is.

MR. HOBERG: Commissioner Reinbold?

COMMISSIONER REINBOLD: You're the Hearing Examiner.

MR. PEARCE: I have one question, if I may, at some point, too.

MR. HOBERG: So we have four questions left

of Mr. Majoros. He's going to be back tomorrow, isn't he? Let's recess tonight and finish in the morning.

(Recessed at 5:04 p.m., the same day.)

ORIGINAL

(The following proceedings were had and made of record, Monday, October 8, 2002, commencing at 9:00 a.m.)

MR. HOBERG: Let's go on the record. This is day two of the hearing in the matter of the application of Montana-Dakota Utilities Company for a natural gas rate increase. Yesterday we concluded -- almost concluded -- we did conclude the direct examination of Montana-Dakota Utilities and we're taking the direct testimony of the staff's case, and we have concluded Mr. King and we're almost, I think, done with Mr. Majoros.

Is there anything we should discuss preliminarily before we finish the testimony of Mr. Majoros today?

COMMISSIONER REINBOLD: I have to leave by 5:00 today.

MR. HOBERG: Hopefully, we're all able to do that. All right. Then I think --

MR. BINEK: Just one point. Yesterday Mr. Pearce or someone from MDU had indicated that one of their witnesses needed to leave early.

MR. PEARCE: That's no longer the case. I'm sorry. I forgot to mention that to you. We have no constraints anymore.

MR. HOBERG: I think when we get done with Mr. Majoros, we'll pause briefly and talk with counsel about what we're going to do in regard to rebuttal testimony, the order. I know you handed out a sheet here, and then mark your exhibits. It's a little bit different format for the exhibits for the rebuttal here, so the Court reporter -- we'll take time to mark those with the Court reporter. That will just take a couple minutes, though, I think.

All right. I believe we had concluded the Commissioners' questions of Mr. Majoros. So, Mr. Binek, did you have any additional questions of Mr. Majoros?

MR. BINEK: I do, but I think that you were at Mr. Diller.

MR. HOBERG: Was I at Mr. Diller? I'm sorry. Okay. Mr. Diller, please.

EXAMINATION

BY MR. DILLER:

Q. Good morning, Mr. Majoros.

A. Good morning.

Q. The depreciation issue is fairly huge in this case. It looks like it's $2.2 million of the difference between the company and staff position

and so I've got a few more questions on depreciation.

Maybe we could just start first by if you could answer this question. If we were -- if the Commission was to adopt your position, how many years would it take for the depreciation reserve to straighten itself out?

A. I would -- to answer that -- I can't give a precise answer to that question. But I would say if you adopt what I'm recommending here, which is to eliminate the negative net salvage from the company's depreciation rates, which would reduce those rates, and then amortize the positive net salvage that they've experienced, including the gain on the building over five years, that, combined with normal plant growth, should start to resolve that problem in about five years, I would think. Would be well on its way to resolving itself.

Q. So in your mind this wouldn't be a fix that would straighten itself out over one year's time, it would take a number of years?

A. Yes.

Q. And you're guessing maybe five years?

A. I'm guessing five years for it to make a significant dent. It will never resolve itself

entirely until, you know, all of the assets are fully depreciated and that would generally be over the average remaining life of these assets.

Q. The difference is so big between the parties I was just wondering -- I mean, if the Commission decided that it wanted to end up somewhere in between, would it matter whether the differences were resolved over five years' time or 10 years' time or 15 years?

A. No. What the Commission -- you know, the Commission could also recalculate rates with new service lives and calculate remaining life rates and then that resolution would be probably longer than five years.

Q. Can you tell me why depreciation is such a big issue here philosophically? I mean, why does the company care whether we use $1 million worth of depreciation expense or $3 million of depreciation expense? Forget about that expense is supposed to match revenues, expense is supposed to match the customers causing the cost, but philosophically, why would the company care one way or the other?

A. Probably because it represents pure cash flow to the company. The more depreciation that's charged, the greater the free cash flow flowing into

the company. Any reduction to that amount is a reduction in cash flow.

Q. Would there be any benefit if the state were to go to, let's say, retail wheeling or some kind of electric reform where it wasn't under rate-of-return regulation, would it be beneficial to have your plant assets depreciated more than is necessary at that point in time or less than is necessary?

A. Well, at that point in time, I think that if I were running the company, I'd want the correct depreciation rates.

Q. You'd want the correct ones?

A. Yes.

Q. It wouldn't be beneficial in a competitive environment --

A. No.

Q. -- to have your assets overly depreciated?

A. No, because in a competitive environment, depreciation does not drive cash flow. It's only in a regulated environment that depreciation drives cash flow because it's built in as a component into the price that's being charged to ratepayers. In a competitive environment, depreciation is an after-the-fact entry on the company's books. Prices are set by the market in a competitive environment.

Q. Okay. So in your mind it's all about cash flow?

A. In this case, yes, that is correct.

Q. Okay.

A. It's all about cash flow and the correct theory and rates.

MR. DILLER: Right. I think that's all the questions I have.

MR. HOBERG: Thank you, Mr. Diller.

Mr. Binek, did you have some more questions of Mr. Majoros?

MR. BINEK: Yes, just a few.

REDIRECT EXAMINATION

BY MR. BINEK:

Q. Mr. Majoros, should ratepayers have benefited from the gain in the building sale?

A. Yes.

Q. How should that gain have been reflected in depreciation?

A. Probably under the existing procedure should have been reflected in depreciation as a positive net salvage ratio in the structures and improvements account.

Q. Was it, to your knowledge?

A. No, it was not.

Q. Okay. What salvage value did the company apply to account 390, that's general plant structures and improvements?

A. If you turn to my Exhibit MJM-4, page 2 of 2, which is common plant, general plant, the building I think was included in account 390, structures and improvements, and you can see that that was depreciated using a negative 10 percent net salvage ratio.

Q. What are the advantages or disadvantages of extending the time period for correcting the depreciation as you have proposed?

A. What are the advantages or disadvantages?

Q. Yeah.

A. To whom?

Q. For the ratepayers.

A. Well, I would say for the ratepayers the advantages of going with my proposal is we get that reserve situation resolved quicker rather than later.

Q. Does it result in lower rates?

A. Yes.

MR. BINEK: I have no further questions.

MR. HOBERG: Thank you, Mr. Binek. Mr. Pearce, did you have some additional questions?

MR. PEARCE: No. No, I don't.

MR. HOBERG: Thank you, Mr. Pearce. Any further questions then of Mr. Majoros at this time?

COMMISSIONER WEFALD: I have one.

MR. HOBERG: Commissioner Reinbold, please.

EXAMINATION

BY COMMISSIONER REINBOLD:

Q. Yes. Mr. Majoros, review for me again when you say small interruptible customers are being overcharged, how, when and why. You said that, didn't you?

A. No, I think Mr. King said that.

Q. Oh, okay. I'm long behind in my notes.

A. One reason they're being overcharged is probably too much depreciation is flowing into their rates.

Q. Okay. I'll take that for now. And I understand the term, but I want to hear you define the phrase "cash flow," in your mind.

A. Cash flow?

Q. Yeah.

A. As I'm using it here it means cash flowing from ratepayers into the company without any corresponding cash outflow. Arrives at the company -- if we talk about labor expense, cash

flows into the company from ratepayers, but there's an offsetting cash outflow, so there's zero cash flow impact of that being included in rates. But with depreciation, cash flows in and there's no corresponding cash flow out, so it's there, stays there for the company's use for whatever it chooses.

Q. So then it becomes a balancing act?

A. Not in my mind, no.

COMMISSIONER REINBOLD: Okay. That's all I have then.

MR. HOBERG: Thank you, Commissioner Reinbold. Commissioner Wefald.

COMMISSIONER WEFALD: On -- well, I guess this relates to whether I'll have a chance to ask a question of staff after we hear the rebuttal of MDU. If I won't have a chance, then I would ask now. But if I will, then I would wait.

MR. HOBERG: Whether he's coming back on as surrebuttal?

COMMISSIONER WEFALD: Yeah.

MR. HOBERG: Mr. Binek, do you intend to call these witnesses, Mr. King and Mr. Majoros, after the rebuttal of MDU?

MR. BINEK: It's going to depend on what the rebuttal of MDU is. Ordinarily, we would not,

but if there's some new evidence that comes in, for instance, we would probably want to rebut that.

COMMISSIONER WEFALD: Should I just ask my question now?

MR. HOBERG: Well, Mr. Pearce, it sounded like yesterday you were expecting them to be called back on.

MR. PEARCE: No.

MR. HOBERG: You weren't. Oh.

MR. PEARCE: I certainly wasn't. I would be quite surprised. In fact, I hope it won't just go on forever and forever that we would have another surrebuttal on the surrebuttal.

MR. HOBERG: Perhaps ask it now then.

COMMISSIONER WEFALD: Then I'll ask my question now.

EXAMINATION

BY COMMISSIONER WEFALD:

Q. On page 17 of Mr. Jeter's testimony he says --

COMMISSIONER REINBOLD: What page are you on?

COMMISSIONER WEFALD: Page 17 of Mr. Jeter. That's in this book here, in the rebuttal testimony.

Q. (COMMISSIONER WEFALD CONTINUING) The

paragraph starting with line 4, the question and then it goes through line 12. "Included in this discussion --

MR. HOBERG: Commissioner Wefald, excuse me. He needs a chance to find it here.

Q. (COMMISSIONER WEFALD CONTINUING) It's in the rebuttal testimony and exhibits. It says, "Included in his discussion of salvage on page 12 of his testimony at lines 1 through 2, Mr. Majoros says, it appears that the company has not recorded any net salvage at all for services; is that true?"

"No. I understand from company personnel that the company has recorded 1.4 million of net negative salvage for services during the years 1995 through 2001. Mr. Majoros took his data from a report of retirement work in progress, which because of the use of blanket work orders show services combined with mains. That is apparently the reason he concluded there was no net salvage applicable to services."

Yesterday I remember that you said that there was no net salvage applicable to services. Did you get your information from this report of retirement work in progress?

A. I got my information from the company's

response to my data request to provide all net salvage for even back prior to 1995, and it may be that they provided a blanket work order or this retirement work in progress material in response to that. But I can tell you that material clearly shows various accounts on it and the one that is strikingly missing is services. So for the company to say that it has recorded 1.4 million of negative net salvage for services, they haven't proven it to me. At this point everything I have says they didn't record any net salvage for services. And I'm responding based upon the information they provided me. Mr. Jeter makes this statement, but there's not a document to support it in his testimony or exhibits.

Q. When you requested the information from MDU, what did you ask for? What did your data request say?

A. My data request No. 21 referenced statements A through F, G through L, N through O, and those are the company statements. Question, Please provide annual North Dakota gas utility gross salvage and cost of removal by plant account beginning in 1986 through 2003.

Response, Please see Attachment A. For the

years '86 through '94, the information is available for the total company only. For the years 1995 to 2001 show both -- the years 1995 through 2001 show both total company and as allocated to North Dakota. Please see Statement O, pages 5 and 6, for salvage and removal costs for projected 2002 and 2003.

And this material I got, here is the -- I guess it's the retirement work order document that Mr. Jeter is referring to. If you want to take a look at it, you can see that it has account numbers and accounts, but one account that is missing is 381. There has not been -- I mean, 380, services. There has not been any net salvage recorded from 1995 through 2001 for services.

Q. Do you want to have that entered into the record?

A. Sure. It will be the response to data request 21. I have it here. I don't know if I have all of it. I mean, I took the pages that I relied on.

MR. HOBERG: Do you have a copy of that, Mr. Binek?

MR. BINEK: We should have a copy.

MR. HOBERG: Let's go off the record.

(Discussion off the record.)

MR. HOBERG: Let's go back on the record. We're going to mark the data request 21 as Exhibit 21 for the record. Did you have any further questions, Commissioner Wefald?

COMMISSIONER WEFALD: No.

MR. HOBERG: Thank you. Any further questions by the Commissioners of Mr. Majoros? Any further questions by any of the parties of Mr. Majoros? Thank you, Mr. Majoros.

MR. BINEK: Off the record, please.

(Exhibits 22, 23, 24, 25, 26, 27, 28, 29, and 30 were marked for identification.)

MR. HOBERG: We're ready to go back on the record. We're back from a short recess to mark exhibits, and I believe we're at the point where Montana-Dakota Utilities will call their rebuttal witnesses, starting with Mr. Jeter; is that correct?

MR. PEARCE: Yes, it is.

MR. HOBERG: Okay. Please call your next witness.

MR. PEARCE: I call John Jeter.

MR. HOBERG: Mr. Jeter, I don't think you've been sworn yet.

THE WITNESS: No.

MR. HOBERG: Were you here yesterday --

well, let me give it today.

THE WITNESS: I was here. I heard it.

MR. HOBERG: But I should give it once at the beginning of the day, just to refresh everybody's recollection, and I'm required to do so by law, anyway.

Let me tell all the witnesses again that the maximum penalty for perjury in this state is a Class C felony, punishable by a maximum five years imprisonment, a $5,000 fine, or both.

Mr. Jeter, being advised of the penalty for perjury, do you promise to tell the truth in this matter being heard? If so, answer I do.

THE WITNESS: I do.

MR. HOBERG: Thank you. Mr. Pearce, please.

JOHN A. JETER,

having been first duly sworn, was examined and testified as follows:

DIRECT EXAMINATION

BY MR. PEARCE:

Q. Would you please state your name and business address?

A. John A. Jeter, 1304 South 185th Circle, Omaha, Nebraska.

Q. What is your occupation?

A. I'm a certified public accountant and self-employed consultant. I retired from full-time association with Arthur Andersen & Company in 1991 after over 37 years with that firm.

Q. What is the nature of the work you performed while you were there?

A. I was involved in examinations of financial statements, and to a much lesser extent in design and installing accounting systems. For many years I performed other financial and accounting consultation services for utility clients.

Q. Would you summarize your educational background and professional experience, please?

A. I'm a graduate of the University of Nebraska at Omaha, from which I obtained a Bachelor of Science degree with distinction in accounting in 1954. I was admitted to the Arthur Andersen & Company partnership in 1967. I'm a member of the American Institute of Certified Public Accountants and the Nebraska Society of Certified Public Accountants. In 1994, I was elected to the Board of Directors of Tucson Electric Power Company and became a director of its parent company, UniSource Energy Corporation, when it was formed. I retired

from the UniSource board and its subsidiary boards in May 2001.

In 1991 I began consulting on my own with utilities regarding accounting and regulatory matters. As is true in this case, I have also consulted in association with Zinder Companies, Inc., a firm that provides economic and financial consultation to regulated utilities.

Q. What experience have you personally had in the utility field?

A. I have participated in or been responsible for regular audits of financial statements, registration statements filed with the Securities and Exchange Commission, the SEC, for the sale of securities, installations of property records and information systems and a variety of other special accounting services for regulated industry clients. For many years before I retired from Arthur Andersen I had regional responsibilities for its regulated industries practice, and was a member of the partnership team that established policies with respect to issues facing clients in rate-regulated industries.

I often taught at both training sessions for Andersen personnel and in training sessions

Andersen offered for its clients and others. This training ordinarily involved accounting issues, tax issues, and various regulatory matters. In 1992, I prepared a paper and presented it twice in a tutorial sponsored by the Institute of Electrical and Electronics Engineers, Inc. Power Engineering Society. The title of my portion of the tutorial was, quote, Accounting for Depreciation, Return, and Income Taxes, unquote.

Q. Have you previously testified before any regulatory agencies?

A. Yes. I've testified before the Federal Energy Regulatory Commission, the FERC, and its predecessor, the Federal Power Commission, the National Energy Board in Canada, the Interstate Commerce Commission, and regulatory agencies in North Dakota and a number of other states, and the province of Alberta, Canada. My testimony has addressed depreciation, accounting for income taxes, post retirement benefits other than pensions, working capital, and various other topics related to accounting and ratemaking issues. I have attached Appendix A, which is a his of my testimony in regulatory proceedings since the beginning of 1996.

Q. What is the purpose of your rebuttal

testimony in this proceeding?

A. I've been asked by Montana-Dakota Utilities, paren, quote, Montana-Dakota, quote, or, quote, the Company, unquote, to respond to the direct testimony of Michael J. Majoros, Jr., on behalf of the staff of the North Dakota Public Service Commission regarding depreciation rates.

Q. I believe you are sponsoring Exhibits 22, your testimony, with JAJ-2 attached, and also Exhibits 29 and 30; is that right? Exhibit 29 we just marked.

MR. PEARCE: That's actually a page from Mr. Jeter's testimony. And Exhibit 30 is a summary of negative salvage from Montana-Dakota Utilities.

MR. HOBERG: Exhibit 29 is a page from his testimony?

MR. PEARCE: I believe that's what it is.

THE WITNESS: It's a new schedule that I prepared.

MR. PEARCE: It's a schedule. I have my little yellow thing on the wrong sheet. That didn't make too much sense, did it?

MR. HOBERG: So are you offering --

MR. PEARCE: I'm not offering yet. I'm just mentioning those are his exhibits; 22, 29 and

30.

Q. (MR. PEARCE CONTINUING) Will you please summarize your conclusions?

A. Yes. The company is using the depreciation rates included in Case No. PU-399-94-297 based on a depreciation study completed in 1992. Currently, Montana-Dakota has retained AUS Consulting to complete another depreciation study by December 31, 2002. There should be no change in depreciation rates until that study has been completed and the appropriate review has taken place as Mr. Majoros did not prepare a depreciation study, has not presented -- has presented no evidence that the depreciation rates should be changed at this time. A proper depreciation study will involve reviewing additions, retirements, transfers, balances, salvage, removal costs, and accumulated depreciation for the entire history of each account in gas plant and common plant for Montana-Dakota's gas distribution, none of which Mr. Majoros did.

Mr. Majoros' reference to cash flow as a basis of setting depreciation rates is completely incorrect and his use of the rough turnover estimation procedures is not reliable and is not used to measure depreciation rates when study data

is available, as it is in this case. His comments regarding net salvage are largely his unsupported opinions and are not based on any analysis of Montana-Dakota facilities, experience, or operations.

Q. Would you please describe the facilities being depreciated by the company?

A. Montana-Dakota's facilities include gas distribution properties in North Dakota that are used to serve approximately 83,500 customers in 76 communities. In addition, there are common facilities that are used in connection with the electrical gas operations in North Dakota and other states, the costs of which are directly assigned or allocated to the North Dakota gas operations.

Q. On pages 5 through 9 of his testimony, Mr. Majoros discusses a relationship between cash flow and depreciation. Is this a normal type of depreciation analysis?

A. No. Mr. Majoros states that depreciation is not intended to finance additions on page 6, lines 3 through 4, but then compares Montana-Dakota's companywide depreciation expense with the plant additions that were made during the years 1996 through 2001. It is well established that

depreciation is not intended to finance plant additions and the relationship between the two is largely meaningless for determining the appropriate time period during which the company's plant should be depreciated.

In spite of this, Mr. Majoros concluded at lines 25 to 26 at page 6 of his testimony that the company, quote, is financing all of its plant additions from depreciation funds it collects from ratepayers and still has a substantial amount of additional cash for other matters, end quote. There is no way he can support that conclusion, because he is assuming incorrectly that there are no other requirements for the cash flow.

Moreover, since depreciation is meant to recover the existing investment, it is irrelevant whether investors reinvest the recovered funds or, instead, find other uses for the funds. The appropriate depreciation rate is dictated by the need to recover the invested capital during the life of the facilities. By ignoring that fundamental purpose of depreciation, Mr. Majoros is effectively proposing that the depreciation rate should vary from time to time depending on the amount of cash the company is investing on projects deemed by

Mr. Majoros to be beneficial to ratepayers. Presumably, in years when the company has, quote, additional cash for other matters, unquote, Mr. Majoros would reduce the depreciation rate. Conversely, in years when the company needs to undertake major investments in plant, Mr. Majoros presumably would propose major increases in depreciation rates so that the company will have sufficient cash flow to fund all of its investments without borrowing, retaining earnings, or issuing common stock.

It is doubtful that Mr. Majoros really means to revolutionize the concept of depreciation so that customers' rates can be increased dramatically to provide financing for new investments. Nevertheless, that is the logical corollary to the new, quote, cash-flow-needs, unquote, standard for setting depreciation rates that Mr. Majoros is advocating.

Q. Is Mr. Majoros' assertion concerning Montana-Dakota's source and uses of funds factually accurate?

A. No. In addition to the fact that the comparison he made is meaningless, the amounts used are not comparable. The depreciation -- and I'm now

referring to his page 6. The depreciation in column 2 includes depreciation of common plant, but the amounts for, quote, construction/acquisition (sic) in column 3 do not include those for common plant.

Now, I'd like to insert here the fact that yesterday Mr. Majoros put forth Exhibit 20, and included in that exhibit is a schedule which is entitled page 6 table expanded. That's the top page of Exhibit 20. What he did there was to add the common plant construction in column 5, which is why it exceeds the amounts in column 3, and then show the corrected incremental cash flow. He could easily have left out columns 3 and 4 because they are obviously -- well, 3 is correct, but column 4 he could have left out because it's no longer correct and I think he would agree with that.

But I wanted to point out that he has now corrected that. During this 1996 to 2001 period there were 28,000 -- $28,064,555 of additions to common plant. This changes the incremental cash flow in his column 4 from $28,473,000 to $408,000. Now, with his expanded schedule, he comes to $409,000. So we differ again by rounding differently on that number by 1,000. The last year in the column and in his original table in his

testimony was shown as 2002 and should have been 2001, and he carried that into his expanded table. Mr. Majoros also -- excuse me. I've come to the next question.

Q. Mr. Majoros also made an analysis using just a North Dakota distribution and general plant additions and depreciation expense amounts in his Exhibit MJM-3. Is that any different?

A. No. It's also meaningless for similar reasons. Once again, his conclusion is completely incorrect. After observing that the depreciation expense for the years '86 through 2001 exceeded the plant additions by 4.5 million he says, paren, on lines 8 and 9 on page 7, close paren, quote, It seems that ratepayers rather than investors have been financing the company's North Dakota plant through excessive depreciation, end quote. Interestingly, he asserts that there is, quote, excessive depreciation, end quote, and has at this point in his testimony mentioned no basis for that other than the comparison of depreciation cash flows and plant additions, which even he agrees are not the basis for setting depreciation rates.

I'd like to insert here also based on his Exhibit 20. Well, let me first explain. The next

paragraph of my testimony I was planning to strike because it was incorrect. However, in Exhibit 20 he revised the Exhibit MJM-3 and in revising it, it's now incorrect. I said earlier that it was when it wasn't and now he's revised it and now it is, in fact, incorrect. And that's the third page in Exhibit 20. He added depreciation of common plant to the depreciation of distribution plant that was originally in his exhibit and that shows in column 2, increased amount there. But he did not add the common plant additions in column 3. Had he added them, I think the schedule would not show what he intended it to show.

For instance, in the first year, 1986, the additions, including common plant, are $2,699,841, compared to the 1,945,514 of depreciation expense. And, therefore, there would have been a negative number in the fourth column of 754,327. I didn't go through all of these to make that correction, but the only other one I did was in '89 and it has the same type of effect only more so.

COMMISSIONER WEFALD: Can you just repeat for me again which document you were looking at?

THE WITNESS: All right. His Exhibit 20 that was entered yesterday, and it's the third page

of that, ma'am, if you just turn back into it. It's several different things, and the third page is the one I was referring to.

COMMISSIONER WEFALD: Thank you.

THE WITNESS: Yes. Now, that is supposedly the same thing as his Exhibit MJM-3, which was attached to his original testimony. And what he has done, if you look at the two, you can see that he has added amounts in column 2 each year so that the total depreciation expense instead of being $33,405,083 as it was in his original exhibit is now $37 million.

MR. HOBERG: Mr. Jeter, are you still wanting to strike that 15 through 21?

THE WITNESS: Yes. I would like to strike it, because I was referring to his original exhibit which was not inconsistent.

MR. HOBERG: Lines 15 through 21 on page 7 should be stricken and replaced with what you just said?

THE WITNESS: With what I said, yes.

COMMISSIONER REINBOLD: What are the lines?

MR. HOBERG: 15 through 21 of page 7 of his rebuttal.

THE WITNESS: It does not change anything.

I still think the exhibit is meaningless, but I had called attention to something I thought was wrong and I was wrong. It is incorrect in his new version attached to part of Exhibit 20.

MR. HOBERG: Thank you. Please continue.

THE WITNESS: It is incorrect in his new version attached to -- as part of Exhibit 20.

Q. (MR. PEARCE CONTINUING) On page 7, at lines 12 to 13 of his testimony, Mr. Majoros states, An excessive depreciation rate is one that produces depreciation and expense more than necessary to return a company's capital investment in an asset over the life of the asset.

Do you agree with the statement?

A. No, because it's incomplete. The Federal Energy Regulatory Commission in its Uniform System of Accounts for natural gas companies, paren, also used by this Commission for the gas companies subject to its jurisdiction, close paren, defines depreciation as:

> The loss in service value not restored by current maintenance, incurred in connection with the consumption or prospective retirement of gas plant in the course of service from causes which

are known to be in current operations and against which the utility is not protected by insurance. Among the causes to be given consideration are wear and tear, decay, action of the elements, inadequacy, obsolescence, changes in the arts, changes in demand, and requirements of public authorities, and, in the case of natural gas companies, the exhaustion of natural resources.

The term "service value" is defined as the difference between original cost and net salvage value of gas plant. Since service value includes net salvage in addition to capital investment, Mr. Majoros omitted an important aspect of the recovery of cost that is necessary through depreciation provisions.

I'd like to also comment here about some of the things that were said yesterday. The expense provision for depreciation includes cost of removal or salvage net and that means that they would either be higher or lower depending on the estimates of whether there's net cost of removal or negative salvage or salvage itself. The reserve is there for

the retirement of the asset and for the cost of removal or salvage as often happens. His comparison is misleading because he's leaving out those aspects of reserve for depreciation in his comparison.

Q. How would the omission of net salvage affect his determination of excessive depreciation?

A. Well, his comparisons are not only baseless, but they're also incorrect in that the entire cost is not included in his thinking. If the net salvage is negative and is estimated at 30 percent of the asset cost, he would be asserting that since the depreciation expense exceeds current additions, it is excessive. That is a wrong comparison to start with, but, in addition, he would be leaving out the fact that the expense would have to be 130 percent of the amount necessary to recover the investment in order to provide for the negative salvage or cost of removal in excess of salvage.

Q. On page 7, line 16, through page 9, line 2, Mr. Majoros quotes a U.S. Supreme Court decision in 1934 as a basis for his contention that excessive depreciation results in the extraction of capital contributions from ratepayers.

Would you please comment on that?

A. Yes. Mr. Majoros seems to have missed the

point of the Court's ruling. He refers to a cite of this decision in the NARUC Depreciation Manual as proof that it is still relevant law. The section in which this term is cited is The Brief History of Utility Regulation. Now, as an aside to that, that's a nine-page chapter. It's the first chapter of this book put out by the NARUC. The following chapter is entitled, quote, Current Concepts of Depreciation, end quote. So the chapter that he's referring to is actually a history of what has happened. Obviously, depreciation practices were still in the development stage in 1934.

Now, I'll go back to the text here. The NARUC text point out the fact that this decision overruled a 1930 decision for depreciation on fair value. That means a value that reflects changes because of inflation, typically, over time. In other words, at that time they were depreciating plant using reproduction cost, new. In other words, they were taking account of inflation over time and then depreciating that inflated amount rather than the original cost of the plant.

Now, since some of my comments about things I've read are not necessarily believed by others, I'd like to read into the record the information

that I was just talking about. And this is from page 3 of this NARUC Depreciation Manual. And it's the third full paragraph.

In 1930 the opinion of the Court had changed and reflected the belief that depreciation expense should be based upon present value rather than original cost. United Railways and Electric Company of Baltimore versus West, 280 U.S. 234, 1930. That opinion appears to have been overruled in the 1934 decision, Lindheimer versus Illinois Bell Telephone Company, 292 U.S. 151, 1934, wherein the Court stated, The method is designed to spread evenly over the service life of the property the loss which is realized when a property is ultimately retired from service. According to the principle of this accounting practice, the loss is computed upon the actual cost of property as entered upon the books, less the expected salvage and the amount charged each year is one year's pro rata share of the total amount.

So this issue had to do with whether we depreciate fair value of the property determined using various indices to estimate the value of an existing property that had been in existence for some time and then depreciating that value, or if we

should use original cost. I frankly had not heard of this case until this testimony was done. And the case you hear of is discussed in the rest of my written testimony. So I'll begin there.

Subsequent to the Hope Natural Gas Company case decided by the Supreme Court in 1944, most regulatory commissions stopped using the value method for measuring the rate base investment and switched instead to the original cost method of measuring rate base. To that extent, I believe the 1934 decision cited by Mr. Majoros is consistent with current regulatory practice, which generally uses original cost rate base for ratemaking. I believe the references in the decision to excessive recovery of depreciation refer to the use of value rather than cost in setting rates. That is certainly not an issue in this case since neither the rate base nor the depreciation amount is derived from an estimate of the current value or replacement cost of the plant.

Q. On page 9, lines 3 through 24, Mr. Majoros shows the relationship of the accumulated depreciation reserve to the plant in service and concludes that the reserves are extraordinarily high, to use his term, and that they suggest that

higher depreciation rates have been excessive.

Do you agree with this conclusion?

A. No. Without information about the average age of the plant, prior retirements, et cetera, it is not possible to tell at what level the accumulated depreciation provisions the reserve should be. Once more, Mr. Majoros has expressed his opinion without benefit of any evidence to support it.

Now, I'd like to comment here again that in his discussions yesterday he mentioned the 70 percent ratio of one of the plant items depreciation reserves to the plant cost itself. And I think we need to understand what's in those depreciation reserves in order to understand those ratios. They're not used to separate. This book says over and over that that shouldn't be done. And there are very few situations in which regulatory bodies actually look at the reserve for depreciation and say that reserve is too much or too little and we're going to correct that right away. It's done in the telephone industry to some extent, but other than that, it's practically not done at all.

The reserve has the provisions that have been charged to expense for cost recovery and for

net salvage, whether it's positive or negative, in it. Credits for salvage increase the reserve. Plant cost retired is in the reserve as a negative amount. In other words, we depreciate over the years with the idea that when the plant is retired, that depreciation reserve will equal the amount of the cost of the plant and the two will offset. It also has charges for the cost of removal because when plant is retired and must be removed, then those costs are charged to the depreciation reserve also because they have been provided for in the provision for depreciation and that goes into that reserve.

Deciding whether reserve is too high or too low is difficult. Mr. Majoros compared the reserve for all distribution facilities which is impossible to understand on its face because it includes a lot of different kind of properties, a lot of different existing ages of those properties, and a lot of different lives of those properties. You need analysis, but usually that's not done in modern depreciation practices other than as a sort of test of what's been done in more detail using curve fitting techniques that are typically used in determining depreciation rates.

Q. Are there others aspects of the level of the depreciation reserves that should be considered?

A. Well, yes. The amount in the reserve includes amounts that are set aside for the net negative salvage, as well as the amounts needed to recover original investment in the plant. Obviously, that makes the percentage relationship of the reserve to the plant amounts look larger than it would if only the investment recovery portion of the reserve were compared. More importantly, the larger the reserve balance is, the lower the rate base is and the lower revenue requirements for return and income taxes are. In some cases the level of reserve can also affect the levels of property taxes paid, and reduce them if the reserve is higher.

Q. Could you quantify the effects of the lower rate base?

A. Yes, I can do that roughly, and I want to emphasize the word "roughly." The direct effect of the lower rate base caused by larger depreciation reserve balance is to lower the revenue requirement. If it is assumed that depreciation has been less -- had been less by the amount of Mr. Majoros' proposed annual adjustment of depreciation since rates were set to be effective in late 1994, we would have

eight years, '95 through 2002, of Mr. Majoros' $2.172 million proposed depreciation expense reduction accumulated in the reserve for depreciation by the end of 2002. That would have reduced the reserve by $17,376,000 and increased the rate base by the same amount.

The effect of an increase in rate base of $17,376,000 would be to increase the revenue requirement. I've computed those amounts using Montana-Dakota's proposed 11.044 percent rate of return shown on Dr. Gaske's testimony and the 39.61 percent combined federal and state income tax rate supplied to me by the company.

Q. And what are the effects on revenue requirements using those assumptions that you mentioned?

A. The revenue requirement avoided because of the 17,376,000 is in the depreciation because that's in the reserve is about 3.2 million annually, which exceeds the 2.2 million annual depreciation adjustment proposed by Mr. Majoros. This means that there would be a greater reduction of revenue requirement -- I said would. There will be a greater reduction of the revenue requirement every year from 2002 on by having the 17,376,000 in the

reserve, than Mr. Majoros' proposed reduction in annual depreciation expense. In addition, the revenue requirement reduction does not reduce the amount of investment being recovered by Montana-Dakota as Mr. Majoros' proposed depreciation expense reduction would. The higher depreciation reserve balances, resulting in a lower rate base, has benefited Montana-Dakota's customers and continues to be a benefit in terms of reducing the revenue requirement.

Q. On page 10, lines 2 and 3, Mr. Majoros states, according to the company, no specific studies have been prepared regarding the adequacy of the depreciation reserve or calculation of any theoretical depreciation reserves.

Is that true and, if so, can you explain why it is true?

A. I understand it is true, and it's certainly appropriate. Theoretical depreciation reserves are discussed in the NARUC text on depreciation, this document, to which Mr. Majoros referred in his testimony. On page 24 the author states, quote, If, for example, depreciation rates have been prescribed by regulatory authorities for an appreciable period in the past, it would be inconsistent to deduct in

establishing a rate base a larger or smaller amount than book depreciation reserve accumulated under the prescribed rates, end quote.

The reason that the company has not done studies of the adequacy of the depreciation reserves or determined theoretical depreciation reserves is that it's inappropriate. Adjustments of depreciation are nearly always done on a prospective basis based on the determination of changes in average service lives or determinations of average remaining service lives, more often remaining service lives.

Q. On page 10 of his testimony Mr. Majoros expresses his opinion that the 1991 depreciation study by Stone & Webster included an extremely high cost of removal factor for account 380, services. Do you agree?

A. No. The 1991 depreciation study of Stone & Webster included a review of account 380 additions from 1936 through 1991 and related salvage data to the extent that it was available. I'd like to insert here some discussion, because I did not talk about the level of net cost to remove or net negative salvage that is in this case and I think that it is more understandable if you start to think

about what's involved than it is if you just look at those rates and say they're too high.

For instance, in salvage in the services area, the service again is the line from the main in the street to the home. They're typically a small-diameter pipe. The installation -- and I think there was an example of $1,000 installation yesterday, and I'd like you to think about what happens when that is installed and then a period of time of 35 years goes by and then it's taken out. For whatever the reason, maybe it's replaced, maybe it's taken out because the home is no longer occupied, but for whatever the reason. It seems to me that it probably would cost about the same amount in terms of labor, time, and equipment, and so forth to take that line out as it did to put it in in the first place. However, in 35 years the cost of doing that is going to have increased. I looked at the Consumer Price Index, and in 1967 the Index was 32.9, in January. In January of 2002 the index was at 177.1. So if the cost of doing these activities has gone up by the inflation amount shown by the Consumer Price Index, the cost would be over five times as much.

So when an estimate of net cost of removal

is 140 percent of the original cost of the facility, that may be pretty close to what's involved, but it may also be short. It may actually cost more than that. So I was accused of not having thought about this or reacted to those salvage amounts. I didn't look at the study in any detail at all, but I'm certainly more willing to accept what people did in an extremely detailed study than to just say offhand those are wrong. And so I think that the amounts that are there are reasonable, probably. Now, I can't swear to that because I haven't done the work that's necessary, but I would certainly wait until somebody does the work in the current study to see if those amounts are reasonable.

And I should mention the inflation during that 35-year period that I talked about was greater than normal. It amounted to 4.9 percent a year because of very high years in the '70s and '80s that we had some very high inflation, but even at 3 percent a year in 35 years, prices will go up 2.8 times so it's still something that has to be dealt with when you're dealing with longer life properties.

I'll continue with the rest of that answer. I would rather rely on that study than Mr. Majoros'

reaction, which seems mainly to be based on the effects of the salvage estimate rather than the basis for it.

Q. On the same page 10 Mr. Majoros concludes that the 36-year life for account 376, mains, and the 34-year life for account 380, services, may be excessive based on his experience in investigating other gas depreciation rates.

Will you please comment?

A. Yes. Again, I would rely on Stone & Webster's 1991 depreciation study. Mr. Majoros' opinion may be based on his experience, but his opinion was formed without any specific determination of the proper life or any specific basis for the life he would have led. The Stone & Webster's study used data from 1936 through 1991 and curve fitting techniques that resulted in the use of the R3 Iowa Curve to determine the 34-year life for the account 380, services. The study used data from 1944 to 1991 for account 376, mains, in the same manner to determine an R5 curve fit and a 36-year life.

The approach used by Stone & Webster for these two accounts is widely used by depreciation experts, including the FERC staff, to determine the

appropriate lives to use to depreciate gas utility plant.

Q. On page 11, lines 1 through 15, Mr. Majoros discusses the geometric mean turnover studies he used to test service lives.

Will you please comment on that?

A. Yes. First, the use of the word "studies" should not be interpreted to mean he did a depreciation study. What he did is a very limited review of certain data, with some unexplained calculations. He said in the testimony that he used the last five years of additions and retirements. However, his Exhibit MJM-5 shows additions and retirement for the period 1985 through 2001. In addition, his exhibit labels certain of the data as a three-year band and it appears not to be for any three-year period. His schedules on Exhibit MJM-5, pages 1 of 4 and 3 of 4, show average plant balances in column b for each year based on the balances at the beginning of the current year and the beginning of the prior year, which means the average balances are all shown for the wrong year. They are all actually averages of the year previous to the one shown.

The average plant balance additions and

retirement shown under the three-year band caption are in each instance the sum of the current year and the previous year amounts from columns b, c, and d. Thus, they are not for three years and they use those incorrect average balances from column b that I discussed. Using the data for this 17-year period Mr. Majoros computed a life estimate of 108.07 years for account 376, mains, and a life of 68.53 years for account 380, services. He does not explain how the data for this 17-year period is reliable, nor how the method he used works to determine the lives.

Now, I'd like to insert here a comment based on the discussions yesterday in the hearing. Exhibit 20 has comparisons of company and industry averages and to put the lives that Mr. Majoros determined in that methodology in context, I'd like you to look at the second piece of paper in Exhibit 20, which is the statistics for lives that he presented. And in that example taking mains, which is account 376, the company life is shown as 36 years. The lives that he got averages from statistics for gas plant, and I assume a rather wide group in the United States are around the 50- to 55-year lives. The minimum life was 10 and the maximum life was 80.

As I'll discuss later, Mr. Majoros has adjusted his MJM-5, and he now finds that the life should be 116 years. One hundred sixteen years exceeds the maximum life of 80 years shown on his schedule by quite a lot and I think is totally meaningless in the context of depreciation rates for this company.

Similarly, on the services the company is using a 34-year life. The range for others is from 10.2 to 40 years. And the maximum life shown was 63 years. His revised determination is 74 years. Again, substantially higher than any other company has or is using. That's in the survey that he produces numbers from.

I'm going back to the text now. In the case of account 376, mains, the 1.167 million of retirement for all of the years from 1985 through 2001 are only 6.2 percent of the balance at the beginning of 1985, and a smaller percentage of the 1985 balance plus subsequent additions. In the NARUC depreciation text mentioned by Mr. Majoros, the turnover methods are discussed in Chapter 8. The geometric mean turnover method he used is described on page 81 as follows, quote, The Asymptotic method and its simplified form, the

geometric mean method, are based on ratios of annual additions and retirements. The latter method more readily indicates trends, but is also prone to producing results with considerable variability. The simplicity of the turnover method and the ease with which they may be applied explain their popularity. Their use is restricted by the assumptions of uniformity and their failure to provide an indication of retirement dispersion. These problems led to their replacement by the Simulated Plant Record model.

Further, under the caption "limitations" on page 92 of the same text, NARUC text, the following summary statements about turnover methods are made. Quote, All of the methods assumed uniformity of the growth ratio and dispersion of retirement for each vintage. A more reliable estimate may be made if the property has experienced at least one life cycle, roughly twice the average life, since, under the consistency assumptions above, the property will be at stability. Since utility property typically does not meet the above consistency assumptions, the method may produce considerable variations in life indications. This is especially true for the geometric mean method.

Now, if you think about applying that, this document says that you need roughly twice the average life of data. Twice of average life that he determined would be 232 years, and I don't think we have any data back to the 1700s.

The 1968 addition of the NARUC text stated on page 138 -- now this is a long time ago, this document. Turnover methods are currently used very little because improved methods have been developed for determining service lives from recorded data. I do not believe Mr. Majoros' conclusions based on his very rough analysis of this data should be given any weight in determining the proper lives to use for Montana-Dakota distribution facilities.

Q. Turning for a moment back to page 14, line 21, you said chapter 8. Did you mean chapter 7?

A. Excuse me. Chapter 7. I misspoke. I also would like to insert here that during Mr. Majoros' summary yesterday he mentioned that the Stone & Webster study had talked about a turnover method and he quoted a paragraph from page 4 of their report. I'd like to quote it again and comment on it, if I may.

I believe the quote was -- and this is from page 4 of that document. The turnover testing is a

procedure in which the adjusted turnover period, the number of years it takes an investment in plant to be retired, is determined by aggregating additions from the year 1991 backward until the total is equal to the plant balance in that year and then adjusting for the rate of growth in the account.

Now, keep in mind, they're talking there about dealing with additions back through the years from the time that they did their study until they could account for all of the balance that was there when they looked. I just mentioned he looked at only 6.2 percent of the retirements in his study and that the additions would have been something less than 50 percent. So he did not do what Stone & Webster said they did. They were both called turnover methods, but his method is a much simpler and less reliable method.

Q. On pages 11 -- sorry. On page 11, line 18, through page 12, line 11 of his testimony, Mr. Majoros discusses net salvage ratios and refers to his Exhibit MJM-6. He concludes that the company's net salvage recovery is vastly overstated.

Do you agree?

A. No. I believe the 1991 depreciation study prepared by Stone & Webster is a much more reliable

source of information regarding net salvage than a cursory look at the net salvage for all accounts over a five-year period. By the way, Mr. Majoros talked about that method being used in, I believe, Pennsylvania and Kentucky. Which said another way is that it's not used in the other 48 states, nor by the FERC, nor by the FCC, nor by anybody else that I'm aware of. It is a method that is bound to charge the wrong customers for these items. The new financial accounting standard is clearly aimed at having the cost of removal spread over the life of the facility so that the customers that have the benefit of that facility are paying for it. Spreading net cost of removal or salvage from a previous five-year period doesn't accomplish that at all and it is bound to be incorrect.

There's been several mentions of a gain on the sale of a building. And I may cover that later in the printed documents. I will. But it's been mischaracterized as a gain several times, including this morning again in cross. There was no gain on the sale of the building. Salvage is the entire amount realized from the sale of the property when it's retired, not the gain on the sale. This building was sold for book value. The salvage went

to the depreciation reserve and there it reduces rates for customers because it's a reduction of the rate base.

And in addition to that, it equaled the amount that they needed because they sold it for book value. So this using a five-year average and including $4.6 or 8 million in the future five years based on that, is totally wrong. First of all, even if that should be done that way, and it shouldn't, but if it should be done, there's not going to be another sale of a building likely in every five-year period in the future, nor one-fifth of that amount realized in any of the five years. It's just absolutely wrong.

I want to make sure everybody understands there was not a gain on the sale. There was nothing that the customers are never going to realize. This building was sold for its net cost. In other words, its original cost less the depreciation that had been accumulated on it from the time that it was placed in service.

And I'm going to continue reading now from my text. I also believe that the cost of removal will tend to be paid near the end of the average life of plant facilities and cannot be estimated

accurately using broad averages of short periods of data as was done by Mr. Majoros. Mr. Majoros used data without so much as questioning. The amounts by year for natural gas vary from $79,685 to $440,703. In addition, the amounts for common utility facilities varied from 12,377 in 1997 to $4,889,037 in 2001.

As I mentioned, I understand that the large amount in 2001 involved the sale of an office building for 4.6 million. The electric amounts include an insurance recovery of about 1.8 million and much of the other salvage during the period is for vehicles and work equipment. These are relatively short-life assets. The salvage very often is trade-in value when work equipment is traded in on new work equipment.

I will discuss the recommendation -- excuse me. In summary, Mr. Majoros has very little basis for his comment and for the effect of net negative salvage he used in his final recommendation. I will discuss that recommendation later in the testimony.

I do not understand Mr. Majoros' comments about the recovery being overstated. I assume the accounts being recovered are being recorded by the company in the records. Perhaps he means that the

amounts being recovered are excessive, and I have commented above about his complete lack of evidence for that claim. He also states on page 12 of his testimony that the company's, quote, ratepayers are being penalized, end quote. The ratepayers will receive full benefit of the amounts recorded by the reduction in rate base as I described above.

MR. HOBERG: Perhaps this would be a good time to take a 10-minute recess. I think we're going to continue for a while. Let's take a 10-minute recess at this point.

(Recess was taken.)

(Exhibit 21 was marked for identification.)

MR. HOBERG: We're back from recess and, we'll continue the examination of Mr. Jeter.

Mr. Pearce, please.

MR. BINEK: Your Honor, I just wanted to mention that I passed out copies of Exhibit 21 during the break.

MR. HOBERG: Thank you, Mr. Binek. This is the big one. It's the data request 21 and the response, which is marked as Exhibit 21. Thank you.

COMMISSIONER REINBOLD: 21?

MR. HOBERG: 21, yes, Exhibit 21.

Mr. Pearce.

Q. (MR. PEARCE CONTINUING) Mr. Jeter, included in Mr. Majoros's testimony in a discussion of salvage he says, it appears that the company has not recorded any net salvage at all for services. Is that true?

A. No. I understand from company personnel that the company has recorded 1.4 million of net negative salvage for services during the years 1995 through 2001. Mr. Majoros took his data from a report of retirement work in progress, RWIP, which because of the use of blanket work orders shows services combined with mains. That is apparently the reason he concluded that there was no net salvage applicable to services.

Now, earlier this morning this was discussed again. And at the time that I wrote the testimony, I had just been informed of that. Subsequently, I asked for some data from the company to explain that. And I should mention I think this was an unfortunate thing. The response to the original data request was misleading. I think there was reason to believe looking at it that there were no salvage amounts for services because they didn't show there. And they were combined because of the kind of blanket work order treatment the company

gives them.

But, in any event, there were actual net cost of removal for services during the period involved. And I have with Exhibit 30 summarized several pages of data that I was given by the company. Each of those pages is headed up services-removal cost. And I have taken the total amount for the year from each of those pages and summarized it in the column called annual on the top page. And you can see from that, that this totals up to $1,387,946.12 or 1.4 million. And the documents that I got did not have monthly detail for all of the months of the year, but on that top schedule I summarized some of those just to get a feel for it. The trouble is, those monthly amounts are not necessarily representative in North Dakota because they're for January and I doubt that there's a lot of construction going on in this part of the world in January, no more than necessary probably. But in any case there were, in fact, a million-four of cost of removal.

Now, I said in my testimony net negative salvage. Looking at these schedules, there could have been some positive salvage that's not accounted for here. I doubt it because typically service

lines don't generate any material that can be sold or used again. But that could be that there is some actual salvage values that are not even in this more detailed review.

Q. Mr. Majoros then guesses the company may be recording cost of removal in connection with services replaced as service transfer expense. Is that what the company is doing?

A. No. As I mentioned above, the company has informed me that the net salvage has been recorded in the accumulated depreciation accounts, the reserve.

Q. Then to the extent you relied on his statements about account 380, services, his conclusion is unsupported; is that right?

A. Yes.

Q. On page 12, lines 13 through 21, Mr. Majoros discusses FAS No. 143 and the changes he believes will be required for fiscal years beginning after June 15th of 2002. Would you please summarize the effects of FAS 143?

A. Yes. I prepared Exhibit JAJ-2, a simple example of the accounting changes involved. On the exhibit -- and it probably would help if we look at that together -- I have assumed a $10,000 plant is

completed on January 1, 2001 and there is an estimate of $500 of cost of removal and no salvage at the time of its estimated retirement on December 31, 2010.

COMMISSIONER WEFALD: I need some help with where this exhibit is found.

THE WITNESS: It's attached to my testimony.

MR. HOBERG: His rebuttal testimony, the very last page.

THE WITNESS: The very last page. In that section we --

COMMISSIONER WEFALD: TAA-5, is that the one we are looking at?

MR. PEARCE: JAJ-2. You must be in the wrong --

COMMISSIONER WEFALD: JAJ-2?

THE WITNESS: Yes.

COMMISSIONER WEFALD: Thank you.

THE WITNESS: The owner of the plant applies a credit adjusted risk-free interest rate to discount the cost of the removal obligation to its present value of $254.17. Now, I'm assuming those things, and the assumptions are basically all shown at the top of the exhibit.

COMMISSIONER WEFALD: Where is this $254 figure?

THE WITNESS: It's at the right-hand side of the top little section there, right below the 7 percent, and it was derived using the 7 percent. That's the present value of $500 10 years out using a 7 percent discount rate. In other words, if you invested $250.17 at 7 percent, 10 years later you would have the $500.

Under existing accounting, as shown at the top table on the exhibit, the depreciation expense would reflect the $500 of cost of removal as an additional provision for depreciation of $50 per year and the total depreciation expense credited to the reserve for depreciation would provide for the retirement of the asset and the cost of removal. The plant and reserve accounts would be zero at the end of the life.

Now, you can see there I've labeled it expense. That's the provision for depreciation that goes to expense and is credited to the depreciation reserve which increases the reserve. At the end of the life -- and this assumes perfect estimation -- there would be $1,000 of plant taken out of the plant records and charged against the reserve, and

there would be payments of $500 to remove that facility. And the balance in the depreciation reserve would therefore become zero and the balance in the plant account would also be zero. That's quite a lot simpler than what I'm going to tell you about next.

Because under SFAS 143 the $254.17 present value of the estimated cost of removal would be recorded on January 1, 2001 as a liability and as an addition to plant. Now, you can see that in the first line of that lower table where plant starts out at $10,254.17. Depreciation of the adjusted plant would be $1,025.42 per year instead of the $1,050 recorded under existing accounting rules. Now, you can see that's a lesser amount, and the reason it's smaller is that we're dealing with a present value of that future payment that has to be made and that's the amount that would be depreciated and recovered through depreciation. In the depreciation -- well, let me read on.

The present value of the liability that would be set up offsetting that addition to plant must be increased each year as the time for settlement approaches. The accretion recorded to do that is the discount rate times the beginning of the

year balance each year. On the exhibit that shows up as $17.79 in 2001 and increases each year until 2010 when it is $32.71. Once again, the plant and reserve accounts, as well as the liability accounts all stand at zero at the end of 2010.

Now, let me take you through this again. We depreciate that additional $254 and, therefore, at the end of 10 years, that's the amount that's in plant and that's the amount we've provided for so the reserve zeros out, and the cost of removal would no longer be charged to the reserve because it's already been taken care of on a present-value basis. But in addition to that cost to be recognized, there is the accretion each year, which is also an expense that reduces the net income of the company. And that accretion increases over time and takes care of the total discount or $254.83 during the life of the facility. Then when the $500 of cost of removal is paid, that obligation is taken care of. Because the amount at the end would be $500 because of the interest being added each year to raise it to that level. In other words, the present value five years out is greater than the present value 10 years before the cost has to be paid.

Now, I think it's also important to note

that the total expense recorded under both of these systems is $10,500. And that's shown in the total expense column of the second table to be $10,500. That's the sum of the depreciation expense of $1,025.42 each year and the accretion over in the third to the last column. Therefore, that amount changes each year and it increases over time, not a particularly handy thing from a regulatory standpoint in my estimation. But the total cost is the same.

Now, Mr. Majoros said in his testimony, and I'll talk about this a little bit, but he talked about only paying the present value and not taking care of inflation. The inflation is specifically required under 143 and it is required, if you think about it, because you have to pay the cost of removal in whatever the dollar values are at the time that the facilities are retired. So inflation is part of the process, and it's taken into account here without regard to this discounting. The discounting must also be taken into account to cover all of the cost. In other words, that's part of the $500 of cost of removal that I assumed in this case.

Q. (MR. PEARCE CONTINUING) Just one quick question, Mr. Jeter. I think, if I heard correctly,

you may have misspoken. In the upper part where you said the figure at the bottom of the plant retirement comment, I think you said 1,000 as I heard it. I think you meant 10,000?

A. Yes, definitely. It's the total cost of the plant.

Q. Would you please comment on Mr. Majoros' discussion of FAS 143?

A. Yes. The new accounting standard will cause Montana-Dakota and other companies to change their accounting for retirement obligations. Mr. Majoros indicates that when companies do not have the asset retirement obligations described in FAS 143, quote, these costs will likely be expensed, end quote. If a company does not have such costs, I do not understand what it is that he would have them -- expect them to expense. He mentioned yesterday, if I understood it right, that the principles of SFAS 143 are that you expense the costs as they're incurred and, to the contrary, 143 is aimed directly at expensing the cost of retiring facilities during their life, over their life. And that's done as I attempted to show in the simple example. In talking about this, he talked about only the present value being recognized and that

would not recognize all of the cost.

In addition, his comments on lines 17 to 18 about measuring those costs at their present value, not the future inflated value, suggests a misconception. I don't know why, but he seems not to believe that the full amount of those costs needs to be recovered. The requirements of SFAS No. 143 are to estimate the future cash flow as expected to be spent removing facilities retired and to discount those amounts to present -- current present values. The requirements -- the required computations specifically include an adjustment for inflation. That's covered in paragraph A20 of this document called Statement of Financial Accounting Standards No. 143.

Mr. Majoros is apparently mixing the effects of inflation with the discount rate used to discount the future cash flow to present values.

Q. Do you agree that GAAP does not control ratemaking as he asserts on page 13, line 2?

A. Regulatory agencies are not required to follow the specifics of each accounting standard. Because of this, Statement of Financial Accounting Standards No. 71, accounting for the effect of certain types of regulation, provides for the

accounting necessary to reflect the effects of such regulatory actions. However, I do not think that anyone knows whether the FERC or the various state regulatory agencies will follow this new accounting in setting rates as he suggests will be done. Frequently, these agencies have decided to retain the accounting for ratemaking that they have been using when the FASB publishes a new standard. I believe that is something yet to be decided.

Q. Is FSA-143 relevant then in this proceeding?

A. Well, I believe it is. And the Commission could rule in this proceeding as to the method Montana-Dakota should use in the future for recording asset retirement obligations and the related operating expenses and how such items should be treated for ratemaking purposes. However, it is possible that the Commission will prefer to deal with the question in a ratemaking -- in a rulemaking-type proceeding involving all of its jurisdictional companies. If it is ultimately decided that the provisions of SFAS No. 143 are to be used for ratemaking, it is obvious that those provisions are relevant. If existing practices are retained, the company must still comply with SFAS

No. 143 and difference must be accounted for under the provisions of SFAS No. 71.

Now, I should mention at this point that this simple example that we went over doesn't begin to recognize the complexities of applying this in real life. The assumption, for instance, that this is a plant that is built and the entire amount is retired 10 years later doesn't apply to things like mains and services and telephone poles, and so on. Those things tend to be retired over a very long period before and after their average lives. So the computations involved -- and the document allows shortcutting so that you may be able to make the computations based on an average life even though you know that the lives of individual items in a group property will be very different. It does add a great deal of complexity to accounting for these items and I think it would add a great deal of complexity to the ratemaking function to wade through this kind of accounting each time a company asks for a rate change or each time you asked a company to change its rates.

And so I do think this is something that really is better dealt with in a rulemaking proceeding as the company has already asked to have

done rather than in a rate case. But it's relevant because Mr. Majoros brought it into the case. I responded to it only because he had talked about it.

Q. Would you please comment on Mr. Majoros' recommendations concerning SFAS-143?

A. Yes. The cost of removal charged to customers already includes the legal asset retirement obligations defined in SFAS No. 143. However, I believe the Commission may require the company to provide for similar obligations that may not meet that definition and those costs should also be included in cost to service. I certainly do not agree that, quote, The company's experience suggests that it does not have any such obligations, end quote, as Mr. Majoros states at the top of page 14. The definition of a, quote, legal obligation, unquote, in FSAS 143 is quite broad and includes entity promises to a third party, which may include the public at large, about its intention to perform retirement activities. Paragraphs A2 and A3 of the statement discuss that.

I do not agree with his comment on page 14 at lines 3 and 4 that, quote, the costs should be measured at their net present value, unquote. My Exhibit JAJ-2 shows why that shouldn't be done. If

rates are set based on the SFAS 143 procedures, the company must be allowed to recover depreciation of the present value of future net negative salaries and the accretion of the liabilities for asset retirement obligations. The sum of these two elements of cost is equal to the undiscounted cost of removal and both must be recovered to compensate the company for costs it is required to pay when costs are recorded as required under the provisions of SFAS No. 143. Here again, Mr. Majoros seems to be mixing the discounting and the effects of inflation. I believe both should be taken into account in setting rates.

One thing I'd like to add right here. We haven't talked about the rate base effects, but, obviously, if additions are made to plant to set up the obligation, you would probably need to consider whether or not those additions are included in rate base and whether that obligation is an offset. I think theoretically that would be the proper approach, but there are other ways that could be considered. In any event, I did not talk about the rate base treatment, but it would have an impact because of that growing obligation and the straight line depreciation on the other side. So it's

something to be considered.

I do not know how the five-year rolling average expensing approach Mr. Majoros recommends on lines 4 to 9 of page 14 works. However, as I explained above, if the Commission elects to follow the provisions of SFAS 143 in setting rates, the costs that need to be recovered are the depreciation present value of the asset retirement obligation, plus the accretion applicable to the present value obligation. That accretion must be expensed each year to adjust the net present value of the obligation to the new current level. The depreciation would be the same each year for any specific obligation, but the accretion would increase over time. Consequently, it would be appropriate to use -- or it could be appropriate to use a projected average amount over several years in order to allow the recovery of the total of the two parts required to be recorded under the provisions of SFAS No. 143.

If the Commission elects to continue to follow the practices it currently follows, then the differences between the two methods should be recorded as a regulatory asset or liability. The differences would be between, one, the recovery of

the estimated net salvage on the existing basis and, two, the expensing of depreciation of the capitalized present value of the asset retirement obligation, plus the accretion that must be recorded under the provisions of SFAS No. 143 beginning in 2003. In the long term, the amounts allowed would be the same, but the timing of the expense would be different under SFAS No. 143 for what -- from what it has been under Generally Accepted Accounting Principles.

In other words, like so often has happened in the past for deferred income taxes and other items that have been handled differently for regulation, there would be an adjustment made on the books to recognize the difference caused by ratemaking not being exactly in agreement with the other General Accepted Accounting Principles.

Q. Is there any basis for the depreciation recommendation shown on Mr. Majoros's Exhibit MJM-7?

A. No. Mr. Majoros has ignored the previous depreciation study with regard to negative net salvage and has also reduced the recommended provision for depreciation for 2003 by $848,000 based on a five-year average of salvage value he obtained from the company. A review of the data

shown on his Exhibit MJM-6 makes it clear that this five-year summary is not reliable for the use he made of it. If this is the five-year average he recommended on page 14, lines 4 to 8, I strongly disagree with his recommendation. As discussed earlier, there are large amounts included in the exhibit which are not recurring, such as the four-million-six sale of the office building and should not be included in any case. That transaction is unlikely to be repeated every five years. Because of this and other problems with this approach, it should not be considered.

Now, I have prepared a schedule that might help understand how that $848 amount was worked into his depreciation recommendation, and this is Exhibit 29. Most of this exhibit comes from Mr. Majoros' Exhibit MJM-7, which is near the back of his testimony. The column A just shows the average plant. And if you look at the bottom of page 1 of MJM-7, you can see that it totals to 68 million -- excuse me. I'm in the wrong column. The average balance is 68,870 -- excuse me -- 68,787,446. And I've taken the very detailed schedule and summarized it to show distribution and general separate from common. And the common facilities have to be

summarized from his schedule and that's done in note 2 at the bottom, that the schedule shows 5,381,000.03, and 1,768,000 separately on the schedule. So you must summarize those to get to the total, and then there's a little bit of amortization other in that plant and that's $299.

Similarly, on the second page of his exhibit, the annual depreciation for the year 2001 that he recommended is shown and it's been summarized in much the same manner. The 1,291,000 is the top line on his exhibit and then I've combined numbers to arrive at the general and the common plant and then the $7 of amortization plant is added and that agrees with his 2,079,802.

Then for the year 2003 on his Schedule MJM-7, page 3 of 3, this is what was being discussed yesterday with some confusion about how we got from where we are to where he recommends. I've again summarized from his schedule and here his numbers are much more summarized, but the total depreciation at that stage of his 2003 recommendation is 1,937,000 as shown at the bottom of column C. More importantly, the annual salvage which he determined on his MGM-6, which is the exhibit just ahead of the one we've been looking at, is $848,010. He arrived

at that by adding to the natural gas plant about 50 percent of the common plant to come to a total five years that he attributed to natural gas of 4,240,000. And, again, this includes that four-million-six sale of a building, but at this stage only to the extent of about 50 percent, because he has allocated part of it to electric and part of it to natural gas.

And I've taken his computation and broken it down. In that four-million-two is included the 1,444,000 of natural gas plant and when you divide that by five years, it's $288,898. And I've taken that up to show in total for distribution in general of $289,0000. That reduces the provision for depreciation in his recommendation. And you can see that happening between columns C and E. Then the rest of that 848,000 is common facilities. And he would have us deduct $559,000 of salvage with respect to common properties which have a depreciation provision of $440,000 so that the provision for common properties would end up being a negative $119,000 in a year. But that all adds into the total that he did recommend of $1,089,000, and that is shown as the very last figure on page 3 of 3 of MJM-7.

Now, I just thought it would help to run through those numbers. I apologize for the details, but I think that it does help understand what it is that's being proposed.

Mr. Majoros -- now, some of this will be a bit repetitive. Mr. Majoros also allocated the common property amounts between electric and gas utilities based on the salvage amounts for each of them separately, which is not the basis used by Montana- Dakota for the allocation of common plant costs. I think it overstates somewhat the amounts attributed to natural gas based on information I've received from the company, but I can't quantify that for you. In any case, he did not support his allocation, other than to say that it was allocated based on the amounts of salvage.

The net result of Mr. Majoros' adjustments would be a 2,172,000 reduction in the amount allowed for depreciation to an amount of 1,089,000. His proposed adjustment would be over 71 percent of the amount currently being recorded by the company. The proposed adjustment is not supported by any evidence and should not be approved. On page 14, lines 16 to 17, Mr. Majoros states that these adjusted rates, quote, are still excessive because they're based on

lives that are too short. They are conservative from the ratepayers' perspective, end quote.

I do not believe that what Mr. Majoros means by -- excuse me. I do not understand what Mr. Majoros means by conservative, but, in my opinion, his proposed rates are not conservative from any standpoint. Any further reduction would make them even less conservative. With the net salvage adjustment he made, the overall average rate he is proposing is 1.58 percent. It cannot be considered conservative in any way. It is almost certainly inadequate.

Q. Would you please summarize your testimony?

A. Yes. No adjustments in depreciation rates should be entertained until the current depreciation study is completed and an appropriate review has taken place. Current rates are based on a comprehensive study prepared in 1991 and used again in 1994. Mr. Majoros has not done a depreciation study and has no basis for suggesting the changes in depreciation rates he is proposing. His review of the depreciation rates currently in effect is entirely superficial and contains many errors. Thus, the depreciation rate should not be changed based on Mr. Majoros' proposal.

Q. Mr. Jeter, did you prepare Exhibits 29 and 30?

A. Yes, I did. Well, Exhibit 30 has information I received from the company. I prepared the summary.

Q. Right. The first page?

A. Yes.

MR. PEARCE: I will offer Exhibits 22, 29, and 30 at this time.

MR. HOBERG: Any objection?

MR. BINEK: Well, I do have an objection to Exhibit 30. According to testimony of the witness, the response to the data request that was submitted to the consultant was misleading. And may I ask a question of the witness?

MR. HOBERG: Yes.

BY MR. BINEK: Is it correct that the information was never provided to Mr. Majoros?

THE WITNESS: Well, first, I'd like to say I don't think it was intentionally misleading. I think it just happened to be because of the way those schedules were prepared. I think the company probably thought that he had all the information he needed. However, he didn't, and it was understandable, in my opinion, that he didn't

realize that that was there. However, I mentioned it in my testimony so he has been aware of it since my testimony has been filed.

MR. BINEK: But that information was never provided to him, was it, to your knowledge?

THE WITNESS: Not to my knowledge. Could have been. I don't know.

MR. BINEK: I will object to --

MR. PEARCE: What's the basis for the objection? That doesn't go to admissibility.

MR. BINEK: The information that this exhibit relates to is based on information that was requested by the Commission consultant and was never provided to him in the response to his request.

MR. HOBERG: You're not saying it's not relevant now?

MR. BINEK: I'm just saying that it has been brought into this proceeding at this time without having previously been provided to us, even though the information contained in it was requested.

MR. HOBERG: Mr. Pearce.

MR. PEARCE: Well, it's certainly relevant. That doesn't go to the question of relevancy. As Mr. Jeter pointed out, his rebuttal testimony does

state that there was, in fact, a million-four in net salvage in the services account so that would have given Mr. Majoros, I would think, the opportunity to request a data basis for that statement.

MR. HOBERG: Okay. Well, I think it's something that's certainly relevant and helpful to the Commission to have at this point. Do you need some chance to respond further to that then, Mr. Binek?

MR. BINEK: May I ask the witness another question?

MR. HOBERG: You may.

MR. BINEK: Does this information change Exhibit MJM-6?

THE WITNESS: I don't think it would.

MR. BINEK: Thank you. I will withdraw the objection.

MR. HOBERG: Okay. Thank you. I'll admit Exhibits 22, 29, and 30 then. Does that conclude the questions of Mr. Jeter?

MR. PEARCE: Yes, it does.

MR. HOBERG: Thank you, Mr. Pearce.

Mr. Binek, did you have some questions of Mr. Jeter?

MR. BINEK: Yes.

CROSS-EXAMINATION

BY MR. BINEK:

Q. Mr. Jeter, on page 3 of your testimony you state that you've testified before the FERC, the ICC and a number of state regulatory commissions on depreciation and a number of other accounting issues. Have you ever sponsored a full depreciation study?

A. No. Not the kind of study that was done in this case. I have in natural gas pipelines cases where the natural resource declines were involved and that was basically a unit of reduction approach, but I have not done a statistical curve-fitting type of studies.

Q. Okay. Thank you.

MR. BINEK: I guess could we go off the record for just a moment?

MR. HOBERG: Let's go off the record, please.

(Discussion off the record.)

MR. HOBERG: Back on the record.

Q. (MR. BINEK CONTINUING) Mr. Jeter, on page 4 you state that AUS Consulting is due to make a complete depreciation study by December 31, 2002. What is the purpose of that study?

A. Well, that information was given to me by the company, obviously. My assumption is that it would be a complete update of the depreciation work done in 1991. And, by the way, I don't know that there's any reason to expect very much change since 1991. There may be, but I don't know of any reason.

Q. Why wasn't a depreciation study done prior to the filing of this rate case?

A. I don't know. You'd have to ask one of the company witnesses.

Q. Okay. If that new depreciation confirms Mr. Majoros's suspicion that MDU's depreciation rates are too high by approximately $2 million, is it MDU's intention to file for a rate reduction?

A. I also don't know that, but I do think that could be answered by one of MDU's subsequent witnesses.

Q. Would you agree that if depreciation rates are significantly changed as a result of the study, those changes, whether up or down, should be reflected in rates?

A. Yes. I think the rate change should coincide with the changes in the depreciation being recorded by the company.

Q. So, basically, by deferring this study

until December 31, 2002, MDU will be asking this Commission to conduct two rate cases in the space of six months; is that correct?

A. If the decision were made to reflect those new depreciation results, assuming they change the amounts -- I guess I should say assuming they change the amounts significantly, then there might be a need to review that study and then adjust rates for the company to reflect whatever change that made in the cost of service, but that would obviously be somewhat limited compared to a full-blown rate proceeding, I would think.

Q. Please turn to page 6 of your testimony and read the sentence beginning on line 1.

A. By ignoring that fundamental purpose of depreciation, Mr. Majoros is effectively proposing that the depreciation rate should vary from time to time depending upon the amount of cash the company is investing in projects deemed by Mr. Majoros to be beneficial to ratepayers.

Q. Where in his testimony does Mr. Majoros make this proposal?

A. I think this is just a corollary to what he's saying. He has talked a great deal about cash flow. But he's not mentioned the fact that the cash

requirement for plant comes when the plant is built or purchased. And that's a cash flow that's already taken place. The cash flows for depreciation are the recovery of those amounts over the life of the plant. And some of that cash may be required to pay off debt that was incurred when the plant was built. That hasn't been mentioned. But that's one of the things that must be done.

To the extent that the facilities have been built with equity funds, retained earnings, or newly acquired equity, those investors also require the recovery of their funds. Now, they may recover the funds from one plant facility, reinvest it in the company through retained earnings and invest it in another facility, but that's the way that works. And to suggest that the cash flow from depreciation is just free and there's nothing else to do with it isn't correct.

And I think the thrust of what he was saying -- although, he said at the beginning it's not the way you set depreciation rates, you don't make these cash flow comparisons, but then he proceeded to make the comparison and suggest that the customers are spending all of the money that's being spent for facilities. That's not the case.

And I don't think he made that case and, therefore, you have to kind of assume that he's suggesting some new change in approach. That's all that whole top of that page is talking about.

Q. Would you please turn to page 6 of Mr. Majoros's testimony and read the question at the top of the page?

A. Is depreciation intended to finance plant addition?

Q. What is the first word of Mr. Majoros' answer?

A. No. Now, I just mentioned that he said that.

Q. On page 8, at lines 17 through 20, you accuse Mr. Majoros of ignoring net salvage as a component of depreciation. Where in his testimony did Mr. Majoros assert that net salvage should be ignored?

A. Well, he took it out. The net salvage that was being recorded as a result of the 1991 study was removed from his computations of depreciation, as I understand it.

Q. What do you think the 848,000 is?

A. Well, four-million-six of it divided by 2, roughly, is the sale of the building, which really

doesn't have a lot to do with the salvage and the net salvage on services and mains. And it seems to me that if one proposes to take a five-year snapshot and divide that by five and use that over the next five years, then you must think that that is going to be repeated in the next five years. Otherwise, you're not doing something that makes any sense at all.

Q. But is that net salvage?

A. I don't think it's going to be repeated in the next five years.

Q. Is the number that Mr. Majoros used net salvage?

A. It is, but it's not salvage in the sense of a depreciation study reflecting the salvage applicable to the facilities involved over the life of the facilities. It gets away from the whole concept of depreciation and the concept under the new Financial Accounting Standard in 143, which is clearly not to recognize this thing based on some average of some short period. It's to recognize them based on the life of the facility and the expected cost at the end of its life to remove those properties or the expected credit in the event that there is, in fact, positive salvage.

Q. In fact, does Mr. Majoros include net salvage in his final depreciation recommendation only as positive rather than negative salvage?

A. Yes. Well, he included net salvage and it was positive. I mean, because of the period he selected and some of the extraneous items included in that period.

Q. On page 9 you take issue with Mr. Majoros' observation that the Supreme Court found that excessive depreciation resulted in extraction of capital contributions from ratepayers. Is it possible to have excessive depreciation of the original cost of an asset or group of assets?

A. I have to know what you mean by "excessive."

Q. How would you define excessive depreciation?

A. Well, if you mean is it possible to have estimates of the life of a facility that turn out to be wrong and turn out to be wrong because they're too short, then some would say that would generate an excessive amount of depreciation expense in the ratemaking situation revenues to cover that expense.

But the excess depreciation in that situation, and this is assumptions that -- we say

the life is going to be 20 years and then we discover after the plant has been in service for 10 years, that it's going to be 15 or 25. If it's going to be 25, then you could say that was excessive. It may not have been. The life used during that first period might be exactly right in terms of the best estimate you could get, but when you get better estimates of what the life is, you should adjust. And the typical method of adjusting depreciation is over the remaining life of the facility.

Q. If a utility depreciates a category of plant on the basis of 140 percent negative net salvage when the negative net salvage is, in fact, only 15 percent, would that constitute excessive depreciation?

A. It might if you accept your assumption. Those are both assumptions. One of them is an estimate made by somebody using judgment and historical facts, and so forth, and the other is just an assumption of 15 percent being the right answer. If that 15 percent were to be the amount determined in a new depreciation study, then I would say that you could say that that had been excessive, but only based on saying we made a wrong estimate in

the past, not based on the fact that we know more now and we're adjusting our estimate. So there's a fine line between whether it's really excessive or it's excessive relative to what you would be thinking it should be in the future.

Q. On page 11 of your testimony you purport to demonstrate that since 1995 the depreciation which Mr. Majoros claims to be excessive would by now have paid for itself in the form of rate base deductions; is that correct?

A. In effect, that's a short way of saying it, I guess.

Q. Did you quantify your rate base deduction by multiplying Mr. Majoros' $2.172 million depreciation expense adjustment by the eight years that have transpired between 1995 and 2002?

A. Yes.

Q. Mr. Majoros' correction is to eliminate the negative salvage and to amortize positive salvage over five years; isn't that correct?

A. That's my understanding, yes.

Q. What makes you believe that Mr. Majoros' adjustment, if applied in 1995, would have amounted to 2.172 million?

A. Well, I emphasized the word "rough" when I

started on this. I did not attempt to go back and figure out what Mr. Majoros' adjustment would have been had he made it in '95. I think that's clear from the way I described it. But I would admit that had he made a similar adjustment back in 1995, it probably would have been somewhat less because there was less plant at that time. I think. Now, I did not do that. This is very rough. It's an example more than anything.

Q. Well, Mr. Majoros would not have included the $848,000 in positive salvage because it didn't occur until 2001; isn't that correct?

A. I don't know what the positive salvage or negative salvage would have been or what five-year period he would have chosen.

Q. MDU's gas distribution plant was a smaller total amount in 1995; would you agree?

A. Yes. And I already said that would have an impact. I did not calculate it.

Q. And so the elimination of negative net salvage would have been a correspondingly smaller amount, wouldn't it?

A. Probably. I don't know. I haven't looked at it.

Q. Wouldn't the result have been a rate base

offset somewhat smaller than the 17.376 million that you ponder on line 4, page 11?

A. It might very well have been, yes.

Q. On page 12 of your testimony you argue that it would be inappropriate to calculate theoretical depreciation reserves to determine whether a reserve excess or deficiency exists. Are you familiar with the term "remaining life depreciation"?

A. Yes.

Q. Would you please describe what that term means?

A. It involves determining the life of the facility, an estimate of the age of all of the facilities, and thereby arriving at a remaining number of years that you would expect those facilities to exist before they're retired. And then converting that to a rate using the total cost of the facility less the depreciation reserve as of the same day.

Q. Does MDU use remaining life depreciation?

A. Yes. It's my understanding that that's been done based on what I've read in the 1999 -- '91 study.

Q. Doesn't remaining life depreciation effectively amortize any reserve excess or

deficiency over the remaining life of each category of plant?

A. Yes. That's why most depreciation studies don't include trying to figure out what a theoretical reserve will be. It's taken care of over the remaining life in any event.

Q. Earlier you discussed R3 Iowa curves. Do you know what a generation arrangement is?

A. Yes. I don't know that I could describe it. I've read quite a little bit about it.

Q. How do you calculate an average remaining life?

A. Well, it's calculated based on the retirement dispersion that is determined using the curves after having determined from the existing data about plant what is the best fit. In other words, the Iowa curves are based on actual evidence of what the lives of various kinds of facilities were. And it was found that using those curves, you could ordinarily find a fit for almost any sort of -- as they referred to them, industrial property, to one of the various curves, the right, left and symmetrical curves.

Once that's done, you have a dispersion of the asset retirements that you would expect and you

can determine using the remaining life of those that have not already been retired what the remaining life would be to use in that situation. Now, that's a pretty rough discussion of that. I have not done that kind of a study. So I understand what's done, but I'm not an expert on using those studies to do what's done other than on a very broad basis.

Q. What is an O curve?

A. I don't know.

Q. Do you know why an O curve is different than an R curve?

A. Did you say L?

Q. An O.

A. No. I think there have been some additional curves developed. I'm not familiar with the O curve.

Q. On pages 13 and 14 and 15 you challenge Mr. Majoros' discussion of service lives for mains and services. Did Mr. Majoros recommend any changes to the service lives underlying MDU's current depreciation rates?

A. No.

Q. From the standpoint of its impact in this case, your criticism of Mr. Majoros' service life discussion is irrelevant; isn't that true?

A. Well, I think it's relevant because I would hate to think that anybody would seriously contemplate a change in depreciation rates based on the 116- and 74-year lives he determined with the only computations he did with respect to service lives. I certainly agree he did not reflect those in his final recommendation. To that extent, it's irrelevant, I would agree, but I don't think I could just not comment on it when I don't think it should be used.

Q. On page 21 you argue that if the Commission elects to apply FAS 143 to MDU's cost of removal, there would have to be two elements of expense; one, the depreciation of the annual present value of future expense and, two, the accretion of the asset's value each year; is that correct?

A. Yes.

Q. You also contend that over the life of the plant both methods recover the same amount; is that correct?

A. Yes.

Q. Do they recover that same amount at the same rate --

A. No.

Q. -- that is, is one method front-loaded more

than the other?

A. The SFAS 143 method would recover plant by increasing amounts over time. It would not be front-loaded. It would be back-loaded.

Q. Okay. And the present method is front-loaded?

A. The present method is -- I think I would call it level. There are methods --

Q. Well, if you have the other method being -- what did you refer to -- back-loaded, then isn't this more front-loaded?

A. In other words, there is more and more expense over time each year. In the present methodology there's the same amount of expense each year, unless there are changes in estimates. You would have depreciation that is level with respect to it. Now, we should be careful about this, because inherent in this discussion is a discussion about a piece of plant that is installed and then later it's retired, all of it. We have many pieces of plant here that have varying lives, with an average life near the center of that long dispersion period of retirement. And if you superimpose SFAS 143 over that kind of a situation, I'm not sure I could even answer the questions, but I think it

would still involve back-loading or growing expense over time with respect to any property or group of properties. I frankly haven't looked at that.

Q. Is Montana-Dakota Utilities subject to FAS-143?

A. It is subject to it when it becomes effective, yes.

Q. Isn't it effective now?

A. No, it's effective -- well, it's effective for some companies now, but for companies with calendar-year financial statements, it's effective for next year.

Q. Does MDU intend to implement FAS 143?

A. I certainly think so. They won't be able to file financial statements if they don't.

Q. So you agree that the company is going to have to comply with FAS 143 and you talked about the complexity of FAS 143. But since the company does have to comply with it, the records will be available for ratemaking purposes; isn't that correct?

A. Sure.

Q. I'd like to have you turn to your JAJ-2. If the company did not have a legal obligation for the $500 removal, then the bottom half of your table

would be incorrect; isn't that correct?

A. Well, the entire exhibit would be incorrect if they don't -- now, excuse me. You specifically put the legal obligation in there and I now understand your question better. That could be true. And as I mentioned in the testimony, the legal obligation is fairly broadly defined. And if we think about what that means in terms of what a company has to do, it's a little hard to imagine very many things that a company would actually remove at the end of the life if they're not required to do so.

Now, there are a lot of people that are making requirements of companies to do that kind of thing. The regulatory agency could probably rule on such things and that makes it become a legal obligation, as I read the new standard. The cities that they deal with who were putting things into the streets and alleys, and so forth, may have something to say about whether those items are removed when they're retired. And it seems to me that with the increased concerns of environmentalists, that's all going in the same direction. We are going to have more and more requirements, rather than less. But if there are things that the company feels it must

remove, even though there is no legal obligation to, it would seem to me they would be very limited. I mean, I don't know why they would remove anything if they are not required to do so.

Now -- and it isn't just removal. In some cases they could be required to be do something to pipe that's in the ground, for instance, to make it safe, fill it with an inert substance, for instance, or do something like that, and that's cost of removal as well, even though technically you're not removing it, you're taking care of a cost that's your obligation at the end of the life, if you are doing that in accordance with some legal requirement as defined.

Q. In your earlier testimony you said that it would cost the same to remove a service as the original cost. Do you think that this company digs up an existing service when it replaces it?

A. I don't know, but I should straighten out what I said there, if you didn't hear me earlier. What I meant was, it would cost the same in time. The effort to remove a service might be the same as it is to put it in in the first place. In fact, it may be greater because nowadays a lot of services are plowed in and I don't think you can plow them

out if you are required to do the removal.

But, in any event, what I really was talking about was not cost the same, but take the same amount of effort, and if it took the same amount of effort, my whole point with that was it might cost a great deal more because of inflation.

Q. But only if they have to dig up?

A. That's correct. And it isn't enough to determine what it would cost. You've got to determine whether or not it has to be done and, if so, when and under what circumstances.

Q. And isn't that one of the important concepts of FAS 143, is that it shouldn't be shown as salvage unless there's an obligation to remove it?

A. Well, as cost of removal.

Q. Okay.

A. I mean, actually, 143 does not discuss salvage. Salvage is to continue to be accounted for.

Q. I used the wrong term. Cost of removal.

A. Cost of removal is what it's aimed at. And it definitely is saying if you have an obligation because of the use of the facilities, then you have to recognize it. And I don't think there are very

many companies that are in business for a profit that are incurring and paying costs of removal that they don't have to pay. I mean, I just don't think that's very --

Q. I would agree with that. Are you familiar with the concept of insertion?

A. Not unless you define it for me.

Q. That's okay. Are you familiar with the concept of abandonment in place?

A. Yes.

Q. Okay. What is that?

A. Well, I earlier talked about abandoning buried pipe, for instance, and in some cases that probably will be allowed and it will just stay where it is. It won't be removed. It may require something being done to it if it is, in fact, abandoned. I know, for instance, in gas transmission facilities, cross-country lines, they're trying to provide for all of the things they're going to be required to do because some of that line is very large and if it decays and rusts out, and so forth, you can have a big cavity there, and so they're faced with some significant amount of costs, but not to remove the line necessarily. They may leave it there, but shore it up so that it's not

going to be a problem over a long period of time in the future.

Q. That's when they replace it, right?

A. Well, replace or abandon. If it's abandoned, that would be more likely. If they replace it, I think in the transmission facilities they typically loop it and put another piece of pipe beside it so they wouldn't necessarily retire it, but if they are retiring it, they might leave it underground or because of right of way and other considerations, they might actually take it out and replace it with other pipe.

Q. I'd like to now talk a little bit about this building sale that you've discussed at length.

A. Yes.

Q. Where was that building?

A. Downtown Bismarck. It was the Schuchart building, as I understand.

Q. When was that building sold?

A. It was the first year of that period, so it must have been in 2001. That's when the sale was recorded. I'm not sure if the accounting -- I would say in as large a transaction as that, that's the year it happened also.

Q. What was the original cost of that

building?

A. I don't know.

Q. When was the building purchased?

A. I don't know.

Q. Why was it sold?

A. I don't know.

Q. What was the sale price?

A. The only information I have on that is the sale price was equal to the net book value at the time of the sale, which means the total cost of the facility that the company has paid for it, less the accumulated depreciation, was equal to the sales price.

Q. And what was that net book value at the date of sale?

A. Well, it was four-million-six or so. Exact amount I'm not sure.

Q. Who was the building sold to?

A. I think it was sold intercompany with respect to MDU Resources. Now, I'm not real familiar with that, but I believe it was sold to an affiliate, in any event. Might actually have been another division of the same company. I'm not that familiar with their corporate structure.

Q. How did the sale price come to match the

net book?

A. By agreement, I assume. I don't really know that.

Q. Do you know if MDU tried to obtain the market value?

A. I have no idea.

Q. Would you please provide the journal entries in the company's books that relates to the sale of this building as a late-filed exhibit?

A. I don't have access to those. I think somebody else that's testifying after I am can.

MR. HOBERG: Is this a request you are making of the company?

MR. PEARCE: I think Mr. Keller would be an appropriate witness for that.

MR. HOBERG: Do you want to reserve that question for Mr. Keller?

MR. BINEK: I can reserve that question, unless the company is willing to provide the information.

MR. PEARCE: It's certainly willing to provide, but I think he can clarify exactly what you want and describe it by official title. So I think it might be easier to put in through Keller.

Q. (MR. BINEK CONTINUING) You state in your

testimony that the other 48 states do not use a current period recognition of net salvage; is that correct?

A. I said that this morning, but that's an assumption on my part based on the testimony to the effect that Pennsylvania and Kentucky are doing such things.

Q. I'd like to have you turn to page 157 of the 1996 NARUC manual that you've been referring to.

A. Yes. I'm sorry. What was the page?

Q. One fifty-seven. Would you please read the two paragraphs, the first beginning with the statement, "historically, most regulatory commissions"?

A. Historically, most regulatory commissions have required that both gross salvage and cost of removal be reflected in depreciation rates. The theory behind this requirement is that since most physical plant placed in service will have some residual value at the time of its retirement, the original cost recovered through depreciation should be reduced by that amount. Closely associated with this reasoning are the accounting principle that revenues be matched with costs and the regulatory principle that utility customers who benefit from

the consumption of plant pay for the cost of that plant, no more, no less. The application of the latter principle also requires that the estimated cost of removal of plant be recovered over its life.

Some Commissions have abandoned the above procedure and moved to current period accounting for gross salvage and/or cost of removal. In some jurisdictions gross salvage and cost of removal are accounted for as income and expense, respectively, when they are realized. Other jurisdictions consider only gross salvage in depreciation rates with the cost of removal being expensed in the year incurred.

Q. Thank you.

MR. HOBERG: Mr. Binek, do you have a number of additional questions?

MR. BINEK: No, I don't believe so.

MR. HOBERG: About how many do you have left?

Q. (MR. BINEK CONTINUING) How often should depreciation studies be done?

A. Well, it's a little bit varied around in various jurisdictions. Many jurisdictions require that studies be done on a periodic basis and I think five years would be fairly typical of that. Others

don't make any requirements and I think some companies go longer times between. Now, they may have looked at the facilities and decided that there aren't any significant changes in what they are seeing with respect to the lives of facilities, and so forth in their records and, therefore, elect not to do it quite as often. But I would say probably in some cases even three years, but depreciation studies are expensive and so three to five to longer periods are probably fairly typical, but with attention to it much more often than that in terms of just deciding whether or not it is required.

MR. BINEK: I have no further questions.

MR. HOBERG: No further questions. Let's take a luncheon recess here. I'm wondering, though, what we should take? An hour? Commissioners request an hour.

COMMISSIONER WEFALD: 1 o'clock.

MR. HOBERG: Let's be back at 1 o'clock.

(Lunch recess was taken.)

MR. HOBERG: Okay. We're ready, back from the luncheon recess, and I think we were -- we just completed the cross-examination by Mr. Binek.

So, Commissioner Reinbold, do you have any questions of Mr. Jeter at this time?

COMMISSIONER REINBOLD: I do not.

MR. HOBERG: Thank you. Commissioner Wefald, do you have any questions?

COMMISSIONER WEFALD: I have one.

EXAMINATION

BY COMMISSIONER WEFALD:

Q. In your testimony you say that the company -- you understand from company personnel and from the exhibit you prepared has recorded 1.4 million of negative net salvage -- of net negative salvage for services during the years 1995 though 2001?

A. Yes.

Q. How does this number of actual cost of removal of services in five years compare to the plant removal costs of service which were figured at 140 percent depreciation?

A. I'm sorry. I don't know that because I didn't have the retirement date that goes with those costs of removal. I think that would be something to look at, but I just did not do it.

Q. So who would I get that --

COMMISSIONER WEFALD: Can MDU provide that information to the Commission as a late-filed exhibit?

MR. HOBERG: Mr. Pearce, did you understand the question and hear it?

MR. PEARCE: I'm not exactly sure we understand the question. Give us a moment here. We'll certainly do the best we can. We'll have to check with the other MDU personnel who are not here, but we'll certainly try to prepare what we understand that request to be.

MR. HOBERG: So it's possible you'll be able to file a late-filed exhibit on that?

MR. PEARCE: Yes.

MR. HOBERG: Okay. I don't think we've had any other late-filed exhibits to this point so that would be Late-Filed Exhibit 1, if you will, that information.

Q. (COMMISSIONER WEFALD CONTINUING) If this number were less than the planned removal cost of service at 140 percent, do some Commissions take a look at actual removal cost and use those versus what the company has planned through depreciation?

A. Well, I would say that most would look at the actual relationship between the cost of removal and the cost of the facility as they're retired, but you almost have to deal with this by vantage. In other words, if some mains were put in in 1968, say,

and removed in 1998, you would expect that to be something like what they had estimated in the depreciation study.

Q. In this case we're talking about the services, not the mains.

A. Okay. Well, and this would be true of either. Let me say services then. They would keep track of how many dollars of plant were involved adding services each year and you almost have to look at it year by year when the retirements are coming out, because, for instance -- and this isn't quite so true for services -- but if something goes in and then two or three years later is taken out of service for one reason or another, I mean, property is destructed or a road moves, any number of things can cause that, then you wouldn't necessarily expect the cost of removal to be what they estimate for the whole life of that group of assets in that vantage.

Q. Well, for example, I live in an older neighborhood built in 1915, so we started out with a coal furnace in our house, which was converted to natural gas when natural gas was brought to Bismarck. Do you know the year natural gas was brought to Bismarck?

A. Well, I understand it was quite early

because I was talking to somebody about the fact that natural gas came into Nebraska in either the late '40s or early '50s, and I understand it was earlier than that here, so it may have been.

Q. So let's say it was even 1950 and at that point then my service main was probably installed to my home.

A. Yes, I would -- it would have to have been.

Q. I've lived in the house since 1970 and there hasn't been any change in my service main during that time so I've been in there 32 years now. So are they anticipating someone is going to be coming out to my house in a couple years and taking out my service main that's underneath my cement driveway?

A. I don't know how long the kinds of equipment that might have been installed in the 1950s would last, but there's a range of time over which assets are retired and so a 50-year sounds like a long time, but that range may go -- assuming that the average life is 50 years, you could have some of them that last 90 years and some 10, but it would be over that whole range and many of them would be clustered around the 50-year point and it might make sense for that facility to be removed or

replaced, or both, because of safety or some other requirement, depending on the condition.

It's hard to answer it any better than that, but I think there are those kind of considerations and in a situation like that, assuming that you would continue to use the house and want gas service, there might just be a new service put in and the existing one removed at the same time or secured and not actually taken out of the ground. Because I suspect that 50-year-old pipe is not going to be worth much to anybody. First of all, if you're removing, retiring it, more than likely there's a reason for that and it's not very good stuff and so you wouldn't expect to be able to use it.

Q. So your answer to my question is that there is more to look at than the actual removal cost versus the planned depreciation removal costs?

A. Well, I think you can look at those things. I just believe you need to look at them in more detail and get down into it and know exactly what it is that you're looking at because there would be varied reasons for things once you got into the details and I think that it's necessary to look at those details.

But your thought of comparing what's actually happening in cost of removal and the relationship of that to the cost of the facilities that's being retired is exactly on point. I think that's what would be done in a depreciation study in connection with trying to estimate what those amounts would be. That's almost exactly what they would be doing. But it would be done at a more detailed level than on a broad overall basis because you don't learn as much unless you get down into those details.

Q. What if the Commission were to say to MDU that we should wait until they get their new depreciation study before we would proceed with this case?

A. Before you would complete the case?

Q. Mm-hmm.

A. I think that's a policy decision on their part. I couldn't answer that. My suspicion is they wouldn't want to do that, but I don't know.

COMMISSIONER WEFALD: Thank you.

MR. HOBERG: Thank you, Commissioner Wefald. Commissioner Clark, did you have any questions?

COMMISSIONER CLARK: I have none. Thank

you.

MR. HOBERG: Thank you. Any further questions of Mr. Jeter?

MR. DILLER: I just have one that I might add on to Commissioner Wefald's.

Since we're getting the cost of removal for service signs, I think you said five years, Commissioner. Did I hear that right?

COMMISSIONER WEFALD: We know they have put on the record 1.4 million is their cost of removal and I asked how that would compare to what they had planned in their depreciation study.

MR. DILLER: I think it would be helpful, too, along with that late-filed exhibit, if we could have the number of service lines retired during the last five years.

MR. HOBERG: You want that as a separate exhibit?

MR. DILLER: However they want to do it.

MR. HOBERG: Late-Filed 2 then. Is that possible?

MR. PEARCE: Sure.

MR. HOBERG: Thank you, Mr. Diller. Any further questions of Mr. Jeter? Mr. Binek?

MR. BINEK: Yes, I have one.

FURTHER CROSS-EXAMINATION

BY MR. BINEK:

Q. You said that you incurred 1.4 million in cost of removal; is that correct?

A. Yes. Now, I think somebody said five years. That data was actually from '95 to 2001, so it's actually seven years.

Q. Okay. But those were the costs incurred by the company. What were the amounts that the company collected for salvage?

A. I think that's the same question as we were just discussing. I don't know because I don't know the amount of the plant that was retired, nor how old it was so I can't answer that question, but I do think that that would be answerable with the additional data in the late-filed exhibit, if I understand what's been asked for.

MR. BINEK: I would ask that that be included in that data.

COMMISSIONER WEFALD: And, actually, if it's supposed to be seven years, I would appreciate that. I'm sorry. I didn't realize. '95 through 2001 is seven years.

THE WITNESS: That doesn't match his exhibit, but that's what the data was that I got.

MR. HOBERG: Mr. Pearce, did you get that?

MR. PEARCE: Yeah, that's fine. I have one redirect question, too.

MR. HOBERG: Okay. Does that conclude yours, Mr. Binek?

MR. BINEK: Yes.

REDIRECT EXAMINATION

BY MR. PEARCE:

Q. Mr. Jeter, in the course of your cross-examination you were asked to read two paragraphs from a NARUC manual. Would you comment on the content of that paragraph and add any additional information you might wish?

A. Yes. The sense of that was that their gross salvage and cost of removal are to be reflected in depreciation rates and that it's difficult to estimate and that some Commissions have abandoned the procedure and moved to a current period accounting. And I just want to say that I think that's absolutely wrong for the reasons I talked about earlier, because it doesn't reflect those costs over the proper period and get the right customer charged with those costs over the life of the facility that's involved.

And then I'd also like to read in the

paragraph that followed the ones that I did read. It says, Determining a reasonably accurate estimate of the average or future net salvage is not an easy task. Estimates can be the subject of considerable discussion and controversy between regulators and utility personnel. This is one of the reasons advanced in support of the current period accounting for these items. When estimating future net salvage, every effort should be made to ensure that the estimate is as accurate as possible. Normally, the process would start by analyzing past salvage and cost-of-removal data and by using the results of this analysis to project future gross salvage and costs of removal.

And the reason I'm very much opposed to this is the reason that the Financial Accounting Standards Board has issued its new SFAS 141. They are deadset on recognition of these costs over the life of the facility, not at the end of the life. And if you think of that in terms of a nuclear generating station, you can see why. Because if you wait until the end of the life of a nuclear plant and then put that cost of removal into the rates at that point, you're charging the future customers, if you can recover, rather than those that benefited

from the use of the nuclear plant during its life. And that's just plain wrong, as far as I'm concerned, from a regulatory standpoint. And it's easier to understand with a nuclear plant, but it's the same thing with others. It's much more difficult to estimate some of these lives of mass properties where they retire over long periods of time, but it's still doable and it's certainly worth the effort in order to get the costs recognized at the time that those properties are serving customers.

MR. HOBERG: Mr. Jeter, did we get in the record what you were reading from again?

THE WITNESS: I'm sorry. I was reading from page 157 of the NARUC Public Utility Depreciation Practices Manual, dated August 1, 1996.

MR. HOBERG: Thank you.

THE WITNESS: And it was -- the part I read was the fourth paragraph on that page and it continues on page 157 and it continues on the next page.

Q. (MR. PEARCE CONTINUING) Just one thing. I think you misspoke. You said 141 and you meant 143, FAS?

A. Did I say 141? I'm sorry. Yes, SFAS 143.

MR. HOBERG: Mr. Binek, do you have another question?

MR. BINEK: Yes, I have one more.

RECROSS-EXAMINATION

BY MR. BINEK:

Q. If you use recent past salvage as a guide, would the overall net salvage be positive or negative?

A. Well, recent based on Mr. Majoros' exhibit would be positive salvage.

MR. BINEK: Thank you.

MR. HOBERG: Anything further then of Mr. Jeter? Thank you, Mr. Jeter.

MR. PEARCE: I'll call Craig Keller.

MR. HOBERG: Mr. Keller, you testified yesterday; is that correct?

THE WITNESS: Yes, I did.

MR. HOBERG: I just need to remind you then that you're still considered to be under oath.

THE WITNESS: Yes.

MR. HOBERG: Mr. Pearce, please.

CRAIG A. KELLER,

having been previously sworn, was examined and testified as follows:

DIRECT EXAMINATION

BY MR. PEARCE:

Q. Mr. Keller, you previously identified yourself and gave your position with the company, I think, yesterday. And you have filed some rebuttal testimony in this case. I would ask if you could simply summarize the main points of your written rebuttal testimony and then add anything that you feel is a part of rebuttal to the staff's case.

A. Sure. I would like to start by addressing the capital structure and costs of debt that was used by Mr. King. And I'd like to start by just making sure that when we use the name MDU Resources Group or Montana-Dakota, that we understand that they're the same legal entity and that the balance sheet is the same. MDU Resources Group in essence is really a separate cost center within that legal entity where we track the costs for our resources group and we allocate those to our different businesses. So, you know, when we talk about Montana-Dakota, we talk about MDU Resources Group's balance sheet, we're talking about the same thing.

And I think it's in this statement, Statement A, where Mr. King tries to, I should say, connect the dots between Centennial's debt and

MDU's. He looks at Statement A and on page 1 where we have the unconsolidated balance sheet of MDU Resources Group and he's using that to connect to the consolidated footnotes in that same schedule. And the difference between a consolidated balance sheet and an unconsolidated balance sheet is that MDU's unconsolidated balance sheet does not reflect the assets and liabilities of the subsidiary companies. It only reflects the investment MDU has made in those companies. On the consolidated balance sheet it would reflect all the assets and liabilities of those companies and in essence you'd have a grossed up balance sheet of all the assets and liabilities of the corporation.

In Statement A, page 1 of the balance sheet, that only reflects the unconsolidated balance sheet of MDU. However, when we go to pages, I think, 3 through 29, which are the footnotes, those reflect the consolidated footnotes of the company, the ones that were attached to the company's annual report. On page, I think, 11 of that, footnote 6, it lists the long-term debt, including Centennial's, on which it would be listed because it's a consolidated balance sheet. And Mr. King implied that that debt was part of the unconsolidated

balance sheet of MDU and that's not correct. That would be Centennial's debt and is not really part of Montana-Dakota's individual balance sheet.

Yesterday King made a statement that MDU was attempting to build, quote, a firewall around MDU to separate the debt of Centennial from MDU. And that is exactly what MDU is trying to do. And I'd like to explain to you the reasons for this and why I believe the Commission should support MDU in its efforts. In questioning Witness King, Commissioner Wefald raised a concern as to the negative effect a bad business decision at Centennial, one of its companies, would have on MDU and its cost of debt. And, quite frankly, MDU, as well as the rating agencies, are also concerned about this. The concern is that bad decisions made at Centennial Energy or one of its subsidiary companies could cause default or cause a bankruptcy that could roll up into Montana-Dakota or MDU. And what we're trying to do is prevent this from happening.

One of the things that -- we heard Mr. King use the term "firewall." The same kind of philosophy or term is used by the rating agency. They call it ring fencing and attorneys call it

bankruptcy proof, but what we're trying to do is protect the assets and the customers of MDU from our nonregulated businesses. And the concern we have is that in the event that there were a default at Centennial or one of its companies, we do not want that to cause a default of MDU. Likewise, if there was a bankruptcy at MDU -- at Centennial, we do not want a bankruptcy judge to have the ability to collapse the corporation and provide the creditors of Centennial or the subsidiaries of Centennial, we do not want them to have access to the assets of the utility. We want to protect our customers from this happening.

And there's some things we can do. And one of them is we need to keep separate and distinct books from Centennial, which we currently do. We need to conduct the business of the utility in a manner that is clearly distinguishable and separate from the operations of Centennial, and we do that. MDU does not participate in a money pool or comparable intercompany fund arrangement with Centennial. This means that MDU does not commingle its corporate funds with those of Centennial. It means that MDU and Centennial maintain their own distinct and separate credit facilities. Neither

have access to the other's credit agreements. To further strengthen this point, MDU does not lend funds or otherwise extend credit to Centennial, and Centennial does not do the same back to MDU.

Mr. King stated yesterday in his testimony that all debt is raised and issued by MDU and is simply pushed down to Centennial and the subsidiaries of Centennial, and this is not correct. A first mortgage lien of MDU's electric property and gas is what's used to secure the long-term financing for MDU. The only property that can be pledged under this is qualifying utility property, and this is our electric and gas property. Centennial cannot pledge its nonregulated assets under this agreement and it cannot access this agreement. There are no cross-default provisions in this credit facility where a default at Centennial would trigger a default at MDU. And there are no requirements from MDU from the capital to advance funds for Centennial or a subsidiary of Centennial under this agreement.

Centennial's credit agreements are separate from MDU and require Centennial to use the funds that they raise under this agreement to conduct the operations of Centennial and the Centennial subsidiaries in order to preserve Centennial's

financial integrity. And, simply stated, if we allowed MDU to have access to the funds raised under Centennial's financing agreement, we in essence would give a bankruptcy judge an opening to take and collapse the company in the event of bankruptcy by Centennial to give those creditors of Centennial access to our assets. And they would do this under the assumption that we may be using these funds to benefit MDU at the expense of the Centennial creditors. So we do not want to do this.

And to further strengthen this position, we make it not only clear to anyone that has borrowed money to Centennial that MDU does not guarantee the debt, but nowhere in those instruments do we allow the name MDU to be used in Centennial's credit agreements.

I'd like to comment on Mr. King's Exhibit 16 yesterday. What that was, it was an exhibit showing the working capital of Montana-Dakota. And on there he had materials, fuel costs, prepayments, customer advances. And he made the comment there were material differences in these accounts. In my rebuttal testimony I stated that these accounts remain relatively constant and support the long-lived assets such as property and plant. And I

further stated it is the Company's policy to finance our long-lived assets with long-term debt. This helps mitigate exposure from interest rate volatility over the asset's life.

Now, looking closer at this exhibit, you'll see that from June to July there's a big decrease in the customer advances. And this decrease accounts for essentially most of the variance in the schedule. And this was a result of a refund of a customer advance that was out of the ordinary. It was an abnormal customer advance and it does not reflect normal activity. Without this adjustment in here, the fluctuations would be minimal and it would really be insignificant to the rate base.

You know, I find it interesting that Mr. King himself is inconsistent in his method of determining capital structure with that of setting debt cost. In arriving at debt cost, Mr. King uses the argument that all debt is commingled. Mr. King uses the argument because it provides him with the lowest cost on debt. If Mr. King makes his argument and assumes that debt is commingled, then it would only be logical and consistent to assume that equity, as well as all capital, is commingled. To follow through with his arguments and logic,

Mr. King should then have used the capital structure of the consolidated MDU resource company versus just the capital structure of MDU.

Now, if you look at the consolidated capital structure, the equity portion is over 60 percent, compared to the capital structure just of MDU, which is roughly 50 percent equity. However, if you were to use a consolidated capital structure, you would have to increase the costs of capital. So he chose to ignore. What he does, he picks the capital structure when it fits him and he takes the weighted average wherever it provides the lowest cost of debt, and it, in my mind, is arbitrary and inconsistent.

In testimony yesterday Mr. King stated that the Commission should use December 23rd, 2001 as a base for the capital structure. As I point out in my rebuttal testimony, North Dakota Administrative Code 49-05-04.1 allows for projected test periods. MDU extends a considerable effort to develop budgets and forecasts from which to make decisions and guide our organization. Mr. King did not provide any testimony or evidence to suggest or dispute the accuracy of these projections and, in fact, Mr. Majoros accepts the projected revenue from this

2000 test period in his testimony.

MR. HOBERG: I'm sorry, Mr. Keller, what was the code section you referenced?

THE WITNESS: 49-05-04.1.

MR. HOBERG: That would be the North Dakota Century Code then.

THE WITNESS: Okay. I stand corrected.

MR. HOBERG: Thank you.

THE WITNESS: In setting capital structure and determining debt cost, Mr. King's methods and arguments are illogical, unfair, and even ignore North Dakota's Century Code. Mr. King's attempt to commingle debt with that of Centennial and that of MDU is not only bad public policy, but it also increases the financial risk for our customers. The capital structure that MDU has filed is correct and should be used.

I'd also like to just briefly document addressing comments made on 143. I think Mr. Jeter has done a very good job of addressing the company's position, but the industry itself -- when I refer to industry, I'm really talking about EI and AG, which are associations for electric and gas industries. They are recommending that we take a go-slow approach to FAS 143, and we agree with this. The

methods we use now are straightforward. They're easy to understand and they're easy to implement.

MDU will need to adopt and comply with FAS 143. We're still studying the effects of that and we don't know the ultimate outcome, but we believe that any changes that are required because of that will have little or no effect on MDU or its customers. And the reason we say that is because if there's any difference between what's required in 143 versus what we do for regulatory purposes, we will defer on said regulatory assets as allowed under FAS-71.

I also thought it would be appropriate for me to talk a little bit about the negative salvage or positive salvage and the removal of costs. I worked in the tax department for a number of years, and through the years I spent a lot of time combing through the depreciation reserves for MDU. And I've looked back over probably, oh, early '70s to late '80s. And over all that time, when I looked through those, when you see large amounts of positive salvage, it almost always resulted from one of three things. Either there was a sale of an asset or some insurance proceeds that we received or we traded an asset for another asset.

If we looked at the period we're talking about, there was a sale of an asset and that was the Schuchart building we talked about. And that was sold at net book value. Mr. Majoros refers to that and he focuses on that part of the reserve where the salvage shows up. However, there's also offsetting adjustments in the reserve for the retirement of the asset as well. So the effect was that there was no gain or loss on that asset. And while there shows large amounts of salvage, there really -- all the company did was collect its cost for that building from the affiliate to which it was sold.

Insurance proceeds in this time period, we received insurance proceeds due to the hailstorm we had in 2001, and we received money for a lot of vehicles and other stuff that was damaged. At the end of it, when we did some repairs and stuff, we had money left over. We took that money and we credited the reserve salvage for that so our customers would benefit in the future from that, rather than take any of that money to the bottom line for the shareholders. That money will help lower depreciation rates going forward.

On trade-ins, we have a program where we trade in our equipment, some of our equipment every

other year. It's a very effective program and we can trade equipment in and get brand-new equipment for almost little or no cost. The effect of this is that when you look at a reserve, you'll see large amounts of salvage going in. In effect, all it is, we're trading in. We're showing the salvage on one hand. We're replacing a piece of equipment so we have a property addition on the other hand. There's really no net increase in plant because of those transactions. It just shows up as salvage.

Removal costs, when we talk about mains or services, in talking to some of our people our normal policy -- or I should say a normal retirement of a service in our company would be that we would take, we would cut the service -- the riser off, which would be next to the customer's premises. We would cut that off below the surface and cap it with a weld or if it's plastic, we put a seal on there. But we also will cut it at the main, and we'll cap it there as well. But we just don't cap and leave the whole service line in the ground. The policy or the procedure we usually do is, we take and remove at least a portion of that service line to move it beyond the public easements, and we do that for some reasons. One of them is that we don't want gas flow

in this thing. We don't want the exposure of gas flowing through there. We also don't want dead lines sitting next to the -- you know, to the mains. We don't want the risk that someone may inadvertently mistake a dead service line for the main and think that they've located the proper line, and we don't want to have a situation with our line locators going out there and accidentally marking the wrong line.

The cost can be quite expensive to do this here, because what you're usually doing here, what my people are telling me, is a lot of times when you are doing removing, you're excavating and repairing under concrete and asphalt so the cost can run pretty high. And I think those contribute to the $1.2, $1.4 million that we're seeing in there. The other comment they're saying is that there are now rules that require the company to maintain detailed records of our dead lines. And so our concern or our thoughts are going forward is that rather than seeing a decrease in these costs, we may see these costs increase in the future because we expect there could be more rules coming down regarding dead lines.

So I guess the bottom line is, we've got

all these things going through reserves. Unless you do a thorough depreciation study, ask the right questions, I think it's very difficult to know what the proper depreciation rates are going to be. And it would be my comment the last time we did a thorough depreciation study was 1991. It was done by Stone & Webster. And we haven't done one since. We're looking at doing one.

One of the reasons we haven't had one completed is that right now it's tough to get consultants. Everyone is busy with 143 and everything else. We also ran into a problem in that Stone & Webster, who previously did our study, they had some financial problems, some people turnover and they moved. They have lost all our records that we had. So it's not just a matter of updating our records going forward. We're going to have to go back and provide and reprovide all our records from back as early as we can -- you know, I think we have most of our records, but we're going to have to redo it. So it's going to take a little longer than our prior study. But we're hopeful to have it done by the end of the year.

It would be my recommendation since the last thorough study done was 1991, that that should

be used for setting rates in this case, and that 143, as recommended by Mr. Fox's opening remarks, is that we should move this to another day. It shouldn't be handled in this case.

MR. HOBERG: Thank you, Mr. Keller.

Any additional questions of Mr. Keller?

MR. PEARCE: I have no questions. I just will offer the exhibit.

Q. (MR. PEARCE CONTINUING) Craig, did you prepare your prefiled rebuttal testimony?

A. Yes, I did.

MR. PEARCE: And that's marked as Exhibit 23. I'll offer that at this time.

MR. HOBERG: Exhibit 23-53 --

MR. BINEK: No objection.

MR. HOBERG: -- is admitted. Okay.

Mr. Pearce, did you have some questions of Mr. Keller?

MR. PEARCE: I don't.

MR. HOBERG: I'm sorry. I looked at Mr. Binek and said Mr. Pearce. Mr. Binek.

MR. BINEK: I was about to start asking questions.

COMMISSIONER REINBOLD: These guys are not interchangeable.

MR. HOBERG: Mr. Binek, please.

MR. BINEK: Thank you. I'll take his money, though.

CROSS-EXAMINATION

BY MR. BINEK:

Q. Mr. Keller, if there's a bankruptcy of MDU Resources that is a result of activities of either unregulated or regulated entities of Montana-Dakota or MDU Resources, isn't a bankruptcy court going to look at all assets of MDU Resources to satisfy creditors' claims?

A. There's -- it depends on what level. You're saying it's at the parent company level?

Q. Right.

A. At the parent company level, they can look at the assets of that, yes. However, I should point out what we're protecting, is we're protecting our regulated customers from the nonregulated business and that's what you're -- you know.

Q. I realize that, but the protection only goes so far.

A. Well, we're trying to do everything we can do to strengthen that as best we can.

Q. Now, I'd like to have you turn to page 3 of your rebuttal testimony. And specifically at line

16. Are you there?

A. Yep.

Q. Okay. At line 16 you object to Mr. King's use of a historical year-end 2001 capital structure and argue instead for your forecasted 2003 capital structure. What capital structure did the company use in its rate-of-return testimony in the electric case earlier this year? That's PU-399-01-186.

A. I'm going to defer that to Rita.

Q. Okay. Now, please turn to page 5 of your rebuttal testimony. At line 14 -- beginning at line 14 you state that FAS 143 does not provide levelized depreciation rates, but instead pushes higher costs toward the retirement date of an asset due to the discounting method used.

Is it your contention that the current method of recovering negative salary produces a levelized effect on ratepayers over the life of an asset?

A. My comment when I made that comment, and I think Mr. Jeter addressed that quite well, is that because of the discounting that is associated with 143, it tends to push numbers, push a cost toward the back end because of the way the discounting interest accretion is done and that's what I'm

addressing here. If you're going to ask specifics on 143, I guess I would defer to Mr. Jeter because I think he's the expert in that area.

Q. Okay. Let's move forward a little bit and see where we end up here.

A. Okay.

Q. If we assume that an asset has a removal cost of, say, 50 percent of its original cost, that cost is recovered ratably; that is, evenly over the life of the asset, correct?

A. That's the theory behind it, yes, the goal.

Q. And that's what you mean by levelized?

A. When I mean levelized -- when I use my primary term levelized, is that we have rates that are consistent and that the rates aren't changing from year to year. That's what I refer to as levelized. And my concern was under FAS 143 because of accretion, if you follow that to the rule, you're not going to get -- you know, you'll see it pinned on the asset as the asset ages. Because of interest expense, accretion is going to change every year. You will not get levelized rates. They will constantly fluctuate. And when I refer to levelized, that's what I'm referring to.

Q. Haven't you forgotten the rate base effect?

When an asset is new, it has very little negative salvage, the removal costs accrue and ratepayers pay a return in income tax on the whole investment; isn't that correct?

A. Can you restate that for me, please?

Q. When the asset is new, it has very little negative salvage cost that's accrued; is that correct?

A. If you're accruing it ratably, I would assume so, yes.

Q. And the ratepayers pay a return in income tax on the whole investment; isn't that correct?

A. On the whole investment net of depreciation reserve?

Q. Yes.

A. Yes.

Q. Only later when the accumulated reserve is built up to a reasonably high level do ratepayers get the benefit of the rate-based deduction represented by accruals of removal cost; isn't that also correct?

A. I would disagree with that. They get the benefit the whole time because -- they get a return basically based on the unrecovered book value, so, you know, that rate base deduction, as you collect

more depreciation will grow, but they're getting the benefit over the whole time.

Q. But it grows; isn't that correct?

A. On that particular asset, yes.

Q. Isn't it true then that the existing system is front-loaded in contrast to the back-loaded recognition of costs under the FAS 143 procedure?

A. I would disagree with that as well. I think the idea of 143 is to accrue it ratably over the life so that you have a proper matching of use with cost. So, you know, I think when we say -- I think 143 tries to separate the interest component from the other pieces. What they're trying to do, I think, is to add some more complexity there, but I think the intent is to accrue it ratably.

Q. Because of system growth and because of inflation isn't the company always adding more plant expressed in dollars than it is removing old plant? Maybe -- they're adding more new plant than they're removing old plant?

A. Are we talking dollars? Are we talking feet? What are we talking?

Q. Dollars.

A. I believe that we've been holding -- you know, they've been fairly constant over the last few

years, that our overall utilities additions and reserve has been fairly constant, but, you know, I think in some years it's less, some years it's more.

Q. Has there ever been a year when the company's gross plant declined?

A. Gross plant declined? The gross plant?

Q. Right.

A. I couldn't answer that question.

Q. Now, please turn to page 6 of your rebuttal testimony, line 2.

A. Excuse me?

Q. Page 6, line 2. There you say that you consider this plant to have an indefinite life. What do you mean by indefinite life?

A. When you say plant, we're talking about the system. We have an obligation to serve the customer. And so as long as we have that obligation to serve the customer, you know, we think that we're going to have to maintain the replacements whenever necessary to keep the system operating.

Q. Okay. Can you identify the specific plant accounts that you consider to have an indefinite life?

A. Well, I mean, I think what -- the responsibility is to -- we have the obligation to

provide service, reliable service indefinitely, so I would guess that the accounts and the assets we have are necessary to do that, so my question would be which of them -- you know, unless technology makes something obsolete, I'm guessing we need all those accounts. We're going to have to replace all of those assets to continue that service.

Q. Did you hear me asking questions about the building that was sold?

A. Yes, I did.

Q. And I think that I was referred to you.

A. Okay.

Q. First of all, what building is this that was sold?

A. It was the Schuchart building.

Q. Okay. Now, where is that building located?

A. It's located on Divide, the old Gold Seal building.

Q. That's the gold building up here?

A. Yeah.

Q. When was that building sold? I'm going to go through the same questions.

A. I think -- I believe it was transferred, sold to an affiliate, I believe it was July 1, 2001.

Q. What was the original cost of that

building?

A. I don't have the information. It was several million dollars. I don't know the exact number.

Q. Okay. But you can provide that information?

A. We can provide it, yes.

Q. Okay.

A. Now, are we talking about the original cost? There was an original cost plus improvements that were made to the building.

Q. Right. And I think we're going to want all of that.

MR. HOBERG: You want a late-filed exhibit, Mr. Binek?

MR. BINEK: Yes, please.

MR. HOBERG: That would be 3, Mr. Pearce.

MR. PEARCE: That's fine.

Q. (MR. BINEK CONTINUING) And when was the building purchased, do you know that?

A. It was purchased in the early -- early to mid 1990s. I'm not certain of the date.

Q. Okay. Once again, I would ask that all of this information be included in a late-filed exhibit, but I'll go through it anyway --

A. Sure.

Q. -- if you can provide some information. Why was the building sold --

A. Initially, when the building --

Q. -- or transferred? I think you used the term transferred.

A. Transferred, sold. Initially, when it was purchased, we were running out of space in our current building so we acquired this building. As the company grew, the share of activities associated with the resources group became less and it was decided that it should be moved outside of the utility since it's -- you know, I think the utility now is quite a bit less than half of the operations over there, so it was decided to move to a different company.

Q. Okay. And the sales price, do you know what the sales price was?

A. The sales price was set at the net book, unrecovered book value of the asset, and I don't know the number. It seems to me it was in that four- to five-million-dollar range. I don't know. It's here someplace.

Q. And what was the entity that it was sold to?

A. It was a subsidiary of Centennial. I believe the subsidiary's name is Future Source. I can't give you the exact legal name. Future Source.

Q. Once again, that will be included, I assume. And I asked Mr. Jeter, I believe it was, to provide all of the journal entries relating to the sale.

A. Okay.

Q. Was there an appraisal done prior to the sale or transfer of this building?

A. I don't believe so, but I can't answer that for sure, but I do not believe there was an appraisal done.

Q. Do you know what the tax appraisal of the building was at the time of the sale?

A. No.

Q. Can you provide that information also?

A. Yes, we can.

MR. BINEK: Okay. And I'm asking that all of that information be included in a late-filed exhibit.

MR. HOBERG: Late-Filed Exhibit 3.

MR. BINEK: I have no further questions.

MR. HOBERG: Thank you, Mr. Binek. Commissioner Reinbold, did you have any questions?

COMMISSIONER REINBOLD: I think so. Probably a statement, too. Everybody is making statements.

EXAMINATION

BY COMMISSIONER REINBOLD:

Q. You know, when I was a kid out at Hebron, 50 miles west of here, MDU was a pickup and two guys with patches on their arms and natural gas and electric service and that was MDU. And everybody accused them of long coffee breaks. And that was kind of a joke in the community, you know. But that wasn't -- I don't think it was the case. They're very efficient. And the point I want to make now is that from that point to now we've really come a long way. And when I say that, I understand MDU Resources Group, Inc., has purchased a number of businesses.

Can you kind of rattle off a list of the businesses that the big MDU Resources now has?

A. Well, I think probably best would be to talk about the lines of business we have. We have, of course, our electric/gas utility operations. We have WBI, which has a transmission and gas storage gathering, as well as an oil and gas exploration, and they also do some -- they have some companies in

what I call innovative technology, where they're looking at, I would say, breaking technology that's applicable probably to some of the things we're in. We also have Knife River Corporation, which invests in aggregate mining, as well as building, road construction and stuff, activities.

We have USI, which is Utility Services, Inc., which is involved in the building and developing of a -- I should say replacing, I would say, utility, electric, gas, overhead, underground lines. They work with the generation side. They do work in telecommunications, as well as inside electrical work, as well as traffic light signaling. And then we have Centennial Power, which is involved in the investment in IPP, looking at doing investments in IPP. And we also have our foreign operations that are currently in Brazil that have made investments in, I think it's 200 megawatts of a gas turbine and they're also looking at some other projects in South America.

Q. You've come a long way?

A. Yeah.

COMMISSIONER REINBOLD: That's all the questions I have.

MR. HOBERG: Thank you, Commissioner

Reinbold. Commissioner Wefald, please.

EXAMINATION

BY COMMISSIONER WEFALD:

Q. In Mr. Jeter's testimony he had said that Montana-Dakota has retained AUS Consulting to complete another depreciation study by December 31, 2002. Are you anticipating that the study will be done by December 31, 2002?

A. Well, we're very hopeful it will be done. As I said, you know, one of the issues and problems we ran into is that we have to provide all our historical records because of the fact that, you know, they inadvertently were lost, but we're hopeful we'll have that completed in that time frame, yes.

Q. That was one thing I was wondering about. With the 1991 study, if the Commission wanted to go in and take a look at that and you're recommending the Commission use the 1991 study, is there any backup data that's available to the Commission at this time other than the few summary charts?

A. I couldn't answer that without talking to our plant people or Stone & Webster and find out what exactly -- you know, what records they do have left from that, you know, that they were able to

locate versus what they don't, but I'm not sure how much information would be available.

COMMISSIONER WEFALD: Thank you.

MR. HOBERG: Thank you, Commissioner Wefald. Commissioner Clark, any questions of Mr. Keller?

COMMISSIONER CLARK: I do have a few.

EXAMINATION

BY COMMISSIONER CLARK:

Q. Getting back to this building, if through the tax appraisal that MDU is going to be submitting, and I understand there wasn't, doesn't sound like, a fair market appraisal done, but if the tax appraisal comes back in the market that the assessors here were setting the value of that, if that ends up being far in excess of the net book value, would it be fair to ratepayers to somehow give them some sort of realization of the difference between the two that, in fact, this asset that had been in the rate base that the ratepayers have been paying for was then transferred to another affiliate within the MDU group, but at far less than the market value of that?

Would it be fair to somehow credit, maybe through an offset of that credit that was originally

given, so that the ratepayers see some realization of that?

A. You know, I would comment that that may be fair for the portion that was allocated to the utility business. A couple comments I'd like to make. One, is that while we didn't do a fair market value, we believe that the book value was very close to the fair market value. So we don't believe, you know -- if we thought there was a big discrepancy in the values, we would have went through and did a fair market value of that, but we don't think there was a big difference between fair market value and net. I'm not sure what the tax value is. I'm not sure if that is a locally assessed or centrally assessed asset. If it's locally assessed, we would have the tax value. If it's centrally assessed, I don't believe it would have a value just for that stand-alone business.

Q. What would be the basis of saying that you think it's pretty close to what the fair market value was, the net book?

A. Well, because we haven't had it that long and we made some pretty substantial investments in there, so we're pretty comfortable that the fair market value -- the fair market value would not have

been much higher than the book value was.

Q. Getting back to the depreciation study that is ongoing, kind of lead me through the -- why was the decision made to have a depreciation study at this time? Was it for the rate case?

A. I'm going -- I'm going to defer that to Rita, but I believe one of the things is, one, it's been a while since we had one, but, secondly, with the cases coming up, we wanted to take a look at it. You know, we look at our plant all the time. We don't think -- you know, one of the comments made, we don't think the makeup of our plant has changed a lot since our last study, but, you know, we thought it may be appropriate to do one. I think it was recommended that we do one for these cases, but Rita could probably answer that better than I can.

Q. When it was originally contracted to be done, was it contracted to be done by the time that this rate case was to be taken up by this Commission?

A. We -- right now, I don't think there's as many consultants in the business doing depreciation studies. You know, the number of consultants -- there seems to be a lot fewer than there have been in the past. We had a very difficult time getting a

depreciation consultant. It was tough to get them. You know, they're quite busy right now. It was difficult to get one. The individual we hired did a depreciation study, just completed one for Great Plains, and we asked him to start on this one as soon as he could and he said he would do his best effort to get it done by the end of this year.

Q. I guess I'm a little confused by that, because I know in the RFP that we put out here at the Commission, I think one of the things that was originally in that was a depreciation study and at some point we decided to peel that off and that I guess MDU would be handling it, but -- and maybe Mike will be able to speak to this when we get to Mr. Diller's questions, but it seemed to me that we had at least five that said that they could get it done by the time that we needed to get it done.

You're saying MDU didn't find anybody out there who could get it done in time?

A. We looked for consultants that had been used by our peers that we knew were very reputable and very good and, you know, we kind of basically looked at -- you know, the people we looked at were the ones we wanted to use. They're very busy right now and timingwise it takes a period of time to do

this and it takes a period of time to gather all these records that we have to go back and recreate, so, you know, we just had difficulty getting a commitment to get it done in a time frame that -- in time to have -- you know, time to have -- prior to the case being filed or this date.

Q. Well, the depreciation case that you have, the study that you have being done, is it going to be ready for the rate cases in the other states within your jurisdiction; South Dakota, Montana, Wyoming, the ones we've heard about that will be --

A. Again, I'm going to have Rita -- he's going to do the study for Montana-Dakota gas operations and would include all our jurisdictions. Timingwise, if that's going to fit with our schedule, Rita could probably answer that.

Q. Okay. Do you know how much -- how much did this particular study cost that you're doing? I know we heard before they're fairly expensive.

A. I'd have to get you that information.

Q. Has MDU received any preliminary information yet on that depreciation study, or is that just all delivered at once?

A. We haven't received any preliminary numbers, no. We're in the process now of providing

information so the consultant can do his work.

MR. HOBERG: Commissioner Clark, did you want a late-filed exhibit on that question?

COMMISSIONER CLARK: I'm sorry. Which question?

MR. HOBERG: The one about how much it costs.

COMMISSIONER CLARK: Yeah, that would be good, if you can provide it.

MR. HOBERG: Late-Filed 4, Mr. Pearce.

COMMISSIONER CLARK: That's all the questions I have. Thank you.

MR. HOBERG: Thank you, Commissioner Clark. Mr. Diller, please.

MR. DILLER: Just a couple.

EXAMINATION

BY MR. DILLER:

Q. Mr. Keller, do you have any knowledge of any agreements that the staff reached verbally with the company as to who was going to do the depreciation study? Do you have any knowledge of that?

A. I don't have any knowledge of that, no.

Q. Okay. I'd also like to add on to Commissioner Clark's late-filed exhibit, if it's all

right, the cost associated with supporting this 11-year-old depreciation study in this proceeding. Since it's going to be virtually obsolete in three or four weeks or a couple of months, whatever it is, I think that would be some information that the Commission might be interested in.

A. Could you rephrase that? Make sure we get what you're looking for.

Q. I just want to know what -- I want to know the total cost to the company to support the 11-year-old depreciation study in this proceeding. Had the depreciation study been done before this proceeding, we wouldn't have spent all this time and money talking about an old study that's not going to be worth anything in a couple of months. So I'd like to know what the total cost to MDU is to support.

A. Well, you know, to say it's not worth anything I think is kind of -- it's a study, but it was a thorough study that was performed and, you know --

Q. Did I hear you say -- I couldn't really hear. You said it real quickly. You said it wasn't done in time because you lost some information?

A. I said one of the reasons we can't get it

done as quickly as we'd like was because we didn't lose some information. Stone & Webster, who performed the last study, lost a lot of the data.

Q. So then if staff had hired a consultant then to do the depreciation study, since we had offers to do that in time for this proceeding, would we have had the same problem? Would we have --

A. It would have been difficult to give you the information. Again, Mr. Jeter may be able to better address this than I can, but I believe to do a thorough, detailed study, I think there's a lot of historical information you're using and, you know, I think there would have been -- to do a complete study, which we are expecting done, I think would have been -- you know, may have been difficult for your consultant to do in time.

Q. Do you understand the question? I'm asking for the cost of --

A. Yep.

MR. DILLER: Okay. I think that's all the questions.

MR. HOBERG: Thank you, Mr. Diller. Any further questions then of Mr. Keller? Mr. Pearce, any?

MR. PEARCE: No.

MR. HOBERG: Mr. Binek, please.

MR. BINEK: Just a couple other questions regarding this depreciation study.

RECROSS-EXAMINATION

BY MR. BINEK:

Q. When did MDU retain a consultant to do the depreciation study?

A. I believe we started looking for one about maybe April and we had -- I think he committed to us, I think, maybe in May. I'm not sure of the dates. And we asked him to complete the Great Plains study and then begin work and complete the Montana-Dakota gas study.

Q. Okay. Included with the late-filed exhibit 4, I would like to ask that any correspondence relating to the contract with -- is it AUS?

A. Yeah.

Q. -- concerning the contract and the contract itself be included in that exhibit.

MR. HOBERG: Mr. Pearce, can you do that?

MR. PEARCE: Well, I assume that's possible, barring some kind of a confidentiality provision that that consultant may have. I don't suppose there is, but I don't know of that, so with that possible proviso.

MR. HOBERG: Anything further, Mr. Binek?

MR. BINEK: No.

MR. HOBERG: Any further questions of Mr. Keller? Thank you, Mr. Keller.

MR. PEARCE: Can we take a couple minutes? We have some exhibits to mark for Dr. Gaske.

MR. HOBERG: Yeah. Let's take five minutes.

(Recess was taken.)

(Exhibit 31, 32, 33, 34, 35, and 36 were marked for identification.)

MR. HOBERG: We're back from recess, and you're taking the rebuttal of Dr. Gaske at this time, Mr. Pearce?

MR. PEARCE: Yes.

MR. HOBERG: Dr. Gaske, you testified yesterday. I'll remind you today that you're considered to be under oath still.

THE WITNESS: I understand.

MR. HOBERG: Mr. Pearce, please.

J. STEPHEN GASKE,

having been previously sworn, was examined and testified as follows:

DIRECT EXAMINATION

BY MR. PEARCE:

Q. Dr. Gaske, you've prepared prefiled rebuttal testimony in this case, have you not?

A. Yes, I have.

Q. Rather than go through all the testimony, I'm simply going to ask you to summarize that testimony, if you will, and add any additional rebuttal points that you feel are appropriate after the staff's direct case.

A. I will try to go through and summarize my testimony, but I won't read the whole thing. But during the course of the summary I would like to direct the attorneys and the Commissioners to various points in the record, because in the course of summarizing this, I hope to lead you through the facts that have been introduced into the record so that, hopefully, you'll be able to follow along why I'm saying what I am and what the basis of the testimony is.

As a broad general overview there are really four big issues with regard to rate of return. One is the question of the flotation cost adjustment. Another is the comparable companies that we use in our DCF analyses. One is the growth

rate that we adopt, and the last is our assessment of risk. With regard to those four things, I advocate a flotation cost adjustment, which I'll talk about in a few minutes.

There's not a big difference between us with regard to the comparable companies. But there are some differences and there's some key factors that you need to understand. There are large differences between us with regard to the growth rate, and I believe very strongly that my growth rate analysis is based on relatively objective, publicly available information. In contrast Mr. King's is really based on a fairly subjective analysis that on its face appears to be fairly biased.

With regard to risk assessment I have two different opinions, depending on which proxy group you use. If you were to adopt the Moody's gas distribution companies as the appropriate proxy group, I believe that Montana-Dakota is slightly above average in terms of their risk. They're slightly riskier than the average company. If you were to adopt the companies that derive more than 75 percent of their revenues from gas distribution operations, then I believe Montana-Dakota is average

relative to that group.

So having said that, I want to walk through and summarize the rebuttal testimony. With regard to the flotation cost issue, it's very important, I think, to understand why you should be allowing a flotation cost adjustment. The standard that's used to evaluate whether a cost of capital or rather allowed rate of return is sufficient is often referred to as a capital attraction standard. That standard requires a rate of return that is sufficient to enable the company to attract capital on reasonable terms. Now, whether the company actually is going out and raising capital, whether it's growing, whether it needs new capital or whether it's built a system that is not growing at all, it still needs to have an adequate rate of return. And so the standard that was established to set that rate of return was this capital attraction standard. There also is a comparable earnings standard, but when we go to using a DCF analysis, we're really looking at a capital attraction standard.

When you set a rate of return based on DCF analysis, in theory you are finding the cost of capital that makes the investors indifferent as to

whether they invest in this plant or in this company and put utility assets in the ground or whether they put their money in U.S. Treasury bonds or CDs or anything else. In other words, it's exactly the amount of money they need to be compensated for the additional risk.

In theory that means that when they invest $1 in utility assets, the value of that investment will be $1. That will be the market value after it's in the ground, if everything goes well. If they do invest $1, though, and they have to raise equity capital to invest $1 in utility assets, they have to essentially raise more than that. They have to go out into the market and raise perhaps $1.05. The five cents goes to the investment bankers and then they have $1 investment in utility assets.

Consequently, the rate of return needs to be adjusted to reflect the cost of flotation. It doesn't mean the company is going to go out and issue common stock. It doesn't mean that it's done so recently. It means that in order to be in a position to attract capital, in my opinion, to meet the capital attraction standard, it has to have a rate of return so that it can go out and issue that common stock without diluting the existing

investors' investment. I put together a numerical example of this concept that I'd like to hand out as an exhibit. It a little bit complicated, and I won't spend too much time on it, primarily because I think you'll fall asleep if I do.

MR. HOBERG: Is this 31?

MR. PEARCE: Yes.

THE WITNESS: Have you handed them out to everyone?

COMMISSIONER REINBOLD: What number is that?

MR. PEARCE: 31.

THE WITNESS: The general assumptions here are that the company has existing equity of $100, book value of $100, and it has a rate of return that is exactly equal to the investor requirement as determined by a DCF analysis. Under those circumstances, the market value should be $100. The number of shares outstanding is 100, so that the existing investors will have a book value of $1 per share and they have a market value of $1 per share. And I've put $1 into plant and that's what it's worth in the market. If they require a rate of return of 15 percent, they would get $15 of return. And that's what this shows across the first line of

numbers there.

If the public utility then goes out and issues new common stock because it needs to build new plant, and it issues $100 in new common stock, under the example here that I have, I've assumed that the investment bankers take 10 percent of that. They take $10. So the company issues $100 in common stock. They raise $100. $90 of that gets invested in a utility plant that's allowed to earn a rate of return. If they earn exactly the 15 percent required, the utility -- the new utility plant will have a book value of $90 that will go into the rate base. The market value will also go up by $90 because they're earning exactly their allowed rate of return. The number of shares outstanding has now doubled. They issued 100 shares all at $1 apiece. But they got net proceeds of $90 so they have 200 shares outstanding now and the new book value is 95 cents per share. And the new market value, if they are earning 15 percent, is also 95 cents per share.

The impact on the existing shareholders is that they were sitting there with stock that was worth $1 and now their stock is worth 95 cents. The reason being is that the company went out and built a utility plant and raised new common equity to

build that plant and was left with only $90 that they could put in their rate base, even though they had to issue $100 worth of common stock. The effect was to dilute the existing investors' return and the value of their stock. If they earn a 15 percent rate of return, the new larger company would have -- in the last column it shows that the new larger company would make $28.50 a year. They get a 15 percent return on the plant that's in the rate base, but they get a zero percent return on the flotation costs that they incurred.

And just in this example, instead of getting a 15 percent rate of return on all of the dollars that were spent, they get a 14.25 percent rate of return. They don't get the 15 percent that the DCF analysis told you that they required. They were not in a position to issue new common equity on reasonable terms without diluting the value of the stockholders' investment.

The second example I have here is a flotation cost adjustment where you increase the allowed rate of return by 10 percent. You multiply 1.1 times the 15 percent that investors require. That comes out with an allowed rate of return of 16.5 percent, which is more than what investors

require, but the goal here is to increase the market value above the book value by 10 percent. Here, if you look at the first line of the second example, you have a book -- starting book value of $100. Because you've applied a flotation cost adjustment, the market value is actually $110. So the market value is actually worth more than the book value. And with 100 shares you have $1 in book value and $1.10 in market value per share.

Now, when the utility goes out and says we need to build new plant, we need to raise common equity to invest in new plant, they sell 100 shares of stock for $1.10 because that's the market value of the stock. They raise proceeds of $110. $10 goes to the flotation costs. That ends up going to the investment bankers. And they're left with $100 that they can invest in utility plant. So by issuing the new common stock, they can add to their new plant by an amount of $100. That new equity if it has an allowed rate of return -- or I'm sorry. They add to their existing plant an amount of $100. If they get a 16.5 percent rate of return on that, it should be worth $110.

In total now, the company has 200 shares outstanding. They have $200 in their rate base

that's earning a return, and they have a market value of $220. The market value is higher than the book value in this case because you've made a flotation cost adjustment. The price per share and the book value per share is $1. $1 for the book value and $1.10 for the market value. You can see that those numbers are the same after the issuance as before the issuance.

The existing shareholders don't lose anything by virtue of the fact that the company has issued common stock. So the company is able to issue the common stock on reasonable terms without diluting the value of these existing shareholders' investments. That -- I don't think I'll walk you through the rest of it because it's a similar example down below.

The last example is just a much larger stock issuance, but the result is the same. You start with a book value of $1. You have a market value of $1.10. You're able to issue common stock and still -- the existing shareholders are still in the same position they were before.

Now, the question is, if the company has not been issuing common stock in recent years, why do you allow this? It's not because they need to be

compensated precisely for what they have just issued in the last year. It's not because they need to be compensated for what they know; in fact, right now they're going to earn next year. It's because the company needs to be in a position to do this at all times. It's a little bit like insurance. I didn't have a car accident last year, so why do I need insurance this year? I didn't have to raise capital last year. Why do I have to have a flotation cost adjustment so I'll be in a position to do so this year? That in essence is what the issue is about.

I mentioned in my rebuttal testimony that a number of other economists advocate exactly the same kind of adjustment. It's not an unusual thing. It is supported by the economic literature. Mr. King has indicated that the company's experience in the recent past has been that flotation costs have been 0.1 percent of the capital rates. That's actually very misleading, because, in fact, that's not what the flotation costs have been on the capital that has been raised.

Let me give you the biggest area where that becomes misleading. Mr. King has noticed that the company issued about $400 million worth of shares to buy other companies. Well, that's not raising

capital. You don't have big flotation costs to swap shares with someone. It's just a share swap. No cash was raised that could be used to go out and put mains in the ground for the public utility customers. Transactions like that don't have very big flotation costs associated. So you really can't include that in the concept of what does it cost this company if it were to have a need to go out and raise cash for the utility operations. The recent historical experience for the company is shown on page 5 of my rebuttal testimony, at lines 12 to 15.

COMMISSIONER WEFALD: Which page, please?

THE WITNESS: Page 5. In recent years the company has raised $157 million. It incurred flotation costs of 5.2 million and the flotation cost adjustment or the amount of flotation costs was 3.43 percent of the net funds that they raised. So that's been their recent experience. If they had no recent experience whatsoever, they would still need a flotation cost adjustment. If they had raised lots of money recently, they would need one on a forward-looking basis. Because this is much more of a concept similar to the idea of risk where it's a forward-looking thing where you need to be in a position to do so at all times.

The study that I've done that appears in my direct testimony was to look at many gas distribution companies and the costs that they have incurred in the past. And I came up with an average of about 4.85 percent as the average for gas distribution companies in terms of the flotation costs. I recommended in this case an adjustment of 4.75 percent as being on a forward-looking basis what the company might on average expect to incur. Sometimes they might get less than that. Sometimes they might have to pay more. And it's just depending on conditions in the market at the time.

I guess to summarize, there is a need for the flotation cost adjustment. Mr. King's adjustment of 0.1 percent does not reflect what it costs to raise capital, and I'll leave it at that on that issue.

The next issue I want to talk about is the proxy group. I have another exhibit to show you. Essentially --

MR. HOBERG: Are you offering 31?

MR. PEARCE: I'll offer it now.

Q. (MR. PEARCE CONTINUING) Dr. Gaske, did you prepare Exhibit 31?

A. Yes, I did.

MR. PEARCE: I'll offer Exhibit 31.

MR. HOBERG: Mr. Binek, any objection?

MR. BINEK: No.

MR. HOBERG: Exhibit 31 is admitted. Please continue, Dr. Gaske.

THE WITNESS: The next exhibit is Exhibit 32.

MR. HOBERG: I've got that here for the Commissioners.

THE WITNESS: I just noticed that there's one thing that's not correct here and that's in the sources I have bond ratings. And, in fact, there are no bond ratings on this page. I had carried that over from a copy of another exhibit. So --

COMMISSIONER WEFALD: Cross that out?

THE WITNESS: -- you can cross that out. The other source is the percent gas distribution, and with one exception that was taken from Mr. King's testimony. The one exception is Keyspan. And if you'll recall yesterday, an exhibit was introduced that showed it was from the Keyspan 10-K and it showed their percentage of revenues from gas distribution and I was asked about that percentage. I did not calculate it in my head, but I went home last night or back to the hotel and calculated 54.5

percent. So it's at the bottom there.

These are the proxy companies that Mr. King and I have used. They're all put together. We have used two different groups. I've used the Moody's gas distribution group. It's a group that I've used routinely in the past in gas distribution cases. The companies in that group are marked with an X here. It's commonly used as a group of companies that are representative of the gas distribution industry and people look at this group for information in general about the industry.

Each of the companies is included in Value Line as being a gas distribution company. Each of the companies is also included in the CA Turner Reports as being a gas -- or gas distribution or integrated gas company. So they are widely perceived to be gas companies. I believe it's appropriate to use these companies for a DCF analysis. It is something -- as I note in my testimony, Mr. King used the same companies about a year ago before this Commission.

Mr. King has proposed an alternative proxy group. And that's companies that derive at least 75 percent of their revenues from gas distribution companies -- or gas distribution operations. The

percent gas distribution column, as I said before, is taken right out of his testimony. You can see that the companies that meet the standard that he established include all of the companies down to Peoples Energy Corp, which derives 80 percent. So actually all of the companies that really meet the standard derive not just at least 75, but derive more than 80 percent from gas distribution.

Mr. King has proposed to also include WGL Holdings, but in my rebuttal testimony I asked the question since they didn't meet his criteria, you know, why would you include it? So that in essence is -- if you want to look at the companies and the criteria that were used to select them, that compares our two groups and accounts for some -- to a small extent some of the differences between the two of us in our studies.

The next area that I want to talk about is the growth rate differences between the two of us. And to help you in the discussion of this, to help me in the discussion of this, I've prepared another exhibit. I know it's been marked as Exhibit 33. Since I'm leaving 32, is there anything --

Q. (MR. PEARCE CONTINUING) Are you finished talking about 32?

A. Yes.

Q. And did you prepare Exhibit 32?

A. Yes, I did.

MR. PEARCE: I'll offer Exhibit 32.

MR. BINEK: No objection.

MR. HOBERG: Exhibit 32 is admitted.

THE WITNESS: The data on Exhibit 33 attempts to do an apples-to-apples comparison between Mr. King's study and my study and other alternatives that have been discussed on the record, as well as alternatives that I have included in my rebuttal testimony. The first column of numbers shows the average results from various studies using various growth rates. My -- and I should say that column is what I refer to as the investor return requirement. It does not have a flotation cost adjustment. The cost of capital after flotation cost adjustment is shown in the last column, but for purposes of this discussion and comparison, I'm really going to focus on the first column.

My second stage retention growth method, which was conducted on Moody's gas distribution group, came up with a 12.83 percent rate of return on average. That simply is a weighted average, two-thirds of the weight on the Zacks analyst

estimate and one-third on the book value growth rate -- or, actually, the earnings retention growth rate.

The second one is the basic study. That's identical to what Mr. King refers to as a classic study, where you simply add the Zacks growth rate estimates. The only difference between us really comes about because we have different companies in our proxy groups. The primary one in my study was one that I looked at the results, I made some subjective judgments and came up with an average of 12.63 percent. And you can see where I made my subjective judgment, my average rate of return actually comes in below what either the second stage retention or the basic came in at. And that was very specific to the companies in the Moody's gas distribution group.

The next group, going down the list, is really derived from cross-examination yesterday when I was on the stand. I was asked what would the average results be if Keyspan and Laclede were removed from my groups, and I couldn't calculate the average in my head, but -- exactly. I think I had some ballpark number, but my second stage retention results would have been 11.75, and my basic would

have been 11.51. Now, I believe that it is appropriate to include Keyspan and Laclede in the results, but these are some numbers that you have before you in the record and when you sit down to consider rate of return, you're going to be looking at these numbers and having to weigh them against the others. I really do believe that those two companies should be included in the group and so you can take those numbers for whatever they're worth. I don't put lots of weight on them.

The next set of numbers are numbers that appear in my rebuttal testimony. I would direct your attention to Exhibit JSG-4, which are the exhibits that are attached at the back of my rebuttal testimony.

MR. HOBERG: JSG-4?

THE WITNESS: Yes. Schedule 1 in particular.

COMMISSIONER CLARK: Which page?

THE WITNESS: I'm sorry. Schedule 1, pages 1 and 2.

Here what I've done is to simply take the companies that meet Mr. King's criteria. They derive at least 75 percent of their revenues from gas distribution based on his numbers. It includes

all of his companies, except Washington Gas Light or WGL. I've used his Zacks numbers, his stock price, his dividend, and his book value per share with the growth rate. The average Zacks growth rate for these companies is 6.38 percent and the average of Mr. King's estimates of the book value growth rate is 7.14 percent. I've taken a weighted average of those two, giving two-thirds weight to Zacks and one-third to the book value growth and come up with an overall weighted average growth rate. I've then taken his stock price and dividend data and adjusted the dividend yield for the .625 dividend adjustment factor that has been somewhat notorious in the case.

And so I've done this in an objective way that matches up with my second stage retention growth method of really taking the information from both of these growth rates and combining them. And I come up with an average of 11.8 percent without flotation costs and 12.4 with. So if you do what I think is much closer to a proper analysis of the growth rate, you would come up with at least 11.8 percent for these companies.

The next page is virtually identical. It's all Mr. King's data and just taking a weighted average and I come up with a -- when I weight book

value growth and Zacks equally, 50-50 for both, I come up with 12 percent for these companies. And those are the numbers and that's the approach.

The last group of figures that I want to talk about are from Mr. King's analysis. His first DCF analysis is based on his book value growth rate. And for his companies, which also included WGL Resources, he came up with a 12.18 percent return and that comes from his testimony on page 20. It's table 7 on that page. Now, you can see the 12.18 percent return in table 7. Immediately thereafter on pages 20 and 21, he indicates that he really doesn't think that this is representative of what investors expect, primarily because for the 11 companies in his analysis, Value Line does not project that their earnings are going to go down in the future.

Well, in fact, if these companies had negative growth rates, nobody would be buying them. He also thinks that Value Line is biased because they project that all 11 companies are going to have increased earnings in the future and they're going to maintain or even increase their current rate of return. So he pretty much discounts and rejects this data. The theory is that Value Line is biased.

Yesterday, in cross-examination of Mr. King, sheets from Value Line were introduced. It showed that Value Line indeed does project declining earnings, declining return on equity for companies. They're not biased. When they believe that a company's earnings are going to go down and its rate of return is going to go down, they do project that. The fact that you can look at these 11 companies and say, gee, they're going to grow in the future is not at all surprising. That's what you expect. That's what the Zacks analysts expect. That's what investors would logically expect for those companies. That's what you expect out of most companies. So at this point in time, you can't take that information and say, well, that means they're biased, just because they think the companies are going to grow or maintain their current rates of return. So Mr. King gives very little weight to the book value analysis, but when you really look at his reason for giving little weight to it, it doesn't make any sense.

He has a historical analysis which is based on historical growth rates. That appears on page 22 of his testimony in table 8. Here, his average rate of return is 11.72 percent. Now, when you look at

table 8 fairly closely, you can see that there's some pretty wild swings. There are some companies that in the past, in the very recent past, have had negative growth rates. No one would actually expect that to be the case in the future. And he has Southwest Gas with a positive 37 percent growth rate, and I don't think you can really expect that to happen in the future, either. These are kind of wildly out of line.

My rebuttal testimony discusses the fact that you really can't give much credence at all to these historical results. Certainly, Value Line, when it does its book value projections, book value growth projections, they were aware of this historical data. The Zacks analysts, when they did their projections, they were aware of this data. I'm sure they took it into consideration. So you really don't have a whole lot here on historical growth numbers typically because they were fairly short periods of time in the past to do much with. But, nevertheless, he has these numbers and he does place some weight on them.

His last approach, the classic approach is that -- that appears on page 23. And I'm sorry. The summary of the three-year results appears on

page 23. The actual analysis appears on page 18, table 6. And here you can see that the average rate of return was 11.29 percent. And that's very straightforward. It's just adding the Zacks analysts' growth forecasts.

One of the major places that I think Mr. King's analysis is flawed is in how he's taken this information and used it subjectively. He says that he started with the classic result, 11.29 percent. And from that he then looked at the book value results. They're a whole lot higher. So he considered those and worked those into the calculation, these much higher numbers. He also took the historical results, also quite a bit higher. So after he gets finished including these higher numbers in his results, he comes up with a lower average on its face that just doesn't make a whole lot of sense.

Now, he says that he went company by company and really analyzed each company individually and described why he did what he did, but the fact of the matter is, is that the level of bias is pretty high when you consider that after consideration of much higher numbers, he ends up with a lower number than he started with. That

gives him a 11.23 percent rate of return. You, as Commissioners, will have to decide out of this evidence that's in the record which of these numbers are credible and which ones to place true weight on. And I would say that, in my opinion, the 11.23 number doesn't make any sense whatsoever.

To the extent that you place any weight on the numbers and evidence that he has put in the record, the recalculation that I've done that gives very explicit consideration to both Zacks and the book value growth rate; the two-thirds/one-third or the 50-50 analysis. They come out pretty close to each other; 11.8 percent or 12 percent before flotation costs. Those at least you can trace mathematically. You can debate whether or not the assumptions are correct and actually have some reasonable basis for decisionmaking.

Now, yesterday I talked about the fact that I generally believe that book value is a floor for your long-term growth rate. I think Mr. King agrees with me on that, but then he ends up saying that he really considers book value to be a ceiling because it has the highest number. But if you look at page 19, lines 5 to 13 of his testimony --

COMMISSIONER WEFALD: 15 to 19 of his

testimony?

THE WITNESS: Page 19, lines 5 to 13.

There he says that the book value growth model is less useful for gas utilities than it used to be for two reasons. One, is that these companies are somewhat diversified. They don't just get their income from regulated operations. The other is that he thinks very few utilities are so closely regulated that the only source of growth in earnings is the increase in book value. Now, I agree with both of those statements. They parrot exactly what I said yesterday when I was on the witness stand.

What these two statements say is that these companies have some unregulated operations so book value growth is not necessarily the best indicator of their growth rate because they have ways they can grow even faster than that. So later in his testimony or around this point in his testimony where he says that book value is a ceiling, the reasoning he has in his own testimony suggests, indeed, that it should be a floor, which is what I think. So when you're looking at his testimony and looking at the 12.18 percent book value and the reasons that he gives for rejecting it, I think you'll find that the record shows that they're not

particularly good reasons, that they don't actually fit with the reasoning of his own testimony. That's one reason in addition that I really don't give a whole lot of credibility to that 11.23 percent that he came up with subjectively.

If you look at the ultimate results he comes up with subjectively, which appear on page 24 of his testimony in table 10, he has his 11.23 number there, and these are his kind of subjectively derived numbers. The range of rate of return there is 9.5 percent to 14 percent. If you go back to Exhibit JSG-4, Schedule 1, that's at the back of my rebuttal testimony, and looking at Schedule 1, page 2 of 2, that's the 50-50 weighting. The range of returns on that exhibit is 9.53 to 14.09. In essence, it's virtually identical to the range that he has in his ultimate DCF analysis. But the average is very different. The average for the group is 12 percent. So I would submit they're not enormous differences between us, but somewhere in the course of making some subjective adjustment, he's come out with a very low number that just is not reflected by the record.

I believe that Zacks growth rate and the book value growth rate should both be given at least

some serious consideration, should both be reflected, and that the appropriate growth rate is somewhere between the two, not below either of them. So having said that --

MR. HOBERG: Commissioner Wefald.

COMMISSIONER WEFALD: On Mr. Gaske's -- now we're about page 10 of his 29 pages of testimony. How much longer is he anticipating going, because I do want to make sure that we have a chance to ask questions of the other people who are here and have a chance to hear the other presentations?

THE WITNESS: I think I've gone through the really detailed parts. It won't -- I don't think it will be nearly as long to do the last.

COMMISSIONER WEFALD: Thank you.

THE WITNESS: The next area that's fairly important is the risk assessment. Mr. King believes that the company, Montana-Dakota Utilities, is a relatively low-risk operation. His primary reason for saying that is that Montana-Dakota Utilities is a part of a very large company. Now, yesterday he gave an example of Atlanta Gas Light, who lost a customer and, you know, obviously had some risk there.

The thing about Atlanta Gas Light is that

in my direct testimony I have evidence that compares the size of Atlanta Gas Light to the size of Montana-Dakota's gas distribution operations and that appears on JSG-2, page 1. And it looks like Atlanta Gas Light's assets are 3.3 billion as opposed to Montana-Dakota's gas distribution assets of 183 million. The operation operating income for AGL was 209 million, but Montana-Dakota's gas distribution operating income was $4 million, an enormous difference in size. For AGL, with a large territory, a very large population, that it serves, it can lose major customers and it will hurt AGL. Montana-Dakota, on the other hand, can be hurt much more if large companies, large operations leave its service territory leaving people unemployed, and perhaps stranded facilities behind or other impacts along those lines.

It's interesting, his argument on the small company issue, because one of the reasons he says Montana-Dakota has low risks is that we're only looking at the gas distribution operations. We're looking at them as a stand-alone operation and they're 100 percent gas distribution, whereas these other companies are diversified, at least to some extent, and at that part of his testimony he says,

essentially gas distribution is less risky than a diversified company. However, when he gets to the small company issue, he says, well, actually, these gas distribution operations of Montana-Dakota, they're part of a great big company.

So there's a direct contradiction there in what he's saying. On the one hand, the company is low risk because we'll look at it on a stand-alone basis, 100 percent gas distribution business. On the next hand, it's also low risk because it's part of a larger holding company with other operations so we'll look at it on a consolidated basis for that issue. Two diametrically opposed positions on the risk when analyzing risks in different situations, but both of those positions lead to the same conclusion, low risk, at least in his mind.

Now, one of the things that he talked about yesterday was, for example, competition. All of these companies, including Montana-Dakota, face competition. So it's not a major factor to distinguish them. He talked about Washington Gas Light in particular, and I have another exhibit and I won't spend too much time on it, just to introduce it into the record, but I went on the Washington Gas Light Website because I happen to be a customer of

theirs. I know something about what happens in their service territory and what has happened in the past.

This Exhibit No. 35, which I think was just --

MR. HOBERG: Exhibit 34?

THE WITNESS: I skipped over 34 in the interest of saving time.

MR. PEARCE: While we're paused for a moment, I'd like to offer Exhibit 33, which I didn't do before, the DCF summary.

MR. HOBERG: Okay.

THE WITNESS: In the late '70s and early --

MR. HOBERG: Just a minute, please.

Mr. Binek, any objection to 33?

MR. BINEK: No.

MR. HOBERG: 33 is admitted then. You skipped over 34, Dr. Gaske?

THE WITNESS: Yes, I did.

MR. HOBERG: Are you still offering 34?

THE WITNESS: Yes, I think I'll mention it very quickly at the end.

MR. HOBERG: Okay.

THE WITNESS: In the Washington, D.C. area a lot of new homes were built with electric heat

pumps in the late '70s and early '80s. It was a relatively new type of appliance. The cost of gas at that time was over $4 a decatherm. On an inflation-adjusted basis we're probably talking about $12, $15, and new homes were being built with these heat pumps. The thing about the heat pumps is that they didn't really work very well. My parents have one and they have heavy sweaters that they wear all the time. People figured that out and not a whole lot of heat pumps are being put in place. The price of gas relative to electric heating has come down considerably since then.

On their Website they talk about the fact that they have an active program for conversions. A lot of people who bought houses that had heat pumps in them are converting. In their Website they say that for gas heating, gas heating is preferred 4 to 1 in their service territory. They have about 80 percent of the heating market. They also in the same exhibit say that 9 out of 10 new homes in the metropolitan area are heated with natural gas.

COMMISSIONER WEFALD: What is the relevance of this exhibit?

THE WITNESS: The relevance is that yesterday we were told that, well, the proxy

companies really face a great deal more competition than Montana-Dakota does. Montana-Dakota faces competition, potential competition from propane. This company faces competition from electric heat pumps. And I wanted to place this in context, that, in fact, they're winning 90 percent of the new business. So they do have competition, and I don't dispute that. Montana-Dakota has competition, and I don't dispute that, but it's really a matter of what degree and how much weight do you give that competition in distinguishing between the companies.

MR. HOBERG: Are you offering Exhibit 35 then?

MR. PEARCE: Yes.

MR. HOBERG: Any objection to Exhibit 35, Mr. Binek?

MR. BINEK: No. I think it's kind of what we were trying to establish yesterday.

MR. HOBERG: Okay. 35 is admitted.

THE WITNESS: Okay. The last exhibit that I want to introduce is the bond ratings for the companies in Mr. King's proxy group. Now, Mr. King says that Montana-Dakota has very low risk relative to these companies, but when you look at the bond rating, it's right about at the average or the

median of the group. It's not exceptionally low. What's interesting about this is that, as he and I both discuss, Montana-Dakota has at least for this -- in this filing and for the utility operations they have a higher equity ratio than many of the other companies. I maintain in my rebuttal testimony that, in fact, they have slightly or somewhat above average business risks. So you have financial risks represented by the capital structure and you have business risks also in there.

When you put the two together, the company has about average risks and that's borne out by these bond ratings, which reflect a combination of both business and financial risk. In my direct testimony, as I said earlier, Montana-Dakota's first mortgage bonds have a lower average rating than the Moody's gas distribution group. And my overall assessment of that group indicates to me that they have above-average risk relative to that group, but relative to Mr. King's proxy group, they have essentially average risk and that's supported in part by these bond ratings, that they have a higher equity ratio, but I think they have higher business risk.

One of those risks is the fact that they're

small. In his testimony Mr. King at one point, and I want to direct you there, but he says, for example, Southwest Gas may be actually less risky because it's growing rapidly. Well, in Montana-Dakota's service territory there's little or no growth at all and, in fact, if you look behind what's going on a little bit, they have customer growth of about 1 percent per year, but a lot of that is people moving out of small towns to the larger cities. So you have a situation where they're needing to expand facilities in the city, but they still have costs that they have to recover in the smaller towns that factor declining population. And in the long run that's a problem for the company.

Mr. King indicates that a fast growing company like Southwest Gas has low risk. Well, when you -- I talked about this in my rebuttal testimony. If you look at Montana-Dakota, it's at the other end of the spectrum.

I have some additional things in my rebuttal testimony. I demonstrate that the premiums between Baa bonds and U.S. Treasury bonds are the highest now they have -- or just about the highest they have been in 10 years, other than briefly after

September 11th. The force and weight of that is that Mr. King has some testimony where he takes the rate of return that's been allowed in some past periods and says, well, here's what the treasury bond rates were then and here's what the treasury bond rates are now, but Baa bond rates are much closer in risk to the common stock of a gas distribution company. And the higher the risk, the bigger the premium. And we talked about this at great length yesterday so I'm not going to go any further than that.

But if you really look closely at the question, I believe that this increase in the risk premium required by investors probably indicates that if you use the past allowed rates of return as a benchmark, you probably ought to have even higher rate of return now, but that's just as a benchmark. The real heart and soul of both analyses are the DCF analyses, and, hopefully, I've helped you understand what the difference is between the two -- between the two of us on that issue.

MR. HOBERG: Thank you, Mr. Gaske. Did you want to offer 34 and 36?

MR. PEARCE: 36, I would offer.

Q. (MR. PEARCE CONTINUING) Did you want to

say something about Exhibit 34, Dr. Gaske?

A. Yesterday I was asked various questions about, I believe it was Exhibit 11 that was introduced that showed returns over a long period of time. Exhibit 34 looks at Ibbotson data, and it finds that when you do a statistical analysis of the difference between bond returns and stock returns, you're assured that there's a difference at a level of about 99.93 percent. And that shows up on the last page of it. I won't go into a lot of detail on the statistical techniques and things like that, but that's the correct way to analyze something like that.

I looked at the average difference between the two and I found what you would expect, that the probability that the premiums are higher than average is 50 percent and the probability that they are lower than average is 50 percent. In other words, the historical premiums do represent the best estimate of what kind of premiums have been available over a long run in the market. And the questions yesterday about standard deviation and mean, I believe were really off point for whatever point ultimately is to be made with that data. So I put this in the record to have what I believe is a

more appropriate analysis.

MR. HOBERG: Thank you. So you're offering 34?

MR. PEARCE: I'll offer 34 as well.

MR. HOBERG: Any objection, Mr. Binek?

MR. BINEK: No.

MR. HOBERG: 34 and 36 are admitted. Any further questions then, Mr. Pearce?

MR. PEARCE: Did I formally offer the written testimony, Exhibit 24? I don't show that yet. I'll offer that at this time.

MR. HOBERG: Any objection to the formal written rebuttal testimony of Dr. Gaske?

MR. BINEK: No.

MR. HOBERG: Exhibit 24-54 is admitted. You have no further questions?

MR. PEARCE: No.

MR. HOBERG: Mr. Binek, do you have a number of questions?

MR. BINEK: It might be a good time to take a little bit of a break and we may be able to shorten our questions.

MR. HOBERG: I think all of the witnesses, next witnesses and the questions regarding all the next witnesses maybe you want to look at to see.

I'm assuming we're going to get done at 5:00. If that's the goal, then we're going to have to look at ways to do that. So let's take five minutes right here.

(Recess was taken.)

MR. HOBERG: We are back from recess and completed the direct of the rebuttal of Mr. Gaske. Mr. Binek, do you have any questions on cross-examination?

MR. BINEK: Yes, I do have a few. Been able to eliminate a number.

MR. HOBERG: Good.

CROSS-EXAMINATION

BY MR. BINEK:

Q. First of all, referring to your exhibits, how many of these exhibits could have been introduced with your rebuttal testimony?

A. All of these exhibits were prepared last night or subsequent to the filing of my rebuttal. Except for maybe one, all of them were prepared last night in response to various things that Mr. King had to say yesterday.

Q. Based on the record here, they could have been prepared prior to that?

A. Some of them could have been, but the ones

that could have been really reflect information that was available in the record. Some --

Q. Okay. It doesn't matter that much, anyway.

A. There really wouldn't have been any reason to introduce them until I heard Mr. King's rebuttal or surrebuttal yesterday where he discussed a number of things that were in my rebuttal testimony.

Q. Okay. Your Exhibit 31 assumes a market-to-book ratio of 1; isn't that correct?

A. Yes.

Q. Do any of either yours or Mr. King's comparable companies have a market-to-book ratio of 1 or less?

A. No.

Q. In fact, don't all of these companies have market-to-book ratios higher than 1?

A. The same principle that's shown in there still applies but, yes. Yes, their market-to-book ratios would go down if they were to issue common stock, and so the value of their other assets would go down.

Q. When a company sells new stock at a market value greater than book, what does that do to the book value of the existing stocks?

A. It increases the book value of the stocks.

The book value for original cost of the plant, if it puts it in utility plant, will be equal to the proceeds, and the market value, as I show there, will go down.

Q. Now, going to Exhibit 32, if you round WGL Holdings percentage gas distribution to the nearest percentage point, what do you get?

A. 75 percent.

Q. Okay. Had you included WGL in -- what is it -- pages 1 and 2 of Schedule 1 of JSG-4, what would it have done to the 11.8 percent you show?

A. It would have made it approximately 11.6.

Q. So it would have reduced it?

A. Yes, if you included it.

Q. Where does Mr. King say he places weight on his historical DCF returns? Perhaps if you look at page 22 of his testimony at the bottom.

A. I'm at page 22.

Q. Well, in fact, doesn't he say exactly what you've said about historical results on pages 23 and 24 -- or 22 and 23?

A. He says -- yes, he says that in general.

Q. Okay. Thank you.

A. Well, actually we can handle that on brief, because I can't find the passage right now that

would answer your original question.

Q. Okay. I'd like to have you turn to page 23 of Mr. King's testimony. Are Mr. King's book value growth results always higher than the classic returns?

A. No.

Q. Did Mr. King use book value growth as a ceiling in all cases? We're referring to table 10.

A. In some cases, yes. Some cases, no. Actually, you shouldn't say that. On table 10 it's not really entirely clear where those numbers come from. They are really his subjective decisions, and earlier in his testimony he says why he considers it to be a ceiling.

Q. But the question was, did he use book value growth as a ceiling?

A. Some of those numbers are higher than the book value growth rate for its individual companies, yes.

Q. Do you recall Mr. King testifying as to the number of customers AGL has, and do you know how many they have?

A. Now, it depends on which part of their operation. He said that AGL has 11, but, in fact, obviously Atlanta Gas Light has, I would guess, more

than a million.

Q. You're certain of that? Do you know who it markets to?

A. Now, are you asking how many customers the utility has or how many gas marketing customers they have?

Q. It's one and the same.

A. Actually, that's not true.

Q. Well, how many gas marketing customers does it have?

A. Well, yesterday he said that they had 11, but it's a gas distributor that serves, you know, people all over the Atlanta area.

MR. BINEK: No further questions.

MR. HOBERG: Thank you, Mr. Binek. Commissioner Wefald, do you have any questions?

COMMISSIONER WEFALD: No, I have none.

COMMISSIONER CLARK: I have none. Thank you.

MR. HOBERG: Mr. Diller, no questions? Any additional questions, Mr. Pearce?

MR. PEARCE: No.

MR. HOBERG: Nothing further then of Dr. Gaske. Thank you, Dr. Gaske. Next witness, Mr. Pearce.

MR. PEARCE: Call Rita Mulkern.

MR. HOBERG: Ms. Mulkern, you, too, testified yesterday so I just need to remind you that you are still under oath.

THE WITNESS: Yes.

RITA A. MULKERN,

having been previously duly sworn, was examined and testified as follows:

DIRECT EXAMINATION

BY MR. PEARCE:

Q. Ms. Mulkern, you have prepared and had prefiled in this case written rebuttal testimony, have you not?

A. Yes, I have.

Q. Is that Exhibit 25? You don't have it there. It's been marked as Exhibit 25.

MR. PEARCE: I will offer that at this time.

Q. (MR. PEARCE CONTINUING) And ask Ms. Mulkern if she could please summarize her testimony.

MR. HOBERG: Any objection to Exhibit 25 -- actually 25-55?

MR. BINEK: No.

MR. HOBERG: No objection. Exhibit 25 is

admitted.

THE WITNESS: I'll summarize my testimony. What I would like to do is to address certain adjustments proposed by Mr. Majoros; namely, the amortization period for rate case expense, the adjustment to other operating and maintenance expenses for inflation, a statement he made concerning the increase requested, and the price of natural gas. And a statement concerning the reasonableness of the increase in the operation and maintenance expenses.

On page 15, line 18 of his testimony, Mr. Majoros proposes a five-year amortization of rate case expense, rather than the three-year amortization proposed by the company. And the sole rationale he uses for setting a five-year is the time period between rate cases. And I presume he's referring to the fact that it has been eight years since the last rate case.

However, just because it's been eight years since the last rate case does not mean it's going to be another five years before the next rate case. We were able to refrain from filing during that time period because we took action to increase our operating efficiency and reduce costs rather than

coming in and seeking a rate increase. And Mr. Fox testified yesterday and specifically talked about some of these measures that we took. He also talked about how we'll continue to strive for operating efficiency and cost reduction, but it is not anticipated that we can replicate our past performance and stay out for -- refrain from filing for another five years. We believe that a three-year amortization provides the best time frame for rate case expense.

Alternatively, if the Commission decides that a five-year amortization is appropriate, then the unamortized portion of the balance of that rate case expense should be included as a rate base addition. And the reason for this is that we're spending the money on this rate case. The cash is going out the door today, 2002. With a five-year amortization, the cost will not be fully recovered until the end of 2007 and, therefore, rate base additions will compensate for that time value of not recovering it -- excuse me -- putting in a rate base will give us a return on that component to compensate it for the length of time it takes to recover the cost.

On page 16 of his testimony Mr. Majoros

proposes to eliminate the inflation amounts from the other operating and maintenance expenses. And he gives his reasons not to allow these because they have not been previously allowed and because he recommends that we not be starting now. Mr. Majoros appears to be missing the point of this adjustment.

In this case we're using a projected 2003 test period. And in projecting out costs for 2002 and 2003, costs were broken down into major categories and these major categories are listed on -- I believe the statements are Exhibit 2, Statement N, page 14. And there we list those items adjusted individually. And those items were labor, benefits, insurance, advertising, and rate case expense. Those adjustments made up 71 percent of the total operating and maintenance expenses for North Dakota gas operations. The remaining 29 percent of costs are real costs incurred by the company and they're not likely to remain flat just because they weren't adjusted individually. This category includes such items as materials, postage, vehicle and work equipment expense, uncollectible accounts and some others. And to adjust these upward, we used a three-year average of the Consumer Price Index.

The last time this Commission addressed inflation factor in our case was in July of 1991, which was over 11 years ago. Now it is time to recognize that these costs are real costs. They are subject to inflationary pressures, just as the costs we adjusted individually were. For example, we know that postage expense went up July 1, 2002 and overall the increase in our postage expense was about 7 1/2 percent. This postage expense was included in that inflation adjustment, so, if anything, our inflation adjustment could be understated because of that. So the proposed inflation adjustment should be allowed.

And now I'd like to just address a couple statements Mr. Majoros made. First, was on page 2, lines 11 and 12 of his testimony, he made the comment that proposed increases will be superimposed on those already resulting from spikes in the market price of gas. Now, that's a very general, broad statement, and is not supported by the evidence. Montana-Dakota's gas cost has been very stable over the long term, with the exception of the winter of 2000-2001 where there was a large spike in gas costs, not only here in North Dakota, but it was seen nationwide.

Exhibit No. 26 -- or 25 is a graph. Excuse me.

MR. PEARCE: RAM-2, Exhibit 25.

THE WITNESS: 25 is a graph showing the history of gas costs for North Dakota's gas customers, the amount included in their rates through the monthly purchased gas cost adjustment, and this graph is shown for the period of January of 1999 through October of 2002. Now, you can look at the graph and you can see that gas costs, with the exception of that 2000-2001 time period have been very stable and, in fact, they have been slightly lower in 2002 than in previous years. So there have been no spiking gas costs, other than one winter here.

In addition, Mr. Majoros seems to be implying that in reviewing a rate case application, one should take into account the cost of gas when looking at that case. But the cost of gas is not what this case is about. As Mr. Fox stated in his testimony, this case is about the distribution portion of our rates, not the gas costs. Those are separate -- done separately through the purchased gas cost adjustment, which we file with this Commission each month under our rate purchased gas

cost rate tariff 88.

Then on page 5 of his testimony, Mr. Majoros states that a 5.7 percent expense growth rate is not reasonable for the period 2000, 2003. Again, this is a broad, general statement and it's not supported by the evidence. It's unsubstantiated and was made without looking to see why those costs went up. There are certain items that were identified in my direct testimony that increased significantly in 2002 from the 2001 levels. For example, the pension and post-retirement expenses both increased in the 10- to 15-percent range due to the market performance and lower interest rates. Insurance expense also increased significantly in 2002 and that was an event that has been experienced nationwide. There's no evidence to back up his statements and, thus, given the current cost levels, a 5.7 increase is entirely reasonable, it's explainable and it's supported by the evidence.

In fact, if anything, the 2003 levels are too low. Recently, we received the actuarial report for pension and post-retirement costs for 2003. The results show that the amounts we have in our projected 2003 case are significantly understated. And the reason that these pension costs are too low

is because of the returns experienced on the investment in 2001 and 2002. The updated expense for these items will result in an increase in our North Dakota gas operating expenses of $150,000 for pension and $90,000 for post-retirement expenses, above what we included in the case. This is a higher level. It's known. It will be -- start recording on the books effective January 2003 and should be recognized.

I might note that pension expense -- I talked about significant increases. It's a negative expense. It's a credit to expense. In other words, it lowers -- still lowers the cost of service because it is still a negative expense even with the increases we've seen.

In addition, the medical costs for 2003 have also increased from the levels projected. And we're projecting now for 2003 it will be $124,000 over the amount that was filed in our rate case.

That completes my rebuttal testimony.

MR. HOBERG: Any additional questions, Mr. Pearce?

MR. PEARCE: No. I have nothing else.

MR. HOBERG: Mr. Binek, any questions of Ms. Mulkern?

CROSS-EXAMINATION

BY MR. BINEK:

Q. A question that got passed on to you. What capital structure did the company use in its rate-of-return testimony in the electric case earlier this year?

A. I don't recall.

Q. On pages 1 and 2 of your rebuttal testimony -- I guess, let me go back to this other question. Would you accept, subject to check, that the capital structure that was used was based on a year-end 2000?

A. That may be, subject to check. However, this is an entirely different case. The electric --

Q. I realize that. That was just my question, what was used there.

MR. PEARCE: She's simply answering the question. I suggest we let her answer.

MR. HOBERG: Why don't you go ahead.

THE WITNESS: The electric rate case you are referring to is an entirely different situation. That was initiated by a staff complaint. It was not a general rate case filed by the company. I believe if you look at past rate cases filed by the company, going back as far as 1986, we have filed projected

test years and the Commission has used them.

Q. (MR. BINEK CONTINUING) On pages 1 and 2 of your rebuttal testimony, you object to the rate case cost recovery that Mr. Majoros has recommended. I believe you heard the testimony of Mr. Jeter that -- about the company preparing a new depreciation study that will be completed by the end of the year?

A. Yes, I heard that.

Q. If this study shows that MDU's depreciation rates should be changed, would the company be filing a new rate case?

A. I guess at this point I can't answer what we will or won't, whether or not we file a rate case.

Q. Okay. If the company did, this would result in two rate cases in the space of one year, wouldn't it?

A. Well, there are several options. As Mr. Jeter mentioned, one option would be a very limited scope, look purely at the depreciation study, and that would be different than a full-blown rate case like this where we are looking at many different issues.

Q. If MDU had completed the depreciation study in time for this case, we'd only have one case; is

that correct?

A. I guess I really can't answer that.

Q. On page 3 of your testimony you state your disagreement with Mr. Majoros' proposal to allow inflation increase and other expenses. Mr. Majoros says he declined to increase these costs for inflation because such inflation has not previously been allowed. Is he correct?

A. Last time this Commission reviewed it was in 1991 and at that time they did not approve it. However, I stated this is 2002. These rates go into 2003, and it is time to recognize that these costs are real and they do -- are subject to inflationary pressures.

Q. I'd like to have you turn to page 13 of Statement N.

MR. HOBERG: Page 13?

MR. BINEK: Yes.

Q. (MR. BINEK CONTINUING) Do you have that?

A. I have it here.

Q. Okay. Does that page show the principal categories of cost to which you have applied the inflation factor?

A. It shows the cost by function.

Q. What is the largest category of expense

shown on page 13?

A. Largest function is administrative and general expenses.

Q. What's the next largest?

A. Next largest is customer accounts.

Q. Okay. And this category of uncollectible accounts -- or that category would consist primarily of uncollectible accounts, wouldn't it?

A. That would be one of the factors in there. Not the sole factor.

Q. Why would uncollectible accounts increase with inflation?

COMMISSIONER WEFALD: Excuse me. What page are we on?

MR. HOBERG: Page 13 of Statement N.

COMMISSIONER WEFALD: Thank you.

THE WITNESS: Uncollectible accounts are a function of various things. I don't know that I can tie inflation to it specifically or tie it to inflation specifically.

Q. (MR. BINEK CONTINUING) Wouldn't uncollectible accounts be more correlated with the overall size of your revenue?

A. It would be revenue. It would also be the ability of customers to pay. Maybe if, you know,

the economy isn't doing well, customers might have more problems paying their bills. That could be indirectly associated with inflation. There are other factors other than the revenue.

Q. Does page 1 of Statement N show that you predict that overall revenue declined dramatically between 2001 and 2002 and will remain virtually flat between 2002 and 2003?

A. What we do in a rate case is, we tie our revenues and cost of gas together at a certain point in time in order to -- because we are looking, really, at what the distribution margin is. So the revenue number of 67 million -- this is in thousands, 944 for 2002 is not our projection of what actually revenue would be. It's our projection of what volumes will be for 2004 at the revenues at a certain point in time. In this case it was the revenues in effect for March of 2002. So this number is not representative of a calendar-year revenue that we would expect to see.

Q. Okay. And on page 13 of Statement N, is there any recognition that uncollectible accounts will change between 2001, 2002, corresponding with the decline in operating revenues between those two years?

A. We did not tie the uncollectible accounts to the revenue.

Q. At the bottom of page 4 and the top of page 5 you cite a number of items that you expect will increase, including pension and post-retirement expenses and medical costs. Has Mr. Majoros recommended disallowing your quantification of the 2003 amounts for any of those items?

A. Can you repeat the items he mentioned again?

Q. It was pension and post-retirement expenses and medical costs.

A. I believe he was in agreement with those.

Q. Now, I'd like to have you turn to page 2 of your rebuttal testimony, specifically line 4, and please read -- on page 2, line 4, would you read the statement there down to the end of line 10?

MR. HOBERG: It's part of the record. Can we save time by asking a question about it?

MR. BINEK: No. We'd like to have that read because there will be some followup questions.

MR. HOBERG: Does she have to read it out loud?

MR. BINEK: I would prefer that.

MR. HOBERG: Okay. Ms. Mulkern.

THE WITNESS: The part starting with Montana-Dakota?

Q. (MR. BINEK CONTINUING) Yes.

A. Montana-Dakota was able to refrain from filing for a rate increase during that time because it took action to increase efficiency and reduce costs using new technologies where possible, rather than seeking an increase in rates, all addressed by Mr. Fox in his direct testimony. Montana-Dakota will continue to strive for operating efficiencies and cost reductions, but it is not anticipated that it can replicate past performance and refrain from filing for another five years.

Q. Is it a fact that you did not project past efficiencies and cost reductions in your 2003 test year costs?

A. All past efficiencies were included in the 2001 base period and, therefore, were included in our 2002 and 2003 projected test periods.

Q. Where do we find that?

A. Well, these efficiency measures have taken place over time, over a period of years. And what's happened is Mr. Fox mentioned that we're serving more customers per employee and that's taken place over time. Basically, our employees have remained

flat. I think maybe even declining. So what you see in 2001 is the effect of all of that. So that's implicit. In our base period those things are -- had already happened.

Q. Do we see further declines in 2002 and 2003?

A. No. Because, as Mr. Fox mentioned, and I think I mentioned, we will continue to strive, you know, continue to look everywhere we can to be more cost efficient and reduce costs, but we've looked at all those opportunities. Right now, while we'll continue to look, our option is to file for a rate increase, which is why we are here.

Q. Now, turning to page 3 and lines 7 to 9, is it true that the Commission should not rely on its 11-year-old decisions?

A. I think what I'm saying there is that 11 years ago was the last time they looked at it and it's time to take a look at it again because things have changed over 11 years. I think our point is that these costs are real costs. This isn't a game we're playing with these costs. They exist, and they are subject to inflationary pressures. So we do believe the Commission should look at it again and realize it is time to acknowledge that and

include an inflation adjustment in our cost of services.

Q. Should the Commission rely on the Company's study and data that are 11 years old?

A. It depends what you're looking at. As regards the inflation adjustment, I would say no, because I can't make a blanket statement that any time period is exactly the same for everything.

MR. BINEK: No further questions.

MR. HOBERG: Thank you, Mr. Binek. Commissioner Wefald, any questions of Ms. Mulkern?

COMMISSIONER WEFALD: Yes.

EXAMINATION

BY COMMISSIONER WEFALD:

Q. What if the Commission were to pick a different number than 2.81 percent, higher or lower, how would the company react to that?

A. I think we would want to see some recognition of inflationary pressures, and if the Commission would choose a different realistic number, we would accept that.

Q. How would you define "realistic number"?

A. Well, I guess we defined it as a three-year average of the inflation adjustment. If the Commission might pick a slightly different period, a

two-year instead of a three-year average or some other measure that -- you know, that would acknowledge it, we would be content with that.

Q. I suppose you can't speculate on what the Commission's thoughts were in not giving an inflation adjustment, but I can perhaps speculate that they wanted to give an incentive to the company to practice savings and to find ways to have savings in those costs while moving forward with their business.

If the Commission chose to give a less than 2.81 percent with that same idea of giving incentive to the company to try to achieve savings in those areas, what would you think of that?

A. Well, I think the company -- we've looked for efficiencies. Our incentive is to -- one of our incentives is to not come in and file for a rate increase, so we are constantly looking for efficiencies so as not to let our costs go up to our customers. If the Commission -- you know, as you said, I can't speculate on why the Commission in 1991, precisely why they did not accept it, but I think we already have the incentive to reduce our costs right now.

COMMISSIONER WEFALD: Thank you.

MR. HOBERG: Thank you, Commissioner Wefald. Commissioner Clark, any questions?

COMMISSIONER CLARK: I do have just a few.

EXAMINATION

BY COMMISSIONER CLARK:

Q. Some of them are related again to that depreciation study. I know Mr. Keller deferred a couple questions to you. And the reason I keep coming back to this is because I do have some significant concerns in that this is a rate case being brought by MDU and this has become a huge portion of the rate case. But it's like we're arguing about something that could be moot in just a very short amount of time. And I want to point out the scenarios that could happen here.

But are you familiar with when the contract was signed and when this depreciation study was supposed to be done? Is it a date that was originally supposed to be done for this rate case, or was it kind of always anticipated that it would be done shortly after when you entered into the contract with the consulting firm?

A. First of all, I'll say I'm generally aware of the time frame for this. And, initially -- and I think Mr. Keller explained it very well. It was

difficult to find a consultant. We did hire a consultant and that person had to complete a depreciation study for Great Plains before they could start working on Montana-Dakota's study and that took more time than anticipated.

Our intent was to have a depreciation study, I believe, around October 1st. Because of various factors, we weren't able to have one by October 1st.

Q. Well, if it were to be done by October 1st, that wouldn't leave a whole lot of time for the staff depreciation expert to delve into it, would it?

A. No. I'm just kind of referring to the general time frame of this depreciation study.

Q. When, about, did you learn that it wouldn't be done on the October 1st time frame?

A. I guess I really can't recall when I heard. I said I'm generally aware, but I wasn't specifically involved in the contract.

Q. Are you aware of the other pending cases that you have in your other jurisdictions, will that study be able to be used in those jurisdictions?

A. We have filed so far two other rate cases in generally about the same time. There was a study

filed -- or not a study. A rate case filed in Montana that there will not be a depreciation study by the time that the Commission holds the hearing. We also filed a rate case in Wyoming. They have until June of 2003 to make a decision. I don't know yet what the status would be of the depreciation study in that case.

Q. And you haven't filed in South Dakota yet?

A. We have not yet filed in South Dakota.

Q. Do Montana or Wyoming require periodic depreciation studies to be filed like some states do on a semi-annual basis?

A. None of the four states that Montana-Dakota serves natural gas or electricity in requires a depreciation study.

Q. Was there any consideration during -- that you're aware of during the last few months that MDU considered delaying this rate case until the Commission could consider it as a whole as opposed to potentially having to do a couple of different rate cases?

A. Could you repeat that?

Q. Are you aware of any discussions at MDU -- have you considered at all kind of holding off on this once you became aware that you may not have a

large portion of your -- the evidence that you should have for a rate case available?

A. Well, we filed this rate case in April of this year. There are no statutory or legal requirements to file a depreciation study. So our filing is in compliance, if I understand, with the legal and statutory requirements. So I don't think that we were remiss in filing a rate case without a depreciation study because it is not required. I think you had another part to that question.

Q. Well, maybe just following up on that, I guess I wasn't implying that there was any legal requirement. It's just my own thought is that, potentially, MDU, being that this is their case and the burden of proof is on them, would want the best information available, but maybe -- I'm just going to close up here quick.

You had mentioned that there may be a number of scenarios that could happen as this plays out. Let's assume that the Commission decides a number of issues that are outside of the depreciation part of this case. I think that has to be done in about a month or so. Is that in November, I think? I can't remember what the exact time frame is that we have to have our decision out.

But -- and then do what MDU is suggesting, which is just kind of put aside the depreciation portion of this.

How does that then play out on December 31st beginning next year when you have a new depreciation study? What are the scenarios that could happen here?

A. Well, I think part of that is maybe off a little bit. Everyone seems to be presuming in this case that there will be -- that, one, the depreciation rates are going to go down when we do a depreciation study. And I don't think that's a presumption that we can make now. We've provided in this case a 1991 study, a fully detailed study, and we still at this point still stand on that study. We believe that it's still a good study and that is what we filed our case on and it's a good, detailed study based on many years, details going back many years, a lot of data, a very complete study.

Q. Okay. So let's go through the scenarios again. If it's the same and it shows the same as the 1991 study and if we accept that as part of this rate case, then nothing would change. If the depreciation changes so that it becomes, in effect, a rate decrease, then do you file updated tariffs

just decreasing their rates, decreasing the tariff rates?

A. I think I'm getting into an area that I think might be, as far as a legal area, as far as what the Commission -- you know, as far as issuing an order and after that. So I think that's really a legal issue and I don't feel that I can properly address that.

Q. Okay. But MDU could consider filing another rate increase if the depreciation schedules indicated that was appropriate, right?

A. Yes.

COMMISSIONER CLARK: Okay. That's all I've got then.

MR. HOBERG: Thank you, Commissioner Clark. Mr. Diller?

EXAMINATION

BY MR. DILLER:

Q. Ms. Mulkern, isn't it true that adjustments for inflation cause inflation? That's a question that Mr. Myer Shark used to ask all the time and I felt like we needed to get his name in the record.

And so isn't it true that -- would you agree that adjustments for inflation causes inflation?

A. I would not agree with that statement.

Q. Could you explain that, please? That's all right. I withdraw the question. I just wanted to have some fun. Let's see if I have a real question here.

I think based on the exchange I heard between you and Mr. Binek, if I could maybe characterize your response to him as there's not been any correlation between CPI and these other O&M expenses that haven't been inflated individually in the past, but you feel like CPI will be a fair indicator of what you can expect with these other O&M costs in the future; would that be a fair characterization?

A. I think that CPI recognizes that these costs are going to increase with time, with inflation.

Q. Now, have you done any long-term comparison between CPI and these other O&M expenses that are being talked about here, any long-term correlations to -- you know, I mean, certainly some years it will be because of efficiencies and this and that the company beats the inflation indicator, but have you done any long-term comparison to see if there's any long-term correlation between CPI and these other

O&M expenses?

A. Well, I'm not sure what constitutes long term, but I did look back to 1994, since the last rate case, at all these other items, and the increase is greater than inflation for the same time period.

Q. Greater than the CPI?

A. Yes.

Q. That's surprising. But we don't have any -- that's not on the record anywhere?

A. No. That was just something that I did on my own.

Q. Is that something that's available for providing to the Commission, or is that just something that you kind of did ad hoc and didn't really --

A. I have a workpaper on that.

Q. Would you mind providing that as a late-filed exhibit?

A. I can provide it.

Q. I mean, it's not really that long term, but it might be interesting to look at.

MR. HOBERG: That would be Late-Filed 5, Mr. Pearce.

MR. PEARCE: Yes.

MR. DILLER: That's all the questions I have.

MR. HOBERG: Thank you, Mr. Diller. Any further questions of Ms. Mulkern?

COMMISSIONER WEFALD: I might have one here. Just a minute.

FURTHER EXAMINATION

BY COMMISSIONER WEFALD:

Q. Go through with me again what expenses are covered under these other expenses where you have this list of them. Which exhibit is that?

A. Well, the one on the exhibit is Statement N, page 14.

Q. Page?

A. Statement N in the statement book. I think it's Exhibit 2.

MR. HOBERG: It's a big book, Statements A through O.

Q. (COMMISSIONER WEFALD CONTINUING) Yep. Statement N?

A. Page 14.

Q. Statement N, page -- like in no?

A. Like no.

Q. Page 14 of 23?

A. Yes.

Q. All right. So I'm seeing on this just cost of gas?

A. These are the items that we did adjust individually. These are the items that make up 71 percent of total operating maintenance expense.

Q. All right. What are the ones that are not?

A. The ones that are not are the ones in the last column that are left over after you adjust all the others separately and that's the one -- that contains such items as postage expense.

Q. Now, are you looking under all other O&M?

A. That's the one.

Q. But it doesn't have anything broken out as to what those include, so you are going to give me a list right now?

A. There are many items in this list. These are the ones that make up the 29 percent -- those five items make up 71 percent of all of the O&M, operating and maintenance expenses. All other items make up 29 percent.

Q. How do we know which ones are administrative and general of four-million-ninety and there's a separate list of ones that aren't covered? There's some under administrative and general that are covered and then there's some that

are not, $1,617,000?

A. Right. We started with our operating expenses in total for North Dakota gas by what we call function, distribution, customer accounting. And from that we deducted in the same by function, the labor expense.

Q. Do you determine which ones are not covered by this or did the Commission in its last case?

A. No. We looked at what -- kind of the major cost items, the ones that make up the majority of the costs. Five items make up 71 percent. So we looked at those five items specifically. Or I should say some we looked at for other reasons, like rate case expense, but we looked at those five items individually and adjusted those individually.

Q. I'm not following you at all. Are they -- rate case expense has --

A. Rate case expense is included in the administrative and general costs area and --

Q. One underneath that?

A. One. And that one we adjusted individually because we were looking at the cost of this rate case proceeding, rate case expense. So since we were adjusting that separately, we took it out.

Q. You've had other gas cases during this

time. I don't understand this chart. So maybe I should just visit with my staff, but I just don't understand the chart at all.

A. If I can explain, if you want me to answer.

Q. Keep going.

A. If you look in the left-hand column and it says "per books," those were the operation and maintenance expenses for 2001.

Q. All right.

A. And it shows it by function. For instance, the distribution, it covers all the costs in operating and maintaining the distribution system. Customer accounting is for all the billing related and, you know, accounting for the customer for that, and so on.

Q. The first one is a total of the other columns; is that correct?

A. No. The first column is a starting point.

Q. All right.

A. From there we were going to -- for instance, for costs of gas for projected 2000 and 2003 we calculated that so we adjusted it individually so we deducted it from the total because we're doing that someplace else, we don't want it in this adjustment. Next, we looked at

labor and, again, we're going to adjust that separately, so we're going to deduct all the labor costs from this total per books amount. And labor goes into all the functions also.

We went down, continued with benefits, which is all charged to an administrative and general account because we adjusted the items and benefits separately. And then insurance we looked at separately. And rate case expense and advertising. So we started with the total per books, we adjusted everything we were going to look at separately, and what's left over is that 29 percent I referred to and this is what we applied inflation to, these costs that were remaining after we adjusted certain items individually.

Q. So the cost of gas is $76,000. Is that one of them then?

A. That was -- yeah. That's what we had in 2001 for gas costs.

Q. $7,988 of labor, is that another one, or am I wrong?

A. No. That was labor expense for 2001.

Q. I don't get the chart, but I'll work on it later. Thank you. I don't understand it. But thank you very much for trying.

MR. HOBERG: Any further questions of Ms. Mulkern? Thank you, Ms. Mulkern. You have three witnesses left?

MR. PEARCE: Yes.

MR. HOBERG: And a short time to do them in. Next one is Ms. Aberle.

MR. PEARCE: Call Tamie Aberle. And I have one -- I have a one-page exhibit.

(Exhibit 37 was marked for identification.)

MR. HOBERG: Ms. Aberle, you also testified yesterday. I just need to remind you, you are still considered to be under oath. Mr. Pearce. Her rebuttal is Exhibit --

MR. PEARCE: 26.

MR. HOBERG: -- 26-52.

TAMIE A. ABERLE,

having been previously sworn, was examined and testified as follows:

DIRECT EXAMINATION

BY MR. PEARCE:

Q. Ms. Aberle, you prepared for this case, did you not, a prefiled written rebuttal testimony?

A. Yes, I did.

MR. PEARCE: And that's been marked Exhibit 26. I'll offer that.

Q. (MR. PEARCE CONTINUING) And ask you to summarize your testimony briefly.

MR. HOBERG: Any objection to 26?

MR. BINEK: No.

MR. HOBERG: 26 is admitted.

MR. BINEK: Has this been marked as an exhibit?

MR. PEARCE: It's marked 37.

MR. HOBERG: He hasn't offered it yet.

THE WITNESS: I will begin with why I do not agree with Mr. King's position regarding the allocation of mains and the class costs of service study. The company has proposed an allocation of mains based on a customer and demand component. Mr. King advocates that it is not correct to allocate a portion of mains on the customer component. We believe it is appropriate to do so and it is a practice that is used in the gas industry and is supported in a report prepared by the NARUC staff subcommittee on gas. And I've included some references in my rebuttal testimony, Exhibit 26. We did prepare a study that indicates that approximately 36 percent of the mains investment should be allocated to the customer component.

Also, Mr. King suggests in his testimony that main additions are only made at the very edges of the system to provide service to new developments. In our system, main additions are also required for purposes of enhancing system integrity and maintaining pressure requirements throughout the system as customers are added. Main additions -- main investment is not a variable cost that increases or decreases as more or less gas is used. Also, the concept of value of service is not appropriate for allocating embedded costs as Mr. King advocates. The value of the heating content of gas does not represent the company's embodied costs or the causation of that cost.

Secondly, with regard to the allocation of mains, the allocator used by Mr. King includes total throughput for the energy, which results in excessive amounts of mains being allocated to the interruptible customers who are not utilizing the distribution mains in order to receive natural gas service. We have a number of customers that are connected directly to the transmission system and there are no mains associated with serving those customers.

I have prepared a study reflecting 50

percent allocation based on throughput at distribution level and 50 percent at the peak day used for the firm customers, and those returns are reported in my testimony. The results are that -- results in higher returns for the Air Force and the interruptible classes, which are those classes that have a larger percentage of customers connected directly to the transmission system.

I also do not agree with Mr. King's allocation of the rate increase, based on either the company's class cost to service study or a class study based on Mr. King's proposed allocation as modified and as set forth in my Exhibit TAA-4. An increase to the Air Force small interruptible or large interruptible class is not warranted. The subsidization provided by the interruptible classes should not be increased by allocating another increase to those customer classes that are already providing a return on rate base higher than the overall return. The increase -- any increase in revenues to this class is also at risk given the flexible rate provision applicable to the interruptible customers. Presently, approximately 20 percent of the small interruptible class and 80 percent of the large interruptible volumes are

transported under discounted rates.

Finally, the Commission did authorize allocating the entire increase to the firm customers in the last rate case.

Now, I'd like to address customer impact discussed by Mr. King yesterday in his testimony. I think it's best to focus on the dollar value impact, rather than the percentage increases. And, also, the rate proposal must be looked at in its entirety to talk about customer impact. I'd like you to take a look at the exhibit that was just handed out marked as Exhibit 37, or TAA-6. This is the same exhibit that is in my direct testimony as Exhibit TAA-2. I've simply added two lines that I think help to portray better what the impact of the rate proposal has on the residential customers.

COMMISSIONER WEFALD: This is TAA --

THE WITNESS: Dash 6. The one that was just handed out --

MR. HOBERG: It's a single sheet.

THE WITNESS: -- to you as a single sheet. This is a representation of a customer's bill under current rates and under the proposed rates as filed. And this is a typical, average residential customer using 110 decatherms. And it is meant to represent

how that gas is used throughout the year. If you look at the line that I've added, base rate as percentage of total, it's indicating that under the proposed rates, our basic service charge or our fixed component of our rate would collect about 28 percent of the total customer's bill versus 16 percent under the present rate. So as shown there, it's not in the high percentages I believe were discussed yesterday.

Also, corresponding with the increase in the basic delivery charge is a decrease in the distribution delivery charge or the commodity, the variable part of the rate. And I've shown on that second line that the non-gas commodity portion of this customer's bill would decrease by $37 under this example or approximately 44 percent.

A couple of other items I'd also like to point out. The increase to the customers, as we've noted to a residential average customer would be approximately $24. As shown in the amount of increase column, the highest increase would be in the summer ones when they are using less gas, but that increase would only be $4 in those months.

And as shown in my rebuttal testimony, Exhibit TAA-5, there's another bill comparison,

which just shows varying levels of consumption, because, as we know, there's customers above and below this. As shown in that Exhibit TAA-5, if a customer used zero volumes through the entire year, their increase per month would still be only $5.20.

MR. HOBERG: That's the last page of your --

THE WITNESS: Last page of my prefiled testimony, rebuttal testimony.

This rate form also provides customers -- or still provides customers with an incentive to conserve natural gas because each decatherm of gas that they conserve, there's still a reduction of $3.33 associated with that less gas use. And that is the combination of the distribution delivery charge and the cost of gas. So they're showing that still the majority of the customer's bill is still a variable component.

What the proposed price structure will do is provide relief to customers during the winter months when their heating requirements result in higher gas use by lowering the amount collected on the volumetric basis and sending an accurate price signal by accurately reflecting fixed costs in the fixed cost component.

Just a couple comments with regard to the distribution delivery stabilization charge that was presented in -- by direct testimony. The company has proposed to implement such a mechanism if the proposed base rate levels are not approved. And I also just wanted to comment that the deferral-type mechanism will not result in significant impact as suggested by Mr. King. As shown on Exhibit No. 8 in Mr. Feingold's testimony, based on -- where we did an example based on historic results, the amount charged per bill will be minimal and significantly less than most PCA changes. In that example, over the four-year period reviewed, a residential customer would see a monthly bill change ranging from a negative 20 cents to a positive 84 cents. And that was a bill change, not an amount per decatherm.

And, finally, I wanted to just comment on the company's proposal to build a basic service change on a daily basis versus a monthly charge as done today. And the only reason for proposing this change was to provide better information to those customers that are cutting in and out of service and are receiving bills for less than a normal billing period. The proposal will not affect our meter

reading or billing schedules.

That's all I have for my summary.

MR. HOBERG: Are you offering Exhibit 37?

MR. PEARCE: I'm offering Exhibit 37. I have no other questions.

MR. BINEK: No objection.

MR. HOBERG: Okay. Exhibit 37 is admitted. Thank you, Mr. Pearce. Mr. Binek, do you have any questions of Ms. Aberle?

MR. BINEK: Yes.

CROSS-EXAMINATION

BY MR. BINEK:

Q. Mr. King has proposed increases in customer charges, hasn't he?

A. Yes, he has.

Q. Specifically, he proposes that even if rates are decreased, the volumetric rates should be flattened and the initial block revenue be recovered through increases in the customer charges; is that correct?

A. Yes.

Q. Do you agree with that recommendation?

A. Yes. At a minimum I believe that should be done.

Q. Mr. King also recommended that if rates are

increased, the increase in customer charge should be twice that of the volumetric rate.

Do you agree with that?

A. I agree if the proposal is -- the rate increase is approved as provided, that our base rates would be approved.

Q. Okay. Well, it isn't nearly as much of a customer charge increase as you propose. Would you agree that Mr. King's proposal moves in the direction of the rate design changes the company is seeking in this case?

A. I would agree that it moves in the direction.

Q. Are the proposed movements toward the company's preferred rate design sufficient to permit the company to withdraw its DDSM proposal?

A. I could not answer that at this time.

MR. BINEK: I have no further questions.

MR. HOBERG: Thank you, Mr. Binek. Commissioner Wefald, please.

EXAMINATION

BY COMMISSIONER WEFALD:

Q. Yes. I'd like to ask a few more questions about this monthly charge divided into a daily charge. Tell me about the people. You say these in

and out accounts. I would like to have a little information about that on the record.

A. The accounts we're talking about are people -- you know, in the fall college students. We get a lot of people in and out. They may move in in the middle of the month versus the beginning of the month.

Q. So what happens at this point --

A. If you are less -- excuse me.

Q. -- if I would move in on the 15th?

A. We have a normal billing cycle, which is 28 to 32 days. If you're outside of that normal billing cycle, your bill is prorated. So that if you're only in service today for -- in service under today's rates for 10 days, you'll receive 10/30ths of the customer charge on your bill. But that bill -- the way that is presented on the bill, because of the way -- it's a proration. Our customer charge is a monthly charge. So it's a combined number on the bill. It shows -- it's combined with the amount of customer charge and usage at that premise for that time period.

And the daily charge would simply allow customers to see the number of days in the bill cycle, which is presented on the bill today, and

multiply that by the charge that's in effect, the daily charge that's on the tariff sheet, if approved, and be able to calculate that amount. It's simply an informational item. The real crux of our proposal is the amount of the increase and not so much whether it's billed or presented on a daily basis versus the current monthly charge. It really will not impact the revenues we collect or the amount customers pay. It's really an informational item.

Q. I understand that. So if you're giving these people who only are using service less than a month and they are already receiving a different amount than the total amount on their bill, then we can just figure that those people are taken care of already?

A. Mm-hmm.

Q. So --

A. It's just information for those people.

Q. So don't you think -- well, so you don't really care whether or not -- you're telling the Commission you don't really care whether we do this on a daily basis or on a monthly basis, as long as the costs come out the same for customers throughout the year?

A. I would rather have the increase on the base, the fixed charge, the monthly amount. And the other was just a move toward trying to provide more information.

COMMISSIONER WEFALD: Thank you.

MR. HOBERG: Thank you, Commissioner Wefald. Commissioner Clark.

COMMISSIONER CLARK: I have no questions.

MR. HOBERG: Thank you. Any further questions of Ms. Aberle? No questions. Thank you, Ms. Aberle.

I think perhaps we should just take -- for the court reporter's benefit take a short break right here. A strict five minutes.

(Recess was taken.)

MR. HOBERG: We are back from a short recess. Your next witness, Mr. Pearce.

MR. PEARCE: I call Mr. Spratt.

MR. HOBERG: Mr. Spratt, I don't think you've been sworn in.

THE WITNESS: No, I haven't.

MR. HOBERG: Were you here earlier when I gave the admonition in regard to perjury today?

THE WITNESS: Yes, I was.

MR. HOBERG: Being advised of the penalty

for perjury, do you promise to tell the truth in that matter being heard? If so, answer I do.

THE WITNESS: I do.

MR. HOBERG: Thank you. Mr. Pearce.

RICHARD D. SPRATT,

being first duly sworn, was examined and testified as follows:

DIRECT EXAMINATION

BY MR. PEARCE:

Q. Mr. Spratt, you have prepared written rebuttal testimony that's been filed in this case, have you not?

A. Yes, I have.

Q. I'll ask you to just briefly state your name and business address and what your position is with the company, and then if you could summarize the important points in your written rebuttal testimony.

A. Okay. It's Richard D. Spratt. My business address is 400 North Fourth Street, Bismarck 58501. I'm vice-president of human resources for Montana-Dakota Utilities, which is a division of Montana-Dakota Resources Group, Inc. My responsibilities include benefits and compensation, staffing, organizational development, behavior, labor and

employee relations.

Q. Thank you. Would you summarize your written testimony then?

A. Yes, I will. And I basically would like to make just a couple points. I'm here basically to refute Mr. Majoros' -- am I saying that right? -- his sort of unsubstantiated statement that we should eliminate bonuses and hold 2003 labor costs equal to 2002.

Let me start with the bonuses. Basically, we have bonuses as part of a total compensation program, which includes not only bonuses, but it also includes your base salary and your benefits and a certain portion of that salary is what we call at-risk. And we do that in varying degrees with different employees based on what's competitive. And that's my first point is that, you know, we see this to use in a competitive way. It makes us competitive and attracts and retains employees for us and so that's, A, why we have a bonus. Now, B, another reason why we do is it sort of focuses employees in on those areas that we need them to focus in on, particularly in recessionary times, to try to save costs and/or at least reduce costs and have it more efficient. So that's my first one,

bonuses.

Second one, compensation, where he says that we basically should hold the 2003 labor costs equal to 2002 level. A couple of things there. First of all, again, we use as part of a total compensation package a base is a portion of that total compensation package and to be competitive and to attract and retain employees, we need to have competitive wages and salaries. And right now -- along with that, we do what we call a compa-ratio analysis to see just how competitive we are. We also use about 11 different surveys that will show us degrees of competitiveness in various areas, including our engineering and our IT staff and our administrative staff. And the compa-ratio analysis that we've done shows that we're really behind competitively, not only in our industry but in general industry in terms of what we've done. So I think in -- to go back a little bit, in 1996 when we started on this -- really started tightening down and started trying cost efficiencies and, you know, looking at costs and one of the things that we did is we started holding our labor costs down quite a bit. And we've gotten behind over the years because of that.

To say that we should not increase or we shouldn't grant, I guess, an increase in labor costs is tantamount to making us fall back another probably -- in one case, in the executive case it would be somewhere in the neighborhood of going from 11 to 15 percent behind. And then in the office and administrative it would be about 9 percent behind. So in those two areas, you know, I think we need to -- it's our belief we need to continue to do what we're doing primarily to get the efficiencies.

Another way we can do this, though, is we could -- particularly with bonuses, is we could build that into our base structure, which basically would cost more money then and that wouldn't be very good for our customers because that has to be passed along as well.

The last thing I'll say is that it's my understanding that the Commission ordered Case No. PU-399-01-186 has allowed these kind of costs and expenses before. With that, questions?

Q. (MR. PEARCE CONTINUING) Just one question, Mr. Spratt, to clarify. Why would it cost more to package all of the compensation into wages or salary rather than bonuses?

A. Right now we have a certain -- in the

beginning I said we had a certain portion of our salaries that are at risk and that -- it's dependent on how we perform against financial goals, as well as -- excuse me -- goals that are personal goals that are set up, cost goals, usually. And that's to make us perform better and to be more efficient. But if we just took those and that's at risk, and if we don't -- if we don't achieve those goals, then we don't get paid that portion of it. So if we just rolled it in, that would obviously make the cost of our payroll go up.

MR. PEARCE: Okay. I'll offer Exhibit 27. I have no other questions.

MR. BINEK: No objection.

MR. HOBERG: Exhibit 27-56 is admitted.

COMMISSIONER WEFALD: Where is 27?

MR. HOBERG: 27 is the rebuttal testimony of Richard D. Spratt. Mr. Binek, do you have any questions of Mr. Spratt?

MR. BINEK: Yes.

CROSS-EXAMINATION

BY MR. BINEK:

Q. Mr. Spratt, what was the total amount of bonuses and commissions awarded last year?

A. Dollar?

Q. Yes.

A. I don't know.

Q. Would you accept $518,000 as the amount, subject to check?

A. I honestly don't know.

Q. Okay. Do you know how much of the -- of the amount was commissions and how much was bonuses? I assume since you don't know the amount, you probably don't know that, either.

A. No.

Q. Would you be able to tell us what the percentage split would be between commissions and bonuses?

A. No. In fact, that commission kind of throws me. I'm not sure -- I know I saw it in here. I think when we're talking about commission, we're talking about incentive and bonuses, period. We don't really have anybody on commission, that I'm aware of. So this would be, in fact, 100 percent bonus.

Q. Okay. And then on page 4 you state 60 percent of hourly employees, 75 percent of salary employees and 90 percent of management employees are eligible to receive bonus. What determines these percentages?

A. Well, those were done -- those are basically surveys that we've done, that we're a part of and that shows that these are the percentage splits that are partaking in bonuses.

Q. Surveys taken of whom?

A. Various companies, including our own, the utility industry.

Q. But these percentages apply to MDU, not to other companies, right?

A. No. No. These percentages apply to other companies. If you took the total of the companies in our surveys, if you go back to -- refer back to in my testimony the back page there, you can see if you go down to utility and energy section and you just take the 20 -- on the left-hand side you'll have industry sectors, utility and energy. What they're showing there is in the utility and energy sector -- well, it shows all -- a number of sectors, but particularly in the utility and energy sector, they're saying that there's an average. If you're in the 30 to $39,000 range, there's a 62.7 percent of those companies are offering bonuses. For 40,000 or more it's 75 percent.

MR. HOBERG: Just for the record, you're at RDS-1, page 1 of 3, on the back?

THE WITNESS: Yes. There's no page number on it.

MR. HOBERG: It's up at the top, RDS-1, page 1 of 3, right-hand corner.

THE WITNESS: Oh, yes. Yes, that's it. That's RDS-1. And then RDS-2, if you go over, they'll show that the utility and energy sector and it gives a number of responses up at the top and the sample was 1,149 companies, of which 76 were utility and energy and 91.2 percent of those offered. So these numbers are industry numbers. They're not our numbers. Our numbers are a little different.

Q. (MR. BINEK CONTINUING) Okay. So what percentage of hourly employees at MDU receive those bonuses, commissions, whatever they are?

A. 100 percent.

Q. Okay. And salary employees?

A. As well, 100 percent.

Q. And management employees?

A. 100 percent.

Q. So all employees are eligible to receive?

A. All employees are eligible, correct.

Q. Within each category that's eligible to receive bonuses, what proportion typically receives them in each year?

A. I'm not sure. I can tell you approximate percentage, but I'm not sure how many.

Q. Give us the approximate percentage.

A. Well, to give you an example, two years ago 75 percent of -- 75 percent of our total employee population eligible for the BETA received a 7 percent bonus. And then last year it was about -- overall it was about six-tenths of a percent that they received.

Q. Okay. Again, 75 percent of the -- is it 75 percent of all employees --

A. Yes.

Q. -- received these bonuses?

A. That's correct.

Q. And it was 7 percent, and what was the figure last year?

A. Last year was six-tenths of 1 percent.

Q. Okay. Does the total amount of bonuses awarded each year typically remain the same, or does it vary from year to year?

A. The number of bonuses?

Q. Total amount of bonuses.

A. The total amount. It would vary some year to year, depending on how we did against our financial goals and how we did against our personal

goals.

Q. Does the total amount of bonuses vary among the three categories of employees, the hourly, salaried and management?

A. Yes, it would.

Q. Do the same employees typically receive bonuses each year?

A. Overall I would say, yes. I mean, 100 percent of our employees are eligible for bonuses and so, I mean, there are some that will -- particularly, if we meet our financial goals, everybody shares in that one, but if they don't hit their personal goals, they wouldn't share in that portion of it.

Q. At the top of page 7 you state that the annual wage increases each year have averaged 3.7 percent over the last five years. According to our calculation, that would mean that over the total five-year period MDU has increased wages by 20 percent. Would you agree?

A. Yes, approximately.

Q. Have bonuses increased proportionately?

A. No. Bonuses have been up and down. I mean, one year -- like I said, last year it was very low. The year before that it was fairly high.

Q. During the past five years has MDU received any increase in its gas rates?

A. I'm not aware of that.

Q. In fact, in 1998 the company agreed to a gas reduction; isn't that true?

A. I don't know. I've only been here for about a year and a half.

Q. So you wouldn't know when the last gas rate increase was?

A. That's right.

Q. Okay. Would you accept, subject to check, that the last case was decided on November 23, 1993?

A. Would I accept that?

Q. Yes.

A. Certainly, yes.

Q. Has the company increased wages each year since 1993?

A. No, I don't think they have. Actually, we had a freeze, I know, for a while and, again, that's -- I'd have to defer that. We had a freeze on wages there for a while, I know.

Q. But over the last five years you did agree that the increases have averaged 3.7 percent each year?

A. Yes.

Q. Okay. How has the company been able to hold retail rates level and, in fact, reduce them while increasing wages each year?

A. Part of that, I think, goes to the fact that we've just become much more efficient. If you look at our population, we've decreased over the years. And, you know, we've asked our employees actually to do more and then technology has also helped us out in that respect.

Q. In other words, you've been able to improve labor productivity over these past years sufficient each year to offset the annual increases in wages, salaries and bonuses; is that correct?

A. I don't know if it completely offsets it, but, yes, essentially, you're correct. We've increased our labor productivity.

Q. Where in this case do we see a forecast of the productivity offset to the wage and salary increases you predict for the year 2003?

A. Where?

Q. Yes.

A. Say that again, please.

Q. Where in this case is there a forecast of a productivity offset to the wage and salary increases you predict for the year 2003?

A. There isn't one per se. We have goals and objectives, however, that -- in fact, we're formulating those right now -- that will hopefully get us some of that offset.

MR. BINEK: Thank you. I have no further questions.

MR. HOBERG: Thank you, Mr. Binek. Commissioner Wefald, do you have any questions of Mr. Spratt?

COMMISSIONER WEFALD: Yes.

EXAMINATION

BY COMMISSIONER WEFALD:

Q. Where is the data on labor costs and bonuses in this case?

A. Where's the data?

Q. Mm-hmm.

A. I'm not sure. We can get that data, if you need it.

MR. HOBERG: Mr. Pearce?

MR. PEARCE: I imagine it's in the statements.

MR. HOBERG: Statements A through O?

MR. PEARCE: Somewhere in there. I think Ms. Mulkern testified to it and that would identify which of the statements or schedules it's in.

THE WITNESS: Are you talking about the numbers themselves?

Q. (COMMISSIONER WEFALD CONTINUING) Yes. For 2000, 2001, 2002, 2003.

A. Okay.

Q. Where would I find the breakout of the numbers of labor and bonuses in this case?

MR. PEARCE: Perhaps we can have Ms. Mulkern point us to that. Perhaps we can find it here. It's certainly in these statements of the expense items. I'll see if we can find it. It's just been pointed out to me from both sides. In Statement N, page 7 of 23 and --

COMMISSIONER WEFALD: Statement N, page 7 of 23.

MR. PEARCE: I don't know if the witness has the exhibit up there. I'll give him this copy.

Q. (COMMISSIONER WEFALD CONTINUING) So am I correct then that the labor expense in 2001 includes bonuses as well? Bonuses as well as other labor expense?

A. Reflects average -- yes, 3.15 increase reflecting average 2002 bonus. Footnote 1 there.

Q. Well, it doesn't tell me the exact amount that was paid out in bonuses during that time, does

it?

A. 3.15 percent, but it doesn't give you the dollar number, you're correct.

Q. But it says that that reflects an average 2000, 2002 bonus?

A. Yes. What was your question?

Q. My question was, does this chart tell me how much was paid in labor and how much was paid in bonuses in the year 2001?

A. Year 2001, it does not, it appears. I'm sorry. No, it does. It's 2001, 2002, but it just gives you the average of the increase. It doesn't break out bonus and dollar.

MR. PEARCE: I think if I may interject, it's -- labor expense isn't broken out, I don't think, anywhere in those statements. That would have to be extracted from the company records. I guess it could be done.

MR. HOBERG: Is that something you'd like to see?

COMMISSIONER WEFALD: Well, I think it would be helpful because the company -- the staff is arguing that we should eliminate bonuses and they have a number. They're saying that it's half of the increase or something that's projected -- I saw that

number someplace. Just a moment. In Mr. Majoros', on page 15 it says, it is unreasonable to be granting bonuses which, in fact, amount to roughly half of the company's overall requested increase when the company is proposing a rate increase to begin with. So I'd like to know what those numbers are so that I can understand better when he talks about it's roughly half of the company's overall requested increase. I'm assuming in labor costs.

MR. HOBERG: Mr. Pearce, can you provide that?

MR. PEARCE: I assume we can. We'll certainly try to provide that number. That would be 6, I think.

MR. HOBERG: Late-Filed Exhibit 6.

Q. (COMMISSIONER WEFALD CONTINUING) So perhaps it would be helpful to have the actual numbers for 2000 and 2001. We don't -- do you know what the numbers are yet for 2002, because we are not at the time end of the year?

A. No, we don't know that now. We wouldn't have the actual until after --

MR. HOBERG: Could you project those out, though, on --

THE WITNESS: We could, yes. It's not

looking good for this year.

Q. (COMMISSIONER WEFALD CONTINUING) And then if you'll explain to me what MDU is doing here. Are you -- in your calculation on page 7 of 23, Statement N, explain to me how you're doing this.

A. Give me that cite.

Q. That same page that we were looking at.

A. Seven.

Q. Okay. So you're just taking from $7,988,000 for labor costs in 2001, you're putting in place a 3.15 percent increase for year 2002 and then you're projecting a 3 percent increase for January 1st, 2003?

A. That's correct.

COMMISSIONER WEFALD: Okay. Thank you.

MR. HOBERG: Commissioner Clark, any questions?

COMMISSIONER CLARK: Just a couple.

EXAMINATION

BY COMMISSIONER CLARK:

Q. When calculating the C ratio compa-ratio, is the term "market value," is that the same as market average? In other words, when you say 91 percent of the market value, is that saying you're 90 percent of the market average for a given

position or wages?

A. Essentially, that's correct. We're at midpoint market average or market value. It's the midpoint of that.

Q. Okay.

A. We're 91 percent of that.

Q. Got it. And that's companywide, it's across the board?

A. That's right.

Q. Would that follow that individual positions are typically at about that or are there certain areas of --

A. Lower and higher. And more lower than higher, though. Because if you took 100 percent, that would mean that everybody was right at the midpoint of their salary range or that market value of their salary range.

Q. Do you have any particular area of expertise that tends to be more of a problem where you are at with midpoint than others?

A. Well, if you read further, you'll see that the managers are actually lower paid, I think. That's probably where we have more of a problem.

Q. Do the C ratios or compa-ratios, include bonuses, or is that just salary?

A. No, that's just salary.

Q. Is there any way to get a handle on what the bonuses, kind of where that brings it? Because it would seem like if the company has a policy which is trying to move more toward bonuses, which in a lot of ways make sense because it's more incentive based and it has some tax advantages or some savings advantages, when you add those in, where do salaries fall?

A. Well, if you take the total compensation package, you know, and you look competitively, you'll see that in various classifications, they'll have different bonus amounts. Overall for mid managers, what we call mid managers -- executives are a little different -- mid managers, but we use about a 15 percent average and that's based on, again, study from Towers Perrin and --

Q. So explain, a 15-percent average means 15 percent of their total compensation package?

A. 15 percent of their base salaries.

Q. 15 percent of their base salaries is?

A. And that's really at risk. I mean, that's -- you know, they have to perform to get any of that.

Q. Okay. I think you're going to have to

explain this 15 percent again. It's 15 percent of their base salary?

A. Base salary, right. That's what they're eligible to receive.

Q. In bonus?

A. Up to 15 percent of their base salary and that's for the middle management.

Q. And you said that rate is comparable to other industry peers?

A. That's -- yeah. That's -- in fact, it's probably a little bit low. If you look at the study, they're going to come in somewhere between 17 and 22 percent.

COMMISSIONER CLARK: That's all I've got. Thanks.

MR. HOBERG: Thank you, Commissioner Clark. Commissioner Wefald.

FURTHER EXAMINATION

BY COMMISSIONER WEFALD:

Q. So if I'm to assume that in 2001 on this same page 7 of 23, Statement N, that a certain amount of dollars are already in 2001 for bonuses?

A. 2001?

Q. Mm-hmm.

A. Those are actuals, I think, aren't they?

Q. Those are actuals in 2001. The actual bonuses that were given in 2001.

A. Right. I'm assuming that's what they are. I didn't make this chart, but since that's past.

Q. So each year you're projecting to give more bonuses, if you put in the increase of the 3.15 percent, is that correct? In the first year to 2002 and 2003 you would be giving each year a greater amount -- have the potential to have a greater number of dollar bonuses in those three years?

A. Let me see if I can clear this up.

Q. Let's say there's $500,000 of bonuses in the first year.

A. Let's start with $1,000. It's easier for me to calculate. Let's say we have a $1,000 worth of -- well, first of all, let's say we have $2,000 worth of salary, period, and we give a 3 percent increase across the board to those $2,000, so that would be $60. So now we have $2,060. Now, if you assume -- you've got the 3 percent of 2,000 would be 60, 3 percent of 2,060 would be something a little more than that. So you're right in assuming that if you give increases, that providing -- and there's nothing guaranteed about these bonuses. If you hit your maximum, then your bonuses would also increase.

Q. But if Mr. -- is it Mr. Majoros who was discussing this in his testimony? Is it your understanding that he's recommending eliminating the entire dollar amount of bonuses out of 2001, or is he just recommending that there not be an increase in the dollar amount of bonuses that's included in 2001?

A. I'm not sure. 2001 is by us so now --

Q. Yes, last year. And your chart here is based on 2001 and then you're making an adjustment, reflects an average of 3.15 percent increase.

A. Over the actuals paid in 2001.

Q. Reflects average 3.15 percent increase reflecting average 2000, 2002 bonus.

MR. PEARCE: I think we may be getting stuck here. Perhaps Ms. Mulkern could come back because she's the one that prepared --

COMMISSIONER WEFALD: Okay. That would be good.

MR. PEARCE: Maybe you can get through this a little faster.

MR. HOBERG: Ms. Mulkern, do you want to come back up? Let's do it right now while we're on the subject. If you could stand up there by the mike, please.

MS. MULKERN: Can I describe maybe how we developed that labor increase?

COMMISSIONER WEFALD: Sure.

MS. MULKERN: Okay. We started with 2001 actual -- in developing a labor adjustment, we started with the actual gas utility labor expense, total company gas utility for 2001, and that contained the payroll over time, these commissions and bonuses, and we use that title. It really isn't bonuses. It kind of carries over from previous years. And looked at 2001, and then we looked at 2002, what was in the budget. And in 2001 we had a higher bonus payout and so if we stayed with the 2001 amount and increased that, really, we would be overstating. So we included a three-year average of bonuses and used a three-year average of bonuses for 2002, 2001, and 2000 and included that as the bonuses for 2002.

So the 3.1 percent -- 3.15 percent increase reflects a three-year average of bonuses in it. So the bonus level for 2000, indirectly 2002 that's embedded in that is less than was actual in 2001 because instead of using the actual bonuses, we restated it to a three-year average.

COMMISSIONER WEFALD: So there is money in

2001 here for bonuses and 2002 you altered the amount of bonus dollars in these and then you also figured a 3.5 percent increase, not only on the bonuses, but on all labor costs?

MS. MULKERN: The 3.15 increase for 2003 is net of the bonus. It's not on top of it. It's net of the change in bonus. So that's the overall increase in all labor and reflecting a three-year average.

COMMISSIONER WEFALD: All right. And then what happens in 2003?

MS. MULKERN: And then in 2003 we adjusted everything up by 3 percent. And that makes sense because everyone's wages are going up and so, generally, the bonus is based on the percent of base salary. So that base goes up and the bonus will go up. If I got, say, a .5 percent bonus in 2002 based on my 2002 salary and, hopefully, I would get a wage increase in 2003 and I got the identical percentage bonus, it would be higher cost because my wage has gone up. So it is appropriate to increase the bonus rate 3 percent, because the overall wages are going up, therefore, the bonus would go up also.

COMMISSIONER WEFALD: All right. I understand it. Thank you.

MR. HOBERG: Thank you, Ms. Mulkern. Any further questions then of Mr. Spratt? Mr. Diller.

MR. DILLER: I see it's after 5:00, but I do have a question.

EXAMINATION

BY MR. DILLER:

Q. Is it true, Mr. Spratt, that wage increases are a cause of inflation?

A. No.

MR. DILLER: I withdraw the question.

MR. HOBERG: Any further questions of Mr. Spratt? Thank you, Mr. Spratt. You've got one witness left?

MR. PEARCE: Call Richard Espeland. Should be very short, I think.

MR. HOBERG: Mr. Espeland, I just need to remind you also that you're still considered to be under oath from yesterday.

THE WITNESS: That's correct, yes.

MR. HOBERG: Mr. Pearce, please.

RICHARD A. ESPELAND,

having been previously sworn, was examined and testified as follows:

DIRECT EXAMINATION

BY MR. PEARCE:

Q. Mr. Espeland, for this case you prepared written prefiled rebuttal testimony, did you not?

A. Yes, I have.

MR. PEARCE: And that's been marked as Exhibit 28, I believe. I'll offer that exhibit and I have no further questions.

Q. (MR. PEARCE CONTINUING) Would you please give a summary of your testimony?

MR. HOBERG: Before you do, any objection to Exhibit 28?

MR. BINEK: No.

MR. HOBERG: Exhibit 28-55 is admitted.

Mr. Espeland, please.

THE WITNESS: Thank you. In my written testimony -- and I'll very briefly summarize and refer mainly to the attachments, which provides us supporting information, because I know in making rate case decisions what common practice is, sometimes needs to be supported. If you look at the Exhibit RAE-2, I provided two survey sources to support the common approach using a SERP or a supplemental income security plan for senior management.

If you look at page 2 of 3 of Exhibit RAE-2 you notice from the Hay survey under the left-hand column under non-qualified plans, it says, 74 percent of plan sponsors have some form of non-qualified retirement plan. So three-fourths of the employers have these types of plans. They're very common. Also, if you look at the right-hand column of the survey highlights, the second bullet from the bottom says, target retirement ratios fall into the 50 percent to 70 percent range, and so that a 50 to 70 percent replacement ratio for retirement income is very common.

On page 3 of 3 is another survey of another survey of another consulting company, Clark/Bardes Consulting. They also, if you look at the plan prevalence, have shown that in 2001 on the left-hand bar, 75 percent of the companies surveyed also have these type of plans. If you look up at the top introduction, the last -- on the right-hand column, about halfway through that paragraph, it says, the primary reason for adopting a SERP is the Omnibus Budget Reconciliation Act of 1993, which lowered calculations to 150,000. And at the time prior to that the index was 225,000. So they reduced by over a third the amount of compensation that could be

considered in a defined benefit pension plan. That was in part what caused these plans to be added.

If you then turn to RAE-3, the next page, which is a graph that shows the percent retirement replacement income, I've shown there on the top ones that qualified plans as to what percent replacement income they provide, and you can see 30,000 is 84 percent, and at the top level it's 20 percent, well below the 50 to 70 percent that is common.

So that's why we have our SISP program and that's why it's appropriate to include in the rates as a common practice as part of the total compensation program. And the bottom graph reflects how it changes when you add SISP. I believe the prior testimony said that we have an inverse relationship with our SISP where the lower level gets a smaller percentage replacement income under SISP and the higher level gets a higher percentage, and that's correct, but that's only a small part of the total picture. You've got to keep things in context.

There are four major parts to our retirement plan. Social Security, and you'll see the inverse relationship there where 40 percent out of the $30,000 level is provided by Social Security,

but only about 3 percent at the top level comes from Social Security. And same with the other plans. Our 401(k) plan has 20 percent provided at the lower income levels, and 8 percent at the higher level. Twenty-four percent comes from the defined benefit pension plan on the lower level and only 9 percent at the top level. That's why we have the SISP, to be fair and competitive and have a reasonable amount of replacement income at the 50 percent level at the top end, which is at the low end of the range of common practice.

Again, I want to emphasize as Mr. Spratt has commented, that we approach compensation in a total compensation approach. We can deliver $1,000 in a lot of different ways. We choose to offer base salary. We choose to have incentive pay so it's not a fixed cost, but it's only given if performance is there. And we choose to have benefits and other programs that provide for economic security. It's the most cost-effective way of doing -- delivering value to the executives and to the employees at all levels. And we could easily pay them all in base salary, all in base rate. It would not be the most cost-effective or the most incentivizing for good customer service.

That concludes my remarks.

MR. PEARCE: I'll offer Exhibit 28. I don't think I did before.

MR. HOBERG: You did.

MR. PEARCE: I didn't mark it. I have no further questions.

MR. HOBERG: Mr. Binek, any questions?

MR. BINEK: This has been covered pretty thoroughly, I think, and I'm going to resist the temptation of asking any questions. So I have no questions.

MR. HOBERG: Thank you. Commissioner Wefald, any questions?

COMMISSIONER WEFALD: I have no questions of this witness.

MR. HOBERG: Commissioner Clark, any questions?

COMMISSIONER CLARK: None. Thank you.

MR. HOBERG: Thank you, Commissioner. Mr. Diller, no questions? No one else has any questions of Mr. Espeland? Thank you, Mr. Espeland.

COMMISSIONER WEFALD: I have one for Mr. Spratt.

MR. HOBERG: Mr. Spratt, Commissioner Wefald would like to ask a question of you.

COMMISSIONER WEFALD: One more.

THE WITNESS: Am I still under oath?

MR. HOBERG: Yes, you are.

FURTHER EXAMINATION

BY COMMISSIONER WEFALD:

Q. Why should the Commission consider 2002 in an average for bonuses when you haven't even completed the whole year?

A. Because we started out last year and told our employees that there was going to be a bonus program. And in that bonus program we have objectives that they're meeting and there are certain financial objectives that we have to meet, as well as personal objectives. So in order for us to be able to keep our promise to our employees, I would like the Commission to do that.

Q. Well, we're not going to be approving anything that would go into effect for 2002. Our earliest date of the order would be --

A. 2003.

Q. Isn't that the year that we're looking at?

A. Yes.

Q. So it wouldn't make any difference what the Commission did for 2002. So we have to make our decision before the end of 2002 and you have to make

projections of what people are going to be getting, but how do we know you are actually going to be giving those bonuses or that people will actually meet the requirements by the end of the year? What I'm wondering is why we shouldn't just use the average of maybe 1999, 2000, and 2001, or maybe just 2000 and 2001, instead of -- if we are even considering adding bonuses and why we would even look at numbers from 2002 when they're not actuals?

MR. PEARCE: I think this is really Ms. Mulkern's area again. Probably she should address it.

MR. HOBERG: Ms. Mulkern, come back up again.

COMMISSIONER CLARK: We want you to sing Stairway to Heaven this time.

MS. MULKERN: We used an average of 2002, 2001 and 2000 because when we were preparing this case in March of 2002, the bonuses are generally paid out in February of each year. So when we prepared this case in March, we had the actual amount of bonuses that had been paid for 2002.

COMMISSIONER WEFALD: Okay. Thank you. That answers that question.

MR. HOBERG: Any additional questions of

Mr. Spratt? Thank you, Mr. Spratt. Is there anything else to bring to the attention of the Commission in regard to evidence in this matter? Mr. Pearce?

MR. PEARCE: Just, I guess, in the way of a general statement. There has been a lot of discussion on the depreciation study that's currently underway and, of course, it's our position that that may or may not have some effect in the future on rates, but really isn't critical for this case because we are operating now under a Commission-approved depreciation study from 1991 that we think is the appropriate one to be used. So that ongoing depreciation study certainly isn't critical. Now, it may or may not have any effect on rates in the future.

Also, I think it's appropriate to renew our motion. It's been taken under advisement, I think, that this proceeding is not the proper one to implement FAS 143 for ratemaking purposes.

MR. HOBERG: That's been taken under advisement, yes. Are you going to be providing the late-filed exhibits shortly?

MR. PEARCE: What sort of time frame? I think those can be done rather quickly.

MR. HOBERG: Probably within the next 15 days?

MR. PEARCE: Certainly, I would think. Even 10 or 15. Fifteen is fine.

MR. HOBERG: That would be appropriate, I believe. There's been some discussion about how to close this out and it's my understanding that both of the -- the staff and you want to file proposed findings of fact, conclusions of law and post hearing briefs?

MR. PEARCE: Yes.

MR. HOBERG: Mr. Binek; is that correct?

MR BINEK: Yes.

MR. HOBERG: Okay. We can do that within 30 days; is that correct?

MR. BINEK: When will the transcript be prepared?

MR. HOBERG: Are we preparing a transcript?

MR. PEARCE: Yes. And I think we should go off the record because the reporter indicated to me she prefers not to be pushed on the record as to the time.

MR. HOBERG: Let's go off the record.

(Discussion off the record.)

MR. HOBERG: Let's go back on the record.

MR. PEARCE: Maybe something like -- talking about the last week of October then, maybe.

MR. HOBERG: The Commission has until the 12th of December to issue a decision.

MR. BINEK: I was going to suggest possibly November 15 as a date for proposed findings and briefs.

MR. PEARCE: That's fine. Sure.

MR. HOBERG: That would give the Commission 30 days.

MR. BINEK: Just about 30 days.

MR. HOBERG: Okay. So you have them to the Commission by the 15th, not mailed or anything, to them by the 15th.

MR. PEARCE: Right, in their hands.

MR. BINEK: I can get them in their hands.

MR. HOBERG: You can do that.

MR. PEARCE: We have messengers. I can do that, too.

MR. HOBERG: Okay. So proposed findings of fact, conclusion of law and briefs to the Commission by November 15. Late-filed exhibits within 15 days. Is there anything else that needs attention at this time? Mr. Pearce?

MR. PEARCE: Nothing for me.

MR. HOBERG: Mr. Binek?

MR. BINEK: No.

MR. HOBERG: Thank you. Commissioner Wefald, did you have any closing statements to make?

COMMISSIONER WEFALD: Thank you for a good hearing.

MR. HOBERG: Thank you. Commissioner Clark?

COMMISSIONER CLARK: Thank you.

MR. HOBERG: Let's close this hearing. It's approximately 5:30.

(Concluded at 5:30 p.m., the same day.)

CERTIFICATE OF COURT REPORTER

I, Linda L. Gingery, a Registered Professional Reporter,

DO HEREBY CERTIFY that I recorded in shorthand the foregoing proceedings had and made of record at the time and place hereinbefore indicated.

I DO HEREBY FURTHER CERTIFY that the foregoing typewritten pages contain an accurate transcript of my shorthand notes then and there taken.

Dated at Bismarck, North Dakota, this 21st day of October, 2002.

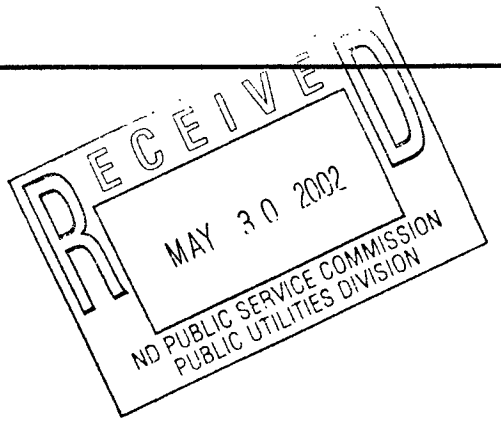
LaCapra Associates

Energy Planning & Regulatory Economics

May 30, 2002



Mike Diller
Director of Accounting
North Dakota Public Service Commission
State Capital, 12th Floor
Bismarck, North Dakota 58505-0480

Re: Request for Proposals Case No. PU-399-02-183

Dear Mr. Diller:

La Capra Associates is pleased to offer this proposal, (an original and five copies), to provide expert advice to the North Dakota Public Service Commission in the areas of cost of service and rate design and to provide expert witness services as necessary.

La Capra Associates is a Boston-based consulting firm specializing in regulatory policy, ratemaking, energy planning, and market analysis in the gas and electric industries. We have been in business for over 20 years and are well established throughout the Northeast U. S. and in many other states. We have extensive experience working with regulatory commissions and consumer advocates and have substantial hands-on experience with the type of cost of service and rate design work described in the request for proposals. We have provided expert testimony in all areas of utility ratemaking and have developed and sponsored entire tariffs for several utilities drawing on experience with utility cost functionalization, cost classification, cost allocation and rate design.

We look forward to hearing from you.

Regards,

GR McCluskey

E LA CAPRA RESUMES

1. Executive Summary

La Capra Associates ("La Capra") is pleased to offer this proposal to provide expert advice and witness services to the North Dakota Public Service Commission ("Commission") in three of the five subject areas specified in the May 10, 2002 Request for Proposal ("RFP"); namely, level of investment, cost of service and rate design.

La Capra is a Boston-based consulting firm specializing in energy planning, market analysis, and regulatory policy in the United States energy industries. We have been in business for over 20 years and have experience across the U. S. and in other countries. We have extensive experience working with public entities such as regulatory commissions and consumer advocates and have substantial, hands-on experience with the type of cost of service and rate design work described in the RFP. La Capra has provided expert testimony in all areas of utility ratemaking and has developed and sponsored entire tariffs for gas and electric utilities, drawing on experience with utility cost identification, functionalization, classification, and rate design. Our experience with cost of service work includes both projected and historical test year periods. La Capra has assembled a team of highly experienced professionals that can work with the Commission Staff to ensure that the project is completed successfully and efficiently. Our team offers experience and depth in:

1. Revenue Requirements Analysis: Our team has experience conducting revenue requirements analyses of gas and electric utilities. Those analyses have included the full range of cost analysis and projections, including weather normalization of revenues and costs. We have critiqued utility revenue requirement requests for public advocates and commissions in many jurisdictions
2. Retail Rate Design: Our team members have, individually and collectively, extensive experience with retail rate design in the gas and electric industries. We have supported the development of rates that reflect appropriate balancing of various rate design objectives. This has been based on consideration of cost causation, of public goals, and of existing rate structures.
3. Fully Allocated Cost of Service Studies: Our team has extensive experience conducting allocated embedded cost of service studies. Specifically, the senior members of our Project Team have experience that includes: data acquisition; creating models to develop cost allocation factors from load data; establishing allocation factors that best reflect cost causation and consideration of all rate

design principles; understanding the data and its limitations; understanding the limitations of joint or common cost allocation mechanisms; and phasing in difficult rate transitions. These individuals are supported by experienced analytical staff.

4. Marginal Cost Studies: La Capra's Project Team has a sound understanding of the principles of marginal cost pricing and the application of those principles to gas and electric utility industries. We have developed marginal cost studies for all gas functions.

5. Expert Witness Services: La Capra's Project Manager and Task Managers have provided expert witness services for public and private entities throughout the U.S. A detailed list of these services is included in the biographies of the appropriate staff.

George McCluskey will be La Capra's Project Manager for our work on this project. He is a ratemaking specialist having experience with La Capra and previously with the New Hampshire Public Utilities Commission. Robert Hix, a Managing Consultant, will be our expert witness on cost of service and rate design matters. Mr. Hix, a former Chair of the Colorado State Commission, has extensive regulatory background and experience working for various public agencies that will allow him to speak authoritatively on a broad range of cost of service and rate design issues. We have assigned a number of other experienced professionals and staff to ensure the project is completed successfully and on time.

We propose a scope of work with a not-to-exceed budget of $39,640, including expenses, to cover the investment, cost of service and rate design issues referenced in the RFP. The details of this budget are provided in Appendix C to our proposal. We will work closely with the Commission Staff to effectively manage the scope and cost of the case.

Dan Peaco, La Capra's Managing Director, is authorized to negotiate and contractually bind the firm for services to the Commission. Please contact Mr. Peaco for further information on this proposal, as follows:

Daniel Peaco, Managing Director
Suite 855, 333 Washington Street, Boston, MA 02108
Phone: (617) 557-9100 x13
Fax: (617) 951-0528
E-mail:dpeaco@lacapra.com

2. Technical Description

2.1 Initial Scoping Exercise

La Capra Associates is proposing to engage the Commission Staff in an initial scoping exercise, (i.e., in advance of developing testimony). The purpose of this exercise would be to explore and understand the Staff's objectives for the case, and the environment in which it operates. This will better enable us to perform the tasks specified in this proposal.

2.2. Investment or Rate Base Tasks

The purpose of this task is to define a level of investment that is an appropriate basis for the return on the utility's investment. The historic rate base is usually considered the starting point, but we would analyze the most recent investments in plant to ensure that they were in response to actual needs. Utilities can accelerate certain investments in order to inflate specific rate requests. The initial analysis of increases to rate base focuses on how investment compares to the Company's past rate of investment, and also how the investment has compared to capital budgets. We would also investigate through discovery and reviewing annual reports to the Commission whether there are extraordinary circumstances that could explain a change in investment. La Capra Associates would consult with Commission Staff to gain a better understanding of the North Dakota environment and the effect it would have on recent and projected investment. For instance, environmental problems or requirements might make additional investments necessary. If the Company has made extraordinary investments, it should be able to justify them by means of cost-benefit analysis. We would apply the same type of analysis that was applied to recent investment would also be applied to projected investment. Another task in examining the level of investment is determining whether investment has been defined appropriately. For instance, some large expenditures could be treated as amortizable expenses rather than rate base. In this task we would also investigate whether retirements, salvage and capital contributions have been accounted for.

2.3. Cost of Service Tasks

After rate base and the return on rate base are determined, the utility's cost of service is computed by determining the appropriate level of remaining costs to reflect the utility's ongoing operations. Those costs then should be allocated to retail customers and among rate classes.

Normally, the level of operating and maintenance expenses actually incurred is not subject to much debate, although there may be issues regarding how those costs are classified. More controversial, and requiring more critical analysis, will be proforma adjustments to those expenses, and any changes that purport to reflect changed utility operations. Forward test years depend on realistic projections of all costs and revenues, both of which should be carefully scrutinized. We would initially compare the rate of increase in different cost accounts with recent actual experience, with the appropriate price inflators, and with past Commission directives to gas utilities. For instance, if utilities had been directed to reduce unaccounted for gas, (losses), this might explain increases in some types of expense or even capital expenditures.

With gas utilities, the impact of weather on both gas costs and on utility revenues is a very significant issue. A northern territory with a great deal of gas heat will be very sensitive to weather. La Capra has extensive experience with estimating normal weather, projecting sendouts and weather normalization of revenues. This experience will contribute to our assessment of the Company's presentation. We would examine the Company's basic assumptions and request through discovery any tests, such as backcasting, of their methodology. We understand that they use a protected model, which makes it somewhat more difficult to determine how normalization is actually performed. Although the model is large and sounds complicated, it appears to be based on a fairly simple base use versus heat use structure. This approach can misstate weather sensitivity during different temperature ranges, and may not appropriately reflect the lag between sendout and sales. Weather normalization is complicated by the significant lag between gas sales and gas sendout if data is reported on a calendar year basis. We could perform an alternative analysis of weather normalization if this was a major issue in the case, but we are not including the cost of this potential effort in our current cost proposal. Revenues also must be normalized for changes in the number of customers and changes in rates during the historic and future year, which may be through the Company's same model or may be a separate computation. This is not a difficult task, so the critique of it consists of insuring that the basic assumptions are complete and reasonable.

2.4. Rate Design Tasks

There are a number of principles that are normally considered in rate design. Rates should be fair and equitable; they should allow for the collection of legitimate costs; they should be relatively simple, which facilitates customer understanding of the rates; rates should assist

with, or at least not conflict with, social goals set by the Commission; rates should provide price signals that encourage efficient use of the product, and there should be concern for rate continuity. All of these principles should be considered, although compromises between principles may be necessary. This phase should begin with discussions between ourselves and the Staff that clarify the Commission's basic principles. Our understanding of the Commission's goals will guide our recommendations when there are conflicts between various principles.

The principle that rates should be fair necessitates examining the relative costs of serving different customer classes. This would begin by separating the costs of serving transportation customers and removing them from retail rates, so that smaller jurisdictional customers do not subsidize the large wholesale customers. The next separation or allocation of costs is between customer classes. While gas allocation methodologies are not as developed as electric methodologies, most costs can be considered to be caused by both commodity and peak usage. There are several methodologies that may accomplish this. We would examine the Company's methodology to determine if it was reasonable. Whether data on peak usage by gas customers, which is used in the allocation process is accurate, may be an issue, and is one that we have addressed numerous times. Other costs are more related to the number of customers, but those costs need to be weighted appropriately. Such costs as meter costs or customer marketing costs are likely to be quite different between rate classes. If there are significant geographic or zonal differences in costs, these need to be addressed in cost allocation and rate design. For instance, if some customers own their own services and meters both plant, expenses, and service revenues will be different from those customers where the Company owns all plant to the customers' premises.

Evidently the Company is attempting to reduce the variability of their net revenues due to weather variability. For this purpose they have proposed a very large increase in the customer charge. The customer charge is not a very useful price signal, and increasing it significantly will create much larger bill impacts on small customers than on large customers. The Company should be required to provide some demonstration that this proposal would provide some benefits to consumers, and any such change should be modified at least until bill impacts were

acceptable. We have found that gas distribution costs are largely a function of customer peak demands, so we would not expect to find that even accurate cost recovery would support very large reduction in customer costs and equivalent reductions in usage sensitive charges.

La Capra will also review and analyze relevant Commission orders relating to rate design issues and, where appropriate, prepare an assessment of the implications of such orders for this case. Based on the results of this assessment, La Capra will develop, in conjunction with the Staff, rate design proposals that meet the Commission's regulatory goals and objectives. We would also investigate the potential bill impacts of the proposed rate changes.

3. La Capra Corporate Experience

3.1 Introduction to La Capra Associates

La Capra is a Boston-based consulting firm specializing in regulatory policy, energy planning and market analysis in the natural gas and electricity industries. We provide strategic planning advice to policy makers and senior managers along with expert, technical analysis to support policy, investment, and operational decisions. Since our founding in 1980, we have earned a reputation for practical and objective advice and for timely, accurate, and innovative analyses.

La Capra provides services to the full range of organizations involved with energy markets – regulatory agencies, public and private utilities, energy producers and traders, financial institutions and investors, consumers, and public policy and research organizations. Over the past several years, we have become recognized for our ability to help our clients with the many new challenges and opportunities that are presented by deregulation of gas and power markets and the restructuring and privatization of utilities. Throughout our history, we have provided services at the forefront of change in the industry, including areas such as marginal cost pricing, integrated resource planning, competitive procurement of independent power supplies, and demand-side management.

La Capra's expertise in energy matters is interdisciplinary. Our technical skills include forecasting models and methods, economics, finance, law, management, planning, pricing, engineering, procurement, and contracts. We are able to support our planning and policy work with detailed technical analysis that often requires complex market system modeling or custom model applications. We also offer skills in market rules, regulations, policy, and negotiations. We regularly provide services ranging from broad policy development to analysis of major investments to short-term planning and operations. Our work frequently leads to presentation of expert testimony or opinion before state or federal regulatory agencies, financial institutions, and corporate management and boards and has consistently withstood detailed scrutiny.

3.2 La Capra Associates References

The following client references can provide additional information about La Capra Associates as a firm and the individuals that we are proposing to work with the Commission on the requested tasks.

Client: **Arkansas Public Utility Commission**

Service: **Rate Design, Price Estimation and Stranded Cost Calculations**

La Capra Associates was retained by the Arkansas Public Service Commission to assist staff in its efforts to implement electricity restructuring legislation in that State. We assisted staff in establishing policy positions covering a range of topics, including: guidelines for market power filings; standard service package design; a decision framework and recommendations for additional utility services to be made competitive; and the proper sequencing of regulatory activities that would be required to achieve retail competition.

In the fall of 2000, La Capra's report to the Commission addressed the conditions necessary for the effective implementation of retail competition, leading to the Commission and the Legislature deciding to delay the start of electric retail access in Arkansas. On behalf of the Staff of the Arkansas Public Service Commission, La Capra prepared expert testimony and analysis that contributed to the evaluation of Entergy Arkansas Inc.'s stranded cost estimates and to its request to continue the accelerated recovery of the Grand Gulf nuclear investment. Testimony discussed the generally accepted approaches for deriving the fair market value of electric generating assets, focusing on the comparable sales methodology used by EAI.

Client Reference: Diana Brenske,
Manager of Electric Restructuring
(501) 682-5656

Client: **Valley Gas Company**

Service: **Cost of Service, Allocation and Rate Design**

La Capra Associates originally negotiated a gas transportation rate with Valley Gas on behalf of a large industrial customer. We were later retained by Valley Gas to advise on unbundling all gas services, performing an allocated cost of service study, and designing new rates. We developed testimony on these issues, and then Valley Gas was acquired by Providence Gas, which is itself a subsidiary of a larger gas company. Ms. Partridge as CFO of Valley Gas worked closely with us. She subsequently was hired by Providence Gas.

Client Reference: Sharon Partridge,

Vice President, Regulatory Affairs
Providence Gas Company
(401) 272-5040

Client: **New Hampshire Public Utilities Commission**

Service: **Power Portfolio Auction, Stranded Cost Analysis and Rate Design**

La Capra was retained by the New Hampshire Commission to assist its Staff in a restructuring case that combines the sale of the utility's power supply contracts with a base rate case to establish the level of new unbundled distribution rates. La Capra's responsibilities include advising the Commission on the divestiture process for the power contracts portfolio, the competitive solicitation of supplies for Standard Offer Service, the calculation of stranded costs, the allocation of the distribution revenue requirement to classes, and the design of unbundled distribution rates.

Client Reference: Mary Coleman,
Assistant Director, Electricity Division
(603) 271-6039

3.3 Additional Relevant Experience

This section of the proposal contains representative examples of public and private clients for whom we have conducted similar or related work, along with associated contact information for our references.

Client: **Various Public and Private Entities**

Service: **Cost of Service and Rate Design Studies**

La Capra has broad experience in the area of cost of service and rate design studies, which sets the foundation for our ratemaking advisory services. Our work in these areas has centered on three areas: the development of embedded cost of service and rate design studies, the development of marginal cost of service studies, and special projects. In the area of embedded cost of service studies, we testified in numerous proceedings on the selection of cost allocation factors for demand-related generation, transmission and distribution costs. In the area of rate design, we performed conventional, time-differentiated bundled and unbundled studies. La Capra personnel have also supervised the development of computerized loss analyses and load research based class demand analyses. Working with the results of these studies, we performed

conventional rate designs as well as developed unbundled, time-of-day, load management, conservation, interruptible, curtailable and experimental rate designs.

Client: **Various Public and Private Entities**

Service: **Expert Witness Testimony on Cost of Service and Rate Design**

Across two decades, La Capra has worked for dozens of regulatory agencies, consumer advocates, user groups, investor-owned utilities, and cooperative utilities and has provided expert testimony in all areas of utility ratemaking. We have developed and sponsored entire tariffs for many private and public utilities, drawing on experience with utility cost identification, functionalization and classification, and rate design.

Client: **Various Gas Utilities**

Service: **Regulatory Rules, Policy Issues, System Reliability**

Over the years, La Capra has advised numerous small and large gas companies on a wide range of ratemaking issues, including design day and design year supply reliability standards, the phase-in of large distribution plant investments, cost-based firm transportation rates, load forecasting, reorganization of all commercial and industrial customers into new rate classes, and cost of service and rate design for transportation rates. Finally, we developed a daily gas dispatch model for a large gas company, which was used to calculate marginal gas costs by season and to allocate gas costs.

Client: **Colonial Gas Company**

Service: **Regulatory Rules, Policy Issues, System Reliability**

La Capra has assisted Colonial with numerous issues in several rate filings and related cases over the years. We developed a daily gas dispatch model for the Company, which was used to calculate marginal gas costs by season and to allocate gas costs. We custom designed an allocated cost of service model and utilized this to allocate costs between users. We then designed new rates and reorganized the Company's commercial and industrial rate classes. Subsequently, we redesigned Company rates based upon marginal cost principles using an allocated cost-of-service study. More recently, we assisted the Company in developing various analytical enhancements for another rate case, including converting class sales data (including a billing lag) to weather-adjusted calendar data for use in revenue normalization and setting rates. La Capra Associates also assisted the Company in the development of a DSM plan, including development of avoided gas supply and distribution costs, and directed an analysis of the cost-effectiveness and non-price attributes of the company's new pipeline transportation contracts.

Client: **Texas and Illinois Clients**

Service: **Unbundled Delivery Service Rates**

La Capra has relevant experience in delivery service rate cases. Several members of the Project Team were involved in proceedings to establish unbundled transmission and distribution rates for three Texas jurisdictional utilities, and Ms. Smith also addressed distribution cost allocation and rate design in Illinois.

Client: **Maine Office of the Public Advocate**

Service: **Rate Design Analysis**

La Capra testified in Maine on the development of marginal cost studies, on the use of marginal cost analysis for ratemaking, and also on performance based rates elsewhere.

4. Project Management and Key Personnel

4.1 Management

La Capra has assembled a highly qualified team to manage and implement the work tasks described in the RFP. George McCluskey will serve as project manager. In this role, Mr. McCluskey will be responsible for project oversight and scheduling, assignment of tasks to the La Capra project team, and ensuring that project deadlines are met. He will maintain regular communications with the Commission Staff, in coordination with La Capra's Task Manager, regarding the management of the La Capra work. Mr. McCluskey will coordinate with the Staff to prepare scope, budget and personnel assignments for the specific work tasks to be conducted.

Mr. McCluskey will work closely with Robert Hix as the Task Manager. Mr. Hix, and Mr. McCluskey, will have day-to-day responsibility for the tasks identified in our proposed scope of work. They will also be responsible for coordinating the involvement of other required La Capra personnel and will serve as the day-to-day contact with the Commission Staff on their respective projects.

4.2 Personnel

In addition to Mr. McCluskey, the Project Team includes the following La Capra personnel:

La Capra Task Manager

Mr. Hix will participate in the preparation of testimony that addresses all of the issues covered by our scope of work and will be responsible for the presentation of that testimony before the Commission. While serving as Chair of the Colorado Commission, and before that with the Colorado Office of Consumer Counsel and Public Service Company of Colorado, Mr. Hix gained extensive experience analyzing the revenue requirements and rate design filings of gas and electric utilities. That experience includes reviewing and critiquing cost of gas adjustment clauses and models for developing weather normalizing adjustments to test year billing determinants and net revenues. Mr. Hix also participated in the review and approval of gas purchase plans for Colorado gas utilities. Additionally, Mr. Hix evaluated the cost structures of all ten of natural gas utilities in Colorado and as PUC Chairman implemented a rule that required gas utilities to disclose to consumers the components of their rates, such as gas cost, upstream pipeline cost and local delivery cost.

La Capra Senior Advisors

Mr. McCluskey and Mr. Hix will have senior advisors from our firm available to assist with policy and technical issues. Lee Smith, a Managing Consultant, will provide advice on economic, technical and policy matters. In addition, Dan Peaco, La Capra's Managing Director, will be available for consultation to provide support for the management and policy direction of the project as needed.

La Capra Analytical and Research Staff

The project teams will also include analytical staff from La Capra, as needed, under the direction of the task managers. The following individual will be the primary staff person for this work:

Arthur Freitas, Analyst, will serve as the primary analytical support to the task managers. Mr. Freitas has over 4 years experience in the energy industry, in both natural gas and electric markets. His relevant experience includes embedded cost of service analysis for natural gas and electric utilities, performance based ratemaking analysis, rate design analysis, unbundling analysis, and natural gas and electric market price forecasting.

Brief biographies for the above individuals are included in Appendix A. Biographies for other personnel available to assist can be provided, as needed. Full resumes of the professionals providing services are included in Appendix E.

5. Cost Proposal, Timeline and Billing Rates

La Capra has prepared a not-to-exceed budget that corresponds with three of the five tasks specified in the RFP. The details of that budget by task and project team member are provided in Appendix C to this proposal. La Capra will be happy to suggest modifications to the scope of work to provide additional services not currently reflected in the proposal. If it should be requested by Staff, La Capra could perform an independent cost allocation on weather normalization using our models at an additional cost. This would have to be agreed upon by Staff.

As discussed above in Section 2.1, we propose to begin with an initial scoping session conducted via telephone, the purpose of which is to ensure the La Capra and the Staff teams have a common understanding regarding the goal and objectives for this case. The budget for this work is $2,440.

The Investment/Rate Base portion of the scope of work is described in Section 2.2. and summarized in Appendix C. The budget for this work is $4,520, excluding the cost of preparing and presenting testimony that explains our conclusions and recommendations.

The Cost of Service portion is described in Section 2.3 and summarized in Appendix C. The budget for this work is $6,360, excluding the cost of preparing and presenting testimony.

The Rate Design portion of the scope of work is described in Section 2.4. and summarized in Appendix C. The budget for this work is $7,380, excluding the cost of preparing and presenting testimony.

With the addition of the costs to prepare and present testimony, respond to interrogatories, attend hearings, and prepare cross examination and findings of fact, we propose a total not-to-exceed budget of $39,080, excluding expenses. This budget assumes that the work will begin in June 2002 and will be completed October 2002. Invoices for payment of services will be prepared and submitted quarterly based on work completed to date and will be payable within 30 days of receipt of invoice. La Capra bills only for direct labor and expenses. If, as discussed above, modifications to the scope of work are requested, we would make appropriate adjustments to the budget based on the billing rates in Appendix B.

6. Equal Employment Opportunity and Americans with Disabilities Act Requirements

La Capra Associates does not discriminate against any qualified employee or applicant for employment because of race, color, national origin, ancestry, age, sex, religion, physical or mental handicap, or sexual orientation. La Capra Associates agrees to comply with all applicable Federal and State statues, rules and regulations prohibiting discrimination in employment including, but not limited to: Title VII of the Civil Rights Act of 1964; Section 504 of the Rehabilitation Act of 1973; the Americans with Disabilities Act of 1991; and M.G.L. c.151B.

Signed: David Pasco

Title: Managing Director

Date: May 29, 2002

7. Conflict of Interest

La Capra has had no business relationship with Montana – Dakota Utilities Company. Also, La Capra will commit that it will not develop such a relationship for a period of one year following termination of this assignment. La Capra does, however, have an agreement with El Paso Pipeline Company to monitor the activities of the Wyoming and Colorado regulatory agencies. El Paso is a partial owner of the Alliance Pipeline Company, a FERC jurisdictional interstate utility that has operations in North Dakota.

APPENDIX A

Brief Biographies

GEORGE MCCLUSKEY

Senior Consultant

Mr. McCluskey is a ratemaking specialist with over 20 years experience in utility economics, including approximately three years reviewing the activities of government owned generation and distribution companies in England. Since joining La Capra Associates in 1999, Mr. McCluskey has provided advice to several clients on a variety of subjects, including stranded cost analysis, rate functionalization and classification, RTO formation, and asset valuation. Prior to joining La Capra Associates, Mr. McCluskey was employed by the New Hampshire Public Utilities Commission ("NHPUC" or "Commission") where he held the positions of Director of the Electric Utility Restructuring Division, Manager of Least Cost Planning, and Gas and Electric Utility Analyst. While at the NHPUC, he testified as an expert witness in numerous gas and electric utility proceedings, including base rate and gas cost adjustment proceeding. Mr. McCluskey also testified on the design of gas transportation rates before the NHPUC and on wholesale ratemaking issues before the FERC. Prior to joining the NHPUC, he worked in England as a pricing policy specialist for the Electricity Council, primarily on the design of retail rates for electricity distribution boards.

Mr. McCluskey's gas related experience includes:

Rate Unbundling - On behalf of the Staff, he prepared and presented direct and supplemental testimony in a proceeding to establish NHPUC policy on the unbundling of firm and interruptible gas services and the establishment of gas transportation rates for commercial and industrial customers.

Purchase Gas Adjustment - He directed the evaluation of numerous purchased gas adjustment filings. This work required a knowledge of gas utility procurement practices and procedures as well as the terms and conditions of available gas supplies, which included firm and interruptible interstate pipeline sales and transportation services, spot market and contract purchases, underground storage services, and local LNG and propane-air systems.

Marginal Cost Pricing – Mr. McCluskey directed the Commission's Gas Rate Design Investigation into the application of marginal cost principles to gas utility ratemaking. He also prepared and presented expert testimony for Commission Staff that addressed areas of disagreement including the methodology for calculating production-related marginal costs and the determination of class revenue requirements.

Embedded and Marginal Cost Analysis – He presented expert testimony on the revenue requirement and rate implications of embedded and marginal cost-of-service studies prepared by two New Hampshire gas distribution companies.

Interruptible Rate Design - On behalf of Commission Staff, he prepared and presented expert testimony on the economic evaluation of a new interruptible rate design for large industrial consumers.

Standby Sales Service – He prepared and presented testimony on ratemaking issues associated with the development of a standby sales service for firm gas transportation customers.

Special Contracts - He directed the economic evaluation of a proposed special contract for a large business customer in New Hampshire.

Investment Appraisal - On behalf of the Commission Staff, he prepared and presented expert testimony on investment appraisal guidelines for discretionary natural gas capital projects. The guidelines were applied to a new, large gas pipeline that delivered natural gas service to an area of New Hampshire previously served by a propane-air system.

ROBERT J. HIX

Director, Denver Office / Managing Consultant

Robert J. Hix joined La Capra Associates as Managing Consultant and Director – Denver Office, to establish a stronger presence in the West. His experience enhances the organizations' ability to meet client needs efficiently in the areas of ratemaking and utility planning, distributed generation, renewable energy public policy and energy efficiency. Prior to joining La Capra Associates, Mr. Hix was appointed Colorado Public Utilities Commission Chairman by Governor Roy Romer. His term expired on January 8, 2001. He is a member of the Advisory Council to the Board of Directors of the Electric Power Research Institute and is a member of the Adequacy Committee of the North American Electric Reliability Council. Previous to his appointment, Mr. Hix was a Senior Engineering Analyst with the Colorado Office of Consumer Counsel, which represents residential, small business and agricultural customers on issues before the Public Utilities Commission. As Senior Engineering Analyst, Mr. Hix testified as an expert in engineering and rate matters at hearings before the Public Utilities Commission. His primary role was to determine the policy and regulatory implications of rate changes and cost allocation among various customer classes. He held various positions at Public Service Company of Colorado from 1971 to 1983. He began his career with Public Service Company as a field engineer responsible for electric distribution engineering projects and negotiations with electrical contractors. He also served in the Rates and Regulations Division where he was responsible for certain electric and natural gas rate filings with the PUC and special rate schedules with the Federal Power Commission, as a member of the Special Projects Division which initiated efficiency and cost control measures within the company, as the Electric Power Contracts Administrator and as a staff assistant to the Manager of Electric System Planning.

LEE SMITH

Senior Economist/Managing Consultant

Ms. Smith has worked on cost allocation and rate design issues for both electric and gas utilities in Massachusetts, Maine, New Hampshire, Kansas, Rhode Island, Pennsylvania, and South Dakota. She developed and presented testimony on cost allocation and rate design for a number of gas distribution utilities. Ms. Smith addressed functional separation and unbundled gas and electric rates in Massachusetts, Arizona, Pennsylvania, Vermont, Arkansas and Maryland. In Pennsylvania, Ms. Smith presented testimony for the Pennsylvania Office of the Consumer Advocate that responded to the rate unbundling requests of all eight investor-owned utilities. Recently, she assisted the Hawaii Office of the Consumer Advocate in settling issues regarding electric backup rates that would allow the installation of gas cogeneration. She has testified on appropriate customer class designation for gas companies. Prior to her employment at La Capra, Ms. Smith was Director of Rates and Research at the Massachusetts DPU, where she oversaw the rationalization of rates based on embedded cost allocation and marginal cost ratemaking principles.

Ms. Smith's gas related experience includes:

Cost of Service and Rate design work – She advised, prepared reports, and presented testimony on cost of service, marginal cost, rate design, and phase-in of large investment for Colonial Gas, Essex Gas, Berkshire Gas, North Attleboro Gas, Blackstone Gas, and Valley Gas.

Gas supply issues - Ms. Smith assisted in developing a gas supply sendout model for marginal cost analysis for Colonial Gas and Berkshire Gas; developed demand side management program for Colonial Gas and Essex County Gas; issued RFPs and negotiated gas supply contracts for Blackstone Gas Company.

Weather normalization methodologies and load forecasts – She developed planning standards and load forecasts for Essex County Gas, North Attleboro Gas, and Blackstone Gas; assisted Colonial Gas in creating daily load forecast and weather normalization model.

Testimony for public entities – She testified on gas cost of service, gas planning and rate design in Massachusetts, Vermont, Kansas, and Washington D.C. for public entities.

DANIEL PEACO

Managing Director

Daniel Peaco is an electric industry planning specialist with twenty years of experience. His expertise includes electric industry restructuring policy, power markets and marketing, strategic planning, pricing and price forecasting, power procurement and contracts, and power systems planning. He was formerly the Manager of Power Supply Planning for Central Maine Power Company.

His recent experience includes expert testimony on: economics of power contracts in litigation (ME, VT); economic analysis of the benefits of retail competition (AR); valuation of generation assets (OH, ME), stranded cost analysis (PA, OH), regional reliability forecasts (New England); standard offer and default service policy (AR, MA).

ARTHUR FREITAS

Analyst

Arthur Freitas joined La Capra Associates in May of 2000. Since joining the firm he has performed analyses in a number of areas. These include analysis of a cost of service study for a rate case involving an electric distribution company, economic feasibility study of various renewable technologies in connection with the Massachusetts Renewable Portfolio Standard, and fuel price forecasts to be used as inputs for a forecast of electricity prices in the New York power market. Before joining La Capra, Mr. Freitas worked as a rate analyst for Boston Gas Company where he was involved with preparing the Cost of Gas Adjustment Factor and the Performance Based Regulation filings for the state regulatory agency, as well as numerous other financial analyses and forecasts.

Sample Work Product

A. Burlington Electric Department

Testimony analyzed the firm transportation rate filed by Vermont Gas Systems.

B. People of the State of Illinois and the Citizens Utility Board

Submitted testimony rebutting the testimony filed by Illinois Power Company relating to rate design issues.

TESTIMONY OF LEE SMITH FOR BURLINGTON ELECTRIC DEPARTMENT

Q. **What is your name and business address?**

A. My name is Lee Smith, and I work for La Capra Associates, 333 Washington St., Boston, Massachusetts.

Q. **What is your occupational experience?**

A. I am a Managing Consultant at La Capra Associates. I have been with this energy planning and regulatory economics firm for 15 years. Prior to my employment at La Capra Associates, I was Director of Rates and Research, in charge of gas, electric, and water rates, at the Massachusetts Department of Public Utilities. Prior to that period, I taught economics at the college level. My CV is attached hereto as Exhibit BED-1.

Q. **On whose behalf are you testifying in this proceeding?**

A. I am testifying on behalf of the Burlington Electric Department ("BED").

Q. **What is the purpose of your testimony?**

A. My testimony will analyze the Vermont Gas System, Inc.'s ("VGS" or "Company") proposed firm transportation rate, FT-G; I will demonstrate why it is appropriate to develop separate local transportation rates for service at the transmission and distribution levels for both firm and interruptible customers; and

I will address why open access policies should be made applicable to VGS and its tariffs.

Q. **What is Burlington Electric Department's interest in this proceeding?**

A. Burlington Electric Department has essentially been denied access to the gas supply market by VGS's transportation pricing policies. BED contends here, as it did in Docket No. 6016, that VGS has priced its transport service so high that no one will find it economic to utilize this service. Notwithstanding the Public Service Board's finding in Docket No. 6016 that VGS's Interruptible-Transportation ("IT") Tariff was just and reasonable, no one has chosen to take service under that Tariff to date. The pricing of the proposed FT-G rate is likewise so high that it is unlikely any one will utilize this service either. The result is that VGS will remain the monopoly provider of bundled gas service in Vermont for the foreseeable future.

BED is a not-for-profit electric utility. It could be a large transportation customer on behalf of its generating plant, the Joseph C. McNeil Generating Station. This plant was designed primarily to burn wood, but it can also use either gas or distillate oil. If BED cannot receive gas at a price low enough to generate electricity, its choices are reduced to wood or oil. BED is a large enough customer so that it would be economic for it to purchase its own gas, if transportation were available at a reasonable rate. If gas transportation is priced higher than either marginal or embedded costs, there will be times when BED is

forced to use another more expensive fuel. This directly increases costs to both electric ratepayers and gas ratepayers. Also, if BED pays a gas transportation rate that is priced higher than cost, its electric ratepayers are providing a subsidy to an investor-owned gas utility. There is no economic or public policy rationale for this result.

Q. **Please explain how BED has been denied access to the gas supply market.**

A. The McNeil plant is located on and served off the VGS transmission system. If VGS offered a transportation rate that reflected only transmission system costs, BED could utilize that rate and have access to the Canadian gas transmission system that serves VGS. If VGS were connected to other interstate gas transmission systems, FERC's open access policies would clearly support such access.

Q. **How has VGS priced its service to McNeil in the past?**

A. A small amount of McNeil usage of gas, which is utilized for firing (start up) of the boilers, has been firm, but fuel for electric generation has been interruptible. The only real choice available has been interruptible sales service, since the IT rate, based on VGS's entire distribution and transmission system, is prohibitively priced. Early in the life of the unit, gas was priced so that it was often economic and was utilized extensively in the summer and warmer periods in the spring and fall. Under the initial contract BED received gas at a commodity charge adjusted by a pricing index. BED also paid a fixed monthly amount for 36 months that

began at $13,786.40 per month, which resulted in total payments of more than $500,000. It was and is BED's understanding that this payment was to repay VGS for the investment costs associated with extending the transmission line to McNeil and for other plant costs, which had an original cost to VGS of $125,399. Since 1993, however, interruptible gas has generally been priced by VGS equivalent to the cost of oil, and it has not been economic to utilize for generation. This was often the case even when the most economic alternative source of energy to gas has not been oil, but wood. VGS has thus not even consistently offered accurate "value of service" pricing to McNeil. As a result, McNeil has not often burned gas in recent years.

Q. What is the impact on McNeil of this pricing of gas and gas transportation?

A. Since McNeil has to pay more than competitive market prices to receive gas, its fuel cost and therefore dispatch price has been higher than for similar electric generators. For instance, under the proposed FT-G rate, a customer with a 50% load factor would pay about $1.90 per MCF transported, whereas the other gas transportation rates I have seen around New England range from $.60 to $1.00 per MCF. These inflated prices reduce the hours in which McNeil is dispatched to provide generation. This increases the cost to BED electric customers and is economically inefficient. The inability to acquire gas at market prices means that energy which could be produced by McNeil burning gas will be produced instead by McNeil burning wood or by other units in New England, which may be

burning oil. Since gas is environmentally preferable to the alternative fuels that are burned, VGS's gas pricing policy may be viewed as having a negative environmental impact.

Q. **Has the Company explained why it has filed only a single transportation rate, applicable to customers who take service at both distribution and transmission levels?**

A. The Company testifies that the operation of its "transmission and distribution facilities is highly integrated." It also referred to the Order in Docket No. 6016. However, the Procedural Order in Docket 6335 states that the question of "whether it is appropriate for VGS to offer a "transmission only" tariff is a subject of consideration in this docket.

Q. **Has the Company presented any reason for not considering a transmission level rate other than the "integrated" nature of the system?**

A. The Company also relies on its judgment that the only customers that are currently eligible to take service under FT-G are distribution level customers. This, however, is inaccurate, as other customers may take service under FT-G if they pay for any required system upgrades. These customers would clearly include the McNeil plant, which is a transmission level customer.

Q. **Why do you recommend both a transmission rate and a distribution rate for transportation service, when the Company has proposed a single Transportation rate?**

A. The transportation rate proposed by the Company is designed on the basis of customers who utilize the Company's distribution network. However, there are customers, such as BED, who are served directly off the Company's local transmission network, and who do not utilize the distribution system.

Q. **How is McNeil served directly from the local transmission system?**

A. The McNeil plant is served by a 3120 foot transmission line that connects directly to the 8" transmission line that "feeds" North Burlington Gate Station. Distribution mains typically operate at less than 100 psig, and distribution systems do not supply gas back to high pressure transmission systems.

Q. **Is this an adequate reason to establish a new rate class?**

A. Yes. Standard ratemaking theory holds that classes should be differentiated based on major cost causation characteristics. If those characteristics mean that cost causation is different between classes, the cost allocation process should reflect those differences. This is the same principle that the Company has applied in creating a transportation rate, reflecting that some customers will not require the Company to provide them with gas supply. The Company has also recognized cost causative characteristics in its proposal to establish new rate classes for firm

customers based on their characteristics rather than their end uses. Some customers do not make use of the distribution system. These customers could stop taking service and would not create any additional capacity on the distribution system. The converse of this situation is that if the distribution system were closed, VGS could still supply gas to McNeil. VGS did not install distribution mains to provide service to customers who take service directly from the local transmission system.

Distinguishing between customers who take service from the distribution and the local transmission system is similar to voltage or service level differentiation in electric cost of service studies. These rates reflect the fact that customers who take service from the primary distribution system do not use and should not pay for the secondary distribution system.

Q. Does the fact that the distribution and transmission systems are "integrated" change the fact that transmission level customers do not utilize the distribution system?

A. No. Clearly, the primary and secondary distribution systems of electric companies are also "integrated". Electricity flows from the primary to the secondary systems, and customers may be served off either the primary or the secondary systems. This has not prevented the development and approval of rates that require primary service customers to pay only for a share of the primary

service facilities, and not for secondary facilities that are utilized by lower voltage customers.

The Company has stated that demand on distribution lines can affect transmission capacity, and vice versa. This does not mean that a customer taking service off the transmission line makes use of the distribution system. If the transmission system has been sized to meet the firm load of the entire system, customers who take service off the transmission system should be able to utilize transportation capacity to the amount of their normal firm load without preventing the Company from serving distribution customers. If an interruptible customer served directly off the transmission system was allowed to take gas at a level that would reduce the Company's ability to serve firm customers on the distribution system, I would describe this as an error on the Company's part. The Company would have allowed the customer to use more of the transmission system than it was entitled to as an interruptible customer. It would not, however, mean that the customer had used the distribution system.

Q. **What would be the appropriate basis for a local transmission rate?**

A. A transmission level transportation rate should be lower than a distribution level transportation rate, because it should not be allocated any of the distribution system except for plant that it actually makes use of, such as meters. Thus the allocation of plant and expenses should exclude a number of costs that are appropriately allocated to distribution customers. I have estimated that a firm

transmission level rate should be priced at roughly 40% or less of the level of the distribution level rate for the same service.

Q. **Would it be unusual to find large customers not transporting their own gas when offered appropriately priced transportation rates?**

A. No. In other parts of the country, gas companies have truly opened access to the gas supply system, and customers have responded by going directly to the gas supply market. The U.S. Congress and the Federal Energy Regulatory Commission have documented the benefits of wellhead decontrol. However, because VGS has not unbundled its system and has priced its transportation services so high that it is not economic to utilize that service, VGS has failed to extend the benefits of wellhead decontrol to McNeil. Unless the Board intervenes and requires VGS to unbundle its transmission function from its distribution function, VGS will have effectively prevented all but one seller, itself, from reaching McNeil.

Q. **Would it also be appropriate to develop an interruptible transportation rate for transmission level customers?**

A. Yes it would. It is clear from the fact that there are no customers on the existing interruptible transportation rate that the rate has been priced above market prices, if not above the actual cost of service. This pricing leads to inefficient results, as customers who could economically purchase gas and transport it across Canada

are unable to get the gas delivered economically. I should note that today, one can purchase gas at the wellhead in Canada and purchase transportation of that gas to the U.S./Canada border. However, from that point to anywhere else in Vermont the bottle neck facilities are controlled by the Company. This problem is compounded in the case of McNeil. The rate is excessive not only because it is not based on marginal costs, but also because it is based on embedded costs of a portion of the Company's plant that does not in any way serve McNeil.

This pricing causes McNeil harm, as described earlier, but it also causes harm to the Company. McNeil would transport more gas than it currently purchases from the Company as interruptible sales if the service was truly cost based. It is most likely that this would provide VGS with greater margins than it currently receives from McNeil. This result would reduce electric costs in Vermont and would also probably increase the revenues above costs that would be contributed by McNeil that could go to benefit other gas ratepayers.

Q. **How should an interruptible transmission level transportation rate be developed?**

A. Such a rate should be based on a cost allocation study that reflects how interruptible customers use the system. The Company only allows interruptible sales customers to use gas when the system has adequate supplies and main capacity to accommodate the interruptible load. Interruptible transportation will be allowed only when the transmission and distribution system has adequate

capacity. Vermont Gas plans its gas supply to meet firm demand peak load, and allocation of the transmission and distribution system should reflect this fact. Next, all plant and expenses associated with distribution level delivery of gas should be excluded from the interruptible transportation rate to produce a similar rate for transmission level customers.

I prepared a cost-based interruptible transportation rate for transmission-only customers in Docket No. 6016, which is attached hereto as Exhibit BED-2. While this exhibit would need to be slightly modified to account for VGS's most recent revenue requirement filing, it generally sets forth a just and reasonable interruptible transportation rate for transmission-only customers like McNeil.

Q. **Do you have any other problems with the proposed transportation rate?**

A. The rate as proposed is very sensitive to customer load factor. The customer must commit to a Maximum Daily Transportation Quantity ("MDTQ") based on the customer's past maximum usage. Since the rate is very demand intensive, a customer with a 50% load factor would pay almost twice as much as a customer with a 90% load factor. This does not necessarily reflect cost causation, because the customer's peak might not even occur during VGS's peak hours or days. The rate could be improved by introducing more pricing flexibility, that would encourage customers to use less gas on the VGS peak rather than simply improving their computed load factor.

Q. Does this conclude your testimony?

A. Yes, it does.

REBUTTAL TESTIMONY

SUBMITTED BY

LEE SMITH

ON BEHALF OF

PEOPLE OF THE STATE OF ILLINOIS

AND THE

CITIZENS UTILITY BOARD

NOVEMBER 6, 2001

REBUTTAL TESTIMONY OF LEE SMITH

Q. WHAT IS YOUR NAME AND BUSINESS ADDRESS?

A. My name is Lee Smith. I work for La Capra Associates, 333 Washington St., Boston, Massachusetts.

Q. HAVE YOU PREVIOUSLY SUBMITTED TESTIMONY IN THIS PROCEEDING?

A, Yes.

Q. WHAT IS THE PURPOSE OF YOUR REBUTTAL TESTIMONY?

A. I am responding to the rebuttal testimonies of Ms. Althoff and Mr. Jones of Illinois Power Company. I will contrast the rate design positions of the Company with that of the People of the State of Illinois and the Illinois Citizens Utilities Board.

Q. DID MS. ALTHOFF RESPOND TO YOUR POSITION ON THE ALLOCATION OF THE COMPANY'S MISCELLANEOUS REVENUES?

A. No. It is not clear that Ms. Althoff understood my position. Her basic response seems to be that she is not aware of any textbook directing that revenues should be allocated in accordance with costs. She continues to assign revenues to classes according to who paid those revenues, with no reference to underlying costs

Q. PLEASE RESTATE YOUR OWN POSITION.

A. It is common practice to allocate costs to customer classes, then to set the class revenue requirements equal to the allocated costs. However, we do not have specific rate classes for the services that give rise to miscellaneous revenues. If we are trying to create rates that reflect cost causation, then most "Miscellaneous Revenues" should be allocated according to the costs that are incurred in order to produce the revenues. Most miscellaneous revenues represent services provided by the utility that have underlying costs which are included in the cost of service in various accounts. For instance, equipment and property rental revenues are received for use of utility plant. Customer

classes all share in the cost of this rented plant, and the revenues should be allocated in the same way that the costs of the plant are reflected in the cost of service. Most other utility provided services that produce revenues, such as reconnects, establishing temporary service connections, and service activation, require that activities be performed by utility distribution personnel. These revenues should be allocated in the same manner that the cost of the personnel performing the service was allocated.

Exceptions to the above treatment include revenues which may not have underlying costs. For instance, forfeited discounts reflect customers not paying bills on time, and it is appropriate that they be credited to customers in proportion to how they were booked.

Q. HAS THE COMPANY PROVIDED ANY INFORMATION THAT WOULD JUSTIFY A DIFFERENT ALLOCATION OF MISCELLANEOUS REVENUES?

A. No.

Q. HAS THE COMPANY CHANGED ITS POSITION REGARDING THE ALLOCATION OF SECONDARY DISTRIBUTION PLANT ACCOUNTS?

A. Yes. Ms. Althoff indicates that "additional statistical information ....disclosed that demand metered general use customers up to 200 kW can have service lines that connect to secondary distribution lines." (IP Exhibit 8.10. p.8, lines 154-155.) This is the position that I argued in my direct testimony. The Company has developed a new allocator for these costs that reflects the fact that most Rate Class 3 customers do make use of secondary facilities. The Company's revised allocation of secondary plant to Rate Class 3 is 25.6%, compared to its original allocation of 0% to this class. This allocates slightly less secondary facilities to Rate Class 3 than the original Primary Service allocator that I utilized in Schedule LS-1 (25.6% compared to 35.1%). I will accept the Company's revision on this issue.

Q. HAS THE COMPANY CHANGED ITS POSITION ON RATE DESIGN?

A. Yes. Mr. Jones has agreed that the Facilities Charges for residential customers taking delivery service should be set at the same levels as the Facilities Charges that will

be in effect on May 1, 2002, after the rate reduction of 5%. I recommend adoption of this proposal.

Q. HAS MR. JONES MODIFIED ANY OF HIS OTHER POSITIONS ON RATE DESIGN?

A. No. In his rebuttal testimony, Mr. Jones accepts that the cost of local distribution facilities does increase with load, but he does not change his position on rate design as a result. He still wants to collect the total cost of local distribution facilities from each customer, as if these costs were collected through a customer charge. He introduces a new exhibit, IP Exhibit 6.12, that he claims shows that secondary distribution costs increase only very slightly as load increases. This exhibit is evidently intended as an argument against volumetric delivery service charges. This very hypothetical exhibit compares the costs of two unique residential circuits, one of which is supposed to serve 6 customers who use an average of 300 kwh/month, and the other which is supposed to serve 6 customers who use an average of 3000 kwh/month. This exhibit purports to show that although secondary facility costs vary with size, they do not increase at nearly the same rate as load, so the cost per kwh of serving a large residential customer is much less than the cost per kwh of serving a small residential customer. For instance, in this exhibit load increases 10 times while costs increase only about two times.

Q. WHAT DOES THIS EXHIBIT ACTUALLY DEMONSTRATE REGARDING THE COST PER KWH OF SECONDARY DISTRIBUTION FACILITIES?

A. At most, it shows that under these particular circumstances, cost per kwh decreases significantly as customers get larger. This exhibit does not prove that this is the case all the time, or that per kwh costs generally decrease significantly with size of customers. IP's results have been determined by two particular hypothetical situations, and there are a number of ways in which these hypothetical installations do not appear typical. According to the response to CUB Data Request 6.11, this example assumes exactly the same plant layout for both small and large customers, with the same distances between houses and the same length services. Both examples show 6 customers in 6 identically shaped lots, served off one 125 foot length of conductor. However, if larger

customers were more widely spaced, they would need a longer length conductor and more poles. The two customer groups also have the same load shape, so that the customers whose energy use is 10 times that of the small customers also use exactly 10 times the peak load. This again appears to be atypical; a customer using 3000 kwh is likely to have air conditioning or electric heating, and is thus likely to have higher peak relative to energy use. The particular costs cited show higher labor and overhead cost for the smaller transformer than for the larger transformer, which is probably not typical, given that the steps to install transformers are similar, although there may be less effort in connecting the small transformer, which is serving single phase customers.

Another theoretical problem with this "analysis" is that it does not indicate at what size a customer needs larger facilities. The example shows that a more expensive conductor and transformer must be installed for the 6 customers who used 3000 kwh per month. However, this same more expensive plant may be needed for 6 customers who used only 1,000 per month. This may happen often because these pieces of equipment do not come in infinite size variations. Once load gets too large for a 10kVA transformer, the next size is probably quite a bit larger. In the Company's hypothetical, if the load that was divided into the cost was 1,000/month per customer rather than 3,000/month per customer, the difference between the cost per kwh in the two customers would be smaller.

I would expect that we could find other segments of the secondary distribution system that would produce very different results. For instance, we might find a circuit serving smaller customers that enabled more customers to share a transformer, and a circuit serving larger customers who were farther apart and thus needed a longer conductor. The first would show greater sales, which would reduce the cost per kwh of these facilities. The second distribution segment would show higher total costs and thus would increase the cost per kwh. These are only two of the variables that could change and cause very different results.

Q. DOES THIS EXHIBIT SUPPORT THE CONCEPT THAT THE COST PER KWH OF SECONDARY DISTRIBUTION FACILITIES DECREASES SO MUCH AS CUSTOMERS GET LARGER THAT SECONDARY DISTRIBUTION FACILITIES COSTS SHOULD BE CHARGED ON A PER CUSTOMER BASIS?

A. No. There is no evidence that this exhibit represents typical distribution facilities.

Q. HAS MR. JONES AGREED WITH YOUR PROPOSAL TO SET THE RATE BLOCK DIFFERENTIAL 0.8 CENTS/KWH?

A. No. Mr. Jones argues that the "winter price differential" should be set at the winter block difference of 1.76 cents per kwh.

Q. PLEASE DISCUSS THE WINTER RATE BLOCK DIFFERENTIAL.

A. The current bundled rate has a higher differential, 1.76 cents, between blocks in the winter, than in the summer. This differential was originally driven by both distribution and generation costs. I do not recommend utilizing this differential in a separate winter delivery service rate.

First, this differential is higher than a cost-based differential, even if we accepted that it should recover secondary distribution costs. It is higher than the differential that the Company had originally claimed was justified by the cost of the secondary distribution system. The Company has since reduced its allocation of secondary distribution plant to the residential class, so its original differential is no longer supported.

Second, this approach would charge each customer as if he or she was responsible for the average level of secondary distribution costs. In my direct testimony I discussed the fact that secondary distribution costs vary with the size of the customer, as we would expect of capacity costs. Mr. Jones' rebuttal testimony accepts that secondary distribution costs do vary somewhat with customer size. If we charge each customer for the average amount of facilities, small customers will pay too much. Thus, the Company has not justified this size differential for average sized customers, and even if it were justified for

average sized customers, this amount of differential will charge too much to low use customers.

Q. IS THIS THE REASON YOU ADVOCATE USING THE SUMMER DIFFERENTIAL IN BOTH SUMMER AND WINTER DELIVERY SERVICE RATES?

A. Yes. While some amount of block differential might be justified on the basis of costs, the Company has not justified the differential that it has proposed. If we use the bundled rate summer differential, customers will see the identical rate structure between the bundled rate and the delivery service rate in the summer. The residential delivery service rate will also be relatively simple, with the same differential in both seasons.

Q. HAVE YOU MODIFIED YOUR COST OF SERVICE?

A. Yes. I have reflected both Mr. Effron's rebuttal testimony and the Company's revised secondary distribution allocator, by modifying the Cost of Service Study (COSS) presented by the Company in its rebuttal testimony. The summary of this COSS is contained in Schedule LS-4. In addition, I have developed the residential rate revenue requirement from this in Schedule LS-5. I would recommend this revenue requirement as the basis for designing rates.

Q. HAVE YOU DESIGNED A RESIDENTIAL DELIVERY SERVICE RATE CONSISTENT WITH YOUR TESTIMONY?

A. Yes. Using the Company's revised billing determinants. I have developed a rate that contains a 0.8 cent differential between 300 kwhs per month and all other usage. This is shown in Schedule LS-6.

Q. WHAT RATES DO YOU PROPOSE?

A. I recommend a residential monthly facilities charge of $5.95, $7.96 and $16.00 for multi-family, single phase and three phase service respectively, and a declining block rate of $0.0260 per kwh for the first 300 kwh and $0.0180 for usage over 300 kwh.

Q. DOES THIS CONCLUDE YOUR TESTIMONY?

A. Yes.

DIRECT TESTIMONY

SUBMITTED BY

LEE SMITH

ON BEHALF OF

PEOPLE OF THE STATE OF ILLINOIS

CITIZENS UTILITY BOARD

SEPTEMBER 12, 2001

I. INTRODUCTION

Q. WHAT IS YOUR NAME AND BUSINESS ADDRESS?

A. My name is Lee Smith. I work for La Capra Associates, 333 Washington St., Boston, Massachusetts.

Q. WHAT IS YOUR OCCUPATIONAL EXPERIENCE?

A. I am a Senior Economist and Managing Consultant at La Capra Associates. I have been with this energy planning and regulatory economics firm for 17 years. Prior to my employment at La Capra Associates, I was Director of Rates and Research, in charge of gas, electric, and water rates, at the Massachusetts Department of Public Utilities. Prior to that period, I taught economics at the college level.

Q. WHAT IS YOUR EXPERIENCE IN RATE DESIGN AND COST ALLOCATION?

A. Since leaving the Massachusetts DPU, I have performed cost studies and prepared rate design for over twenty utilities in more than twelve states. I have advised Commissions and consumer advocates on issues related to electric and gas rates and electric restructuring. My resume is attached.

Q. PLEASE DESCRIBE YOUR EDUCATIONAL BACKGROUND.

A. I have a bachelor's degree with honors in International Relations and Economics from Brown University. I have completed all requirements for the Ph.D. except the dissertation from Tufts University.

Q. ON WHOSE BEHALF ARE YOU TESTIFYING IN THIS PROCEEDING?

A. I am testifying on behalf of the Illinois Citizens Utility Board and the People of the State of Illinois.

Q. WHAT IS THE PURPOSE OF YOUR TESTIMONY?

A. I will comment on the Company's cost allocations and on its proposed changes in rate design, and provide the allocated results of the changes produced by Mr. Effron.

Q. PLEASE SUMMARIZE YOUR CONCLUSIONS.

A. I have found that the Company has overstated the cost of service of the residential class, as a result of several allocations which are not appropriate. The Company has developed rates using billing determinants which are too low, which produce rates that are higher than they should be. In addition, Illinois Power's proposed residential rate design is not justified. Specifically, the Company's proposal to increase the difference between declining block rates conflicts with a number of rate design principles and should not be adopted.

I recommend that the customer charge for residential delivery service mirror the customer charge for residential bundled rates, and that the differential between the first and the second block charge found in bundled rates remain the same in the delivery service rates. This will allow customers to more easily compare bundled and unbundled rates, and prevent any unreasonable or unjustified price disparities in the event a customer chooses unbundled service. I further recommend that those block rates should be set according to

the revenue requirement recommended by Mr. Effron and the allocations recommended by myself.

II. ALLOCATED COST OF SERVICE STUDY

Q. PLEASE DESCRIBE THE COMPANY'S ALLOCATED COST OF SERVICE STUDY.

A. The Company has allocated its claimed delivery service cost of service to the rate classes for whom it is proposing delivery service rates. The fundamental Delivery Service Tariff will include four rate groups, for residential (SC2 and 3), non metered general service customers (SC 13), demand metered general service customers (Rate Class 3), and small non-demand metered general service customers (Rate Class 2A). The Company allocated costs to its existing rate classes, then combined classes into only the four categories for Delivery Service rates. The categories of costs allocated include subtransmission, distribution, customer costs, and administrative and general costs. Much distribution plant is allocated on the basis of non-coincident peak ("NCP") allocators, which are intended to measure class peak usage as a proportion of the sum of peak usage of all classes. These peaks generally occur at different times, unlike coincident peaks, which reflect what each class uses at the time of the system peak. The theory behind allocation on the basis of non-coincident peaks is that distribution plant must be constructed to meet the peak load of every class, whenever it occurs. Most of the other distribution plant is allocated on the basis of the numbers of customer in each class, weighted by cost differences among the type of plant serving different customer classes.

Q. HAVE YOU FOUND ANY PROBLEMS WITH THE COMPANY'S CLASS

ALLOCATED COST OF SERVICE STUDY ("COSS")?

A. Yes. The Company allocates no secondary distribution costs to Rate Class 3, which contains most of the commercial and industrial (general service) customers. Since most Rate Class 3 customers take service at a secondary voltage, as a whole, they would be expected to utilize secondary service facilities and therefore should be allocated a portion of the cost of these facilities.

In the typical configuration of electric systems, serving both residential, and small and medium sized general service customers, the primary system delivers power to line transformers which step down the power to secondary voltage. All customers other than very large ones are served either from a secondary service line from the line transformer or a secondary distribution line. The configuration of secondary service to general service customers taking power at secondary voltage will be similar to that of residential customers. Thus, normal treatment is to allocate secondary distribution plant to all customers who receive service at secondary voltages.

Q. IS THERE EVIDENCE IN THIS CASE THAT SUPPORTS YOUR ARGUMENT THAT CLASS 3 CUSTOMERS TAKING SERVICE AT DISTRIBUTION LEVEL USE THE DISTRIBUTION SYSTEM IN A MANNER SIMILAR TO RESIDENTIAL AND OTHER SECONDARY SERVICE CUSTOMERS?

A. Yes. Mr. Jones testifies that Demand Metered General Service customers under 200 kW "typically receive service at low voltage" (line 266, p.14). According to the Company's Electric Service Marginal Cost, in the response to IIEC Data Request 2.22 D, p.6, the

service cost for overhead distribution customers for much of current bundled rate 11 (now in delivery service Rate Class 3, for demand-metered general service customers) is the same as residential and the non-demand metered general service customers. Again, this suggests that the use of the secondary system by these rate 11 customers is similar to the use of the system by the residential class.

Q. WHAT IS THE EFFECT OF THIS ON RATE CLASS REVENUE REQUIREMENTS?

A. Other classes, specifically the residential class, the unmetered general service class, and class 2A, will be allocated more costs because Rate Class 3 is not paying any share of secondary distribution plant.

Q. HOW WOULD YOU ADJUST THE ALLOCATION OF SECONDARY DISTRIBUTION FACILITIES?

A. I would allocate secondary distribution facilities to all customers who take service at the secondary level, including most Rate Class 3 customers. According to the Company's response to IIEC Data Request 2.22-D, approximately 31,000 Class 3 customers receive secondary level service. Since these customers receive secondary level service, they should be allocated some of the costs of secondary poles (account 364), secondary distribution lines (account 365), secondary underground conduit (account 366), and secondary underground conductors and devices (account 367). The COSS however allocates 0% of these accounts to Rate Class 3.

The best allocator for these secondary accounts would be the non-coincident peak of all

customers taking secondary service. About 5% of the non-coincident peak load in Rate Class 3 takes service at higher voltage levels. The best allocator would therefore be very close to the non-coincident peak allocator calculated by the Company which does include all classes, labeled DEMPRI. Since the cost of service study does not contain the correct non-coincident peak allocator, we have utilized DEMPRI to allocate these secondary distribution plant accounts.

Q. SHOULD ANY OTHER COST ALLOCATIONS BE MODIFIED?

A. Yes, but these will occur automatically as the COSS model is run. For instance, a number of expenses are allocated based on how plant is allocated. Thus as less secondary line is allocated to residential customers, related expenses will also be reallocated.

Q. WOULD YOU PLEASE DESCRIBE THE COSTS OF PROVIDING THE SERVICES THAT GIVE RISE TO OTHER OPERATING REVENUES?

A. The cost of service study does not identify the cost of providing the miscellaneous services that give rise to "other" revenues.

When asked whether the Company allocated miscellaneous revenues on the same basis as the costs associated with the services that produced these revenues, the Company states[1] that costs expended in "handling miscellaneous revenues" are spread across various accounts, and that allocating them according to "where the costs are recorded" is not appropriate. It is not clear what the Company is referring to in the response above. What

[1] Response to Data Request CUB 2.10

matters is not the cost of "handling" revenues, but the cost of providing the underlying service.

The Company receives miscellaneous revenues primarily as a result of providing services. These services are provided by Company employees and/or by Company equipment. For instance, distribution personnel would reconnect customers along with their other duties, and the reconnection revenues would be booked under other operating revenues. It would appear that most of the reconnection costs would be booked under distribution maintenance expense or distribution plant (for the category titled equipment).

Q. HAS THE COMPANY ALLOCATED OTHER OPERATING REVENUES CORRECTLY?

A. No. Since the COSS allocates all costs to rate classes, revenues are usually allocated in the same manner as the allocation of the underlying costs.

The largest amount of Other Operating revenues is in the category of Miscellaneous revenues. These include forfeited discounts, equipment, reconnection charges, temporary services, miscellaneous, and water heater rentals. The revenues that result from these services should be allocated in the same manner as the expense of the employees or the underlying equipment. For instance, if revenue is produced by one activity of meter readers, the revenue should be allocated in the same manner that the meter readers expense is allocated. Customers should receive the benefits (i.e. the revenues) equivalent to the costs that underlie the services that result in the revenue.

Under the Company's approach, one class could be allocated most or even all of an expense that allowed the service to be provided, and yet could receive credit for none of the revenues created by these services.

Q. HOW HAVE YOU ALLOCATED THESE REVENUES?

A. I expect that equipment revenue, which represents the majority of miscellaneous revenues, includes payments by customers paying for maintenance of installations on their premises, which will sometimes include replacement plant. I have allocated all of the miscellaneous revenues on the same basis as the Distribution Operating Labor expense. Although residential customers pay a small proportion of miscellaneous revenues, and therefore in the Company's COSS receive a small allocation of these revenues, they have been allocated a much larger share of the underlying expenses. Residential customers essentially "paid for" those miscellaneous revenues through IP's allocation of costs. My change to the COSS recognizes this.

Q. WHAT IS THE RESULT OF THIS REALLOCATION OF SECONDARY DISTRIBUTION COSTS AND OTHER REVENUES?

A. The allocation changes described above, to secondary distribution plant and to miscellaneous revenues, were made utilizing the Company's COSS model. The residential class revenue requirement decreases as the rate base decreases by $27 million and Total Operating Expenses decrease by about $4 million. This is illustrated in Schedule LS-1, the summary page of my revision of the Company's COSS.

III. BILLING DETERMINANTS

Q. WHAT IS THE PROBLEM WITH THE BILLING DETERMINANTS USED BY THE COMPANY IN CALCULATING RATES?

A. There are several problems. First, as Mr. Effron testifies, they have not normalized billing determinants to reflect even the number of customers on the system at the end of the test year. Second, the Company is making proforma adjustments to costs without reflecting equivalent adjustments to billing determinants. It would be appropriate to reflect the same time period in billing determinants that is reflected in cost adjustments. Third, the Company "discovered the need to revise billing determinants", according to an Email original sent to Greg Gudeman of Dynegy on 8/31/01, evidently related to weather normalization and selection of the wrong demand. The Company should be ordered to normalize billing determinants to the end of the test year, utilize correct weather normalized billing determinants, and then project these normalized billing determinants to a period consistent with any proforma plant adjustments allowed. This will result in slightly lower rates. Failure to make these adjustments will mean the Company will overcollect its revenue requirement.

IV. RESIDENTIAL RATE DESIGN

Q. WHAT IS THE COMPANY PROPOSING FOR A RESIDENTIAL RATE DESIGN?

A. The Company proposes that residential rates be differentiated by single and three-phase service for single family residences, and for multi-family service. The proposed

customer charges (called facilities charges by the Company) are $8.43 for single phase, and $13.62 for three phase service and $7.30 for multi-family service.

Illinois Power's proposed delivery charges for all residential customers include $.03438 for the 1st 300 kwh per month, and $.02176 per kwh for additional kwhs. In other words, this is a declining block rate, with the tailblock $.01262 less than the first block.

Q. HOW DO THESE CHARGES COMPARE TO THE EXISTING BUNDLED RATE DESIGN?

A. Current residential customer charges for bundled service are $8.46 for single phase and $17.00 for three phase service, and $6.33 for multi-family. Current bundled rates contain customer charges which are essentially the same for single phase customers, who are in the majority of residential customers, higher for three phase customers, and lower for multifamily customers. Current bundled rates also have two blocks, with the same block sizes, but the rate reduction from the first to the second block is only $.0085, or $ .00412 less than the Company's proposed differential.

Q. IS IT CLEAR WHY THE COMPANY HAS PROPOSED THESE CHANGES IN CUSTOMER CHARGES?

A. No. The Company has explained neither the rationale nor the result on bill impacts or customer behavior of changing these charges.

Q. WHAT IS THE RESULT OF THE PROPOSED RESIDENTIAL RATE DESIGN?

A. While decreasing customer charges is often a desirable rate design change, charging different delivery service customer charges from bundled service customer charges is not desirable, since all of the costs to be recovered in customer charges are related to distribution service. It means that customers may either pay more or less under delivery service rates than under bundled service. It would also appear to affect customers bills differentially depending on the size of the bills. For instance, the increase in the DST multifamily customer charge may cause a number of small customers' bills to increase if they leave bundled service, and if their generation costs are the same as those included in bundled service.

Increasing the steepness of the block rate means that smaller use customers pay more of the class revenue requirement. If all customers pay the same for generation, smaller customers will receive a higher percentage increase than other customers. Also, the rates provide less incentive to conserve usage, since it costs less for usage over 300 kwh than flat rates or even than if the existing differential were retained.

Q. WHAT IS THE COMPANY'S RATIONALE FOR THE PROPOSED DECLINING BLOCK DISTRIBUTION CHARGE?

A. Mr. Jones states that the Company both "considered the requirement in the Customer Choice Law that delivery service rates be cost-based" and also considered the requirement that rates should take into account voltage level differences. Specifically, the Company's rate design is intended to recover the costs of secondary lines and transformers through the first block energy charge. Since 80% of customers consume

more than 300 kwhs per month, presumably 80% of customers will pay for the local secondary distribution costs. Collecting these costs through the first block charge is almost the same as collecting them through a customer charge, which Mr. Jones also claims is appropriate.

Q. DO EITHER OF THESE PROVISIONS REQUIRE THE RATE DESIGN PROPOSED BY THE COMPANY?

A. No they do not. The declining block energy charges result from the Company trying to recover the cost of local secondary facilities through the first block charge. The Company implies that certain facilities costs must or should be collected through a particular rate component. The law, however, does not state or even imply a particular formulaic approach. Once the Commission finds that it is appropriate that the Company collect a certain amount of revenue, rates should be designed to collect this revenue requirement. There is no compelling reason why a particular type of cost must be collected in a certain charge.

Also, according to Mr. Jones, this pricing better matches how local low voltage costs are incurred. Again, this provision does not require the rate design proposed by the Company. In order to meet the requirement that rates reflect voltage level differences, costs should be differentiated by voltage level where possible and allocated according to how they are used. If there are customers served at different voltage levels within a rate class, rate design can differentiate between them. The higher first block charge does not contribute to voltage level differentiation.

Q. DOES THE COMPANY'S RESIDENTIAL RATE PROPOSAL ADEQUATELY CONSIDER BILL IMPACTS?

A. No. The Company's rate design creates uneven bill impacts. If residential customers can purchase generation at the credit included in the bundled rate, this rate design will result in smaller customers receiving significant rates increases if they choose alternative suppliers, while large customers receive either lower increases or rate decreases.

Q. HOW DO YOU RECOMMEND THAT THE RESIDENTIAL RATES BE DESIGNED?

A. There are a number of principles that are normally considered in rate design. Rates should be fair and equitable; they should allow for the collection of legitimate costs; they should be relatively simple, which facilitates customer understanding of the rates; rates should assist with or at least not conflict with social goals set by the Commission, such as making electric service available to all customers (universal service) and/or encouraging conservation; rates should provide price signals that encourage efficient use of the product, and there should be concern for rate continuity. All of these principles should be considered, although compromises between principles may be necessary.

With regard to delivery service rates, these principles suggest a number of things. Rate continuity suggests that changes should be gradual, so that changes take into consideration the impact that they will have on customer bills. It would contribute to simplicity and customer understanding to change rates as little as possible from the existing bundled rates, particularly during this period of change. In this case, customers

are facing many changes in the way electricity is sold and delivered, which would seem to make rate continuity an important consideration.

With regard to equity and cost collection, the starting point for rate design should be a proper identification of delivery service costs; next, these costs should be allocated across rate classes. The principal basis for cost allocation should be cost incurrence; however, there may be other considerations, particularly where the cost incurrence cannot be clearly identified.

To provide proper price signals, rates must at a minimum communicate the marginal cost of increasing usage. In other words, if it costs two cents per kwh to deliver additional energy, the usage charge should be at least two cents. This is discussed further later in the testimony.

Equitable rates for distribution services will emphasize usage charges. Most distribution costs are a function of the size of load, particularly of peak customer load. For instance, larger customers require greater expenditure on transformers, either because they use larger transformers or because they require individual transformers rather than sharing them. Among residential customers, larger customers tend to be on larger lots, and will usually require more length of line and more poles than smaller customers. All of these considerations support delivery service rates based on usage so that bills increase as usage increases. Providing signals for conservation is also enhanced by usage sensitive rates.

Q. THE COMPANY ARGUES THAT CERTAIN DISTRIBUTION SYSTEM COST COMPONENTS SHOULD BE COLLECTED IN NONUSAGE SENSITIVE CHARGES. DO YOU AGREE?

A. No. Although customer and meter costs are driven by the number of customers, this does not require that monthly customer or facilities charges be set to collect these particular costs. There is even less rationale to collect distribution system costs (other than customer-related costs) in customer charges than there is to collect customer-related costs in this manner. Attempting to collect particular subsets of embedded costs in any particular manner may well conflict with fundamental rate design principles.

A specific example can illustrate why insisting on setting the customer charge according to embedded cost of service results may produce inappropriate price signals. I do not dispute the proposition that the number of meters and services installed is driven almost entirely by the number of customers, weighted by the cost of meters and services. Suppose that the embedded cost of meters and services is $10 per month, and all other embedded costs distribution costs only average $.04/kwh. To deliver an additional kwh costs the Company $.05/kwh. If customer charges were set according to the embedded costs, the remaining distribution charge would be less than marginal distribution costs. The volumetric distribution rate would encourage customers to use (actually, to have delivered) additional energy that they valued at only $.04, energy which it cost the Company $.05 to deliver.

Q. ARE THE PROPOSED RATE CHANGES CONSISTENT WITH PROVIDING EASY ACCESS TO ALL CUSTOMERS, OR THE CONCEPT OF UNIVERSAL SERVICE?

A. No. One underlying principle of electric rate design is the idea that electricity is a necessary public good that should be reasonably available to all residential customers. The higher the customer charge and the higher the first block charge, the less affordable electric service is to customers, particularly to small customers. The higher customer charge for multifamily residences and the steeper declining block charges proposed by Illinois Power will create a negative impact on small customers.

The Company computed the difference between bills based on a flat delivery service charge and the proposed delivery service charge. Large customers would pay about 8% more under flat rates, while customers under 850/kwhs per month usage would pay less under flat rates. This is indicative of the fact that increasing the rate differential between the first block and the tailblock results in larger customers paying less and smaller customers paying more as a result of increasing the differential.

Q. WHAT TYPE OF PRICE SIGNALS DO DECLINING BLOCK RATES PROVIDE?

A. The lower the charge for additional usage, the less incentive customers have to conserve energy. The most crucial element of price signal in a charge is that it reflects the incremental cost of additional usage. However, to the extent that there are societal (or external costs) of both production and delivery that are not reflected in monetized costs, there is rationale for incremental rates to be set higher than incremental costs.

It has become evident in California and other places that additional usage at peak times causes significant increases in power costs and significant stress on transmission and distribution systems. This stress increases maintenance costs and requires investment in plant. These impacts have not yet been felt in Illinois because of the existence of rate caps, but they will be felt in the future. Rates need to communicate to customers that additional usage will probably increase average costs. Declining block rates communicate the opposite message.

Q. YOU HAVE INDICATED ABOVE THAT EMBEDDED COST INCURRENCE IS NOT NECESSARILY THE BEST BASIS FOR SPECIFIC RATE CHARGES. IN ADDITION TO THIS PROBLEM, HAS THE COMPANY ESTABLISHED THAT ITS PROPOSED RATE DESIGN APPROPRIATELY REFLECTS COST INCURRENCE?

A. No. The Company has overstated the local low voltage costs that must be incurred to serve customers. The amount of plant that must be installed to provide power to customers is the minimum amount that could be built. However, the company does not build the minimum amount. Utilities install plant that is designed to meet demands well above minimum and to comport with a variety of other requirements. Thus, utilities often do not even purchase the minimum size. They utilize larger and more expensive equipment because customers are likely to have certain peak loads, and if the equipment is not sized to meet these loads, the system will not be reliable. Even if the Company knew that a particular location would use very little energy, it would build distribution that would provide for more typical energy usage, both because those would be the size transformers and conductors that were stocked and because usage could increase. In

other words, usage and reliability are cost drivers for distribution plant. The Company recognizes this in its allocation of distribution plant to rate classes on the basis of non-coincident peak usage, but there is a mismatch between this allocation and their rate design. By attempting to recover secondary distribution costs entirely through the first block charge, the rate design essentially allocates these costs among customers on the residential rate on the number of customers. It treats the full cost of secondary distribution, costs that are allocated in the COSS on peak usage, as if it were a customer cost.

Q. IF IT WERE APPROPRIATE TO CHARGE EACH CUSTOMER FOR THE MINIMUM COST OF PROVIDING SECONDARY SERVICE TO THEIR FACILITIES, WOULD THE COMPANY'S COMPUTATION BE CORRECT?

A. No. Even if it were appropriate to allocate a certain amount of secondary distribution plant to each customer, which it is not, the Company's approach would allocate too much to each customer. Its approach implies that it is necessary to incur the average cost of lines and transformers for every customer. This is not correct. Mr. Jones apparently wants to collect the average cost of local secondary facilities (lines and transformers) from every residential and small general service customer. Depending on the location and size of the customer, the cost of secondary lines and transformers varies between customers. A 10 kVA transformer can serve up to 2 customers. The average is 1.2 customers per transformer. Obviously some customers are utilizing only one-half of a transformer, yet if their facilities charge (or first block charge) reflects the average, they are paying for .83 transformers. This is even more true with regard to 25kVA

transformers, where the average served is 3.1 but the transformer can serve up to 6 customers. If every customer pays the average, some customers, particularly smaller customers, will pay for more than the cost incurred in providing power to them.

Q. WHAT DO YOU RECOMMEND FOR THE RESIDENTIAL RATE DESIGN?

A. I recommend that secondary distribution costs, which are driven by usage, should not be recovered in the first block charge, which is equivalent to recovering these costs in the customers charge. Also, I recommend that rate design, that is the customer charge and the price differential between the block rates, should be the same in the delivery service rate and the bundled rates. Finally, a reduction in the class revenue target will result in lower average per kwh charges than proposed by Illinois Power.

V. IMPACT OF COST OF SERVICE CORRECTIONS

Q. HAVE YOU ESTIMATED THE IMPACT ON CLASS REVENUE REQUIREMENTS OF MR. EFFRON'S RECOMMENDED CHANGES TO THE COST OF SERVICE?

A. Yes. I have reduced expenses and rate base following Mr. Effron's recommendations. In most cases, Mr. Effron indicates in what account the costs reside. In several instances, it was necessary to allocate his recommended reduction between several accounts. The reduction to distribution, both for depreciation expense and for plant, was allocated among accounts 361 to 368 according to the total amount of plant in these accounts in the Company's filed cost of service study. The reduction to general plant was likewise allocated among accounts 390 to 392. Since each of these accounts are allocated by the

same allocator, this last assumption does not affect the results in any way. The increase to accumulated depreciation was spread among all distribution plant accounts. I have relied on the COS model to calculate income taxes, so the total Company results are not identical to those produced by Mr. Effron. However, this COS should be very close to final results. I would recommend that the Company make these modification to reflect costs by account more accurately.

Q. WHAT ARE THE RESULTS OF THESE CHANGES?

A. The summary page of the COSS with the 4 rate groups, resulted from revising the Company's COSS to reflect my allocation changes and Mr. Effron's recommendations, is attached as Schedule LS-2. The Company's COSS model summary page does not actually show the total revenue requirement, but it does show the changes in separate cost components. Total operating and maintenance expenses allocated to the residential class decrease by $15.5 million, while depreciation and amortization expenses decrease by $4 million. Rate base allocated to the residential class decreases by $88.8 million. I have calculated that the return based on the rate of return utilized by Mr. Effron decreases by $11.7 million. The Company's COSS model does not show the reduction in income tax that should result from this reduction in income, either for the total company or for the residential class. I have estimated that income tax would decrease proportional to the decrease in return. The final result, shown in Schedule LS-3, is that the residential class revenue requirement declines by $35.2 million. The revenue requirements of all other classes also decrease. I recommend that rates be designed in the manner I have recommended, using appropriate billing determinants, to collect these revenue

requirements.

Q. HAVE YOU DETERMINED WHAT THE RESIDENTIAL RATES SHOULD BE?

A. No. As discussed earlier, I recommend that customer charges should mirror the bundled rate. I cannot determine my recommended per kwh charges because Illinois Power has not provided the correct billing determinants. I reserve the right to address this issue in rebuttal testimony.

Q. DOES THIS CONCLUDE YOUR TESTIMONY?

A. Yes.

APPENDIX E

GEORGE R. McCLUSKEY

LA CAPRA ASSOCIATES
Senior Consultant

George McCluskey is a ratemaking and planning specialist with over 20 years experience in utility economics. Since joining La Capra Associates in 1999, Mr. McCluskey has provided advise to several clients on a variety of restructuring, cost of service, merger and asset valuation issues. Previously, Mr. McCluskey directed the electric utility restructuring division of the New Hampshire Public Utilities Commission ("NHPUC."). Before that, Mr. McCluskey was manager of least cost planning, directing and supervising the review and implementation of electric and gas utility least cost plans and demand-side management programs. Mr. McCluskey has testified before the NHPUC in numerous electric and gas rate proceedings on cost of service analysis, rate design, power supply portfolio planning, and the integration of demand and supply-side resources. Mr. McCluskey has also testified before the FERC on prudence and stranded cost issues related to requirements power contracts.

RELEVANT EXPERIENCE

- Project manager for case before the Public Utility Commission of Texas requiring expert testimony on unbundled cost of service, cost allocation and rate design for three restructured transmission and distribution utilities.
- Directed the NHPUC's investigation into the application of marginal cost principles to gas utility ratemaking. Also prepared and presented expert testimony on behalf of NHPUC Staff that addressed all areas of disagreement including the methodology for calculating production-related marginal costs and the determination of class revenue requirements.
- Provided advice on pricing policy issues to electric distribution companies in England and Wales. This work involved translating the cost messages contained in the Central Electricity Generating Board's marginal cost based wholesale tariff into retail tariff messages for small and large consumers.
- Participated in the economic evaluation of power contracts entered into by the California Department of Water Resources valued at about $43 billion over ten years. This work was conducted on behalf of the Bureau of State Audits.
- Prepared and presented direct and supplemental testimony in a proceeding to establish the NHPUC's policy on the unbundling of firm and interruptible gas services. Also presented testimony on illustrative gas transportation rates for commercial and industrial customers.
- Advised the General Staff of the Arkansas Public Service Commission regarding Entergy Arkansas Inc.'s application to transfer ownership and control of transmission assets to an RTO. Includes cost-benefit analysis of the proposal to

create a Transco and the retail rate implications of transferring transmission assets to a FERC jurisdictional utility.

- Directed the preparation of the NHPUC 's plan to restructure New Hampshire's electric utility industry.
- Supervised the design and implementation of New Hampshire's first in the nation retail competition pilot program.
- Prepared and presented expert testimony before the NHPUC regarding the stranded cost aspects of the Restructuring Settlement Agreement submitted by Public Service Company of New Hampshire ("PSNH") and various settling parties. Testimony presents an analysis of PSNH's stranded costs and makes recommendations regarding the recoverability of such costs.
- Prepared and presented expert testimony on behalf of the NHPUC before the Federal Energy Regulatory Commission regarding the Order 888 calculation of wholesale stranded costs for utilities receiving requirements power supply service.
- Presented expert testimony on the rate and revenue requirement implications of embedded and marginal cost-of-service studies prepared by New Hampshire distribution companies.

EMPLOYMENT HISTORY:

La Capra Associates — Boston, Ma
Senior Consultant — *1999 - present*

New Hampshire Public Utilities Commission — Concord, NH
Director, Electric Utility Restructuring Division — *1993 - 1999*
Manager, Least Cost Planning, Economics Department
Gas and Electric Utility Analyst, Economics Department

Electricity Council — London, England
Pricing Specialist, Retail Tariff Policy Section, Commercial Department — *1977 - 1987*
Information Officer, Secretary's Office

EDUCATION

University of Sussex Space Physics Laboratory — Sussex, England
Ph.D. candidate in Theoretical Plasma Physics — *1977*
Withdrew in 1997 to accept position with the Electricity Council.

University of Sussex — Sussex, England
B.S., Theoretical Physics — *1975*

RECENT REPORTS

LEE SMITH

LA CAPRA ASSOCIATES
Senior Economist

Ms. Lee Smith is a Managing Consultant and Senior Economist at La Capra Associates. Ms. Smith has twenty years experience in utility economics and regulation. Her work has encompassed all aspects of utility pricing, cost analysis, forecasting, and both demand-side and supply planning in electric, gas, and water utility cases. Ms. Smith has analyzed issues of electric rate design, including rate unbundling and appropriateness of utility costs in 17 different states for a multitude of utilities and other entities. As a consultant, her clients have included gas and electric utilities, regulatory commissions and other public bodies. Previous to La Capra Associates, Ms. Smith was employed as the Director of Rates and Research at the Department of Public Utilities.

RELEVANT EXPERIENCE

- Modified cost of service allocations and testified on delivery service rate design on behalf of Illinois consumer advocates.
- Estimated retail class generation rates under continued regulated and retail access Arkansas Public Utilities Commission Staff; analyzed proposed change to System Resource Agreement by Entergy.
- Assisted the Arizona Corporation Commission in developing unbundled rates for all Arizona utilities; preparing positions, and negotiating with utilities on stranded cost and rate design.
- Advised Pennsylvania Office of the Public Advocate staff in restructuring proceedings; presented testimony on cost functionalization and rate unbundling in eight cases.
- Developed allocated cost of service studies and rates for a number of small utilities that required use of borrowed load data.
- Represented the Massachusetts Department of Energy Resources at NEPOOL committees engaged in developing the New England Independent System Operator, and an Open Access Transmission Tariff for New England.
- Directed Nantucket Electric Company in development of full load research program for small island utility for use in cost allocation and load forecasting.

EMPLOYMENT HISTORY

La Capra Associates — Boston, MA
Managing Consultant — *1984 - present*

Department of Public Utilities — Boston, Ma
Director of Rates and Research — *1982 - 1984*

EDUCATION

Tufts University — Medford, MA
Ph.D. in Economics, all but dissertation — *1966 - 1969*
Economics Department Fellowship

Boston College — Boston, MA
Study of Statistics — *1966*

Brown University — Providence, RI
B.A. with Honors, International Relations and Economics — *1965*
Prize in International Relations

PROFESSIONAL

Bunting Institute Fellowship — *1970 - 1971*

DESCRIPTION OF SELECTED PROJECTS

Arizona Corporation Commission Staff *2002*
Citizens request for increase in PPFAC to recover $87 million in power costs.

Massachusetts Water Resources Authority *2002*
Testified against BECo request to raise delivery service rates.

Illinois Citizens Utilities Board *2001*
Testified on appropriate distribution cost allocation and rate design.

Arkansas Public Service Commission Staff *2001*
Analysis of generation prices under competition and under deregulation, supported by testimony.

Pennsylvania Office of the Consumer Advocate *2001*
Testified against GPU's request to increase its Provider of Last Resort Rates.

Texas Retailers Association *2000*
Testified as to the appropriate cost of service for three major Texas utilities, focusing on transition costs, transmission plant increases, and support services costs allocated to regulated affiliates.

Burlington Electric Department *2000*
Testimony on Transportation Rate proposed by Vermont Gas Systems.

Arkansas Public Utilities Commission *2000*
Estimated retail class rates under continued regulated and retail access.

Hawaii Division of Consumer Advocacy *2000*
Prepared allocated cost of service study and rate design for the Hawaii Electric Company.

Arizona Corporation Commission *2000*
Helped develop Codes of Conduct for Electric Affiliates; testified in stranded cost case for Arizona Electric Cooperative.

Arkansas Public Utilities Commission *1999*
Assisted in market power docket, standard offer and default service policy development, rate unbundling.

Ohio Consumer's Counsel *1999*
Advised OCC on stranded generation costs and retail market generation costs.

Arizona Corporation Commission *1998*
Assisted ACC in cases that will develop unbundled rates for all regulated Arizona utilities; testified on stranded cost and retail access for AEPCO, APS, and TEP.

Maryland Office of the People's Counsel *1998*
Advised on stranded cost, prepared analysis and testimony on rate unbundling for PEPCO and Delmarva.

Burlington Electric Department *1998*
Prepared testimony on interruptible gas transportation rate for an electric generator.

Pennsylvania Office of the Consumer Advocate *1997*
Analyzed and prepared testimony on rate unbundling in eight major utility cases; advised OCA on stranded cost; assisted in testimony on stranded cost and market price; assisted in settlement discussions.

Maine Office of the Public Advocate *1997*
Prepared testimony on Bangor Hydro Electric emergency rate and normal rate proceeding; issues included Maine Yankee, replacement power costs, depreciation rates, and cost mitigation.

Maryland/Pennsylvania Public Advocates *1997*
Advised staff of both public advocates on PJM restructuring, including analysis of FERC filings and ongoing development of market structures and ISO.

Massachusetts Division of Energy Resources *1997*
Assisted DOER in drafting restructuring legislation, negotiating additional restructuring settlements with utilities, and with development of New England ISO.

New Hampshire Public Utilities Commission *1996*
Assisted Commission staff in writing Draft Order on Restructuring; prepared discovery for utilities; prepared discovery questions for hearings on various issues, including corporate unbundling, market structure, transmission, stranded cost theory, measurement, and mitigation.

Massachusetts Division of Energy Resources *1996*
Represented the DOER at NEPOOL committees engaged in developing an Independent System Operator, a revised NEPOOL Agreement, and an

Open Access Transmission Tariff for New England. Assisted the DOER in

other matters including development of model for Boston Edison pilot program based on proxy for competitive market real-time pricing.

CMEEC *1996*
Developed methodological basis for rate unbundling for the five Connecticut municipal utilities that are members of CMEEC.

Black Hills Power and Light Company, South Dakota *1995*
Advised Company on development of ancillary services and open access transmission rates.

Pennsylvania Office of the Consumer Advocate *1995*
Assisted with preparation of comments on restructuring issues.

Maine Office of the Public Advocate *1995*
Prepared alternative marginal cost study on Maine Public Service Company. Presented testimony advocating allocation of excess costs on the basis of generation allocators rather than EPMC.

Massachusetts Division of Energy Resources *1995*
Assisted DOER in all aspects of electric industry restructuring, from rate unbundling to planning and developing revised market structure for the New England Power Pool.

Littleton Water and Light Department, N.H. *1995*
Developed retail wheeling rate; advised on retail wheeling issues.

Boston Edison Company *1995*
Presented rate design workshop for Company personnel to assist in preparing for restructuring.

World Bank *1995*
Developing conditions under which State of Orissa, which is privatizing its electric distribution system, should consider revaluation; assisting with other restructuring issues.

Division of Energy Resources *1994*
Advised DOER on position on changes in Integrated Resource Management, including proposal to open Transmission and Distribution access to meet resource needs.

Black Hills Power and Light Company, South Dakota *1994*
Advised Company on rate treatment and phase-in of major new generating unit,

development of wholesale transmission rate, and response to retail wheeling.

New Hampshire Office of the Consumer Advocate *1994*
Advised Office on retail wheeling concerns; prepared testimony on cost of service, cost allocation and marginal cost presented by an electric utility.

Town of Fort Fairfield *1994*
Prepared response of town to CMP's threat to shut down a renewable energy facility following state-financed buyout of a high-priced unit contract, resulting in settlement.

Constellation Energy *1994*
Projected market price of power, advised developer on potential market.

Stow Electric Energy Study Committee *1994*
Advised committee on setting up new municipal utility, based upon results of response to RFP for provision of power and operations services, negotiated with bidders.

Massachusetts Department of Energy Resources *1993*
Assisted with analysis of economic impact of retiring older generating plants to meet Clear Air Act Targets.

Eastern Energy Associates *1993*
Directed analysis and computation of avoided costs of a major electric utility.

Maine Public Utility Commission Staff *1993*
Directed Staff's case in opposition to Central Maine Power Comp.'s request that it be allow to market power at below marginal cost rates; presented testimony on impact of CMP's proposal.

Office of the People's Counsel, Washington D.C. *1993*
Advised Office, presented testimony on appropriate recovery of deferred and present costs of ongoing Least Cost Planning program.

Plattsburgh Municipal Lighting Department *1993*
Advised utility on selection of least-cost power contracts.

Nantucket Electric Company *1993*
Directed development of long-run end-use load forecast for tourism-based economy.

Massachusetts Municipal Wholesale Electric Company *1992*

Analysis of and testimony on economic inefficiencies created by Bay State pricing of

interruptible gas to Stony Brook generating unit.

Woodsville Water and Light Department *1992*
Advised Department on least-cost power supply and led negotiations with potential suppliers, resulting in significant long-run savings.

Stow Electric Energy Study Committee *1992*
Advised Committee on advisability of separating from municipal electric system currently serving the town; analyzed costs and benefits of different sources of supply.

Boston Edison Electric Company *1992*
Assisted in analysis of customer's demand for experimental color-corrected streetlighting, resulting in settlement of long-standing dispute.

Plattsburgh Municipal Light Department *1992*
Prepared rate case, including revenue needs, allocation of costs, and rate design; directed Company in reorganization of billing data.

Altresco *1992*
Advised on siting, fuel costs, and bidding of potential new intermediate power project.

Middleton Electric Light Department *1992*
Renegotiation of contract for transmission of all power to the utility.

Nantucket Electric Company *1992*
Directed revision of load research sampling (determining appropriate sample size and selection).

Nantucket Electric Company *1991*
Applied load research data to develop detailed (daily) demand and revenue projections.

Nantucket Electric Company *1991*
Assisted in rate case, including allocating costs between customer classes, developing marginal costs, designing rates.

Nantucket Electric Company *1991*
Presented testimony on externalities created by emissions from electric generation on Nantucket Island, and potential impact of inclusion of externalities on ratepayers.

Illinois Office of Public Counsel *1990*

Provided expert advice to consumer advocate group on developing state least-cost planning guidelines for gas utilities.

Plattsburgh Municipal Light Department *1990*
Developed new rate for large, 46 KV service customers, directed development of value of plant serving the proposed class.

Middleton Electric Light Department *1989*
Developed innovative cost-based rate for very large interruptible customer and negotiated with both NEPOOL and customer.

Littleton Water and Light Department *1989*
Updated Company's revenue allocation and rates to reflect new marginal-cost based wholesale power tariff.

Boston Edison Company *1989*
Assisted Company in analysis of jurisdictional cost allocations in major court dispute; developed company response to FERC order on allocation of distribution/transmission plant.

Reading Municipal Light Department *1988*
Analyzed power supply options, determined least-cost options.

Wellesley Municipal Light Plant *1987*
Redesigned rates for municipal utility, including allocating costs, estimating marginal costs, and designing rates, including a time-of-use rate for largest customers.

DANIEL E. PEACO

LA CAPRA ASSOCIATES
Managing Director

Daniel Peaco is an electric industry planning specialist with 20 years of experience. His expertise includes power markets and marketing, strategic planning, pricing and price forecasting, power procurement and contracts, and power systems planning. Mr. Peaco has 10 years of management experience in the utility industry and has significant experience as an expert witness and as an advisor to senior utility managers and public policy officials. His consulting practice has included a range of electric restructuring projects, including stranded cost assessment and mitigation, generation asset valuation, strategic planning, design and pricing of default service, competitive market formation and pricing, and market power. In addition to his tenure at La Capra Associates, he has held management and planning positions at Central Maine Power, CMP International Consultants, Pacific Gas & Electric, and the Massachusetts Energy Facilities Siting Council.

RELEVANT EXPERIENCE

- Led LCA team in review of the California Department of Water Resources 2001 Power Procurement Program. LCA advised and assisted the California Bureau of State Audits conduct its audit of this $43 billion power contracting effort. 2001.
- Led LCA team in review of San Diego Gas & Electric's approach to the California Block Forward Markets during the Fall 1999 to Summer 2000 period. Assist in the formation of testimony presented on behalf of the California Office of the Ratepayer Advocate before the California PUC. 2001.
- Prepared expert testimony and analysis regarding the outlook for benefits from the deregulation of the Arkansas retail generation market on behalf of the General Staff of the Arkansas Public Service Commission in an industry restructuring proceeding regarding the timing and approach to implementation of retail competition. 2000.
- Presented expert testimony before the Arkansas Public Service Commission regarding the design of standard service package, market power, competitive billing services in preparation for retail open access. 2000.
- Directed the analysis of the value of the generating assets of five Ohio investor-owned utilities on behalf of the Ohio Consumers Counsel in Ohio industry restructuring proceedings regarding generation asset value, transition costs, and retail market formation in preparation for adjudication and support of settlement negotiations. 1999 - 2000.
- Presented expert testimony on the reliability, economic and environmental need for new power supplies in New England before the Massachusetts, Connecticut,

and Rhode Island Energy Facility Siting Boards on behalf of seven proposed gas-fired, combined-cycle merchant power plants. 1997 - 2001.

- Directed analysis of Pennsylvania Power and Light's restructuring plan on behalf of the Pennsylvania Office of the Consumer Advocate; assessed the value of PP&L's generation assets and the company's claim for $4 billion in stranded costs. 1997.
- On behalf of seven proposed gas-fired, combined-cycle merchant power plants, prepared and presented expert testimony on the reliability, economic and environmental aspects of the need for new power supplies in New England before the Massachusetts, Connecticut, and Rhode Island Energy Facility Siting Boards. 1997 - 2001.
- Provided litigation support and deposition testimony regarding dispute of pricing provisions in two purchased power agreements on behalf of Central Maine Power Company. 1999 - 2001.
- Directed a market valuation analysis of a 1000 MW New England generation portfolio, including a 360 MW hydroelectric system, assisting a major national generating company with the development of a purchase offer. 1997 - 1998.
- Directed an assessment of an assessment of the engineering, licensing, and economic future of a small scale hydroelectric facility for the Village of Barton, Vermont, including the development of options for a long term relicensing plan and continued ownership. 1998 - 1999.
- Directed market valuation studies for three New England merchant power plant developers, supporting their project prospectus for potential lenders and equity participants. 1997 - 1998.
- Directed the analysis of Pennsylvania Power and Light's restructuring plan on behalf of the Pennsylvania Office of the Consumer Advocate; assessed the value of PP&L's generation assets and the company's claim for $4 billion in stranded costs. 1997.
- On behalf of Central Maine Power (CMP), prepared and presented expert testimony before the Maine Public Utilities Commission on the economic benefits of a proposed 30 year, 1000 MW power contract with Hydro Quebec. 1987 - 1988.
- Directed CMP's power system planning activities, assessing power system economics, evaluating numerous IPP power sales contract economics, forecasting long-term market prices, preparing power system development plans, and preparing economic studies for the federal relicensing applications of several of CMP's hydropower facilities. 1987 - 1993.
- Assessed the economics and reliability of PG&E's hydropower system, identifying opportunities for capital improvements and options for operations management. 1983 - 1985.

EMPLOYMENT HISTORY

La Capra Associates — Boston, MA

ROBERT J. HIX

LA CAPRA ASSOCIATES
Director, Denver Office / Managing Consultant

Robert J. Hix joined LaCapra Associates as Managing Consultant and Director – Denver Office, to establish a stronger presence in the West. His experience enhances the organizations' ability to meet client needs efficiently in the areas of ratemaking and utility planning, distributed generation, renewable energy public policy and energy efficiency. Prior to joining La Capra Associates, Mr. Hix was appointed Colorado Public Utilities Commission Chairman by Governor Roy Romer and was confirmed by the Colorado Senate. His term expired on January 8, 2001. He is a member of the Advisory Council to the Board of Directors of the Electric Power Research Institute and is a member of the Adequacy Committee of the North American Electric Reliability Council. Previous to his appointment, Mr. Hix was a Senior Engineering Analyst with the Colorado Office of Consumer Counsel, which represents residential, small business and agricultural customers on issues before the Public Utilities Commission. As Senior Engineering Analyst, Mr. Hix testified as an expert in engineering and rate matters at hearings before the Public Utilities Commission. His primary role was to determine the policy and regulatory implications of rate changes and allocation among various customer classes.

RELEVANT EXPERIENCE

- Served as Chairman of the Colorado Public Utilities Commission from May 1994 to July 1999. Continued as Commissioner from July 1999 until May 10, 2001. Regulate transportation, intrastate railroad, water, telecommunications, electric, natural gas and steam utility companies operating in the state of Colorado. Was a member of the National Association of Regulatory Utility Commissioners (NARUC) Committee on International Relations, Committee on Electricity and Subcommittee on Strategic Issues. Earlier, served on NARUC's Committee on Gas. Member of the Advisory Council to the Board of Directors of the Electric Power Research Institute and member of the Planning Committee of the North American Electric Reliability Council. Member of the Advisory Council of the New Mexico State University Institute of Public Utilities.

- Conducted a Regulatory Partnership with the Orissa Electricity Regulatory Commission (state in India). Over a two period, advised the OERC; India's Central Electricity Regulatory Commission (Federal); the Administrative Staff College of India; the Commission for the state of Uttar Pradesh; and the Tata Energy Research Institute.

- Represented the interests of residential, small business, and agricultural customers, testified as expert witness on engineering and rate matters at hearings before the Public Utilities Commission. Primary role was to determine the policy and regulatory implications of rate and regulatory changes among various customer classes. Coordinated activities of outside expert consultants.

- Coordinated activities of the Public Service Company of Colorado division relative to a Management Audit ordered by the Colorado Public Utilities Commission and performed special assignments and contract analysis for the Division Manager.

- Initiated a project to develop procedures and direct activities necessary for initiating, negotiating and managing power contracts. Resulted in being named Power Contracts Administrator responsible for the satisfactory completion of arrangements for Bulk Power Purchase, Transmission Interconnection and Joint Venture Projects with other utilities for power plants and transmission facilities.

- Developed and calculated Fuel Cost Adjustments, Gas Cost Adjustments and refund applications and prepared and submitted applications to the Colorado PUC for Public Service Company.

- Developed Gas Rate Riders for Western Slope Gas Company and Cheyenne Light, Fuel and Power Company and prepared applications to the appropriate Commissions.

- Prepared technical exhibits and data responses for rate proceedings and energy related matters.

- Prepared applications for Special Rate Schedules to the Federal Power Commission (Federal Energy Regulatory Commission).

- Involved with Cost of Service Analysis for Electric Rate Design and actual Electric and Gas Rate Design to produce the revenue requirements of Public Service Company.

- In addition to normal distribution engineering duties for the Public Service Company of Colorado, was responsible for estimation, negotiation and purchase of secondary and "in-building" services from electrical contractors for Public Service Company.

EMPLOYMENT HISTORY

La Capra Associates — Denver, CO
Director / Managing Consultant — *2001 - present*

Colorado Public Utilities Commission — Denver, CO
Chairman/Commissioner — *1994 - 2001*

Colorado Office of Consumer Counsel — Denver, CO
Senior Engineering Analyst — *1985 - 1994*

U.S. Peace Corps — Sigatoka, Fiji
Peace Corps Volunteer, Mathematics and Physics Teacher — *1984*
Lomowai Secondary School

Public Service Company of Colorado — Denver, CO
Electric System Planning Staff Assistant — *1971 - 1983*
Power Contracts Administrator
Special Projects Analyst, Special Projects Division
Rate Engineering Technician, Rates and Regulations Division
Field Engineer, Electric Distribution Engineering Department

EDUCATION

Michigan State University Institute of Public Utilities — East Lansing, MI
Williamsburg Conference, Advanced Regulatory Studies, and Regulatory Studies Program — *1974 - 1987*

University of Colorado — Denver and Boulder, CO
Graduate coursework in Combinatorial Analysis, Management Science, Marketing and Business Statistics — *1974 - 1975*

International Correspondence School
Diploma, Electric Distribution Engineering — *1974*

Regis College — Denver, CO
B.S. in Mathematics with a Minor in Physics — *1970*

PROFESSIONAL

Member of the Advisory Council to the Board of Directors
Electric Power Research Institute — *1999 - present*

Member of the Advisory Council, New Mexico State University
Center for Public Utilities — *1999 - present*

Member of the Planning Committee, North American Electric Reliability Council — *1998 - 2001*

ARTHUR FREITAS

LA CAPRA ASSOCIATES
Analyst

Arthur Freitas has over 4 years experience in the energy industry, in both the natural gas and electric markets. His experience includes cost of service analysis for natural gas and electric utilities, rate design analysis, unbundling analysis, natural gas and electric market price forecasting, retail electric and natural gas market analysis, and retail energy planning and procurement. Since joining La Capra Associates in May 2000, Mr. Freitas has assisted in a number of regulatory proceedings, which include electric and natural gas utility rate cases, electric restructuring hearings, and utility prudency reviews.

RELEVANT EXPERIENCE

- Analyzed the cost of service study submitted by Hawaii Electric Light Company in its 2000 rate case. Assisted in developing expert testimony on behalf of the Hawaii Division of Consumer Advocacy.
- Analyzed the allocated cost of service studies of three Texas distribution utilities in a restructuring proceeding. Assisted in the preparation of expert testimony on the reasonableness of the cost of service studies on behalf of large commercial end users of electricity.
- Prepared and submitted to the Massachusetts utility regulator, the bi-annual Cost of Gas Adjustment factor and the annual Cost of Gas Reconciliation for the Blackstone Gas Company.
- Prepared an embedded cost of service study for Blackstone Gas Company in its most recent rate case. Assisted in developing expert testimony on the reasonableness of the expenses included in the cost of service study.
- While at Boston Gas Company, prepared the Cost of Gas Adjustment factor and Annual Reconciliation and submitted the filing to the Massachusetts utility regulator.
- Prepared the compliance filing for Boston Gas Company's performance based ratemaking authority and performed the rate design to allocate the allowed revenue to the various rate classes.
- Assisted the Massachusetts Water Resources Authority (MWRA) in obtaining an electric power supply for its wastewater treatment plant in Boston Harbor. Analysis included estimating the cost savings of competitive electric supply and examining the best method to utilize MWRA's on-site generation resources to maximize the value of the generation resources.

EMPLOYMENT HISTORY

La Capra Associates — Boston, MA
Analyst — *2000 - present*

Boston Gas Company — Boston, MA
Rate Analyst — *1998 - 2000*

EDUCATION

Marquette University — Milwaukee, WI
M.S. in Applied Economics — *1998*

Marquette University — Milwaukee, WI
B.A., Economics and Finance — *1994*

I. INTRODUCTION

The North Dakota Public Service Commission ("Commission") has issued a request for proposals from firms with expertise in natural gas rate matters, including cost of capital, cost of service, and rate design, for assistance with an investigation of Montana-Dakota Utilities Co.'s ("MDU") gas rate increase request in Case No. PU-399-02-183. The selected firm will investigate, analyze, and provide testimony regarding the fairness and reasonableness of MDU's proposed rates. The completion date for the investigation and written testimony is August 30, 2002.

II. DESCRIPTION OF GDS ASSOCIATES, INC.

Founded in 1986, GDS Associates, Inc. ("GDS") is a multi-utility consulting firm headquartered in Marietta, Georgia, with offices in Austin, Texas; Auburn, Alabama; Manchester, New Hampshire; Madison, Wisconsin; Manchester, Maine; and Bellingham, Washington. During the past 15 years, GDS has grown to a 90-person firm that serves clients located in 46 states. GDS is a young, dynamic organization that has grown from a strong commitment to client service, backed by comprehensive experience, and state-of-the-art computer and information resources. With comprehensive consulting services related to public utilities, GDS can address the complex governmental, economic, engineering, accounting, environmental and scientific issues that impact utilities and their customers.

GDS serves a diverse base of clients, customer groups, publicly-owned utilities, municipalities, joint action agencies, law firms, government agencies, public service commissions and other consulting firms.

Major natural gas and electric utility services provided by GDS include regulatory consulting, resource planning, conservation and demand-side management consulting, industry restructuring and deregulated energy market analysis. GDS also has specialized skills in wholesale and retail rate studies and expert testimony; cost-of-service studies; energy efficiency program planning, implementation and evaluation; market research; statistical analysis; cogeneration feasibility studies; economic feasibility studies; RFPs for energy supply; contract negotiations with energy suppliers; financial forecasts; bond certification; load research and load forecasting; property valuation and territorial integrity services; management consulting services; and the development and application of computer models.

GDS consultants have significant experience in providing expert testimony on complex operational and ratemaking issues in regulatory proceedings before state and federal regulatory commissions. Examples of recent GDS projects are provided in Section V. of this proposal. GDS certifies that it complies with applicable provisions of the Americans with Disabilities Act of 1991. Additional information on GDS is available on our website, www.gdsassoc.com.

III. SCOPE OF SERVICES

1. Level of Investment – Work in this area will be limited in scope and will primarily rely on a review of the last rate case and historical comparisons. No cash working capital calculation will be performed. The majority of this work will be performed in the Austin office by Ellen Blumenthal, Jim Daniel and Valerie Anderson.

2. Cost of Capital – MDU's cost of capital includes long-term debt, preferred equity and common equity. The most critical element of the cost of capital is the return on equity component. To accurately determine MDU's appropriate cost of capital, GDS would expect to perform consulting duties including, but not limited to: analysis and review of MDU's filing, preparation of discovery, preparation of written testimony, presentation of oral testimony, cross-examination of expert witnesses, and assistance to staff in the preparation of proposed findings of fact. The majority of this work will be performed in the Marietta office by J. Bertram Solomon.

3. Cost of Service – A critical element of the cost of service is the appropriate level of weather normalized sales. The cost of service portion will also require a strong review of other operating and maintenance expenses. To accurately determine MDU's appropriate cost of service, GDS would expect to perform consulting duties including, but not limited to: analysis and review of MDU's filing, preparation of discovery, preparation of written testimony, presentation of oral testimony, cross-examination of expert witnesses, and assistance to staff in the preparation of proposed findings of fact. This work will be performed in the Marietta office by John Hutts and in the Austin office by Ellen Blumenthal, Simon Peña, and Chuck Loy.

4. Rate Design – In its application, MDU is seeking a significant increase to the monthly basic service charge. Should the Commission not accept this increase, MDU is arguing for the inclusion of a weather normalization adjustment. To develop the appropriate rate design, GDS would expect to perform consulting duties including, but not limited to: analysis and review of MDU's filing, preparation of discovery, preparation of written testimony, presentation of oral testimony, cross-examination of expert witnesses, and assistance to staff in the preparation of proposed findings of fact. The majority of this work will be performed in the Austin office by Jim Daniel and Valerie Anderson.

5. Depreciation Study – As MDU's last depreciation study was conducted in the early 1990's, the Commission may want to have a new study completed for this proceeding. To perform a new depreciation study for MDU, GDS would expect to perform consulting duties including, but not limited to: analysis and review of MDU's filing, preparation of discovery, preparation of written testimony, presentation of oral testimony, cross-examination of expert witnesses, and assistance to staff in the preparation of proposed findings of fact. The majority of this work will be performed in the Marietta office by Cary Cook.

IV. PERSONNEL

GDS has assembled an experienced team of economists, accountants, regulatory analysts and engineers for this project. Ms. Ellen Blumenthal will serve as overall project manager and will direct the analysis, expert testimony, data requests and recommendations. Ms. Blumenthal is a Senior Project Manager with GDS, a CPA and has over twenty years of experience in the utility industry.

The following GDS personnel will be involved in the project:

Name	Title	Location
John Hutts	Principal	Marietta, GA
J. Bertram Solomon	Vice President and Treasurer	Marietta, GA
Jim Daniel	Vice President	Austin, TX
Cary Cook	Senior Project Manager	Marietta, GA
Simon Peña	Senior Project Manager	Austin, TX
Charles Loy	Senior Project Manager	Austin, TX
Valerie Anderson	Project Consultant	Austin, TX
John Kirkpatrick	Associate Analyst	Austin, TX

Resumes for each member of the project team are provided in Attachment 1.

V. QUALIFICATIONS AND PRIOR EXPERIENCE

GDS Associates, Inc. has extensive experience in the natural gas utility industry, with a wide variety of projects such as gas rate case analysis and testimony, gas procurement strategies, analysis of the strategic plans and operating programs of natural gas utilities, benefit/cost analyses of alternative gas marketing and energy efficiency initiatives, contract negotiations, and market monitoring and research. A description of several recent natural gas utility related projects is provided below to give a sampling of GDS' experience in the natural gas industry. For all of the projects identified, GDS has provided the project title, the name of the client, the client's name address and phone number, and a description of the scope of work.

Project Name: **Review of Peoples Natural Gas Company Rate Request (Nebraska)**
Client Organization: Ninety-two Nebraska Municipalities
Client Reference: Roger Cox, Esq.
Harding, Schultz & Downs
P.O. Box 82028
Lincoln, Nebraska 68501-2028
Phone: 402-434-3000

Project Description: During 1995 and 1996, GDS reviewed and analyzed Peoples Natural Gas Company's (PNG) request for rate relief in its largest Nebraska rate area. This work was done on behalf of ninety-two Nebraska municipalities. In Nebraska, municipalities rather than the Nebraska Public Service Commission have jurisdiction over the rates of investor-owned natural gas utilities. Our report to the municipalities identified numerous revenue requirement and rate design issues including the following: (1) acquisition adjustment, (2) manufactured gas plant site clean up costs, (3) capital structure, (4) return on common equity, (5) projected plant additions, (6) self-insurance reserves, (7) income taxes, (8) legislative advocacy expenses, (9) materials and supplies inventory, (10) cash working capital, (11) the regulatory treatment of post-retirement benefits, (12) the allocation of affiliate costs, (13) customer growth, (14) weather normalization, (15) jurisdictional cost allocations and (16) rate design. One of the more controversial issues in the proceeding was the impact of UtiliCorp's acquisition of other gas distribution systems. GDS, in conjunction with municipal representatives and the municipalities' legal counsel, negotiated a settlement of the rate case with PNG. A similar rate review was conducted by GDS regarding PNG's proposed rate increase in 1991 and 1992.

Project Manager: Jim Daniel

Project Name: **Cost of Service Testimony in Arkansas Western Gas Company Rate Case**

Client Organization: Arkansas Attorney General

Client Reference: Shawn McMurray, Deputy Attorney General
Office of Arkansas Attorney General
CURAD Division
323 Center St., Suite 200
Little Rock, Arkansas 72201
501/682-2007

Project Description: GDS reviewed the cost of service study and proposed rate design of Arkansas Western Gas Company in Arkansas Public Service Commission Docket No. 97-019-U. Testimony was filed regarding the distribution of Arkansas Western's proposed revenue increase and regarding rate design issues. GDS also assisted in negotiating a settlement in the case.

Project Manager: Jim Daniel

Project Name:	**Natural Gas Procurement Strategy for the City of Chicago**
Client Organization:	City of Chicago
Client Reference:	Tyrone Evans Deputy Commissioner City of Chicago Department of General Services 30 North LaSalle Suite 3700 Chicago, IL 60602 Phone: (312)774-6045
Project Description:	GDS was retained by DMG-Maximus, a consulting firm, to assist the City of Chicago in preparing a natural gas procurement strategy. The City purchases gas on an aggregated basis to serve City facilities and has an option to participate in a gas purchasing consortium of other cities, government agencies and school districts. GDS identified and reviewed current strategy, conducted a market research survey, recommended a natural gas procurement strategy for short-long term conditions and assisted in the implementation of strategy.
Project Manager:	Simon Peña and Jim Daniel

Project Name:	**Testimony in U.S. Tax Court – Natural Gas Reg. Issues**
Client Organization:	Internal Revenue Service-Administrative Service Center
Client Reference:	Thomas E. Ritter, Esq. Office of Chief Counsel Internal Revenue Service North Florida District 400 W. Bay Street, Room 564 Jacksonville, FL 32202 Phone: 304-256-6000
Project Description:	GDS assisted the Internal Revenue Service (the Service) in its review of the proposed tax treatment of demand-side management and energy conservation project costs of Peoples Gas System, Inc., a local gas distribution company and subsidiary of Lykes Energy. GDS filed an expert opinion report with the U. S. Tax Court on behalf of the Service. Lykes Energy and the Service subsequently reached a favorable settlement in this proceeding.
Project Manager:	Jim Daniel

Project Name:	**Unbundled Natural Gas Cost of Service and Rate Study**
Client Organization:	Westfield Gas and Electric Light Department
Client Reference:	Joyce Bodak, Gas Supply Manager City of Westfield, Massachusetts P. O. Box 990 Westfield, Massachusetts 01086 Phone: 413-572-0100
Project Description:	In response to utility restructuring legislation in Massachusetts, GDS prepared an unbundled cost of service study of the City's natural gas utility and developed unbundled gas rates. The City's unbundled gas rates were subsequently implemented. The project also involved the review and analysis of unbundled rate and utility restructuring filings of investor-owned natural gas local distribution companies in Massachusetts.
Project Manager:	Jim Daniel

Project Name:	**Acquisition of Gas Distribution Facilities**
Client Organization:	City of Wahoo, Nebraska
Client Reference:	Paul Erickson, Utilities Director City of Wahoo, Nebraska 605 N. Broadway Wahoo, Nebraska 68066 Phone: 402-443-3222
Project Description:	GDS assisted the City of Wahoo, Nebraska in its planned acquisition of the gas distribution facilities of Peoples Natural Gas Company (PNG) within the city limits. The City offered to purchase PNG's facilities but was turned down by the Company. GDS provided expert testimony before the Condemnation Court appointed by the Supreme Court of Nebraska in litigation regarding condemnation proceedings.
Project Manager:	Jim Daniel

Project Name:	**Lone Star Pipeline Gas Transportation Rate Case**
Client Organization:	City of Garland, Texas
Client Reference:	Lambeth R. Townsend, Esq. Lloyd, Gosselink, Blevins, Rochelle, Baldwin & Townsend, P.C. 111 Congress Ave., #1800 Austin, Texas 78704 Phone: 512-322-5800
Project Description:	GDS assisted a coalition of cities in Texas review and analyze a proposed gas transportation rate (city gate rate) increase case by Lone Star Pipeline Company. Testimony was presented before the Texas Railroad Commission on revenue requirement issues related to operating expenses, income taxes, affiliate transactions, other

	revenues and Y2K costs. In addition, competition and merger-related issues were addressed.
Project Manager:	Jim Daniel

Project Name:	**Revise Current Electric, Natural Gas and Water Extension Policies**
Client Organization:	City Utilities of Springfield, Missouri
Client Reference:	John Twitty City Utilities of Springfield Missouri P. O. Box 551 Springfield, Missouri 65801 Phone: 417-831-8527
Project Description:	GDS is to review and revise City Utilities' current line extension policies so as to be more responsive in the emerging competitive and restructured utility environment. In addition, GDS is to survey the utility industry to obtain information about extension policies and practices of other utility companies and compile this information into a set of "most common" policies and unique and innovative policies. GDS will also develop a program for City Utilities and GDS to use in presenting the revised extension policies to the "public".
Project Manager:	Jim Daniel

Project Name:	**Review of Sales Forecast and Weather Normalization Adjustments**
Client Organization:	Michigan Attorney General
Client Reference:	Orgiakor N. Isiogu, Assistant Attorney General Attorney General's Office, Special Litigation Division 630 Law Building, P. O. Box 30212 Lansing, Michigan 48909 Phone: 517-335-0817
Project Description:	On behalf of the Michigan Department of Attorney General, GDS analyzed Michigan Consolidated Gas Company's (MichCon) sales forecast, weather normalization adjustments and other issues in two proceedings before the Michigan Public Service Commission. The two proceedings are MichCon's Gas Cost Review (GCR) filing, Case No. U-10105, and MichCon's application for a general rate increase, Case No. U-10150.
Project Manager:	Jim Daniel

Project Name:	**Texas Unbundled Cost of Service/Excess Cost Over Market Dockets**
Client Organization:	Texas Office of Public Utility Counsel
Client Reference:	James Rourke Assistant Public Counsel Texas Office of Public Utility Counsel 1701 M. Congress Ave., Suite 9-180 Austin, Texas 78711 Phone: 512 936 7500
Project Description:	Participated in gas price forecast workgroup, evaluated utility-filed model results and testimony, developed discovery and testimony on stranded cost quantification in several contested cases.
Project Manager:	Scott Norwood

VI. COST ESTIMATE

GDS has developed a fixed price to provide all services sought in the RFP. The fixed price is based on our past experience with similar cases, our expectations regarding the amount of time each component will require, and our current fee schedule. The price for each component of the project is as follows:

COMPONENT	COST
1. Level of Investment	
Professional services fees	$12,500
2. Cost of Capital	
Professional services fees	$35,000
Travel expenses	1,500
3. Cost of Service	
Professional services fees	$32,500
Travel expenses	1,500
4. Rate Design	
Professional services fees	$15,000
Travel expenses	1,500
5. Depreciation Study	
Professional services fees	$35,000
Travel expenses	1,500
6. Additional necessary costs	
Copying, printing and postage	$1,000
Long distance telephone and fax	750
Data processing	750
Total Cost Estimate	
Professional services fees	$130,000
Travel Expenses	6,000
Additional costs	2,500
TOTAL	$138,500

The above cost estimates assume that there will be one technical hearing and that it will last for two consecutive days (October 7 and 8, 2002). The estimated travel expenses for each project component include the travel expenses for one expert to attend the technical hearing and include airfare, hotel, rental car and per diem expenses.

EXPERIENCE

GDS Associates, Inc., March 2002 to present

Senior Project Manager of GDS Associates, Inc., Engineers and Consultants, Corpus Christi, Texas. Provides financial analysis for natural gas and electric markets; assists consumers in acquiring power needs in the competitive markets; provides analysis in gas, electric, telephone and water utility rate increase filings and presents expert testimony in regulatory proceedings on behalf of interveners. Issues addressed in testimony include all aspects of revenue requirement determination.

Independent Consultant, June 1982 to February 2002

Financial analysis for natural gas and electric markets; Provided analysis and expert witness testimony in gas, electric, telephone and water utility rate increase applications on behalf of interveners.

C. H. Guernsey & Co., Consulting Engineers & Architects, November 1980 - June 1982

Title: Regulatory Accountant and Financial Analyst

Duties included preparation of financial and accounting aspects of rate filings for electric cooperatives for presentation before the Public Utility Commission of Texas. Testified as an expert witness on accounting matters before the Public Utility Commission of Texas. Advised electric cooperatives on accounting and regulatory matters. Participated in review of rate increase applications of investor-owned utilities and prepared and presented expert witness testimony based on such review. Participated in special projects such as cost-benefit analyses related to owner participation in power plants and alternative regulatory treatments for nuclear generating stations.

Public Utility Commission of Texas, May 1977 - November 1980

Title: Chief Accountant III

Duties included providing expert witness testimony in investor-owned and cooperative telephone, electric and water utility rate cases filed with the Commission in the following areas: Fuel and purchased power, Operation and

maintenance expenses, Federal income taxes, Taxes other than federal income taxes, Affiliate transactions, Oil and gas exploration and development. Reviewed the books and business records of public utilities to determine the reasonableness of rate requests. Reviewed public utilities' implementation of fuel adjustment clause and other rate schedules to determine compliance with tariffs approved by Commission.

Sample List of Testimony Filed and participation in Regulatory Proceedings:

TXU Gas Distribution Application to Change Distribution Rates in its South Region on behalf of affected Texas municipalities, Fall 2002.

TXU Lone Star Pipeline Application to Change the City Gate Rate, Texas Railroad Commission Docket No. 8976 on behalf of the Aligned Cities, January 2000.

Santa Fe Pipeline Partnership, L.P., FERC Docket No. OR92-8-000, *et al* on behalf of Refinery Holding Company, L.P., January 1996.

Peoples Natural Gas Company, Rate Area Three on behalf of the Municipalities Served, December 1995.

Compliance review of Southern Union Gas Company's fuel cost recovery in the City of El Paso on behalf of the City of El Paso, Texas, Spring 1995.

Kansas Pipeline Partnership and Kansas Natural Partnership, Kansas Docket No. 190,362-U on behalf of Citizens' Utility Ratepayer Board, September 1994.

KN Energy, Inc., Kansas Corporation Commission Docket No. 186,363-U on behalf of Citizens' Utility Ratepayer Board, September 1993.

Peoples Natural Gas Company, Kansas Corporation Commission Docket No. 180,416-U, on behalf of the Citizens' Utility Ratepayer Board, August 1992.

Kansas Public Service Company, Kansas Corporation Commission Docket No. 179,484-U, on behalf of the Citizens' Utility Ratepayer Board, April 1992.

Greeley Gas Company, Kansas Corporation Commission Docket No. 177,142-U, on behalf of the Citizens' Utility Ratepayers Board, November 1991.

Peoples Natural Gas Company, Rate Areas Two and Three on behalf of the Municipalities Served, November 1991.

Southern Union Gas Company El Paso Service Area, Public Utility Regulatory Board of El Paso on behalf of the City of El Paso, November 1991.

Rio Grande Valley Gas Company, Texas Railroad Commission Docket No. 7604, Consolidated, on behalf of the Intervener Cities, May 1990.

Southern Union Gas Company El Paso Service Area, Public Utility Regulatory Board of El Paso on behalf of the City of El Paso, October 1990.

Rio Grande Valley Gas Company, Texas Railroad Commission Docket No. 4717, 1984 and Docket No. 3858, on behalf of the Rio Grande Valley Cities, March 1982.

Reliant Energy HL&P Application for Approval of Unbundled Cost of Service Rates, Texas PUC Docket No. 22355 on behalf of the City of Houston and the Coalition of Cities, December 2000.

TXU Electric Company Application for Approval of Unbundled Cost of Service Rates, Texas PUC Docket No. 22350 on behalf of the Office of Public Utility Counsel, October 2000.

Texas-New Mexico Power Company Application for Approval of Unbundled Cost of Service Rates, Texas PUC Docket No. 22349 on behalf of the Office of Public Utility Counsel, January 2001.

Houston Lighting and Power Company, Texas PUC Docket No. 12065 on behalf of Office of Public Utility Counsel, November 1994.

El Paso Electric Company, Texas PUC Docket No. 12700 on behalf of Office of Public Utility Counsel and The City of El Paso, Texas, June 1994.

Application of Central and South West Corporation and El Paso Electric Company For Approval of Acquisition, PUC Docket No. 12700 on behalf of Office of Public Utility Counsel, June 1994.

El Paso Electric Company, Public Utility Regulation Board of The City of El Paso, Texas on behalf of the City of El Paso, Texas, May 1994.

City of Austin Water and Wastewater Utility before City Counsel on behalf of residential and small commercial ratepayers, October 1993.

Texas Utilities Electric Company, Texas PUC Docket No. 11735 on behalf of Certain Cities Served by Texas Utilities Electric Company, September 1993.

Complaint of General Counsel against Cherokee County Electric Cooperative, Inc. regarding application of Cherokee's switchover tariff, Texas PUC Docket No. 11351, on behalf of the Cooperative, June 1993.

Texas Utilities Electric Company, Texas PUC Docket No. 11735 on behalf of the Office of Public Utility Counsel, April 1993.

Application of Entergy Corporation and GSU for Sale, Transfer or Merger, Texas PUC Docket No. 11292, on behalf of Office of Public Utility Counsel, January 1993.

Complaint of NBC Telecommunications, Inc. against Southwestern Bell Telephone Company, Texas PUC Docket No. 10762, on behalf of complainant, September 1992.
Central Texas Telephone Company, Texas PUC Docket No. 9981, on behalf of the Office of Public Utility Counsel, December 1991.

Texas-New Mexico Power Company, Texas PUC Docket No. 10200, on behalf of the Office of Public Utility Counsel, December 1991.

City of Round Rock, Texas Water Commission Docket No. 8600-M, on behalf of Brushy Creek Municipal Utility District, October 1991.

El Paso Electric Company, Texas PUC Docket No. 9945, on behalf of the Office of Public Utility Counsel, April 1991.

Houston Lighting & Power Company, Texas PUC Docket No. 9850, on behalf of the Office of Public Utility Counsel, February 1991.

Greeley Gas Company, Kansas Corporation Commission Docket No. 170,588-U, on behalf of the Citizens' Utility Ratepayers Board, August 1990.

Texas Utilities Electric Company, Texas PUC Docket No. 9300, on behalf of the Intervener Cities, April 1990.

Gulf States Utilities Company, Texas PUC Docket No. 8702, on behalf of the Intervener Cities, July 1989.

Central Power & Light Company, Texas PUC Docket No. 8646, on behalf of the Intervener Cities, June 1989.

Lower Colorado River Authority, Texas PUC Docket No. 8400, on behalf of several wholesale customers, February 1989.

Lower Colorado River Authority, Texas PUC Docket No. 8032, on behalf of several wholesale customers, June 1988.

Tawakoni Water Utility Corporation, Texas Water Commission Docket No. 7368-R, on behalf of Tawakoni Water Consumers Association, January 1988.

Hill Country Waterworks Company, Texas Water Commission Docket No. 172-W, on behalf of the City of Hill Country Village and the City of Hollywood Park, July 1987.

Detroit Edison Company, Michigan PSC, Case No. U-8683, on behalf of North Star Steel Michigan, May 1987.

Gulf States Utilities Company, Texas PUC Docket No. 7195, on behalf of North Star Steel Texas, January 1987.

Mustang Telephone Company, Texas PUC Docket No. 6635, July 1986, on behalf of intervener cities.

Lower Colorado River Authority, Texas PUC Docket No. 6027, on behalf of several wholesale customers, March 1985.

Fannin County Electric Cooperative, Texas PUC Docket No. 4940, on behalf of the Cooperative.

Dewitt County Electric Cooperative, Texas PUC Docket No. 4919, on behalf of the Cooperative.

Houston Lighting and Power Company, Texas PUC Docket No. 4540, August 1982, on behalf of the City of Houston.

Houston Lighting & Power Company, Texas PUC Docket No. 3320, September 1980, on behalf of the Texas Public Utility Commission.

Inquiry by Public Utility Commission of Texas into Certain Affiliate transactions of Texas Electric Service Company , Texas Power and Light Company and Dallas Power and light Company, Texas PUC Docket Nos. 1517, 1813 and 1903, February 1979, on behalf of the Texas Public Utility Commission.

EDUCATION: Master of Business Administration, Georgia State University, 1990
Concentration: Finance and Decision Sciences
Bachelor of Business Administration, The University of Texas at Austin, 1978.
Concentration: Statistics and Operations Research

PROFESSIONAL MEMBERSHIP: American Statistical Association (ASA)

EXPERIENCE:

1986-Present GDS Associates, Inc.

Responsibilities include the direction of statistical services provided by GDS and supervision of supporting project staff. Areas of expertise include long-term and short-term forecasting, sample design, consumer surveys, load research, weather normalization, database management, and decision support systems.

1980-1986 Southern Engineering Company

Responsibilities included participation and project management of projects focusing on statistical applications, including load forecasts and consumer surveys.

Specific Project Experience Includes:

Designed, implemented and currently manages load forecasting systems for thirteen electric utilities in Texas. Forecasting systems provide long-term (15 year) and short-term (12-month) forecasts for resource and financial planning and are supported by a network of econometric and end-use models. Consumer attitude and appliance stock surveys are conducted every three years. Outputs of the system include load forecast reports, consumer surveys, oral/written testimony, and documentation to regulatory agencies.

Developed and implemented an electric load forecasting system for the Public Service Authority of South Carolina. Short-term models were based on ARIMA techniques, and long-term models were developed using both econometric (SAS software) and end-use models (EPRI's REEPS model, Residential End-Use Energy Planning System). Project highlights included: (i) extensive data collection and development of the end use model, and (ii) on-site industrial customer interviews.

Developed load forecasts for electric utility systems in Alabama, Alaska, Georgia, Kentucky, Illinois, Indiana, Mississippi, North Carolina, Ohio, South Carolina, Texas, and Virginia. Methodologies included econometric modeling, end-use modeling, trending, and delphi techniques.

Currently manages ongoing consulting services to an Atlanta, Georgia based marketing services firm in applications regarding consumer research in the retail industry. Primary areas of service focus on project management, statistical issues and analytical expertise regarding consumer surveys. Specific services provided include: definition of consumer market trade areas,

development of survey questionnaires, implementation of data processing procedures, development of sampling methodology, interpretation of survey results, and preparation of final survey reports. Developed a process for merging economic/demographic data (sources: U.S. Census and Bureau of Economic Analysis) with survey data. Developed models used to estimate average consumer expenditure in response to influential characteristics, including: area of residence, average household income, age, and gender.

Managed residential consumer survey projects for utilities in Texas, South Carolina, and Alabama. Developed questionnaire, identified population frame, designed sample, validated responses, tabulated results, and documented conclusions and methodology. Developed applications software to select stratified random sample (Dalenius/Hodges and optimum allocation), produce mailing labels, tabulate responses, and calculate confidence bands by stratum and by total sample. Software was developed using the Statistical Analysis System (SAS) software package.

Provided consumer survey services to a Marietta, Georgia based consulting firm for a series of surveys administered to banking customers at branches located throughout the north Georgia area. Provided cross-tabulations of survey results, developed local demographic and economic profiles of households located in the branch areas, and created indexes as a means of comparing banking customers to the general population.

Presented expert testimony before the Georgia Public Service Commission on behalf of the Staff Adversary team. Testimony addressed issues regarding Georgia Power Company's Load and Energy Forecast filed with the company's 1998 and 2001 Integrated Resource Plans.

Presented expert testimony before the Michigan Public Service Commission on behalf of the state of Michigan, Office of the Attorney General. Testimony addressed the review, conclusions and recommendations regarding the load forecast presented by Consumers Power Company.

Presented expert testimony before the Public Utility Commission of Texas on behalf of Wood County Electric Cooperative. Testimony addressed the defense of load research results utilized in the cooperative's rate filing.

Conducted load research for ten electric cooperatives in Texas. Project involved sample design, sample selection, translation of pulse data, computation of class CP and NCP estimates, and development of relationship between class NCP and kWh sales. Results provided input for cost of service and rate design studies.

TRAINING SEMINARS CONDUCTED:

1. Load Forecasting Techniques: Georgia Public Service Commission Staff
2. Econometric Modeling using SAS: Public Service Authority of South Carolina
3. Customer Surveys in the Retail Industry: Morris & Fellows, Inc.

SOFTWARE EXPERTISE:

Statistical Analysis System (SAS),
Microsoft Office Products
MetrixND
EPRI Residential End-Use Energy Planning System (REEPS),
Energy 2020,
Micro TSP,
Lotus 1-2-3,
@Risk

Post Graduate Work in Accounting, Georgia State University, 1974

EXPERIENCE:

Mr. Daniel has over twenty-five years of experience in the natural gas, electric, water and telecommunications utility industries. As manager of GDS Associates, Inc.'s Texas District Office, he has both administrative and project management responsibilities. The administrative duties involve personnel management, staffing, strategic planning, service development and marketing. A description of examples of his prior client project responsibilities follows.

1986-Present GDS Associates, Inc.:

Vice President and Manager, Texas Office of GDS Associates, Inc., Engineers and Consultants, Austin, Texas. Provides analysis of natural gas, electric, telephone and water utility rate increase filings and presents expert testimony in regulatory proceedings on behalf of intervenors. Issues addressed in testimony include revenue requirements, cost allocation, and rate design. Other project responsibilities involving rate expertise include the preparation of rate studies for publicly-owned utilities. In the energy procurement area, Mr. Daniel provides electric and gas procurement assistance, including the preparation of RFPs, the analysis of supply and delivery proposals, and contract negotiations with investor-owned utilities on behalf of various wholesale and retail customers. Additional experience in load management and energy conservation studies, power requirements studies, and economic analysis of alternate power supply sources.

1983-1986 Southern Engineering Company:

Manager, District Office of Southern Engineering Company, Austin, Texas. Provided expert testimony before various regulatory agencies on issues related to utility rate design, cost allocation, revenue requirements, and utility economics. Prepared comments on generic rulemaking issues before regulatory agencies and presented ratemaking seminars or courses before various organizations. Also involved in power supply negotiations, litigation support, rate studies for publicly-owned utilities and energy conservation studies.

1979-1983 R.W. Beck and Associates:

Supervising Analyst, R.W. Beck and Associates, Phoenix, Arizona. Prepared rate studies for publicly-owned electric, gas, water and wastewater utilities, including the development of revenue requirement studies, cost of service

studies, and rate design studies. Also presented expert rate testimony before various regulatory commissions on behalf of utility customers. Additional experience in the preparation of municipal utility bond financing feasibility studies.

1974-1979 Southern Engineering Company:

Consultant, Southern Engineering Company, Atlanta, Georgia. Analyzed utility rate increase applications and presented expert testimony on behalf of utility customers. Also developed economic analysis of alternate power supply sources and generation and transmission feasibility studies.

Specific Project Experience:

James W. Daniel has conducted technical economic analyses of gas, electric, telephone, water and wastewater cases involving over 45 investor-owned utilities and 20 publicly-owned utilities in 25 states. Presentation of expert testimony has been made by Mr. Daniel before the following regulatory commissions: Federal Energy Regulatory Commission; Public Utility Commission of Texas; Texas Natural Resource Conservation Commission, the Railroad Commission of Texas, Arizona Corporation Commission; South Dakota Public Utility Commission; New Mexico Public Service Commission; Louisiana Public Service Commission; State Corporation Commission of Kansas; Arkansas Public Service Commission; and the Illinois Commerce Commission. He has also presented testimony at public hearings and at the Condemnation Court Appointed by the Supreme Court of Nebraska. Mr. Daniel has submitted an expert opinion report before the United States Tax Court. In addition, Mr. Daniel has presented utility ratemaking training seminars and has presented utility related workshops for the National Rural Electric Cooperative Association. The following is a list of utility related proceedings in which Mr. Daniel presented expert testimony and/or analysis:

Texas Utilities Company Lone Star Pipeline, before the Texas Railroad Commission in GUD Docket No. 8976, on behalf of the City of Denton, et.al, 2000.

Peoples Natural Gas Company, before the Condemnation Court Appointed by the Supreme Court of Nebraska in Docket No. 101, on behalf of the City of Scribner, Nebraska, 1998.

Peoples Natural Gas Company, before the Condemnation Court Appointed by the Supreme Court of Nebraska in Docket No. 13880, on behalf of the City of Wahoo, Nebraska, 1997.

Peoples Natural Gas Company, before PNG's Rate Area Three Municipalities, on behalf of 90 Nebraska municipalities, 1995.

ENSTAR Natural Gas Company, before the Alaska Public Utilities Commission, on behalf of Elmendorf Air Force Base, 1986.

Lykes Energy, Inc., before the United States Tax Court in Dockets No. 7685-96 and 4979-97 on behalf of the Internal Revenue Service, 1997.

Arkansas Western Gas Company, before the Arkansas Public Service Commission in Docket No. 97-019-U on behalf of the Office of Arkansas Attorney General, 1997.

Houston Lighting & Power Company, Texas PUC Docket No. 9850, on behalf of the Coalition of Cities, 1990-91.

Sharyland Utilities, L.P., before the Texas Public Utility Commission in Docket No. 22348, on behalf of Sharyland Utilities, L.P., 2000.

Sharyland Utilities, L.P., before the Texas Public Utility Commission in Docket No. 21591, on behalf of Sharyland Utilities, L.P., 1999.

Central Power and Light Company, before the Texas Public Utility Commission in Docket No. 21528, on behalf of Texas Retailers Association and Texas Hospital Association, 1999.

Central and South West Corporation and American Electric Power Company, Inc., Texas PUC Docket No. 19265, on behalf of the East Texas Cooperatives, 1999.

Sharyland Utilities, L.P., before the Texas Public Utility Commission in Docket No. 20292, on behalf of Sharyland Utilities, L.P, 1998.

Entergy Gulf States, Inc., before the Federal Energy Regulatory Commission in Docket No. EL-99-6-000, on behalf of Sam Rayburn G&T, Inc., 1998.

Entergy Texas, before the Texas Public Utility Commission in Docket No. 16705 on behalf of High Load Factor Commercial Customer Group, 1997.

Longbranch Associates, L.P. dba Coppertree Apartments, before the Texas Natural Resource Conservation Commission in Docket No. 96-0652-UCR on behalf of the City of Houston, Texas, 1996.

Texas Utilities Electric Company, before the Texas Public Utility Commission in Docket No. 15638 on behalf of Tex-La Electric Cooperative of Texas, Inc., 1996.

Central Power and Light Company and West Texas Utilities Company, before the Texas Public Utility Commission in Docket No. 15643 on behalf of Rio Grande Electric Cooperative, Inc., 1996.

Commonwealth Edison Company, before the State of Illinois Commerce Commission in Dockets No. 96-0245 & 96-0248 on behalf of the Citizens Utility Board, the City of Chicago, Illinois, and the Office of the Attorney General, 1996.

Public Utility Commission, before the Texas Public Utility Commission in Docket No. 15296 on behalf of the City of Bryan, Texas, 1996.

City of Bryan, Texas, before the Texas Public Utility Commission in Docket No. 15766 on behalf of the City of Bryan, Texas, 1996.

Central Power and Light Company, before the Texas Public Utility Commission in Docket No. 14965 on behalf of H. E. Butt Grocery Company, 1996.

City of College Station, Texas, before the Federal Energy Regulatory Commission in Docket No. TX96-2-000 on behalf of the City of Bryan, Texas, 1996.

Southwestern Electric Power Company, before the Texas Public Utility Commission in Docket No. 14435 on behalf of Northeast Texas Electric Cooperative, Inc., and Upshur-Rural Cooperative, Inc., 1995.

West Texas Utilities Company, before the Texas Public Utility Commission in Docket No. 13369 on behalf of the City of San Angelo, Texas, 1995.

Houston Lighting and Power Company, before the Texas Public Utility Commission in Docket No. 12065 on behalf of the City of Houston, Texas, 1995.

Central Power and Light Company, before the Texas Public Utility Commission in Docket No. 12820 on behalf of H. E. Butt Grocery Company, 1994.

Kansas Natural Pipeline and Kansas Natural Partnership, before the Kansas Corporation Commission in Docket No. 190-362-U on behalf of Citizen's Utility Ratepayer Board, 1994.

KN Energy, Inc., before the Kansas Corporation Commission in Docket No. 186-363-U on behalf of Citizens' Utility Ratepayer Board in a natural gas rate case, 1994.

Lower Colorado River Authority, Texas PUC Docket No. 9427, on behalf of New Braunfels Utilities, Guadalupe Valley Electric Cooperative, Inc., DeWitt County Electric Cooperative, Inc., San Bernard Electric Cooperative, Inc., 1990.

Central Power and Light Company, Texas PUC Docket No. 9561, on behalf of South Texas Cotton Ginners, 1990.

El Paso Electric Company, Texas PUC Docket No. 9165, on behalf of El Paso Community College, 1990.

Texas Utilities Electric Company, Texas PUC Docket No. 9300, 1990; Docket No. 6677, 1986; Docket No. 5640, 1984; on behalf of Tex-La Electric Cooperative of Texas, Inc.

Lower Colorado River Authority, Texas PUC Docket No. 8032, on behalf of Guadalupe Valley Electric Cooperative, Inc. 1988.

Peoples Natural Gas Company, before PNG's Rate Area Two and Three Municipalities, on behalf of 33 Nebraska municipalities, 1991-1992.

Central Louisiana Electric Company, Louisiana Public Service Commission Docket No. U-16150, on behalf of England Air Force Base and the Federal Executive Agencies, 1986.

Gulf States Utilities Company, Federal Energy Regulatory Commission Docket No. ER85-538-001, on behalf of Cajun Electric Power Cooperative, Inc., Sam Rayburn G&T, Inc., Sam Rayburn Municipal Power Agency, and Louisiana Energy and Power Authority, 1985.

Texas Utilities Electric Company, Texas PUC Docket No. 5709, Rusk County Electric Cooperative, Inc. 1984.

Gulf States Utilities Company, Texas PUC Docket No. 5560, on behalf of North Star Steel Texas, Inc., 1984.

Texas Power & Light Company, Texas PUC Docket No. 5294, on behalf of Tex-La Electric Cooperative of Texas, Inc. 1983.

Arizona Public Service Company, FERC Docket No. ER81-179, on behalf of Electrical District No. 6, Roosevelt Irrigation District, Maricopa County Water Conservation District, Electrical District No. 3, Buckeye Water Conservation & Drainage District No. 7, Arizona Power Electrical District No. 1, 1981.

Citizens Utilities Company, Arizona Corporation Commission Docket No. 9962-E-1032 (Phase II), on behalf of GK Technologies, Inc. and McCulloch, Corp., 1980.

Public Service Company of Indiana, Federal Energy Regulatory Commission Docket No. ER78-153, on behalf of Wabash Valley Power Association, Inc., 1980.

Northwestern Public Service Company, South Dakota Public Utilities Commission Docket No. F-3055, on behalf of the Commission staff.

REGULATORY EXPERIENCE:

Mr. Daniel has presented expert reports and/or testimony and exhibits in rate and cost-of-service matters before the following regulatory commissions or courts:

Arizona Corporation Commission
Arkansas Public Service Commission
Condemnation Court Appointed by the Supreme Court of Nebraska
Illinois Commerce Commission
Kansas Corporation Commission
Louisiana Public Service Commission
Nebraska Municipality Rate Area
New Mexico Public Service Commission
Public Utility Commission of Texas
Railroad Commission of Texas
South Dakota Public Utility Commission
Texas Natural Resource Conservation Commission
United States Tax Court
Federal Energy Regulatory Commission
(Formerly Federal Power Commission)

EDUCATION: Master of Business Administration - Finance, Georgia State University, 1973
Bachelor of Industrial Management, Georgia Institute of Technology, 1972

EXPERIENCE:

Mr. Solomon has extensive experience in electric utility ratemaking and power supply contracting. This broad experience includes projected future power cost and power supply analysis; allocated cost-of-service and rate design analysis; revenue requirements and rate of return analysis; avoided cost analysis, presentation of expert testimony before the Federal Energy Regulatory Commission in wholesale rate cases and before state utility commissions in wholesale and retail rate cases, least cost integrated resource planning and certificate of convenience proceedings; negotiation of wholesale and retail full requirements, partial requirements, economic development, interruptible, and transmission rates and contracts; preparation and presentation of depreciation studies; analysis of management audits of electric utilities; preparation and evaluation of merger and acquisition analyses; participation in bankruptcy proceedings; and valuation of electric utility distribution systems.

Mr. Solomon has also been heavily involved in assisting clients in the electric industry restructuring process. He has participated in evaluating, negotiating and testifying on independent system operator/regional transmission organization ("ISO/RTO") formation and implementation and other industry restructuring issues. He has experience with the PJM ISO, New York ISO, Midwest ISO, Alliance RTO formation and has been actively involved in the Cincinnati RTO collaborative process since its initiation by FERC Order No. 2000. In addition, Mr. Solomon has testified in industry restructuring proceedings in Virginia, Arkansas, Texas and Ohio.

Mr. Solomon was employed by Southern Engineering Company from January 1975 until February 1986. While at Southern Engineering, Mr. Solomon provided electric utility ratemaking services to rural electric cooperatives, municipally-owned utilities, large industrial firms, and governmental agencies advancing from rate analyst to Assistant Vice President, Economic and Regulatory Services. In February 1986, Mr. Solomon participated in the founding of GDS Associates, Inc. where he continues to provide regulatory consulting services, expert testimony on electric and gas utility pricing and service matters, and power supply contracting services.

Mr. Solomon has presented expert testimony before numerous regulatory bodies in the following areas: the cost of capital and required rate of return for both privately-owned and publicly-owned utilities; accounting as applied in ratemaking and the effects of appropriate alternative accounting methods on expenses, income taxes, revenues, rate base and cost of capital; proper methods of cost allocation; proper methods of measuring working capital requirements; the proper development of test year revenue requirements; rate design; least cost integrated resource planning; industry restructuring issues; stranded cost analysis; and the development of competitive electricity markets through properly designed ISOs, Transcos and RTOs.

(770) 425-8100
(770) 426-0303 - Fax
Butch.Solomon@GDSAssociates.com - E-Mail

Mr. Solomon has testified extensively before the Federal Energy Regulatory Commission (formerly Federal Power Commission) in proceedings involving full and partial requirements wholesale rates and terms and conditions of service, mergers and acquisitions, market-based rate applications, regional restructuring and implementation of an ISO and energy exchange, transmission rates and service terms, coordination service rates, service reliability, fuel adjustment provisions, customer filed complaints and special accounting dockets. Mr. Solomon has also testified before the Arkansas Public Service Commission, the Florida Public Service Commission, the Georgia Public Service Commission, the Public Service Commission of Indiana, the Kentucky Public Service Commission, the Maine Public Utilities Commission, the Michigan Public Service Commission, the Public Utilities Commission of Minnesota, the Nevada Public Utilities Commission, the New Jersey Board of Public Utilities, the North Carolina Utilities Commission, the Public Utilities Commission of Ohio, the Pennsylvania Public Utility Commission, the Public Utilities Commission of the State of Rhode Island, the Public Utility Commission of Texas, and the Virginia State Corporation Commission in matters similar to those before the FERC plus the appropriate costing and design of interruptible, economic development and special contract rates and prudent integrated resource planning practices. In addition, Mr. Solomon has participated in the successful negotiation of settlements in many cases thereby eliminating the requirement for the filing of testimony.

In addition to filing expert testimony, Mr. Solomon has participated in the preparation of comments for submission to the FERC and state regulatory commissions in generic rulemaking proceedings on the following subjects: income tax normalization; changes to FERC Form 1; rate of return on common equity; CWIP in rate base; interest rate on refunds; treatment of captive fuel operations; cash working capital; changes in filing requirements; price squeeze; and pricing of electricity sales.

Additionally, Mr. Solomon has testified before the U.S. Senate Committee on Energy and Natural Resources, Subcommittee on Energy Regulation concerning the "Construction Work in Progress Policy Act of 1983" (S.817 and S.1069) and before the Utilities Committee of the Mississippi House of Representatives regarding valuation of electric distribution systems.

EDUCATION: Georgia Southern University; BBA, Management, 1966-1970
Woodrow Wilson College of Law; JD, 1972-1975
Certified Public Accountant, 1987

PROFESSIONAL MEMBERSHIPS: American Institute of Certified Public Accountants
Georgia Society of Certified Public Accountants
Society of Depreciation Professionals

EXPERIENCE:

Mr. Cook has extensive experience in the electric utility industry. This experience includes preparation of cost of service studies and revenue requirements analysis; development of depreciation studies, development of rate study models, preparation of merger studies, cost of capital analysis and negotiation of wholesale and retail revenue requirements and rates.

Mr. Cook was employed by Ebasco Business Consulting Company from March 1978 through June 1982. While at Ebasco Mr. Cook served as Project Manager in the utility rates division where he provided cost of service, revenue requirements and FERC reporting services to investor-owned and municipal electric utilities. In June 1982 Mr. Cook joined Southern Engineering Company as a Project Manager where he continued to provide cost of service and revenue requirements assistance to rural electric cooperative and municipal electric utilities. In February 1986 Mr. Cook joined GDS Associates, Inc. where he has served as Senior Project Manager. He has provided cost of service, revenue requirements, depreciation analysis, mergers and acquisitions studies, FERC and state reporting and other ratemaking services to electric cooperative, municipal, industrial and governmental organizations. Mr. Cook has also provided electric rate negotiation services on behalf of electric utilities.

Mr. Cook has prepared testimony and has testified before several regulatory agencies. Mr. Cook has filed testimony regarding the preparation of utilities' cost of service, o & m expenses, depreciation, taxes other than income taxes, a & g expenses, other revenues, income taxes and rate base on behalf of various electric utility clients. Mr. Cook has testified before the Georgia Public Service Commission, the Texas Public Utilities Commission and the Alaska Regulatory Commission. Mr. Cook has also participated in the filing of comments regarding generic ratemaking dockets including, Construction Work in Progress (CWIP), cash working capital and return on common equity.

Specific Project Experience Includes:

Prepared 1997 cost of service analyses regarding Cleveland Electric Illuminating Company on behalf of Cleveland Public Power.

Reviewed and prepared cost of service analyses regarding 1997 Southern Company open access transmission filing on behalf of Southeastern Federal Power Customers, Inc.

Reviewed and analyzed Florida Power & Light Company's 1997 depreciation filing on behalf of Seminole Electric Cooperative, Inc.

Prepared 1997 transmission rate cost of service analyses regarding South Carolina Electric & Gas Company on behalf of Southeastern Federal Power Customers, Inc.

Prepared 1997 cost of service analyses of Western Resources/KCPL merger filing on behalf of Kansas Electric Power Cooperative.

Prepared 1997 analyses of SEPCo's depreciation rate study on behalf of Georgia Public Service Commission.

Provided 1998 cost of service and rate assistance to Georgia Public Service Commission regarding Georgia Power Company retail rate filing.

Provided 1999 litigation support and analysis on behalf of Niagara Mohawk Power in counterclaim regarding Baesha Engineering Associates.

Provided 1999 cost of service and rate analysis assistance to Southeastern Federal Power Customers regarding SEPA/TVA proposed rate increases. Reviewed and provided recommendations regarding reasonableness of costs.

Prepared 2000 testimony regarding depreciation issue in Reliant HL&P filing on behalf of City of Houston and others. Provided 2001 testimony on behalf of City of Houston at retail rate proceeding.

Prepared 2000 testimony regarding appropriate administrative & general expense of Chugach Electric Association 1997 revenue requirements study on behalf of Matanuska Electric Association. Provided 2001 testimony on behalf of Matanuska at rate proceeding

Prepared 2000 testimony regarding recommended revenue requirements and wholesale cost of service of Pennsylvania Electric Company on behalf of Allegheny Electric Cooperative, Inc.

Prepared 2001 testimony regarding appropriate administrative & general expense of Chugach Electric Association 1998 revenue requirements study on behalf of Matanuska Electric Association.

American Gas Association
Past Director, TGA
Past Chairman, TGA Distribution Committee
Chairman, TGA Membership Committee
Chairman, TGA Scholarship & Community Affairs Committee

EXPERIENCE:

Over seventeen years of experience in operations, financial, construction, marketing, customer service, regulatory compliance and training for the natural gas pipeline industry. Currently a natural gas consultant/project manager for the Cities of Brady, Castroville, Corpus Christi, Dilley, Port Aransas, and Starr County Gas System, gas gathering companies, GDS Associates, Inc., Universal Ensco, Inc., Pipeline Accident Prevention Service and the Texas A & M University System. Have taken special courses in pipeline safety regulations-application and enforcement of pipeline systems, business, and management. Received the Outstanding Service Award to the Railroad Commission of Texas in 1987, the Texas Gas Association Service (TGA) Award in 1995, 1996, 1999, and 2000 and Distinguished TGA Carrying the Flame Award in 1996 for outstanding contributions to the natural gas industry. Bilingual in Spanish.

Present GDS Associates, Inc.

Senior Project Manager/Consultant, GDS Associates, Inc. Currently assisting the Navigant/GDS Team in conducting a Utility Privatization Study for the Department of Navy. The study consists of evaluating existing inventory, operations, maintaining, capital improvements data, and to create a replacement cost for natural gas and other utilities on a 25-year life cycle for the purpose of future privatization consideration. The Bases that have been evaluated are: USMC, Barstow, California; USMC, Yuma, Arizona; Naval Bases, NAWS & CBC, Ventura County, California; and NPS, Monterey, California. Project Manager on a City of Dilley rate adjustment study. Project Manager on a regulatory review for the Cities of Port Aransas, Castroville, Dilley and Bay City Gas Company. Project Consultant on a Cost of Service Study for the Cities of Westfield, CN and Dilley, TX. Project Manager on creating an energy procurement strategy for the Cities of Chicago, Illinois and Corpus Christi, Texas. Project Manager in gas supply contracts negotations for the Cities of Dilley and Port Aransas, Texas. Conducted research and development of operator qualifications program with Pipeline Accident Prevention Service. Project

Consultant in a review of fixed price option by Peoples Gas to the City of Norfolk, Nebraska. Project Manager on a system lost and unaccounted investigation for the City of Cotulla, Texas.

1997- 2001 Peña & Associates

Natural Gas Consultant, Peña & Associates. Assisting various gas distribution (public/private) and transmission companies throughout Texas in their dealing with issues concerning operations, construction, marketing, training and regulatory compliance. Served as an expert witness for Griggs & Harrison, Houston, Texas. An advisor and instructor to the Texas A & M University System's Engineering Extension Service, Public Sector Division, Pipeline Operator Qualification Program. Provide consulting services to Universal Ensco, Inc., a pipeline-engineering firm conducting pipeline evaluations on military Bases. Providing Training services for the Texas Gas Association and Pipeline Accident Prevention Service members/clients.

1997-1999 Pipeline Accident Prevention Service (PAPS)

Director, Business Development, Pipeline Accident Prevention Service (PAPS). Worked in the development of PAPS and consulting. PAPS is a consulting, training, and field service provider in the natural gas pipeline industry. Provide training and consulting services for Gas Natural del noroeste in Hermosillo, Sonora, Mexico and Igasamex, Integrated Gas Services De Mexico, Mexico City, Mexico.

1989-1997 Gulfside Industries Ltd.

Executive Vice President and Director, Gulfside Industries Ltd., Somerset, Texas. Managed the operations and administration of a natural gas utility in South Texas with approximately 2600 meters for 7 ½ years. President of Paladin Resources, Inc., a wholly owned subsidiary Oil and Gas Production Company of Gulfside for 2 ½ years.

1984-1989 Texas Railroad Commission

Engineering Technician IV, Transportation/Gas Utilities Division, Pipeline Safety Section for the Railroad Commission of Texas for 5 years. Performed routine technical work relating to pipeline safety and compliance for the Pipeline Safety Section of the Transportation/Gas Utilities Division. Conducted routine safety evaluations, accident and special investigations, responded to emergency situations, prepared necessary reports and completed administrative functions for gas distribution and transmission systems, small and major. Served on the training committee and was an instructor in Commission seminars and workshops.

1982-1984 City of George West, Texas

Gas Technician, City of George West, Texas. Studied and suggested improvements for gas system.

1980-1994 Independent Contractor

Self Employed Contract Gauger, Independent Contractor. Gauged natural gas and oil well production.

EDUCATION: BBA Accounting, University of Texas at Austin
Certified Public Accountant, Texas

PROFESSIONAL MEMBERSHIPS: National Association of Water Companies
Texas Society of Certified Professional Accountants

EXPERIENCE:

Mr. Loy has over 20 years experience in Public Utility regulation and financial matters.

2001-Present GDS Associates, Inc.: Sr. Project Manager – Mr Loy started with GDS in June of 2001. His focus is on regulatory accounting and finance. He is experienced in electric, gas, water, and wastewater regulatory and accounting matters. While at GDS, Mr. Loy has assisted with the financial analysis of purchase power and aggregation projects as a result of the recent deregulation of the electric industry in Texas. Further, he assisted in the analysis of the TXU Gas Distribution South Region Rate Case filed before various municipalities in Texas.

1999-2001 AquaSource Inc.: General Manager Rates and Regulatory Affairs - AquaSource Inc., a wholly owned subsidiary of DQE Inc and parent of Duquesne Light. AquaSource was formed in 1997 to take advantage of the consolidation in the water and wastewater industries and spent three years and more than $400 million acquiring water and wastewater companies.

Mr Loy's duties included directing the compilation and filing of rate cases, acquisition analyses and related filings, commission staff relations, and governmental relations in the twelve states in which AquaSource operates. Additionally, he supervised a professional staff located throughout the country and assisted in business development, contract negotiations and other special projects.

His appointment came in the middle of AquaSource's aggressive acquisition phase. Accordingly, his first year was spent primarily working to clean up a very chaotic regulatory environment. In so doing, he introduced order and process where before there was none.

1993-1999 Citizens Utilities Company: Manager, Regulatory Affairs – Mr. Loy served as Project Manager of four multiple-company rate case filings, including two in Ohio, six in Illinois, five in Pennsylvania and six in Arizona. In those cases, he prepared and presented testimony, developed revenue requirement calculations, generated revenue and expense pro forma adjustments, performed working capital lead/lag studies, and evaluated rate design/cost of service issues. He proposed surcharge mechanisms for purchased water, a reverse osmosis process, and

contract waste treatment. Additionally, Mr. Loy designed and directed the development of the multiple company revenue requirement models that generated filing schedules. In the fall of 1997, Citizens promoted Mr. Loy to Manager Regulatory Affairs, after which he reported to the Vice President of Regulatory Affairs. In the new position, he supervised the staff responsible for all regulatory activity involving gas, electric and water/wastewater in ten states. The last project he was involved with before leaving Citizens was planning and directing the preparation of a rate filing for the Company's electric distribution system in Vermont

Other Accomplishments and Relevant Experience:

- Played a key role in the acquisition of three water and wastewater companies and their inclusion in the rate case of three other Citizens companies.
- Analyzed several likely municipal and private acquisitions, and developed and analyzed cash flow forecasts to determine their value and potential. These projects included evaluating a trade of Citizens wastewater treatment plants for a municipal water system.
- Directed a team of accountants assembled to develop common accounting procedures for the Arizona, Illinois, Indiana, Ohio and Pennsylvania water/wastewater properties. This helped position the company to compete more efficiently in the unregulated O&M contract business.
- Developed the accounting and regulatory strategy for Citizens Public Works Services Company, a wholly owned unregulated subsidiary involved in the O&M contract business. The treatment established accounting for future projects and precedents for future commission decisions regarding affiliated transactions with unregulated subsidiaries.
- Contributed to project with Citizen's Lake Michigan pipeline that was seeking an unregulated status. This was the first privately-owned water pipeline of its kind in a major metropolitan market.
- Key contributor on a team which successfully competed with other major utilities and O&M companies for a major water/wastewater franchise serving 12,000+ customers in the Phoenix area. Mr. Loy worked in developing the proposal, actively participated in the final negotiations, and prepared the regulatory filings.
- Mr. Loy served on a team that developed the accounting and regulatory strategy for the implementation of Citizens Business Service Company, a wholly owned unregulated subsidiary.

1989-1993 Southern Union Gas Company: Rate Manager – Mr. Loy joined Southern Union as Sr. Internal Auditor. In that capacity, he contributed to multiple projects pertaining to the upcoming merger with a large publicly traded corporation. These projects included supervising audits of gas purchases, accounts receivable,

accounts payable and oil and gas holdings. He was promoted to Rate Manager reporting to the Vice President of Regulatory Affairs. In that capacity, he supervised a team of four directing the preparation and implementation of 16 rate increase applications before various municipal and state regulatory bodies, and led negotiating sessions with elected and municipal officials. Under Mr. Loy's direction, the Regulatory Affairs Department reduced the preparation time of rate applications from approximately 6 months to 8 weeks.

Other Accomplishments and Relevant Experience:

- Performed analysis and due diligence for numerous municipal and private acquisitions.
- He was a member of a team that reviewed, analyzed and selected financial and customer billing software for the company. The team accomplished this objective under budget and on schedule.
- Mr. Loy served on a team that re-engineered the meter testing and maintenance department. The result was a 50% reduction in costs and the department was eventually sold at a sizable profit.

1987-1989 Diversified Utility Consultants, Inc.: Sr. Accounting Analyst - Diversified Utility Consultants (DUC) is a consulting firm which represents consumers' interests in rate case proceedings. The firm's clients include municipalities and various state-supported consumer agencies. As a Sr. Accounting Analyst, Mr. Loy worked on seven electric rate cases, two gas rate cases and one water rate case. Additionally, he worked on various utility related assignments which included electric rate design for municipalities and the review and analysis of nuclear power plant decommissioning costs.

Prior to 1987 Mr. Loy spent summers in college roughnecking, both offshore and onshore, on oil and gas drilling rigs. His first job after college was in the oil & gas industry where he started in accounts receivable and specialized in collecting past due accounts. He was in the Joint Interest Auditing Department where he reviewed drilling costs and negotiated refunds for the company and its joint interest owners.

EDUCATION: Bachelor of Arts, Economics and French, Simmons College, Boston, Massachusetts, 1995

Brethren Colleges Abroad (BCA), Strasbourg, France
BCA Honors Program, Institut d'Etudes Politiques, Faculté des Lettres and Faculté de Théologie Protestante, 1994

EXPERIENCE:

Ms. Anderson has over six years of experience in the utility industry, with an emphasis on utility rate regulation and electric industry restructuring.

2001-Present GDS Associates, Inc.:

Analysis of electric and natural gas utility rate increase filings, rate unbundling proposals and restructuring policy. Provide assistance in the preparation of testimony and discovery in federal and state regulatory proceedings in areas including revenue requirements, cost allocation and rate design.

2000-2001 The Center for Business Intelligence, Woburn, Massachusetts:

Conference Producer for CBI's Energy Team. Conducted extensive market research to generate commercially viable topics and develop high quality, targeted conferences for the domestic energy industry. Interviewed, recruited, negotiated with and managed senior executive speakers. Led a production team for marketing, operations and sponsorship sales initiatives. Produced and managed conferences with revenues totaling over $500,000 on topics such as load profiling and forecasting, CRM, RTO market structure, fuel cells, desalination, electric asset valuation, electric distribution reliability, Clean Air Act compliance, pricing in wholesale and retail electric markets utility mergers and acquisitions and distributed generation.

1999-2000 La Capra Associates, Boston, Massachusetts:

Analyst. Developed forecasts of retail electric prices to help clients evaluate their position in the competitive marketplace. Provided analytical services to clients in multiple areas, including price forecasting, load profiling, stranded cost modeling and rate unbundling. Supported a team of consultants in areas such as regulatory policy, energy planning, market analysis, and pricing in the electric, natural gas, and water industries in the U.S. and abroad. Primary author of a comprehensive study of the history and status of electric industry restructuring in Massachusetts. Assisted in the preparation of expert testimony for presentation before Public Utility Commissions in several U.S. states in the areas listed above.

1998-1999 COM/Energy Services Company, Regulatory and Industry Affairs Division, Cambridge, Massachusetts:

Regulatory Analyst. Prepared rate cases, discovery responses, special contracts, rate reconciliation and review of purchased power agreements for filing with the MA DTE. Identified, analyzed, assessed, and followed emerging regulatory issues in the domestic electric and gas industries. Participated in the Massachusetts Gas Unbundling Collaborative. Assisted in the development and communication of policies and procedures consistent with and responsive to federal and state regulatory requirements. Provided project management and litigation support services for business and regulatory issues, including rate regulation, rate administration, and rate design. Assisted in maintaining and updating the company's Intranet site and oversaw the Y2K compliance activities of the company.

1995-1998 Massachusetts Department of Telecommunications and Energy, Electric Power Division, Boston, Massachusetts:

Economist. Reviewed and analyzed utility company filings pertaining to fuel and energy procurement, electric industry restructuring, energy conservation, and rate adjustments. Assisted in the development of a legislative proposal and regulations necessary to initiate competition in the electric utility industry in Massachusetts. Developed discovery and cross examined expert witnesses on testimony in public hearings before the Commission. Served as technical staff in settlement negotiations. Prepared and presented policy recommendations to the Commissioners of the Department. Represented the Commonwealth in the Massachusetts and Rhode Island Renewable Energy Collaborative groups, Massachusetts Energy Conservation Services Public Advisory Committee and DTE (Electric Industry Restructuring) Speakers Bureau.

1995 The Tax Equity Alliance for Massachusetts, Boston, Massachusetts:

Intern. Conducted an econometric analysis of the Earned Income Credit's (EIC) labor market effects and anti-poverty effectiveness. Assisted in the coordination of the 1995 EIC Campaign. Worked jointly with the Internal Revenue Service to maintain the EIC hotline and provide tax preparation assistance.

EXPERIENCE:

Mr. Kirkpatrick has had diversified experience in the micro computer field including installation and training for word processors, graphics, communications, spreadsheets, and databases. He exhibits expertise in the setup and repair of numerous DOS/Windows PC compatible systems, Palm Pilots, much of the Apple line of computers, and many other computer types. Computer languages that Mr. Kirkpatrick uses include Visual Basic, Lotus 123 and Excel macro scripts, dBase/xBase, Paradox PAL, Basic, Pascal, C, C++, some Fortran, Cobol, RPG II, Z80, and 6502 assembly. Mr. Kirkpatrick is also well versed in several Computer Aided Instruction authoring languages. Advanced database and spreadsheet skills are utilized in rate design and Cost-Of-Service modeling that Mr. Kirkpatrick is called on to develop, review, and customize. A description of his responsibilities follows:

1988-Present GDS Associates, Inc.:

Analyst, GDS Associates, Inc., Austin, Texas. Utilizing a broad technical training of both hardware and software, Mr. Kirkpatrick planned, installed and currently administers the Austin network and assists with other GDS corporate and client networks. Current project duties include the creation of gas and electric wholesale rate design models, Cost-Of-Service and Unbundled Cost-Of-Service models, aggregation of load data, water/wastewater inventory & cost estimation systems, extensive database system planning, implementation, and maintenance

as needed. Additional responsibilities include presentation layout and graphics design, software/hardware training and help desk duties responding to both corporate and client needs.

1986-1988 Rex Supply Corporation:

Salesman, Rex Supply Corporation, Houston, Texas. Duties included inside sales, outside sales and field delivery, and concurrent training in company supported Computerized Numerical Control (CNC) lathes.

1984-1986 Kirkpatrick Consulting:

Duties included on-call software and technical consulting to multiple small PC stores and contractual consulting to small businesses. Responsibilities included needs assessment, purchasing, installation, personnel training for hardware and software, custom database programming, and maintenance of wide varieties of micro computer systems.

1982-1984 Heliflight Systems, Inc.:

PC Specialist, Offshore Logistics Inc., Conroe, Texas. Responsibilities included installation, periodic maintenance, and repair of remote computer/training systems throughout Texas and Louisiana, and administration of an Apple II based Local Area Network at Heliflight headquarters. Primary duties included creation of Computer Aided Instruction (CAI) programs used by flight instructors for the initial training of foreign helicopter pilots, and used by maintenance department management and personnel to meet annual federal recurrent training requirements.

1978-1982 Retail Computer Stores:

Service Manager, Computer Technician, Salesman
Duties included inventory management, preparation and installation of new hardware and software, on-site installation and training, maintenance, system repair, sales and contract programming.

SPECIFIC PROJECT EXPERIANCE:

AquaSource Utility Inc., Texas

Development of a valuation of purchased assets database for 270 water/wastewater systems. Assisted in development of internet based facilities reporting system.

Citizens Utility Ratepayer Board

Provided gas Cost-Of-Service and rate design analysis.

City of Wahoo, Nebraska

Provided analysis of the Minnegasco acquisition.

Dayton Power and Light, Dayton Ohio

Creation of PC based data filtering program with operator definable parameters to handle anomalies and fully approximate corrupted records for data stemming from Time Of Use experiment for mainframe MIS department. This filtering system generates daily system status, record error reports, and historic error reports to enable Dayton Power and Light to investigate possible equipment problems.

Guadalupe Valley Electric Cooperative, Inc.

Aided in development and maintenance of Cost-Of-Service and rate design models. Helped to develop and maintain annual lease payment and net benefits analysis.

HEB Grocery Stores

Cost-Of-Service and rate design analysis in Central Power and Light, Entergy/Gulf States Utilities, Texas Utilities, and Texas-New Mexico Power rate cases. For Load Aggregation Pilot and Full Competition Power Supply Contracting projects, helped to identify potential suppliers, develop issue and pricing proposals, evaluate responses and provide analysis for negotiation of final contracts.

League Of Nebraska Municipalities

Provided gas Cost-Of-Service and rate design analysis.

Reliant Energy/Houston Lighting And Power

Aided in development and maintenance of cost allocation and unbundled Cost-Of-Service models. Provided analysis in fuel cases, assisted in water and sewer rate case, worked on FY2002 power cost budget analysis.

Rio Grande Electric Cooperative, Inc.

Analysis of issues in Central Power and Light, and CSW rate and transmission cases, assist in Transmission Cost-Of-Service filing package. Provided statistical analysis for Legislation Proposed in Rio's 76th Texas Legislature. Analyzed and graphed of West Region - Market Clearing Prices and produced aggregated load data files for West Texas Utilities and Lower Colorado River Authority.

Sharyland Utilities, L.P.,

Analyze preliminary transmission and distribution costs and assist in Certificate Of Convenience And Necessity filing. Co-developed Cost-Of-Service, Transmission Cost-Of-Service, and Unbundled Cost-Of-Service models and tariff sheets.

Tex-La Electric Cooperative of Texas, Inc. (Tex-La,) East Texas Electric Cooperative, Inc. (ETEC) ,and Northeast Texas Electric Coop (NTEC,)

Installation and maintenance of the multi-user document tracking database system, Case Information System by D-M Information Systems, Inc. Annual Southwestern Electric Power Company (SWEPCO) formula rate review and rate analysis.

Stone & Webster Consultants™
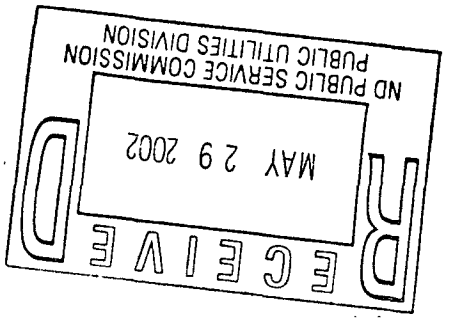
A Shaw Group Company

June 28, 2002



Mr. Mike Diller
Director of Accounting
North Dakota Public Service Commission
State Capital, 12th Floor
Bismarck, ND 58505-0480

Dear Mr. Diller:

Re: Proposal in Response to RFP Case No. PU-399-02-183 to Assist the Commission Staff in its Investigation of MDU's Gas Rate Increase Request

Stone & Webster Consultants, Inc. (Stone & Webster Consultants) is pleased to submit the enclosed technical proposal to provide consulting services to The North Dakota Public Service Commission (NDPSC) in connection with assisting the Commission Staff in its investigation of Montana-Dakota Utilities Co.'s (MDU's) gas rate increase request. Our proposal covers each of the five areas of the Commission's investigation. They are:

1. The appropriate level of investment;
2. The appropriate cost of capital;
3. The correct cost of service;
4. The appropriate rate design; and
5. Depreciation study.

We are very experienced in support of rate cases for commissions and for various types and sizes of utilities. Our experience covers the analysis of cost drivers, cost allocation, functionalization of costs, customer segmentation studies, cost of service and rate policies and their application, regulatory policy and regulatory strategy, rate design, performance based ratemaking issues and design and depreciation studies. In our appraisal studies performed for commissions, utilities and appellate tax boards, we regularly analyze the cost of money assumptions necessary for a litigated review of appropriate asset appraisals.

We recognize the importance of this effort to NDPSC and its responsibility as regulator, to assure that all stakeholders receive fair and equitable treatment. Stone & Webster

Consultants staff pledges to work closely as a team member with NDPSC staff to ensure that the objectives of this investigation are fully realized.

Stone & Webster Consultants is a premier international consulting firm in the electricity, gas, water and broader utility sectors. We have offices throughout the US, Canada and the UK. We are dedicated to providing strategic, economic, business, and technical services that offer value, insight, and expertise to clients worldwide. We are a knowledge-based firm with a reputation for delivering superior business solutions through an integrated set of products and services. Our client base is broad --- we serve companies in the electric, gas, and water businesses; investment and commercial banks; bilateral and multilateral institutions; and regulatory bodies and governments worldwide.

As a result of powerful global, regulatory, technological and economic forces at work throughout the energy and utility industries, our clients demand and receive customer-tailored business solutions that create real value. Stone & Webster Consultants offers its clients a comprehensive array of consulting services --- assisting the client in developing its vision and strategic plan, identifying and selecting economic and technical solutions which add value to their businesses, and providing on-site implementation services through the development and training of client employees.

Fundamental changes in the structure of the North American electric sector leading to a new competitive market are producing opportunities as assets are sold and companies merge and diversify. Stone & Webster Consultants is providing services to asset owners in the process of divesting and to asset buyers in their efforts to acquire, assets. Transaction support services include plant technical descriptions, competitive market evaluations and unit evaluations. In cases where companies are merging, Stone & Webster Consultants has provided independent appraisal services as well as assessments of and implementation of efficiency improvements. We have a staff of more than 250 consultants, with many more available when supplemented and complemented by our sister companies and business partners in Canada and the US, who are available to us as required.

Stone & Webster Consultants also offers the services of Power Technologies International (PTI), a leader in transmission and distribution consulting and software analysis and planning tools. PTI is a division of Stone & Webster Consultants.

Benefits of Choosing Stone & Webster Consultants

Stone & Webster Consultants has provided diverse services to clients worldwide from which this project can directly benefit – we are effective and efficient in our project approach, and bring professionals with broad knowledge of all aspects of the energy market. Stone & Webster Consultants has professionals with extensive supply knowledge, in both, electricity and gas markets. We bring a combination of business and technical knowledge to provide diverse analyses and strategies to our clients. We have advised executives, middle managers and technical staff – providing us a diverse set of experiences from which to draw. Highlighted below are a few of the excellent and targeted qualifications Stone & Webster Consultants will bring to this assignment:

☛ **We have performed more than 100 bundled and unbundled and marginal cost of service studies and rate design development in the US and Canada.**

Stone & Webster Consultants staff have completed segmentation analysis, cost analysis, and studies to assist utilities in their development and application of cost based rates. We are extremely knowledgeable in these areas and will contribute our extensive experience to the issues facing the NDPSC.

☛ **We have modeled and evaluated numerous domestic and international power generation, electric transmission, and natural gas pipeline facilities.**

Stone & Webster Consultants has reviewed existing and new electric generating facilities throughout the United States and in Canada. These reviews have been performed as a part of the following activities:

- utility asset sales –assisting both sellers and buyers,
- utility asset and equipment appraisals of value for use in asset sales or tax reviews;
- financings associated with asset purchases,
- financings associated with utility restructuring (transfer of assets to an unregulated subsidiary), and,
- financings of new merchant power facilities.

This experience affords us a global view of the impacts of utility financial issues, and costing and rate decisions.

☛ **We offer the services of a noted expert in depreciation studies for this effort.**

We have completed more than 126 depreciation studies since 1986, of which 47 have been for electric properties for commissions and utilities throughout our history. Our primary consultant for this effort has 39 years of experience as a consultant with Stone & Webster Consultants and four years experience as an independent consultant, including retention to perform Stone & Webster Consultants' depreciation studies. Our experts have provided testimony 48 times in 25 jurisdictions since 1986.

☛ **Our professional staff have completed more than twenty electric market pricing studies in the past year that assess the ability of a new generation unit to profit in the competitive market in the regions of interest.**

These studies involve an assessment of the bid based clearing price, potential capacity payments, and ancillary service revenues, while considering transmission load flows and potential constraints in the system.

- **We are committed to start and complete the assignment in a timely manner while ensuring stability of assigned staff.**

We have also conducted numerous consulting assignments throughout the country in support of regulators and regulatory strategy and issues for utilities and have a committed staff to support the requirements of this assignment.

- **NDPSC will have access to a broad range of experts.**

We have assembled a team of industry and functional experts with first-hand knowledge in utility economics, fully-allocated and marginal cost of service, rate design, valuation and financial studies, adjustment clause mechanisms and depreciation studies. We expect to work with you to ensure we have a full understanding of your concerns, and that the results of this study are meaningful.

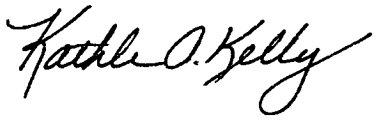
Compensation Proposal

Our estimate for services in each of the areas is set forth in the Fee Proposal section of this proposal. Our fee estimate (prior to preparation of testimony and presence at hearings) is based on a flat hourly rate of $185 per hour for all levels of consultants assigned to this project. This includes senior consultants through vice presidents at $185, with the exclusion of administrative support services that will be provided at $50 per hour as needed.

Closing

Stone & Webster Consultants sincerely appreciates this opportunity to present our proposal and qualifications. If selected, we will devote our best professional efforts to this assignment to assure a product of high quality and lasting value to the NDPSC. We trust you will find our proposals to be fully responsive to the requirements of your request-for-proposal. If you have any questions or need additional information please call me at 617-589-5215.

Sincerely,



Kathleen A. Kelly
Vice President and Practice Leader

CC: Mr. A. M. Ferrer

1. Experience

Stone & Webster Consultants is a leader in providing strategic, economic and technical review, study and engineering services for domestic and international Clients. We have considerable experience working in all segments of the utility industry having supported utility companies with asset divestiture, banking houses as lender's engineer including expert engineering analysis and financial evaluations and appraisal services to the industry. We provide a balance of technical and business services that include business and product strategies, regulatory and restructuring policy and strategy, utility economics, utility commission audits and rate case reviews, rate case unbundling and rate design studies, and collaborative facilitation services of a technical support nature. Stone & Webster Consultants provides the above multi disciplined full service capability for the power, gas, water and waste water industry in the United States and the world.

Stone & Webster Consultants, Inc. has extensive expertise in all aspects of energy planning, regulation, and restructuring issues. We have served the energy industry for over one hundred years and more recently played a crucial role assisting utilities and commissions with business strategy, deregulation issues, market dynamics, energy procurement, and energy saving strategies. Our broad and deep utility experience covers national and international energy issues.

With over 250 employees including economists, transaction advisors, financial analysts, institutional specialists, engineers and scientists, Stone & Webster Consultants is uniquely positioned to provide our clients the range of skills and experience required to meet the challenges of today's market.

Stone & Webster Consultants is a leader in providing strategic, economic and technical review, study and engineering services for domestic and international Clients. We have considerable experience working in all segments of the utility industry having supported utility companies with asset divestiture, banking houses as lender's engineer including expert engineering analysis and financial evaluations and appraisal services to the industry. We provide a balance of technical and business services that include business and product strategies, regulatory and restructuring policy and strategy, utility economics, utility commission audits and rate case reviews, rate case unbundling and rate design studies, and collaborative facilitation services of a technical support nature. Stone & Webster Consultants provides the above multi disciplined full service capability for the power, gas, water and waste water industry in the United States and the world.

Stone & Webster Consultants is part of The Shaw Group of Companies which includes our parent company Stone & Webster, Inc., an engineering and

construction company with a distinguished heritage of providing services to the energy and infrastructure sectors since 1889. Our geographic coverage includes work in 60 countries on more than 20,000 projects, and offices or representatives in over 27 countries.

With offices in the United States and around the world, Stone & Webster Consultants is staffed by specialists in private sector participation, regulation, utility economics, finance and institutional design.

Market and Regulatory Strategy Practice

Stone & Webster Consultants has provided Market and Regulatory Strategy Services for over 50 years to the electricity, water and natural gas industries. Stone & Webster Consultants formulates strategies and implementation tactics which inform management decision-making. Stone & Webster Consultants has been involved in the industry restructuring process from the outset and can aid electric and gas utilities, power retailers, power producers and aggregators in identifying opportunities and solutions as the new energy market emerges and evolves. Our staff is multi-disciplined and is equipped with the resources and experience necessary to assist every client in assessing the impact of changing markets on each client's operating environment and crafting strategies to create value for its shareholders.

Stone & Webster Consultants staff is skilled in strategic and market planning, utility finance and economics, utility regulation, energy market forecasting and resource planning, and customer information system development. We routinely design and utilize the most up-to date analysis tools in the energy industry. Tools such as cost of service and allocation models, market-pricing models, resource planning models, financial forecasting systems, and economic models, are frequently requested in responding to a client's request for service. We understand energy markets issues from the viewpoint of a variety of constituencies, including investor-owned utilities, cooperative distribution and generation and transmission utilities, municipal system operators, state and federal regulators, customers, and the newer market participants such as merchant plant operators and retail marketers or aggregators.

As a result of powerful global, regulatory, technological and economic forces at work throughout the energy and utility industries, our clients demand and receive customer-tailored business solutions that create real value. Stone & Webster Consultants offers clients a comprehensive array of consulting services --- from assisting the client in developing its vision and strategic plan, to identifying and selecting economic and technical solutions, right through implementation of the plan and follow-up.

1.1. RELATED EXPERIENCE HIGHLIGHTS

Several related projects are highlighted below that utilize the skill sets required for this type of assessment.

Alternative Rate Plans

Ms. Kelly reviewed testimony and exhibits filed in several jurisdictions relative to PBR in order to analyze the impacts and recommend the appropriate solution for one utility in the US. This required a review of gas, telecommunication, and electric PBR constructs to adequately reflect the intent of PBR as well as the revenue implications and implementation issues that might arise. Ms. Kelly testified to the positions in several regulatory forums.

Ms. Kelly and Mr. Boudreau have implemented a real-time pricing program, customer retention rates, interruptible rates, economic development rates, and other "new" rate designs. Implementation of such rates requires thoughtful anticipation of the trade-offs that may be encountered and simplicity in communication to customers.

Ms. Kelly implemented a demand-side management load curtailment program involving ten extremely large customers while at a Northeast utility. This required developing the incentive rate, persuading customers to participate, developing regular communication tools to hold their interest, managing monthly meetings of the customers to respond to questions and obtain suggestions for improvement, implementing a computer program to provide real time load and price information, and reporting the results to management and regulators. The program effectively reduced the utility's peak by nearly 30 MW at needed times.

Customer Retention Rates

Mr. Greneman completed the cost and rate studies that led to the development and implementation of customer retention rates at Southern Indiana Gas & Electric Company, Barbados Light and Power, Centra Gas, and China Light & Power, to name a few applications.

Mr. Greneman worked with Barbados Light and Power and Midland Electric Power Cooperative within the past year on the development of cogeneration rates.

Ms. Kelly and Mr. Boudreau initiated special contract rates designed to retain customers and attract retail customers with a choice of supplier in their positions at a Northeast Utility. In these same positions, they sought and received approval for manufacturer retention rates for large customers and economic development rates to attract large customers to the metropolitan area.

Rate Design and Cost of Service

The following is a description of recent cost of service and rate design projects completed by our consulting team.

Centra Gas of Manitoba, Inc.
Worked with utility staff to assess the policy implications and need for an inter-utility rate for gas service. Reviewed consistency of recommendation with corporate policies and regulatory policy. Developed inter-utility rate consistent with accepted rate designs and prepared documentation in anticipation of regulatory investigation.

Burlington Water Department
Prepared cost of service analysis and revised rate design for northeast water utility. Developed and implemented rate design alternatives designed to increase annual load and the utility's competitive position. Presented results to city managers.

Winnipeg Hydro
Reviewing cost of service study and providing recommendations for alternative functionalization and allocation methodologies based on client objectives.

China Light & Power Company, Ltd.
Performed a comprehensive review of this utility's cost of service and tariff system and made recommendations for tariff changes over the next five years in light of the current regulatory, economic and political environment in Hong Kong. A significant focus of the study pertained to structuring rates to encourage retention of industrial load that was closing operations, moving out of the service territory, or installing self-generation.

Midland Electric Power Cooperative (IA)
Provided testimony and exhibits in support of this cooperative's backup rates for cogeneration customers.

Regulation and Restructuring

New Jersey Board of Public Utilities - Electric Restructuring Audit
Engaged in a project on behalf of the New Jersey Public Utility Commission to audit, evaluate and critique the electric restructuring, stranded cost, and rate unbundling filings of one of the investor-owned electric company's in the state. Reviewed and audited the filings for accuracy, completeness, and compliance with New Jersey restructuring policy. Met with key utility staff to assess the extent of the efforts undertaken internally. Recommended modifications and additions to the filing where appropriate. Prepared and provided testimony on recommendations.

Colorado Public Utilities Commission
Forecasted wholesale prices in Colorado and the other sub-regions of the Western Systems Coordinating Council (WSCC) and utility stranded costs through 2017 under various policy scenarios, in support of legislative restructuring effort

New Jersey Board of Public Utilities – Market Assessment
Forecasted wholesale power prices in sub-regions of Pennsylvania-New Jersey-Maryland (PJM) interconnection, sub-regions of New York Power Pool (NYPP), and the other regions of the Eastern Interconnection, through 2015. Forecasted annual operating income and estimated market value and stranded costs of generation plants in New Jersey as part of the Board's review of restructuring changes.

Cost of Service and Rate Issues - Restructuring

Southwest Louisiana Electric Membership Corporation
Prepared an unbundled cost of service study and associated unbundled rates for an electric restructuring filing before the Louisiana Public Service Commission. Provided filing strategy advice and support for the case. Provided testimony and exhibits to unbundle costs and rates into power supply and distribution components. Developed a power adjustment clause mechanism, which the Commission recommended as a model for use by all cooperatives within Louisiana.

In a follow-on effort, prepared restructuring position white papers and regulatory support documents for submission before the Commission in its investigation of industry restructuring. Worked with the client to evaluate the business impact on the cooperative in anticipation of adoption of the various restructuring policies proposed in the state.

Montana-Dakota Utilities Co., (Montana)

Completed a marginal cost study and prepared expert testimony in support of a gas rate increase application.

Holyoke Gas and Electric Department
Completed an extensive cost of service effort for this East Coast municipal utility system with gas, electric, and steam operations. The project objective was a fully unbundled component cost of service study that properly separated the costs of providing service to each business line. Critiqued the utility's then current cost allocation procedures and provided recommendations for modifications that would better comply with the emerging competitive markets in that region. Conducted extensive cost and profitability analyses to determine the financial impacts of steam operations elimination upon the remaining gas and electric systems.

Consolidated Edison Company of New York
Developed menu-driven fully unbundled cost of service studies for electric, gas and steam operations for use in the company's restructuring filings before the New York Public Service Commission.

Southern Indiana Gas and Electric Company
Provided ongoing regulatory support including fully unbundled electric and gas cost of service studies, development of fair value rate base, rate design and preparation of testimony and exhibits. Unbundled cost of service studies were heavily relied on in developing new projects and successfully attracting new business to the service territory, including an automobile assembly plant.

Northern Indiana Public Service Company
Developed fully unbundled cost of service study for electric operations in preparation for restructuring and support of current rates.

Commonwealth Edison Company
Developed fully unbundled electric cost of service studies and testimony for rate cases, including a functional unbundling study in support of the company's Distribution Services Tariff proceeding pertaining to restructuring in Illinois.

Edison Sault Electric Company (MI)
Provided ongoing regulatory support including fully unbundled cost of service and rate design studies, supported by preparation of testimony and exhibits.

Barbados Light and Power Company, Ltd.
Developed unbundled cost of service study and provided recommendations for changes to rate structure with the objective of retaining industrial customers considering self-generation.

Western Municipal Utility
Prepared first unbundled cost of service for the client, developed recommendations for changes in accounting and reporting to facilitate updating study. Assessed the changes necessary to rate structure relative to the unbundling of costs. Advised client on California restructuring issues and implications for their financial viability. Recommended the treatment of potential stranded asset costs and developed an implementation plan for recovery.

Resource Planning And Acquisition

Santee Cooper - Generation Resource Planning Study
Performed a comprehensive generation resource planning study for Santee Cooper in 1998. This study included a comprehensive assessment of all potential supply-side options including self- and joint-ownership, cogeneration, and all types of purchased power and sales. The study consisted of six major tasks: (1) Project initiation, (2) Resource bid solicitation, (3) Supply-side analysis, (4) Integration and evaluation, (5) Sensitivity and risk analysis, and (6) Report and presentation. A key part of the study was to prepare a letter and specifications to solicit bids from potential power suppliers, and to evaluate/rank the bids received in comparison to other supply-side options. To perform the "integration" analysis of the power supply bids and supply-side options we used the EGEAS optimization model to determine the least-cost generation resource plan.

Kissimmee Utility Authority (KUA)
Assisted KUA with development of an integrated resource plan for the years 1996 through 2015. Specifically, assisted KUA with the development of a system load forecast, evaluation of DSM and supply-side planning alternatives, financial analysis of the resulting plans, and evaluation of the risk associated with the various scenarios and futures that were considered to be realistically possible.

City of Tallahassee
Performed the initial integrated resource plan for the City of Tallahassee and a subsequent update that determined the timing and type of the most cost-effective resource to add to the system. Based upon the results of the IRP the

City of Tallahassee issued an RFP solicitation for new capacity. Assisted the City in the development of the RFP and also performed the bid evaluation including a detailed sensitivity and risk assessment. The City of Tallahassee accepted our recommendation for the best bid. Appeared before the Tallahassee City Council in support of the recommended project and the City Council approved the recommendation.

Lansing Board of Water & Light (LBW&L)
Evaluated electric and steam supply-side planning alternatives to complete an integrated resource plan. Created a "base case" which modeled existing generation resources, then evaluated and modeled generic power supply options as well as existing repowering options. Finally, created a checklist of unit data requirements for all electric and steam options to be evaluated in the final IRP.

Barbados Light & Power Company
Performed the generation and transmission expansion study for the island of Barbados. As part of that study performed a retirement study on the existing generation in addition to developing a list of candidate resources to be used for future resource additions. The generation expansion plan analysis took into consideration site locations and the cost of site impacts on transmission expansion. Determined the reliability criteria to be used in the study as a function of loss of load probability. The impact of renewable resources such as wind energy and municipal solid waste were evaluated for economic feasibility and their impact on reliability.

Public Service Company of New Mexico (PNM)
Performed all aspects of the RFP process associated with the solicitation of a peaking capacity resource. Provided oversight to the design of the RFP and developed the structure by which bids were evaluated. Facilitated the development of the non-price criteria. Performed the price evaluation of all bids and incorporated the non-price evaluations into a combined ranking. PNM accepted our recommendation for the short-listing of bids. Also performed the price evaluation of the short-list bids including a sensitivity and risk assessment. Testimony for this study was provided.

Union Bank of California, BZW Division of Barkleys
Used the Pennsylvania-Jersey-Maryland EGEAS database to determine the market value of the Warrior Run power plant. The model assumed the unit was running within the PJM system to determine the capacity and energy savings that would be obtained if the Warrior Run plant was included in the system.

Wisconsin Public Service (WPS)
Assisted WPS in a resource plan filing. Demand-side and supply-side alternatives were evaluated. Completed several EGEAS computer runs to be

used in their integrated resource plan. Risk and financial analyses were also completed as a part of this study effort.

Southern Indiana Gas & Electric Company (SIGECO)
We periodically carry out an investigation and analysis of the economic, social, and technological factors that effect energy sales over a 20-year forecast period. Our work covers a wide range of socioeconomic factors, among which are national, state, and local trends; population; migration; birth rates; housing and energy economics for the residential, commercial and industrial sectors. The basic approach of this study is end-use analysis for the residential class and a combination of econometrics and end-use techniques for the small commercial and industrial classes. An examination of appliance saturation coupled with appliance efficiencies and the impact of competitive fuels (particularly natural gas) is included in addition to an evaluation of the social and economic trends of the area.

Stone & Webster Consultants has performed various IRP studies for SIGECO's electric and gas systems. The studies included a comprehensive analysis of all supply-side and demand-side options and the development of an integrated resource plan. Also provided support with pre-filed testimony and served as expert witnesses in regulatory hearings before the Indiana Utility Regulatory Commission.

Oklahoma Gas & Electric (OG&E)
Integrated Resource Plan - Assisted OG&E Electric Services with development of an integrated resource plan. Assisted OG&E with the evaluation of DSM and supply-side planning alternatives, environmental strategies, financial analysis of plans, and the risk associated with the various scenarios and futures that were considered to be realistically possible.

Market Analysis

The experience outlined below in many cases was completed for clients that wish to remain confidential. The wholesale price studies were developed and cover all the NERC regions of the US considering interconnections, market rules, plant ownership and operation, expected introduction of customer choice, fuel price forecasts, and merchant plant operation characteristics. These studies provide dispatch information, operating characteristics, capacity market prices, energy market clearing prices and the resulting plant revenue expectations. A summary of the numerous studies undertaken is provided below.

Type of Study	# of plants	Regions Modeled
New Unit(s)	5 thermal	ECAR, FRCC, PJM, MAIN, MAPP, NPCC, SERC, SPP
Repowering	1-thermal	SERC
Asset Valuation	1-hydro	NPCC
Portfolio Valuation	4-thermal	PJM, NPCC
Asset Valuation	10-thermal	ECAR, FRCC, PJM, MAIN, MAPP, NPCC,SERC, SPP
New Unit(s)	1-thermal	Mexico
New Unit(s)	1-thermal	Poland
Asset Valuation	19-thermal	Poland
Asset Valuation	>30 hydro and thermal	WSCC
Repowering	1-renewable	WSCC
New Unit(s)	2-thermal	ECAR, MAIN, MAPP, SERC, SPP
Many Market Price Only Studies	Various units and combinations of units	Various regions

Aggregation and Resource Acquisition

Rhode Island League of Cities and Towns
Worked with a Municipal agency to assess and incorporate the electricity purchasing requirements of its members into a designed RFP, reviewed supplier bids, negotiated a five-year contract, and evaluated actual savings for members. Represented members and organization in regulatory investigation into restructuring implementation planning. Providing ongoing advice relative to contract issues and regulatory investigations.

Rhode Island Public Transit Authority
Developed and issued RFP to procure gas service for existing and under construction structures. Reviewed bids and market to recommend successful negotiation partner. Contract negotiations underway with selected bidder(s).

University of Michigan
Developed and issued an RFP for electric and gas energy procurement for large campus. Worked with the client to assess needs, reviewed bids and assisted in the contract development.

Industry Restructuring Issues

Stone & Webster Consultants has been very active in the market development process in the majority of restructured states within the US as well as in privatization activities internationally. Stone & Webster Consultants has actively participated in:

- Legislative language development;
- Policy consideration and recommendations (including PBR);
- Negotiation of legislative language and utility settlements;
- Developing unbundled cost and rate studies,
- Reviewing customer retention policies and alternative rate structures (RTP, PBR),
- Developing competitive markets for electric generation;
- Assisting commissions with review of plans and assessing impacts;
- Establishing the rules of competition for suppliers and distributors;
- Evaluating stranded cost calculation and impacts on the market; and
- Developing market interaction requirements and settlement.

New Jersey Board of Public Utilities - Electric Restructuring Audit
Engaged in a project on behalf of the New Jersey Public Utility Commission to audit, evaluate and critique the electric restructuring, stranded cost, and rate unbundling filings of one of the investor-owned electric company's in the state. Reviewed and audited the filings for accuracy, completeness, and compliance with New Jersey restructuring policy. Met with key utility staff to assess the extent of the efforts undertaken internally. Recommended modifications and additions to the filing where appropriate. Prepared and provided testimony on recommendations.

Colorado Public Utilities Commission
Forecasted wholesale prices in Colorado and the other sub-regions of the Western Systems Coordinating Council (WSCC) and utility stranded costs through 2017 under various policy scenarios, in support of legislative restructuring effort

New Jersey Board of Public Utilities
Market Assessment - Forecasted wholesale power prices in sub-regions of Pennsylvania-New Jersey-Maryland (PJM) interconnection, sub-regions of New York Power Pool (NYPP), and the other regions of the Eastern Interconnection, through 2015. Forecasted annual operating income and estimated market value and stranded costs of generation

plants in New Jersey as part of the Board's review of restructuring changes.

Indiana Public Service Commission
Provided a fair value study or valuation of rate base for SIGICO.

California Public Service Commission
Valuation of the transmission and distribution system for sale of PG&E.

Ontario Energy Board
Developing a Performance Based Ratemaking standard for electric utilities in the province.

Expert Testimony

Most of our staff has provided testimony before regulatory commission on various subjects.

Mr. Greneman has provided rate case testimony to the following:

Delaware Public Service Commission
Federal Energy Regulatory Commission
Indiana Public Service Commission
Iowa Utilities Board
Kentucky Public Service Commission
Louisiana Public Service Commission
Michigan Public Service Commission
Montana Department of Public Utilities

Ms. Kelly has presented testimony in many cases before the Massachusetts Department of Telecommunications and Energy (MA DTE) and the Energy Facilities Siting Council (EFSC).

- Investigation into the restructuring plans of Orange & Rockland before the New Jersey Board of Public Utilities (1998).

Mr. Strand has provided testimony on depreciation studies 48 times since 1986 in 25 jurisdictions.

Mr. Green has provided valuation testimony in litigated valuation cases involving electric transmission and distribution systems, gas distribution systems, water and wastewater systems and power generating facilities. He has prepared dozens of appraisals of all types of utility property over the past two decades with most of them prepared in anticipation of litigation (i.e. either condemnation or property tax disputes). In all cases, the proper cost of capital or discount rate is a fundamental element of the appraisal process and must withstand challenge in a litigated context.

2. Technical Approach

2.1.1. The appropriate level of investment in North Dakota

In keeping with the NDPSC's limited focus on the appropriate level of investment, Stone & Webster Consultants will rely on a review of the last MDU rate case along with historical comparisons. Annual reports filed with the Commission will provide a principle source of all rate base components. Stone & Webster Consultants assumes that the scope of the NDPSC investigation in this RFP does not include a review of the propriety of any rate base allocations between the North Dakota jurisdictional customers and other jurisdictions and/or affiliates. If such review is indeed desired, Stone & Webster Consultants is extremely qualified to perform this work. However, the fee estimate does not include this effort.

2.1.2. The appropriate cost of capital

Stone & Webster Consultants will perform an extensive review of MDU's cost of capital filing including a critique of their fundamental assumptions and their selection of comparable companies, capital structure, data sources, model application and final recommendation. This analysis will not include our own independent cost of capital study using our preferred data sources and methodologies, but will instead include our recommendation resulting from our review and/or correction of MDU's filing.

2.1.3. The appropriate cost of service

Stone & Webster Consultants will perform an extensive review of MDU's operating and maintenance expenses including actual test-year expenses as well as pro forma, annualization and normalization adjustments. The review will be done on an account by account basis and focus on the appropriate level of the expenses and assessed against past expenses, industry norms, company issues and circumstances as well as Commission mandates. A significant effort in this task will focus on the level of gas cost, which is dependent on weather-normalized sales. We will perform a thorough review of MDU's weather normalization procedure.

Stone & Webster Consultants assumes that the scope of the NDPSC investigation in this RFP does not include a review of the propriety of rate base allocations between the North Dakota jurisdictional customers and other jurisdictions and/or affiliates. If such review is indeed desired, Stone & Webster Consultants is extremely qualified to perform this work. However, the fee estimate does not include this effort.

2.1.4. The appropriate rate design

Stone & Webster will perform a thorough review of MDU's proposed rate design, including level of monthly customer charge, usage block structure and rate provisions. In performing this task, we will rely on unbundled cost components as detailed in the company's cost of service study, as available, customer class composition, class usage characteristics, competitive and other relevant concerns. As indicated in the RFP, in the event the Commission does not accept the basic service charge increase, MDU is arguing for the inclusion of a weather normalization adjustment. To this end, Stone & Webster Consultants will assess the appropriateness of MDU's proposed $11.70 customer charge against the customer-related cost to serve and the components included, e.g., minimum system, services, meters, billing, collecting, etc. We will also perform a intensive review of MDU's weather normalization adjustment mechanism. As appropriate, Stone & Webster Consultants will make alternate recommendations to the NDPSC for ways to stabilize revenues due to year-to-year weather variations.

2.1.5. Depreciation Study at the Request of Staff

If requested, SWC will conduct a depreciation study of the Company's depreciable properties using established proven techniques. We propose to conduct the study using the broad group (or average life) procedure, remaining life technique and straight line method. Determinations of average service lives and estimated mortality patterns (Iowa curves) will be based where possible on the simulated plant balance methodology using the Company's historic database. The effect of estimated gross salvage and cost of retirement/removal will be included in the depreciation rates, and will also be based to the extent possible on the Company's specific experience.

As an integral input to the judgment required in conducting a depreciation study, it may be very helpful in talking with several staff members regarding pending or possible changes in specifications, operating policies or other factors which have a bearing on plant service lives, extraordinary retirements, and the like. This might include inspections of major and representative assets.

A depreciation study follows a certain general path, with inevitable variations. Some of the activities may be carried on together; others may be done in different sequencing. In general, the procedure is as follows:

- The data required for the study is obtained and edited. The data comprises, for each
- primary plant account to be reviewed, annual dollar additions and retirements for the history of the account. (Should this history be extremely long for certain accounts, 40 or so years will suffice). Some accounts will have comparatively short

histories. The actual need for a certain span of years depends on the nature of the property. Also required are dollar amounts of annual gross salvage and/or retirement cost (negative salvage) if any, for each separate account but only for the most recent 10-12 years. The final need is for the current plant balance and reserve for depreciation for each account. Only the most recent year is required for this data.

- Editing each account means it is checked for being in balance. All additions ever made less all retirements ever made should equal the current balance. If not, some adjustment is needed. Editing also attempts to place accounting adjustments of account-to-account transfers or year-to-year adjustments in the pertinent year instead of the year in which the accounting change was made.
- One of the outputs of the editing process are the results of first in-first out turnover testing, an old and still useful tool for service life study.
- The accounts with adequate data, in terms of total years of length and number of years with retirements, are then tested by means of the simulated plant balance technique. This means that computer simulations of a span of years' worth of plant balances is compared with the actual historical balances. The account's actual record of annual additions is analyzed under a wide variety of service lives and mortality dispersions (Iowa curves) to create a number of simulated balances by calculating and summing the surviving plant from past annual additions. Generally one life and curve combination will produce balances close enough to the actual balances to permit the conclusion that this fairly represents the performance of the account historically.
- The move to the next step involves considerable judgment and experience. It must be decided whether each account can be expected to continue in its present apparent life pattern, or whether there are reasons for a change in the future. Company managers may have knowledge of changed plans, conditions or regulations which could affect service lives, remaining lives or salvage factors. There may be other reasons for change, as well.
- After lives, curves and salvage factors are selected, the estimated future service life of the dollars surviving from each annual addition is calculated, in accord with the life and Iowa curve factors, and the dollar weighted average remaining life of the whole account determined. Typically in a simulated plant balance study an account's vintage survivors are calculated in accordance with the dictates of the chosen Iowa curve. This is

also usually necessary as most utilities can not provide plant balances as a summation of vintage year survivors.

- The depreciation rate appropriate for each account is produced by means of a spread sheet as follows: the current plant balance is increased by some percentage representing the amount needed for future retirement or removal cost, or decreased by some percentage expected as gross salvage upon retirement. This amount is then reduced by the amount of the current reserve for depreciation to obtain the undepreciated amount in the account. That result is then divided by the years of remaining life to produce an annual amount of depreciation accrual to adequately provide for the retirement of the dollars in the plant balance over their future expected life. The accrual amount, divided by the plant balance, produces a depreciation rate (percentage) that may be used over a reasonable period into the future to depreciate past survivors, as well as future additions, if they can be expected to have similar characteristics.
- The next step is to present this summary spreadsheet to NDPSC as a preliminary finding and engage in questions, answers, and if warranted, revisions should some information have been overlooked or misinterpreted.
- The final report describes the methodology involved and any information necessary to explain unique situations or deviations from routine test results and the like; the summary spread sheets presenting the depreciation rates, described earlier; and the detailed worksheets computing the remaining life of each account.

2.1.6. Methodology and Process

In association with the above tasks, Stone & Webster Consultants will:

1. Prepare and conduct discovery as necessary;
2. Provide monthly progress reports of discovery, conclusions and recommendations;
3. Prepare and file written and oral testimony;
4. Assist staff in preparing cross-examination of the witnesses of other parties tothe proceeding; and
5. Assist staff in the preparation of proposed findings of fact.

3. Schedule

Stone & Webster Consultants is prepared to begin work within one week of your authorization to proceed and will dedicate the resources needed to meet the August 30th completion date for the investigation and written testimony.

4. Personnel

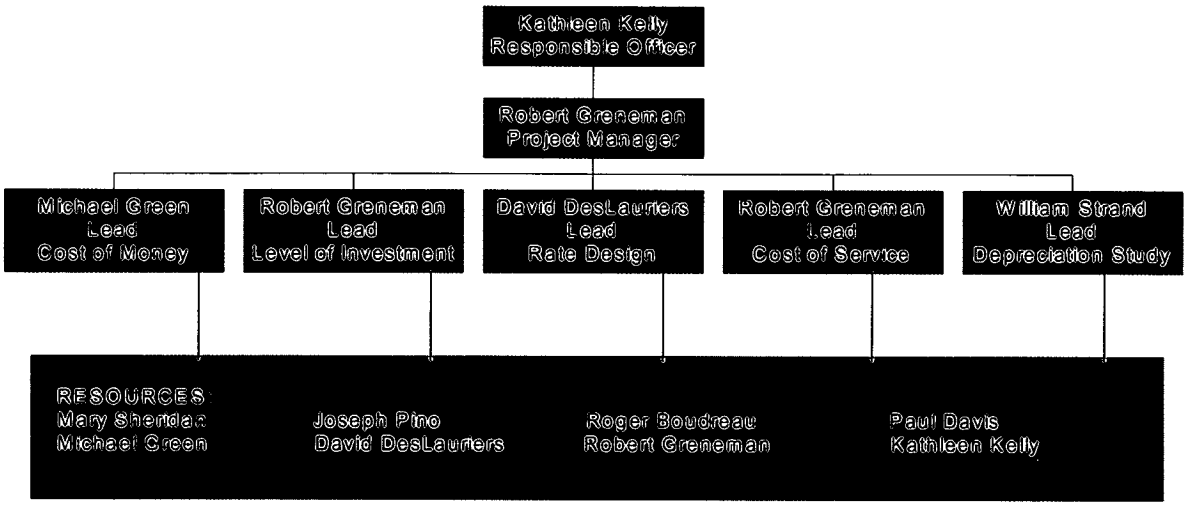
Stone & Webster Consultants will establish one overall project manager reporting to Kathleen Kelly, the corporate responsible officer for this project. This project manager will communicate regularly with NDPSC staff, establish key deadlines, assign appropriate personnel for the effort, and manage the day to day activities as work progresses. We have identified key contributors that will participate in this work effort to provide the technical and management requirements. A summary of our key participants is provided in this section. Resumes for the key team members are provided in Appendix 1.

Ms. Kathleen Kelly is actively involved in the restructuring process in several states and has over 20 years of extensive rate policy, business strategy and planning, consensus building, and regulatory policy experience. Ms. Kelly, located in our Boston office, has presented expert testimony on many subject areas and has recently directed engagements for municipal and cooperative utilities involving industry change and competitive positioning. Ms. Kelly has extensive experience in utility business management, policy and regulatory issues, competitive development, rate issues, load research, forecasting, demand-side management, resource planning, asset valuation, and group facilitation. She has worked with the New Jersey Board of Public Utilities and is currently working with the Ontario Energy Board and Centra Gas BC on application of restructuring and PBR policies. Ms. Kelly has prepared for many rate cases in numerous jurisdictions and is knowledgeable in restructured utility issues.

Ms. Kelly will be assisted by Mr. Robert Greneman, Mr. David DesLauriers, Mr. William Strand, Mr. Michael Green, Mr. Roger Boudreau, Ms. Lisa Vedder, Mr. Paul Davis, Mr. Joseph Pino and Ms. Sheridan. Resumes for each contributor are included in Appendix 1.

Mr. Greneman, Associate Director and Project Manager for this effort, has more than thirty years of experience in electric, gas and water utility cost of service, rate design and analysis. He developed our own SCOST model, which we utilize and license to our clients for cost of service use. He has testified before many commissions and has advised more than 100 utilities across the US, Canada and worldwide on cost of service issues and rate design. He has also prepared a marginal cost study for MDU's Montana division and will contribute his strong technical knowledge in the level of investment, cost of service and rate design areas of the effort. As project manager, he will ensure the technical recommendations are effective and that the personnel are available and efficiently completing the assignments.

Project Organization



Mr. DesLauriers has more than fifteen years of experience with electric, water and gas utilities and commissions with respect to rate case development and review. He brings a balanced view of the rate case, having reviewed utility filings for commissions in the past. He will contribute his knowledge of rate design, cost of service and utility economics to this project.

Ms. Lisa M. Vedder has extensive senior-level experience in the energy industry with emphasis on electric and gas industry restructuring. Her areas of expertise include regulatory policy, rate-making, technical and financial evaluations of power generation technologies, including alternative fuels, energy contracts, and financing of complex sale/leasebacks & swaps.

Mr. Strand has 39 years of experience as a consultant with Stone & Webster. 4 years experience as an independent consultant, including retention to perform Stone & Webster's depreciation studies. He has completed 126 depreciation studies completed since 1986, of which 47 have been for electric properties. He has provided 48 testimonies in 25 jurisdictions since 1986. In addition to the 126 completed studies mentioned above, a considerable number of other small assignments, such as annual updates, have been done.

Mr. Michael Green has nearly twenty years of experience in the valuation of utility property with most of that experience derived from actual or potential litigated valuation cases. His training in finance, working knowledge of the regulated industries and unique appraisal background gives him a "real world" perspective on market required rates of return for utilities. He is well-versed in

the theoretical underpinnings and practical applications of the standard cost of capital models and their various iterations (e.g. multi-staged DCF models, multi-factor build-up models, levered and unlevered beta methodologies, etc.)

Mr. Boudreau has more than thirty years of experience in utility management in the areas of distribution planning, load research and cost of service and rate design. As Manager of Load Research at a northeastern US utility, he implemented a load research effort and managed the accumulation, analysis and use of the data for more than twenty years. He also worked with cost of service studies and rate case development utilizing the load research and cost information he developed.

Mr. Joseph Pino has recently joined Stone & Webster Consultants and brings more than twenty years of experience in data applications, analysis and cost of service and rate design. He has extensive customer information and billing system background and has developed PBR for the utility he recently left. He will work with others in the review process.

Mr. Paul Davis contributes more than thirty years of planning and rate experience to this project. He has modeled all of the NERC regions to establish resource plans and market pricing for deregulated markets.

Ms. Mary Sheridan specializes in the technical and financial review of power generation projects. She has over twenty years of expertise in pro forma economic reviews, contract reviews, performance evaluations, feasibility studies, due diligence reviews, and bid evaluations. Ms Sheridan also has extensive regulatory experience at the state and federal level.

5. Fee Proposal and Rates

Based on your RFP, Stone & Webster Consultants estimates a fixed price for each task as set forth below. We welcome the opportunity to meet with you to expand on our qualifications and discuss the scope of the tasks in more detail. At that time, we will be better able to prepare a final fixed price estimate based on a more complete understanding of the work.

TASK	DESCRIPTION	HOURS	COST
Task 1	Level of Investment	80	$15,000
Task 2	Cost of Capital	108	$20,000
Task 3	Cost of Service	162	$30,000
Task 4	Rate Design	108	$20,000
Subtotal (excluding testimony)		460	$85,000
Preparation and presentation of testimony		90	$22,000
Total		550	$110,000
Task 5	Depreciation Study (optional)	270	$50,000

The above fixed price estimates are based on a billing rate of $185 per hour for all level of consultants from senior consultant to vice president, for all efforts excluding testimony. For testimony preparation and actual testimony we offer our standard rates on average $245 per hour for executive consultants or associate directors. We will include the first 80 hours as part of the fixed cost estimate for testimony at $245 per hour; all additional hours will be agreed to by the NDPSC before they are undertaken.

Our actual invoices to the NDPSC will be based on the hours that each consultant worked on the project; as such, the final billing may be less than the final fixed price estimate. We will not exceed the final fixed price estimate without your express authorization, based specifically on reasons such as expanded scope, our unforeseen involvement in specific areas of review, or protracted hearings.

The fixed price estimate excludes travel to your office. All travel costs will be billed at our cost, and are typically 15% of the labor cost for an effort. Anticipated expenses for travel are $10,750, and are only invoiced to you as incurred.

We have also provided our standard contract for your information. We will work with you on mutually agreeable terms under which to conduct this assignment.

6. NDPSC Responsibilities

NDPSC staff is responsible for the following:

- Provision of data, assumptions, constraints and filings in electronic format, if available.
- Timely review of communications provided by Stone & Webster Consultants such that the schedule can be met;
- Access to appropriate information from current studies to facilitate efficiency and eliminate duplication of efforts; and
- Provision of regulatory precedent and orders of importance to the issues under study.

8. Appendix 1 Resumes of Key Personnel

KATHLEEN A. KELLY

Vice President

An experienced manager with twenty-five years of leadership, supervisory and project management experience. Management consultant with extensive strategic utility experience including retail industry restructuring issues, developing a competitive industry framework, business analysis, market strategy, functional unbundling, market analysis, stranded costs, re-regulation, pricing, and business infrastructure implementation planning and education. Facilitates and advises senior managers on strategic issues and strategy development and implementation. Experienced in corporate planning, forecasting, management, valuation, market research, rate design and cost unbundling, utility management, and Demand-Side Management (DSM) planning, implementation and evaluation. Provides expert testimony on retail restructuring, rate design, forecasting and DSM.

PROFESSIONAL EXPERIENCE

1997 - Present **Stone & Webster Consultants, Inc. Boston, MA**

Vice President

Highlights of Recent Consulting Engagements:

Completed efforts with several clients to *value a potential acquisition* of utility assets including auctions of assets.

- Provided decision tools including pro forma income statements including assessment of potential risks. Directed the efforts of a team of experts reviewing data room materials to assess the revenue and cost impacts of the available information. Prepared market assessment for generation opportunities in various markets. Assets analyzed include generation, transmission, distribution and competitive businesses.
- Advised a client in the assessment of opportunities, risks and financial alternatives in the consideration of an acquisition.
- Reviewed the business plans, financial proformas, and assessed the potential business value for more than 15 power facilities worldwide. This effort included an assessment of upside value potential.

Completed a three-phase project working with the *Iowa Association of Electric Cooperatives*. Phase one involved the facilitation of a restructuring task force comprised of member cooperatives working together to strategize and formulate their joint restructuring position. Developed written educational material on key restructuring issues and outlined alternative positions on those issues, identified potential cooperative business impacts, and facilitated

discussion and documentation. Phase two relied required both facilitation and technical knowledge and focused on negotiation strategy and implementation of that strategy, resulting in a cooperative leadership role in state restructuring legislation development. Phase three developed and implemented an education series for cooperative managers, directors and employees to prepare for industry restructuring.

Worked with *Centra Gas Manitoba* to develop strategic rate options for customers. Required an assessment of current policies in the United States and Canada for both gas and electric utilities. Worked with the client to develop policy recommendations for management review.

Directing two audits of two major eastern utilities' distribution outage situations to determine the cause and recommend improvements.

Worked with the City of Fayetteville Public Works Commission and the Town Manager to assess the planning for competition by identifying business lines and evaluating appropriate lines of business in a competitive environment. Developed a financial model of the independent business lines from a fully bundled business for use in decision analysis. Presented findings to the governing board.

Arbitrated the development of appropriate pricing for a new unit contract for an island based water and power authority. Presented and defended conclusions before the board. Worked with two clients to establish joint assumptions and methodologies.

Working with a client to assess alternative resource procurement strategies for an aggregation with more than 500MW of electricity consumption.

Directed the procurement effort for gas by the *Rhode Island Public Transit Authority.*

For the *New Jersey Board of Public Utilities* (NJBPU) reviewed Rockland Electric's utility restructuring plan for completeness and compliance with NJBPU guidelines for New Jersey's restructured electric industry. Recommended necessary changes in the proposal, interviewed utility management to gauge implementation activities, and advised and testified on behalf of BPU staff on restructuring implementation planning.

Worked with a collaboration of *Massachusetts utilities* to foster discussion and development of new terms and conditions of service between competitive suppliers and distribution utilities and updating customer terms and conditions of service to reflect standard offer service, default service and changes in customer relationships. Developed meeting strategy, facilitated discussion and closure on issues, provided a central clearinghouse for comments, and

supported discussions with technical knowledge of current and new market requirements.

Developing unbundled costs, rates and rate strategy for a *Southern electric cooperative* and prepared positions and regulatory support documents for restructuring the electric industry in that state. Worked with the client to examine the impact of various policies identified by the state regulatory commission and assessed the potential impacts. Identified alternatives restructuring proposals to provide to the regulatory commission.

Completed a successful energy procurement process for the *Rhode Island League of Cities and Towns*. The effort required an assessment of market opportunities that would provide the greatest savings opportunities to participants. Stone & Webster Consultants developed supporting information, facilitated the definition of needs of the more than thirty cities and towns, and worked with commission staff as needed to obtain information or to influence their decision making process relative to standard offer tariffs. Developed and issued both a short and a long term RFP, evaluated proposals, and negotiated the final contract for services. Presented recommendations to the client's board and to their members as needed.

Worked with *several municipal utilities and joint action power agencies* in separate projects to assess the impact of competition on their operations, developed strategies for the businesses to grow, and facilitated the development of implementation plans for successful growth. Responsibilities included the unbundling of costs and rates, identification of business issues, development of potential strategies, assessment of those strategies on the municipal utility as well as the town government, and presentations at public meetings. Specific restructuring issues include the development and assessment of transition cost recovery methodologies and standard offer or basic generation services.

Facilitated *strategic planning sessions* for several cooperative and municipal utilities to establish strategies for a competitive market framework. Advised the manager and senior management team of a municipal utility on strategic issues and planning for competition, providing a decision analysis tool and developing and evaluating alternative strategies. Worked with the team in assessing the opportunities and risks associated with each strategy.

1977 - 1997 **Boston Edison Company**
Manager of Industry Restructuring

Held various positions within the corporation managing groups of professionals in marketing, analysis, rate design, regulatory issues, business strategy, and DSM planning and evaluation. A summary of key activities is provided below by topic area.

Industry Restructuring

Author of Boston Edison's electric industry restructuring plan, evaluating strategic financial, operational and customer impacts of the proposed plan and building consensus both within and outside the corporation. Negotiated solutions with regulators and third parties resulting in settlement of major issues. Identified the structure and resources necessary to meet the demands of the new competitive energy market. Developed strategies for business infrastructure implementation. Coordinated regulatory strategy and witness preparation. Expert witness on rate design, implementation issues and customer education requirements. Company representative on industry working groups investigating and negotiating statewide restructuring issues. Spokesperson with area trade associations, businesses and customers on industry restructuring.

Market & Competitive Analysis

Developed a competitive marketing plan utilizing market research results in preparation for a transition to a competitive environment. Initiated competitive positioning analysis at a northeast utility by working with senior management to define strategic information and analysis requirements. Completed a first time assessment of competitive customer value of electricity and the utility's competitive position, while completing a competitive positioning analysis of bundled and unbundled electric pricing. Directed the development of in-depth competitor assessments covering market share, pricing strategy, and restructuring positioning and new market strategies.

Utility Regulation

Extensive regulation and regulatory interaction experience. Developed resource plan filings, DSM budgets, DSM evaluation and reconciliation for cost recovery purposes, rate filings and restructuring filings. Testified before regulatory commissions supporting sales forecasting and resource planning, DSM planning, rate structures and restructuring proposals.

Rates and Pricing

Directed the development of cost allocation methods, retail and wholesale tariffs and filing requirements for rate cases. Successfully implemented the use of creative utility pricing tactics. Positioned a utility as the first in the region capable of regional real time pricing through negotiated model development and successful customer pilot of hourly day ahead pricing. Educated and trained corporate personnel on pricing strategy, positioning and tactics.

Developed and implemented successful responses to competitive retention challenges with several major customers. Developed alternative long-term contracts and pricing terms to retain or expand customer base. Designed new product prices for non-core services and products. Designed an individual customer profitability model to segment customer retention strategies and differentiate customers.

Resource Planning

Developed models utilized to predict short and long term electric and steam sales and revenues for all classes of customer. Developed DSM business plans by assessing the most profitable opportunities from a business rather than regulatory framework, and devised a strategy for regulatory filings supporting the business plan. Led a statewide utility team that successfully negotiated a collaborative development of generic DSM programs with non-utility parties. Developed a long term DSM evaluation methodology that was adopted by the state regulators. Efforts gained a national reputation in the industry.

Designed and managed residential and business equipment and attitude surveys used to support the development of long term forecasts. Researched customer satisfaction surveys utilized in customer service improvements and as management incentive assessments.

RELATED BACKGROUND

Costing, Pricing and Ratemaking

Actively involved in electric industry restructuring assignments including, preparation of fully unbundled cost of service study models, unbundled rate alternatives and myriad other issues associated with electric deregulation.

Developed cogeneration rates, load retention rates and strategies. In conjunction with a comprehensive review of the tariff system for China Light & Power Company, focused on ways of structuring rates to retain industrial load that was closing operations, moving out of the service territory or installing self-generation. Developed unbundled cost of service study for the Barbados Light & Power Company and advised client as to recommendations for changes to rate structure with an objective of retaining industrial customers that are considering self-generation. Prepared unbundled electric and gas cost of service studies for Southern Indiana Gas and Electric Corporation that were heavily relied on in developing new projects and successfully attracting new business to the service territory, including an automobile assembly plant.

Developed a power adjustment clause for Southwest Louisiana Electric Membership Corporation and adopted as a model for use by cooperatives within the state of Louisiana. Developed an operation and maintenance adjustment clause mechanism for Alpena Power Company, and automatic adjustment clauses for the Guyana Electricity Corporation to adjust rates for changes in foreign exchange, fuel, labor, and inflation. Provided support Northern Indiana Public Service Company for purchased power and environmental trackers. Compiled an industry survey of characteristics of gas adjustment clause mechanisms of responding utilities in the U.S. and Canada to be presented to the American Gas Association.

Prepared a Glossary of Rate and Regulatory Terms; investigated the costs associated with implementation of time-of-day metering; compared the effects of master metering and individual metering on utility load and revenues; and analyzed the impacts of automatic fuel adjustment clauses on revenues in conjunction with the Public Utility Ratemaking Guidelines Project for the U.S. Department of Energy.

Conducted research for a report on The Evolution of Cost Allocation Methodologies Employed by the FPC and FERC (gas pipelines) in conjunction with providing rate case support for Pan-Alberta Gas, Ltd.

Conducted water system costing and pricing studies including work for a large New York water a authority with over 300,000 customers.

Participated in a comprehensive review of the main extension policy for Oklahoma Natural Gas Company including cost of extensions and recommendations for change on policy and practices to encourage new load.

Valuation

Prepared pro forma income and rate base statements for clients in valuation efforts in connection with the potential acquisition of utility and other business assets.

Organizational Studies

Conducted an investigation of the organization, structure and operation of the rate department of a major Northeast combination utility. Focused on the gas ratemaking function as part of a study to determine if gas should operate as separate business unit from electric.

Power Contract Analysis

Conducted an analysis of a proposed negotiating plan by Westvaco Corporation to modify an electric service agreement with the Potomac Edison Company for purchase and sale of power from Westvaco's Luke Mill Plant.

Energy Procurement

Participated in a study concerning the Niagara Power Project in which Vermont, Pennsylvania and Ohio were competing for a 30-MW block of low-cost hydro power from the Power Authority of the State of New York. Performed load forecasting and research, including coal reserve data for report to show why Vermont could derive the greatest economic benefit.

Load Forecasting

Performed a load forecast for a proposed 650-MW, combined-cycle plant in Georgia, Vermont. Analysis of Vermont's present installed capacity, joint ownership in out-of-state units, and future purchased power agreements versus peak-load forecasts for the state.

Feasibility Studies

Participated in a study to determine the economic feasibility of constructing a 40-MW electric generating plant in Vermont, using wood chips obtained from the state's rough and rotten trees as fuel.

Marketing Studies

Performed an analysis of local market conditions for the disposal of flue gas desulfurization by-products for a major northeastern utility. Conducted research and interviews to determine current and forecasted supply/demand

characteristics for five potential by-products. Recommended which product had the most favorable market for absorption of continuing supplies.

Energy Audits and Electrical Load Surveys

Conducted a study for Riverbay Corporation to determine the quantity of heat generated by its steam plant and transferred for sale via a high-temperature, hot-water system to six nearby public schools. Compared cost with current price of this service to the New York City Board of Education.

Conducted electrical load surveys and cost analyses to determine reasonable charges to be paid for electricity by a customer in billing disputes involving the utility, or the landlord in the case of submetered properties. Clients included Radio New York Worldwide (WRFM), Wometco WWHT, Inc., Key Food Supermarkets, Morningside Heights Housing Corporation, Pavlo Engineering Company, A7A Graphic Arts Studio, Inc. and Fisher Brothers Management Company.

Electrical Systems Design

Responsible for design and engineering of electrical systems including power distribution, lighting, and signal systems for various commercial and educational facilities.

ARTICLES & PRESENTATIONS

"A Determination of Fire Hydrant Rental Fees," presentation at the 16th Annual Legislative Dinner of the Long Island Water Conference.

"Utility Rate Design and Structure," *Skylines*, August 1983 (Building Owners & Managers Association).

"Preparing for a Rate Case" and "Electric Utility Cost of Service", Presentation at a General Electric Company Seminar. Schenectady, N.Y., June 1992

"Gas Cost of Service and Rate Design in a Deregulated Environment", Presentation at a joint conference of the American Gas Association (AGA) and the Mexican Natural Gas Association (AMGN) in Mexico City, March 28, 1996.

Speaker on "Gas Cost of Service" and "Gas Marginal Costing" at Stone & Webster's Utility Management and Development Program.

"Setting Up Your Cost Models", Presentation at the INFOCAST Functional Unbundling Program. Chicago, IL, November 2000.

DAVID F. DESLAURIERS

Manager

BACKGROUND SUMMARY

Management consultant to the utility and energy industry with comprehensive experience in industry restructuring, regulation, economics, and retail market issues. Expertise includes: business strategy and quantitative decision support services, energy procurement management services, regulatory affairs and policy, financial forecasting and modeling, competitive assessments, rate unbundling and other rate matters, and other services related to the competitive retail energy markets. Expertise includes power, natural gas, and water industries. Experienced in providing full regulatory support services including expert testimony, regulatory strategy, and quantitative support tools. Expert financial modeling skills related to energy and utility industry.

PROFESSIONAL EXPERIENCE

1997-Present	**Stone & Webster Consultants, Inc.** Sr. Consultant, Markets, Finance & Regulation, Boston, MA
1990-1996	**The Columbia Group, Inc.** Sr. Consultant, Rates & Regulatory Affairs Division, Boston, MA

EDUCATION

- MBA, Finance, *Awarded With Distinction*, Babson College Graduate School of Business Management, Wellesley, MA, 1990
- BA, College of the Holy Cross, Economics, Worcester, MA, 1985

SPEECHES AND PAPERS

- Aggregation Insights into the Competitive New England Energy Market, paper presented at 10th National Energy Services Conference, Tucson, AZ, December 1999. Sponsored by *Association of Energy Services Professionals International, Association of Professional Energy Managers, Edison Electric Institute, and Electric Power Research Institute.*
- "What Every Smart Customer Needs to Know About Billing and Retail Settlement", *INFOCAST,* The New Rules of the Game: Taking Advantage of Electricity Choice in Pennsylvania and New Jersey, June 1998, Philadelphia, PA

- "Buying Electricity in the Future--Easier or More Difficult?", *Edison Electric Institute*, National Accounts Workshop, September 1997, Washington, DC

CONSULTING ENGAGEMENTS

Electric Industry Restructuring Projects

Strategic Services for Competitive Electric and Natural Gas Commodity Purchasing Programs- 1999

Retail Load Aggregation Program-a New England Based Group of Cities and Towns

Provided strategic and technical consulting services to the *Rhode Island League of Cities and Towns* and developed a successful large scale retail competitive energy procurement plan entitled "The Rhode Island Energy Aggregation Program" or "REAP". Provided wide range of strategic, advisory, and technical services that led to participation level of nearly 190 million kWh from local government accounts in the state of Rhode Island. Specific activities included facilitating consensus definition of needs and program objectives, regulatory intervention, monitoring, and communication, RFP development and other retail procurement tools, retail electric market and regulatory analysis, load definition and description, economic and rate analysis, contract negotiation, marketing and outreach services. Project requires in-depth knowledge of New England regulatory and competitive retail market climate and familiarity with local government decision making processes and group dynamics.

Competitive Purchasing of Natural Gas for Local Government Agency

Currently spearheading an effort to assist the *Rhode Island Public Transit Authority* to establish a competitively supplied natural gas purchasing program for its fleet of natural gas powered buses and its operating facilities. Facilitated goal and objective setting process and developed RFP for competitively supplied retail level natural gas. Project requires keen understanding of competitive natural gas markets and local government operations. Currently assisting in the review of responses to RFP and the selection of winning bidder for program.

Strategic, Regulatory, and Legislative Activity Projects- 1997-1999

Mid-Sized West Coast Municipal Electric Utility

Conducted a strategic review of electric utility's electric restructuring options. Assisted in development of competitive assessment leading to recommendations for services and pricing in competitive electric markets. Conducted in depth cost studies and led review of utility's stranded costs.

Evaluated options to recover stranded costs and recommended unbundled rate and stranded cost recovery mechanisms.

Southeastern Electric Cooperative Utility
Prepared electric restructuring filing for mid-sized electric cooperative in Louisiana. Filing presented unbundled cost of service analysis and proposed restructuring positions which addressed Louisiana Public Service Commission restructuring orders. Worked with clients to examine impact of various policies itemized by the LPSC and prepared comments filed with LPSC outlining restructuring positions.

Southeastern United States Electric Utility
Currently providing strategic decision making support to southeastern utility facing electric industry restructuring. Assisting in the facilitation of a consensus based strategic and qualitative evaluation of industry restructuring options available to the utility. Employing numerous policy, management review, and business planning techniques to build to a future vision consensus for the utility. Building quantitative business decision analysis model which forecasts financial impacts upon utility of various business direction alternatives

Rockland Electric Company (NY) on behalf of New Jersey Board of Public Utilities
Critically evaluated the rate unbundling filing of large New York-based electric company with service territory in New Jersey. Critiqued company's unbundled rates filing for completeness and compliance the New Jersey Board of Public Utility's order addressing electric industry restructuring. Provided recommendations for modification to filing and accompanying proposed rate design to achieve improved compliance with Board restructuring policy and other appropriate ratesetting and restructuring standards. Submitted report on findings to Board and presented expert written and verbal testimony before Board in support of recommendations.

New England Municipal Utility- Electric Restructuring Quantitative and Qualitative Support
Prepared a comprehensive business planning and forecasting model for utility to be used as a management decision analysis tool within context of restructuring strategic planning framework. As a scenario-based financial forecast, the model determines the impact of numerous distinct restructuring planning scenarios to each of the utility's separate business units and on a system wide basis. Model also contains an unbundled rate analysis, which calculates the separate unbundled cost levels of the utility's electric rates for each scenario and a sensitivity analysis which provides a detailed review of the relative dynamic financial and rate impacts of each scenario. Results of the model will be used to inform qualitative strategic planning process for utility.

Conducted focus groups with utility personnel designed to stimulate discussion and strategic thought around the important electric restructuring issues to the utility.

Strategic Restructuring Analysis and Legislative Support- Iowa Association of Electric Cooperatives
Currently assisting in an electric industry restructuring task force comprised of member cooperatives to develop an electric restructuring strategic plan and joint restructuring position. Assisting in the development of electric restructuring position statements for the association and in the formulation of draft legislation to be presented to the state legislative body. Assisting also, in providing qualitative support services designed to assist the association with negotiations with other electric restructuring stakeholders in the state.

New England Municipal Utility
Assisted in the preparation of unbundled electric cost of service study and accompanying unbundled rates for New England municipal utility. Assisted in the identification, separation, and allocation of costs between utility's steam and electric facilities. Model separates costs between the utility's gas, steam, and electric operations and then unbundles electric operations costs. Calculated demand allocation methodologies and overall cost shifts between gas, electric, and steam operations as a result of unbundling. Provided recommendations as to specific cost allocation as well as unbundled tariff design consistent with electric industry restructuring issues.

Electric Power Industry Projects-International

Economic Optimization Model for Large South American Utility: Luz Del Sur
Prepared an iterative economic optimization model for large electric distribution and generation utility in Lima, Peru, South America. Devised iterative financial model to identify the optimum economic size and loading of conductors and transformers at various system load requirements for the large electric utility. Work conducted within the context of rate setting proceeding before South American regulatory body, which sets rates, based on an ideally sized system model.

Other Electric Power Projects Involving Local Government

Electric Rate Negotiations on behalf of County and City Governments
Examined large mid-Atlantic electric utilities' jurisdictional cost of service study for rate negotiations conducted on behalf of utility's public authority clients comprised of a league of the cities, towns, and counties of two Eastern Seaboard states. Reviewed classification and allocation methodologies, recommended variations in cost of service techniques, and estimated alternative class rates of return. Participated in negotiations on behalf of clients.

Base Rate Filings-Electricity
Conducted full cost of service review of large Mid-Western electric company's first base rate filing after its merge with another retail electric company. Critically evaluated cost of service study and investigated use of cost of service methodology, revenue allocation among classes of service, setting of customer charge, and issues related to retail wheeling. Measured sensitivity of utility cost of service to changes in cost allocation determinants and assumptions. Provided complete litigation support services including conducting of filing analysis and formulating technical litigation positions, preparing written and telephonic discovery, developing of cross-examination questions.

Prepared electric cost of service study for mid-sized Northern New England municipal utility, which was filed before state commission. Drafted expert testimony and assisted in defending filing before commission.

Electric Cost of Service Study Training Program
Developed electric cost of service training models for two New England municipal utilities. Presented and developed models in dynamic interactive setting. Investigated use of alternative cost allocation methodologies and rate design proposals.

Natural Gas Industry Restructuring: Planning, Regulatory, and Rate Support

Natural Gas Pipeline FERC Filings
Assisted in the review of rate filing of major natural gas pipeline before FERC on behalf of large mid-western natural gas concern. Analysis focusing upon cost of service and rate design and issues related to the pricing of new services as the natural gas markets reshape.

Natural Gas Rate Unbundling
Determined cost based firm transportation rate for two municipal gas utilities. Estimated amount of revenue and consumption change due to implementation of rate. Developed unbundled tariffs and created new balancing terms and conditions.

Prepared specialized rate for high load factor customers of a large municipal gas utility.

Long Range Gas Supply Plan
Prepared long range load forecast for large municipal gas utility. Evaluated and forecasted peak day and annual requirements. Developed econometric model to forecast load. Built regression equations to forecast peak day load and derived load curves. Analyzed future gas supply options in terms of cost, reliability, and feasibility. Conducted sensitivity analyses, which measured

effects of changes in planning assumptions upon peak day and annual requirements

Gas Supply Planning and Management
Critically reviewed several purchased gas adjustment clauses of investor owned natural gas utilities including rulemaking proposals to unbundle the PGA. Prepared PGA rulemaking recommendations designed to improve the way in which gas costs are recovered. Issues included peak day planning, setting of reserve margins, evaluation of balancing rates, and treatment of producer reservation fees. Non-traditional issues included treatment of capacity release and off-system sales revenues, incentive ratemaking, use of hedging techniques, and competitive aspects of the natural gas industry.

Incentive Based Ratemaking Program Reviews-Natural Gas
Critically reviewed proposed incentive based ratemaking program of major Southeastern investor-owned gas utility and developed recommendations to improve program and ratemaking process. Evaluated risk allocation between shareholders and ratepayers and the proper setting of benchmark.

Gas Contracting Reviews
Reviewed over 100 post-Order 636 gas supply contracts of the investor-owned utilities in the Commonwealth of Massachusetts. Analysis focused upon proper pricing, supply assurance and reliability, contract flexibility, and other terms and conditions. Evaluated use of incentive ratemaking for companies involved.

Gas Prudence Reviews
Conducted a gas prudence review of investor-owned natural gas utility. Evaluated prudence of Company's long term gas contracts with its affiliate producer.

Natural Gas Retail Rates
Conducted full cost of service and rate design analysis of over 50 investor-owned natural gas, electric, and water utility base rate filings. Analyses focused upon cost of service methodology, rate design including customer charges, allocation of revenue increase, and policy and rate design issues relating to emerging utility competition.

Developed financial models, which determined sensitivity of utility cost of service to changes in cost allocation determinants and assumptions.

Provided complete litigation support services including conducting of filing analysis and formulating technical litigation positions, preparing written and telephonic discovery, developing cross examination questions, drafting written expert testimony, and providing oral expert testimony.

Water and Wastewater Projects: Planning, Regulatory and Rate Support

Retail and Wholesale Rate Design
Performed annual updates to retail water and wholesale water cost of service studies of large mid-Atlantic municipal utility. Developed wastewater cost of service study for Utility and updated annually.

Prepared cost of service analysis and revised rate design for mid-sized New England water utility. Developed and implemented rate design alternatives designed to increase annual load and utility's competitive position. Proposed comprehensive Economic Development Rate program. Delivered presentation to City fathers regarding merits of new rate design. Developed gas and electric cost of service training models for two New England municipal utilities.

Developed wastewater cost of service model for large Mid-Atlantic municipal utility. Made recommendations to change rate design and updated model annually for several years.

Special Rate Development
Developed pro-forma 30-year rates to determine the feasibility of forming a regional water authority. Conducted extensive cost allocation variations, which considered the operating and financial aspects of numerous participating parties.

Water Rate Training Workshops- New England Water Works Association
Providing ongoing training of financial staff members of New England based water utilities on matters pertaining to water utility economics and rate design.

Expert Testimonies

- Rockland Electric Company: Energy Master Plan Phase II Proceeding
- Connecticut Natural Gas Company
- Connecticut American Water Company
- Philadelphia-Suburban Water Company
- Pennsylvania Gas & Water Company- Scranton Division
- Pennsylvania Gas & Water Company- Spring Brook Division
- Pennsylvania Gas & Water Company- Crystal Lake Division

ROGER C. BOUDREAU
Associate Director

Management consultant with diverse experience in the electric utility industry centering on deregulation, state and federal regulatory proceedings and load research. Joined Stone & Webster Consultants with a Bachelors Degree in Electrical Engineering and over 30 years experience that includes distribution engineering, load research, rates, cost-of-service, load forecasting, market research and load profiling.

PROFESSIONAL EXPERIENCE

2000 - Present	Stone & Webster Consultants, Inc. Associate Director
1965 - 2000	Boston Edison Company Manager of Load Research

BACKGROUND

Team Leader, Load Research

- Reestablished the load research program in anticipation data requirements for the deregulation of the electric utility markets.
- Prepared the designs of new load research surveys to improve the accuracy of estimates in the daily load profiling process.
- Designed graphical representations of customer load profiles analyzing annual usage patterns for competitive suppliers.
- Maintained the Company's load research system and trained other departments in load research practices.

Utility Restructuring

- Served as a key advisor on the open access team that prepared the company for all aspects of oncoming deregulation.
- Configured the load research system to perform daily load profiling for open access.
- Participated in the design of a customer data warehouse to be used in support of open access.
- Managed the outsourcing for the development of load research data and allocation factors for the cost-of-service and rate design associated with the company's rate restructuring filing.

Project Manager of Real-Time Pricing Pilot

- Served as project manager for a real time pricing project requiring the coordination, implementation and direction for this pilot program.
- Prepared quarterly reports to the Department of Telecommunications and Energy (DTE) on the results of the pilot program.

Principal Engineer

- Developed new procedures for forecasting peak demands in the company's service territory.
- Contributed to the development of new procedures for customer billing analysis, unbundled services, cost-of-service, rate design, market pricing and load research.
- Primary contributor in the development of real-time pricing policies.
- Acted as team leader in developing a rate case contingency plan and assisted in the management of a "Pricing" plan for the E-Plan filing.
- Prepared annual report for the Massachusetts utility commission detailing the analysis and results of the Generator Assistance Program that was a DSM project designed to reduce system loads during summer peaks.

Manager, Load Research

- Directed the implementation and management of the company's load research programs, cost-of-service studies and system loss studies.
- Managed a technical division with a staff of five to ten professionals working on regulatory requirements.
- Instrumental in the design and implementation of the time-of-use billing process.
- Crafted a load research program that continuously met with Department of Telecommunications and Energy (DTE) approval.
- Served as member and chairman of the Advanced Metering Technology Task Force.

Principle Analyst

- Assumed progressive responsibilities for the data base management and data analysis of load research surveys.
- Participated in the preparation of rate and load research analysis for rate case filings.

- Provided services for data preparation, data analysis and impact evaluation associated with the company's DSM filings.
- Served as chairman of the Time-Of-Use Billing Task Force.

Distribution Planning Engineer

- Conducted advanced engineering studies in technical areas such as transformer life cycles, streetlighting economics and system losses.
- Produced technical reports with recommendations relating to transformer load management and the power factor policies for streetlighting ballasts.

Distribution Engineer

- Provided the network system design and associated distribution engineering for secondary network system in downtown Boston.
- Prepared new business work orders and met with customers and/or contractors to resolve issues relating to the installation of services for network transformer vaults.
- Updated and maintained a computer load flow model of the five secondary networks.

EDUCATION

BS, Electrical Engineering, Northeastern University

PROFESSIONAL AFFILIATIONS

Institute of Electrical and Electronic Engineers, Member

PAUL DAVIS
Associate Director

SUMMARY

Thirty years of industry experience, consistently leading the industry for implementing innovative, forward thinking, business driven methodologies. Proven ability to enhance corporate growth and effect positive change. Earned reputation as project manager with team building skills and a results orientation. Have been at the cutting edge of utility innovation/restructuring for twenty years. Recognized as expert witness in regulatory hearings concerning planning, economics, econometrics, mathematics, statistics, load research, local/regional economics and demand forecasting. Innate ability to separate the wheat from the chaff in technical analyses.

EXPERIENCE

1999 - Present	**Stone & Webster Consultants, Inc.**
1969 - 1999	**Boston Edison Company**

Joined Stone & Webster Consultants in 1999 bringing thirty years of utility experience from NSTAR (Boston Edison) including a multi-year assignment with the New England Power Pool. Extensive experience in distribution planning, metering, load forecasting, load research, demand side management, deregulated market pricing, asset management, and life cycle planning. Participated in much of the deregulation process in Massachusetts and, more recently was part of the transition to an asset management approach to transmission and distribution resource planning.

Life Cycle Plan Manager (1997-1999)

Responsible for the development and management of the $200 million Distribution Electric Delivery multi-year Life Cycle Plan.

Key Accomplishments

- Developed a multi-year detailed capital and O&M plan to which strives to optimize the cost and performance of the distribution assets.
- Coordinated integration steps between Asset Strategy, Investment Planning, and Field Forces to eliminate "blanket" work orders.
- Budget decreased from $200M to $160M over two years and productivity increased so that more work is being done with lower expenditures.

Principal Engineer/Research Analyst (1983 – 1997)

Responsible for establishing analytical methodologies for evaluation of supply-side/demand-side programs for this $1.5 billion electric utility.

Key Accomplishments

- Implemented the U K. market model as a starting point for the free market system for NEPOOL member utilities.
- Analysis and methodological review of the computer program used to review and evaluate the bids in the "first ever" supply options offering for an electric utility.
- Streamlined the analysis of supply side analysis by implementing the PC version of EGEAS and later modified the PROSYM model for long range supply planning.
- Developed a NEPOOL generation database consistent with the Boston Edison database.
- Built an inter-organizational taskforce of nine professionals from Finance, Engineering, Rates, Forecasting, Marketing and System Programming.
- Implemented and made operational the EGEAS (Electric Generation Expansion Analysis System) as a PC based analysis tool with savings of $200, 0001year.

Head, Forecasting & Demand Research Groups (1978 - 1982)

Responsible for short-run, long-range, and sub-regional forecasts of sales. The Company's budget and construction programs are based upon this Group's forecasts. Responsible for setting up the Company's Load Research Group including metering technology, measurement techniques, load shape analysis and statistical methodologies.

Key Accomplishments

- Originated both groups and instituted a multi-disciplinary approach to forecasting.
- Testified before regulatory agencies as an expert witness.
- Secured approval of annual forecasts and market assessment methodologies.
- Results included a $480 million nuclear plant construction cost recovery.
- Managed nine professionals in each group.
- Implemented a planning and activity report system to increase productivity and accountability.

Senior Load Research Analyst (1977 - 1978)

Responsible for implementing forecasting methods at Boston Edison.

Key Accomplishments
- Established market segment forecast.
- Added price response effects to Company forecasts (a first in New England).
- Introduced demographics as an integral part of forecasting.
- Set the criteria for market research data collection.
- Performed as Massachusetts State Model Manager for the New England Power Pool.

Electrical Engineer (1976 - 1977)

Special assignment to the New England Power Pool.

Key Accomplishments
- Worked with a multi-disciplinary taskforce from other utilities, the New England power Pool, and Battelle-Columbus to design and develop a highly disaggregated state of the art long-range forecasting model.

Electrical Engineer (1969 - 1976)

Worked in three different areas during this time period: Distribution, Metering, and Planning.

Key Accomplishments
- Performed a variety of engineering tasks gradually increasing from small projects (under $100K) to larger transmission and distribution projects ($10 million).
- Instituted risk analysis for distribution system.
- Revised the distribution and substation forecasting model that is still used.

EDUCATION

Post Graduate courses in macro, micro and regional economics

Northeastern University, 1974, M.S. Electrical Engineering

University of Massachusetts, 1969, B.S. Electrical Engineering

JOSEPH F. PINO JR.
Manager

Management consultant with diverse experience in the electric utility industry centering on deregulation, state and federal regulatory proceedings and customer billing. Joined Stone & Webster Consultants with a Bachelors Degree in Mathematics and over 20 years experience that includes rates, cost-of-service, demand side management, performance base rates, pricing, billing and information systems.

PROFESSIONAL EXPERIENCE

2002 - Present	Stone & Webster Consultants, Inc. Associate Director
1981 - 2002	NSTAR / Boston Edison Company Manager - Customer Information System

BACKGROUND

Manager, Customer Information System

- Liaison between information systems and business partners.
- Led NSTAR effort during merger of customer information systems.
- Provided support and resources leading up to merger process.
- Managed implementation of supplier billing using EBT/EDI.
- Managed successful Y2K team effort for the Customer Information System.
- Led team responsible for the daily operation and maintenance of the billing system.
- Implemented several tariff changes to billing system.
- Assisted in the creation of new financial and usage reports.

Utility Restructuring

- Implemented new unbundled tariffs for deregulation.
- Developed method of unbundling cost by rate class.
- Participated in the redesign of a customer billing system for deregulation.
- Assisted in development of Performance Based Rates (PBR).
- Separated street lighting revenue and cost to prepare for municipalization.

Pricing

- Served on team responsible for implementing real time pricing pilot.
- Implemented several rate changes.
- Assisted in development of sample performance base rates (PBR) for PUC.
- Created pricing for several special contracts in competitive situations.
- Set policy and pricing on products, services and special contracts.

Demand Side Management (DSM)

- Developed company's first data warehouse to retrieve billing and customer information for DSM related projects.
- Managed several internal consultants in creating DSM information system.
- Managed external consultants in review of several DSM programs.

Information System Analyst

- Provided data and key contributor to meter technical task force.
- Enhanced and supported customer information system.
- Created customer and billing information files for conversion to new system.
- Implemented software for new billing stock on laser printer.
- Enhanced and supported billing system.
- Assisted in training of new personnel.

EDUCATION

BS, Mathematics, University of Massachusetts - Boston

MICHAEL E. GREEN
Executive Consultant
APPRAISAL DIVISION

SUMMARY

Michael E. Green, ASA, is an executive consultant with over nineteen years of experience in the valuation of public utility and railroad property. He has appraised properties owned by natural gas pipelines, natural gas distribution companies, electric utilities, non-utility generators, short-line and regional railroads, private railcar companies, water and sewer companies, and telecommunications companies. His appraisals have been used in buy/sell decisions, ad valorem tax litigation, condemnation proceedings and fraud litigation. He is also a licensed general real property appraiser with experience in the appraisal of office buildings, apartments, shopping centers, industrial properties and various other types of commercial real estate.

Mr. Green is experienced in the preparation of detailed cost of capital studies using standard corporate finance models (Discounted Cash Flow or "Gordon's Model" and the Capital Asset Pricing Model) and "project finance" structures commonly used in the power generation industry. He routinely prepares detailed cost of capital estimates in conjunction with his appraisals and valuation related consulting assignments and has prepared independent cost of capital studies for utility clients in connection with *ad valorem* tax valuation negotiations.

Prior to his association with Stone & Webster Consultants, Mr. Green was employed by John E. Green & Associates, a firm specializing in the valuation of public utility and railroad property and was a sub-contractor to Real Estate Appraisers, Inc. in Montgomery, Alabama.

PROFESSIONAL EXPERIENCE

1998 to present Stone & Webster Consultants
1982 to 1998 John E. Green & Associates
1982 to 1994 Real Estate Appraisers, Inc. (sub-contractor)

PROFESSIONAL LICENSES

Certified General Real Property Appraiser – Alabama License Number G00193
Ohio License Number 448603
Maine License Number CG1266
New York Temporary License through 3/17/03

PROFESSIONAL ASSOCIATION

American Society of Appraisers – Accredited Senior Appraiser

EDUCATION

Master of Business Administration (1986), Auburn University at Montgomery, Alabama

Bachelor of Science in Business Administration-Finance (1982); Auburn University, Auburn, Alabama

Post-Graduate Studies:

Financial Engineering (2000), Auburn University Graduate School of Business, Auburn, Alabama

APPRAISAL EDUCATION

American Institute of Real Estate Appraisers –

Real Estate Appraisal Principles Course 1A-1, 1981
Basic Valuation Procedures Course 1A-2, 1983
Capitalization Theory and Techniques Part A, 1985
Capitalization Theory and Techniques Part B, 1985
Case Studies Course 2-1, 1986
Valuation Analysis and Report Writing Course 2-2, 1986
Standards of Professional Practice, 1987, 1993, 1995, 1997, 2001

Wichita Workshop – Appraisal of Communications, Energy and Transportation Properties for Ad Valorem Taxation

Annual Attendee, 1983 to present
1994, 1995, 1996 and 1998 Planning Committee Member
Speaker 1996, 1997 and 1998

LISA M. VEDDER
Senior Consultant

SUMMARY OF QUALIFICATIONS

Extensive senior-level experience in the energy industry with emphasis on electric and gas industry restructuring. Areas of expertise include regulatory policy, rate-making, technical and financial evaluations of power generation technologies, including alternative fuels, energy contracts and financing of complex sale/leasebacks & swaps.

EDUCATION

HARVARD UNIVERSITY, JOHN F. KENNEDY SCHOOL OF GOVERNMENT, Cambridge, MA
Masters in Public Administration, June 2000
Methodological Areas of Concentration: Negotiation & Conflict Resolution; and Regulation & Industry Analysis

Women's Leadership Initiative Fellow
Harvard Business School courses: privatization, regulation and deregulation (Dyck); capital markets (Froot); and negotiating complex deals and disputes (Wheeler).

Research Assistant to Henry Lee, Jaidah Family Director Environment and Natural Resources Program

UNIVERSITY OF WISCONSIN – MADISON, Madison, WI
BS in Industrial Engineering, December 1984 – Tau Beta Pi, Alpha Pi Mu

WORK EXPERIENCE

July 2000-present *Advisor,* **London Economics International, LLC** – *Senior* **Cambridge, MA**

- Evaluated expected LRMC of CCGT in Central Europe.
- Provided supporting opinion for reasonableness of interest rate for financing of complex sale/leaseback of USD 110 M fixed telcom assets in Belgium.
- Provided supporting opinion for reasonableness of interest rate for financing of future swap transaction linked to revenues from Austrian electricity & gas network assets.
- Provided supporting opinion for reasonableness of interest rate for financing of future swap transaction linked to convention center complex in Germany.

- Researched & reported upon status of EU natural gas and electricity market liberalization.
- Evaluated Transmission Administrator's function, role and incentive structure in support of re-design of Albertan power market.
- Researched and reported upon ISO-NE's proposed Standard Market Design.
- Designed ISO New England's proposed 2001 self-funding tariff including preparation of expert testimony & associated FERC filings.
- Designed proposed 2001 tariff to assure recovery of industry restructuring costs by NEPOOL.
- Provided expertise in the analysis of PBR regimes for a foreign utility.
- Provided project support to clients on a variety of energy industry assignments.

1998-1999 **Economics And Technology, Inc**, *Senior Consultant*, **Boston, MA**

- Provided policy expertise & authored testimony on synergistic benefits of proposed Bell Atlantic/GTE merger to the California PUC's Office of Ratepayer Advocates (CPUC ORA).
- Provided policy expertise to & authored testimony on electric industry unbundling for the CPUC ORA in the 1999 General Rate Case for Pacific Gas & Electric, with particular emphasis on the treatment of costs associated with support of both regulated and non-regulated (competitive) functions.
- On behalf of the Office of Consumer Advocates for the PAPUC, authored comments at the FERC on terms governing natural gas pipeline capacity (RM98-10-000/RM98-12-000).
- On behalf of a mobile telephony provider, in support of litigation, defended award of an international mobile telephony license and supported cross and direct examination.

1993-1998 **LEVITAN & ASSOCIATES, INC.** *Managing Consultant*, Boston, MA

- Served as key member of the transaction team providing analytical and negotiation support that culminated in the termination of NUG power purchase agreements (PPAs) representing nearly $2 billion in ratepayer savings and 1,000 MW of capacity.
- Supported PPA restructuring and securitization analyses on behalf of utilities and other interested parties.
- Performed generation asset valuations, including creation of dispatch models, supporting bids for generation assets auctioned off by utilities in New England.

- Served as the primary author of reports concerning the future outlook for the New England energy market, including consideration of NEPOOL restructuring, the nuclear sector, natural gas pipeline capacity additions and transmission constraints in Eastern REMVEC.
- Performed technical and financial evaluations of waste-to-energy, waste fuel-fired and conventional non-utility generation (NUG) projects.
- Participated in electric industry restructuring proceedings before various state commissions and legislative bodies including the preparation and submission of testimony.
- Provided "all-energy" (electricity, natural gas and fuel oil) procurement services for large industrials and institutional energy users; managed database development activities associated with energy user load profiling, load aggregation and Btu optimization.
- Provided litigation support, participated in discovery, prepared interrogatories and authored testimony.
- Analyzed natural gas supply, transportation and storage contracts and arrangements.

1991-1993, **ROY F. WESTON, INC.,** *Project Manager*, Burlington, MA & Los Angeles, CA

- Served as co-Project Manager for the City of Los Angeles's $1.2 million Solid Waste Generation Study conducted to ensure full compliance with California law AB 939; responsibilities included making formal presentations on behalf of the City to the Board of Public Works and industry and trade groups, training and overseeing staff, and managing ten sub-contractors.
- Conducted technical and economic analyses of solid waste projects and served as primary author for Consulting Engineer's Feasibility Reports for the financing and refinancing of solid waste processing facilities throughout the US.
- Prepared RFPs and RFQs, performed financial and technical evaluations of proposals, and negotiated contracts for solid waste processing, transportation and disposal services on behalf of municipalities and authorities.
- Performed technology assessments, waste stream quantification and composition analyses, and designed and implemented computer-based technical and financial models.
- Designed a proprietary model to calculate landfill dimensions, estimate landfill development and construction costs, and forecast landfill-operating costs in support of feasibility analyses.

1990-1991 Stone & Webster Engineering Corporation
Information Technology Division – *Engineer* Boston, MA

- Developed and supported computerized solutions in various languages, operating systems and platforms for large diverse engineering and construction projects.
- Enhanced and customized the proprietary relational database package ACCESS for the Massachusetts Water Resources Authority's Boston Harbor cleanup.

1986-1990, **CSI RESOURCE SYSTEMS, INC.**, *Associate*, **Boston, MA**

- Analyzed waste stream compositions and quantities, financial arrangements, risk structures, alternative technologies and facility sizing for solid waste projects.
- Provided procurement support for massburn resource recovery facilities, refuse derived fuel facilities, transfer stations, materials recovery facilities, mixed solid waste composting facilities, yard waste composting facilities and curbside recycling services.
- Prepared RFQs and RFPs, evaluated qualifications and proposals in support of vendor selection.
- Supported service agreement negotiation for solid waste management services.
- Prepared Consulting Engineer's Feasibility Reports for the financing of various solid waste processing facilities.
- Monitored construction and Acceptance Testing of various refuse derived fuel and massburn resource recovery facilities in New York, Connecticut, and Florida.

1985-1986, DYNAMICS RESEARCH CORPORATION, *Operations Research Engineer*, Wilmington, MA

- Designed and integrated a computer simulation model for interface with an existing Materials Requirements Planning (MRP) package.
- Developed a production control module for the Mita-5 gyroscope and integrated this module into the existing MRP package.
- Designed procedural protocols for maintenance and use of magnetic media attached to missile guidance systems. Generated flow charts for components of the MK6 guidance system accelerometer and Mita-5 gyroscope.

Appendix 2 Contract Standard

TERMS & CONDITIONS OF CONSULTING ASSIGNMENTS

1. *Scope* - Stone & Webster Consultants, Inc. ("Stone & Webster Consultants") will perform the services set forth in the Letter or Proposal of which these Terms and Conditions ("Terms") are a part and together make up the "Agreement." The provisions of these Terms shall control in the case of conflict with any provisions of the Letter or Proposal or any other contract document.

2. *Fees and Expenses* - Fees: Unless otherwise stated, fees for services provided by Stone & Webster Consultants shall be based upon the rates, at the time the work is performed, of the personnel actually involved in the assignment. Expenses: Report production and printing, reproduction, telephone and computer services will be billed to you at Stone & Webster Consultants' standard charges for such materials or services. Expenses of consultants while on assignment or any other charge incurred or expenditure made on your behalf will be charged at our cost.

3. *Payment* - Stone & Webster Consultants will submit monthly invoices reflecting actual work performed and expenses incurred. Payment shall be due 15 days after the date of an invoice. Amounts past due more than 30 days shall bear interest from the due date until payment is received. The rate of interest applicable during a calendar month shall be the Prime Rate (or in the event a range of Prime Rates is published, the mean of such range) as published in the Eastern Edition of The Wall Street Journal on the first business day of each month that the amount is outstanding. In addition to all other available remedies, Stone & Webster Consultants may, at its option, stop work or terminate the Agreement in the event there is an unpaid balance due for more than 30 days.

4. *Insurance* - Stone & Webster Consultants will maintain comprehensive general and automobile liability insurance with a combined bodily injury and property damage limit of $300,000 and worker's compensation insurance as required by law.

5. *Independent Contractor* - It is understood and agreed that Stone & Webster Consultants shall for all purposes be an independent contractor, shall not hold itself out as representing or acting in any manner for you, and shall have no authority to bind you to any contracts or in any other manner.

6. *Termination* - This Agreement shall be subject to the right of either party to terminate at any time upon not less than ten (10) days' prior written notice to the other party. Upon termination, you shall pay the full amount due for services rendered and costs and expenses incurred and not paid for up to that time, and the costs of returning consultant personnel to home base and other reasonable costs and expenses incurred in effecting termination (including cancellation charges) and returning documents.

7. *Responsibility Statement* - Stone & Webster Consultants' services will consist of reviewing and advising you concerning the subject project and/or facilities for which Stone & Webster Consultants has no engineering, design, construction, operation or maintenance responsibility. Stone & Webster Consultants' review of any information prepared by you or others, including, but not limited to, design, schedule, interface, environmental, permitting, performance, market or economic information, shall in no way serve to transfer to Stone & Webster Consultants responsibility or liability for the accuracy, correctness, or timeliness of such information. Such information shall be timely submitted to Stone & Webster Consultants and Stone & Webster Consultants' advice will be based on and limited by the accuracy, scope, and timeliness of information furnished to Stone & Webster Consultants. Time and scope limitations inherent in Stone & Webster Consultants' performance preclude definitive verification of factors, which may later be shown to have been important to the project. Stone & Webster Consultants' review, therefore, may not uncover all of the significant risks and variables. The parties acknowledge that the actual project economic viability and technical performance depend on many factors not within the control of Stone & Webster Consultants, such as proper design, equipment, construction, operation, maintenance, etc. Therefore, Stone & Webster Consultants specifically does not guarantee, warranty or otherwise underwrite the project, its economic viability or its technical performance. Any engineering, design, construction, operation or maintenance deficiencies shall remain the complete responsibility of the party or parties providing the engineering, design, construction, operation and maintenance services for the project. It is understood that Stone & Webster Consultants shall have no right of authority to stop any work, nor shall Stone & Webster Consultants have any responsibility for the means, methods, techniques or safety programs of the engineer, constructor and/or operator. Stone & Webster Consultants' services are provided for your sole benefit and not for the benefit of or use by any other party. No third party shall be entitled to rely upon Stone & Webster Consultants' work product.

Stone & Webster Consultants agrees that the services provided for herein will be performed in accordance with recognized professional consulting standards for the same or similar services. If, during the performance of these services or within one year following completion of the assignment, such services shall prove to be faulty or defective by reason of a failure to meet such standards, Stone & Webster Consultants agrees that, upon prompt written notification from you of any such fault or defect prior to the expiration of the one-year period following the completion of the services, such faulty or defective portion of the services shall be redone to meet such standards at no cost to you up to a maximum amount equivalent to the cost of the services rendered under this assignment. If the foregoing remedy is not appropriate or suitable under the circumstances, Stone & Webster Consultants shall be liable to you for any extra costs or damages incurred or suffered by you as a direct result of such fault or defect up to 50% of the amount of the fees for services received by Stone & Webster Consultants for this assignment, and this shall be your exclusive remedy.

Notwithstanding any other provision to the contrary in this Agreement, Stone & Webster Consultants' total aggregate liability to you for damages suffered by you under this Agreement shall be limited to 50% of the amount of the fees for services received by Stone & Webster Consultants under this Agreement or, for Stone & Webster Consultants' liability for which there is insurance coverage explicitly set forth in this Agreement, Stone & Webster Consultants' liability shall be limited to the proceeds up to the specific limits of any applicable insurance coverage explicitly set forth in this Agreement. In no event shall Stone & Webster Consultants, its parent corporation, or its or their affiliates, agents, employees, or others providing materials or performing services in connection with this Agreement be liable for any other direct, or for any indirect, incidental, consequential or special loss or damage, whether attributable to breach of contract, warranty, express or implied, tort, including negligence, strict liability, or otherwise. Except as herein provided, you release, indemnify and hold harmless Stone & Webster Consultants, its parent corporation and its and their affiliates, agents, employees, or others providing materials or performing services in connection with this Agreement from and against any and all liability, as well as costs of defense, settlement and reasonable attorney's fees, irrespective of fault or negligence, except where such liability arises out of "gross negligence" or willful misconduct on the part of Stone & Webster Consultants or its assignment personnel or both. "Gross negligence" means any act that was performed with the wanton and reckless indifference and disregard to the harmful consequences on the safety or property of another person or entity.

8. *Confidential Information* - Neither party shall disclose to any third party any Confidential Information of the other, and such Confidential Information shall be identified or marked as confidential at the time of disclosure, for a period of two (2) years after completion of this Agreement. As used herein, Confidential Information includes, but is not limited to, any information that relates to any party's research, development, trade secrets, proprietary products or business affairs, but does not include information that (i) is at the time of its disclosure publicly known or becomes publicly known through no breach of the terms of this Agreement; (ii) was already known by the receiving party at the time of disclosure; (iii) is lawfully received from a third party not bound under a confidentiality agreement with either party; or (iv) is disclosed under legal compulsion. This paragraph 8 shall survive expiration or termination of this Agreement.

9. *Work Product* - Any report or other document prepared pursuant to this Agreement shall be for your use only. Stone & Webster Consultants' prior written consent is required for the use of (or reference to) its report or any other document or information prepared pursuant to this Agreement, including use in connection with a public offering of securities or in connection with any other financing. It is understood and agreed that Stone & Webster Consultants' use of its proprietary computer software, methodology, procedures or other proprietary information in connection with an assignment shall not give you or anyone else any rights with respect to such proprietary computer software, methodology, procedures or other proprietary information, and you agree to keep confidential and not disclose such proprietary information to any third parties. Subject to the confidentiality obligations hereunder, Stone & Webster Consultants may retain and further use the technical content of its work hereunder. This paragraph 9 shall survive termination or expiration of this Agreement.

   The following legal notice shall be affixed to any report or other document furnished by Stone & Webster Consultants hereunder and to any report or other document resulting from this Agreement which may be distributed outside your organization.

"LEGAL NOTICE"

This document was prepared by Stone & Webster Consultants, Inc. ("Stone & Webster Consultants") solely for the benefit of _____. Neither Stone & Webster Consultants, nor parent corporation or its or their affiliates, nor _____, nor any person acting in their behalf (a) makes any warranty, expressed or implied, with respect to the use of any information or methods disclosed in this document; or (b)

assumes any liability with respect to the use of any information or methods disclosed in this document.

Any recipient of this document, by their acceptance or use of this document, releases Stone & Webster Consultants, its parent corporation and its and their affiliates, and _____ from any liability for direct, indirect, consequential or special loss or damage whether arising in contract, warranty, express or implied, tort or otherwise, and irrespective of fault, negligence, and strict liability."

10. *Excused Performance* - Stone & Webster Consultants shall not be deemed in default of any provision hereof or be liable for any delay, failure in performance, or interruption of service resulting directly or indirectly from a force majeure event, including but not limited to acts of God, civil or military authority, civil disturbance, war, strikes or other labor disputes, fires, other catastrophes, or other force, event or condition beyond its reasonable control, whether or not such event may be deemed foreseeable.

11. *Notices* - All notices and communications given under or pursuant to the Agreement shall be in writing and sent by certified mail, telecopied or delivered to Stone & Webster Consultants, Inc. at 1430 Enclave Parkway, Houston, TX, 77077, Fax: 281-368-4491, Attention: General Counsel, and if to Client at the address or telecopy number shown on the Letter or Proposal or such other address or telecopy number as Client may designate by written notice to Stone & Webster Consultants. All such notices and communications shall be effective: (a) if mailed, when received, as evidenced by a Return Receipt; (b) if telecopied, when sent, as evidenced by receipt of a confirmation from the correct telecopier number; and (c) if delivered personally or by courier, when actually received as evidenced by a receipt.

12. *Complete Agreement* - It is understood and agreed that this Agreement embodies the complete understanding of the parties and that any and all provisions, negotiations and representations not included herein are hereby abrogated and these Terms cannot be changed, modified or varied except by written instrument signed by both parties. In the event you issue a purchase order or memorandum or other instrument covering the services herein provided, it is hereby specifically agreed and understood that such purchase order, memorandum, or instrument is for your internal purposes only, and any and all terms and conditions contained therein, whether printed or written, shall be of no force or effect unless agreed to in writing and signed by Stone & Webster Consultants. No waiver by either party of a breach hereof or a default hereunder shall be deemed a waiver by such party of a subsequent breach or default of like or similar nature.

13. *Governing Law* - This Agreement shall be construed and otherwise governed pursuant to the laws of the Commonwealth of Massachusetts, excluding the conflicts of laws principles, and the parties agree to the jurisdiction of the courts of said state.

14. *Dispute Resolution* - The parties shall make a diligent, good faith attempt to resolve by negotiation all disputes arising out of or in connection with this Agreement. If such negotiation is unsuccessful within a period of forty-five (45) days, the parties shall make a diligent, good faith attempt to settle the dispute by mediation pursuant to the American Arbitration Association's Commercial Mediation Rules, except as excluded or varied by this Agreement. If such mediation is unsuccessful within a reasonable period of time, either party may submit any unresolved dispute to arbitration in accordance with the Commercial Arbitration Rules of the American Arbitration Association. Any such arbitration shall be conducted in Boston, Massachusetts, by the Regional Office of the American Arbitration Association. Any award less than $500,000 shall be final and binding, and may be entered into a court of competent jurisdiction for enforcement. Any award of $500,000 or greater may be appealed to any state or federal court in Massachusetts for a trial de novo.

Each party shall be responsible for its own costs and expenses, including legal fees, incurred in the course of any arbitration or legal proceedings. The fees of the arbitrators shall be shared equally by the parties. The arbitrators shall be bound by the terms of this Agreement and shall not have the power or authority to award costs, expenses, attorney's fees, punitive damages, or consequential damages.

I. BUSINESS ORGANIZATION

Larkin & Associates

Larkin & Associates, PLLC is a firm of certified public accountants and regulatory consultants, with offices at 15728 Farmington Road, Livonia, Michigan 48154.

Subcontractors

If the project team is selected to address issues 2 and/or 4, Dr. John Legler and Scott Rubin, each individual subcontractors to Larkin & Associates on this project, would function as the lead consultants and expert witnesses in these areas, respectively.

Larkin & Associates Firm Background

In April 1970, the certified public accounting firm of Larkin, Chapski & Co., was formed by former employees of Peat, Marwick, Mitchell & Co., a big eight accounting and auditing concern. In addition to the auditing, accounting and tax work typical of CPA firms, Larkin, Chapski & Co, specialized in the area of utility regulation. In September 1982, the firm was reorganized into Larkin & Associates, a certified public accounting and consulting firm with Hugh Larkin, Jr., as senior partner. As such, Mr. Larkin has the ultimate responsibility for all regulatory consulting work performed by the firm. Section III of this proposal provides further details on the management of our utility regulatory project team. Larkin & Associates performs a wide variety of auditing and accounting services, but concentrates in the area of utility regulation and ratemaking. The firm has performed regulatory consulting services for numerous clients.

Larkin & Associates performs independent regulatory consulting primarily for public service/utility commission staffs and consumer interest groups (public counsels, public advocates, consumer counsels, attorneys general, etc.). Larkin & Associates has extensive experience in the utility regulatory field as expert witnesses in over 300 regulatory proceedings.

Our project team is unusually well qualified to conduct this important study for the North Dakota Public Service Commission. We believe we satisfy the key ingredients for success of this assignment: strong technical skills, utility industry experience, relevant audit experience, extensive experience with natural gas utility rate and regulatory filings, an understanding of the regulatory environment, and demonstrated project management capability.

The distinct advantages of our approach include the following:

Maximum consulting skill applied to each assignment. The effective use of consultants rests on finding the best fit between the client's needs and the skill, knowledge, and experience of the individual consultants who actually work on the assignment. Our approach maximizes the productive time of the senior consultants who work on the engagement. Furthermore, we are not encumbered by the overhead necessary to support a large firm; consequently, our clients receive more pure consulting services for every dollar they spend.

Extensive utility industry experience. Collectively, the consultants available for our assignments have extensive and diverse experience with utilities and regulation. In addition

to possessing the requisite professional skill, our project team brings together people with broad practical experience. The consultants we propose have meaningful prior experience in their field of specialization, which is the public utilities sector.

Proven technical skills. Consulting is a skill-based professional service. Our project team is made up of seasoned, career consultants who have climbed well up the experience curve at each functional discipline. The methodologies we employ have been tested successfully on many engagements. We believe our approach provides the greatest probability of producing both useful and measurable benefits.

Value added approach. Our consulting philosophy emphasizes a collaborative approach. We strive to establish the closest possible working relationship with our client's personnel. We believe that the success of consulting engagements varies directly with the degree of client involvement. Therefore, we encourage our clients to become actively involved in our assignments.

Demonstrated project management capability. We consider project management to be an essential responsibility. We have substantial experience managing a full spectrum of consulting engagements, including many complex, large-scale projects. Senior consultants are responsible for providing direction to the project team, insuring that there is sufficient depth, detail, and balance to work plans. We use the detailed work activity plans and budgets to monitor progress and as a focal point for communications with the client.

Several CPAs on project team. Our project team includes four seasoned CPAs and three CPA candidates, each of whom has devoted his or her career to addressing the issues affecting public utilities. In our extensive public utility consulting work, which encompasses management studies and rate case assistance, we stress the quantification of recommendations. Having several experienced CPAs on our team helps to insure that all of our recommendations are quantified, where possible, and that the underlying facts have been thoroughly verified.

Experience as expert witnesses. Project team members have presented testimony and have been cross-examined on numerous issues in regulatory proceedings. As a result of this experience, our team has a sharper appreciation of the value of rigorous fact verification and documentation of our findings and conclusions. We approach the investigative audit process with the type of discipline that enhances our ability to support our findings in subsequent regulatory proceedings, if and as necessary.

Expertise in developing spreadsheet models. Over the past several years, we have developed significant expertise in developing spreadsheet models to develop revenue requirements and cost of service studies.

Experience with North Dakota utility regulation. Larkin & Associates has extensive experience with North Dakota utility regulation, having assisted the Staff in a variety of utility regulatory projects.

Importance of this engagement. We can offer all of the talents and experience of a large consulting firm. At the same time, we are a small growing business where every client is very important. We strive to give each client a high degree of personalized care and attention. We anticipate being able to bring to this project, a valuable blend of big firm capabilities and small firm commitment, attention, and responsiveness.

II. PROJECT SUMMARY

Approach to Scope of Work

The purpose of the contract will be to have Larkin & Associates, along with Dr. John B. Legler and Scott Rubin, provide comprehensive technical assistance to the North Dakota Public Service Commission ("PSC" or "Commission") Staff ("Staff") in analyzing the rate increase filing made by the Montana-Dakota Utility Company (MDU).

Larkin & Associates will address issue areas 1 (rate base/investment), 3 (cost of service/revenue and expense analysis), and 5 (depreciation). Dr. Legler will address issue 2 (cost of capital), and Mr. Rubin will address issue 4 (rate design). All professionals proposed for this project have worked with each other on other regulatory projects.

The ultimate objective of this project involves presenting our conclusions and recommendations, in the form of oral testimony, before the Commission. We will assess, in light of the Commission's and Staff's regulatory philosophies and goals, an appropriate revenue requirement and rate base for MDU. We will determine a revenue requirement that can be effectively and convincingly supported at the proceeding. In order to meet these objectives, we will perform a thorough review of the filings and supporting workpapers underlying the request for an increase in rates.

Throughout the project, a high degree of communication will be maintained among all members of the project team, as well as with PSC staff members assigned to the project. Communications will be facilitated by regular staff meetings, telephone conference calls, and if necessary, trips to North Dakota to meet with Staff personnel and review data.

Our findings will be presented first in the form of oral telephone discussions and monthly progress reports to PSC staff members working on the project. Upon completion of the analytical work, we will prepare and submit to the appropriate PSC staff members, drafts of testimony. Then, after discussions with, and approval by these persons, our findings will be presented to the Commission in the form of written testimony and exhibits, to be followed with oral direct testimony and cross examination at the hearings. We will respond to interrogatories related to our scope of work issued by any parties to the proceeding. We will also analyze rebuttal testimony, prepare and assist in cross-examination procedures, and prepare and present oral testimony at the hearings. In addition, we will provide PSC Staff with technical support at the hearings, and after the hearings, in preparing proposed findings of fact. In order to present a convincing and accurate case to the Commission, we will utilize to the fullest extent possible, our accumulated expertise in accounting, economics, finance, law, taxation, and utility ratemaking.

Project Team Resources

As founder and senior partner of the firm, Hugh Larkin, Jr., assumes ultimate responsibility for each regulatory engagement the firm undertakes. Mr. Larkin will be available to act as project director of the case and will also be available to provide expert testimony in the proceedings. Mr. Larkin has worked in the regulatory field for over 20 years and has testified in over 300 rate proceedings. On this particular project, Mr. Larkin's role is anticipated to be limited to high level supervision, as necessary.

The Larkin & Associates professional staff includes four CPAs with over 80 years cumulative business public accounting experience and utility related work. Our personnel our familiar with cost of service, rate base, income taxes, lead/lag studies, and accounting adjustments as well as many other issues that have been contested in ratemaking proceedings. This background enables us to analyze these areas and to draw on knowledge gained through comparable studies performed in other utility cases. Resumes of the members of Larkin & Associates who will be participating in this project are included as Appendix I, Background and Qualifications – Resumes of Larkin & Associates professionals. Summaries of Larkin & Associates' prior gas utility rate cases are included as Appendix II, Gas Case Summaries.

Dr. Legler's and Mr. Rubin's qualifications are presented in Appendices III and IV, respectively.

Functional Approach To Work Tasks

The work on this project will be divided into multiple tasks that provide a sensible, chronological series of expected activities, encompassing the required work areas within the established time constraints. The major tasks described below represent the anticipated approach to the overall scope of work. Interaction with Staff is anticipated to coincide with all tasks performed, to provide for substantial input by these persons, so as to optimize project team performance.

1. We will discuss with Staff assigned to the project, the specifics of the approach Staff wishes to follow in this case. In this meeting, we will discuss the areas that are of particular concern. A time line will be agreed upon establishing all critical project deadlines.

2. We will perform a detailed review of the Company's filing in the current case, including its testimony and supporting workpapers. This will include a thorough analysis, review, and evaluation of all pertinent evidence filed on behalf of all parties in the current case. Additionally, we will review testimony, briefs, and orders of the Commission in prior cases to determine what issues were presented by the various parties, and how they were resolved by the Commission. Furthermore, we will determine if there are any new areas of concern that are raised by making a comparison to the testimony and order in the prior case. Based on this analysis, we will advise and recommend an approach to each specific issue.

3. We will conduct discovery of MDU, sufficient to conduct a complete analysis of the Company's case. This will include preparation of a comprehensive array of written requests for information as may be necessary for a thorough analysis of the case. Our discovery files contain many standardized data requests designed to obtain the information necessary to thoroughly evaluate typical issues we have encountered in other rate cases. These standardized requests for information provide an efficient, effective starting point in developing the first set of discovery to be served upon the Company. Additionally, we develop Company-specific data requests to clarify issues, pinpoint problem areas, and obtain follow-up information, as well as address issues and quantifications unique to this Company and rate case.

4. Larkin & Associates will submit periodic progress reports in which we will update Staff of the conclusions and recommendations we have formulated based upon our review of MDU's response to discovery. Such progress reports will also advise Staff of any potential problems we foresee in meeting project deadlines.

5. We will carefully analyze and evaluate the information received in steps 1 through 4. All information gathered as well as analyses and evaluations will be performed in order to consider all possible issues, which come to our attention during the course of our review. Based upon this evaluation, we will discuss our findings with Staff to determine which items should form the basis for proposed adjustments as part of our formal testimony.

6. We will submit drafts of testimony and exhibits in advance of the filing date so that Committee Staff and Counsel assigned to the project will be able to review them. We will thoroughly review, verify, and correct the draft testimony and exhibits to meet the satisfaction of the Committee in order to have finished copies ready for filing sufficiently in advance of the filing deadline.

7. We will assist Staff counsel with the preparation of cross-examination questions. Our tested and effective format for preparing cross-examination includes, for each issue, identification of the appropriate witness; a summary of the issue (what the Company did, why it may be inappropriate, impact on rates, and discussion of relevant discovery responses), specific cross-examination questions (primarily drafted to elicit a "yes" or "no" response to keep the witness on track) and anticipated witness responses.

8. For issues 1, 3 and 5 (rate base, net operating income, and depreciation), Helmuth W. (Bill) Schultz III or Ralph Smith will present expert testimony and undergo cross-examination at the hearings. Both have previously testified before the Commission. For issue 2 (cost of capital), Dr. Legler will be the expert witness. Dr. Legler has previously presented prefiled testimony on cost of capital before the Commission in a prior MDU rate case. For issue 4 (rate design), Scott Rubin will be the expert witness. Mr. Rubin has not previously testified in North Dakota, but has presented expert testimony on rate design before a number of other state regulatory commissions. As a result of our extensive experience in presenting expert testimony before regulatory commissions, we believe that the best preparation for responding to cross-examination by others is to present well-conceived, clearly worded, and thoroughly verified pre-filed written testimony at the onset.

9. We shall assist Staff subsequent to the hearing by preparing proposed findings of fact with respect to issues relevant to our scope of work.

Substantive Approach to Analysis of Each Group of Issues Identified in the RFP

In the following subsections of our proposal, we address our substantive approach to addressing the issues encompassed within each of the five issue groups identified in the RFP.

Approach to Revenue Requirement Analysis (Issues 1, 3 and 5, Rate Base, Net Operating Income and Depreciation)

If Staff selects Larkin & Associates to perform the work on issue areas 1, 3 and 5, we believe that this combined review would produce synergies by having the same consultants and same witness address the revenue requirement issues in this rate case. We propose to review such revenue requirement issues in the following manner. Since we have not yet begun an in-depth study of the project, the following discussion consists of areas that will have to be addressed and general areas that are likely to be of concern, and our approach to them.

Revenue Requirement

We will review the Company's proposed revenue requirement, recommend adjustments, and independently develop a revenue requirement. The revenue level should be sufficient to enable the utility to recover all of its prudently incurred costs found to be includable in the adjusted test year, plus an adequate return of its capital invested in used and useful assets devoted to the provision of jurisdictional utility service. In other words, total allowed revenues should equal total operating expenses plus depreciation, and an adequate return on investment. This is, of course, inclusive of a sufficient level of income taxes to provide an opportunity to earn such return on an after-tax basis.

Test Year

Keeping in mind prior Commission orders and North Dakota law, we will review the test year used by the Company to determine its appropriateness. We will carefully analyze any adjustments proposed by the Company to the test year to ensure that there is a proper synchronization of rate base with revenue and expense levels.

Using a historical test year assumes that revenue and expense levels experienced in the past will continue in the future; this may not be the case. Unusual events, costs, and changes in operations will be evaluated for this purpose. In the event the historical test year does not facilitate the rate recognition of such items as plant being placed into service, we will maintain the test year concept of matching rate base, return, and expenses with appropriate levels of sales.

In the event that the Company has used a projected test year or a partially historic/partially projected test year, we will analyze all budgets and forecasts underlying the projected data. Such projections will be compared to historical data and all unusual increases and decreases in costs will be questioned.

Rate Base Analysis (Issue 1)

We would expect to perform the following analysis pertaining to rate base. As noted in the RFP for issue 1, the rate base determination is not nearly as critical in terms of rate impact as is establishing the appropriate cost of service. Consequently, work in this area will be limited in scope and will commence with a review of the last rate case and historical comparisons, along with a review of MDU's filing. Variations in MDU's filing from the prior case and deviations from Commission precedent will be used as guidance for where to focus the analysis. We understand that Staff does not want the consultant to perform a cash working capital calculation.

Based on the above overall approach, issues concerning the rate base determination that may be encountered include the following:

Review the Company's accounting and budget data to ensure that the per book or forecast balances included in rate base are stated appropriately. Also ensure that all major balance sheet accounts have, in some way, been accounted for through either the rate base or capital structure ratemaking components.

Review all Company adjustments to the rate base to ensure their propriety. Rate base adjustments are normally made to update items such as plant in service to a specified date, to adjust working capital and depreciation reserve to correspond with adjusted expenses, and also to include adjustments to deferred tax offsets to the rate base. All adjustments must meet the requirements of being known and measurable. Where Company adjustments are believed to be inappropriate, we will propose alternative adjustments and explain reasons for rejecting the Company adjustment in testimony.

Analyze sources of non-investor supplied capital. Determine whether all non-investor supplied capital has either been appropriately deducted from the rate base or included in the capital structure at zero cost. Balances that should appropriately be deducted from the rate base include:

1. Accumulated deferred income taxes, reflecting the fact that this represents non-investor supplied capital.

2. Customer deposits, while at the same time treating customer deposit interest as an above-the-line expense.

3. Pre-1971 Unamortized Investment Tax Credits. Deduction from rate base of these tax credits, is not prohibited by law. To the extent that such unamortized balances are still on the Company's books, they should be deducted from rate base as non-investor supplied capital.

4. Accounts Payable associated with Plant in Service (PIS), Construction Work in Progress (CWIP), and Materials and Supplies (M&S). The PIS, CWIP, and M&S balances included in the rate base for a current return that may be partially financed by accounts payable on a continuous basis throughout the year. Such payables (e.g. contractor retentions) represent vendor-supplied capital and should be offset against the PIS, CWIP, and M&S balances in the rate base.

5. Determine whether customer advances or contributions in aid of construction are present on the Company's books and propose recommendations accordingly.

6. Review balance sheets for any other types of non-investor supplied capital, which should be reflected in the determination of rate base. These would include reserves for items such as injuries and damages, property damage, self-insurance, etc.

Determine if MDU has included any CWIP in rate base. We will determine if the expected in-service date is accurate. If CWIP is not expected to be in service within a reasonable period after the test year-end, then it should not be included in the rate base.

Review and analyze all costs associated with new plant, which goes into service during the test year. Ensure that the cost savings associated with it are simultaneously and adequately reflected.

Evaluate any Plant Held for Future Use (PHFFU) in the rate base. Some Commissions have approved the inclusion of PHFFU in the rate base. We will analyze the items requested for inclusion by the Company, verify dollar amounts, and existence of a definite plan of use within a reasonable time frame for each piece of property held for future use included in rate base. This will allow us to determine whether or not each specific item merits inclusion in the rate base.

Ensure that components of the rate base are determined on a consistent basis with components of capital employed (e.g. 13 month averages, beginning and end-of-year average balances). If considered helpful to our analysis, we will reconcile the rate base with capital structure. This can be an important analytical procedure in testing the overall reasonableness of rate base.

Analyze the specifics of certain typical rate base accounts, such as prepayments and M&S, in sub-account detail, to ensure that all sub-accounts are proper for inclusion in the rate base. Items such as temporary investments, which earn their own return or non-utility items should be excluded from the rate base.

Ensure that the Company's accounting for prepayment items are proper. Investigate the interrelationship of prepaid balances with the determination of cash working capital under the lead/lag study approach to verify that no double counting is included in the rate base.

Ensure that the inclusion of deferred debits is appropriate and review deferred credits to determine if any accounts or individual sub-accounts are proper as offsets to the rate base.

Review the deferred income tax offset to the rate base in conjunction with detailed revisions of Account 190. Account 190 (accumulated deferred income tax debit) represents an increase to rate base. Therefore, it is important to ensure that each sub-account is proper for inclusion.

It appears from MDU public financial statements that the company is deferring natural gas commodity, transportation and storage costs which are greater or less than amounts presently recovered through existing rate schedules. Consequently, MDU may have an under-recovered or over-recovered balance of deferred gas costs, which may impact the derivation of rate base. If deferred gas costs are proposed to be included in rate base by MDU, we will evaluate the balance for appropriateness, including an assessment of how financing charges related to the deferred gas cost balance are recovered in rates, and whether the balance during the test year may have been impacted by abnormal weather or includes costs which are not appropriate for ratemaking purposes. To the extent that MDU has over-recovered gas costs, the resulting balances appear to be recorded in other accrued liabilities. If over-recovered balances are

consistently occurring on MDU's books, this may represent a source of capital to the company that may need to be considered as a rate base deduction.

Operating Income and Expense (Issue 3)

In general, we will review operating income and expenses, including normalizing and out-of-period pro forma adjustments. The RFP identifies weather normalized sales as being a crucial element to the determination of adjusted net operating income. We will focus a significant amount of attention on evaluating MDU's weather normalized sales for the test year, as well as reviewing in detail MDU's proposed operating and maintenance expenses.

Our review of the operating income statement will include the following areas:

Revenues and Sales in the Test Year

Ensure that current revenues reflect the revenues, which should be generated based on the rates currently in effect. This will be done by verifying billing determinants to historical experience.

Analyze the Company's filing to determine if test year sales and revenues are representative of normal going-forward conditions, and propose any necessary adjustments. Particular attention will be paid to MDU's estimates of weather normalized sales. We have extensive experience using NOAA degree-day data and historical gas sales to estimate weather normalized sales for gas distribution utilities. Our review of MDU's test year sales will begin with a review of the Company's calculations, including detail of the Company's weather normalized sales. We will also review Commission precedent concerning the period used to determine "normal weather." Traditionally, in the utility industry, a 30-year period has been used to determine normal weather. However, in some jurisdictions, other periods have been used.

The historical accuracy of MDU's past forecasts will be examined, and an adjustment may be proposed if a pattern of sales under projection is established.

Operating revenues will be analyzed to ensure that the proper levels of revenue are reflected in these accounts. Adjustments to annualize sales for year-end customer levels and usage will be appropriately coordinated with weather normalization adjustments after review.

We will closely examine the impact of any large industrial or commercial customers closing operations or adding new operations in the Company's service territory.

The sales mix will be analyzed to ensure that unusual or non-recurring conditions have not temporarily caused shifts in usage between rate classes, such as residential and commercial. Any unusual shift in usage patterns can affect revenue calculations and cost allocation studies.

The components of "other revenues" will be reviewed to ensure that an appropriate level of each type has been reflected in the test year.

Determine whether appropriate projections are made for occasional gas sales revenue, and other types of miscellaneous revenue, which utilities frequently claim are difficult to accurately forecast.

Uncollectible accounts will be analyzed to ensure that the adjusted test year balance is representative of normal conditions. We will review the correlation of uncollectibles to revenues. Test year uncollectibles will be compared to historical results. Additionally, we will:

1. Examine the historical results experienced by the Company in the past in order to determine whether the proposed uncollectibles rate is reasonable, and whether it will likely reflect future occurrences.

2. Examine the method the Company used to calculate uncollectibles for reasonableness and compliance with Commission policy.

3. Verify the accuracy of all source amounts, including items such as gross write offs as well as residential and commercial revenues. The mathematical accuracy will also be checked to ensure that the amounts are correct.

4. Determine an appropriate provision for uncollectibles in conjunction with the calculation of the gross revenue conversion factor.

5. Evaluate the level of uncollectibles by computing uncollectibles-to-sales ratios, comparing to historical experience, and investigating Company collection policies and efforts.

We will review test year late payment charge revenues. This review will be coordinated with an analysis of uncollectibles.

Further review of weather on MDU's gas sales may be conducted, if deemed necessary. Such review may include the following type of analysis:

1. Evaluate weather information gathered from weather monitoring stations (airports and other weather stations) and information available from government resources.

2. Determine which weather station's data should be considered representative of the Company's service territory.

3. Compare data to historical averages (which represent "normal") to determine if the test year weather falls outside the range of what is considered normal.

4. Test year weather that falls significantly outside the normal range requires that test year revenues be adjusted as if the weather had been classified as "normal".

Review and analyze the Company's treatment of revenues received off system sales and net nonjurisdictional revenues. We will coordinate this review with our evaluation of the assignment/allocation of the related costs.

Operation and Maintenance Expenses

Maintenance expense will be examined to ensure that the test year does not include unusual or non-recurring maintenance, which should be amortized over a longer period for rate case purposes.

Gas costs and transmission costs. Gas cost is the largest single component of MDU's revenues, comprising about 80% of MDU's total revenues in 2001, according to the RFP. For most gas distribution utilities, gas costs are recovered through a separate rate. We will coordinate the pro forma amounts of gas costs with any revenue adjustments, including year-end annualizations and weather normalizations. To the extent deemed appropriate for this proceeding, we will also review the components of MDU's gas costs and related transportation. We have extensive experience reviewing utility gas purchasing activities and fuel procurement management. We will discuss with Staff the extent to which MDU's gas purchasing, transportation and storage costs should be reviewed in conjunction with this proceeding. Depending upon Staff's guidance in this area, discovery may be utilized to obtain an understanding of MDU's gas purchasing practices, including arranging for pipeline transportation, and incurrence of related costs. In other jurisdictions, we have also seen interest expressed concerning methods by which utilities can limit their exposure to upside gas price volatility as part of their gas procurement. We note from a review of MDU's financial statements that the Company has used natural gas and oil price swap agreements to manage a portion of its market risk associated with fluctuations in the price of natural gas and oil. MDU appears to have an overall energy price (and interest rate) risk management program. It is unclear from information reviewed to date to what extent the Company's energy risk management has affected its regulated utility operations, or whether the cost of such hedges is being charged or allocated to MDU's North Dakota gas utility operation. We will discuss such issues with Staff to see if there is an interest in pursuing such analysis with respect to MDU in this or other regulatory proceedings. For purposes of determining the cost of service in the MDU rate case, the analysis of gas cost is anticipated to be limited, unless we are otherwise instructed by Staff.

The review of non-gas cost operating and maintenance expenses is anticipated to comprise a significant portion of the cost of service review for issue 3.

Review labor and fringe benefit costs for reasonableness. We will review any adjustments for increased labor costs based on projected wage increases. Wage levels of current employees will be evaluated to determine if any increases are reasonable. We will also review wage and benefit analyses conducted by or prepared for the Company. We will compare management wage increases with those granted union employees as the result of arms-length bargaining.

Compare budgeted with actual wages and staffing levels for a representative historical period. Evaluate whether the Company budgets for unfilled employee positions, or if they otherwise tend to over-project budgeted wages. We will consider an adjustment for average vacancies.

Review relocation expense. Review any austerity measures, such as a temporary hiring freeze, leaving unfilled job vacancies produced by attrition, and offering voluntary early retirement. Investigate the impact upon test year employee costs of these programs. Evaluate

the amortization of any large one-time costs, such as those relating to an early retirement program.

Examine the Company's accounting for pension benefits. Ensure that book pension expense is computed in accordance with FASB 87 guidelines. Determine the basis for the utility's ratemaking claim for pension expense. Consider adjustments to pension expense, in light of prior Commission decisions on this issue.

If the Company has supplemental retirement plans for officers and directors, or an Employees' Investment Plan (i.e. 401k), ensure that the costs of these plans reflected in the test year reflects a normal, reasonable level of costs.

Evaluate the Company's proposal in regard to post retirement benefits other than pensions (PBOP). The prior decisions of the Commission provide guidance for how utilities are to account for the benefits other than pensions (PBOP's) using the accrual method prescribed by SFAS 106. Moreover, the SFAS 106 accruals remain subject to Commission review of prudence and reasonableness in rate cases. In performing an investigation of PBOP accounting, we may investigate some or all of the following:

1. Identify the Company's PBOP liability under SFAS 106. Review and evaluate any actuarial studies the Company or its actuary has conducted to estimate annual PBOP costs, including interest cost, service cost, and amortization of the transitional PBOP cost existing at the date the Company adopted FASB 106 for book accounting purposes.

2. Evaluate whether or not the Company's request in the current proceeding is in compliance with the Commission's prior decision.

3. Determine whether the Company has fully funded its plan under the most tax advantageous methods.

4. Review all steps being taken or planned by the Company to reduce its prospective employee benefit costs and PBOP liability.

5. Obtain the most recent actuarial estimates for the FASB 106 accrual. In past cases, we have noted that utilities' initial estimates of FASB 106 accruals have been high, and more current estimates reflect reduced accrual amounts.

6. Investigate whether the utility has capitalized a portion of its FASB 106 accrual cost. In past cases, we have noted instances where utilities have failed to capitalize portions of their FASB 106 accruals and have inappropriately attempted to over-charge O&M expense as a consequence of such failure.

Review the Company's accounting for legal expense to ensure that unusual or inappropriate costs are not charged to retail ratepayers. The test year should reflect a normal level of legal expense. Remove any penalties or unusual settlements from test year expenses, which should reflect normal operations. Consider deferral of large legal expenditures for litigation in

progress concerning questionable areas, e.g., lawsuits against officers and directors for alleged imprudence.

Review the impact of FASB 112 on expenses. The FASB 112 accrual is in the nature of a one-time establishment of a liability balance, with subsequent annual "incremental" adjustments. In this regard, it is similar to the compensated absence accrual established pursuant to FASB 43. It is the converse of unbilled revenue accounting, whereby many utilities credited Revenue and debited Unbilled Revenue Receivable (similar to an Account Receivable, but before the bill is issued) in adopting this aspect of accrual accounting. In each subsequent year, adjustments are made to the accounts for incremental changes in the balance of Unbilled Revenue. The Commission's prior handling of the unbilled revenue and the compensated absence accrual issues could therefore provide insight into potential arguments that could be presented concerning the FASB 112 issue. We will examine any FASB 112 accrual amounts proposed by the utility, and we will recommend appropriate ratemaking adjustments.

Review incentive compensation arrangements and special bonuses to employees and officers. Ensure that only reasonable amounts are included in the test year.

Review special "perks" available to top management, including "golden parachute" arrangements, use of Company assets for personal functions, bonus plans, supplemental pensions, incentive stock options, etc.

Review dues for membership in industry associations. Remove the lobbying and institutional advertising portion of such dues. Obtain data concerning benefits of association programs to the Company. Review other membership dues for appropriateness as test year expenses.

Analyze test year advertising and marketing expenses. Determine which programs and activities benefit ratepayers and provide a recommendation based on this determination for recovery of advertising and marketing expenses.

1. Review copies of advertisements run and bill inserts sent during the test year. Review Company categorization of advertisements.

2. Review test year advertising to ensure that no advertising disallowed in the last docket has been included in the current docket.

3. Review customer surveys the Company may have.

4. Review Commission orders in recent utility cases to ascertain treatment (allowance or disallowance) of promotional activities. Use such orders as guidance for treatment of marketing programs.

Analyze operating and maintenance accounts by primary and sub-accounts to determine whether any significant increases or decreases in these accounts have occurred. Investigate and document the reasons for any significant changes in operating and maintenance expenses.

Recommend adjustments for inappropriate increases and for unexplained, or unjustified cost increases.

Taxes Other than Income Taxes

Analyze other taxes by type to determine that the tax expense is related only to the test period under consideration.

Verify tax rates to current state statutes and tax assessments. Evaluate trends in property taxes and tax assessed valuation over a representative historical period. Use the most recent actual tax rates for all property.

Ensure that plant balances used in the calculation of property tax expense are appropriately synchronized with the plant balances reflected in rate base.
Investigate property tax refunds and ensure that they are properly treated for ratemaking purposes.

Analyze the rate used by the Company to determine whether the use of that rate is appropriate for state and municipal taxes.

Examine the tax rates for the major components of state and municipal taxes to ensure that there has been no decrease in state and municipal taxes, which should be reflected in the period being examined.

Below-the-Line Revenues and Expenses

Briefly analyze revenues and expenses in so-called "below-the-line" accounts. Examine these accounts with the intention of determining that these revenues and expenses are properly excluded from the cost of service.

Verify the embedded costs of debt and preferred stock to the financial statements and other supporting documents.

Determine whether the Company has sold any property during the test year or before, and realized a gain on such sales. Determine whether sold property was previously included in rate base to earn a return, or in depreciation expense or property taxes, i.e., included in rates. Consider whether any gain on the sale of such property should accrue to the benefit of the ratepayers.

Gain/Loss on Repurchase of Outstanding Debt

Some regulatory commissions have determined that it is appropriate to flow through the benefits of gains on repurchased debt to ratepayers. We will examine this issue to determine whether such treatment would be appropriate under the North Dakota regulatory framework.

If it is determined that any gains on reacquired debt should be amortized over a period of two or more years, then a determination must me made as to the proper ratemaking treatment of the amortized (credit) balance. The ratemaking treatment of such an amortized balance is the converse of the ratemaking treatment for unamortized debit balances, such as plant cancellation losses or deferred expenses.

Income Taxes
Review all tax computations in the rate filing.

Determine that interest expense used in the tax computation is properly synchronized with the interest computation in cost of capital.

Determine that deferred investment tax credits are being properly amortized. Review tests of ITC amortization performed by the Company and/or its independent auditor to ensure compliance with IRC 46(f). Coordinate ITC amortization with depreciation rates adopted in this case.

Review the Company's federal tax returns for prior two years with particular emphasis on Schedule M adjustments.

Review the Company's deferred income taxes, focusing on any Company proposed normalization treatment which deviates from established Commission policy and procedures.

Address the issue of amortization of non-protected excess deferred income taxes.

Investigate the impact of the alternative minimum tax (AMT) on the Company's income tax expense for ratemaking purposes. AMT is allowed to be carried forward indefinitely as a credit against federal income taxes payable in the future (other than AMT). Ensure that savings from participation in a consolidated federal income tax return are appropriately recognized in the ratemaking process.

Depreciation and Amortization Expense
For purposes of task 3, the cost of service review, we will analyze the Company's calculation of test year depreciation expenses to ensure that it reflects the use of Commission authorized depreciation and is properly coordinated with the other aspects of the revenue requirement determination, including the balance for Accumulated Depreciation being reflected in rate base.

Ensure that the depreciable assets used in calculating the depreciation expense agree with the books and records of the Company.

Ensure proper "matching" between depreciation expense reflected in adjusted net operating income and net plant amounts reflected in the rate base, paying particular attention to new additions to rate base.

Review each item being amortized as test year expense. Remove amortizations, which will be completed prior to rates set in this proceeding going into effect.

A more extensive review of MDU's depreciation rates, and possible changes to such rates since MDU's last depreciation study is not included in our proposed work for task 3, but is included in our proposed work for task 5. Details on our proposed approach to the

depreciation rates review (task 5) are presented in a subsequent section of this proposal, on page 20.

Rate Case Expenses
Review and analyze rate case expenses to be allowed for ratemaking purposes in this proceeding. Address the appropriate level of expenses as well as the appropriate amortization period, and treatment of the unamortized balance.

Administrative and General Expenses
Ascertain the reasonableness of the Company's test year claims for administrative and general expenses:

1. Examine the individual items by account and sub-account detail, to determine whether such amounts properly relate to the provision of gas service to ratepayers.

2. Examine all membership association dues and the related expenses to ascertain the benefit to ratepayers.

3. Examine all adjustments made by the Company to the test year expenses for reasonableness. Where we find that such adjustments seem unreasonable and do not reflect actual past experience, we will provide alternative amounts to be included as expenses.

4. Examine all costs associated with Company sponsored programs in order to determine whether such amounts are reasonable, and whether the benefits to ratepayers are commensurate with the cost of those programs.

Cost of Capital (Issue area 2)
The RFP indicates that MDU is proposing a return on equity of 13.25% using DCF analyses. This strikes us as being quite high. We also understand from the RFP that in the instant proceeding Staff does not anticipate presenting arguments for a lower cost of debt using an accounting approach rather than a yield-to-maturity approach. Dr. Legler's analysis will address the capital structure and cost of equity. It appears in this proceeding, as indicated in the RFP, that the most critical element of cost of capital will be the return on equity component.

Capital Structure
Dr. Legler will propose an equity ratio consistent with the riskiness of companies engaged in similar activities. Our experience has been that Commissions generally prefer to adopt actual capital structure ratios when actual capital structures are available. Dr. Legler will evaluate the Company's proposed capital structure to determine if it is reasonable and comparable to similarly situated companies. If not, Dr. Legler will make alternate recommendations regarding the appropriate capital structure.

Cost Rate for Debt Securities
Appropriate cost rates for senior securities, including debt and preferred stock, will be recommended. Typically, cost rates for debt securities are generally less controversial than

the cost of equity. However, it is possible that they could be an issue in this proceeding. A limited review will be conducted of the cost rates for debt and other securities in the capital structure. Such review is not anticipated to include presentation of an alternative accounting approach to determining the cost of debt.

Cost Rate for Common Equity

Dr. Legler will present an independent analysis of the cost rate for common equity, using the Discounted Cash Flow method.

The Discounted Cash Flow or DCF Method

The DCF method is based on the notion that the cost of equity is the rate which sets the discounted value of the future stream of cash flows (dividends and ultimately the selling price) equal to the current price of a company's common equity. In its basic form (assuming the stock is held forever), this translates into the sum of the expected dividend yield in the coming time period plus the assumed growth rate in dividends. Although Dr. Legler prefers the annual single growth rate version of this model, he recognizes that at the current time with low interest rates, this model produces quite low estimates of the cost of equity. Other witnesses attempt to pump up the estimated cost of capital by applying a quarterly version of the model with multiple growth rates. Dr. Legler is prepared to defend his approach, and provide critical comments regarding the assumptions frequently made by other witnesses. Dr. Legler would apply this model to the applicant company and groups of comparable risk gas companies. It should be noted that while the staff at Larkin & Associates is aware that the DCF method is MDU's preferred method of determining return on equity, the following alternative methods are presented in this proposal as well, to demonstrate Dr. Legler's expertise on the subject.

We do not anticipate much analysis of the cost of equity in this proceeding using methods other than the DCF method. However, if equity cost estimates are presented by MDU using other estimation methods, Dr. Legler is fully capable and has extensive experience addressing issues related to the use of other methods, including risk premium and CAPM. Dr. Legler's typical approach for these other methods is briefly summarized below.

Risk Premium Method

It is Dr. Legler's position that the risk premium varies considerably over time, and during periods of volatility, it may provide an unreliable estimate of the cost of equity. For consistency, Dr. Legler generally makes estimates of the cost of equity using the risk premium method and discusses why they should not be used as the primary estimate of the cost of equity, but rather be supportive of other estimates. Dr. Legler's risk premium methodology is based on estimates of expected rather than historical or realized risk premiums often used by other witnesses. Expected returns on equity are estimated using a DCF approach and a CAPM approach over a fairly long period of time. Yields on debt of comparable risk to the company being analyzed or risk-free Treasury bonds are subtracted from these equity estimates to arrive at risk premiums. Average risk premiums are then added to current yields on debt to arrive at estimates of the current cost of equity.

The Capital Asset Pricing Model (CAPM)
There is considerable controversy as to whether or not the CAPM is appropriate for estimating the cost of equity for regulated utilities. At the current time, the CAPM is likely to produce the highest estimates of the cost of equity. It is Dr. Legler's opinion that the rather high estimates produced by this model are largely the result of misapplications of the model. While Dr. Legler's own preference is not to use this method, it has gained regulatory support in recent years, and is often used by witnesses. Dr. Legler can provide estimates of the cost of equity using this method, if desired, correcting for deficiencies in the applications of other witnesses.

In applying the CAPM, the only variable that has an effect on the cost of equity of one company compared to another, is beta. Beta is a measure of a stock's volatility compared to the volatility of the overall market. A company which has less volatility than the market is considered to be less risky than the market and would have a lower cost of equity than the market. Dr. Legler's testimony documents the inconsistency of risk and return produced by this method.

The betas most frequently used by witnesses using this method are published by Value Line. Value Line betas are adjusted betas based on weak statistical properties and tend to raise the estimated cost of equity. These problems are pointed out in Dr. Legler's testimony.

Other issues, such as flotation cost adjustments or market pressure adjustments may also be raised by utility witnesses in their determination of the proposed cost of common equity. Dr. Legler has extensive experience and expertise in addressing such issues, as briefly summarized below.

Market Pressure and Flotation Cost Adjustments
Company witnesses often argue that the "bare bones" cost of equity estimates should be adjusted upward for market pressure and flotation costs associated with the issuance of additional common equity. Dr. Legler's basic position is that these costs only should be considered if the company under review has announced intentions of offering additional common stock through a public offering. It is also his opinion that the adjustment should be limited to externally raised equity capital, not the entire equity component.

Rate Design (Issue 4)
Scott Rubin will be the lead consultant and expert witness on rate design issues. The RFP indicates that MDU is proposing an increase to the residential monthly basic service charge from $6.50 to $11.70. In the event that the Commission does not accept this, MDU is proposing a weather normalization adjustment.

We will fully review MDU's cost of service study, proof of revenues, and proposed rate design to ensure that they are consistent with the Commission's policies and with established ratemaking principles. Initially, we will focus on the company's proposal to nearly double its customer charge or, alternatively, to propose an automatic adjustment mechanism to reflect weather normalization.

We are aware that other utility commissions have rejected weather normalization clauses and we agree that there are numerous policy reasons for objecting to such a clause. For example, weather normalization clauses tend to violate test-year matching principles by reflecting the impacts of one change without also reflecting corresponding (and potentially off-setting) changes in other areas of the utility's operations. In addition, a weather normalization clause sends a terrible message to the utility's customers: "because the weather was mild, your rates must go up." Customers understand, and rightly so, that mild weather should lead to lower utility costs, not higher ones. Finally, a weather normalization clause can also place undue reliance on statistical models that attempt to correlate gas consumption with particular weather characteristics. While such models might be useful for understanding trends in consumer behavior over an historical time period, they might not be as accurate or useful in predicting precise consumption levels in any particular year (which, of course, is what would be required to use such a model in an automatic rate adjustment mechanism).

In addition to the company's proposed weather normalization adjustment, we also will carefully evaluate its proposed dramatic increase in the customer charge. By making these proposals alternative, it appears clear that the company is not attempting to cost-justify an increase in the customer charge; rather it appears that it is simply attempting to reduce its level of risk from changes in sales levels. We will carefully evaluate whether there is a cost justification for changing the customer charge.

We also will carefully review and evaluate other aspects of MDU's proposed tariff changes and rate design, including the cost of service bases for its changes and proposals.

Our testimony and exhibits will include a revised rate design under the Company's proposed revenue requirement (to facilitate comparison with the Company's proposed rate design), and a recommended rate design under our proposed revenue requirement. It also will include a discussion of the methodology that should be followed to design rates to reflect any other changes in the revenue requirement.

Depreciation Rates (Issue 5)

The RFP indicates that MDU's last depreciation study was conducted in the early 1990s, and the Commission may be interested in having a depreciation study completed for this proceeding. Larkin & Associates proposes to address this issue in the following manner for purposes of this proceeding.

We will review MDU's last depreciation study.

We will review changes in the asset balances that have occurred since the data source period utilized in MDU's last depreciation study.

We will request and review retirement data and cost of removal/salvage data for selected plant accounts.

We will review any depreciation rate changes proposed by MDU in the instant proceeding.

We will review details of MDU's Accumulated Depreciation balance, and changes to the balance, by plant account detail (if available) since MDU's last depreciation study.

We will review information in Staff's files and in our files concerning depreciation rates used by other gas distribution utilities.

We will review the impact of changed standards and technology on MDU asset types.

We will review the impact of any pipe replacement programs that have been implemented by MDU since its last depreciation study.

Our work on depreciation rates analysis will be focused on evaluating accounts with the largest impact on depreciation expense and rates, and on accounts where significant changes have occurred since the preparation of MDU's last depreciation study. Our review of MDU's depreciation rates is anticipated to be adequate for making adjustments in the context of the current rate case. However, we are not proposing to conduct a fully detailed depreciation study for MDU from scratch.

Based on the above review, we will formulate recommendations concerning particular plant accounts where a change in MDU's existing depreciation rates appears to be necessary. To the extent any such adjustments are found to be necessary, we will calculate the estimated impacts on MDU's revenue requirements in this case. This will be done as a pro forma adjustment.

III. MANAGEMENT SUMMARY

The management structure of our proposed project team ensures that our work effort produces a work product of the highest quality, in a timely manner and within budget. A project director and project manager will both be utilized to ensure that the objectives of the project are met in an effective manner.

Hugh Larkin, Jr., CPA, founder and senior partner of Larkin & Associates, will serve as project director. As head of the project team, Mr. Larkin will be available to provide expert testimony, if necessary; however, it is anticipated that Mr. Larkin will not be one of the expert witnesses for this proceeding. Mr. Larkin's regulatory experience includes rate cases, management audits, litigation assistance, and training seminars. As project director, Mr. Larkin will assume ultimate responsibility for the completion of the project and the quality of the resulting work product. Ultimate approval of scheduling and each work phase will be done under his supervision. Communications between Mr. Larkin and the professional staff assigned to the project will be maintained on a daily basis.

Helmuth W. Schultz, CPA, is a senior regulatory analyst and the firm's audit and tax partner. Mr. Schultz is particularly well versed in the regulatory arena and has presented testimony on several occasions, including before the North Dakota Commission. Mr. Schultz will perform analytical work on this project on issues 1, 3 and 5 (rate base, net operating income and depreciation). Depending on the timing of the case and availability, Mr. Schultz may testify as the expert witness on behalf of Larkin & Associates concerning such issues.

Ralph C. Smith, CPA, is senior regulatory analyst. Mr. Smith has provided testimony in numerous rate cases and other regulatory matters, including testimony before the North Dakota Commission. He will perform analytical work on this project. Depending on the timing of the case and availability, Mr. Smith may testify as the expert witness on behalf of Larkin & Associates concerning such accounting issues.

Either Mr. Schultz or Mr. Smith will function as project manager for the overall work effort on this project. As such, one of these senior professionals will work closely with Staff members, coordinate the daily work efforts of the Larkin & Associates professional staff and subcontractors, monitor the progress of the project, and ensure that all deadlines are met.

Donna M. DeRonne, CPA, will perform analytical work on the project. Ms. DeRonne has extensive experience with gas utilities. She will perform a substantial amount of the detailed analysis, and will personally supervise and direct the work of the other Larkin & Associates' rate analysts assigned to the project. Ms. DeRonne will also have primary responsibility for developing the spreadsheet models to state all adjustments and to provide reconciliation of revenue requirements, as adjustments are modified by various parties during the proceedings. If desired by Staff, Ms. DeRonne would also be available to testify as an expert witness.

Dr. John B. Legler, PhD., will perform the analysis of cost of capital and fair rate of return on equity issues. In recent years, in cases in which Dr. Legler has presented testimony, rarely has a commission adopted a return on common equity lower than that recommended by Dr.

Legler. In fact, several commissions have adopted his recommendations, even when his testimony was on behalf of an intervenor. Dr. Legler has previously presented prefiled testimony concerning cost of capital and return on equity before the North Dakota Commission in a prior MDU proceeding.

Scott J. Rubin will address issue 4 (rate design) and will function as the expert witness for rate design issues. Mr. Rubin is an independent attorney and consultant, working exclusively on issues affecting the public utility industry. From 1983 until January 1994, he was an attorney and policy expert with the Pennsylvania Office of Consumer Advocate. From 1990 until he left the OCA, Mr. Rubin chaired the Water Committee of the National Association of State Utility Consumer Advocates. Since establishing his own practice in 1994, Mr. Rubin has served as a consultant, expert witness, or attorney in more than a dozen states, and before FERC and the FCC, in matters involving electric, gas, water, and telecommunications utilities. He also has testified before the U.S. House of Representatives Science Committee and a legislative committee in Pennsylvania. Mr. Rubin has given speeches throughout the country, published technical papers, and contributed to books on issues affecting the utility industry. He is a member of the faculty of the Annual Regulatory Studies Program at Michigan State University and he has served as a member of AWWA's Rates and Charges Subcommittee. Mr. Rubin earned his Bachelor's degree with distinction from Pennsylvania State University and his law degree with honors from the National Law Center at George Washington University. Mr. Rubin has testified as an expert witness on rate design and cost of service issues in more than a dozen rate cases in Arizona, Kentucky, and Pennsylvania. He also has provided assistance and technical support to another rate design consultant on several projects involving municipally owned utilities throughout the United States. Mr. Rubin's most recent appearance as a rate design and cost of service expert witness involved Kentucky-American Water Company, a water utility serving more than 250,000 people in the greater Lexington, Kentucky area. His recent work for the Ohio Consumers' Counsel in a Cincinnati Gas & Electric Co. rate case involved a combination of public policy and rate design work, focused on the utility's proposal to implement an automatic adjustment clause for main replacement expenditures. His work in that case also included advising the client on various rate design options, including considerations that should be used in designing the customer charge.

Robin Vial Bonini, Tina Miller, and Mark Dady are staff accountants and regulatory analysts with Larkin & Associates. Each has prepared calculations, performed analyses, and prepared schedules and exhibits on several Larkin & Associates' engagements. They will be involved in the project by performing analytical work, preparing schedules and exhibits, editing written testimony, and verifying data.

Appendix I, Background and Qualifications – Resumes of Key Project Personnel, presents the professional resumes, with references, of the Larkin & Associates professional staff identified above. Dr. Legler's resume is provided in Appendix III and Mr. Rubin's qualifications are presented in detail in Appendix IV.

Throughout this project, a high degree of communication will be maintained among all members of the project team, as well as PSC Staff. Communications will be facilitated by regular staff meetings, telephone conference calls, and written status reports.

IV. PRIOR EXPERIENCE

Larkin & Associates proposed project team is highly qualified to perform this engagement for the North Dakota Public Service Commission. Members of the Larkin & Associates project team have extensive experience providing consulting expertise in public utility regulation to regulatory agencies. Professional personnel proposed for this project have worked as consultants on numerous regulatory projects for regulatory commission staffs and intervenors.

Senior professionals at Larkin & Associates, including Mr. Schultz and Mr. Smith have presented expert written and oral testimony on behalf of the Staff on a number of occasions. Their resumes and the qualifications of other Larkin & Associates professionals available to work on this project are presented in Appendix I.

Appendix II, Gas Case Summaries, presents a listing of natural gas regulatory engagements which qualify Larkin & Associates to undertake the work discussed herein. References are provided for each engagement, and key project team members are identified.

Dr. Legler has previously filed testimony on behalf of Staff in other proceedings before the North Dakota Commission, and in numerous other regulatory proceedings before many other state commissions. Appendix III summarizes his qualifications and experience in performing such work.

Scott Rubin has prior experience with expert rate design testimony, including customer charges for water and energy utilities. He is also familiar with utility-proposed weather normalization adjustments. His qualifications are summarized in Appendix IV.

V. COST AND PRICE

In order to best match the project effort to the Commission Staff's needs and budget, we are proposing a number of price/issue coverage combinations, as detailed below:

Larkin & Associates, Issue 1 Only (Rate Base) Separately
If selected only to perform work related to issue 1, rate base, Larkin & Associates proposes a total not-to-exceed price of $16,500. This includes estimated professional fees of $15,500 and $1,000 for expenses. This does not include cost for an on-site review at MDU's offices, which if desired by Staff, we have separately priced, as described below.

Larkin & Associates, Issue 3 Only (Net Operating Income) Separately
If selected only to perform work related to issue 3, net operating income, Larkin & Associates proposes a total not-to-exceed price of $23,500. This includes estimated professional fees of $21,300 and $1,200 for expenses. This does not include cost for an on-site review at MDU's offices, which if desired by Staff, we have separately priced, as described below.

Larkin & Associates, Issues 1 and 3, Combined (Rate Base and Net Operating Income)
We believe there would be substantial synergies in having the same consultant and witness address both rate base and net operating income issues (i.e., addressing issues in areas 1 and 3). Accordingly, if selected to perform work on issues 1 and 3 (rate base and net operating income), Larkin & Associates proposes a total not-to-exceed price of $29,500. This includes estimated professional fees of $28,000 and $1,500 for expenses. This does not include cost for an on-site review at MDU's offices, which if desired by Staff, we have separately priced, as described below.

Larkin & Associates, Issue 5 (Depreciation) Separately
If selected only to perform work related to issue 5, review of depreciation rates, Larkin & Associates proposes a total not-to-exceed price of $16,500. This includes estimated professional fees of $15,500 and $1,000 for expenses. This does not include cost for an on-site review at MDU's offices, which if desired by Staff, we have separately priced, as described below.

Larkin & Associates, Issues 1, 3 and 5 Combined (Rate Base, Net Operating Income, Depreciation)
We believe there would be additional substantial synergies in having the same consultant and witness who is addressing both rate base and net operating income issues (i.e., addressing issues in areas 1 and 3) also address and present testimony on MDU depreciation rates (issue 5). Accordingly, if selected to perform the work described in our proposal for combined issues 1, 3 and 5 (rate base, net operating income, and depreciation), Larkin & Associates proposes a total not-to-exceed price of $35,000. This includes estimated professional fees of $33,000 and $2,000 for expenses. This does not include cost for an on-site review at MDU's offices, which if desired by Staff, we have separately priced, as described below.

Dr. John B. Legler, Issue 2 (Cost of Capital)
The separate issue price for the cost of capital section of this project is $8,500. This price includes $500 for travel and expenses, and is a firm, not-to-exceed price.

Scott J. Rubin, Issue 4 (Rate Design)
The separate issue price for the rate design section of this project is $9,000. This price includes $1,000 for travel and expenses, and is a firm, not-to-exceed price.

Total Project Price, All Five Issue Areas Combined
Because the members of our project team have worked together on other regulatory projects, and from past experience there may be a reasonable expectation that some issues being addressed by the project team would be settled prior to hearings, we believe there are additional opportunities for cost savings by having our proposed project team perform the work for Staff on all issue areas. If selected to perform all such work described in our proposal, our project team proposes to perform such work for a combined total not-to-exceed price of $49,500. This includes professional fees and expenses, but does not include cost for an on-site review at MDU's offices.

Estimated Additional Cost for On-Site Review at MDU Offices
In the event that an on-site review at MDU's offices is deemed necessary or desirable by Staff, our total bid would increase by $3,500. This additional amount includes professional fees plus travel expenses related to such on-site review.

VI. CONFLICT OF INTEREST DISCLAIMER

The undersigned does hereby certify there is no financial substantive interest in the utilities which are or may be parties in this proceeding. It is also certified than no business officer, partner, employee, agent, or any immediate family member has a substantive financial interest in the utilities, which are or may be parties in this proceeding. It is further certified that, should such a financial interest occur during the period of active involvement in the proceedings, the Commission will be immediately notified and shall have the right to terminate the contract.

Hugh Larkin Jr — May 29, 2002

Hugh Larkin, Jr. — Date

**This conflict of interest disclaimer is applicable to Larkin & Associates, John B. Legler, and Scott J. Rubin.

VII. COMPLIANCE WITH APPLICABLE LAWS & REGULATIONS

Larkin & Associates, along with John B. Legler and Scott J. Rubin, agree to comply with all applicable Equal Employment Opportunity laws and regulations, as well as the applicable provisions of the American Disabilities Act of 1991.

VIII. AUTHORIZED NEGOTIATORS

Hugh Larkin, Jr. and Ralph C. Smith are authorized to negotiate any contract on behalf of Larkin & Associate and the subcontractors for our proposal to perform the work on this project.

Hugh Larkin, Jr., CPA,
Senior Partner
Ralph C. Smith, CPA,
Senior Regulatory Consultant
Larkin & Associates PLLC
15728 Farmington Road
Livonia, MI 48154
(734) 522-3420

With Dr. Legler's and Mr. Rubin's concurrence, Larkin & Associates agrees to negotiate on behalf of the entire project team in order to simplify such negotiations from the PSC's perspective.

APPENDIX I

BACKGROUND & QUALIFICATIONS - RESUMES OF KEY PROJECT PERSONNEL

The personnel Larkin & Associates proposes for this project are ideally suited to the project's requirements. The project team includes professionals with educational backgrounds in accounting, finance, economics, business management, taxation, law and computers as well as expertise in addressing regulatory issues for electric, gas, telecommunications, water and sewer utilities.

Members of this team have extensive experience providing consulting to regulatory agencies concerning a wide range of issues affecting public utilities. The professionals proposed for this project have worked as consultants on numerous projects for regulatory commission staffs and intervenors, and have provided litigation assistance on behalf of law firms representing utilities and others. Our team includes expert consultants and CPAs who are thoroughly familiar with the issues in utility regulatory consulting engagements.

Concise resumes emphasizing gas utility experience for the professionals proposed for this project follow:

Page

HUGH LARKIN, JR. 1
HELMUTH W. SCHULTZ, III 6
RALPH C. SMITH 10
DONNA M. DeRONNE 14
TINA THILL 20
ROBIN VIAL BONINI 23
MARK S. DADY 25

HUGH LARKIN, JR.

Mr. Larkin is a certified public accountant, founder and senior partner of Larkin & Associates. He is thoroughly versed in independent auditing, as well as the design and review of accounting systems and the presentation of data for management and financial reporting. Mr. Larkin is licensed in the states of Michigan and Florida.

For 29 years, Mr. Larkin has concentrated in the field of public utility regulation. He has served as project leader for numerous financial and compliance audits and regulatory consulting engagements, and has testified as an expert witness on issues dealing with public utility management and regulation in over 300 proceedings. His testimony has been sponsored by public utility/service commission staffs, state attorneys general, groups of municipalities, a district attorney, people's counsel, public counsel, and other such entities. Jurisdictions in which Mr. Larkin has presented expert testimony include: Alabama, Alaska, Arizona, California, Connecticut, Delaware, Florida, Georgia, Hawaii, Idaho, Illinois, Indiana, Kentucky, Kansas, Louisiana, Maine, Maryland, Michigan, Minnesota, Mississippi, Missouri, Nevada, New Jersey, New York, North Carolina, Ohio, Pennsylvania, South Carolina, South Dakota, Texas, Vermont, Utah, Washington, Wisconsin, West Virginia, FERC and Canada.

Relevant Regulatory Experience

Project Manager in the review of Connecticut Natural Gas Company's proposed performance based ratemaking plan. Our testimony addressed numerous deficiencies with the Company's proposed plan. Other issues addressed in testimony included: the Company's estimated merger synergies, treatment of goodwill/acquisition premium and marketing program costs in calculating the return on equity for regulatory purposes, and the appropriate treatment of the PGA under any earnings sharing plans and several other issues inherent in the Company's proposal. Mr. Larkin & Ms. DeRonne also proposed an alternative performance based ratemaking plan for consideration.

Key project team member in the review of Southern Connecticut Gas Company's proposed performance based ratemaking plan. Larkin & Associates' testimony pointed out numerous problems with the Company's proposed plan as well a discussion of the following issues: the Company's estimated merger synergies, treatment of goodwill/acquisition premium and marketing program costs in calculating the return on equity for regulatory purposes, and the appropriate treatment of the PGA under any earnings sharing plans and several other issues inherent in the Company's proposal. Mr. Larkin & Ms. DeRonne also proposed an alternative performance based ratemaking plan for consideration.

Key project team member in the review of Connecticut Natural Gas Corporation's rate case filing. Our review recommended a reduction in the Company's rates as opposed to the increase requested by the Company. Ultimately, the Company's rates were reduced. Issues addressed in testimony included: injuries and damages reserve, FAS 106 deficiency deferred debit, working capital, uncollectibles, hardship arrearage program, inflation, insurance, outside services, commission assessments, maintenance of plant, public relations expense, and property tax expense.

- Mr. Larkin was a key participant in the review of Black Mountain Gas Division of Northern States Power Company, Page Operation's rate increase request. Larkin & Associates was retained by the Residential Utility Consumer Office of Arizona to submit testimony regarding Black Mountain Gas Division of Northern States Power Company, Page Operation's request for rate increase. Testimony addressed the following issues: revenue annualizations, weather normalization, late payment revenues, employee benefits, corporate overhead allocation, insurance expense, directors' fees, advertising expense, property tax expense, rate case expense and income tax rates. This was the first rate case subsequent to the purchase of Black Mountain Gas by Northern States Power Company. Consequently, corporate allocations were of particular concern in this case.

  Project team member in the review of Connecticut Natural Gas Company's proposed performance based ratemaking plan. Our testimony addressed numerous deficiencies with the Company's proposed plan. Other issues addressed in testimony included: the Company's estimated merger synergies, treatment of goodwill/acquisition premium and marketing program costs in calculating the return on equity for regulatory purposes, and the appropriate treatment of the PGA under any earnings sharing plans and several other issues inherent in the Company's proposal. Mr. Larkin & Ms. DeRonne also proposed an alternative performance based ratemaking plan for consideration.

  Project Director in the review of the rate increase request of the Connecticut Natural Gas Corporation. Issues addressed in Mr. Larkin's testimony included: plant additions, accumulated depreciation, air conditioning rebate program, working capital - cost of gas, working capital - O&M, deferred credits, hardship arrearage forgiveness program, residential late payment charge revenues, sale of automatic meter reading assets, production and distribution, rent expense, payroll, employee benefits, matching gift program, personal use of Company automobile, directors' and officers' liability insurance, outside services, rate case expense, economic development expense, uncollectibles, lobbying expense, membership dues, miscellaneous expenses, general inflation adjustment, depreciation expense, property taxes, income tax expense, and interest synchronization.

  Project Director in the review of the application for an increase in rates and charges filed by the Mountain Fuel Supply Company. Testimony addressed the Company-proclaimed impact on its working gas inventory and labor requirements resulting from FERC Order 636. Another issue of paramount importance was unbilled revenue. Other issues included: cash working capital, accumulated deferred income taxes, "banked" vacation, equal payment plan, payroll expense, overtime expense, stock purchase plan expense, O&M expense percentage, payroll taxes, executive incentive retirement plan, supplemental executive retirement plan, postretirement benefits other than pensions, and consolidated income taxes.

  Project Director in the review of the request of the Indiana Gas Company to increase its rates. Issues addressed in Mr. Larkin's testimony included: weather normalized gas sales, appropriate ratemaking treatment of an acquisition adjustment, inter-company allocations, collection charge revenues and changes in customer levels.

Project Director in the review of the rate increase requested by Connecticut Natural Gas Corporation. Issues addressed in testimony by Larkin & Associates included: natural gas vehicles, software additions, working capital, accounts payable, materials and supplies, deferred credits, deferred conservation expense, economic development, sales, late payment revenue, payroll, executive compensation, incentive compensation, pensions, employee benefits, uncollectibles, hardship arrearage forgiveness program, hardship shortfalls, corporate insurance, D&O insurance, environmental liability insurance, injuries and damages, production and distribution expense, computer costs, legal expense, training costs, demonstration and selling, promotional advertising, market development, service contracts, dues, inflation and taxes.

Project Director in the review of Southern Union Gas Company's request for an increase in rates. Issues included: acquisition adjustment amortization, investment tax credit amortization, liability insurance expense, and acquisition investigation costs.

Project Director in the audit and review of United Cities Gas Company's rate increase request. Policy issues addressed in Mr. Larkin's testimony included: ratemaking treatment of acquisition adjustment, non-compete agreement, pipeline safety deferrals, gas costs, employee benefits and distribution expense.

Project team member in the review of a rate increase request by Hope Gas, Inc. The case was settled prior to hearings. Issues specifically addressed by Larkin & Associates included: post-test year plant additions, consolidated tax savings, revenues, labor costs, FAS 106, benefits, Employee Appliance Purchase Plan, corporate charges, affiliated charges, advertising and injuries and damages expense.

Project Director in the review of accounting and revenue requirement issues of the Southwest Gas Corporation. Specific issues included: prepayments, pipe replacement program, marketing and advertising expense, revenues, gain on disposition of property and officers' compensation.

Project Director in the review of Southwest Gas Corporation's Purchased Gas Adjustment Report. The following topics were addressed: lost and unaccounted for gas, adjustment to account 191 for tier-2 gas cost corrections, Santa Fe margin on system gas sales to be credited to ratepayers, allocation to Arizona of Santa Fe's profits on end-user sales.

Project Director in the review of Mountaineer Gas Company's request for an increase in rates. Issues included: plant in service, accumulated depreciation, sale of liquid propane gas plant, plant acquisition from Columbia, materials and supplies inventory, prepayments, working cash allowance, customer deposits, accrued vacation pay, rate refunds, unclaimed accounts, weather normalization, commercial and industrial sales growth, miscellaneous revenue, O&M expense, payroll expense, pension expense, uncollectibles, rate year expense, expense for mandatory drug/alcohol testing, legal and outside services expense, affiliated transactions, rate case expense, truck lease expense, inflation adjustment, EDP lease expense, advertising expense, software expense, taxes other than income, payroll taxes and income taxes.

Project Director in the evaluation of the impact of the Tax Reform Act of 1986 on the gas distribution utility operations of the Northern States Power Company. Issues included: reduction in the corporate tax rate, uncollectibles reserve, ACRS, unbilled revenues, customer advances, CIAC and timing of TRA associated impacts upon utility rates.

Project Director in the analysis of the Connecticut Natural Gas Corporation to determine the appropriate regulatory treatment associated with various changes in the tax code caused by tax reform and determine the impacts of the Tax Reform Act on the cost of service and revenue requirements. Other areas examined were: unbilled revenues, allowance for bad debt, inventory storage costs, cash flow changes associated with the TRA, excess accumulated deferred income tax reserve and adjustments to CNG's calculations.

Project Director in the review of Southwest Gas Corporation's Audit of Gas Procurement Practices and Purchased Gas Costs. The following topics were addressed: summary of audit conclusions and recommendations, propriety of deferred gas account, accrual of PGA reports, take-or-pay, two-tiered gas costs, non-traditional gas purchases from affiliate, ratemaking implications of SWG/Santa Fe/NGC relationship and acronyms and definitions.

Project Director hired to research and describe in detail the historical development of natural gas transportation issues at Federal and State jurisdictional levels in the case of Reynolds Metals Company vs. The Columbia Gas System, Inc. In addition, the calculation of damages and present alternative damage calculations.

A complete list of cases in which Mr. Larkin has participated/testified will be provided upon request.

Previous Positions

Employed by the international certified public accounting firm Peat, Marwick, Mitchell and Company from 1963 through 1969. Supervised major audits of the Detroit office.
Partner in the public accounting firm of Tischler & Lipson, 1969-1970.
Formed the certified public accounting firm of Larkin, Chapski and Company in 1970 (reorganized in 1982 as Larkin & Associates).

Education

Bachelor of Science, Accounting, Michigan State University, East Lansing, Michigan, 1960.
Certified Public Accountant, 1966.
Continuing professional education necessary to maintain CPA license.

Professional Affiliations

Michigan Association of Certified Public Accountants.
American Institute of Certified Public Accountants.

HELMUTH W. SCHULTZ, III

Helmuth ("Bill") Schultz, a certified public accountant and management consultant, was employed with Larkin & Associates' predecessor firm, Larkin, Chapski & Company, in 1975. He is presently a Larkin & Associates partner and, as such, is responsible for all the accounting and much of the auditing work done by the firm. Mr. Schultz has evaluated numerous issues affecting regulated public utilities including capital structure, rate base, sales, fuel and purchased power expenses, O&M expenses, taxes of all types, and management controls over operations and expenses. He has made projections in the areas of sales, required generation, capital structure, rate base, overhead, O&M expenses, taxes, and cost of debt. Mr. Schultz has testified as an expert witness in numerous regulatory proceedings.

Relevant Regulatory Experience

Project team member in the review of Southwest Gas Corporation's application to amend its rate schedules. The following issues were addressed: rate base, work management system, post-test year safety additions, completed construction not classified correction, cash working capital, corrections to prepayments, working capital offset for payments from UPI, and the relationship between Southwest Gas and Utility Partners Inc. Adjustments to operating income included: labor annualization, management incentive plan, outside contractor expense, office closures, expired amortizations, amortizations of payments from UPI, environmental amortizations, American Gas Association membership dues, officer retreat expense, directors' and officers' liability insurance, property tax expense, interest synchronization, and merger related costs.

Project team member in the review of Southern Connecticut Gas Company's rate case filing. Our review recommended a reduction in the Company's rates as opposed to the increase requested by the Company. Issues addressed in our testimony included: conservation expenditures; working capital; payroll; incentive compensation; pensions; PBOP; early retirement plan expense; outside services; computer system maintenance expense; age change program cost savings; uncollectibles; environmental remediation amortization; property taxes; reduction of income tax reserve; and federal income taxes.

Mr. Schultz was a lead consultant in the review of Black Mountain Gas Division of Northern States Power Company, Page Operation's rate increase request. Larkin & Associates was retained by the Residential Utility Consumer Office of Arizona to submit testimony regarding Black Mountain Gas Division of Northern States Power Company, Page Operation's request for rate increase. Testimony addressed the following issues: revenue annualizations, weather normalization, late payment revenues, employee benefits, corporate overhead allocation, insurance expense, directors' fees, advertising expense, property tax expense, rate case expense and income tax rates. This was the first rate case subsequent to the purchase of Black Mountain Gas by Northern States Power Company. Consequently, corporate allocations were of particular concern in this case.

Project team member in the review of Connecticut Natural Gas Corporation's rate case filing. Our review recommended a reduction in the Company's rates as opposed to the

increase requested by the Company. Ultimately, the Company's rates were reduced. Issues addressed by Larkin & Associates in testimony included: injuries and damages reserve, FAS 106 deficiency deferred debit, working capital, uncollectibles, hardship arrearage program, inflation, insurance, outside services, commission assessments, maintenance of plant, public relations expense, and property tax expense.

Lead Consultant. Assisted the Office of Consumer Counsel of the State of Connecticut in a financial review of Southern Connecticut Gas Company. The review determined that the Company was over-earning and a reduction in rates was recommended. As a result of the investigation, the Company was required to either voluntarily reduce rates or file a full rate case proceeding before the Connecticut Department of Public Utility Control. Mr. Schultz testified as an expert witness in this case. Issues addressed by us in our testimony included: plant-in-service; conservation expenditures; working capital; inflation; payroll; incentive compensation; pensions; PBOP; outside services; advertising; rent expense; leak survey costs; uncollectibles; Conservation Adjustment Mechanism; depreciation; amortization; property taxes; reduction in state income tax rate; federal income taxes; and cost savings from sale and lease back of liquidated natural gas facility.

Project Manager in the review of the rate increase request by Connecticut Natural Gas Corporation. Issues addressed included: plant additions, accumulated depreciation - plant additions, air conditioning rebate program, working capital - cost of gas, working capital - O&M, deferred credits, hardship arrearage forgiveness program, residential late payment charge revenues, sale of automatic meter reading assets, production and distribution - LNG facility, rent expense - O&A center, payroll, employee benefits, pension expense, removal of certain employee benefits, matching gift program, personal use of Company vehicles, directors' and officers' liability insurance, outside services - legal, rate case expense, economic development expense, uncollectibles, lobbying expense, membership dues, adjustment for miscellaneous expenses, general inflation adjustment, CIS/DCIS depreciation expense, property taxes, income tax expense, interest synchronization.

Lead Consultant retained to review the filing of the Minnesota Alliance for Fair Competition (MAC) against Minnegasco and to analyze the July 1993 filing by Minnegasco in response to MAC's filing. Mr. Schultz was to analyze the filings and make a determination as to whether Minnegasco's Cost Apportionment Manual provide a means of: 1) determining whether costs can be identified, 2) determining if an allocation process is reasonable such that all direct costs are allocated, the remaining common costs to be allocated are reasonable, and the allocator being used is reasonable, 3) determining if the allocation process is auditable, and 4) determining if an audit trail exists.

Key project team member in the review of the accounting and revenue requirements of Southwest Gas Corporation. Prefiled testimony addressed the following issues: prepayments, pipe replacement program, marketing and advertising expense, revenues, gain on disposal of property and officers' compensation.

Project Manager in the review of the rate increase requested by Connecticut Natural Gas Corporation. Issues addressed in testimony by Larkin & Associates included: natural gas vehicles, software additions, working capital, accounts payable, materials and supplies, deferred credits, deferred conservation expense, economic development, sales, late payment revenue, payroll, executive compensation, incentive compensation, pensions, employee benefits, uncollectibles, hardship arrearage forgiveness program, hardship shortfalls, corporate insurance, D&O insurance, environmental liability insurance, injuries and damages, production and distribution expense, computer costs, legal expense, training costs, demonstration and selling, promotional advertising, market development, service contracts, dues, inflation and taxes.

Key project team member in the review of Southwest Gas Corporation's - Purchased Gas Adjustment Report. The following topics were addressed: lost and unaccounted for gas, adjustment to account 191 for Tier-2 gas cost corrections, Santa Fe margin on System Gas sales to be credited to ratepayers, allocation to Arizona of Santa Fe's profits on end-user sales.

Project Manager. Larkin & Associates was retained by the Iowa Utilities Board to perform an audit of Peoples Natural Gas Company's direct assignment and allocation of costs to its non-regulated operations in the State of Iowa. The purpose of our audit was to assess if the Company complied with its Cost Allocation Manual and to evaluate the propriety of the allocation methods embodied within the Manual.

Project Manager in the determination of the appropriate regulatory treatment associated with various changes in the tax code caused by tax reform and determine the impact of the Tax Reform Act on the cost of service and revenue requirements. Further, examine unbilled revenue, allowance for bad debt, inventory storage costs, cash flow changes associated with the TRA, excess accumulated deferred income tax reserve and adjustments to Connecticut Natural Gas' calculations.

Key project team member in the audit of gas procurement practices and purchased gas costs of Southwest Gas Corporation. The following topics were addressed: summary of deferred gas account, accuracy of PGA reports, take-or-pay, two-tiered gas costs, non-traditional gas purchases from affiliate, ratemaking implications of SWG/Santa Fe/NGC relationship and acronyms and definitions.

Lead Consultant retained by the Delaware Valley Chapter PCAUUP to review the accounting records of Philadelphia Electric Company's gas operations with specific focus on the Gas House Heating Service Contract Program. The purpose of the review was to attempt to determine the propriety of the Company's recording of revenue and expenses for the Contract Service Program. In addition, attempted to determine whether the Contract Service Program was subsidized by ratepayers' monies and whether the price of the program was below an average variable cost.

A complete list of cases in which Mr. Schultz has participated/testified will be provided upon request.

RALPH C. SMITH

Mr. Smith's professional credentials include being a certified financial planner, a certified rate of return analyst, a licensed certified public accountant and attorney. He functions as project manager on consulting projects involving utility regulation, regulatory policy and ratemaking and utility management. His involvement in public utility regulation has included project management and in-depth analyses of numerous issues involving telephone, electric, gas, and water and sewer utilities.

Mr. Smith has performed work in the field of utility regulation on behalf of industry, public service commission staffs, state attorney generals, municipalities, and consumer groups concerning regulatory matters before regulatory agencies in Alabama, Alaska, Arizona, California, Connecticut, Florida, Georgia, Hawaii, Illinois, Indiana, Kentucky, Louisiana, Maine, Michigan, Minnesota, Mississippi, Missouri, New Jersey, New York, Nevada, Ohio, Pennsylvania, South Carolina, Texas, Washington, Canada, Federal Energy Regulatory Commission and various state and federal courts of law. He has presented expert testimony in regulatory hearings on behalf of utility commission staffs and intervenors on several occasions.

Relevant Regulatory Experience

Project Manager in the review of Southwest Gas Corporation before the Arizona Corporation Commission. Involvement included, but was not limited to, preparing testimony, performing data analysis and monitoring the progress of the overall project. Mr. Smith was also actively involved with the Southwest Gas Corporation's Rebuttal & PGA Audit as well as the Audit of Gas Procurement Practices and Purchased Gas Cost both before the Arizona Corporation Commission.

Project team member in the review of Southern Union Gas Company's revenue requirements. Mr. Smith filed testimony addressing issues resulting from this review. Issues included: Acquisition adjustment amortization, investment tax credit amortization, liability insurance expense and acquisition investigation costs.

Project Manager in the analysis of Equitable Gas Company's rate base, operating income and revenue requirement issues including the Company's capitalization of promotional allowances, projected plant additions, accumulated deprecation, materials and supplies, accounts payable related to CWIP, customer deposits, provision for rate refund, cash working capital (billing lag, collection lag, other taxes lag, income tax lag, interest expense lag) residential sales, take-or-pay liability amortization, uncollectibles, advertising and promotional expense, recoveries of theft gas, associated dues, employee retirements, projection of work force, pension expense, marketing study, energy assistance program, depreciation, gross receipts tax, customer deposits interest and income tax expense.

Project Manager in the evaluation of Southwest Gas Corporation. Reviewed gas procurement practices and purchased gas costs. Retained by Arizona Corporation Commission to prepare a report on audit of gas procurement practices and purchased gas costs. The following topics were addressed: Summary of Audit Conclusions and

Recommendations; Propriety of Deferred Gas Account; Accuracy of PGA Reports; Take-or-pay; Two-Tiered Gas Costs; Non-Traditional Gas Purchases from affiliate; and Ratemaking implications of SWG/Santa Fe/NGC Relationship.

Project Manager in Larkin & Associates' review of Citizens Utilities Company, Arizona Gas Division's request for an increase in rates. Responsible for analyzing rate base and net operating income issues, quantifying adjustments, and writing testimony. Specific issues addressed included: Stamford Administrative Office common plant balance, cash working capital, revenue annualization, payroll expense, employee benefits expense, and investment tax credit amortization.

Project manager in the review of Missouri Gas Energy's ("MGE") affiliated transactions and Southern Union Company's corporate costs. This was the first rate case review after the acquisition by Southern Union of MGE. MGE and Southern Union's previously owned gas distribution operations (located in Texas) were approximately the same size in terms of annual revenues and rate base. This project involved a thorough review of the corporate cost allocation model that was developed after the merger occurred. Testimony addressed the following issues: common plant - Austin, Texas office; accumulated deferred income taxes; corporate allocations; New York Stock Exchange listing fees (initial and ongoing) for the new company; executive stock options and stock-based compensation; SFAS 123; incentive compensation; pensions and SFAS 106 nonpension post retirement benefits; budgeting of corporate costs and employee levels; executive offices in New York City; treatment of salary expense for geographically removed executives; affiliated transactions; KellAir, an affiliated supplier of airplane passenger service; allocation factors; use of time reporting for corporate executives.

Project team member in the evaluation of the impact of the Tax Reform Act of 1986 on the gas distribution utility operations of the Northern States Power Company. Issues included: reduction in the corporate tax rate, uncollectibles reserve, ACRS, unbilled revenues, customer advances, CIAC and timing of TRA associated impacts upon utility rates.

Project Manager. Larkin & Associates was employed by the Office of Consumers' Counsel of Ohio ("OCC") to review and evaluate the material filed by the River Gas Company and the East Ohio Gas Company, the PUCO Staff, and any other parties to the proceedings, relating to FAS 106 and FAS 112. Review included, but was not limited to, Company testimony and standard filing requirements, responses to discovery, Company workpapers, the Staff Report, Staff workpapers, actuarial studies supporting the accrual of postretirement benefits and the comments and findings in prior cases. This case was settled.

Project manager in the review of the rate increase requested by CNG Transmission Corporation. Issues addressed in testimony included: ratemaking treatment of extraordinary gas loss at CNG Transmission Corporation; treatment of costs incurred by CNGT associated with the Company's violations of environmental laws, and; the amortization period to be applied to CNGT's FAS 106 regulatory asset.

Project manager. Larkin & Associates was hired by the Pennsylvania OCA to review Columbia Gas Company's request to increase its rates. Mr. Smith prepared discovery, reviewed responses, reviewed documents and interviewed Company employees on-site at their Columbus, Ohio office, quantified adjustments for a wide range of issues, and prepared a report containing the impacts of our adjustments. Larkin & Associates also quantified various alternatives as part of the "collaborative" negotiating process that resulted in the final agreement concerning the amount of rate increase.

Project Manager in the analysis of Pacific Gas & Electric Company. Issued addressed included: Review revenues, sales and customer forecast, O&M expense, labor and non-labor cost, income taxes, other taxes, depreciation, return and rate base items. Adjustments were proposed for rad-waste disposal expense, non-routine maintenance expense, Geyers effluent pipeline project, outage management system, integrated distribution information system, distribution expense - tree trimming, customer accounts expense, customer charge, relocation expense, long-term disability expense (FAS 112), Performance Incentive Plan, total compensation, hazardous substance tax expense, nuclear decommissioning expense, depreciation on hydraulic production plant, and 215/245 Market Street headquarters building seismic retrofit project costs.

A complete list of cases in which Mr. Smith has participated/testified in will be provided upon request.

Previous Positions

With Larkin, Chapski and Co., the predecessor firm to Larkin & Associates, Mr. Smith was involved in utility regulatory consulting, tax planning and research for businesses and individuals, tax return preparation and review, independent auditing, review and preparation of financial statements. Installed computerized accounting system for a realty management firm.

Education

Bachelor of Science in Administration in Accounting, with distinction, University of Michigan, Dearborn, 1979.
Master of Science in Taxation, Walsh College, Michigan, 1981. Master's thesis dealt with investment tax credit and property tax on various assets.
Juris Doctor, cum laude, Wayne State University Law School, Detroit, Michigan, 1986.
Recipient of American Jurisprudence Award for academic excellence.
Continuing education required to maintain CPA license and CFP certificate.
Received CPA certificate in 1981 and certified Financial Planning certificate in 1983.
Admitted to Michigan and Federal bars in 1986.

DONNA M. DeRONNE

As a certified public accountant with Larkin & Associates, duties include the analysis of utility rate cases, researching accounting and regulatory developments, preparing computer models and spreadsheets, and preparation of written testimony and exhibits. Ms. DeRonne has testified as an expert witness in numerous regulatory proceedings. Jurisdictions in which Ms. DeRonne has participated in the analysis of regulatory filings include: Alaska, Arizona, California, Connecticut, Florida, Guam, Hawaii, Illinois, Indiana, Kentucky, Pennsylvania, Rhode Island, Utah, Vermont, Virginia, Washington, West Virginia and Wisconsin.

Relevant Regulatory Experience

Project Manager in the review of Southwest Gas Corporation's application to amend its rate schedules. Ms. DeRonne submitted testimony which addressed the following issues: rate base, work management system, post-test year safety additions, completed construction not classified correction, cash working capital, corrections to prepayments, working capital offset for payments from UPI, and the relationship between Southwest Gas and Utility Partners Inc. Adjustments to operating income included: labor annualization, management incentive plan, outside contractor expense, office closures, expired amortizations, amortizations of payments from UPI, environmental amortizations, American Gas Association membership dues, officer retreat expense, directors' and officers' liability insurance, property tax expense, interest synchronization, and merger related costs.

Project Manager in the review of Southern Connecticut Gas Company's rate case filing. Our review recommended a reduction in the Company's rates as opposed to the increase requested by the Company. Issues addressed in testimony included: conservation expenditures; working capital; payroll; incentive compensation; pensions; PBOP; early retirement plan expense; outside services; computer system maintenance expense; age change program cost savings; uncollectibles; environmental remediation amortization; property taxes; reduction of income tax reserve; and federal income taxes.

Project Manager in the review of Southern Connecticut Gas Company's proposed performance based ratemaking plan. Larkin & Associates' testimony pointed out numerous problems with the Company's proposed plan as well a discussion of the following issues: the Company's estimated merger synergies, treatment of goodwill/acquisition premium and marketing program costs in calculating the return on equity for regulatory purposes, and the appropriate treatment of the PGA under any earnings sharing plans and several other issues inherent in the Company's proposal. Mr. Larkin & Ms. DeRonne also proposed an alternative performance based ratemaking plan for consideration.

Project team member in the review of Connecticut Natural Gas Company's proposed performance based ratemaking plan. Our testimony addressed numerous deficiencies with the Company's proposed plan. Other issues addressed in testimony included: the Company's estimated merger synergies, treatment of goodwill/acquisition premium and marketing program costs in calculating the return on equity for regulatory purposes, and

the appropriate treatment of the PGA under any earnings sharing plans and several other issues inherent in the Company's proposal. Mr. Larkin & Ms. DeRonne also proposed an alternative performance based ratemaking plan for consideration.

Key project team member in the review of Connecticut Natural Gas Corporation's rate case filing. Our review recommended a reduction in the Company's rates as opposed to the increase requested by the Company. Ultimately, the Company's rates were reduced. Issues addressed in testimony included: injuries and damages reserve, FAS 106 deficiency deferred debit, working capital, uncollectibles, hardship arrearage program, inflation, insurance, outside services, commission assessments, maintenance of plant, public relations expense, and property tax expense.

Ms. DeRonne was a lead consultant in the review of Black Mountain Gas Division of Northern States Power Company, Page Operation's rate increase request. Larkin & Associates was retained by the Residential Utility Consumer Office of Arizona to submit testimony regarding Black Mountain Gas Division of Northern States Power Company, Page Operation's request for rate increase. Testimony addressed the following issues: revenue annualizations, weather normalization, late payment revenues, employee benefits, corporate overhead allocation, insurance expense, directors' fees, advertising expense, property tax expense, rate case expense and income tax rates. This was the first rate case subsequent to the purchase of Black Mountain Gas by Northern States Power Company. Consequently, corporate allocations were of particular concern in this case.

Project Manager. Assisted the Office of Consumer Counsel of the State of Connecticut in a financial review of Southern Connecticut Gas Company. The review determined that the Company was over-earning and a reduction in rates was recommended. As a result of the investigation, the Company was required to either voluntarily reduce rates or file a full rate case proceeding before the Connecticut Department of Public Utility Control. Ms. DeRonne testified as an expert witness in this case. Issues addressed in testimony included: plant-in-service; conservation expenditures; working capital; inflation; payroll; incentive compensation; pensions; PBOP; outside services; advertising; rent expense; leak survey costs; uncollectibles; Conservation Adjustment Mechanism; depreciation; amortization; property taxes; reduction in state income tax rate; federal income taxes; and cost savings from sale and lease back of liquidated natural gas facility.

Key project team member in the review of Connecticut Natural Gas Company's rate filing. Assisted with the preparation of data requests, analysis of data, on-site review, and preparing testimony, schedules and exhibits. Ms. DeRonne also testified as an expert witness in this case. Issues of this case were: Natural gas vehicles, software additions, working capital - O&M, accounts payable related to gas materials and supplied, non-gas materials and supplies, deferred credits, deferred conservation expense, economic development assistance deferred debits, sales, late payment revenue, payroll, pensions, employee benefits, personal use of company vehicles, uncollectibles, hardship arrearage forgiveness program, hardship shortfall deferral, corporate insurance update, directors' and officers' liability insurance, environmental liability insurance, injuries and damages, production and distribution, computer rental, maintenance and conversion, radio

maintenance and repair, management audit expense, consultants for generic proceedings, outside services - other, non-recurring outside services expense, outside services - legal, lobbying expense, corporate training expense, demonstration and selling expense, promotional advertising, market development and engineering studies, economic development deferral amortization, service contract and charge service, servicemen licensing fees, American Gas Association Membership dues, social and service club dues, postage expense, inflation adjustment, payroll taxes, property taxes, income tax expense, and interest synchronization.

Project Manager in the review of Mountaineer Gas Company on behalf of the West Virginia Consumer Advocate Division. Ms. DeRonne and Mr. Larkin prepared written testimony and exhibits in this case, however, the case was settled prior to hearings. Issues addressed by Larkin & Associates include: Post-test year plant additions, acquisition adjustment, prepayments, working capital, consolidated tax savings, revenues, payroll, pensions, FAS 112, uncollectibles, computer expense, legal costs, advertising, customer relations and training expense.

Project Manager in the review of a rate increase request by Hope Gas, Inc. Ms. DeRonne and Mr. Larkin prepared written testimony and exhibits in the case. The case was settled prior to hearings. Issues specifically addressed include: post-test year plant additions, consolidated tax savings, revenues, labor costs, FAS 106, benefits, Employee Appliance Purchase Plan, corporate charges, affiliated charges, advertising and injuries and damages expense.

Key project team member in the review of the rate increase requested by Connecticut Natural Gas Corporation. Assisted with the preparation of data requests, analysis of data, on-site review, and preparing testimony, schedules and exhibits. Ms. DeRonne also testified as an expert witness in this case. Issues addressed in testimony by Larkin & Associates include: natural gas vehicles, software additions, working capital, accounts payable, materials and supplies, deferred credits, deferred conservation expense, economic development, sales, late payment revenue, payroll, executive compensation, incentive compensation, pensions, employee benefits, uncollectibles, hardship arrearage forgiveness program, hardship shortfalls, corporate insurance, D&O insurance, environmental liability insurance, injuries and damages, production and distribution expense, computer costs, legal expense, training costs, demonstration and selling, promotional advertising, market development, service contracts, dues, inflation and taxes.

Key project team member in the review of a rate increase request by Columbia Gas Company before the Pennsylvania Public Service Commission. Ms. DeRonne prepared discovery, reviewed responses, reviewed documents and interviewed Company employees on-site, quantified adjustments for a wide range of issues and assisted in the preparation of a report containing the impact of Larkin & Associates adjustments. The case was settled prior to the filing of testimony under a "collaborative" negotiating process.

Project Manager in providing assistance to the West Virginia Consumer Advocate Divisions in the conduct of a general investigation of Equitable Gas Company's West Virginia operations. The purpose of the investigation was to determine whether Equitable's base rates were just and reasonable. Prepared rate base, operating income and revenue requirement schedules, along with addressing accounting issues. Issues addressed in the report included: discrepancies between the Company's operating reports and the annual reports filed to the Commission, plant allocated from affiliated service company, rent from gas properties, return on service company assets, comparison of cost levels with other utilities, meter reading charges allocated from an affiliate, meter & house regulatory expense, injuries and damages, legal costs, affiliated cost savings, depreciation expense and consolidated income tax savings.

Project leader in the review of a billing dispute between the Navy Public Works Center-Guam and the Guam Power Authority. Key issues included the appropriate treatment of certain costs under the FERC USOA, as required under a contract between the two parties. Duties included the analysis of Navy and GPA records, on-site review and preparation of final recommendation report and schedules.

Key Project Member. Larkin & Associates was retained by the Office of Consumer Counsel of the State of Connecticut to review the rate increase request by Connecticut Natural Gas Corporation. Issues addressed: Rate Base; including plant additions, accumulated depreciation - plant additions, air conditioning rebate program, working capital - cost of gas, working capital - O&M, deferred credits, hardship arrearage forgiveness program. Operating Income; including IS mechanism, residential late payment charge revenues, sale of automatic meter reading assets, production and distribution - LNG facility, rent expense - O&A center, payroll, employee benefits, pension expense, removal of certain employee benefits, matching gift program, personal use of Company vehicles, directors' and officers' liability insurance, outside services - legal, rate case expense, economic development expense, uncollectibles, lobbying expense adjustment - outside services, membership dues, adjustment for miscellaneous expenses, general inflation adjustment, CIS/DCIS depreciation expense, property taxes, income tax expense, interest synchronization.

A complete list of cases in which Ms. DeRonne has participated/testified will be provided upon request.

TINA THILL

Ms. Thill is a staff accountant and regulatory analyst with Larkin & Associates. As such, Ms. Thill prepares discovery requests, produces spreadsheets and models, assists with the review and analysis of regulatory filings, and performs regulatory and accounting research.

Education

Eastern Michigan University - Ypsilanti, MI.
Bachelor of Business Administration: Accounting
April 1996

Relevant Regulatory Experience

Key project team member in the Management Audit and Market Power Mitigation Analysis of the Merged Gas System Operation of Pacific Enterprises and Enova Corporation. Our task involved performing an extensive investigation of the combined utilities gas system, tariffs, contracts, and operation. An analysis of the combined utilities compliance with market power safeguards adopted in the Commissions Decision D.98-03-073 to ensure open and nondiscriminatory service was conducted. Ms. Thill assisted with the analysis of key issues, drafting of data requests, performed on-site reviews at the company's offices, attended numerous interviews with company personnel, reviewed over 4,000 recorded telephone calls of the Gas Scheduling and Control Departments, and assisted with drafting of the final report and exhibits.

Participated in the review of the merger application between Energy East and Connecticut Energy Corporation. Larkin & Associates evaluated the merger in regards to the effect on competition in Connecticut, whether the merger is a benefit to both consumers and shareholders, effect on regulation, any factors which compels the merger for the benefit of customers, and whether there are acceptable customer protections in place to ensure affective cost control.

Participated in the rate case filing by Connecticut Natural Gas Corporation. Our review recommended a reduction in the Company's rates as opposed to the increase requested by the Company. Ultimately, the Company's rates were reduced. Issues addressed by us in testimony included: injuries and damages reserve, FAS 106 deficiency deferred debit, working capital, uncollectibles, hardship arrearage program, inflation, insurance, outside services, commission assessments, maintenance of plant, public relations expense, and property tax expense.

Key project member in the review of Chesapeake Utilities Corporation application for Approval of a Cost Accounting Manual and a Code of Conduct. Issues addressed in testimony included: regulated vs. non-regulated costs, Non-Regulated Activities, Common Management, asymmetrical pricing, segregation of duties, sales leads, joint sales calls, confidential customer information, and fees and rebates.

Project team member in the review Ameritech Illinois, Inc.'s earnings and revenue requirement in conjunction with the five-year review of the Company's Alternative Regulation Plan in ICC Docket No. 98-0252.

Project team member in the review of Matanuska Telephone Company's application for an interim rate increase and partial rate design. Duties performed included: gaining an understanding of the Company's rate case filing package, and formulating an opinion concerning the reasonableness of the amounts included in the Company's proposal.

Project team member in the review of US West Communications, Inc.'s application for approval to transfer certain assets to its new subsidiary, US West Broadband Services, Inc. Prior to the submission of Staff's testimony, the Company withdrew its application.

Project team member in the review of US West Communications, Inc.'s application for a rate increase. Tasks performed on this project included reviewing US West's filing, issuing and reviewing discovery, reviewing background information, obtaining US West's direct and rebuttal testimony from its prior rate case, and conducting discussions with Staff and US West regarding various issues.

Project team member in the review to determine whether the proposed merger between US West Communications, Inc. (USWC), and Qwest Communications Corporation was in the interest of ratepayers. The analysis consisted of review of the application, data responses, and USWC's service quality history.

Key project member in the review of Delmarva Power & Light's billing system conversion problems. Consulting services were provided to the Hearing Examiner of the Delaware Public Service Commission. Relevant issues addresses included: compensation and economic damages to customers, proration, arbitration procedures. Non-economic issues included: "reaching back" problem, budget plans, tariff rates on bills, high bill parameters, PriceWaterhouseCoopers audit report, payment posting sequence, emergency phone number, issue list, lost customers, walk-in offices, and a summit for unresolved issues.

Key project member in the review of Delmarva Power & Light's application for Approval of a Cost Accounting Manual and a Code of Conduct. Consulting services were provided to the Hearing Examiner of the Delaware Public Service Commission.

Participated in the review of the merger application between Energy East and Connecticut Energy Corporation. Larkin & Associates evaluated the merger in regards to the effect on competition in Connecticut, whether the merger is a benefit to both consumers and shareholders, effect on regulation, any factors which compels the merger for the benefit of customers, and whether there are acceptable customer protections in place to ensure affective cost control.

Regulatory Experience

Project team member in the review of Southwest Gas Corporation's application to amend its rate schedules. The following issues were addressed: rate base, work management system, post-test year safety additions, completed construction not classified correction, cash working capital, corrections to prepayments, working capital offset for payments from UPI, and the relationship between Southwest Gas and Utility Partners Inc. Adjustments to operating income included: labor annualization, management incentive plan, outside contractor expense, office closures, expired amortizations, amortizations of payments from UPI, environmental amortizations, American Gas Association membership dues, officer retreat expense, directors' and officers' liability insurance, property tax expense, interest synchronization, and merger related costs.

Key project team member in the Regulatory Audit of GTE California Incorporated and its Corporate Affiliates. The project team reviewed and reported on the Company's performance under an alternative regulatory plan including affiliate transaction compliance. Analysis consisted of formal data requests, interviews with numerous Company personnel, discussions with Staff, and an extensive review of the company's financial records. The main concentration of the audit was the review of the Company Cost Allocation Manual, the Allocation process, verification of cost allocation factors and testing of cost allocations. Specific testing was performed on selected budget center allocations and the criteria used in assigning the respective budget centers allocation factor. Also a detailed analysis of affiliate contracts was performed to evaluate whether contracts did not provide an opportunity for cross subsidization. Finally controls were reviewed to determine whether sufficient structural safeguards exist to provide a reasonable level of assurance that costs are being applied appropriately.

Project team member in the review of US West Communications, Inc. application for a rate increase. Tasks performed on this project included reviewing US West's filing, issuing and reviewing discovery, reviewing background information, obtaining US West's direct and rebuttal testimony from its prior rate case, and conducting discussions with Staff and US West regarding various issues.

Project team member in the review of US West's access and toll rate reductions for North Dakota Service pursuant to ND Senate Bill No. 2420, and to review US West's residence

rate increase pursuant to ND Senate Bill No. 2420. Relevant issues analyzed included: Intrastate Loop Cost Recovery, NTS Central Office Equipment Costs, Extended Area Service Costs, Sale of US West North Dakota Exchanges, and Other Adjustments.

Key project team member in the annual financial audit of a Lake State Railway Company. Duties include: verification of cash and authority over fund receipts and disbursements.

Contact: Richard Sobolewski
Gene Koss

Assignment: Larkin & Associates was retained by the Office of Consumer Counsel of the State of Connecticut to review Connecticut Natural Gas Company's proposed performance based ratemaking plan. Our testimony addressed numerous deficiencies with the Company's proposed plan as well as the following issues: the Company's estimated merger synergies, treatment of goodwill/acquisition premium and marketing program costs in calculating the return on equity for regulatory purposes, and the appropriate treatment of the PGA under any earnings sharing plans and several other issues inherent in the Company's proposal. Mr. Larkin & Ms. DeRonne also proposed an alternative performance based ratemaking plan for consideration.

Assignment: Larkin and Associates was retained by the Residential Utility Consumer Office to review Black Mountain Gas Division of Northern States Power Company Page, Operation's rate increase request. Testimony submitted addressed the following issues: revenue annualizations, weather normalization, late payment revenues, employee benefits, corporate overhead allocation, insurance expense, directors' fees, advertising expense, property tax expense, rate case expense and income tax rates. This was the first rate case subsequent to the purchase of Black Mountain Gas by Northern States Power Company. Consequently, corporate allocations were of particular concern in this case.

Contract Duration:	December 1995 - October 1996

Columbia Gas of Pennsylvania (Collaborative)

Client:	Pennsylvania Office of Consumer Advocate 555 Walnut Street Forum Place, 5th Floor Harrisburg, PA 17101-1923 (717) 783-5048
Contact:	Tad Berger
Assignment:	Larkin & Associates was hired by the Pennsylvania Office of Consumer Advocate to review Columbia Gas Company's request to increase its rates. We prepared discovery, reviewed responses, reviewed documents and interviewed Company employees on-site at their Columbus, Ohio office, quantified adjustments for a wide range of issues, and prepared a report containing the impacts of our adjustments. We also quantified various alternatives as part of the "collaborative" negotiating process that resulted in the final agreement concerning the amount of rate increase.
Key Participants:	Ralph C. Smith Donna DeRonne
Geographic Location:	Pennsylvania
Contract Duration:	1995 - 1996

Missouri Gas Energy; Case No. GR-96-285

Client:	Missouri Public Service Commission Staff P.O. Box 360 Jefferson City, Missouri 65102
Contact:	Chuck Hyneman, Case Coordinator, (816) 889-3551 Roy Boltz, Lead Auditor, (573) 751-4890 John Himmelberg, Jr., Assistant General Counsel, (573) 751-7485
Assignment:	Larkin & Associates was retained by the Missouri Public Service Commission Staff to review Missouri Gas Energy's ("MGE") affiliated transactions and Southern Union Company's corporate costs. This was the first rate case review after the acquisition by Southern Union of MGE. MGE and Southern Union's previously owned gas distribution operations (located in Texas) were approximately the same size in terms of annual revenues and rate base. This project involved a thorough review of the corporate cost allocation model that was developed after the merger occurred. Testimony addressed the following issues: common plant - Austin, Texas office; accumulated deferred income taxes; corporate allocations; New York Stock Exchange listing fees (initial and ongoing) for the new company; executive stock options and stock-based compensation; SFAS 123; incentive compensation; pensions and SFAS 106 nonpension post retirement benefits; budgeting of corporate costs and employee levels; executive offices in New York City; treatment of salary expense for geographically removed executives; affiliated transactions; KellAir, an affiliated supplier of airplane passenger service; allocation factors; use of time reporting for corporate executives.

Contract Duration:	1996

Equitable Gas Company; Case No. 96-0059-G-GI

Client: Consumer Advocate Division
West Virginia Public Service Commission
7th Floor, Union Building
723 Kanawha Boulevard, East
Charleston, West Virginia 25301
(304) 558-0526

Contact: Billy Jack Gregg
Byron Harris

Assignment: Larkin & Associates was retained by the Consumer Advocate Division of the State of West Virginia to assist in the conduct of a general investigation of Equitable Gas Company's ("Equitable") West Virginia operations. The overall purpose of the investigation, which was initiated by the Consumer Advocate Division, was to determine whether Equitable's base rates, which were set over five years prior, were just and reasonable. Since there was not a rate case filed by the Company, we were responsible for preparing the rate base, operating income and revenue requirement schedules, along with addressing all accounting issues. Issues addressed in our final report include: discrepancies between the Company's operating reports and the annual reports filed to the West Virginia Public Service Commission; plant allocated from an affiliated service company; rent from gas properties; return on service company assets; comparison of cost levels with other West Virginia utilities; meter reading charges allocated from an affiliate; meter & house regulator expense; injuries and damages; legal costs; affiliated cost savings; depreciation expense; and consolidated income tax savings.

Indiana Gas Company; Cause No. 39353, Phase II

Client:	Office of Utility Consumer Counselor Indiana Government Center North 100 N. Senate Avenue, Room N501 Indianapolis, Indiana 46204 (317) 232-2494
Contact:	Robert Glennon
Assignment:	Larkin & Associates was under contract with the Indiana Office of the Utility Consumer Counselor to review issues pertaining to Statement of Financial Accounting Standards No. 106 (FAS 106) and the rate recovery of costs for postretirement benefits other than pensions (OPEB) requested by Indiana Gas Company (IGC). Our testimony summarized the background and requirements of FAS 106; discussed IGC's proposed ratemaking treatment of FAS 106; identified concerns regarding the FAS 106 accrual, and recommended alternatives to full accrual for recovery of OPEB expenses through rates.

Minnegasco; Docket No. G008/C-91-942

Client: Minnesota Department of Public Service
Suite 200
121 7th Place East
St. Paul, Minnesota 55101-2145
(612) 297-1773

Contact: Marya White, Supervisor
Sundra Bender

Assignment: Larkin & Associates was assigned to review the January 20, 1993 filing of the Minnesota Alliance for Fair Competition against Minnegasco (MAC) and to analyze the July 1993 filing by Minnegasco in response to MAC's filing. Larkin & Associates' analysis of Minnegasco's July 1993 filing was intended to determine whether Minnegasco had adequately responded to the allegations made by MAC. Also and more specifically, Larkin & Associates was requested to determine whether Minnegasco's Cost Apportionment Manual provides a means of:

1) Determining whether costs can be identified;
2) Determining if an allocation process is reasonable such that: a) all direct costs are allocated, b) the remaining common costs to be allocated are reasonable; and c) the allocator being used is reasonable.
3) Determining if the allocation process is auditable; and
4) Determining if an audit trail exists.

Contract Duration: 1993

Mountain Fuel Supply Company; Docket No. 93-057-01

Client: Committee of Consumer Services
Heber M. Wells Building
160 East 300 South, P.0. Box 146782
Salt Lake City, Utah 84114-6782
(801) 530-6674

Contact: Dan Gimble

Assignment: Larkin & Associates was under contract with the Committee of Consumer Services to review the application for an increase in rates and charges filed by Mountain Fuel Supply Company on April 2, 1993. Our testimony addressed the Company-proclaimed impact on its working gas inventory and labor requirements resulting from FERC Order 636. Another issue of paramount importance was unbilled revenue. Larkin & Associates proposed that the Company's cumulative unbilled revenue balance be amortized into rates over a period of five years. Other issues addressed in testimony were: Cash Working Capital; Accumulated Deferred Income Taxes; "Banked" Vacation; Equal Payment Plan; Payroll Expense; Overtime Expense; Stock Purchase Plan Expense; O&M Expense Percentage; Payroll Taxes; Executive Incentive Retirement Plan; Supplemental Executive Retirement Plan; Postretirement Benefits Other Than Pensions; and Consolidated Income Taxes.

Attention: Mr. Mike Diller, Director of Accounting

Dear Mr. Diller,

The Barrington-Wellesley Group, Inc. (BWG) is pleased to submit the enclosed proposal to provide assistance to the North Dakota Public Service Commission Staff in its investigation of Montana-Dakota Utilities Company's gas rate increase request. BWG is proposing to offer assistance related to the appropriate level of investment in North Dakota and the appropriate cost of service.

As requested, one original and five copies of the proposal are enclosed.

We are committed to managing our work in a manner that will assure meeting Commission objectives in the most efficient manner possible and look forward to working with you and your associates on this important project.

Please contact me at the above phone number or by email at laros@bwgi.com if you have any questions or require further information.

Thank you for your consideration of our proposal.

Sincerely,

Michael A. Laros

Michael A. Laros
Managing Director

CHAPTER I

STATEMENT OF THE PROJECT

The Barrington-Wellesley Group, Inc. (BWG) is pleased to respond to the May 10, 2002 Request for Proposal (RFP) from the North Dakota Public Service Commission ("NDPSC" or "Commission") for an independent consultant to investigate, analyze and provide testimony regarding the fairness and reasonableness of Montana-Dakota Utilities' ("MDU" or "Company") proposed gas rates. This chapter presents a brief overview of the Company, describes our understanding of the objectives and scope of the consulting assignment, and summarizes our proposal.

Background

On April 12, 2002, Montana-Dakota Utilities Co., a Division of MDU Resources Group, Inc., filed a Natural Gas Rate Increase Application with the North Dakota Public Service Commission. This application was assigned Case No. PU-399-02-183.

Montana-Dakota Utilities sells natural gas at retail, serving over 213,000 residential, commercial and industrial customers located in 141 communities and adjacent rural areas as of December 31, 2001, and provides natural gas transportation services to certain customers on its system. A significant portion of these customers have retail rates regulated by the NDPSC. MDU Resources Group acquired Great Plains Natural Gas (Great Plains) in July 2000. Great Plains also provides retail natural gas service in North Dakota but is not part of the current rate proceeding.

MDU Resources Group – Natural Gas Distribution Division, comprised of MDU and Great Plains, and operating in five northern plains states, contributed $0.7 million, $4.8 million and $3.2 million (0.5%, 4.4%, and 3.8%) to consolidated earnings on common stock in 2001, 2000 and 1999, respectively. The decrease in earnings in 2001 is attributed to lower sales volumes, largely the result of weather in the fourth quarter which was 22 percent warmer than the previous year, and higher operation and maintenance expenses, primarily increased payroll costs and higher bad debt expense. Lower average realized rates, return on natural gas storage, demand and prepaid commodity balances, and decreased service and repair margins also added to the earnings decline. The increase in earnings from 1999 to 2000 was also largely the result of weather. Degree days as a percent of normal were 94.5%, 100.4% and 88.8% in 2001, 2000 and 1999, respectively. The average cost of natural gas increased from $3.56 per decatherm in 1999 to $5.50 per decatherm in 2001.

For the three months ended March 31, 2002, earnings at MDU Resources Group's natural gas distribution segment increased to $4.5 million, compared to $2.7 million in the same period in 2001. This increase was due to slightly higher retail sales, increased returns on natural gas held in storage, higher non-regulated service and repair margins and lower operation and maintenance expense.

Project Objectives and Scope

BWG proposes to provide assistance related to rate base and cost of service issues. Related to those two areas, our work will include analyzing and reviewing the filing, preparing and conducting discovery as required, preparing monthly reports of discovery, conclusions and findings, preparing and filing written testimony, providing oral testimony, assisting staff in preparing cross-examination of the witnesses of other parties to the proceeding, and assisting the staff with the preparation of proposed findings of fact.

The Commission Staff has provided the following direction in the RFP related to rate base and cost of service issues. We have relied on these representations in developing our estimate of time required to complete the assignment contained in this proposal.

Rate Base -- "The rate base determination is not nearly as critical in terms of rate impact as is establishing the appropriate cost of service. Therefore, work in this area should be limited in scope and should primarily rely on a review of the last rate case and historical comparisons. Annual reports are filed with the Commission and include all rate base components. MDU does not seek a return on working capital in this case. Staff calculated cash working capital in MDU's last rate case and the resulting impact to rates was minimal. Therefore, rate base will not require a cash working capital calculation."

Cost of service -- "In 2001, 80% of MDU's revenues were spent on the cost of gas. Therefore, a critical element of cost of service is the appropriate level of weather-normalized sales. The cost of service portion will also require a strong review of other operating and maintenance expenses."

Proposal Summary

BWG is well-qualified to provide the assistance required by the Commission related to rate base and cost of service issues. Our proposed Project Director, Michael Laros, CMC, is a BWG Managing Director and Co-founder and has over twenty-five years of utility consulting experience. He has testified on a variety of utility management issues before various State regulatory commissions and the FERC. Supporting Laros are David P. Vondle, CMC, and Joel F. Jeanson, CPA, both of whom have significant experience in the natural gas distribution utility industry. The combination of consulting and direct gas utility industry experience represented by the project team will provide the assurance that all relevant issues related to rate base and cost of service will be addressed.

We are proposing a work plan requiring an estimated 250 professional staff hours to complete the assignment. We expect to start this project in June 2002 in order to satisfy Commission requirements that the investigation and written testimony be completed by August 30, 2002. We plan to work closely with the Staff and to provide all information requested in the RFP to aid in its monitoring of the progress of our work.

Organization of this Proposal

The remaining chapters describe BWG's proposed technical approach, experience, and project costs. These chapters are organized as follows:

- Chapter II describes BWG's timeline and preliminary work plan. Tasks are described in sufficient depth to afford the Commission and staff a thorough understanding of our work plan. After orientation, initial interviews, and preliminary analysis, a final detailed work plan will be prepared and submitted to the Commission Staff for approval.

- Chapter III describes our proposed project organization and the experience and education of each audit team member.

- Chapter IV describes our experience conducting similar projects during the previous five years. For each project completed during the previous five years, we have provided a brief description of the project, including the name of our client, the name, address and telephone number of the responsible official of the client company or organization.

- Chapter V provides our cost estimate for each task including manpower costs, costs of materials and supplies, subcontractor costs, transportation costs and total cost. Manpower costs are broken down to identify the category of personnel, estimated hours, rate per hour and total cost. Also included in this chapter are our estimates of the time required to complete each audit task.

- Chapter VI indicates that BWG has no prior or current relationship with the Company or any other potential parties in this proceeding and certifies our compliance with all applicable EEO laws and regulations as well as our compliance with applicable provisions of the Americans with Disabilities Act of 1991.

CHAPTER II

PROJECT TIMELINE AND WORKPLAN

Introduction

This chapter provides a timeline and summary of the proposed project and preliminary detailed work plans for the two areas included in the proposal – rate base and cost of service – based on the assumption that the successful consultant will be selected by June 12, 2002.

Project Timeline and Work Plan

Phase One: Planning /Work Prioritization *(June 17 – 19)*

- Meet Commission Staff assigned to project.
- Discuss coordination of our task areas with those of other consultants or Commission Staff.
- Obtain relevant documents filed in this proceeding.
- Obtain comments on preliminary work plan contained in this proposal.
- Confirm timing of project and key deadlines.
- Confirm project protocols, including progress reporting and document requests.
- Complete final work plan.

Phase Two: Investigation and Analysis *(June 24 – August 13)*

Task 1: Verify the appropriateness of the proposed rate base.

- Obtain a copy of the approved, detailed rate base from the last rate case
- Obtain a copy of the most recent MDU Gas Annual Report filed with the NDPSC.
- Compare current rate base by plant account to that approved in the last rate case.
- Obtain explanations for significant changes.
- Identify controls in place to ensure that only investments made in North Dakota are included
- Review annual depreciation expense by plant account for reasonableness.
- Develop conclusions and recommendations based on the above steps.
- Discuss conclusions and recommendations with Commission Staff.

Task 2: Verify the appropriate of the proposed cost of service.

- Obtain copies of MDU Gas Annual Report for the last three years.
- Obtain copy of test year actual results and pro forma adjustments.
- Review test year and pro forma adjustments for reasonableness. Specific issues include:
    - Weather-normalized sales volumes
    - Bad debt reserve
    - Staffing levels
    - Allocations
    - Any other costs that appear unreasonable based on our trend analyses and industry experience
- Develop conclusions and recommendations based on the above steps.
- Discuss conclusions and recommendations with Commission Staff.

Phase Three: Prepare Written Testimony *(June 29 – August 30)*

During this phase we will prepare written testimony related to rate base and cost of service based on the work performed and conclusions and recommendations reached in Phase Two. We will review this testimony with Commission Staff prior to filing.

Phase Four: Provide Oral Testimony and Other Assistance *(October 7 & 8)*

During this phase BWG will provide oral testimony as well as assist staff in preparing cross-examination of the witnesses of other parties to the proceeding, and assist staff in the preparation of proposed findings of fact.

Professional Standards

BWG will conduct this work in accordance with generally accepted government auditing standards. These standards are set forth in the booklet entitled *Government Auditing Standards, 1994 Revision* developed by the Comptroller General of the United States and published by the United States General Accounting Office. These standards pertain to auditors' professional qualifications and, among other things, requires auditor independence and that the audit be carefully planned and performed in accordance with a written work plan. In addition, audit findings and conclusions are required to be properly documented in working papers and results are to be communicated in a written report.

Work Products

As requested in the RFP, we will provide Commission Staff with monthly progress reports summarizing the results of discovery as well as our conclusions and recommendations related to rate base and cost of service. We will also prepare and file written testimony and provide oral testimony.

Project Management

The work plans and the related individual consultant task assignments, schedules and time estimates are the basic tools we use to manage a project of this type. In Phase I, we will work with the Staff Project Manager to reach agreement on the final scope of the project, establish the schedule and determine the level of involvement and time commitment of members of the Commission Staff who may participate in the audit. We will also ask the Commission Staff to designate a single individual to serve as our principal point of contact and will ask this individual to assist us by coordinating responses to our information requests.

In our experience, these relatively simple project management techniques are ordinarily sufficient to ensure that an audit is completed on schedule and within budget. The members of our team are committed to making this study successful and we will faithfully fulfill our schedule and time commitments in all phases of the audit.

Conclusion

The Barrington-Wellesley Group, Inc. is very well qualified and committed to successfully performing the services the Commission requires. We have worked extremely well with those that engage us and are respectful of the people and particular conditions in the organizations that are the subject of the reviews. We look forward to meeting the project manager and other members of the Commission Staff in the project to ensure that we have communicated our understanding of the objectives of the assignment and to demonstrate our commitment to the performance of a successful engagement.

CHAPTER III

PROJECT TEAM

Introduction

BWG is proposing a small project team comprised of exceptionally well-qualified consultants to provide the services the Commission requires in the two areas included in the proposal. All of our work will be performed in accordance with detailed work plans to be submitted to the project manager for approval before work in any audit area begins. The BWG Project Director will coordinate all work on the engagement and will be responsible to the Commission for all services performed on this assignment.

Project Team Personnel

The following is a brief introduction of the three members of the project team. Complete resumes are provided at the end of this section of the proposal.

Michael A. Laros. Mr. Laros is a managing director and co-founder of the Barrington-Wellesley Group, Inc. He is a Certified Management Consultant (CMC) with over twenty-five years of consulting experience. He will serve as Project Director and be responsible for directing the project team and coordinating and reporting our activities to the project manager and the Commission.

Mr. Laros was the lead consultant for affiliate earnings in the California energy market in the review of Pacific Gas and Electric's financial condition for the California PUC in the midst of the California energy crisis. He has testified as an expert regarding the reasonableness of utility management practices in a variety of civil litigation matters and in rate proceedings before the Federal Energy Regulatory Commission (FERC), and the California, Illinois, New Jersey, and Ohio state public utility commissions. Mr. Laros received his B.S. degree in industrial distribution from Clarkson College of Technology and an M.B.A. from the University of California, Berkeley.

David P. Vondle. Mr. Vondle, a Certified Management Consultant, brings over twenty-five years of management consulting experience in the utility industry. Vondle will serve as the lead consultant on this project and will be responsible for the day-to-day activities associated with this project.

He has testified as an expert witness in eight different jurisdictions, and has prepared written testimony for each of these appearances as well as others. In 2001, Mr. Vondle testified before the California Public Utility Commission regarding PG&E's gas supply and management practices as part of BWG's review of PG&E's financial solvency. Vondle has also testified before the Tennessee Public Service Commission in connection with the United Cities Gas rate case and prepared written testimony on behalf of West Penn Power in a Pennsylvania rate case and on behalf of United Cities Gas in Tennessee and Kansas rate cases.

A complete list of his expert witness / rate case experience is provided in his resume. Mr. Vondle received his B.S. in Industrial Management from the University of Akron and his M.B.A. from Southern Methodist University.

Joel F. Jeanson. Mr. Jeanson, a C.P.A., has twenty-three years of diversified utility financial management and auditing experience, primarily in the natural gas distribution utility industry. He brings the utility insider perspective to this project, having served as director of accounting, budgeting and management reporting, director of corporate performance, financial director of marketing and operations, and director of auditing in his eighteen years with a major Midwestern natural gas distribution utility. Jeanson will serve as the primary analyst on this project.

Prior to joining Indiana Gas, he was a senior auditor with Arthur Andersen. He is a member of the AICPA and the Indiana CPA Society and a past president of the Indianapolis Chapter of the Institute of Internal Auditors. Mr. Jeanson has a B.S. in business from Indiana University, with distinction, majoring in accounting.

Expert Testimony

Upon request of the Commission, either Mr. Laros or Mr. Vondle will be the firm's principal witness and sponsor of the written testimony. Compensation relating to preparation time, travel and presenting testimony is included for the two-day technical hearing indicated in the RFP. Any additional requirements will be billed at our standard compensation rates as identified in the proposal.

Michael A. Laros

BWG Co-President and Co-Founder

Summary of Qualifications

Mr. Laros is a Managing Director and co-founder of the Barrington-Wellesley Group, Inc. He is a Certified Management Consultant (CMC) with over twenty-five years of management consulting experience. He has particular expertise in the areas of utility restructuring, organizational development and major-project cost effectiveness. He has directed industry restructuring-related assignments for utility and regulatory clients in the U.S, England, Canada, and South Africa. Mr. Laros has testified as an expert regarding the reasonableness of utility management practices in a variety of civil litigation matters and in rate proceedings before the Federal Energy Regulatory Commission (FERC), and the California, Illinois, New Jersey, and Ohio state public utility commissions.

Education

M.B.A.	University of California, Berkeley (1976)
B.S.	Clarkson College of Technology (1969)

Utility Testifying Experience:

- *Expert Witness and Engagement Director* -- reviewed the reasonableness of costs incurred in remediation of electrical violations and other areas of operations regarding the Trans Alaska Pipeline System (TAPS) and provided expert testimony for the State of Alaska in a hearing before the Federal Energy Regulatory Commission.
- *Expert Witness and Engagement Director* – reviewed the reasonableness of the premature retirement of the Connecticut Yankee Atomic Power Plant. Testified before the FERC on behalf of the Connecticut Department of Public Utility Control (CDPUC) regarding the reasonableness of the shutdown and of the economic viability study sponsored by the Company in support of the decision to permanently retire the unit.
- *Expert Witness and Engagement Director* – reviewed the reasonableness of costs incurred by Pacific Gas and Electric in the design and construction of the California portion of a $1.6 billion gas pipeline. Prepared report and filed testimony before the California Public Utility Commission regarding management reasonableness and quantification of unreasonably incurred costs.

- *Expert Witness and Engagement Director* – of a prospective management audit of the project management practices employed by Public Service Electric & Gas Company during the start-up phase of the Hope Creek nuclear project. The study was the third in a series of three management audits of Hope Creek aimed at providing improvement-oriented recommendations. Testified before the New Jersey Board of Public Utility Commissioners in various phases of the rate case proceedings on the findings of the three audits regarding the reasonableness of PSE&G's management of Hope Creek.
- *Expert Witness and Engagement Director* - Provided litigation support for a major Northeastern utility involved in a civil lawsuit concerning the design and construction of a nuclear power plant. Provided and sponsored expert report quantifying the impact of the A/E's mismanagement of engineering and construction on the nuclear power plant costs.
- *Expert Witness and Engagement Director* – of a retrospective audit of the project management practices employed by Illinois Power on the Clinton nuclear project. Also performed focused studies of the "as-built" schedule, project management staff experience, start-up procedures development, and other specific issues identified by the utility's outside law firm. Testified in various phases of the rate case proceedings before the Illinois Commerce Commission.
- *Expert Witness and Engagement Director* - of reviews of the fuels management practices and procedures of Toledo Edison Co. and Cleveland Electric Illuminating Co. for the Public Utility Commission of Ohio EFC Management/Performance Audit Program. Testified before the PUCO on the reasonableness of the utilities' fuels management practices.

Other Representative Consulting Assignments:

- Lead consultant for affiliate earnings in the California energy market in the review of Pacific Gas and Electric's financial condition for the California PUC in the midst of the California energy crisis. (2001)
- *Engagement Director* - for a large northeastern electric utility on development of a strategic plan for unbundling and restructuring of the utility's transmission business unit incorporating emerging access and pricing issues.
- *Engagement Director* - provided advisory services for the Los Angeles City Council regarding the impact of the California restructuring proposals on the Los Angeles Department of Water and Power.
- *Lead Consultant* – Verification of SDG&E hourly Power Exchange Energy Credit (PX Credit) calculations to ensure compliance with Commission orders and utility advice letters. Assessed the utility's calculation methodology and audited all actual costs included in the PX Credits.
- *Engagement Director* - of organizational and strategic planning studies of the Demand Side Management and Marketing functions for a northeastern utility.

- *Project Manager* - of the Phase 1 retrospective management audit, "Assessment of the Impact of Management Practices on the Construction Expenditures of the Trans-Alaska Pipeline," for the State of Alaska. Review included all aspects of TAPS' $10 billion expenditure for the planning, management, design, and construction of the pipeline, the pump stations, and the Valdez terminal.
- *Project Manager* - of a comprehensive retrospective review of the project management practices employed by Houston Lighting and Power Co. on the South Texas Nuclear Project.
- *Engagement Director* - of audit preparation assignments for two electric utilities conducted in anticipation of commission ordered retrospective management audits of nuclear projects owned by the utility.
- *Assistant Project Manager* - of an in-depth, multiple-sponsor review that resulted in the "Study of the U.S. Utility Industry"; author of the "State of the Art of Engineering and Construction Management Practices" segment of the study. Included site visits and executive interviews covering the evolving project management practices employed by the 32 sponsors, as well as research of the E&C sections of over 40 utility-wide management audits and the management audits of several individual nuclear construction projects.
- *Lead consultant* - on a comprehensive research study of the evolution of nuclear power plant construction in the U.S. and an in-depth analysis of the factors having the greatest impact on controlling costs and minimizing cost overruns. Primary author of the resulting report, entitled "A Survey of Organizational and Contractual Trends in Power Plant Construction," which documented the changes in management practices implemented by utilities to meet their cost, schedule, and quality-assurance responsibilities and to make their involvement commensurate with the financial risk of these major projects.
- *Lead Consultant* - of a review of the fuels management practices of Dairyland Power Cooperative. Conducted an in-depth evaluation of the financing alternatives for a fleet of barges owned by the cooperative. Assisted in a competitive-bid leverage lease evaluation for a cooperative-owned unit train.
- *Consultant* - responsible for evaluating the adequacy of the financial and computer modeling aspects of generation planning performed by Sunflower Electric Cooperative, Inc., to support their decision to build a 280-MW coal plant. Study was conducted as part of a third-party review for the Kansas Corporation Commission.
- *Consultant* - on a comprehensive review of fuels procurement practices and procedures for a major Southeastern electric utility. Assignment included development of a long-range fuels procurement strategy for the company.

Previous Experience

- *Vice President / Director* - Theodore Barry & Associates (1977-1990). Responsible for TB&A's litigation support and utility industry competitive restructuring practices (1986-1990).

- *Partner* - Laros & Menezes Associates (1975-1977*).* Provided consulting services to specialty contractors and construction trade associations in the areas of planning, management, and project control.
- *Sales and marketing* - Trane Company, La Crosse, Wisconsin (1969-1974*).*

Professional Affiliations & Publications

- *Member,* Institute of Management Consultants (Certified Management Consultant since 1981)
- *Member*, Project Management Institute (since 1980).
- *Member,* Keystone National Policy Dialogue on Commercial Nuclear Reactor Decommissioning, Washington DC.
- *Publications:*

  A Survey of Organizational and Contractual Trends in Power Plant Construction, Theodore Barry & Associates, March, 1979.

DAVID P. VONDLE, CMC

Managing Consultant

Summary of Qualifications

Mr. Vondle is a managing consultant with the Barrington-Wellesley Group. He has over twenty-five years of experience in assisting clients increase sales, improve quality and service, and reduce costs. Mr. Vondle has served clients in the electric and gas utility, telecommunications, manufacturing, health care, government, and service industries. A partial list of clients served by Mr. Vondle is shown on Exhibit I. He has a special interest in the management of regulated utility distribution enterprises, including electric, gas, telephone and water. Mr. Vondle has testified as an expert witness in eight different jurisdictions.

Mr. Vondle has been designated a Certified Management Consultant (CMC) by the Institute of Management Consultants. He received his M.B.A. from Southern Methodist University and his B.S. in Industrial Management from the University of Akron.

Mr. Vondle is a published author. His book, Service Management Systems: How to Create Competitive Advantages Through Integrated Work Management, Materials Management, Facilities Management, and Cost Management Systems, was published by McGraw-Hill. Mr. Vondle is also a frequent contributor on management topics to periodicals such as Public Utilities Fortnightly, Management Review, SAM Advanced Management Journal, Small Business Reports, and others.

Mr. Vondle has accumulated a broad range of experience in his twenty-five years of consulting experience. Examples of this experience are provided below under the following headings:

A. Expert Witness Testimony
B. Management Audits
C. Business Planning, Performance Measurement, Benchmarking, Best Practices, and Balanced Scorecard
D. Process Improvement

A. EXPERT WITNESS TESTIMONY

Mr. Vondle has appeared as an expert witness on utility management topics in the following jurisdictions:

- √ *Alaska Public Utility Commission*—Contel rate case
- √ *California Senate Energy Committee* – California energy crisis
- √ *California Public Utilities Commission* – PG&E
- √ *U.S. District Court*—AT&T anti-trust trial
- √ *Florida Public Service Commission*—setting of contributions-in-aid-of-construction
- √ *Guam Public Utilities Commission*—Guam Power Authority rate case
- √ *New Mexico Public Service Commission*—Public Service Company of New Mexico's acquisition of the Gas Company of New Mexico
- √ *Tennessee Public Service Commission*—United Cities Gas rate case

Mr. Vondle has prepared written testimony for each of the expert witness appearances cited above, as well as:

- √ On behalf of West Penn Power in a Pennsylvania rate case
- √ On behalf of United Cities Gas in Tennessee and Kansas rate cases
- √ On behalf of the Missouri Public Service Commission in a Utilicorp United rate case

Mr. Vondle has also done consulting work in support of, or related to, rate cases in Massachusetts, Colorado, Georgia, Missouri, and New Jersey.

B. MANAGEMENT AUDITS

Mr. Vondle has served as an engagement director, project manager, and/or lead consultant on 27 management audits of electric, gas, telecommunications, and water utilities. Exhibit II presents representative examples of projects completed.

EXHIBIT II

COMPANY	JURISDICTION	PROJECT ROLE	YEAR
Los Angeles Department of Water and Power	City of Los Angeles	• Lead - Workforce Planning, succession planning, management and technical training, gas procurement and business information systems	2002
National Fuel Gas Corporation—Pennsylvania Operations	Pennsylvania Public Utility Commission	• Project Manager • Lead—Gas system planning, design, and construction; gas system operations and maintenance; gas supply; staffing plans and levels	1997
Central Illinois Light Company	Illinois Commerce Commission	• Lead—Organization and work force management; gas system planning, design and construction; operations and maintenance	1995
Peoples Gas Light and Coke Company	Illinois Commerce Commission	• Lead—Use of available technologies, system betterment, maintenance programs, and system mapping and records	1994
Southern California Gas Company	California Public Service Commission	• Team Leader—Distribution operations and measurement	1989

C. BUSINESS PLANNING, PERFORMANCE MEASUREMENT, BENCHMARKING, BEST PRACTICES, AND BALANCED SCORECARD

Mr. Vondle has extensive experience in assisting clients improve business processes and on the related subjects of benchmarking, best practices studies, feasibility studies, and balanced scorecard. Representative examples of these projects are listed below:

BENCHMARKING AND BEST PRACTICES CONSORTIUM

Mr. Vondle initiated, developed, and directed a Utility International Best Practices Consortium. Over its seven years of operation, the Consortium attracted thirty energy utility member participants from seven countries. The Consortium included a balanced scorecard of benchmarked performance measures covering all aspects of company operations and executive conferences that examined innovative best practices from around the world.

BALANCED SCORECARD

Project manager on an engagement to develop a balanced scorecard of key performance indicators for a large Midwestern energy utility. The indicators chosen represent the perspectives of all major stakeholders and are used to guide the business planning process and for self-evaluation.

D. PROCESS IMPROVEMENT

Mr. Vondle has extensive experience in both facilitating employee teams and in leading consultant-driven efforts for a wide variety of business process improvement programs, representative examples of which are presented below:

MAINTENANCE ORGANIZATION AND STAFFING TEAM

Project manager and lead consultant on an engagement to provide guidance and support to a gas transmission and storage compressor station employee team seeking to improve maintenance effectiveness while reducing costs. This study also included conducted a maintenance organization and staffing best practices study of other large oil and gas transmission and storage companies. The project produced practical recommendations to reduce maintenance work, compress equipment down times, decrease overtime and contractor use, and reduce the number of both supervisory and maintenance positions.

CONTRACTING AND CONTRACTOR MANAGEMENT PROCESS REENGINEERING

Lead consultant on a project for a major Midwestern gas distribution company to reengineer the contracting and contractor management processes to reduce costs and exposure to fraud. The project included contractor versus in-house employee decision-making, contractor qualification and selection, project specification writing, compensation policies, contractor quality control and evaluation, and dispute resolution.

CUSTOMER SERVICE REPRESENTATIVE AND SERVICE TECHNICIAN PERFORMANCE IMPROVEMENT TEAMS

Project manager and lead consultant on engagements to analyze and improve the service, quality, and cost performance levels for the customer service representatives and service technicians for a major Midwestern energy utility. The projects involved guiding and assisting a cross-sectional employee team of managers, professionals, supervisors and workers.

Joel F. Jeanson

Senior Associate

Summary of Qualifications

Mr. Jeanson is a Senior Associate of the Barrington-Wellesley Group, Inc. He has extensive experience in public utility finance and accounting, financial and operational auditing, corporate performance, budgeting and management reporting. He has worked in the utility industry since 1979.

Mr. Jeanson received a Bachelor of Science degree in Accounting, with distinction, from Indiana University. He has continued his studies with course work at the Indiana University Graduate School of Business and is also a graduate of the Wabash Executive Program. He is a Certified Public Accountant licensed in Indiana and Wisconsin and is a member of the American Institute of CPAs and the Indiana CPA Society. Mr. Jeanson is a past president of the Indianapolis Chapter of the Institute of Internal Auditors.

During his business career, Mr. Jeanson has directed the accounting, budgeting, corporate performance and auditing departments at a major investor owned gas distribution utility headquartered in Indiana. He began his career with a Big Five public accounting firm.

Utility Consulting Experience

- Lead consultant on project with the largest municipal utility in the United States focusing on the areas of financial management and controls and workforce planning.

- Lead consultant on project for the California Public Service Commission evaluating the effectiveness of energy efficiency programs for two major California investor-owned utilities.

Gas Distribution Utility Experience

- As director of accounting for a major Midwestern gas distribution utility, had responsibility for gas and revenue accounting as well as the general ledger and financial reporting. Issues addressed during this time included margin analysis, unaccounted for gas and the financial impact of weather on earnings. Also responsible for corporate budgeting, including oversight of the development of revenue and throughput budgets.

- As director of corporate performance and financial director of marketing and operations, was responsible for identifying and implementing performance improvement opportunities, primarily focused on marketing and field operations.

- Developed responsibility reporting process, budgets and management reports for Vectren (capital and O&M) for first year post-merger that reflected merger-related costs and savings.

- Financial lead in Vectren merger integration efforts for the various financial areas, including identification of staffing levels and cost savings opportunities and making recommendations to provide structure and direction for the company's financial organization.

- Project director for activity-based management initiative focused on internal products and services. ABM used to assess performance against other service providers, measure performance, and improve decision-making.

- Updated and enhanced monthly financial report used to review actual and projected operating results, and set direction as to action required to meet corporate financial objectives.

- Directed team that established capital expenditure guidelines, policies and procedures for new business capital investments. Introduced discounted cash flow modeling to decision-making process.

- Directed the corporate business planning and budgeting process. Integrated the strategic and operational planning processes so that departmental plans, budgets and performance measures would be focused on both continuous improvement and the accomplishment of corporate objectives – which included both financial and non-financial measures.

- Developed quarterly performance measurement reports that included non-financial as well as financial measures that tracked performance over time and across operating regions as well as against external benchmarks.

- Led customer service business process improvement initiative that assessed performance and made recommendations for improvement of all customer service processes, leading to improved customer service and reduced costs. Facilitated the development of customer service standards.

- Key member of team that completed a study to identify the services, and levels of service, that customers are willing to pay for. This study resulted in significant changes in how the company delivered services to its customers.

- Directed the service technician performance management pilot project to evaluate customer satisfaction and identify cost savings opportunities. This pilot project ultimately led to establishing processes to evaluating operating performance and quality for the entire bargaining unit workforce.

Work Experience

- Senior Associate, Barrington-Wellesley Group (2001 - present)
- Director of Accounting, Budgeting and Management Reporting, Vectren and predecessor companies. (1996 - 2001)
- Director of Corporate Performance, Indiana Gas (1992 - 1996)
- Financial Director of Marketing and Operations, Indiana Gas (1989 - 1992)
- Director of Internal Audit. (1983 - 1989)
- Senior Auditor, Arthur Andersen (1979 – 1983)

Articles and Presentations

- With Gary Gienger, Morris Jacobs, and Glen Martin, "Indiana Energy Gets a Boost from ABC/M", *As Easy As ABC*, Spring 2000.
- "ABC/ABM – A Nucleus of Performance Measurement", Global Business Research Cost Management Congress, November 1994.

CHAPTER IV

PRIOR EXPERIENCE

About the Firm

The Barrington-Wellesley Group, Inc. is a general management consulting firm providing high quality management consulting services to public utilities, regulatory agencies and other professionals serving the public utilities industry. The firm specializes in assisting its regulatory agency clients discharge their oversight responsibilities by performing management and regulatory audits and providing other services to help formulate regulatory policy and test compliance.

Partners in the firm are recognized experts in the public utilities industry. We have a dedicated group of full time employees and augment our capabilities through use of a number of independent consultants with whom we have established relationships. We combine the advantages of large firm expertise needed to successfully perform complex and sensitive assignments with small firm responsiveness, competitiveness and creativity. We have substantial experience in strategic planning, organizational planning and development, corporate performance improvement, management and operational auditing, and litigation support. We have the specialized consulting skills and experience necessary to evaluate all aspects of our client's operations effectively and objectively.

Why Barrington-Wellesley Group?

- *We know the utilities industry.* Through past studies and prior work experience, our consultants have gained a thorough understanding of the utilities business, as well as the nature, strengths, and limitations of utility regulation.
- *We have a reputation for objectivity.* We have a broad management perspective and have worked with clients on a wide range of performance, organizational and management issues. We apply our knowledge of business practices in the utilities and other industries in our search for effective solutions to our client's problems.
- *We seek pragmatic solutions.* Our conclusions and recommendations are tailored to the realities of the client's situation. They are practical, action-oriented, and aimed at improving management effectiveness, operational efficiency and service levels.
- *We have the skills and experience our clients require.* Our professional staff has the diversity of technical training, skills and experience that enables us to serve our clients across a broad range of their business needs. We have successfully performed a large number of utility organization studies and have helped clients implement performance improvement programs in all areas of their management and operations.

Whenever possible, the firm plans and conducts its assignments to maximize client participation. The firm emphasizes team building within the client organization and believes that teamwork in the client-consultant relationship is most effective in finding workable solutions to many problems.

Firm Experience and References

Since its founding in 1990, BWG has performed over thirty independent management and operational audits and regulatory compliance reviews of utility companies for regulatory commissions, governing boards and other clients. Representative assignments completed during the past five years are described in this part of the proposal, including references for some of our most recent assignments.

We selected these projects to demonstrate the firm's broad experience in a wide variety of situations requiring financial verification and testing of regulatory compliance as well as to show the firm's experience in the gas distribution industry. As can be seen, we serve clients in all segments of the public utilities industry across a broad range of subject matter. We are also pleased with the number of repeat assignments we receive from organizations we have worked with in the past and enjoy the continuity of our relationships with many of our clients.

Pacific Gas & Electric (PG&E) -- Financial Condition

BWG performed an audit of the financial condition of PG&E in the midst of the California energy crisis for the California PUC. The audit covered the following topics: credit and default relationships; power purchases and cash flow; cash conservation activities; accounting mechanisms to track stranded cost recovery; intercompany cash flows; and affiliate earnings in the California energy market. [2001]

The complete report BWG's audit of PG&E's Financial Condition can be found on the CPUC's website at: http://www.cpuc.ca.gov/static/industry/electric/electric+issues/pge_sce_audit.htm

San Francisco, CA 94102
(415) 703-2557

Philadelphia Gas Works

BWG was engaged by the Pennsylvania Public Utilities Commission (PPUC) to perform a general management audit of this large municipal gas distribution company. Under law, the PPUC assumed regulatory responsibility replacing the City of Philadelphia Gas Commission on July 1, 2000. Audit results cover the full range of operations and are directed at improved

governance, business planning, financial management, and workforce management to improve performance. (2000)

Audit of Atlantic City Electric Company Industry Restructuring Filings

On April 30, 1997, the New Jersey Board of Public Utilities (BPU) published its Findings and Recommendations relating to Restructuring the Electric Power Industry in New Jersey requiring New Jersey electric utilities to prepare unbundled rates, stranded costs, and restructuring plan filings. BWG was retained by the BPU to perform the audit of Atlantic City Electric Company's (ACE) filings.

The purpose of the audit was to determine whether or not the filings were responsive to the Board's and the State of New Jersey's goals with respect to increased competition. These goals include reduced rates, increased customer choice, and maintenance of New Jersey's competitive position in regional, national, and international markets. In addition, the audit determined whether the proposed unbundled rates and restructuring plans provided reasonable

assurance that safe, adequate, and reliable delivery of electric power would continue in the future, when customers have a choice of power suppliers.

Los Angeles County Board of Supervisors
Management Audits of the Parks and Recreation Department
Department of Public Works
Office of County Counsel

BWG has performed a number of general management audits for the Los Angeles County Board of Supervisors. An audit of the Parks and Recreation Department was completed in 2000. Audits of the Department of Public Works and Office of County Counsel were completed in 1999, and 1998, respectively.

Pacific Gas and Electric Company, San Diego Gas & Electric Company, and Southern California Edison Company

With the approval of the California Public Utilities Commission and certain independent energy service providers, BWG was engaged by the three largest California Electric Utilities to perform an audit of the Hourly PX Prices calculated by the companies and used to provide billing credits to customers obtaining electricity from alternative service providers in the deregulated California energy market. Regulatory compliance and price verification audits are being performed for the months of April 1998 through December 2000.

City of Burbank

BWG was engaged to perform a comprehensive diagnostic management audit of the City's water and electric utilities department for the Burbank City Council. The audit involved an assessment of PSD's competitive position in the emerging deregulated utilities environment, and provided recommendations in all areas of utility management and operations. Subsequently BWG assisted PSD with implementation of audit recommendations and performed a number of follow-up assignments including the quantification of PSD stranded costs (1997).

California Utilities Audit of Transition Cost Balancing Accounts and Headroom Revenues

BWG and Mitchell &Titus, LLP (a certified public accounting firm) were engaged by the California Public Utilities Commission (CPUC) to review the balances transferred to the transition cost balancing accounts and headroom revenues of the three major California electric utilities. This assignment was completed in December 1998 with the issuance of an agreed-upon special procedures report.

Headroom revenues of the utilities are determined residually in accordance with well defined regulatory requirements. Using either revenue requirements or actual rates, amounts related to transmission, distribution, nuclear decommissioning, public purpose programs, fixed transition amount, and Commission-approved obligations such as ISO and PX charges are subtracted from total revenue. Accordingly, this engagement required knowledge of the manner in which the utilities determine PX Credits in the aggregate and for individual rate schedules and

included tests of a statistically valid sample of PX charges and ESP PX credits included on customers' bills.

California Electric Utilities Stranded Cost Filings

BWG and Mitchell & Titus, LLP (a certified public accounting firm) were engaged by the CPUC to review the sunk cost and future competitive transition cost filings of the three major California electric utilities. The specific objectives of the review were to 1) verify and validate the methodology used by the companies to develop their cost estimates; 2) render an audit opinion on the accuracy of reported sunk costs; 3) determine if the future competitive transition costs claimed by each company were allowable under existing legislation or past CPUC decisions; 4) identify any inconsistencies between the companies' filings; 5) identify questioned costs and propose necessary adjustments; and 6) identify key issues for consideration by the Commission.

Key issues in the review included the determination of future costs associated with QF and other purchased power contracts, estimating the costs of contract buy-outs or buy-downs, determining which future plant additions were necessary to keep the plants operating (and recoverable through a non-bypassable customer charge) and which were primarily aimed at making a plant more cost efficient and competitive (and not directly recoverable).

Diablo Canyon Financial Verification Audit

Following the 1997 California Utilities Transition Cost Audit, BWG and Mitchell and Titus, LLP (a certified public accounting firm) were retained to perform a financial verification audit examining the Diablo Canyon nuclear power plant accounts and to express an opinion on the propriety of the financial statements. This financial verification audit evaluated the beginning balances of the Diablo Canyon transition costs included in PG&E's Competitive Transition Cost (CTC) application.

In connection with the performance of the financial audit, the project team also performed an Agreed Upon Procedures Review of Diablo Canyon Sunk Costs. In this review BWG determined the regulatory framework relating to the specific accounting items, performed detailed testing, and identified proposed adjustments or questioned costs. The final project reports were delivered in September 1998.

Connecticut Yankee Atomic Power (CY) - Economic Viability

BWG was retained by legal counsel for the Connecticut DPUC and the Attorney General of Connecticut to develop and provide expert testimony for FERC hearings relating to the economic viability of the early shutdown of the CY plant. (1997)

BWG Management and Operational Audits

BWG has performed the following audits of utilities for regulators since it's founding in 1990:

- Philadelphia Gas Works – Comprehensive -- Pa PUC (2001)
- Pacific Gas & Electric - Financial Condition -- California PUC (2001)
- Southern Connecticut Gas - Affiliate Relations -- Connecticut DPUC (2000)
- Peoples Natural Gas - Comprehensive -- Pennsylvania PUC (1994)
- New Jersey Natural Gas - Comprehensive -- New Jersey BRC (1993)
- Delta Natural Gas - Comprehensive -- Kentucky PSC (1992)
- SBC/Ameritech - Cost Allocations and Merger Savings -- Illinois Commerce Commission (2001)
- California Electric Utilities - PX Prices -- California PUC (2001)
- Nevada Power - Power Systems -- Nevada PSC (1994 and 1999)
- Department of Public Works - Comprehensive -- LA Board of Supervisors (1999)
- Connecticut Light & Power - Financial Viability -- Connecticut DPUC (1998)
- California Electric Utilities - Transition Cost Balancing Account -- California PUC (1998)
- Pacific Gas & Electric - Diablo Canyon Financial Verification - California PUC (1998)
- Atlantic City Electric - Industry Restructuring Filings -- New Jersey BPU (1998)
- Maine Yankee Atomic Power - Prudence -- Maine PUC (1997)
- California Electric Utilities-Stranded Cost Filings -- California PUC (1997)
- Connecticut Yankee Atomic Power - Economic Viability -- Connecticut DPUC and Connecticut Attorney General (1997)
- Northeast Utilities - Nuclear Operations -- Connecticut DPUC (1996)
- Connecticut Light & Power-Diagnostic -- Connecticut DPUC (1996)
- Burbank (CA) Public Service Department - Comprehensive -- City Council (1996)
- Mountain Water District - Comprehensive -- Kentucky PSC (1996)
- Pacific Bell - Customer Service -- California PUC (1995)
- US West - Affiliate Transactions -- Oregon, Washington, Idaho and Minnesota Commissions (1995)
- Pacific Gas & Electric - Pipeline Expansion -- California PUC (1995)
- Los Angeles Department of Water and Power - Diagnostic -- LA City Council (1994)
- Pacific Gas & Electric - Demand-Side Management -- California PUC (1994)
- Southern California Water - Comprehensive -- California PUC (1994)
- Southern California Edison - Research, Development & Demonstration -- CPUC (1993)

CHAPTER V

BUDGET AND TIME ESTIMATES

Cost and Price Analysis

BWG estimates professional fees for providing the requested consulting services at $48,500. We have estimated project expenses at 18% of professional fees, or $8,730 for a total not-to-exceed cost of $57,230. Exhibit V-1 provides a breakdown of the hours and professional fees estimated for each phase of work by individual consultant.

Exhibit V-1
Estimated Hours and Costs By Task and Individual

CONSULTANT	Laros	Vondle	Jeanson	Total Hours	Total Fees
PROJECT RESPONSIBILITY	Engagement Director / Testimony	Lead Consultant / Testimony	Lead Analyst		
Staffing Level	Managing Director	Managing Consultant	Senior Associate		
Rate Per Hour	$225	$175	$150		
1 – Planning / Work Prioritization	5	10	15	30	$5,125
2 – Investigation and Analysis	10	60	80	150	$24,750
3 – Written Testimony	15	20	20	55	$9,875
4 – Oral Testimony / Other Assistance	20	20	5	45	$8,750
Total Hours	50	110	120	280	
Total Fees By Individual	$11,250	$19,250	$18,000		$48,500

BWG's cost estimates incorporate the following assumptions:

- Work begins June 17, 2002 and is completed by October 8, 2002.
- The above billing rates incorporate a discount for government/non-profit organizations of approximately 13% below standard BWG billing rates.
- The final allocation of hours and resources to the requested work tasks will be determined in consultation with the NDPSC staff based on Commission priorities. BWG will only charge for time actually incurred on behalf of the client. BWG will not exceed the total estimated cost without prior NDPSC approval.
- Our quotation includes a separate estimate for travel and other project related expenses at 18% of professional fees. Based on our past experience, this is a realistic estimate of these costs for projects of this nature, giving the above

average travel costs associated with getting to Bismarck North Dakota. BWG only charges for expenses at actual cost, without any markup. BWG will comply with any NDPSC restrictions on travel expenses and expense reporting.

- Costs for additional work tasks (if any are deemed required by the NDPSC) will be estimated at the above hourly rates and presented to the Commission for approval prior to proceeding with any proposed work. BWG is prepared to participate, subsequent to the technical hearing, as a witness in additional hearings before the Commission, at the same hourly rates shown in Exhibit V-1.
- BWG agrees that this contract can be terminated at any time. BWG would expect to be given reasonable time to wind down its activities and, if appropriate, to document the work and results for future use.

Proposed Billing Methodology

Invoices will be submitted to the project manager monthly with required supporting documentation by the 10th day of the following month. Billings will be based upon actual hours expended and actual expenses incurred. Following approval of the monthly invoices, payments will be due from the NDPSC within 20 working days of their receipt of the approved invoices.

Our invoices will show the hours incurred by each individual assigned to the project and their hourly rates. Travel and other costs directly attributable to the project will be billed at cost. All invoices will be in sufficient detail to enable the project manager to identify the work completed and the corresponding charges.

CHAPTER VI

CONFLICTS OF INTERESTS AND COMPLIANCE WITH APPLICABLE AMERICANS WITH DISABILITIES ACT OF 1991 AND EEO LAWS AND REGULATIONS

Conflicts of Interest

Neither the Barrington-Wellesley Group, Inc. nor any of its employees have now or in the past had any relationship with Montana-Dakota Utilities or any company affiliated with the MDU Resources Group, Inc. In connection with our work, we regularly perform studies for other utilities and regulatory agencies, and sometimes testify in connection with these assignments. To the best of our knowledge, we currently have no assignments that would create potential conflicts of interest on this engagement. All of our current assignments and those completed within the past five years that might be of interest to the Commission are disclosed in Chapter III – Prior Experience or in the individual resumes provided in Chapter IV of the proposal.

During the course of the review, BWG and its employees will be in compliance with our internal policies concerning conflict of interest on management reviews of utilities. These policies include the following:

A. No Solicitation or Acceptance of Gifts or Favors

Neither BWG nor any of its employees or subcontractors will solicit or accept anything of value to the recipient, including a gift, loan, reward, meal, promise of future employment, favor, or service from employees or representatives of any of the entity being audited.

B. No Conflicting Employment or Contractual Relationship

Neither BWG nor any of its employees will have or acquire any employment or contractual relationship with the audited firm during the course of this audit. BWG and its subcontractors will not perform subsequent work for MDU Resources Group or affiliates for a period of two years following the completion of the review without the prior approval of the Commission.

C. No Disclosure or Use of Proprietary Information

Neither BWG nor any of its employees will disclose or use any proprietary information concerning operations of the utility that was gained by reason of our position on the review and which is not available to the general public, for corporate or personal gain or benefit, or for the gain or benefit of any other business entity or person unless we are otherwise instructed by the Commission.

D. No Financial Positions in MDU Resources Group

Neither BWG, and to the best of our knowledge do any of our proposed project team members, currently hold or have intentions to acquire any interest (financial or otherwise) in MDU Resources Group or any of its affiliated companies.

Compliance

BWG currently complies and will continue to comply with all applicable Equal Employment Opportunity laws and regulations and with the applicable provisions of the Americans with Disabilities Act of 1991.

State Capitol, 12th Floor
Bismarck, ND 58505-0480

Dear Mr. Diller

Enclosed herewith are three signed copies of the proposal of Snavely King Majoros O'Connor & Lee, Inc. to the North Dakota Public Service Commission in response to your request for proposal, dated May 10, 2002, for consulting assistance in connection with the Commission Staff's investigation of Montana-Dakota Utilities Co's gas rate increase request, Case No. PU-399-02-183.

I would be happy to respond to any questions or comments you may have concerning this proposal.

Thank you very much for this opportunity to submit our proposal.

Sincerely,

Charles W. King
President

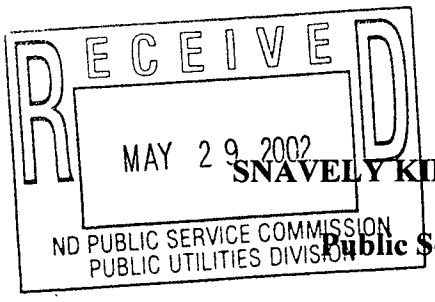
05/29/2002 CC: Comm Legal Illona, Pat, Jerry Mike .



Proposal by
SNAVELY KING MAJOROS O'CONNOR & LEE, INC
to the
Public Service Commission of North Dakota
Case No. PU-399-02-183

Snavely King Majoros O'Connor & Lee, Inc. ("Snavely King") is pleased to respond to the May 10, 2002 Request for Proposal ("RFP") from the Public Utilities Commission of North Dakota ("PSC") for expert witness consulting assistance in connection with Case No PU-399-02-183, involving Montana-Dakota Utilities' ("MDU") rates for natural gas.

I. The Firm

Snavely King, formerly Snavely, King & Associates, Inc., was founded in 1970 to conduct research on a consulting basis into the rates, revenues, costs and economic performance of regulated firms and industries. The firm has a professional staff of 10 economists, accountants, engineers and cost analysts. Most of its work involves the development, preparation and presentation of expert witness testimony before Federal and State regulatory agencies. Over the course of its 32-year history, members of the firm have participated in over 500 proceedings before almost all of the state commissions and all Federal commissions that regulate utilities or transportation industries.

II. Objective

The objective of the work contemplated in this proposal is to develop the Commission Staff's position on five issues pertaining to MDU's request for an increase in its gas rates: (1) the appropriate level of investment, (2) the appropriate cost of capital, (3) the appropriate cost of service, (4), the appropriate rate design, and (5) appropriate depreciation rates. For purposes of this proposal, issues (1) and (3) will be consolidated into the single issue of "revenue requirement"

III. Issues

A. Revenue Requirement

As noted in the attachment to the RFP, 80 percent of MDU's gas revenues are spent on the procurement of gas. As a consequence, the projection of weather-normalized sales takes on a high degree of importance in this proceeding, as does MDU's gas procurement practices. For the past five years Snavely King has participated on behalf of the D.C. Office of People's Counsel in the Gas Procurement Working Group convened by the District of Columbia Public Service Commission to examine the gas purchasing practices of the Washington Gas Light Company. We are therefore familiar with the procedures used to weather-normalize gas consumption and the pricing and contractual practices associated with the procurement of gas, gas transportation and gas storage.

There are a number of additional revenue requirements issues that were raised in MDU's electric case, Case No. PU-399-01-186, and resolved in favor of the Commission staff. These included office expenses, administrative salaries, and the Supplemental Security Income Plan. Presumably, the Company has recognized the Commission's findings with respect to these items and will not seek recovery of them again. However, it will be necessary to examine all expenditures, capital and operating, to ensure that they are fully justified by the need to serve the Company's North Dakota retail customers.

B. Cost of Capital

The Commission's decision in Case No. PU-399-01-186 also resolves many of the controversies that have arisen with resect to MDU's cost of capital, including the capital structure, the cost of debt, and the selection of comparable companies for purposes of implementing the Discounted Cash Flow procedure for estimating equity return. We expect that the rate of return to equity for MDU's gas service to be somewhat lower than the 11.8 percent found appropriate for MDU's electric service.

That is because gas distribution service is generally considered by investors to be less risky than electric service.

C. Rate Design

Gas rate designs are generally quite simple, consisting of a customer charge and a commodity charge, with the latter sometimes having a declining block structure. Gas companies prefer to increase the customer charges because they are not susceptible to the vagaries of weather, nor do they suffer attrition when customers install more fuel efficient appliances. The objection to high customer charges, particularly for residential customers, is that they cannot be mitigated by conservation, thereby diluting the benefit from improving insulation and installing more efficient furnaces.

Snavely King will defer to the Staff on the issue of whether to support a weather-normalization adjustment. There are benefits to both the Company and consumers from such an adjustment because it tends to reduce bills in unusually cold winters, even though it increases them in warmer winters. Furthermore, there is a cost of capital effect resulting from the reduction in risk to the Company's earnings stream. On the other hand, customers may react negatively to rate adjustments that are not transparent, and that appears to result from a "black box" calculation they can neither duplicate nor understand.

D. Depreciation

Snavely King is widely recognized as one of the nation's leading analysts of utility depreciation on behalf of consumer interests. Its experience goes back to the 1970s, when Snavely King acted as consulting experts to a number of state commissions and consumer advocates in the tri-annual represcriptions of depreciation rates conducted by the FCC Accounting and Audits Division. Generally, Snavely King reviews, evaluates and restates depreciation rate studies submitted by the utilities.

However, the firm has the capability to conduct a *de novo* depreciation study if it can be given access to the utility's plant records.

We confidently predict that a major depreciation issue will be cost of removal. Typically, gas utilities mark up the original cost of distribution mains for purposes of depreciation by 40 to 60 percent and customer services by 60 to 100 percent. The presumed objective of this mark-up is to account for the expected future cost of removing these facilities. Snavely King has successfully attacked this practice (most recently in Georgia[1]), and it is now subject to further challenge under the prescriptions of Financial Accounting Standard 143, *Accounting for Asset Retirement Obligations.* Removal or modification of these very large removal cost mark-ups will significantly reduce the depreciation rates for MDU's gas distribution facilities.

IV. Staffing

Charles W. King, President of Snavely King, will be the overall project director. He will also serve as the expert witness on cost of capital, gas procurement practices, weather normalization, and rate design. Michael J. Majoros, Jr., Vice President, will direct the review of MDU's accounting and depreciation presentations and will provide expert witness testimony on these issues. These two principals will be assisted by Snavely King's support staff, consisting of Margaret Kenney, Kajal Kapur, David Geisler and Caridad Garcia. Resumes of Messrs. King and Majoros are attached to this proposal.

V. Work Plan

The work tasks required for this project are those conventionally associated with rate cases, as follows:

- Review the Company's initial filing,

[1] See Order, Georgia P.S.C. Docket No. 14311-U, *Earning Review of the Atlanta Gas Light Company,* April 29, 2002.

- Prepare initial data requests,
- Evaluate the responses to the data requests and determine the availability of data to support the analysis of the issues,
- Evaluate and analyze each issue, quantitatively wherever possible,
- Prepare direct testimony,
- Respond to data requests on the prefiled testimony,
- Review and evaluate the Company's rebuttal testimony,
- Prepare data requests on the rebuttal testimony,
- Prepare surrebuttal testimony,
- Attend hearing in Bismarck, and
- Assist counsel on brief.

It is possible that some of these tasks will not be permitted under the Commission's procedures. For example, commissions do not always allow Staff to submit surrebuttal testimony. Our experience in North Dakota, however, is that such testimony is permitted, whether in prefiled form or live on the witness stand. Additionally, the "common" budget allows three days for the hearing. Our experience is that North Dakota P.S.C. hearings do not necessarily require that much time.

The attached schedule sets forth the estimated workhours of company principals and support staff for each task, subdivided by subject area. Note that separate workhour estimates are provided for "depreciation review," where the Company submits a depreciation study, and "depreciation study," where Snavely King conducts a depreciation study directly from the Company's plant records. There is a separate category called "common" covering attendance at the hearing, and it is assumed that the workhours presented would be the same regardless of the mix of assignments. The one exception would be if the Commission were to assign only one subject area, in which case the common workhours would be halved because only on Snavely King principal, not two, would attend the hearing.

VI. Budget

The attached schedule presents the fee and expense budget for each of four subject areas, with the depreciation phase shown under two scenarios, "depreciation review" if the Company submits a depreciation study, and "depreciation study" if Snavely King conducts the depreciation study from the Company's plant records. The "common" category reflects the need to send two witnesses from Washington, DC to Bismarck. As noted, if only one subject area is assigned, the fees, as well as the travel-related expenses, would be halved.

The subject area budgets are developed in isolation, that is, they reflect the assumption that only that subject would be assigned. Since there is some synergy among the subject areas, Snavely King proposes that the aggregate fee budget be reduced by 10 percent for each additional subject added. For example, if the Commission were to assign revenue requirements and cost of capital, the overall budget would be as follows:

Revenue Requirements	$19,340
Rate of Return	11,400
Common	3,840
Total Fees	$34,580
Less 10%	(3,458)
Total Fees Adjusted	$31,122
Expenses	2,880
Final Budget	$34,002

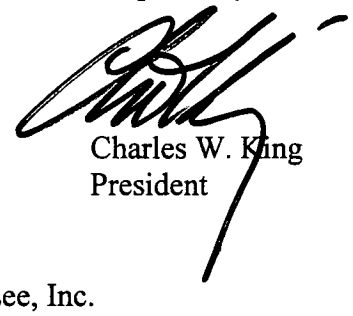
If all four subject areas were assigned, including the review of a MDU depreciation study, the budget would be as follows:

Revenue Requirements	$19,340
Rate of Return	11,400
Rate Design	7,760
Depreciation Review	22,880
Common	3,840
Total Fees	$65,220
Less 30%	(19,566)
Expenses	2,880
Final Budget	$48,534

VI. Conclusion

We believe the foregoing information responds fully to the RFP. However, we would be happy to respond to any questions or comments the Commission Staff may have concerning our firm, its staff or this proposal. Snavely King appreciates this opportunity to submit its proposal to the North Dakota Public Service Commission.

Respectfully Submitted,



Charles W. King

Michael J. Majoros, Jr.

Experience

Snavely King Majoros O'Connor & Lee, Inc.

Vice President and Treasurer (1988 to Present)
Senior Consultant (1981-1987)

Mr. Majoros provides consultation specializing in accounting, financial, and management issues. He has testified as an expert witness or negotiated on behalf of clients in more than one hundred thirty regulatory proceedings involving telephone, electric, gas, water and sewerage companies. Mr. Majoros has appeared before Federal and state agencies. His testimony has encompassed a wide variety of complex issues including taxation, divestiture accounting, revenue requirements, rate base, nuclear decommissioning, plant lives, and capital recovery. Mr. Majoros also provides consultation to the U.S. Department of Justice.

Mr. Majoros has been responsible for developing the firm's consulting services on depreciation and other capital recovery issues into a major area of practice. He has also developed the firm's capabilities in the management audit area.

Van Scoyoc & Wiskup, Inc., *Consultant (1978-1981)*

Mr. Majoros performed various management and regulatory consulting projects in the public utility field, including preparation of electric system load projections for a group of municipally and cooperatively owned electric systems; preparation of a system of accounts and reporting of gas and oil pipelines to be used by a state regulatory commission; accounting system analysis and design for rate proceedings involving electric, gas, and telephone utilities. Mr. Majoros also assisted in an antitrust proceeding involving a major electric utility. He submitted expert testimony in FERC Docket No. RP79-12 (El Paso Natural Gas Company). In addition, he co-authored a study entitled Analysis of Staff Study on Comprehensive Tax Normalization that was submitted to FERC in Docket No. RM80-42.

Handling Equipment Sales Company, Inc., *Treasurer (1976-1978)*

Mr. Majoros' responsibilities included financial management, general accounting and reporting, and income taxes.

Ernst & Ernst, *Auditor (1973-1976)*

Mr. Majoros was a member of the audit staff where his responsibilities included auditing, supervision, business systems analysis, report preparation, and corporate income taxes.

University of Baltimore - *(1971-1973)*

Mr. Majoros was a full-time student in the School of Business. During this period Mr. Majoros worked consistently on a part-time basis in the following positions: **Assistant Legislative Auditor – State of Maryland, Staff Accountant – Robert M. Carney & Co., CPA's, Staff Accountant – Noron & Wrgod, CPA's, Credit Clerk – Montgomery Wards.**

Central Savings Bank, *(1969-1971)*

Mr. Majoros was an Assistant Branch Manager at the time he left the bank to attend college as a full-time student. During his tenure at the bank, Mr. Majoros gained experience in each department of the bank. In addition, he attended night school at the University of Baltimore.

Charles W. King

Experience

Snavely King Majoros O'Connor & Lee, Inc.
Washington, DC

President (1989 to Present)
Vice President (1970 - 1989)

Mr. King, a founder of the firm and acknowledged authority on regulatory economics, brings over thirty years of experience in economic consulting to his direction of the firm's work in transportation, utility and telecommunications economics.

Mr. King has appeared as an expert witness on over 300 separate occasions before more than thirty state and nine U.S. Canadian federal regulatory agencies, presenting testimony on rate base calculations, rate of return, rate design, costing methodology, depreciation market forecasting, and ratemaking principles. Mr. King has also testified before House and Senate Committees on energy and telecommunications legislation pending before the U.S. Congress.

In telecommunications, Mr. King has testified before the Federal Communications Commission on a number of policy issues, service authorization, competitive impacts, video dialtone, and prescription of interstate depreciation rates. Before state regulatory bodies, he has presented testimony in proceedings on intrastate rates, earnings and depreciation. Mr. King recently directed analyses of the prices of services under Federal Government's FTS2000 long distance system.

In addition to his appearances as a witness in judicial and administrative proceedings, Mr. King has negotiated settlements among private parties and between private parties and regulatory offices. Mr. King also has directed depreciation studies, investment cost benefit analyses, demand forecasts, cost allocation studies and antitrust damage calculations.

In Canada, Mr. King designed and directed an extended inquiry into the principles and procedures for regulating the telecommunication carriers subject to the jurisdiction of the Canadian Transport Commission. He also was the principal investigator in the Canadian Transport Commission's comprehensive review of rail costing procedures.

EBS Management Consultants, Inc.
Washington, DC

Director, Economic Development Department (1968-1970)

Mr. King organized and directed a five-person staff of economists performing research, evaluation, and planning relating to economic development of depressed areas and communities within the U.S. Most of this work was on behalf of federal, state, and municipal agencies responsible for community or regional economic development.

Principal Consultant (1966-1968)

Mr. King conducted research on a broad range of economic topics, including transportation, regional economic development, communications, and physical distribution.

W.B. Saunders & Company, Inc.,
Washington, DC

Staff Economist (1962-1966)

For this economic consulting firm, which later merged with EBS Management Consultants, Inc., Mr. King engaged in numerous research efforts relating primarily to economic development and transportation.

U.S. Bureau of the Budget, Office of Statistical Standards

Analytical Statistician (1961-1962)

Mr. King was responsible for the review of all federal statistical and data-gathering programs relating to transportation.
