Conoco became a publicly traded company in October 1998 after DuPont conducted an initial public offering (IPO) for 30% of its oil subsidiary. DuPont issued 191.5 million shares to the public at $23 a share, for a total of about $4.4 billion. In August, 1999, DuPont conducted a tax-free spinoff of the remaining 70% of Conoco stock to DuPont shareholders, giving the entire divestiture a transaction value of about $21 billion.

BUSINESS: Conoco is an integrated energy company engaged in the exploration for, development, production and sale of crude oil, natural gas, the refining of crude oil and other feedstocks into petroleum items, and the distribution of petroleum products. Daily 2001 prod.: oil, 322,000 barrels; natural gas, 2.0 bill. cub. feet. Reserves at 12/31/01: 1,153 mill. bbls. oil; 6,029 bill. cu. ft. gas. Average 5-yr. finding costs per barrel: $4.67 (vs. ind. avg. $4.28). 5-yr. replacement rate 119% (vs. ind. avg 145%). Has about 20,000 employees. FMR Corporation owns 12.4% of common stock; Officers & directors own 2.4% (4/02 proxy). Chrmn., Pres. & CEO: Archie Dunham, Inc.: DE. Addr: 600 North Dairy Ashford Road, Houston, TX 77079. Tel: 281-293-1000. Internet: www.conoco.com.

Our 2002 share-net estimate for Conoco is now $1.70, a reduction of $0.10. The revision reflects the weakness in oil prices and the extremely narrow margins available in the downstream arena in the March quarter. Energy prices have since risen and refining margins have widened, but by not enough to completely offset the difficult operating environment experienced by Big Oil at the beginning of 2002. **The planned merger of equals between Conoco and Phillips Petroleum remains on track.** Under the terms of the deal, each Conoco shareholder would receive .4677 of a share of Phillips stock for each Conoco share owned. Each Phillips share would then be exchanged for one share of the new entity to be called ConocoPhillips. All told, Conoco shareholders would own 43.3% of the new company. James Mulva, Phillips CEO, would become president and CEO of the combined entity, while Archie Dunham, Conoco chairman and CEO, would become chairman. **We believe the merger is a positive for Conoco's shareholders.** Although the deal offers a very minimal premium for owners of COC stock, it seems like a fair proposal, since Conoco shareholders would hold equity in a more competitive company (see below). The merger, which is still scheduled to be completed in the second half of 2002 (FTC approval is expected to be forthcoming) and is excluded from our financial presentation until then, would be accretive to earnings and cash flow within the first year of the merger. In fact, our projections call for ConocoPhillips to generate annual pretax savings from synergies of about $750 million. **Assuming the deal goes through,** ConocoPhillips' reserves would total 8.7 million barrels of oil equivalent (BOE), with annual production of 1.7 million BOE. Its balance sheet would benefit, with a debt-to-capital ratio in the 30% to 35% range. **The merger will likely accelerate Conoco's long-term share-earnings growth,** due to the aforementioned cost-savings synergies, and higher volumes. As a result, we advise Conoco stockholders to tender their shares for Phillips stock. In the meantime, our projections call for Conoco to deliver solid 3- to 5-year total returns as a stand-alone entity.

Charles Clark *June 21, 2002*

(A) Based on primary earnings in 1998 and diluted thereafter. There are no share earnings in 1997 since Conoco was not yet a publically traded entity. Next ergs. report due late July.

(B) Next dividend meeting in late July. Goes ex in mid-Aug. Approximate dividend payment dates: 30th of March, June, September, and December.

(C) In millions

BUSINESS: Frontier Oil Corporation is an independent energy company engaged in crude oil refining and wholesale marketing of refined petroleum products. It operates refineries in Cheyenne, Wyoming and El Dorado, Kansas with a total crude oil capacity of roughly 156,000 barrels per day. The company focuses its marketing efforts in the Rocky Mountain and Plains States regions of the United States. Has about 730 employees. Ingalls & Snyder owns 12.0% of common stock; Oppenheimer Funds, 11.4%; officers and directors, 7.0% (3/02 proxy). Chairman, President, and CEO: James R. Gibbs. Incorporated: Wyoming. Address: 10000 Memorial Drive, Suite 600, Houston, Texas 77024-3411. Telephone: 713-688-9600. Internet: www.frontieroil.com.

Frontier Oil Corporation's earnings per share have dropped dramatically thus far in 2002 compared to the previous year. This can be attributed, in large part, to contracting crude oil differentials, reflecting production curtailments by OPEC. On the positive side, sales volumes and yields for the energy company have been higher, made possible by an initiative to convert chemicals production to gasoline at the El Dorado Refinery. Furthermore, refinery operating expenses have been down relative to 2001, attributable partly to decreased natural gas costs and usage. Assuming only minimal improvement in crude oil differentials, we believe that earnings per share will decrease substantially this year. Nevertheless, **the company appears to have sound 3- to 5-year prospects.** Its El Dorado and Cheyenne refineries are quality assets, as they have the ability to process heavier, less expensive types of crude oil while still producing a significant percentage of gasoline, diesel fuel, and other high-margin refined products. What's more, Frontier's operations are concentrated in the Plains States and Rocky Mountains regions, which are among the most profitable refined product markets in the U.S. Lastly, we look for the energy company to strengthen its position via purchases of additional refineries. (Future acquisitions have been excluded from our presentation, however, due to the many uncertainties involved.)

The equity's price has decreased considerably since our last report in March, stemming partly, it seems, from investors' gloomy near-term outlook on crude oil differentials. And for the coming six to 12 months, it's ranked to be just an average market performer. But these shares offer excellent price-recovery potential, as supported by our positive earnings projections. They are most appropriate for risk-tolerant accounts, though, in view of the below-average Safety rank and low Price Stability rating.

BUSINESS: Holly Corporation is a refiner and marketer of petroleum products. Chief markets for 60,000 barrel-per-day Navajo refinery near Artesia, NM are in Arizona, New Mexico, and Texas. 2000 sales mix: Gasoline, 59%; Diesel fuel, 21%; Jet fuel, 11%; Asphalt, 5%; LPG and other, 4%. Also operates transportation pipelines, terminals, and a 7,000 B/D refinery at Great Falls, Montana. Invests in oil & gas exploration/production. '01 deprec. rate: 7.1%. Est'd plant age: 6 years. Has 520 employees, 1,800 shareholders. Officers & Dirs. hold 18% of stock; Brown Bros. Harriman, 20%; ESOP, 10%; 2 funds, 16% (11/01 proxy). Chrmn. and CEO: Lamar Norsworthy. Inc.: Del. Address: 100 Crescent Court, Dallas, TX 75201. Tel.: 214-871-3555. Web: www.hollycorp.com.

Earnings have declined for Holly Corporation. Over the past couple of quarters, crude oil prices have increased without a corresponding rise in finished product prices. As a result, margins have deteriorated and profits have dropped for Holly Corporation and the industry as a whole. The decline is particularly evident when compared to last year's earnings, which benefited from high prices for the refined products. Recent results were also hurt by two planned maintenance turnarounds at the Navajo Refinery.

The company continues to defend itself in the Longhorn lawsuit. Recently, the Texas district court denied Holly's motion for a summary judgment in the lawsuit brought on by Longhorn Partners Pipeline. The suit, which has been pending since August of 1998, claims that Holly supported separate litigation against Longhorn regarding a Texas pipeline. It's possible that Holly will prevail in the lawsuit. However, if Holly were to lose, we anticipate it will be unlikely the cost will be anywhere near the $1 billion Longhorn is seeking. There is a good deal riding on the decision though, since under certain conditions, the Longhorn Pipeline, once in operation, could overload the El Paso region with refined products. In the meantime, the litigation is not affecting Holly's capital expenditure budget.

We expect earnings to recover down the road. The summer driving season will likely generate better demand for the upcoming quarters. This will help margins, which already showed improvement in the latter stages of the April quarter. What's more, the ongoing operational enhancements should help the company's earnings recover. Furthermore, Holly has solid financials, which will enable it to invest in internal expansion and possibly acquisitions. All told, we expect profits to bounce back, albeit not to the levels achieved in fiscal 2001 (year ends July 31st).

Holly shares have some appeal. The company's results have been down of late due to poor industry fundamentals. The lawsuit aside, we anticipate the worst is in the past, and earnings should begin to pick up. Based on our 3- to 5-year earnings projections, this untimely stock provides above-average appreciation potential.

Evan J. Rosenthal *June 21, 2002*

(A) Fiscal year ends July 31st. (B) Diluted earnings. Excludes nonrecurring gains (losses): '87, (22¢); '93, (12¢); '95, 69¢. Excludes inventory writedown FY'99, 42¢; inventory recovery FY'99, 42¢. BUSINESS: Tesoro Petroleum Corporation refines and markets petroleum products and provides marine services in the Gulf of Mexico and the West Coast. Operates 677 retail stations. Refineries located in Kenai, Alaska, Oahu, HI, Anacortes, WA, Salt Lake City, UT, Mandan, ND, and San Francisco, CA. Acquired CA refinery 5/02; ND, 9/01; UT, 9/01; HI, 5/98; WA, 8/98. Divested E&P operations, 12/99. 2001 refinery throughput 290,000 bbl./day (74.4% of capacity). Has about 3,300 employees; 3,500 shareholders. Officers and directors own 5.4% of common stock (5/02 Proxy). President & CEO: Bruce Smith. Incorporated: Delaware. Address: 8700 Tesoro Dr., San Antonio, TX 78217. Telephone: 210-828-8484. Internet: www.tesoropetroleum.com.

Tesoro Petroleum has completed the purchase of the Golden Eagle, CA, refinery from Valero. Terms of the transaction were altered at the last minute to stave off concerns that Tesoro might face liquidity problems, given the precipitous decline in West Coast refining margins and the company's lofty debt load. In the end, Tesoro paid $1.075 billion for the assets, $50 million less than it originally planned. Valero also agreed to loan Tesoro $150 million with a below-market interest rate and contribute an additional $25 million to an ongoing capital improvement project. The deal was mostly financed with debt, boosting Tesoro's debt-to-capital ratio close to 70%, and at a time when there is significant uncertainty regarding the outlook for refining margins. By amending the transaction and reducing capital spending plans for the rest of the year, the company was able to avoid tapping its $250 million revolving credit facility, leaving some financial flexibility if operating conditions worsen.

Tesoro has aggressively acquired refining and marketing facilities during the past few years as part of a plan to become an industry leader. Debt levels have swelled as a result. Refining margins were well above average during much of the expansion period, enabling it to generate enough cash flow to cover its needs. But when margins plummeted in the first quarter, the company borrowed to cover its operating expenses. Leverage is even higher now, and although tougher environmental standards are likely to benefit margins in California, we think that spreads will remain volatile, potentially exposing the company to significant liquidity risk.

Tesoro shares are a highly speculative proposition at this juncture. If industry conditions remain consistently strong over the next several years, our projections may well prove conservative. The ultracompetitive nature of the refining industry makes this far from a sure thing, however, and the hefty leverage adds substantial risk.

BUSINESS: EnCana Corp., formerly PanCanadia Energy Corp., explores for and produces crude oil, natural gas, natural gas liquids, and sulfur, primarily in western Canada, as well as offshore Canada, and the Gulf of Mexico. Net proven reserves at 3/31/01 (after royalty): conventional crude oil and natural gas liquids, 399 million barrels; natural gas, 2.9 billion cubic feet. 2001 daily production (after royalty): oil, 97.7 kbbls.; natural gas liquids, 13.5 kbbls.; natural gas 940 mmcf. Net landholdings: 24.6 mill. net acres (2.9 mill. developed and 21.9 undeveloped). '01 depr. rate, 5.8%. Has approx. 1,755 employees. Pres. & CEO: Gwyn Morgan. Inc.: Canada. Addr.: P.O. Box 2850, Calgary, Alberta, Canada T2P 2S5. Tel.: 403-290-2000. Internet Addr.: www.pancanadian.ca.

EnCana has resulted from the merger of PanCanadian Energy with Alberta Energy. The transaction was completed in early April, and the newly formed company has one of the largest exploration and production businesses in North America. The driller reported pro forma results of $0.36 per share for the first period. However, year-over-year comparisons are difficult, due to the merger, as well as the discontinuation of some midstream and marketing operations.

The company is integrating newly acquired operations well. There has been a reduction of staff by about 5%. And, there will likely be further reductions going forward. The company also plans to sell some of its assets, probably about $1 billion. The merger should generate significant cost savings, and lower some equipment and capital expenditures. EnCana's debt-to-capital level is at about 35%, which should allow the company to acquire companies without becoming overleveraged.

Production remains strong and will likely increase at about 6%-10% annually, going forward. On a pro forma basis, production of oil equivalents rose about 12% year over year. However, lower prices for most commodities have caused revenues to be a bit sluggish. Natural gas prices were weak and have declined almost 63%, year over year. And, oil prices, although rebounding a bit, still remain down about 12%, compared to the year-ago period. The company expects production to be about 60% oil projects, and about 40% natural gas, going forward. EnCana has a large base of assets, and recent acquisitions in the U.S. Rocky Mountains, should add to production capabilities.

We expect earnings to increase at about 15% annually over the next few years. The company has several projects, such as coal bed methane production, and power generation, that should add to its diversified energy production.

These shares have not moved much since our March report. This likely reflects investors' concern over the merger, as well as the volatility of energy prices. Our current projections indicate that these shares offer slightly below-average appreciation potential for the next 3- to 5-years.

BUSINESS: Marathon Oil Corporation is an integrated oil company. Daily 2001 production: oil, 209,000 barrels; natural gas, 1.3 billion cubic feet. Reserves at 12/31/01: 570 million barrels of oil; 2.9 trillion cubic feet of natural gas. Average 5-yr. finding costs: $6.95 per bbl. (vs. ind. avg. $4.28). 5-yr. reserve replacement rate, 107% (vs. ind. avg. 145%). Daily refining capacity, 935,000 bbls. Markets to 5,970 stations. Capital employed by segment: Upstream, 56%; Downstream, 42%; Other, 2%. Has 30,671 employees. Barclay's, Capital Securities owns 6.9% of stock; Capital Research, 5.9% (4/02 Proxy). Chairman: Thomas Usher. CEO & President: Clarence Cazelot, Jr. Inc.: DE. Address: 5555 San Felipe Rd. Houston, TX 77056. Tel.: 713-296-4129. Internet: www.marathon.com.

Marathon Oil stock shows few signs of soon being able to break out of the trading range it has been in since 1996. Earnings volatility is a big factor. Share net in 2002 will likely approximate the level of six years past, albeit with wide swings in between. Poor pricing conditions in this year's first quarter, which gave rise to weak earnings, reinforce the notion that Marathon's bottom line is largely captive to forces beyond its control.

Earnings should nevertheless perk up over the next 18 months. That's essentially due to improved price realizations, of course, both at the gasoline pump, and for Marathon's oil and natural gas production. Overall, oilfield production should be flat in 2002, unless Marathon can make some more acquisitions. There's greater profit potential in 2003, assuming margins hold up and the company makes headway with its drilling program.

Marathon Oil is relying on a recent large acquisition and some fill-in projects to sustain growth. The $1 billion, January purchase of natural gas interests in Equatorial Guinea will shore up hydrocarbon reserves nicely for the next few years, reversing a downtrend in this area. The move has sizable expansion potential, and, in conjunction with investments in the Rockies, Alaska, Norway, and the Gulf of Mexico, may lead to moderately higher production down the road.

The rise in financial leverage is a burden. It will take a few years to pay down the debt taken on to pay for this year's big purchase and to consummate the split-up with U.S. Steel. Marathon still enjoys very good cash flow, though, and we don't see a threat to its credit rating at this juncture.

The shares offer good long-term possibilities. In addition to changeable business conditions, the stock has been held back by asset writedowns and a lack of drilling success. Assuming Marathon can get some growth out of its development projects, find more oil, avoid writeoffs, and keep its refining division running smoothly, earnings, and the stock price, should benefit. The dividend should also rise in time, and the yield, well above average, contributes to very respectable total return potential out to 2005-2007. But the stock is untimely for the months ahead.

PROSPECTUS

$150,000,000
Secured Medium-Term Notes
MDU RESOURCES GROUP, INC.

MDU Resources Group, Inc. (the "Company") intends from time to time to offer up to $150,000,000 aggregate principal amount of its Secured Medium-Term Notes (the "Notes") as an additional series of the Company's first mortgage bonds having maturities ranging from 9 months to 35 years from the date of issuance. Each Note will bear interest at a rate determined by the Company at or prior to the sale thereof. The aggregate principal amount, interest rate, interest payment dates, purchase price, maturity and redemption terms, if any, of each issue of the Notes will be set forth in a Prospectus Supplement or Prospectus Supplements (the "Prospectus Supplement") including Prospectus Supplements to be filed with respect to each issuance and sale of Notes. The terms upon which each issuance and sale of Notes are offered, together with the names of the agents (the "Agents") and the Agents' commissions or discounts, if applicable, will also be set forth in Prospectus Supplements.

THESE SECURITIES HAVE NOT BEEN APPROVED OR DISAPPROVED BY THE SECURITIES AND EXCHANGE COMMISSION OR ANY STATE SECURITIES COMMISSION NOR HAS THE SECURITIES AND EXCHANGE COMMISSION OR ANY STATE SECURITIES COMMISSION PASSED UPON THE ACCURACY OR ADEQUACY OF THIS PROSPECTUS. ANY REPRESENTATION TO THE CONTRARY IS A CRIMINAL OFFENSE.

The Company may sell the Notes through underwriters, dealers or agents, or directly to one or more purchasers. The Prospectus Supplement will set forth the names of underwriters, dealers or agents, if any, any applicable commissions or discounts and the net proceeds to the Company from the sale of the Notes. See "Plan of Distribution" for possible indemnification and contribution arrangements for the Agents.

The date of this Prospectus is April 6, 1992

AVAILABLE INFORMATION

The Company is subject to the informational requirements of the Securities Exchange Act of 1934, as amended (the "Exchange Act"), and in accordance therewith files reports, proxy statements and other information with the Securities and Exchange Commission (the "Commission"). Such reports, proxy statements and other information can be inspected and copied at the public reference facilities maintained by the Commission at 450 Fifth Street, N.W., Washington, D.C. and at its regional offices at 75 Park Place, New York, N.Y. and 500 West Madison Street, Chicago, Ill. Copies of such materials can be obtained from the Public Reference Section of the Commission at 450 Fifth Street, N.W., Washington, D.C. 20549 at prescribed rates. Such reports, proxy statements and other information can also be inspected at the offices of the New York Stock Exchange, Inc., on which certain of the Company's securities are listed.

INCORPORATION OF CERTAIN DOCUMENTS BY REFERENCE

The following document filed by the Company with the Commission under the Exchange Act is incorporated herein by reference:

The Company's Annual Report on Form 10-K for the year ended December 31, 1991.

All documents subsequently filed by the Company pursuant to Sections 13(a), 13(c), 14 or 15(d) of the Exchange Act prior to the termination of the offering of the Notes shall be deemed to be incorporated by reference herein and to be a part hereof from the date of filing of such documents.

The Company hereby undertakes to provide without charge to each person, including any beneficial owner, to whom a copy of this Prospectus is delivered, upon written or oral request of any such person, a copy of any or all of the documents referred to above which have been or may be incorporated by reference in this Prospectus, other than exhibits to such documents not specifically incorporated by reference herein. Requests for such copies should be directed to Office of the Treasurer, MDU Resources Group, Inc., 400 North Fourth Street, Bismarck, North Dakota 58501, telephone (701) 222-7900.

THE COMPANY

The Company is a diversified natural resource company which was incorporated under the laws of the State of Delaware in 1924. Its principal executive offices are at 400 North Fourth Street, Bismarck, North Dakota 58501, telephone (701) 222-7900.

Montana-Dakota Utilities Co., the public utility division of the Company, provides electric and/or natural gas distribution service at retail in North Dakota, eastern Montana, northern and western South Dakota and northern Wyoming, and owns and operates electric power generation and transmission facilities. The Company, through its wholly-owned subsidiary, Centennial Energy Holdings, Inc., owns Williston Basin Interstate Pipeline Company ("Williston Basin"), Knife River Coal Mining Company ("Knife River"), the Fidelity Oil Group (comprised of Fidelity Oil Co., Fidelity Oil Holdings, Inc., and High Plains Gas Company) and Prairielands Energy Marketing, Inc. ("Prairielands"). Williston Basin produces natural gas and provides wholesale natural gas sales, underground storage and transportation services through an interstate pipeline system serving Montana, North Dakota, South Dakota and Wyoming. Knife River surface mines and markets low sulfur lignite coal. The Fidelity Oil Group owns oil and natural gas interests in the western United States, the Gulf Coast and Canada through investments with several oil and natural gas producers, and holds a minority equity position in one of those producers. Prairielands seeks new energy markets as well as methods to enhance and retain present markets for natural gas, which include buying, selling and arranging transportation services to end users, pipelines and local distribution companies.

FINANCING PROGRAM

Depending upon market conditions, the Company expects to offer all or a portion of the Notes and/or first mortgage bonds up to a maximum aggregate principal amount of $150,000,000. The Company also expects to have short-term borrowings outstanding from time to time during such period.

CERTAIN FINANCIAL INFORMATION(1)
(Dollars in Thousands)

	Years Ended December 31,		
	1989	1990	1991
Income Summary:			
Operating revenues	$343,502	$334,077	$367,311
Operating income	84,715	78,433	85,303
Net income	36,740	27,927	38,017

	December 31, 1991	
	Amount	%
Capital Structure:		
Long-term debt (including unamortized net discount)	$222,923	41.5
Preferred stock (including premium)	17,400	3.2
Common stock	296,605	55.3
Total(2)	$536,928	100.0

(1) This information should be read in conjunction with the Company's Annual Report on Form 10-K for the year ended December 31, 1991.

(2) Includes obligations due within one year. Does not reflect the redemption by the Company on March 18, 1992, of $1.0 million of its First Mortgage 7¾% Sinking Fund Bonds, due October 15, 1992, and $9.4 million of its First Mortgage Bonds, 7⅛% Series due November 1, 1993.

RATIO OF EARNINGS TO FIXED CHARGES

The following table sets forth the consolidated Ratio of Earnings to Fixed Charges for the periods indicated:

Years Ended December 31,				
1987	1988	1989	1990	1991
2.10	2.25	2.37	1.99	2.49

The Ratio of Earnings to Fixed Charges represents, on a pretax basis, the number of times earnings cover fixed charges. Earnings consist of net income, to which have been added fixed charges and taxes based on income. Fixed charges consist of interest on funded indebtedness, other interest, amortization of net discount on debt and the interest portion of all rentals charged to income.

USE OF PROCEEDS

Unless otherwise set forth in a Prospectus Supplement, the net proceeds from the sale of the Notes will be used to retire certain of the Company's outstanding senior securities, including the refunding of outstanding first mortgage bonds, and for other general corporate purposes.

PLAN OF DISTRIBUTION

The Notes may be offered on a continuing basis by the Company through the Agents, each of which will agree to use its reasonable efforts to solicit offers to purchase the Notes. The Company may also sell the Notes to any of the Agents at negotiated discounts for its own account or for resale to one or more investors at varying

prices related to prevailing market prices at the time of resale, as determined by such Agent, or for resale to one or more dealers at a discount, as determined by such Agent.

The Agents with respect to the offer and sale of any issue of the Notes will be named in the Prospectus Supplement relating thereto. The Prospectus Supplement will also describe the discounts and commissions to be allowed or paid to the Agents.

Under agreements which may be entered into by the Company with the Agents, Agents who participate in the distribution of the Notes may be entitled to indemnification by the Company against certain liabilities, including liabilities under the Securities Act of 1933, or to contribution by the Company with respect to payments which the Agents may be required to make in respect thereof.

DESCRIPTION OF NOTES

General

The Notes constitute a series of first mortgage bonds under and secured by an Indenture of Mortgage dated as of May 1, 1939, from the Company to The New York Trust Company and A.C. Downing (The Bank of New York, successor Corporate Trustee, W.T. Cunningham, successor Individual Trustee), as Trustees, and indentures supplemental thereto, including the Forty-fifth Supplemental Indenture which contains a Restatement of the Indenture, and which may include one or more supplemental indentures relating to the Notes, all of which are collectively referred to as the "Indenture." All of the first mortgage bonds issued and outstanding under the Indenture, including the Notes, are hereinafter referred to as "First Mortgage Bonds."

The Notes will be issuable only in registered form, without coupons, in denominations of $10,000 and integral multiples thereof and will be exchangeable for other Notes of the same series with the same interest rate, maturity and other terms, in equal aggregate amounts. No service charge will be made to holders of Notes for any transfer or exchange of Notes, but the Company may require payment of a sum sufficient to cover any tax or governmental charge incident to the transfer or exchange. Transfers and exchanges of Notes may be made at the Corporate Trust Office of The Bank of New York, New York, New York.

Reference is made to the Prospectus Supplement for the following terms relating to each of the Notes (among others): (i) the designation, series and aggregate principal amount of the Notes; (ii) the percentage of their principal amount at which such Notes will be issued; (iii) the date on which the Notes will mature; (iv) the rate per annum at which the Notes will bear interest; (v) the dates on which such interest will be payable; (vi) the place where the principal of and interest on the Notes will be payable; (vii) redemption terms, if any; and (viii) any other terms or provisions relating to such Notes which are not inconsistent with the provisions of the Indenture.

The following statements are, in part, summaries of certain provisions contained in the Indenture and do not purport to be complete. Certain of the terms used herein without definition are defined in the Indenture, to which reference is made for a complete statement of the terms and conditions of the Notes.

Redemption of Notes. Reference is made to the Prospectus Supplement for the redemption terms of the Notes, if any. If, at the time notice is given, the redemption monies are not on deposit with the Corporate Trustee, the redemption may be made subject to their receipt on or before the date fixed for redemption and such notice shall be of no effect unless such monies are received. (45th Supp. Ind., Part II, Art. V.)

Security. In the opinion of General Counsel for the Company, the Notes will be secured, together with all other First Mortgage Bonds now or hereafter issued under the Indenture, by a valid and direct first mortgage lien on substantially all of the fixed properties owned and all franchises held by the Company, subject to the lien of taxes for the current year and the lien of taxes and assessments not yet delinquent and to certain exceptions and reservations which do not, in the opinion of such counsel, materially affect the Company's title to or its right to use such properties. There are excepted from the lien cash, receivables and securities (including the capital stock of Centennial, Williston Basin, Knife River, the companies comprising the Fidelity Oil Group, Prairielands and any other subsidiaries); certain contracts; merchandise, appliances, materials or supplies; electric energy, gas, steam and certain other products; and automobiles, tractors, ships,

railroad cars and aircraft and various other transportation equipment. The property of subsidiaries, including Centennial, Williston Basin, Knife River, the companies comprising the Fidelity Oil Group and Prairielands, is not subject to the lien of the Indenture. The Company may release property subject to the lien of the Indenture against various credits, including property which is already also subject to the lien, but which has not yet been used as a credit under any provisions of the Indenture. Property not used as the basis for the issuance of First Mortgage Bonds or otherwise as a credit under the Indenture may in effect be released without substitution of equivalent property. The Company has released basically all of its gas production and pipeline-related property (but not its gas distribution property) from the lien of the Indenture and has transferred such property to Williston Basin. The Trustee has a security interest in certain of such property transferred as a result of related purchase money mortgages.

The Indenture contains provisions for subjecting to the lien thereof property which the Company may hereafter acquire, subject to liens existing thereon at the date of acquisition, and to limitations in the case of consolidation, merger or sale of substantially all of the Company's assets. (Orig. Ind., Granting Clauses; 45th Supp. Ind., Part II, Art. XII.)

Issuance of Additional Bonds. The Company may issue additional First Mortgage Bonds ranking equally with the Notes in a principal amount equal to (a) 70% of the net bondable value of property additions acquired by the Company, (b) the amount of cash deposited with the Corporate Trustee, and (c) the amount of refundable First Mortgage Bonds surrendered to the Corporate Trustee. (45th Supp. Ind., Part II, Secs. 3.04, 3.05 and 3.06.)

The Notes will be issued against property additions, refunded First Mortgage Bonds and/or the deposit of cash. On December 31, 1991, the Company had approximately $52.5 million of available property additions and $85.7 million of refunded First Mortgage Bonds. See "Description of Notes-Seeurity."

With certain exceptions in the case of (c) above, additional First Mortgage Bonds may be issued only if net earnings of the Company available for interest after depletion, as defined in the Indenture, for any twelve consecutive calendar months within the fifteen calendar months immediately preceding the month in which the application for such additional First Mortgage Bonds is made, are in the aggregate equal to at least two times the amount of the annual stated interest charges on all First Mortgage Bonds thereafter to be outstanding, and on all permitted equal or prior lien debt, if any. (45th Supp. Ind., Part II, Secs. 1.01 and 3.03.) For the twelve months ended December 31, 1991, the net earnings of the Company available for interest after depletion were $62.6 million or 3.8 times the annual stated interest charges on all First Mortgage Bonds and permitted equal or prior lien debt outstanding on that date, which would have permitted the Company to issue approximately $175.0 million of First Mortgage Bonds.

Property available for use as property additions includes property useful in the energy business in any form (other than gas but including gas distribution property) and water and steam heat property. Such property may be located anywhere in the United States of America or its coastal waters and may also include space satellites (including solar power satellites), space stations and other analogous facilities. (45th Supp. Ind., Part II, Sec. 1.01.)

Restrictions on Dividends. So long as any of the Notes are outstanding, the Company may declare and pay dividends in cash or property on its common stock only out of Surplus, as defined, or out of net profits for the fiscal year or the preceding fiscal year. However, the Company may not pay dividends out of net profits if the Capital of the Company, as defined, has been diminished to a specified extent.

Maintenance and Depreciation Provisions. The Company is required to make such expenditures as shall be necessary to maintain the mortgaged property in good repair, except that the Company may abandon any property, and to make provisions for depreciation and for depletion of depletable fixed assets in accordance with good accounting practices and in accordance with any applicable rules of any regulatory authority having jurisdiction. (45th Supp. Ind., Part II, Sec. 6.06.)

Modification of the Indenture. Modifications of the terms of the Indenture may be made with the consent of the Company by an affirmative vote of at least 60% in principal amount of outstanding First Mortgage

Bonds and of at least 60% in principal amount of outstanding First Mortgage Bonds of any series especially affected by such modification; but no such modification may be made which will affect the terms of payment of the principal at maturity of, or interest on, any First Mortgage Bond. (45th Supp. Ind., Part II, Art. XV.)

Events of Default. "Events of default" include the failure to pay principal, failure for 30 days to pay interest or to make any required deposit in any fund for the purchase or redemption of First Mortgage Bonds (including any sinking fund or improvement and sinking fund), failure for 90 days after written notice to perform any other covenant, and various events in bankruptcy or insolvency. (45th Supp. Ind., Part II, Art. IX.)

The Trustees are required to give notice to Bondholders of any continuing event of default known to them, but other than for a default in the payment of principal or interest or a sinking fund installment, the Trustees may withhold such notice if the responsible officers of the Corporate Trustee in good faith determine that such withholding is in the interests of the Bondholders. (45th Supp. Ind., Part II, Sec. 13.03.)

The Company must file an annual certificate with the Corporate Trustee as to compliance with the Indenture.

Concerning the Trustees. In the regular course of business, the Company may obtain short-term funds from several banks, including The Bank of New York. For information relating to the issuance of letters of credit by The Bank of New York on behalf of Centennial in connection with a 1989 settlement agreement effected with Atlantic Richfield Company related to certain contract litigation, see "Liquidity and Capital Commitments" in the Company's Annual Report on Form 10-K for the year ended December 31, 1991.

EXPERTS

The Company's consolidated financial statements incorporated in this Prospectus by reference to the Company's Annual Report on Form 10-K for the year ended December 31, 1991, have been audited by Arthur Andersen & Co., independent public accountants, as set forth in their report incorporated therein, and are incorporated herein in reliance upon such report and upon the authority of said firm as experts in auditing and accounting.

The information set forth in the estimates dated January 9 and 21, 1992, of Ralph E. Davis Associates, Inc. concerning natural gas reserves and oil reserves incorporated by reference in the Company's Annual Report on Form 10-K for the year ended December 31, 1991, has been reviewed and verified by Ralph E. Davis Associates, Inc. and has been incorporated herein in reliance upon the authority of said firm as experts.

The information set forth in the report dated January 20, 1989, of Paul Weir Company Incorporated relating to lignite coal reserves of Knife River incorporated by reference in the Company's Annual Report on Form 10-K for the year ended December 31, 1991, has been reviewed and verified by Paul Weir Company Incorporated and has been incorporated herein in reliance upon the authority of said firm as experts.

LEGAL OPINIONS

The validity of the Notes will be passed upon for the Company by Lester H. Loble, II, Esq., General Counsel for the Company, and also by Reid & Priest, 40 West 57th Street, New York, New York 10019, and for any Agent by Berlack, Israels & Liberman, 120 West 45th Street, New York, New York 10036. Reid & Priest and Berlack, Israels & Liberman will rely on Lester H. Loble, II, Esq. with respect to matters of local law.

Authorized Rate of Return On Common Equity: An Annual Survey of Gas and Electric Rate Proceedings

Introduction

The following pages present the results of our latest annual survey of authorized rates of return on common equity (ROE) for state-regulated energy utilities. This year's survey covers orders issued by state regulatory commissions during the period October 1, 2000 through September 30, 2001. The survey reports the results of traditional, cost-of-service rate filings, as well as generic ROE proceedings, price regulation plans, and merger-related rate agreements. The reported ROE figures were obtained from a variety of sources, including rate analysts at state public utility commissions, rate department personnel at major, investor-owned electric and gas utilities, and directly from orders issued by state regulators. Explanatory footnotes are provided as necessary, and citations are given for orders published in *Public Utilities Reports, Fourth Series (PUR4th)*. Many of the unpublished orders are accessible through PURbase CD ROM, WESTLAW, and LEXIS.

A review of the rate orders included in the survey indicates that many state regulatory commissions continue to rely primarily on the results of discounted cash flow analyses in setting authorized ROE. However, other factors — e.g, general trends in interest rates, business risk, and regulatory risk — are often given considerable weight in ROE determinations.

Debate continues over the effect of electric industry restructuring and generation asset divestiture on risk, investor expectations, and required return. Similarly, regulators continue to consider whether the movement toward a competitive market model for the pricing of gas supply requires a reassessment of risks and required returns for natural gas local distribution companies. For example, in *Re Montana Power Co.*, 209 PUR4th 434 (Mont.P.S.C.2001), the state public service commission concluded that the electric util-

ity operations of Montana Power are less risky now that it has restructured and divested its generation assets. As a consequence, the commission reduced the equity ratio used in determining cost of capital for rate-making purposes from 44.12% common equity to 43%. In setting rates for the gas utility operations of Montana Power, the commission found that the gas utility faces less risk following the deregulation of natural gas supply and the implementation of a natural gas cost tracker that allows changes in commodity costs to be passed through to ratepayers without a full rate case. The authorized ROE for both the electric and gas utility was set at 10.75% — down from the 11% ROE last authorized for the electric utility and the 11.25% ROE awarded when rates were last set for the gas utility.

Although the number of "full-blown" rate cases appears to have diminished in recent years — the result of low inflation and the trend toward price regulation — the process of determining authorized ROE for energy utilities continues to dismay state regulators. The Oregon Public Utility Commission brought attention to this point while setting rates for Portland General Electric Company following an unprecedented rise in the cost of wholesale power. Noting that a large part of the rate hearing was devoted to argument over the proper ROE, the commission complained that given the inherent complexity of the issue it "may be impossible to devise a method to make the process of determining a reasonable ROE an agreeable one." Nevertheless, in an attempt to make the process less burdensome, the commission offered a generalized set of guidelines for witnesses to follow in presenting cost of capital recommendations in future rate cases. *Re Portland General Electric Co.*, UE 115, Order No. 01-777, 212 PUR4th 1 (Or.P.U.C.2001).

*Settlement, no authorized ROE specified.

[9]Order modifies and clarifies *Re Western Resources, Inc.*, 211 PUR4th 8, in which the commission set interim rates for two affiliated electric utilities. Rates to be made permanent once effect of recent corporate reorganization on capital structure is demonstrated. Commission rules that it may apply an "interest synchronization adjustment" if high debt level threatens financial stability of operating utilities.

[10]Return revenue requirement determined by applying cost of capital to gas capitalization, rather than to test period rate base. Commission finds that use of "inflated" rate base figures would produce inaccurate estimate of utility income requirements.

[11]Proceeding to review utility earnings.

[12]Figure shown is stated in approved modified settlement agreement.

[23]Rate application includes performance-based rate plan for five-year period 2001-2005. Allowed ROE varies around stated mid- point depending on performance results.

[24]Approved settlement agreement provides 1.2% increase in non- gas base rates. Test period cost of service reduced by $.125 million for savings resulting from merger of Northern States Power Co. and New Century Energies, Inc.

[25]Approved settlement initiates 5-year performance-based rate plan. Rates approved in 1999 earnings review case found just and reasonable as starting point for new rate plan.

[26]Performance-based rate plan includes price cap mechanism limiting rate adjustments based on comparable rates, inflation, and previous year earnings.

[27]Base line ROE for revenue sharing component of performance- based rate plan.

[28]Result of approved revenue stipulation.

[29]Increase reflects power costs updated subsequent to date of filing.

[37]ROE figure stated in approved settlement agreement.

[38]Utility also requested $12.2 million electric and $3.7 million gas revenue increase to take effect beginning in 2002. No change for 2002 authorized by commission.

[39]Utility did not request a change in ROE in this docket.

Response of Charles W. King
To Montana-Dakota Utilities Co.
North Dakota Public Service Commission
Case No. PU-399-02-183
September 6, 2002 Data Request

14. Reference: Page 32, lines 17-19:
Describe the "observations" referred to by the testimony, including the observations of the return differences, and provide a copy of all source data for these various observations.

Response: The "observations" are the annualized returns to common stocks and to bonds. The attached tabulation of the Ibbotson data for equity and debt returns shows that the standard deviation for each series is substantially greater than the arithmetic mean, the geometric mean or the median. Any use of these mean or median numbers as a predictor of current equity risk premiums is therefore statistically invalid.

After reviewing the annual filings, I recommend that the commission close all 2001 annual reports without further investigations. I will briefly discuss why each report should be closed.

Staff has reviewed the earnings of Great Plains Natural Gas in recent years resulting in a rate decrease and rate moratorium. In addition, staff anticipates that Great Plains will be reporting significant losses during the next several years due to the amortization of the premium paid by MDU to acquire Great Plains. Due to the agreements reached in recent years and expected earnings levels in the near future, staff recommends that the commission close the 2001 annual report of Great Plains.

September 3, 2002 Mike Diller memo
by Public Service Commission
Exhibit # 10
10/07/2002 CC: Comm Legal Illona, Pat, Jerry Mike .

The commission staff recently filed a complaint case against MDU's electric operations and proved its case before the commission. Therefore, there is little reason to pursue additional investigations in the immediate future. In addition, MDU has communicated to staff that regardless of the outcome of the off-system sales issue pending before the district court, MDU intends to file for a rate increase this fall in order to recover the costs of a new generator expected to come on-line before next summer.

MDU's gas operations have been earning reasonable returns on its equity invested in North Dakota with an average return of 12.16% over the past four years. However, a rate increase application has been filed by MDU alleging increased costs necessitating a 4.1% increase in rates. The commission will be making a determination in this case within the next couple of months and no further review or investigation is necessary regarding its 2001 annual report.

North Dakota Telephone has been reporting earnings in North Dakota averaging 12.17% in recent years. The earnings levels appear to be reasonable and no further investigation is warranted.

NSP's electric operations and Otter Tail Power are operating under a performance-based ratemaking plan for a five-year period ending December 31, 2005. The plans call for a review to be conducted after operating results are reported for the year ending 2002. Accordingly, the 2001 annual reports for both NSP electric and Otter Tail should be closed and a review conducted in 2002.

NSP's gas operations have averaged earnings of 5.01% during the past four years. As you may recall, NSP reported high earnings on its gas operations prior to the Flood in 1997. Since then, earnings have languished due to the rebuilding after the flood. In addition, NSP has gassed up some of the smaller communities around Fargo requiring a lot of capital expenditures. NSP is currently considering the need to file for a rate increase in 2002. Due to the earnings levels in recent years, NSP's 2001 annual report should be closed without further ado.

Qwest continues to make huge profits in North Dakota. In 2001, the company reported earnings on investment of 26.76% and an average return of 19.46% during the past 4 years. It is also worth noting that the Qwest numbers are a return on investment as compared to a return on equity reported by the other utilities. To show the impact of this difference,

if you assumed one-third of the investment in North Dakota was financed by an average debt cost of 8%, the average earnings on stockholder equity would be 25.19%. Said another way, Qwest would be recovering its stockholder investment in North Dakota approximately every 4 years. Qwest is not rate of return regulated but included here for comparative purposes. Because Qwest's rates are regulated through a price cap mechanism prescribed by law and not rate of return regulated, staff recommends that Qwest's annual report be closed without further review.

I will provide copies of this memo to each of the regulated entities referenced in this report so that they can file comments should they choose to do so.

This memo has been docketed in case management, as follows:

LATE FILED EXHIBITS
CASE NO. PU-399-02-183

Late Filed Exhibit 1

Provide the retirements related to the $1.4 million net negative salvage for services (Acct. 380) recorded in the period 1996 through 2001.

Response:

Please see Attachment A for the number of services, the original cost of plant, the removal cost, the accumulated depreciation and net over(under) recovery on services. The schedule shows vintage years and indicates that removal costs for the 6 year period averaged 138 percent of the original cost and that the accumulated depreciation fell far short of recovering the total cost.

Late Filed Exhibit 2

Provide the number of service lines retired that coincides with the information in Late Filed Exhibit 1.

Response:

Please see Late Filed Exhibit 1, Attachment A.

MONTANA-DAKOTA UTILITIES CO.
LATE FILED EXHIBITS
CASE NO. PU-399-02-183

Late Filed Exhibit 3

Provide the details on the sale of the Schuchart Building including who it was sold to, when it was sold, the purchase price, original cost of the building, a copy of the journal entries recording the sale and a copy of the tax appraisal at the time of the sale. Did the Company have an appraisal performed for purposes of the sale?

Response:

The Schuchart Building was sold to FutureSource Capital Corp., an indirect wholly owned subsidiary of MDU Resources Group, Inc., on July 1, 2001. The transfer price was the net book value at the time of transfer including land, building, and appurtenances. A summary of the transaction by sub plant account number is provided in Attachment A. A copy of the Transaction Journal is provided in Attachment B. The building was centrally assessed so there is no tax appraisal available. The Company did not have an appraisal performed for purposes of the transfer. However, there was an appraisal performed for another purpose at about the time of the transfer. That appraisal indicated a market value of the property of $2,700,000. It should be noted that the appraisal covers the land and the building only. The net book value of the land and building at the time of transfer was $3,198,359 as shown on Attachment A. A copy of the appraisal letter is included as Attachment C.

KNUDSON APPRAISAL SERVICE

BILL KNUDSON, IFA

July 28, 2001

Mr. Alvin J. Feist
MDU Resources Group, Inc.
PO Box 5650
Bismarck, ND 58502

Dear Mr. Feist:

At your request I have made an appraisal of the fee simple estate of a real property known as the Schuchart Office Building located at 918 East Divide Avenue in Bismarck, North Dakota. The property is owner occupied and thus there is no leasehold interest or leased fee estate to considered. The purpose of this appraisal is to determine the market value of the fee simple estate for financing purposes. Market value is defined as the most probable price which a property should bring in a competitive and open market under all conditions requisite to a fair sale, the buyer and seller, each acting prudently and knowledgeably and assuming the price is not affected by undue stimulus. Implicit in this definition is the consummation of a sale as of a specified date and the passing of the title from the seller to the buyer.

I have personally inspected the property. I have considered similar properties in the area in order to determine the value by comparison to other properties which have sold in the marketplace. The market value of subject property "As Is" as of July 3, 2001 is $2,700,000.00. **Departure from the Uniform Standard of Professional Appraisal Practice was not taken. This is considered to be a complete appraisal in summary format and meets the USPAP. There is no personal property included in the appraised value.**

Following in report form are definitions, limiting conditions, comparable sales data, maps, photographs and the qualifications of the appraiser. It has been a pleasure working on this on your behalf. If you have any questions or further requirements, please give me a call.

Respectfully,

Bill A. Knudson, IFA
CG-1031--ND
Expires: 1/1/02

LATE FILED EXHIBITS
CASE NO. PU-399-02-183

Late Filed Exhibit 4

Provide the cost of the 1991 depreciation study, the cost of supporting the 1991 study in this proceeding and a copy of all correspondence and the contract with AUS Consultants for preparation of the new depreciation study.

Response:

The cost of the 1991 depreciation study performed by Stone & Webster was $97,461.10. The cost covered complete studies for electric, gas and common plant. A breakdown by category is not available.

The cost incurred by Montana-Dakota in addressing the depreciation recommendation of Mr. Majoros on behalf of the Staff was $31,900 through the conclusion of the hearing on October 8.

Please see Attachment A for a copy of correspondence with AUS regarding depreciation studies. The remaining correspondence, which was accomplished by email, is no longer available as it was deleted from the system in the normal course of cleaning up old files. There is no written contract for the new depreciation study.

Subject: GPNG & MDU Depreciation Studies

Paul,

This e-mail confirms the information that we discussed during our telephone conversation of last evening. I acknowledge that our target date for completing the Great Plains Natural Gas depreciation study is July 31, 2002. Conversely, it was our initial goal of completing the Montana Dakota Utilities Co - Gas & Common deprecation studies as of early September, 2002, however, you indicated that the time line for completing those study drafts are likely to be extended to some time in November, Certainly the extended amount of time will be welcome to you as well as us, given that I will be physically out of the office during late September and early October.

With regard to cost it is estimated that the Great Plains Natural Gas depreciation study will aggregate in the range of $23,000-$25,000 plus reimbursement of out of pocket costs for travel and living expenses, postage, etc. Conversely for the Montana-Dakota Utilities Co-Gas depreciation study the aggregate cost for the study is estimated at $35,000 plus out of pocket cost. One item that we did not discuss during our conversation was the cost of the Common Plant depreciation study which I estimate would aggregate in the range of $9,000-$11,000 plus out of pocket cost.

Finally, as discussed during our telephone conversation, attached is an initial data request listing the data requirements for completing the depreciation studies. In addition to the data request also attached is a data template and data request memo that provides additional notes and discussions related to the data request.

If you have any questions, wish to discuss any of the items, or need assistance in any way please do not hesitate to call.

I would like to thank you for the opportunity to provide this service to your company, and look forward to long term relationship with you and your associates.

Earl

Dear Mr. Binek:

On October 7 and 8, 2002, I presided as a procedural administrative law judge in the matter of MDU Natural Gas Rate Increase Application - PU-399-02-183. The hearing is closed. Accordingly, I am closing our file on this matter and returning that portion of the record I have in my possession to you. Please find enclosed copies of documents that have been transmitted to us, as well as originals and copies of documents received while the file was in our possession, for filing with the official agency record of this matter. The court reporter has the original exhibits because she is preparing a transcript.

I have also included an exhibit list for the file that documents all of the 37 exhibits that were admitted as evidence and the four documents that were made a part of the record on official notice by the commission (hearing examiner).

Thank you for your attention to this matter.

Sincerely,

Allen C. Hoberg
Administrative Law Judge

MOTION

October 10, 2002

Montana-Dakota Utilities Co.
Natural Gas Rate Increase
Application

Case No. PU-399-02-183

I move the Commission bill Montana-Dakota Utilities Co. for costs incurred to date in Case No. PU-399-02-183, Montana-Dakota Utilities Co., Natural Gas Rate Increase, Application.

RE: Case No. PU-399-02-183
Montana-Dakota Utilities Co.
Natural Gas Rate Increase
Application

Enclosed is a copy of the statement approved at the October 10, 2002 Public Service Commission meeting for the expenses incurred to date in Case No. PU-399-02-183.

Under N.D.C.C. 49-02-02, these expenses are billed through the Valuation Fund and must be paid for by the company involved.

Please make your check payable to the Public Service Commission.

Sincerely,

Gloria Geiger
Administrative Staff Officer

Re: General Natural Gas Rate Application
Case No. PU-399-02-183

Montana-Dakota Utilities Co. (Montana-Dakota), a Division of MDU Resources Group, Inc. herewith submits the original and seven (7) copies of the rebuttal testimony of Dr. J. Stephen Gaske, Mr. Craig A. Keller, Mr. Richard D. Spratt, Mr. Richard A. Espeland, Mr. John A. Jeter, Ms. Rita A. Mulkern and Ms. Tamie A. Aberle.

Two (2) copies of the rebuttal testimony have been mailed to Snavely King Majoros O'Conner & Lee, Inc., 1220 L St NW, Suite 410, Washington, DC 20005.

Please acknowledge receipt by stamping or initiating the duplicate copy of this letter attached hereto and returning the same in the enclosed self-addressed, stamped envelope.

Sincerely,

Donald R. Ball

BEFORE THE NORTH DAKOTA PUBLIC SERVICE COMMISSION

CASE NO. PU-399-02-183

PREPARED REBUTTAL TESTIMONY OF

J. STEPHEN GASKE

Q1. Please state your name, position and business address.

A. My name is J. Stephen Gaske and I am President of Zinder Companies, Inc., 7720 Wisconsin Avenue, Suite B-102 Bethesda, MD 20814.

Q2. Are you the same J. Stephen Gaske who filed Prepared Direct Testimony earlier in this proceeding?

A. Yes.

Q3. What is the purpose of your Prepared Rebuttal Testimony?

A. I have been asked by Montana-Dakota Utilities Co. ("Montana-Dakota") to evaluate the Direct Testimony of Charles W. King filed on behalf of the Staff of the North Dakota Public Service Commission ("PSC") on August 30, 2002. In his testimony, Mr. King makes a number of errors in analysis that lead him to recommend an inadequate allowed rate of return for setting Montana-Dakota's North Dakota gas distribution rates. Consequently, I will respond to various issues addressed in Mr. King's testimony including: the need for a flotation cost adjustment, the incorporation of growth rate data in the estimate, the dividend yield adjustment to the DCF model, the relevance of the Risk Premium and Alternative

Equity Investment analyses in my Prepared Direct testimony, the selection of a proxy group, and the risk implications of being a diversified, regulated company.

Flotation Cost

Q4. At page 28, lines 1-5 of his testimony, Mr. King claims that Montana-Dakota's costs of raising new common equity capital are 0.1 percent. Do you agree with his analysis and conclusion?

A. No. Mr. King has made a classic "apples-to-oranges" comparison in attempting to calculate the flotation costs that Montana-Dakota would incur if it needed to attract any significant amount of new common equity capital in order to finance its gas distribution utility operations. Mr. King's analysis looks at the issuance costs that Montana-Dakota has incurred since 1997 to conclude that the costs of *issuing* new common equity are relatively low. However, the real test of a reasonable allowed return is whether it is sufficient to attract new capital for investment in the regulated operation on reasonable terms. Mr. King's analysis does not address that issue.

Q5. Is Mr. King correct in saying on page 28, line 2, that "(f)lotation costs are incurred only when a company issues new stock?"

A. Yes. However, his observations and conclusions on this issue are off point as he seems to misunderstand the primary reason why a flotation cost adjustment is required. The Supreme Court established the "Capital Attraction" standard as one test of a reasonable allowed rate of return. For example, in *Bluefield Water Works & Improvement Company v. Public Service Commission of West Virginia* (262 U.S. 679, 693 (1923)), the Court indicated that:

> *"The return should be reasonably sufficient to assure confidence in the financial soundness of the utility and should be adequate, under efficient and economical management, to maintain and support its credit and **enable** it to raise the money necessary for the proper discharge of its public duties."*[1]

Similarly, in *Federal Power Commission v. Hope Natural Gas Company (320 U.S. 591, 603 (1944))* the Court described the relevant criteria as follows:

> *"From the investor or company point of view it is important that there be enough revenue not only for operating expenses but also for the capital costs of the business. These include service on the debt and dividends on the stock.... That return, **moreover**, should be sufficient to assure confidence in the financial integrity of the enterprise, so as to maintain its credit and to attract capital."*[2]

The Court's requirement that the allowed return must "enable" a company to raise capital does not mean that the company must raise capital within some specified time period. Instead, it means that the company must have in place the ability to attract capital so that it can exercise that ability if and when required. By its use of the word "moreover" the Court made it clear that an allowed return is not sufficient if it merely allows the company to meet its current financial obligations. Instead, an additional and overriding requirement is that the return also must be sufficient to assure that the company can attract capital and maintain its financial integrity. Because flotation costs are the additional component of capital costs that apply above and beyond the return required to service current capital needs, an allowance for flotation costs is required in order to meet the "Capital Attraction" standard.

[1] Emphasis added.
[2] Emphasis added.

Q6. What is the difference between the "Capital Attraction" standard and Mr. King's approach?

The Capital Attraction standard requires that the allowed rate of return must be sufficient to allow the regulated company to raise capital by issuing new common stock on reasonable terms. This standard applies to companies that are not planning to issue new common stock, as well as to those that are planning to issue such stock. This "yardstick" established by the Court poses a hypothetical stock issue as a means for measuring the reasonableness of the allowed rate of return: *if* the allowed rate of return is sufficient to allow the company to raise new capital on reasonable terms, *then* the rate of return is legally adequate.

Mr. King and I are in agreement that flotation costs are incurred when a company must issue common stock to raise new capital. However, we are suggesting different standards for setting an allowed rate of return. I propose that the "Capital Attraction" standard be applied by recognizing that flotation costs must be incurred if the company needs to issue new common stock in order to attract capital. In contrast, Mr. King is proposing an "Indifference" or "No-New Capital" standard. Without flotation costs, a correctly established DCF rate of return should make existing investors indifferent between (i) providing natural gas service to the public or (ii) paying out all cash flow as dividends and gradually liquidating the utility operation. Such a rate of return may be barely adequate to compensate capital that is already sunk in the utility, but it is inadequate to attract capital from any outside sources because it is not sufficient to compensate for the flotation costs associated with raising capital in the market. Thus, although Mr. King recognizes

that flotation costs are a cost of attracting new common equity capital, he does not recognize that the ability to attract new common equity capital, *i.e.* the "Capital Attraction" standard, is a key measure of the adequacy of an allowed rate of return for regulated companies.

Q7. What has been Montana-Dakota's cost of attracting new common equity capital for investment in its gas distribution operations in recent years?

A. Examination of the data cited by Mr. King on page 28, lines 7-11 and footnote 3, indicates the level of common stock flotation costs incurred by Montana-Dakota to attract new capital funds. The flotation cost associated with obtaining new common equity capital funds that could be invested in rate base was 3.43 percent, computed as follows:

Amount Raised	$157,411,736
Flotation Cost	5,214,211
Net Funds Available	$152,197,525
Flotation Cost/Net Funds	3.43%

Thus, if one focuses on the portion of Mr. King's analysis that is relevant for estimating Montana-Dakota's cost of attracting new common equity capital for investment in its gas distribution utility operations, that past experience indicates a cost of 3.43 percent. Since the recent past experience of MDU Resources is close to the cost experienced by other gas distribution companies on some stock issuances, as shown on Exhibit No. ___(JSG-2), Schedule 3, it is clear that the flotation cost adjustment should be at least 3.43 percent. However, the experience of other gas distribution companies suggests that a flotation cost adjustment of 4.75 percent is required to ensure that the allowed rate of return is sufficient to attract capital on reasonable terms.

Q8. Is Mr. King correct when he suggests that the required flotation cost adjustment is 0.1 percent?

A. No. Mr. King's adjustment is not a cost of capital, expressed as a percentage of new capital raised. Instead, his proposed adjustment is based on the absolute amount of flotation costs incurred in the recent past, as a percent of the total capital of MDU Resources. In other words, if MDU Resources had issued large amounts of common stock recently, Mr. King would calculate a larger flotation cost adjustment. But, if MDU Resources had not issued common stock recently, Mr. King would have calculated no flotation cost adjustment.

This approach of Mr. King's misses the point of applying a flotation cost adjustment. Because flotation costs are a necessary component of the cost of attracting capital, a flotation cost adjustment is required in order for the allowed return to be sufficient to "assure confidence in the financial integrity of the enterprise, so as to maintain its credit and to attract capital." Financial integrity and the ability to attract capital are fundamental requirements that exist regardless of how much new capital a company has raised recently. Thus, the flotation cost adjustment required to attract capital cannot be measured based on the absolute amount of new capital the company has raised recently. Instead, the appropriate flotation cost adjustment should be measured as an estimated percentage of the amount of any new capital that the utility might need to attract, if the company were to have a need to attract new funds. Otherwise, the company would not be in a position to attract new common equity without impairing the financial integrity of existing stockholders' investment.

Q9. Is the need for a flotation cost adjustment to the rate of return widely recognized among economists as a required part of an allowed rate of return that will attract capital without diluting the value of existing investors' equity?

A. Yes. In commenting on the fair rate of return in his classic treatise on public utility ratemaking, Bonbright stated that:

> *"...book values (with allowances for the probable need to underprice new common-stock offering) should set a floor to the market values..."*

James C. Bonbright, *Principles of Public Utility Rates*, Columbia University Press, 1961, p. 249. Similarly, Myron Gordon, the man who is credited with having developed the DCF model for estimating rate of return, has stated that a regulatory agency should set the allowed rate of return greater than the investor return requirement so as to allow the firm to issue stock at a price that will yield net proceeds equal to book value. Professor Gordon advocates the following adjustment:

> *"The agency need only estimate the proportion that the proceeds per share on an issue bear to the price of the stock and adjust the allowed rate of return so that the price per share is the indicated ratio of the book value per share. If the proceeds on an issue are 91 percent of market price, the agency should maintain market price at about 110 percent of book value."*

Myron J. Gordon, *The Cost of Capital to a Public Utility*, Michigan State University, 1974, pages 165-166. In order to meet this requirement, the flotation cost adjustment must be applied to the entire rate of return. The flotation cost adjustment that I have proposed attempts to meet the same standards advocated by these other economists.

Selection of Proxy Companies

Q10. Do you have any comments on the group of proxy companies that Mr. King has selected for his study?

A. Although Mr. King has selected a group of companies that could appropriately be included in a proxy group for setting natural gas distribution company rates of return, it should be noted that his proxy group in this proceeding contradicts his rate of return testimony in two recent proceedings before the North Dakota Public Service Commission.

For example, 18 months ago, in Case No. PU-400-00-521 involving the natural gas distribution rates of Xcel Energy, Mr. King filed testimony in which he based his recommended rate of return on DCF analyses of two groups of companies that he specifically agreed should be used to set a rate of return for gas distribution operations:

- Moody's Gas Distribution Group, and
- Five Combination Companies.

Similarly, seven months ago in Case No. PU-399-01-186, Mr. King based his recommended rate of return for Montana-Dakota's North Dakota electric operations on the results for a group of combination gas and electric utilities. In doing so, he specifically rejected the results for a group of electric utilities that were not combination companies.[3]

Now, in this proceeding concerning Montana-Dakota's North Dakota natural gas distribution rates, Mr. King rejects the use of Moody's Gas

[3] In its Findings of Fact, Conclusions of Law and Order dated April 24, 2002 in Case No. PU-399-01-186, the Commission decided that the rate of return should be based on a group of Combination companies as well as Electric-only companies that derive at least 85 percent of their revenue from regulated operations.

Distribution group and also abandons his position that Montana-Dakota's rates should be based on results from a proxy group of combination companies. Mr. King's rejection of his own recent positions raises obvious questions as to what rate of return would have been produced had Mr. King adhered to the expert opinions that he recently advocated to this Commission.

Q11. Have you used the same proxy group that Mr. King has recently advocated?

A. Yes. In my Prepared Direct Testimony, I used the same Moody's Gas Distribution group of companies that Mr. King used in Case No. PU-400-00-521. Obviously Moody's Gas Distribution proxy group indicates higher required returns than Mr. King's new proxy group. Mr. King suggests that the Zacks growth rate projection for Laclede is now much lower than when I prepared my testimony. However, updating the DCF analysis for Laclede would reduce the results of my various analyses by less than 50 basis points and would still indicate a cost of capital of approximately 12.75 percent including flotation costs and 12.2 percent without flotation costs. Since this rate of return for the Moody's Gas Distribution Group is significantly above the return produced by Mr. King's new group of proxy companies, one would have to question why the Moody's Gas Distribution group was acceptable to Mr. King last year, but not this year.

Growth Rate Estimation Method

Q12. Do you have any comments on the method Mr. King used to set growth rates in this proceeding?

A. In this proceeding, Mr. King used what he calls a "Classic" DCF approach as a starting point for estimating growth rates for his proxy companies. He then gives subjective consideration to Book Value growth rates and Historical growth rates to adjust the results of his "Classic" DCF analysis. However, as suggested by the following Table, Mr. King's subjective adjustment process appears to be biased and unexplainable.

DCF Growth Rate Approach	Mr. King's Average DCF Return Results	Basis Points Above/(Below) "Classic" Results
"Classic"	11.29%	
"Book Value"	12.18%	89
"Historical"	11.72%	43
After Incorporation Of "Book Value" and "Historical" Results	11.23%	(6)

The growth rates for Mr. King's "Classic" DCF analysis produce an average rate of return of 11.29 percent that he used as a starting point. His "Book Value" growth rates produce a significantly higher DCF return of 12.18 percent and his "Historical" growth rates also produce a significantly higher average DCF return of 11.72 percent. However, once Mr. King finishes subjectively incorporating his "Book Value" and "Historical" growth rates with his "Classic" DCF results, he gets a lower average rate of return than is produced by his "Classic" DCF

approach. This result is so contrary to the data and evidence that one must conclude that Mr. King's subjective adjustment process appears to be biased and unexplainable.

Q13. Do you object to Mr. King's objective growth rate calculations?

A. The Zack's data used in his "Classic" DCF analysis is a commonly-used source of data and is similar to the data used in my own analyses. Similarly, Mr. King's "Book Value" growth rates are essentially similar to my "Second-Stage Earnings Retention Growth" method, with the exception that he adds a component for growth expected to occur by issuing common stock at prices above book value.

However, Mr. King's historical growth rate approach is not a reasonable or valid approach to use. Although an analyst must be aware of past growth rates, and historical experience can affect investor expectations, the DCF growth rate estimate must be forward looking. Relying on historical results in this case would produce obviously incorrect gross anomalies such as the negative required rates of return that Mr. King calculated for Laclede Group (-1.11%) and WGL Holdings (-0.68%). Presumably the analysts surveyed by Zacks, and those that prepare the Value Line forecasts used to calculate Book Value growth rates, are aware of historical growth rates for each company and have considered that information in preparing their forecasts. Consequently, the forward-looking projections should receive virtually all of the weight in these circumstances, and the historical growth rates presented by Mr. King should be given virtually no weight whatsoever.

Q14. In your opinion, what is the best approach for combining the Zacks analysts' growth rates with the Book Value growth rates to produce a rate of return estimate for the companies that derive 75 percent of their revenues from natural gas distribution operations?

A. For these companies at this time the growth rate method should not require an "either/or" choice between Zacks analysts' estimates and the Book Value growth rate projections. Instead, the two sets of forward-looking projections should be combined to produce a composite result for the two groups. Consequently, I have combined the results from the two growth rate approaches by giving a two-thirds weight to Zacks analysts' forecasts and a one-third weight to the Book Value growth rate. These are the same weightings that I used in my Second-Stage Retention Growth method.

Using Mr. King's data and proxy group selection criteria, a more appropriate DCF rate of return estimate for these companies is calculated on Page 1 of Schedule 1 of Exhibit No. ___(JSG-4). This calculation uses growth rates for each company that are based on a weighted average that gives a two-thirds weight to Zacks growth rates and a one-third weight to projected Book Value growth. Because, as shown on Exhibit___(CWK-3), WGL Holdings derived less than 75 percent of its revenue from regulated natural gas operations, and therefore does not meet the selection criteria established by Mr. King, I did not include it in this re-calculation based on Mr. King's data. The average DCF rate of return estimate produced by companies that meet Mr. King's proxy criteria is **11.8 percent** before adjustment for flotation costs. When a flotation cost adjustment is added, the

indicated cost of capital for companies that meet Mr. King's selection criteria is **12.4 percent**.

Q15. Have you also calculated the return that would be indicated for companies that meet Mr. King's criteria if one were to apply equal weights to the Zacks and Book Value growth rates?

A. Yes. These results are calculated on Page 2 of Schedule 1 of Exhibit No. ___(JSG-4). With an equal weighting on the two growth rate estimates, the average DCF rate of return estimate produced by companies that meet Mr. King's proxy criteria is **12.0 percent** before adjustment for flotation costs, and **12.5 percent** after a flotation cost adjustment is added.

Dividend Yield Adjustment Factor

Q16. Is Mr. King correct in his description and assessment of the 0.625g dividend yield adjustment factor that you recommend?

A. No. Mr. King's first error occurs at page 28, lines 27-28 when he says that my 0.625g factor "assumes that the investor will not receive his/her first dividend until exactly three months from the date of purchase." This statement is factually incorrect. Attached as Exhibit ___(JSG-4), Schedule 3 is a copy of the document that was provided to Mr. King in Case No. PU-399-01-186 in response to his request for the derivation of the 0.625g factor. That response clearly indicates that if one assumes that the investor will not receive his/her first dividend until exactly three months from the date of purchase, the correct adjustment factor is **0.75g**. Thus, it is clear that the 0.625g is not based on that assumption.

Mr. King's second error occurs at page 28, line 29 where he says that "(t)he average for the next dividend increase is thus (.25+.50+.75+1.0)/4 = .625." However, as shown on Exhibit ___(JSG-4), Schedule 3 this calculation of Mr. King's misstates the source and derivation of the 0.625g factor. Instead, the 0.625 is the average of two far more complex calculations that incorporate the timing and time value of both dividends and dividend growth. The assumptions and results of these two complex calculations can be summarized as follows:

First Dividend Received In:	Dividend Increase In:	Factor Derived
3 months	6 months	0.75
0 months	6 months	0.50
Average		**0.625**

Thus, the 0.625 factor is the average of the assumption that the first dividend is received: (i) in 3 months, and (ii) immediately. The average of these two assumptions approximates the assumption that the first dividend could be received at any time during the first three months. In addition, both calculations assume that the dividend increase occurs in 6 months, which is consistent with Mr. King's assumption.

Mr. King's third error occurs when he states that his .5g factor reflects the assumption that the dividend increase is randomly distributed throughout the year and that the average delay in the dividend increase under Mr. King's assumption is one-half of a year. As shown in the preceding paragraph and Exhibit ___(JSG-4), Schedule 3, Mr. King's 0.5g factor is correct only in the extreme case that the next dividend is to be received immediately upon purchase of the stock, with no delay. However, if one must wait 3 months for the first dividend, the correct factor is 0.75g.

The average of these two extremes produces the most reasonable dividend adjustment factor: 0.625g.

Q17. If you and Mr. King both agree that it is most reasonable to assume that the next dividend increase is one-half year away, why is the appropriate dividend adjustment factor 0.625 and not 0.5?

A. Although I agree with Mr. King with regard to the assumed timing of the dividend increase, his error occurs when he mistakenly also assumes that there is no time value to money. However, one of the salient features of the DCF model is that it explicitly incorporates the time value of money in order to find the cost of capital that equates the market price of a share of stock with the expected timing and amount of future dividends. For example, if there is a 50% chance that a dividend increase will occur at the beginning of the year and a 50% chance that it will occur at the end of the year, the average expected timing of the dividend increase would be at mid-year. However, because a dividend increase received at the beginning of the year has a greater discounted present value than a dividend increase received at the end of the year, the effect of a mid-year timing assumption results in a dividend adjustment factor to the DCF model that is greater than one-half.

The fact that a dollar received today is more valuable than a dollar received one year from now is perhaps the most fundamental concept in finance. Thus, it is surprising to read Mr. King's testimony and realize that he is erroneously claiming that the equation on page 28, line 29 of his testimony is the same as the mathematical derivation in Exhibit ___(JSG-4), Schedule 3.

Benchmark Analyses

Q18. At pages 29-33, Mr. King criticizes your benchmark analyses. Are his criticisms misplaced?

A. Yes. For example, in discussing my Risk Premium analyses Mr. King sets up a "straw man" by stating that "(t)he theory is that over a long enough period, actual return differentials between stocks and bonds will equate to required or expected return differentials." However, that is neither my theory nor the theory that guides how I have used these analyses.

The return required by investors is estimated by my DCF analysis. But it is also true that when investors decide to purchase common stocks, rather than buy a new car or invest in long-term bonds, they are aware of and influenced by the premium that common stocks have historically earned relative to bonds. In fact, if the long-term average premium were zero or negative, it is doubtful that investors would purchase common stocks or make any equity investments at all. Indeed, through the workings of competitive markets equity investments, stock prices and bond yields all interact to force the long-term average premium to be a positive number. On a year-to-year basis, actual results are bound to differ from the long-term average and the expected risk premiums that investors require will vary significantly. However, the Risk Premium analysis is a good benchmark to determine whether the return generated by my DCF analyses is within a reasonable ballpark relative to historic average risk premiums. The greater the difference between the DCF results, the more one would have to question whether the DCF results are valid. Thus, although I do not believe that the Risk Premium results are

equal to the required rate of return, such results still provide an important perspective for evaluating the DCF results.

Q19. Does Mr. King propose a risk premium approach in his testimony?

A. Yes. At page 30, line 13 of his testimony, Mr. King refers to risk premium analysis as a "sanity check" on the results. That same type of "sanity check" is the purpose and function of my risk premium analysis.

Q20. Do you agree with Mr. King's position at page 29, lines 30-31 that "when recession threatens, the spread between bond yields and required stock returns is likely to increase?"

A. Yes. For example, the economy has been in a recession at various points during the past two years and there has been a "flight to quality" by investors who are now holding large cash balances and currently are more inclined to invest in high quality bonds than in common stocks. Consequently, the current risk premium spreads between bond yields and required stock returns are unusually high at this time.

Q21. Can you provide any examples of the unusually high risk premiums that investors currently require?

A. One indicator of investors' relative risk premium requirements can be seen from the Yield Spreads between (i) Baa-rated corporate bonds and (ii) the yields on less-risky 10-year U.S. Treasury Bonds and Aaa-rated bonds. The risk premiums required by Baa-rated corporate bonds for each month from July 1991 to August 2002 are shown on Exhibit ___(JSG-4), Schedule 4. It can be seen that for 10 years the yields on Baa-rate bonds averaged approximately 75 basis points more than the

yield on Aaa-rated bonds, but the yield spread suddenly shot up to more than 120 basis points in December 2001 and has remained at these exceptionally high levels ever since. Similarly, prior to 1999 the yield on Baa-rated bonds was generally between 150 and 200 basis points above the yield on 10-year U.S. Treasury Bonds. However, during the past two years, this yield spread has increased dramatically so that it is now approximately 330 basis points. Obviously investors' "flight to quality" and reluctance to invest in risky securities has caused the premiums required for Baa bonds to rise to the highest levels seen in the past decade. Because common stocks are considerably riskier than Baa-rated bonds, the unusually high cost of risk in the current market means that, in order to induce them to take on the additional risks of investing in common stocks, investors currently must expect to earn a premium on common stocks that is significantly greater than usual.

Q22. At page 29, lines 19-25, Mr. King suggests that a decline in interest rates causes stock prices to increase, thereby causing required returns on common stocks to decline when interest rates decline. Does this correctly describe current conditions in the financial markets?

A. No. Mr. King correctly describes the theoretical relationship that economists generally expect. If bond prices increase, causing bond yields to decline, we would generally expect investors to allocate more funds to stocks and bid up the price of common stocks. So, at least in theory, higher bond prices (and lower bond yields) should be accompanied by higher stock prices (and lower required returns on stock). However, that is <u>not</u> what has happened in the current market. During the past year, stock prices have declined while bond prices have increased. The

following changes in various indexes during the most recent 12 months illustrate the unusual nature of the current financial markets:

Index	12-Month Price Change
Bonds:	
Merrill Lynch 10+ Year Bonds	10.78%
Merrill Lynch Yankee Bonds	9.65%
Merrill Lynch Corporate Master Bonds	7.83%
Lehman Bros. U.S. Aggregate Bonds	8.71%
Stocks:	
S&P 500	-14.43%
New York Stock Exchange Composite	-10.90%
New York Stock Exchange Industrials	-9.43%
New York Stock Exchange Utilities	-37.90%
Dow Jones Composite	-11.00%
Dow Jones Industrials	-6.70%
Dow Jones Utilities	-30.78%

Source: *The Wall Street Journal Online*, September 19, 2002.

The increase in bond prices has caused interest rates to decline, but stock prices went in the opposite direction and have gone down significantly. This suggests that, despite the decline in interest rates, investors are reluctant to invest in common stocks and that they require expected stock returns that have relatively high expected risk premiums over bond yields at this time.

Q23. At page 33, lines 4-18, Mr. King claims that your Alternative Equity Investment analysis is irrelevant because he claims that "(i)nvestors in unregulated industrial, retail and transportation firms have no access to book equity value." Is he correct?

A. No. Mr. King is confusing the "primary" market for investing in hard assets such as utility plant with the "secondary" market for investing in paper assets such as already-issued common stocks. Investors who own stock in a corporation have access to returns on book equity at all times. Managers of most corporations continually consider what to do with the stockholders' cash that is held by the corporation. Managers may pay cash dividends to shareholders, or reinvest cash in a multitude of potential investments to create higher future earnings. Expected earnings on the book value of potential investments are a primary determinant of how corporations use and allocate the stockholders' money. Thus, Mr. King is incorrect. Stockholders, through managers acting as their agents, do have access to book value investments.

Q24. Does the average return on book value provide one type of "sanity check" on the level of return required by investors?

A. Yes. I have no doubt that investors in gas distribution utility assets similar to Montana-Dakota's North Dakota operations do not require the 29.4 percent return on average book value that investors in industrial companies have achieved in recent years. However, that is the average level of returns in recent years that Montana-Dakota must compete against in attracting capital.

An allowed rate of return established by the DCF method should make the value of the gas distribution operations equal to the book value of those operations in the absence of a flotation cost adjustment. In other words, the purpose of the DCF analysis is to find the rate of return that will make investors indifferent between investing to provide gas distribution service to the public or investing in, for example, U.S. Treasury bills. In contrast, when investors or corporations invest in non-regulated assets the market value of those investments has been many times the book value.

Consequently, when managers of a company evaluate possible investments they must consider the possibility of investing $1.00 in gas distribution utility assets with the expectation that the market value of those assets will be $1.00 and, thus, no value will be created for investors. On the other hand, when managers invest $1.00 in non-utility assets, they have a reasonable possibility of earning a 29 percent return on that investment and turning $1.00 of book value into $5.00 of market value.[4] Thus, while Montana-Dakota does not require anything close to a return of 29 percent on its gas distribution investments, knowledge of such potential average returns that Montana-Dakota must compete against helps place Montana-Dakota's required rate of return of 13.25 percent in perspective.

[4] The average market-to-book ratio for the S&P Industrial Index is 4.98 according to *Barron's*, September 16, 2002, page MW 46.

Relative Risk

Q25. At page 27, lines 1-7 of his testimony, Mr. King suggests that his studies indicate Montana-Dakota has risks that are far below the average for his proxy companies. Do his studies support this conclusion?

A. No. Mr. King bases his risk conclusion on a selective, anecdotal comparison of his own rate of return estimates with the capital structures and percent of revenues from gas distribution of the proxy companies.

In his capital structure analysis, Mr. King cites several companies that have below-average equity ratios and above-average rate of return requirements according to his study. From this selective observation regarding a few companies in his proxy group, Mr. King suggests that his data and analysis show a strongly inverse relationship between equity ratios and required rates of return. He then jumps to the conclusion that Montana-Dakota must be a low risk company because its common equity ratio is above average for the proxy companies.

However, Mr. King ignores several counter-examples within his own study that contradict his conclusion. For example, Southwest Gas has the lowest common equity ratio in his proxy group (31.9%), and it also has one of the lowest required returns (10.0%) according to Mr. King. Similarly, NICOR has one of the highest common equity ratios in the group (49.9%), and according to Mr. King it also has an above-average required return (12.0%). As shown on Schedule 2 of Exhibit No. ___(JSG-4), the correlation between Mr. King's estimated returns and the equity ratios of his proxy companies is relatively low and not statistically

significant. For example, the correlation between return and equity ratio in Mr. King's study is only –0.35 and there is a 29 percent probability that these two variables are either unrelated or positively correlated. Clearly, one cannot conclude from Mr. King's anecdotal study that common equity ratios are strongly or significantly inversely related to the overall risk or required rate of return that he estimated for these companies. Instead, Mr. King's data demonstrate that a company with an above-average common equity ratio, like Montana-Dakota, can also have an above-average required rate of return.

Q26. Does Mr. King's risk analysis based on the percentage of revenues derived from gas distribution operations suffer from similar shortcomings and contradictions?

A. Yes. In his analysis of gas distribution operations, Mr. King starts with the premise that companies that derive a greater share of their revenues from gas distribution operations require a lower rate of return. In other words, Mr. King claims that relative involvement in gas distribution operations is inversely related to the required rate of return for his proxy companies. However, this premise is not supported by Mr. King's data. For example, WGL Holdings derives less than 75 percent of its revenue from natural gas distribution operations (and therefore does not meet Mr. King's criteria for inclusion in the proxy group). But WGL Holdings has the lowest required rate of return according to Mr. King. Similarly, ATMOS Energy derives an above-average percentage of revenues from natural gas distribution operations, and it also has an above-average required return (12.5%) according to Mr. King. These relationships contradict Mr. King's

assumption that gas distribution operations have any significantly lower risk or required rate of return than the other operations of these proxy companies. As shown on page 2 of Schedule 2 of Exhibit No. ___(JSG-4), the correlation between the percent of revenues from gas distribution and Mr. King's return estimates is only –0.08 and not statistically significant. Thus, again one cannot conclude from Mr. King's data that there is any significant inverse relationship between relative involvement in gas distribution operations and the returns produced by Mr. King's study.

Q27. Do you have any other observations regarding Mr. King's risk analysis based on the percentage of revenues from gas distribution operations?

A. As an aside at this point, one irony of Mr. King's flawed analysis of gas distribution operations should be noted. For purposes of assessing risks and determining the allowed rate of return in this analysis, Mr. King treats Montana-Dakota's gas distribution operations as a stand-alone operation. This treatment appears in Table 11 on page 25 of his testimony, wherein he shows that MDU Utilities' Gas Distribution operation derives 100 percent of its revenue from its gas distribution business. This stand-alone treatment of Montana-Dakota's gas distribution operations also appears at page 26, lines 21-26 where Mr. King cites the high, 100 percent of revenues from gas distribution as one of the two reasons he believes Montana-Dakota should receive a below-average rate of return. I agree that Montana-Dakota's gas distribution operations should be treated as a stand-alone entity for purposes of assessing risk and establishing the allowed rate of return. The irony is that, while Mr. King agrees with me at this point in his

testimony, later, at page 33, lines 24-29, he argues that the small-size risks of Montana-Dakota's gas distribution operations should be ignored specifically because the consolidated businesses of its parent company, MDU Resources, are much larger than the stand-alone gas distribution operations. Apparently Mr. King believes that some risks should be assessed on a stand-alone basis and other risks should be evaluated on a consolidated basis. The only discernible pattern to this contradiction in his testimony is that by employing divergent views on the same topic within his testimony Mr. King is able to conclude that each source of risk is low.

Q28. In your opinion, why does Mr. King's data fail to support his conclusions?

A. His analyses are limited and appear to ignore the possibility of other types of risk that are more important for explaining differences in the required rate of return. The most important deficiency in this regard is his lack of recognition that business risks can have a significant effect on both the required rate of return on common equity and on the level of common equity in the capital structure.

For example, some companies with higher business risks might tend to offset such risks to some degree by tending to borrow less and maintaining higher common equity ratios. Similarly, some companies with low business risks might take on greater financial risks by borrowing more and tending to maintain lower common equity ratios. Because the required rate of return on common equity depends on the interaction of both business and financial risks, and because these risks often offset each other, an analysis that focuses solely on the financial risks

implied by the capital structure may not tell us much about the overall risks and required rate of return on equity of a company. At various times some companies may have capital structures and financial risks that over-compensate for their business risks and at other times some companies may have financial risks that under-compensate for their financial risks. This possibility would explain why Mr. King's data demonstrate such a weak relationship between equity ratios and required rates of return.

One source of the problem with Mr. King's analysis is a subtle, but important, misapplication of financial theory. Theory suggests that the required return on common equity should increase as a firm's common equity ratio decreases, *all other things being equal*. However, since all firms do not have the same business risks, there is not necessarily any discernable or significant relationship between common equity ratios and required rates of return on common equity when the effect of equity ratios are considered in isolation, as Mr. King has done in his analysis. Relative to the proxy group based on Mr. King's selection criteria, Montana-Dakota's below-average financial risks tend to offset the above-average business risks discussed in my Prepared Direct Testimony. This suggests that Montana-Dakota has overall risks that are about average relative to the proxy group based on Mr. King's selection criteria.

Q29. Why do you think Mr. King's data do not show any significant relationship between the percentage of gas distribution revenues and the required rate of return on common equity for his companies?

A. Because all of these companies, except WGL Holdings, derive more than 75 percent of their revenue from natural gas distribution operations, they should all be relatively close to each other in terms of overall risks. Mr. King has merely presumed that companies within his proxy group that are less diversified and more focused on gas distribution operations have less risk. However, his data clearly indicate that within his sample group there is virtually no relationship between percentage of revenues from gas distribution operations and the required rate of return on common equity that he estimated. Diversification into other lines of business may reduce the overall risks for some of these companies while such diversification may increase the overall risks of other companies. Within a sample group these variations may tend to cancel out. Thus, Mr. King's data indicate that, once one has a sample group that derives more than 75 percent of its revenues from natural gas distribution operations, the accuracy of the rate of return estimate for Montana-Dakota cannot be improved or fine-tuned by further consideration of the percentage of revenues from gas distribution operations.

Q30. At page 33, lines 24-29, Mr. King asserts that Montana-Dakota's gas distribution operations do not have higher risks associated with small size than the proxy companies. Do you agree with his reasoning?

A. No. We both agree that Montana-Dakota's gas distribution operations are relatively small, but Mr. King's only reason for objecting to size as a

consideration in comparing Montana-Dakota to the proxy companies is the fact that Montana-Dakota is a subsidiary of MDU Resources. As I noted earlier, the risk and rate of return analysis of Montana-Dakota's gas utility operations should be based on the risk of these operations on a stand-alone basis. The other diversified operations of Montana-Dakota do not reduce the risks of the gas distribution operations. The risk of those operations would be essentially the same regardless of whether MDU Resources owns the gas distribution operations or these operations are spun off as a stand-alone company. Smaller size generally implies greater risk and return requirements because adverse risk events can often have a far greater relative impact on smaller operations.

Q31. At page 26, lines 13-16, Mr. King suggests that gas distribution companies that have service territories with fast-growing populations may have lower perceived risk. Does Montana-Dakota's service territory contain a fast-growing population?

A. No. In fact, North Dakota ranked 48th among the 50 states in terms of population growth rate between 1990 and 1997. A major long-term problem and source of risk for Montana-Dakota derives from the fact that many of the small towns that it serves are experiencing declining populations. Once gas distribution facilities are constructed to serve such towns, the facilities cannot be easily moved even if the population declines significantly. The population shifts that are occurring in Montana-Dakota's service territory pose a significant risk that it may at some point be unable to recover the cost of its gas distribution investments. Consequently, and as discussed further in my Prepared Direct Testimony, Mr.

King's suggestion that Montana-Dakota should receive an allowed return below the average for the proxy group does not reflect the overall risks of the company.

Q32. Does this conclude your Prepared Rebuttal Testimony?

A. Yes.

MONTANA-DAKOTA UTILITIES CO.
REQUESTS FOR INFORMATION
CHARLES KING ON BEHALF OF NORTH DAKOTA PUBLIC SERVICE COMMISSION STAFF
DATED JANUARY 22, 2002
CASE NO. PU-399-01-186

Request No. 5:

Refer to page 15, line 7: Explain why a model that assumes that the next dividend will be received today results in a multiplication of the dividend yield by (1 + .5g). Conversely, explain why the multiplication of the dividend yield by (1 + 5g) implies that the next dividend will be received today.

Response:

Please see Attachment A for a description of the derivation of the 0.75g multiplier. The derivation of the 0.5 multiplier is identical, except that it (i) moves the timing of each dividend forward one-quarter by subtracting 0.25 from the exponent in the denominator of each term in equation (1), and (ii) does not contain the (1+g) factor in the numerator until the third term in the equation.

Incorporating the assumptions that "the next dividend increase is a half year away" and the next dividend is one quarter away in the constant growth DCF model means that the current market price of a share of common stock would be:

$$P_0 = \left[\frac{D_0}{4(1+k)^{.25}} + \frac{D_0(1+g)}{4(1+k)^{.5}} + \frac{D_0(1+g)}{4(1+k)^{.75}} \right.$$

$$+ \frac{D_0(1+g)}{4(1+k)} + \frac{D_0(1+g)}{4(1+k)^{1.25}} + \frac{D_0(1+g)^2}{4(1+k)^{1.75}}$$

$$\left. \ldots + \frac{D_0(1+g)^{\infty}}{4(1+k)^{\infty}} \right] \qquad (1)$$

where,

k = the annual cost of common equity capital;

D_0 = the current annual dividend (most recent quarterly dividend multiplied by four);

P_0 = the current price per share; and

g = the expected annual dividend growth rate.

Employing the same algebraic steps used in deriving the annual dividend model results in the following DCF model:

$$k = \frac{D_0}{4P_0}\left[(1+k)^{.75} + (1+g)(1+k)^{.5} + (1+g)(1+k)^{.25} + (1+g)\right] + g \qquad (2)$$

Equation (2) assumes that the next dividend at the current rate will be received in three months, or one-quarter year. The $(1+k)^{.75}$ term in brackets is associated with this first dividend. The second dividend is assumed to be received in six months, or one-half year. This dividend also includes the annual dividend increase, hence, the second term in brackets is $(1+g)(1+k)^{.5}$.

The investor required rate of return estimated using equation (2) overstates the required rate of return for ratemaking since it includes the return that investors expect to earn during part of the year by reinvesting the dividends received in the first three quarters of the year. In other words, equation (2) describes investors' effective market required rate of return, k_{mkt}. The required rate of return estimated using this model includes the partial year return which investors have an opportunity to earn on their own by reinvesting the first three quarterly dividends. The portion of the effective market rate of return that is associated with dividend reinvestment is:

$$k_{div} = \frac{D_0}{4P_0}\left\{[(1+k)^{.75} - 1] + (1+g)\,[(1+k)^{.5} - 1] + (1+g)\,[(1+k)^{.25} - 1]\right\} \qquad (3)$$

Subtracting equation (3) from equation (2) yields the following required ratemaking rate of return, k_{reg}:

$$k_{mkt} - k_{div} = \frac{D_0}{4P_0}\left[1 + (1+g) + (1+g) + (1+g)\right] + g$$

$$= \frac{D_0}{P_0}\left[1 + .75g\right] + g. \qquad (4)$$

DESCRIPTION

PU - 399 - 02 - 183

MONTANA-DAKOTA UTILITIES CO.
A Division of MDU Resources Group, Inc.

Before the Public Service Commission of North Dakota

Case No. PU-399-02-183

Rebuttal Testimony
of
Craig A. Keller

Q. Would you please state your name and business address?

A. Yes. My name is Craig A. Keller and my business address is 400 North Fourth Street, Bismarck, North Dakota 58501.

Q. What is your position with Montana-Dakota Utilities Co.?

A. I am the Vice President, Controller and Chief Accounting Officer (CAO) for Montana-Dakota Utilities Co. (Montana-Dakota), a Division of MDU Resources Group, Inc.

Q. Are you the same Craig A. Keller who filed direct testimony earlier in this proceeding?

A. Yes, I am.

Q. What is the purpose of your rebuttal testimony?

A. The purpose of my rebuttal testimony is to address certain adjustments proposed by Mr. Charles W. King and address comments made by Mr. Michael J. Majoros, Jr., testifying on behalf of the North Dakota Public Service Commission Staff (Staff).

Q. Why do you object to the inclusion of short-term debt in the makeup of the capital structure as recommended by Mr. King in his testimony?

A. I object because the materials and supplies, prepayments and fuel stocks that are included in rate base remain relatively constant, not changing materially from one month to another . While classified on the balance sheet as short-term assets, they support the long-lived assets such as plant, property, equipment and related items. It has been the Company's policy to finance these assets with long-term debt.

Q. Should the Company include Centennial Energy Holdings, Inc. (Centennial) debt as stated in Mr. King's testimony, when calculating the capital ratios and costs?

A. No. It's inappropriate for the Company to include Centennial debt, which includes Commercial Paper and Senior Notes, to calculate the debt cost for Montana-Dakota. Pursuant to the debt covenant of Centennial, only Centennial and its subsidiaries have access to this debt. This debt is unsecured and bears no ties to the utility assets. Whereas, the MDU Resources' debt is specific to utility assets secured by the First Mortgage Bond Indenture. The utility cannot access or use Centennial debt as a source of financing nor can Centennial access utility debt (First Mortgage Bond Indenture), as the assets in rate base secure utility debt. Regulated and non-regulated debt is kept separate and not commingled or fungible. Utility debt is issued when required for investment in utility assets. Certain debt was issued in the 1980's when debt costs were at some of the highest historical levels. These issues were then refinanced in the 1990's

at a substantial lower debt cost but a redemption cost was incurred as a result of the early retirement.

In his testimony Mr. King included the Centennial debt to determine the weighted average cost of debt but gave no consideration to the Centennial equity and debt when determining the capital ratios and required return. This is inconsistent and unfair as the investment in Centennial possesses a higher risk, which requires a higher equity return. Had Mr. King followed his own calculation as he suggests he would have used the entire consolidated MDU Resources Group, Inc. capital structure, which would result in a higher return requirement. Including Centennial debt for one component of the calculation but not for the entire capital structure and required return is arbitrary, selective and improper. The Company's capital structure is correct as filed.

Q. Do you agree with using December 2001 as the basis for the Capital Structure as stated by Mr. King page 4 of his rebuttal testimony?

A. No, I do not. A forecasted test period is allowed under the North Dakota Administrative Code (NDAC) 49-05-04.1. Projected costs are included when determining the level of rates and cost of service. Mr. Michael J. Majoros, Jr., in his direct testimony, accepted the projected 2003 test period for revenue requirements, while Mr. King's testimony is in direct contrast to Mr. Majoros' and is a mismatch with the rest of the revenue requirement.

The Company possesses a financial forecasting system and process that allows it to forecast effectively on a short-term basis. The projected costs used in the rate case filing are the forecasted costs used to develop the forecasted capital structure. Long-term debt schedules (balance outstanding, weighted cost, retirements) by issue are known and available when developing the long-term forecasted debt levels. Forecasted earnings are derived from projected revenue and costs that are comparable to those used in the rate case. To determine the projected equity balances, forecasted earnings are added to the actual beginning equity balance and dividends per the dividend policy are deducted from the balance. To say that the forecasted capital structure is merely a creation of the Company is unreasonable and without merit.

Q. Do you have any comments on the treatment of FAS 143 proposed by Mr. Majoros?

A. Yes. I would like to comment on the testimony of Mr. Majoros with regard to FAS 143, Accounting for Asset Retirement Obligations. The purpose of FAS 143 is to require companies to accrue for the expected retirement cost of an asset over the asset's useful life through increased depreciation. This pronouncement was intended to address nuclear power plants and similar assets where legal and environmental uncertainties could result in material retirement cost at the end of the assets useful life. After the exposure draft was issued many comments

and questions surfaced increasing the scope of the draft to include many electric and gas utility assets.

Q. How does FAS 143 compare to Montana-Dakota's current practice?

A. Historically, Montana-Dakota has set depreciation rates based on detailed depreciation studies prepared by specialists in this area. The depreciation studies incorporate assumptions and methodology common to the theories and principals applied in FAS 143. The depreciation rates are designed to match the recovery of the asset, including negative salvage, to the customers benefiting from the use of the asset. The methodology of the current depreciation system provides a systematic and straightforward process for recovering cost. This methodology is not unduly complex and is easy to update and revise on a timely basis providing a proper matching of revenue and expense. On the other hand, FAS 143 is quite complex and administratively burdensome. FAS 143 does not provide levelized depreciation rates, instead FAS 143 pushes higher cost towards the retirement date of an asset due to the discounting methods used.

The depreciation rates used by Montana-Dakota include estimates for negative salvage on interim plant retirements. The negative salvage rate incorporates actual incurred removal cost on assets retired by the Company. FAS 143 will likely result in more uncertainty since our current depreciation rates reflect removal cost for interim plant retirements whereas FAS 143 would require us to estimate the net present value of

removal cost necessary to retire plant at the date service is terminated to our customers. We currently consider this plant to have an indefinite life. Furthermore, as pointed out in Mr. John Jeter's testimony and the supporting schedules, the total depreciation and removal cost recovered from our customers would be the same regardless if we continue to use our current depreciation recovery methods or we adhere to the requirements of FAS 143. The period in which the recovery would occur would be different but since the reserve for accumulated depreciation is a reduction in rate base, the economic effect to the customer should be neutral.

It is my opinion the depreciation methodology employed by Montana-Dakota is very practical and cost effective and there would be no benefit to our customers in adopting the more complex and administrative burdensome requirements of FAS 143 for ratemaking purposes.

Q. Will Montana-Dakota be required to follow or adopt FAS 143?

A. Montana-Dakota follows Generally Accepted Accounting Principles (GAAP) and intends to implement FAS 143. The goal of Montana-Dakota would be to keep the administrative burden of complying with FAS 143 to a minimum. This could best be accomplished by implementing the standard at a higher level of detail, sufficient detail for financial reporting purposes but substantially less than would necessary for setting rates to our customers. The difference between the requirements of FAS 143 and what is allowed for regulatory accounting would result in the recording of a

regulatory asset or liability under FAS 71, *Accounting for the Effects of Certain Types of Regulation*.

R. Does this complete your rebuttal testimony?

A. Yes, it does.

MONTANA-DAKOTA UTILITIES CO.
A Division of MDU Resources Group, Inc.

Before the Public Service Commission of North Dakota

Case No. PU-399-02-183

Rebuttal Testimony
of
Richard D. Spratt

Q. Would you please state your name and business address?

A. Yes, my name is Richard D. Spratt. My business address is 400 North Fourth Street, Bismarck, North Dakota 58501.

Q. What is your position with Montana-Dakota Utilities Co.?

A. I am the Vice President – Human Resources of Montana-Dakota Utilities Co. (Montana-Dakota), a Division of MDU Resources Group, Inc.

Q. What are your duties and responsibilities with Montana-Dakota?

A. I am responsible for all the disciplines in the Human Resources arena including staffing, compensation and benefits, organization development and training, organizational structure, labor and employee relations and governmental compliance with employment and employee relation's laws and practices.

Q. Would you please outline your educational and professional background?

A. Yes. I have a Bachelor of Science and Master's degree in Labor and Industrial Relations from Michigan State University. I began my HR career 25 years ago with Eaton Corporation (a 9 billion dollar fortune 100 corporation) where I was promoted through a series of HR generalist jobs, including HR Professional, Asst. HR Manager, HR Manager, Division HR

56 PU-399-02-183 Pages: 11

Manager, Group HR Manager and the last position I held with them was HR Group Director for Cutler Hammer's Power Distribution Production and International Group. I was with Eaton for approximately 21 years. I then accepted the position of VP Human Resources Controls Group with Invensys, a 20 billion dollar company based in London, UK. I was in that job approximately two years and joined Montana-Dakota in 2001 as Vice President - Human Resources, which is my current position.

Q. What is the purpose of your testimony?

A. The purpose of my testimony is to address the recommendation made by Mr. Michael J. Majoros, Jr. on behalf of the North Dakota Public Service Commission staff to eliminate bonuses and hold the 2003 labor costs equal to the 2002 level.

Q. On pages 3 and 15 of his testimony, Mr. Majoros described his elimination of bonuses and commissions from the Company's revenue requirement and his holding of the 2003 labor cost levels equal to the projected 2002 levels. Do you agree that this is appropriate?

A. No. This is not appropriate.

Q. At page 15, lines 9 through 11 of his testimony, Mr. Majoros claims it is unreasonable to be granting bonuses as he thinks we are in some type of recession. Do you agree with that statement?

A. No. Bonuses are an integral part of our overall compensation philosophy to remain competitive with other employers and the part of total compensation that is at risk from the employee's perspective. Whether or

not we are in a recession has no relevance to maintaining competitive wages to attract and retain a competent work force.

Q. Would you please explain why the Commission should include bonuses and commissions, and include the 2003 labor costs presented by the Company?

A. Yes, these costs should be included in this proceeding because they are legitimate costs of doing business; they are reflective of ongoing costs to execute our business strategy; they are consistent with Montana-Dakota's compensation philosophy; and, they are consistent with industry norms. Inclusion of these costs is consistent with the past practice of this Commission, most recently affirmed in the Commission's order in Case No. PU-399-01-186.

Q. What is Montana-Dakota's basic compensation philosophy?

A. It is Montana-Dakota's philosophy to compensate employees based on each position's value to the company and the value the position holds in the appropriate labor/salary market. Montana-Dakota considers base pay, bonus and incentive pay, employee benefits and the work environment as important components of the total compensation package provided. Montana-Dakota strives to construct a competitive appropriate total compensation mix that will attract, retain, and motivate employees, thus balancing the interests of customers, stockholders, and employees.

Q. How are the interests of customers balanced through the use of bonus and incentive pay?

A. The interest of customers is enhanced through the use of bonus and incentive pay because placing a portion of the employee's pay at risk for good performance focuses employees on working more efficiently to achieve better results. For example, to achieve payout of the bonus under the BETA plan, which applies to the bulk of Montana-Dakota employees, certain goals must be met. Those goals include a contribution to earnings, health care cost containment and safety measures. All of these items directly affect the cost of utility service and to the extent the goals are met, the customers, the employees and the stockholders all benefit.

Q. Is Montana-Dakota's compensation philosophy different from other companies in the utility industry?

A. Montana-Dakota's compensation philosophy is similar to most utility organizations. Each year Human Resource professionals gather data to assure company programs are appropriate and competitive. Data from the 2002 Watson Wyatt Survey Series indicated a strong trend continues to provide employees in the utility industry the opportunity for bonuses and other incentives. Approximately 60% of hourly employees, 75% of salaried employees, and 90% of management employees are eligible for bonuses in our industry. The relevant survey pages are attached as Exhibit No. ___(RDS-1). The primary reason these plans are offered is to focus and engage employees to achieve key strategic objectives of the organization.

Montana-Dakota's base pay philosophy is more conservative than many organizations in the Watson Wyatt surveys. Approximately half of the participating organizations strive to provide a total compensation package that is above the market average. Montana-Dakota strives to pay at market average.

Q. How do Montana-Dakota's salary projections for 2003 compare with others in the utility industry?

A. In an effort to provide competitive rates to our customers, Montana-Dakota has, for many years, managed its operations as economically as possible, to the point of providing very conservative wage adjustments for employees. This method of management has resulted in lower wage rates offered our employees as compared to those offered by our competition. For example:

- For exempt and non exempt office employees the combined compa-ratio (percentage of market value) currently stands at 91%. What this means is that this group of employees, on average, are currently paid 9% below what other employers in the market place are paying.
- We have a similar situation for executive pay. According to a recent study done by Towers Perrin, an executive compensation consulting group, Montana-Dakota's executive salaries are currently 11.1% below what the market is paying. If we allow this trend to occur in 2003 we will be 15% or more below what the

market pays. If you fall 10% or more behind the market you are at a much greater risk for losing employees to your competitors and you are unable to attract new talent into those vacated positions.

- The national association of compensation and benefits professionals, "WorldatWork," projects that total salary budgets will increase approximately 4% in 2003. Montana-Dakota projected that increase at only 3% in this case. Even with that increase we would still be 9 to 10 percent below the market rates.

The proposal Mr. Majoros makes on page three of his testimony to eliminate bonuses and hold labor cost levels equal to the projected 2002 levels is unreasonable as we work to keep our wage rates competitive and the deficit from widening in the labor market.

We are extremely concerned about Montana-Dakota offering competitive pay in our industry. We know if our wages consistently lag the market, it has a detrimental impact on our ability to recruit the talent we need to continue to provide safe and reliable service to our customers. This is of particular concern now as we face the reality that Montana-Dakota is going to experience a great deal of turnover within the next five years due to retirement.

Q. Has Montana-Dakota granted wage increases to its employees in past years?

A. Montana-Dakota has granted its employees modest wage increases in past years. In the last five years there were increases

granted in each year and the percentage increases granted averaged 3.7%.

Q. Are bonus and incentive plans a new component of Montana-Dakota's total compensation philosophy this year?

A. No, the Company has offered these plans and considered them a cost of doing business for many years. They are part of Montana-Dakota's total compensation mix.

Q. Are the bonus and incentive plans offered by Montana-Dakota discretionary bonuses that are determined by management opinion?

A. No, these plans have been carefully designed to pay out when key financial and productivity thresholds are met and also have a portion of payout geared toward individual goal attainment. All of this is tied back to cost effectiveness and achieving the organization's overall business goals.

Q. Could Montana-Dakota avoid a bonus payout in 2003?

A. A payout could be avoided only if the predetermined financial targets and goals are not met. The goals and payout levels were set at the close of last year for 2002. The dollars we will be paying out in 2003 are based on measures established and communicated to employees nearly a year ago.

Q. Are there advantages to customers if Montana-Dakota moves away from bonus programs?

A. In my opinion, no. If you go back to the Company's compensation philosophy, the fact still remains that Montana-Dakota needs to remain

competitive in the labor market. If bonuses were eliminated, that portion of the total compensation mix would need to be reallocated into base wages or benefit costs in order to retain and attract talent. That does not save money for our customers and might even cost money because it would have to included under some other part of compensation and would not be an incentive dependent on performance.

Q. Does this complete your rebuttal testimony?

A. Yes, it does.

MONTANA-DAKOTA UTILITIES CO.
A Division of MDU Resources Group, Inc.

Before the Public Service Commission of North Dakota

Case No. PU-399-02-183

Rebuttal Testimony
of
Richard A. Espeland

Q. Would you please state your name and business address?

A. Yes, my name is Richard A. Espeland. My business address is 918 East Divide Avenue, Bismarck, North Dakota 58506.

Q. What is your position?

A. I am Vice President—Human Resources for MDU Resources Group, Inc. (MDU Resources).

Q. Are you the same Richard A. Espeland who filed direct testimony in this proceeding?

A. Yes.

Q. What is the purpose of your rebuttal testimony?

A. The purpose of my rebuttal testimony is to respond to the recommendation of Mr. Michael J. Mojoros, Jr. on behalf of the North Dakota Public Service Commission staff that the Supplemental Income Security Plan (SISP) not be included in the cost of service in this proceeding and to provide additional information supporting the program.

Q. What additional information are you providing?

A. Supplemental Employee Retirement Plans (SERPs) like Montana-Dakota's SISP have become common practice in utilities and related

Rebuttal Testimony of Richard A Espeland
by Montana-Dakota Utilities Co., a Division of MDU Re
Exhibit # 28
09/24/2002 CC: Comm Legal illona, Pat, Jerry Mike

companies. Such plans provide a supplemental pension benefit to employees and are designed to provide equitable retirement benefits for certain employees. Recent studies by consulting firms such as the Hay Group indicated that 74% of the companies offer non-qualified retirement plans and Clark/Bardes Consulting has also reported that about 75% of the companies, including utilities, have non-qualified plans. This clearly indicates the common practice of providing this type of benefit. I have included the relevant pages from the above studies as Exhibit No. ___(RAE-2).

To put our retirement programs in perspective, I have prepared Exhibit No. ___(RAE-3) which has been up-dated to reflect the retirement programs available to employees, including SISP on an annuity basis. As you will note from the graph, at the lower income levels, the replacement income through the qualified retirement programs is about 84% and at the higher income levels it is only about 20%. This includes Social Security, the Defined Benefit Pension Plan and the Company match to employee contributions under the 401(k) Plan. As an employee moves up the income scale, the percentage of income replaced by retirement plans significantly decreases based on retirement plan design requirements and government limitations on retirement plans. The SISP, as a supplemental pension benefit plan, has been designed to replace some—but not all—of the income that is not replaced by Social Security, the Defined Benefit Pension Plan, and the 401(k) Plan. At the higher income levels, even with

the SISP benefit, only about 50% of the annual income is replaced. This is certainly not excessive.

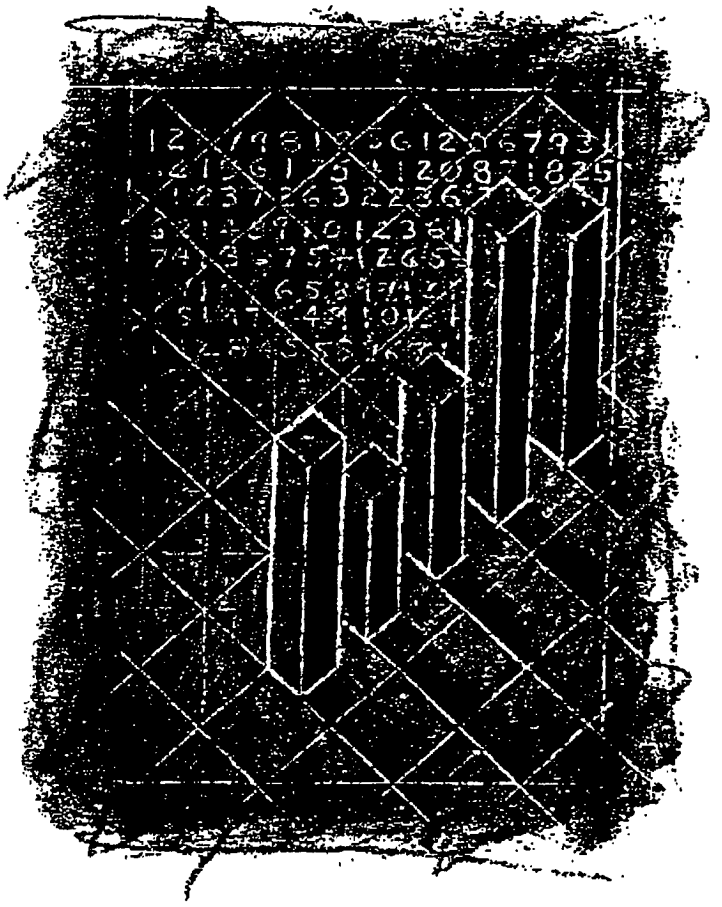
Q. Should the costs of Montana-Dakota's SISP be included in rates?

A. Yes, they should be. Supplemental non-qualified pension benefit plans like the SISP are now becoming common in the industry and other businesses and are becoming more and more an integral part of the overall compensation package. Today, a greater portion of overall compensation is placed at risk, from the employees perspective, through the now common use of bonuses and incentives based on performance. The supplemental pension benefit is necessary to attract and retain employees in key positions.

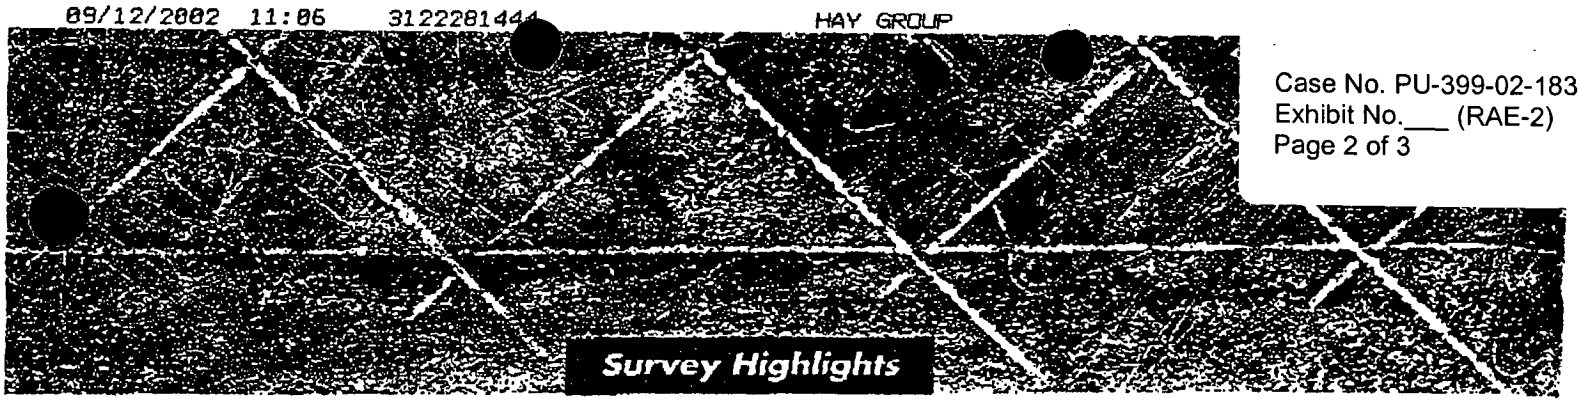
Q. Does this complete your rebuttal testimony?

A. Yes, it does.

A 2001 SURVEY



HayGroup®

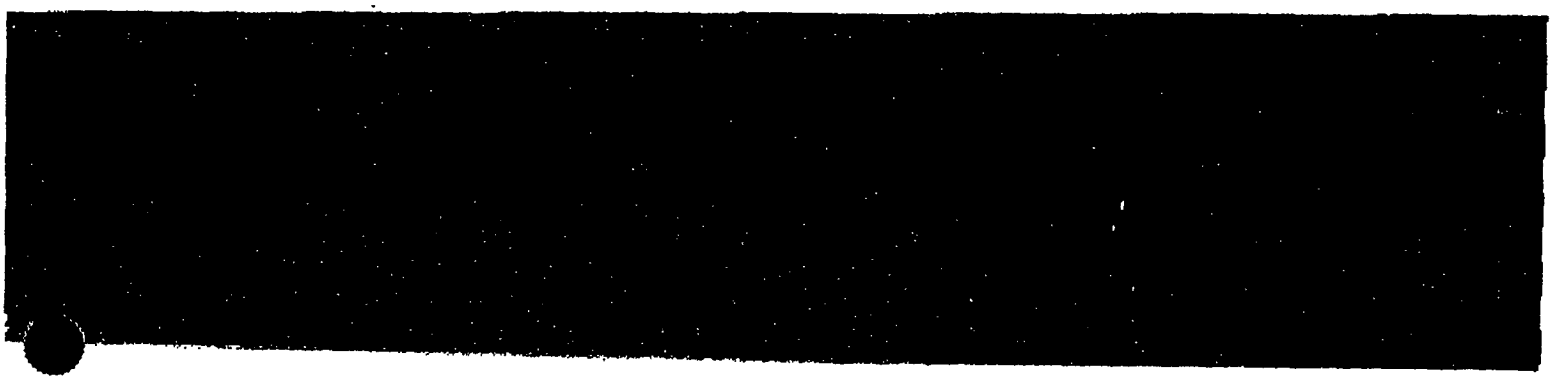


Perquisites

- Cell phones have now joined cars/car allowances as the most prevalent perquisites.
- In most perquisite categories, prevalence is significantly higher for the CEO.
- Employment Guarantee-type perquisites (employment contracts, Golden parachutes, severance) continue as the fastest growing perquisites.
- Executive Flex Plans, while on the increase, are still not widely offered, despite their flexibility for executives.

Non-Qualified Plans

- 74% of all participants sponsor some form of nonqualified retirement and/or deferred compensation arrangement.
- Prevalence of such plans varies substantially by size of organization from 56% (1,000 or fewer employees) to 91% (over 10,000 employees).
- Prevalence was considerably higher among industrial organizations (76%) and financial service organizations (90%) than among general service organizations (59%).
- Prevalence of plans was substantially higher for taxable organizations (77%) than among tax-exempt organizations (58%).
- CEOs are generally more likely to have plans than other top officers.
- Almost two-thirds of such plans (64%) offer unreduced early retirement prior to age 65.
- Target retirement ratios fall into the 50% to 70% range for three-fourths of the plans reporting, an increase over prior surveys.
- Funding, in the context of non-qualified plans, is prevalent in 77% of the plans, a major increase over prior surveys.



INTRODUCTION

For purposes of the Survey, a Supplemental Executive Retirement Plan ("SERP") is a nonqualified retirement plan under which the *employer* provides an additional retirement benefit to the employee. A SERP may be characterized as either a nonqualified defined contribution plan or a nonqualified defined benefit plan. Often, a SERP is tied in some fashion to the benefits provided under the employers' qualified retirement plans.

Approximately 75% of Respondents have adopted a SERP to provide benefits to executives in excess of amounts limited by qualified plan restrictions, holding steady from 2000. The primary reason for adopting a SERP is the Omnibus Budget Reconciliation Act ("OBRA") of 1993 which lowered the limit on compensation used for qualified pension calculations to $150,000 (currently indexed to $170,000 in 2001) (Internal Revenue Code [IRC] §401(a)(17)).

Montana-Dakota Utilities Co. **Case No. PU-399-02-183**

REBUTTAL TESTIMONY
OF
JOHN A. JETER
ON BEHALF OF
MONTANA-DAKOTA UTILITIES CO.

INTRODUCTION

Q. Please state your name and business address.

A. My name is John A. Jeter. My address is 1304 South 185th Circle, Omaha, Nebraska, 68130.

Q. What is your occupation?

A. I am a certified public accountant and I am a self-employed consultant. I retired from full time association with Arthur Andersen & Co. in 1991, after over thirty-seven years with that firm.

Q. What is the nature of the work you performed while you were with Arthur Andersen?

A. I was involved in examinations of financial statements, and to a much lesser extent, in designing and installing accounting systems. For many years I performed other financial and accounting consultation services for utility clients.

Q. What is your educational background and professional experience?

54 PU-399-02-183 Pages: 26
Rebuttal Testimony of John A Jeter
by Montana-Dakota Utilities Co., a Division of MDU R
Exhibit # 22
09/24/2002 CC: Comm Legal Illona, Pat, Jerry Mike

A. I am a graduate of the University of Nebraska at Omaha, from which I obtained a Bachelor of Science Degree with distinction in accounting in 1954. I was admitted to the Arthur Andersen & Co. partnership in 1967. I am a member of the American Institute of Certified Public Accountants and the Nebraska Society of Certified Public Accountants. In 1994, I was elected to the Board of Directors of Tucson Electric Power Company, and became a director of its parent company, UniSource Energy Corporation when it was formed. I retired from the UniSource board and its subsidiary boards in May, 2001. In 1991 I began consulting on my own with utilities regarding accounting and regulatory matters. As is true in this case, I have also consulted in association with Zinder Companies, Inc., a firm that provides economic and financial consultation to regulated utilities.

Q. What experience have you personally had in the utility field?

A. I have participated in or been responsible for regular audits of financial statements, registration statements filed with the Securities and Exchange Commission (SEC) for the sale of securities, installations of property records and information systems, and a variety of other special accounting services for regulated industry clients. For many years before I retired from Arthur Andersen, I had regional responsibilities in its regulated industries practice, and was a member of the partnership team that established policies with respect to issues facing clients in rate-regulated industries.

I often taught in both training sessions for Andersen personnel and in the training sessions Andersen offered to its clients and to others. This training ordinarily involved accounting issues, tax issues and various ratemaking matters.

In 1992, I prepared a paper, and presented it twice, in a tutorial sponsored by the Institute of Electrical and Electronics Engineers, Inc. Power Engineering Society. The title of my portion of the tutorial was "Accounting for Depreciation, Return, and Income Taxes."

Q. Have you previously testified before any regulatory agencies?

A. Yes. I have testified before the Federal Energy Regulatory Commission (FERC) (and its predecessor, the Federal Power Commission), the National Energy Board of Canada, the Interstate Commerce Commission and regulatory agencies in North Dakota and a number of other states, and the Province of Alberta, Canada. My testimony has addressed depreciation, accounting for income taxes, post retirement benefits other than pensions, working capital, and various other topics related to accounting and ratemaking issues. I have attached Appendix A, which is a list of my testimony in regulatory proceedings since the beginning of 1996.

Q. What is the purpose of your rebuttal testimony in this proceeding?

A. I have been asked by Montana-Dakota Utilities Co. ("Montana-Dakota" or "the Company") to respond to the direct testimony of Mr. Michael J. Majoros, Jr. on behalf of the staff of the North Dakota Public Service Commission regarding depreciation rates.

Q. What exhibits are you sponsoring?

A. I am sponsoring Exhibit No. ___(JAJ-1), Rebuttal Testimony of John A. Jeter, and Exhibit No.___(JAJ-2), Example – Statement of Financial Accounting Standards No. 143, which I prepared.

Q. Will you please summarize your conclusions?

A. Yes. The Company is using the depreciation rates included in Case No. PU-399-94-297 based on a depreciation study completed in 1992. Currently, Montana-Dakota has retained AUS Consulting to complete another depreciation study by December 31, 2002. There should be no change in depreciation rates until that study has been completed and the appropriate review has taken place as Mr. Majoros did not prepare a depreciation study, and has presented no evidence that the depreciation rates should be changed at this time. A proper depreciation study would involve reviewing additions, retirements, transfers, balances, salvage, removal costs, and accumulated depreciation for the entire history of each account in gas plant and common plant for Montana-Dakota's gas distribution operations, none of which Mr. Majoros did.

Mr. Majoros' reference to cash flow as a basis of setting depreciation rates is completely incorrect, and his use of the rough turnover estimation procedures is not reliable and is not used to establish depreciation rates when study data is available as it is in this case. His comments regarding net salvage are largely his unsupported opinions and are not based on any analysis of Montana-Dakota's facilities, experience or operations.

BACKGROUND INFORMATION

Q. Please describe the facilities being depreciated by the Company.

A. Montana-Dakota's facilities include gas distribution properties in North Dakota that are used to serve approximately 83,500 customers in 76 communities. In

addition there are common facilities that are used in connection with the electric and gas services in North Dakota and other states, the costs of which are directly assigned or allocated to the North Dakota gas operations.

DEPRECIATION

Use of Current Cash Needs to Set the Depreciation Rate

Q. On pages 5 through 9 of his testimony, Mr. Majoros discusses the relationship between cash flow and depreciation. Is this a normal type of depreciation analysis?

A. No. Mr. Majoros states that depreciation is not intended to finance additions (page 6, lines 3-4) but then compares Montana-Dakota's company-wide depreciation expense with the plant additions that were made during the years 1996-2001. It is well established that depreciation is not intended to finance plant additions, and the relationship between the two is largely meaningless for determining the appropriate time period during which the Company's plant should be depreciated. In spite of this, Mr. Majoros concludes at lines 25-26 of page 6 of his testimony that the Company ". . .is financing all of its plant additions from depreciation funds it collects from ratepayers, and still has a substantial amount of additional cash for other matters." There is no way he can support that conclusion, because he is assuming incorrectly that there are no other requirements for the cash flow.

Moreover, since depreciation is meant to recover the existing investment, it is irrelevant whether investors reinvest the recovered funds or, instead, find other uses for the funds. The appropriate depreciation rate is dictated by the need

to recover the invested capital during the life of the facilities. By ignoring that fundamental purpose of depreciation Mr. Majoros is effectively proposing that the depreciation rate should vary from time to time depending upon the amount of cash the company is investing on projects deemed by Mr. Majoros to be beneficial to ratepayers. Presumably, in years when the company has "... additional cash for other matters ..." Mr. Majoros would reduce the depreciation rate. Conversely, in years when the company needs to undertake major investments in plant, Mr. Majoros presumably would propose major increases in depreciation rates so that the company will have sufficient cash flow to fund all of its investments without borrowing, retaining earnings or issuing common stock. It is doubtful that Mr. Majoros really means to revolutionize the concept of depreciation so that customers' rates can be increased dramatically to provide financing for new investments. Nevertheless, that is the logical corollary to the new "cash-flow-needs" standard for setting depreciation rates that Mr. Majoros is advocating.

Q. Is Mr. Majoros' assertion concerning Montana-Dakota's source and uses of funds factually accurate?

A. No. In addition to the fact that the comparison he made is meaningless, the amounts he used are not comparable. The depreciation in column (2) includes depreciation of common plant, but the amounts for "Construction/Acquistion" (sic) in column (3) do not include those for common plant. During this 1996-2001 period there were $28,064,555 of additions to common plant. This changes

the "Incremental Cash Flow" in his column (4) from $28,473,000 to $408,000. (The last year shown in column (1) should be 2001 rather than 2002.)

Q. Mr. Majoros also made an analysis using just the North Dakota distribution and general plant additions and depreciation expense amounts in his Exhibit___(MJM-3). Is that any different?

A. No. It is also meaningless for similar reasons. Once again, his conclusion is completely incorrect. After observing that the depreciation expense for the years 1986-2001 exceeded the plant additions by $4.5 million, he says (lines 8-9 on page 7) "It seems that ratepayers rather than investors have been financing the Company's North Dakota plant through excessive depreciation." Interestingly, he asserts that there is "excess depreciation" and has, at this point in his testimony, mentioned no basis for that other than the comparison of depreciation cash flows and plant additions, which even he agrees are not the basis for setting depreciation rates.

Although this exhibit is meaningless, I should point out the fact that it is also incorrectly prepared. Mr. Majoros included depreciation expense for gas distribution and general facilities in column (2) of the exhibit. (See Company response to Data Request No. 29.) However, he included additions to gas distribution, general and common plant physically located in North Dakota in column (3) of his exhibit. (See Company response to Data Request No. 10.) This clear mismatch merely adds to the uselessness of the Exhibit.

Q. On Page 7 at lines 12-13, Mr. Majoros states "An excessive depreciation rate is one that produces depreciation expense more than necessary to return a

company's capital investment in an asset over the life of the asset. Do you agree?

A. No, because it is incomplete. The Federal Energy Regulatory Commission in its Uniform System of Accounts for Natural Gas Companies (also used by this Commission for the gas companies subject to its jurisdiction) defines depreciation as:

> the loss in service value not restored by current maintenance, incurred in connection with the consumption or prospective retirement of gas plant in the course of service from causes which are known to be in current operation and against which the utility is not protected by insurance. Among the causes to be given consideration are wear and tear, decay, action of the elements, inadequacy, obsolescence, changes in the art, changes in demand and requirements of public authorities, and, in the case of natural gas companies, the exhaustion of natural resources.

The term "service value" is defined as the difference between original cost and net salvage value of gas plant. Since service value includes net salvage in addition to the capital investment, Mr. Majoros omitted an important aspect of the recovery of cost that is necessary through depreciation provisions.

Q. How would the omission of net salvage affect his determination of "excessive depreciation"?

A. His comparisons are not only baseless, but they are also incorrect in that the entire cost is not included in his thinking. If the net salvage is negative, and is estimated to be 30% of the asset cost, he would be asserting that, since the depreciation expense exceeds current additions, it is excessive. That is a wrong comparison to start with, but in addition, he would be leaving out the fact that the expense would

have to be 130% of the amount necessary to recover the investment, in order to provide for the negative salvage (cost of removal in excess of salvage).

Q. On page 7, line 16 to page 9, line 2, Mr. Majoros quotes a U. S. Supreme Court decision from 1934 as a basis for his contention that excessive depreciation ". . .results in the extraction of capital contributions from ratepayers." Would you please comment?

A. Yes. Mr. Majoros seems to have missed the point of the Court's ruling. He refers to a cite of this decision in the NARUC Depreciation Manual as proof that it is still relevant law. The section in which this item is cited is the "Brief History of Utility Depreciation". The NARUC text points out the fact that this decision overruled a 1930 decision for depreciation on fair value. In other words, the references to over recovery of cost meant that the depreciation on a **value** basis would over-recover **cost.** Subsequent to the *Hope Natural Gas Company* case decided by the Supreme Court in 1944, most regulatory Commissions stopped using the "value" method for measuring the rate base investment and switched, instead, to the "original cost" method of measuring rate base. To that extent, I believe the 1934 decision cited by Mr. Majoros is consistent with current regulatory practice, which generally uses an "original cost" rate base for ratemaking. I believe the references in the decision to excessive recovery of depreciation referred to the use of value rather than cost in setting rates. That is certainly not an issue in this case since neither the rate base nor the depreciation amount is derived from an estimate of the current value or replacement cost of the plant.

Accumulated Depreciation (Reserve)

Q. On page 9, lines 3-24 Mr. Majoros shows the relationship of the accumulated depreciation reserve to the plant in service and concludes that the reserves are "extraordinarily high" and that they suggest that "prior depreciation rates have been excessive." Do you agree?

A. No. Without information about the average age of the plant, prior retirements etc., it is not possible to tell at what level the accumulated depreciation provisions (reserve) should be. Once more Mr. Majoros is expressing his opinion without benefit of any evidence to support it.

Q. Are there other aspects of the level of the depreciation reserves that should be considered?

A. Yes. The amount in the reserve includes amounts that are set aside for the net negative salvage as well as the amounts needed to recover the original investment in the plant. Obviously, that makes the percentage relationship of the reserve to the plant amounts look larger than it would if only the investment recovery portion of the reserve were compared. More importantly, the larger the reserve balance is, the lower the rate base is and the lower revenue requirements for return and income taxes are. In some cases the level of the reserve can also affect the levels of property taxes paid, and reduce them if the reserve is higher.

Q. Could you quantify the effect of the lower rate base?

A. Yes, I can do that roughly. The direct effect of a lower rate base caused by a larger depreciation reserve balance is to lower the revenue requirement. If it is assumed that depreciation had been less by the amount of Mr. Majoros' proposed

annual adjustment of depreciation since rates were set to be effective in late 1994, we would have had 8 years (1995-2002) of Mr. Majoros' $2.172 million proposed depreciation expense reduction accumulated in the depreciation reserve by the end of 2002. That would have reduced the reserve by $17.376 million and increased the rate base by the same amount.

The effect of an increase in rate base of $17.376 million would be to increase the revenue requirement. I have computed those amounts using Montana-Dakota's proposed 11.044% rate of return shown in Dr. Gaske's testimony, and the 39.61% combined Federal and state income tax rate supplied to me by the Company.

Q. What are the effects on revenue requirements using those assumptions?

A. The revenue requirement avoided because the $17.376 million is in the depreciation reserve is about $3.2 million annually which exceeds the $2.2 million annual depreciation adjustment proposed by Mr. Majoros. This means that there will be a greater reduction of the revenue requirement **every year from 2002 on** by having the $17.376 in the reserve than Mr. Majoros' proposed reduction in annual depreciation expense. In addition, the revenue requirement reduction does not reduce the amount of investment being recovered by Montana-Dakota as Mr. Majoros' proposed depreciation expense reduction would. The higher depreciation reserve balances, resulting in a lower rate base, has benefited Montana-Dakota's customers and continues to be a benefit in terms of reducing the revenue requirement.

Q. On page 10, lines 2-3, Mr. Majoros states "According to the Company, 'no specific studies have been prepared regarding the adequacy of the depreciation reserve or calculation of any theoretical depreciation reserves'." Is that true, and if so, can you explain why it is true?

A. I understand it is true, and it is certainly appropriate. Theoretical depreciation reserves are discussed in the NARUC text on depreciation to which Mr. Majoros referred in his testimony. On page 24, the authors state, "If, for example, depreciation rates have been prescribed by regulatory authorities for an appreciable period in the past, it would be inconsistent to deduct, in establishing a rate base, a larger or smaller amount than the book depreciation reserve accumulated under the prescribed rates." The reason that the Company has not done studies of the adequacy of the depreciation reserves or determined theoretical depreciation reserves, is that it is inappropriate. Adjustments of depreciation are nearly always done on a prospective basis based on the determination of changes in average service lives or determinations of average remaining service lives.

Net Negative Salvage

Q. On page 10 of his testimony Mr. Majoros expresses his opinion that the 1991 depreciation study by Stone & Webster included an "extremely high" cost of removal factor for Account 380 - Services. Do you agree?

A. No. The 1991 depreciation study of Stone and Webster included a review of Account 380 additions from 1936 through 1991 and related salvage data to the extent that it was available. I would rather rely on that study than Mr. Majoros'

reaction, which seems mainly to be based on the effects of the salvage estimate rather than the basis for it.

Depreciation Lives

Q. On the same page 10 Mr. Majoros concludes that the 36-year life for Account 376 – Mains and the 34-year life for Account 380 – Services "may be excessive" based on his experience in investigating other gas depreciation rates. Will you please comment?

A. Yes. Again, I would rely on Stone & Webster's 1991 depreciation study. Mr. Majoros' opinion may be based on his experience, but his opinion was formed without any specific determination of the proper life or any specific basis for the life he would select. The Stone & Webster study used data from 1936 through 1991, and curve fitting techniques that resulted in the use of the R3 Iowa Curve to determine a 34-year life for the Account 380 – Services. The study used data from 1944 to 1991 for Account 376 – Mains, in the same manner to determine an R5 curve fit and a 36-year life.

The approach used by Stone & Webster for these two accounts is widely used by depreciation experts, including the FERC staff, to determine the appropriate lives to use to depreciate gas utility plant.

Q. On page 11 at lines 1-15 Mr. Majoros discusses the "Geometric Mean Turnover studies" he used to test service lives. Will you please comment?

A. Yes. First, his use of the word "studies" should not be interpreted to mean that he did a depreciation study. What he did is a very limited review of certain data, with some unexplained calculations. He said in the testimony that he used the last

five years of additions and retirements, however his Exhibit___(MJM-5) shows additions and retirements for the period 1985 through 2001. In addition, his exhibit labels certain of the data as a "3 Year Band" and it appears not to be for any three-year period. His schedules on Exhibit___(MJM-5) pages 1 of 4 and 3 of 4 show average plant balances in Column b for each year based on the balances at the beginning of the current year and the beginning of the prior year, which means the average balances are all shown for the wrong year. They are all actually averages for the year previous to the one shown.

The "Ave. Plant Balance", "Additions", and "Retirements" shown under the "3 Year Band" caption are, in each instance, the sum of the current year and the previous year amounts from Columns b, c and d. Thus they are not for three years, and they use those incorrect average balances from Column b. Using the data for this 17-year period, Mr. Majoros computed a life estimate of 108.07 years for Account 376 – Mains and a life of 68.53 years for Account 380 – Services. He does not explain how the data for this 17-year period is reliable, nor how the method he used works to determine the lives.

In the case of Account 376 – Mains, the $1.167 million of retirements for all the years from 1985 through 2001 are only 6.2% of the balance at the beginning of 1985, and a smaller percentage of the 1985 balance plus subsequent additions. In the NARUC depreciation text mentioned by Mr. Majoros, turnover methods are discussed in Chapter VII. The Geometric Mean turnover methods he used is described on page 81 as follows: "The *Asymptotic* method and its simplified form, the *Geometric Mean* method, are based on ratios of annual

additions and retirements. The latter method more readily indicates trends but is also prone to producing results with considerable variability. The simplicity of the turnover methods and ease with which they may be applied explain their popularity. Their use is restricted by the assumptions of uniformity and their failure to provide an indication of retirement dispersion. These problems led to their replacement by the Simulated Plant Record (SPR) model."

Further, under the caption "Limitations" on page 92 of the NARUC text, the following summary statements about turnover methods are made: "All the methods assume uniformity for the growth ratio and the dispersion of retirements for each vintage. A more reliable estimate may be made if the property has experienced at least one life cycle (roughly twice average life) since, under the constancy assumptions above, the property will be at stability. Since utility property typically does not meet the above constancy assumptions, the methods may produce considerable variation in life indications. This is especially true for the Geometric Mean method."

The 1968 edition of the NARUC text stated on page 138 that "Turnover methods are currently used very little because improved methods have been developed for determining service lives from recorded data." I do not believe Mr. Majoros' conclusions based on his very rough analysis of this data should be given any weight in determining the proper lives to use for Montana-Dakota distribution facilities.

Net Salvage – Five Year Average

Q. From page 11, line 18 to page 12, line 11, Mr. Majoros discusses net salvage ratios, and refers to his Exhibit___(MJM-6). He concludes that ". . .the Company's net salvage recovery is vastly overstated." Do you agree?

A. No. I believe the 1991 depreciation study prepared by Stone & Webster is a much more reliable source of information regarding net salvage than a cursory look at net salvage for all accounts over a five year period. I also believe that cost of removal will tend to be paid nearer the end of the average life of plant facilities and cannot be estimated accurately using broad averages of short periods of data, as was done by Mr. Majoros.

Mr. Majoros used data without so much as questioning it. The amounts by year for natural gas varied from $79,685 to $440,703. In addition, the amounts for common utility facilities varied from $12,377 in 1997 to $4,889,037 in 2001. I understand that the large amount in 2001 involved the sale of an office building for approximately $4.6 million. The electric amounts include an insurance recovery of about $1.8 million, and much of the other salvage during the period is for vehicles and work equipment. In summary, Mr. Majoros has very little basis for his comments and for the effect of net negative salvage he used in his final recommendation. I will discuss that recommendation later in this testimony.

I do not understand Mr. Majoros' comments about the recovery being "overstated". I assume the amounts being recovered are being recorded by the Company in its records. Perhaps he means that the amounts being recovered are excessive, and I have commented above about his complete lack of evidence for

that claim. He also states on page 12 that the Company's ". . .ratepayers are being penalized." The ratepayers will receive full benefit of the amounts recorded by the reduction in rate base I discussed above.

Q. Included in his discussion of salvage, on page 12 of his testimony at lines 1-2 Mr. Majoros says ". . .it appears that the Company has not recorded any net salvage at all for Services." Is that true?

A. No. I understand from Company personnel that the Company has recorded $1.4 million of net negative salvage for Services during the years 1995 through 2001. Mr. Majoros took his data from a report of retirement work in progress ("RWIP"), which, because of the use of blanket work orders, shows Services combined with Mains. That is apparently the reason he concluded that there was no net salvage applicable to Services.

Q. Mr. Majoros then guesses that the Company may be recording cost of removal in connection with Services replaced as "Service Transfer Expense". (Page 12, lines 4-6.) Is that what the Company is doing?

A. No. As I mentioned above, the Company has informed me that net salvage has been recorded in the accumulated depreciation accounts (reserve).

Q. Then to the extent that he relied on his statements about Account 380 – Services, his conclusion is completely unsupported. Is that right?

A. Yes.

Statement of Accounting Standards No. 143

Q. On page 12, lines 13-21, Mr. Majoros discusses SFAS No. 143 and the changes he believes will be required for fiscal years beginning after June 15, 2002. Will you please explain the effects of SFAS No. 143?

A. Yes. I have prepared Exhibit No. ___(JAJ-2), a simple example of the accounting changes involved. On the exhibit I have assumed a $10,000 plant is completed on January 1, 2001 and there is an estimate of $500 of cost of removal and no salvage at the time of its estimated retirement on December 31, 2010. The owner of the plant applies a credit adjusted risk-free interest rate to discount the cost of removal obligation to it present value of $254.17.

Under existing accounting, as shown in the top table on the exhibit, the depreciation expense would reflect the $500 cost of removal as an additional provision for depreciation of $50 per year and the total depreciation expense credited to the reserve for depreciation would provide for the retirement of the asset and for the cost of removal. The plant and reserve accounts would be zero at the end of the life.

Under SFAS No. 143, the $254.17 present value of the estimated cost of removal would be recorded on January 1, 2001 as a liability and as an addition to plant. Depreciation of the adjusted plant would be $1,025.42 per year instead of the $1,050 recorded under existing accounting rules. However, the present value liability must be increased each year as the time for settlement approaches. The accretion recorded to do that is the discount rate times the beginning of the year balance each year. On the exhibit that shows up as $17.79 in 2001 and increases

each year until 2010 when it is $32.71. Once again, the plant and reserve accounts, as well as the liability account all stand at zero at the end of 2010.

It is important to note that the total expense recorded under both accounting standards is the same $10,500.

Q. Will you please comment on Mr. Majoros' discussion of SFAS No. 143?

A. Yes. The new accounting standard will cause Montana-Dakota and other companies to change their accounting for retirement obligations. Mr. Majoros indicates that when Companies do not have the asset retirement obligations described in SFAS No. 143 ". . .these costs will likely be expensed. . .". If a company does not have such costs I do not understand what it is that he would expect them to expense. In addition, his comment on lines 17-18 about measuring these costs ". . .at their present value, not the future inflated value." suggests a misconception. The requirements of SFAS NO. 143 are to estimate the future cash flows expected to be spent removing facilities retired, and to discount those amounts to current present values. The required computations specifically include an adjustment for inflation that is expected to increase the nominal cost of removal from present cost levels to cost levels expected to be in effect at the time when the costs of removing retired facilities are paid. Mr. Majoros is apparently mixing the effects of inflation with the discount rate used to discount the future cash flows to present values.

Q. Do you agree that GAAP does not control ratemaking as he asserts on page 13, line 2?

A. Regulatory agencies are not required to follow the specifics of each accounting standard. Because of this, *SFAS No. 71 - Accounting for the Effects of Certain Types of Regulation* provides for the accounting necessary to reflect the effects of such regulatory actions. However, I do not think anyone knows whether the FERC or the various state regulatory agencies will follow this new accounting in setting rates, as he suggests will be done. Frequently these agencies have decided to retain the accounting for ratemaking that they have been using when the FASB publishes a new standard. I believe that is something that is yet to be decided.

Q. Is SFAS No. 143 relevant in this proceeding?

A. Yes, I believe it is. The Commission could rule in this proceeding as to the method Montana-Dakota should use in the future for recording asset retirement obligations and the related operating expenses, and how such items will be treated for ratemaking purposes. However, it is possible that the Commission will prefer to deal with the question in a rulemaking type proceeding involving all its jurisdictional companies. If it is ultimately decided that the provisions of SFAS No. 143 are to be used for ratemaking, it is obvious that those provisions are relevant. If existing practices are retained, the Company must still comply with SFAS No. 143, and differences must be accounted for under the provisions of SFAS No. 71.

Q. Mr. Majoros' recommendation concerning SFAS No. 143 is explained on page 13, line 17 to page 14, line 9. Would you please comment on those recommendations?

A. Yes. The cost of removal charged to customers already includes the legal asset retirement obligations defined in SFAS No. 143. However, I believe the Commission may require the Company to provide for similar obligations that may not meet that definition, and those costs should also be included in cost of service. I certainly do not agree that ". . .the Company's experience suggests that it does not have any such obligations." as Mr. Majoros states at the top of page 14. The definition of a "legal obligation" in SFAS No. 143 is quite broad and includes entity promises to a third party (which may include the public at large) about its intention to perform retirement activities. (See paragraph A3. of the Statement.)

I also do not agree with his comment on page 14 at lines 3-4 that ". . .the costs should be measured at their net present value." If rates are set based on SFAS No. 143 procedures, the Company must be allowed to recover depreciation of the present value of future net negative salvage, and the accretion of the liability for asset retirement obligations. The sum of these two elements of cost is equal to the undiscounted cost of removal and both must be recovered to compensate the Company for costs it is required to pay, when costs are recorded as required under the provisions of SFAS No. 143. Here again, Mr. Majoros seems to be mixing the discounting and the effects of inflation. I believe both should be taken into account in setting rates.

I do not know how the 5 year rolling average expensing approach he recommends on lines 4-9 of page 14 works. However, as I explained above, if the Commission elects to follow the provisions of SFAS No. 143 in setting rates, the costs that need to be recovered are the depreciation of the present value of the

asset retirement obligation plus the accretion applicable to the present value obligation. That accretion must be expensed each year to adjust the net present value of the obligation to the new current level. The depreciation would be the same each year for any specific obligation, but the accretion would increase over time. Consequently, it could be appropriate to use a projected average amount over several years in order to allow the recovery of the total of the two parts required to be recorded under the provisions of SFAS No. 143.

If the Commission elects to continue to follow the practices it currently follows, then the differences between the two methods should be recorded as a regulatory asset or liability. The differences would be between; 1) the recovery of the estimated net salvage on the existing basis, and 2) the expensing of the depreciation of the capitalized present value of the asset retirement obligation plus the accretion that must be recorded under the provisions of SFAS No. 143 beginning in 2003. In the long term, the amounts allowed would be the same, but the timing of the expense would be different under SFAS No. 143 from what it has been under present Generally Accepted Accounting Principles ("GAAP").

Mr. Majoros' Depreciation Recommendation

Q. Is there any basis for the depreciation recommendation shown on Mr. Majoros' Exhibit___(MJM-7)?

A. No. Mr. Majoros has ignored the previous depreciation study with regard to negative net salvage, and has also reduced the recommended provision for depreciation for 2003 by $848,000 based on a five-year average of salvage values he obtained from the Company. A review of the data shown on his

Exhibit___(MJM-6) makes it clear that this 5-year summary is not reliable for the use he made of it. If this is the 5-year average he recommended at page 14, lines 4-8, I strongly disagree with his recommendation. As discussed earlier, there were large amounts included in that exhibit that are not recurring, such as a $4.6 million sale of an office building, which should not be included in any case. That transaction is unlikely to be repeated every five years. Because of this and other problems with this approach, it should not be considered.

Mr. Majoros also allocated the common property amounts between electric and gas utilities based on the salvage amounts for each of them separately, which is not the basis used by Montana-Dakota for the allocation of common plant costs. In any case he did not support his allocation of $2,795,600 to gas operations in his testimony or on the exhibit.

The net result of Mr. Majoros' adjustments would be a $2.172 million reduction in the amount allowed for depreciation to an amount of $1.089 million. His proposed adjustment would be over 71% of the amount currently being recorded by the Company. The proposed adjustment is not supported by any evidence and should not be approved. On page 14, lines 16-17, Mr. Majoros states that these adjusted rates ". . .are still excessive because they are based on lives that are too short. They are conservative from the ratepayers perspective." I do not understand what Mr. Majoros means by "conservative" but in my opinion his proposed rates are not conservative from any standpoint. Any further reduction would make them even less conservative. With the net salvage

adjustment he made, the overall average rate he is proposing is 1.58%. It cannot be considered conservative in any way. It is almost certainly inadequate.

Q Would you please summarize your testimony?

A. Yes. No adjustment of depreciation rates should be entertained until the current depreciation study is completed and an appropriate review has taken place. Current rates are based on a comprehensive study prepared in 1991 and used beginning in 1994. Mr. Majoros has not done a depreciation study and has no basis for suggesting the changes in depreciation rates he is proposing. His review of the depreciation rates currently in effect is entirely superficial and contains many errors. Thus the depreciation rates should not be changed based on Mr. Majoros' proposal.

Q. Does this conclude your rebuttal testimony?

A. Yes.

Case No. PU-399-02-183
Exhibit No.___ (JAJ-2)
Page 1 of 1

MONTANA-DAKOTA UTILITIES CO.
A Division of MDU Resources Group, Inc.

Before the Public Service Commission of North Dakota

Case No. PU-399-02-183

Rebuttal Testimony
of
Rita A. Mulkern

Q. Would you please state your name and business address?

A. Yes. My name is Rita A. Mulkern and my business address is 400 North Fourth Street, Bismarck, North Dakota 58501.

Q. What is your position with Montana-Dakota Utilities Co.?

A. I am the Regulatory Analysis Manager of Montana-Dakota Utilities Co. (Montana-Dakota), a Division of MDU Resources Group, Inc.

Q. Are you the same Rita A. Mulkern who filed direct testimony earlier in this proceeding?

A. Yes, I am.

Q. What is the purpose of your rebuttal testimony?

A. The purpose of my testimony is to address certain adjustments proposed by Mr. Michael J. Majoros, Jr., testifying on behalf of the North Dakota Public Service Commission Staff (Staff).

Q. On page 15 of Mr. Majoros' testimony, he proposes a five-year amortization of rate case expense instead of the three years the Company is requesting. Do you agree with his proposal?

No, I do not. The sole rationale Mr. Majoros sets forth for a five-year amortization is because of the period between rate cases.

53 PU-399-02-183 Pages: 6
Rebuttal Testimony of Rita A Mulkern
by Montana-Dakota Utilities Co., a Division of MDU Re
Exhibit # 25
09/24/2002 CC: Comm Legal Illona, Pat, Jerry Mike

Presumably he is referring to the fact that the last general rate case was filed in 1994. However, just because it has been eight years since the last general rate case does not mean that it will be five years before the next rate case. Montana-Dakota was able to refrain from filing for a rate increase during that time because it took actions to increase efficiencies and reduce costs, using new technologies where possible rather than seeking an increase in rates, all addressed by Mr. Fox in his direct testimony. Montana-Dakota will continue to strive for operating efficiencies and cost reductions, but it is not anticipated that it can replicate past performance and refrain from filing for another five years. Montana-Dakota believes that a three-year amortization provides the best time frame for rate case expense amortization.

Optionally, if the Commission does decide that a five-year amortization is appropriate, the unamortized rate case expense balance should be included as a rate base addition.

Q. On page 16 of his testimony, Mr. Majoros proposes to eliminate the inflation amount from the proposed level of other expenses. What is wrong with his adjustment?

A. Mr. Majoros does not allow these costs because they have not previously been allowed and he does not recommend that they start now. Mr. Majoros appears to be missing the point of this item. Montana-Dakota is using a projected 2003 test year. In projecting 2002-2003 expenses, costs were broken down into major categories. As shown on Statement

N, page 14, the items adjusted individually (labor, benefits, insurance, advertising and rate case expense) make up 71 percent of the total per books 2001 operation and maintenance (O&M) expense. The remaining 29 percent are real costs incurred by the Company and not likely to remain flat just because they were not individually adjusted. This category includes such items as materials, postage, vehicles and work equipment expense, uncollectible accounts, etc. The last time the Commission addressed the use of an inflation factor was in July 1991, over eleven years ago. It is time to recognize that these costs are subject to inflationary pressures just as the other identified items have been. For example, we know that postage expense, included in the inflation adjustment, increased effective July 1, 2002. The proposed inflation on other O&M items should be allowed as proposed.

Q. On page 2, lines 11-12 of his testimony, Mr. Majoros makes the comment that the proposed increase "will be superimposed on those already resulting from spikes in the market price of gas". Do you agree with that statement?

A. No, I do not. First, Montana-Dakota's gas costs have been very stable over the long-term, with the exception of the winter of 2000-2001 where there was a large spike in gas costs, both in North Dakota and nationwide. Exhibit No.___(RAM-2) is a graph showing a history of gas costs included in customers' rates through the monthly Purchased Gas Cost Adjustment (PGA) for the period January 1999 through October

2002. As can be seen on the graph, gas costs have been very stable, with the exception of the winter of 2000-2001, and in fact have been slightly lower in 2002 than in previous years.

Second, Mr. Majoros seems to be implying that when reviewing a rate case application, one should take into account the changes in the cost of gas. However, the cost of gas is not a part of the rate case.

Q. On page 5 of his testimony, Mr. Majoros states that " a 5.7 percent expense growth rate is not reasonable" for the period 2000 to 2003. Do you agree with his statement?

A. No, I do not. Mr. Majoros' statement is unsubstantiated and made without looking to determine if there are reasons for such an increase. There are certain items, identified in my direct testimony, that increased significantly in 2002. For example, pension and postretirement expenses both increased in the 10-15 percent range due to the market performance and lower interest rates. Insurance expense also increased significantly in 2002, an event that has been experienced nationwide. Mr. Majoros has no evidence to back up his statement, and thus, given the current cost levels, a 5.7 percent increase is entirely reasonable and explainable.

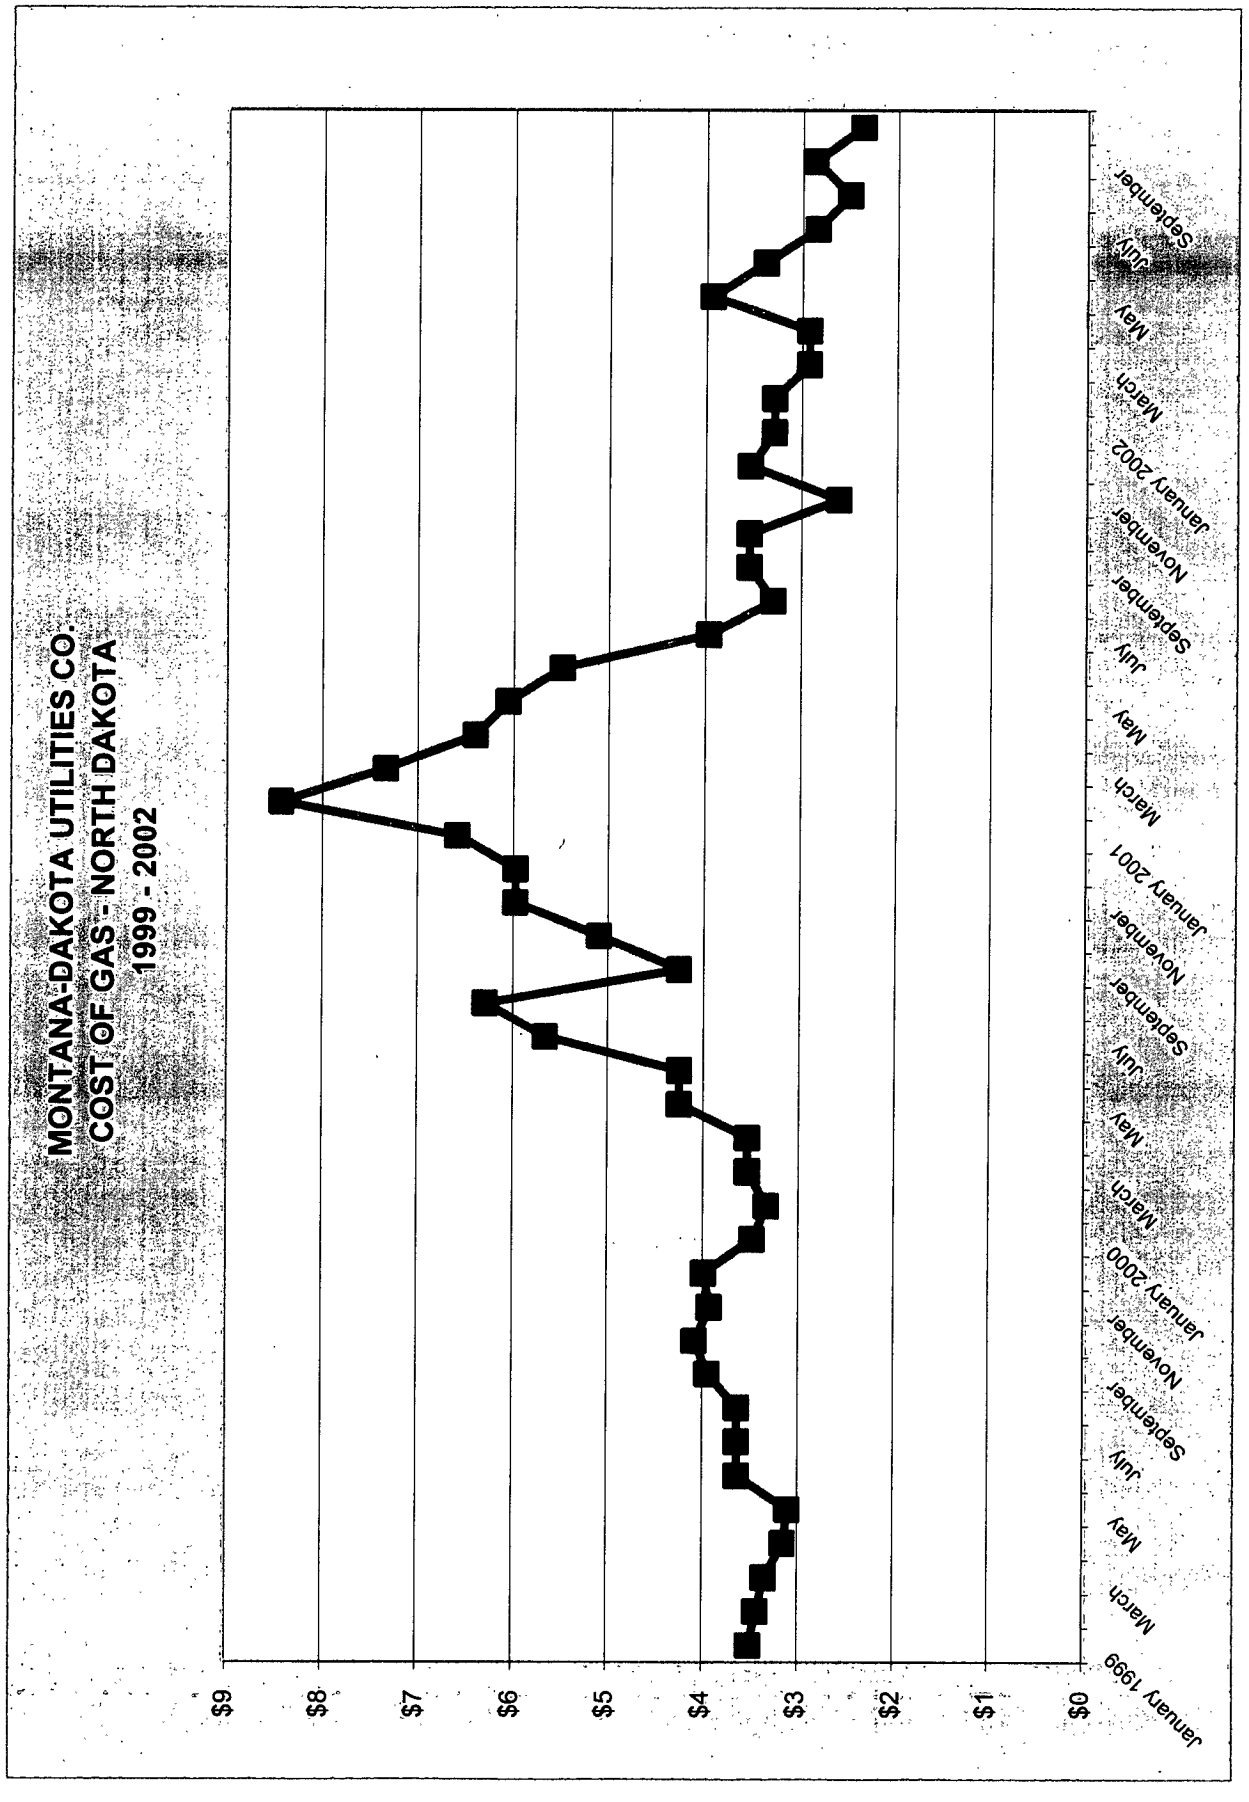
In fact, the actuarial reports for pension and postretirement costs for 2003 were just received and the results show that the pension and postretirement expenses included in the cost of service for 2003 are significantly understated. The updated expense for these items results in an increase in North Dakota gas pension expense of $150,000 and in

postretirement expense of $90,000 above the 2003 levels included in the rate case. The increase in expense is due to the lower investment returns in 2001-2002. This higher level of expense is now known and should be recognized in the revenue requirement for 2003.

In addition, medical costs for 2003 have also increased significantly from the levels included in the projected 2003 test year, and are now projected to be $189,000 over the amount in the case.

Q. Does that complete your rebuttal testimony?

A. Yes, it does.



MONTANA-DAKOTA UTILITIES CO.
A Division of MDU Resources Group, Inc.

Before the Public Service Commission of North Dakota

Case No. PU-399-02-183

Rebuttal Testimony
of
Tamie A. Aberle

Q. Would you please state your name and business address?

A. Yes. My name is Tamie A. Aberle, and my business address is 400 North Fourth Street, Bismarck, North Dakota 58501.

Q. What is your position with Montana-Dakota Utilities Co.?

A. I am the Pricing & Tariff Manager in the Regulatory Affairs Department of Montana-Dakota Utilities Co. (Montana-Dakota), a Division of MDU Resources Group, Inc.

Q. Are you the same Tamie A. Aberle who filed direct testimony in this proceeding?

A. Yes, I am.

Q. What is the purpose of your rebuttal testimony in this proceeding?

A. The purpose of this rebuttal testimony is to address recommendations made by Mr. Charles King, testifying on behalf of the North Dakota Public Service Commission Staff, regarding the embedded cost of service study and rate design.

Q. Would you please explain why you do not agree with Mr. King's position with regard to the Company's allocation of mains to the customer

component as he describes beginning at page 38 of his testimony?

A. Yes. The allocation of a portion of gas distribution mains to the customer component is a standard practice throughout the gas industry. The June 1989 version of the Gas Distribution Rate Design Manual prepared by the NARUC Staff Subcommittee on Gas states at page 22:

> "Customer costs are those operating capital costs found to vary directly with the number of customers served rather than with the amount of utility service supplied."

The manual further states-

> "A portion of the costs associated with the distribution system may be included as customer costs. However, the inclusion of such costs can be controversial. One argument for inclusion of distribution related items in the customer cost classification is the "zero or minimum size main theory". This theory assumes that there is a zero or minimum size main necessary to connect the customer to the system and thus affords the customer an opportunity to take service if he so desires."

Also, the cost of service study example provided in the NARUC Gas Distribution Rate Design Manual reflects the use of the zero or minimum size main theory and provides for the allocation of a portion of the mains investment to the customer component. Distribution mains are

appropriately allocated to the customer component by virtue of the fact that distribution mains exist because customers exist.

Q. Do you agree with Mr. King that the only time main additions are required is when a gas main is extended in order to serve new developments in previously unserved areas and that the customer allocation of mains is irrational for the customers served through the existing embedded system of gas mains as stated on page 39 of his testimony?

A. No, I do not agree with either premise purported by Mr. King in regard to the allocation of the Company's investment in mains. Main additions are not made only at the very edges of the system to provide service to new developments. Main additions are also required for purposes of enhancing system integrity and maintaining pressure requirements throughout the system as customer additions occur. Mr. King's analogy of a line originally installed to serve a single factory under the commercial rate that ultimately provides service to both residential and commercial customers is not a valid example using customer allocation and does not offer further support for his proposed allocation of mains on an energy related basis nor is it relevant to Montana-Dakota system's. The class cost of service study represents the allocation of embedded costs on an aggregate basis and not by line segment.

Q. Mr. King asserts that the heating content of the gas is the value delivered, and should be the allocator of the main's cost. Do you agree?

A. No. Main investment is not a variable cost that increases or decreases as more or less gas is used. The heating content is one value delivered but the capability to have natural gas service available on demand is the cost of having the main in place to serve customers. The value of the heating content does not represent the Company's embedded cost or the causation of the cost required to deliver natural gas to the customer.

Q. Is the allocation of mains presented by Mr. King consistent with past Commission practices?

A. No it is not. The peak day allocator used by the Commission in past cases did not assign any peak day usage to the interruptible classes on the premise that these customers do not contribute to the peak day design of mains. The peak day allocation factor used by Mr. King (as taken from the Company's study), includes an assignment based on a 100% load factor imputation of demand for the interruptible customers. This coupled with the allocation based on annual throughput results in an excessive amount of mains being allocated to the interruptible customers. Mr. King's study is further flawed because the allocation based on annual throughput includes the volumes sold or transported to transmission level customers who are not utilizing the distribution mains in order to use natural gas service. Exhibit No.___(TAA-4) provides the results of allocating mains 50% based on throughput @ the distribution level and 50% based on peak day use for the firm customers. The returns by

customer class, with this change in allocation factors, are as shown below:

Residential Service	6.367%
Firm General Service	1.106%
Air Force	69.369%
Small Interruptible	40.905%
Small Interruptible Transport	57.738%
Large Interruptible Transport	27.320%

Q. Are you in agreement with Mr. King's allocation of the rate increase as set forth at lines 1-6, page 47 of his testimony?

A. No, I am not. Based on either the Company's class cost of service study or a class study based on Mr. King's proposed allocation of mains as modified and set forth in Exhibit No.___(TAA-4), an increase to the Air Force, Small Interruptible or Large Interruptible classes is not warranted. Mr. King provided no basis for furthering the subsidization provided by the interruptible classes by allocating an increase to those customer classes that are already providing a return on rate base in excess of the overall return on rate base. Furthermore, the recovery an any increase in total revenues to be collected from the interruptible classes is at risk given the flexible rate provision applicable to this group of customers. Presently, approximately 20% of the small interruptible volumes and 80% of the large interruptible volumes are transported under discounted rates.

Q. Please comment on Mr. King's allegation that the very low-use customers will find the increases in their average monthly bill extortionate as noted

on page 48 of his testimony.

A. The monthly Basic Service Charges proposed by the Company are cost based and not reflective of extortionate pricing. As depicted on the attached bill comparison (Exhibit No.___TAA-5), which reflects the change in rates for residential customers at varying levels of consumption, the maximum increase per month is $5.20 which would only be applicable to those customers using zero gas volumes in a particular month. The proposed rate structure should have no adverse impact on the customer's incentive to conserve their use of natural gas in order to avoid paying high gas bills as the cost of gas itself is the major component of the bill and that component is not affected by the Company's proposal. What the proposed price structure will do is provide relief to customers during the winter months when their heating requirements result in higher gas use by lowering the amount collected on a volumetric basis and sending an accurate price signal.

Q. Does this conclude your rebuttal testimony?

A. Yes, it does.

Public Service Commission Evaluation Criteria
for
Request for Proposals/Competitive Negotiations

CASE No. PU-399-02-183

The following point system will be used in evaluating the proposals submitted. The individual criterion and point system was established in the written request for proposals. Each rater will use this form to score each proposal received and accepted. The total points of all raters will be added together and divided by the number of raters to establish the final score. All rating sheets will be kept as a part of the contract file.

1. Quality of written proposal (0-5) Points Awarded 4
   Comments, if any

2. Capability including personal qualifications, specialized experience, training, education, and performance record (0-20) Points Awarded 19
   Comments, if any

3. Understanding of the project (0-20) Points Awarded 18
   Comments, if any

4. Proposed work approach (0-10) Points Awarded 9
   Comments, if any

5. Price $48,534 (All Issues)

a.	Lowest bid to 120% =	45
b.	121% to 130% =	44
c.	131% to 140% =	42
d.	141% to 150% =	38
e.	151% to 160% =	32
f.	161% to 170% =	24
g.	171% to 180% =	14
h.	181% to 190% =	2
I.	191% and over =	0

Points Awarded 45

TOTAL POINTS AWARDED 95

SCORING SYSTEM

a.	Lowest bid to 120% =	45	$12,000 to $14,400
b.	121% to 130% =	44	$14,401 to $15,600
c.	131% to 140% =	42	$15,601 to $16,800
d.	141% to 150% =	38	$16,801 to $18,000

Michael J. Majoros, Jr.

RECEIVED
AUG 30 2002
ND PUBLIC SERVICE COMMISSION
EXECUTIVE SECRETARY

DIRECT TESTIMONY OF
MICHAEL J. MAJOROS, JR.

Introduction

Q. Please state your name, position and business address.

A. My name is Michael J. Majoros, Jr. I am Vice President of the economic consulting firm of Snavely King Majoros O'Connor & Lee, Inc. ("Snavely King"). My business address is 1220 L Street, N.W., Suite 410, Washington, D.C. 20005.

Q. Please describe Snavely King.

A. Snavely King was founded in 1970 to conduct research on a consulting basis into the rates, revenues, costs and economic performance of regulated firms and industries. The firm has a professional staff of 15 economists, accountants, engineers and cost analysts. Most of its work involves the development, preparation and presentation of expert witness testimony before federal and state regulatory agencies. Over the course of its 30-year history, members of the firm have participated in over 500 proceedings before almost all of the state commissions and all Federal commissions that regulate utilities or transportation industries.

Q. Have you prepared a summary of your qualifications and experience?

A. Yes. Appendix A is a summary of my qualifications and experience. It also contains a tabulation of my appearances as an expert witness before state and federal regulatory agencies.

Q. For whom are you appearing in this proceeding?

A. I am appearing on behalf of the staff of the North Dakota Public Service Commission.

Direct Testimony of Michael J. Majoros, Jr.
by Snavely King Majoros O'Connor & Lee, Inc.
Exhibit # 19
08/30/2002 CC: Comm Legal Illona, Pat, Jerry Mike

Objective of Testimony

Q. What is the objective of your testimony?

A. The objective of my testimony is to recommend the appropriate jurisdictional revenue requirement for the North Dakota Gas Division of Montana-Dakota Utilities Co. ("MDU"). By comparing this revenue requirement with the Company's 2003 pro forma revenues, I derive the indicated change in revenues which I believe is appropriate for the Company. The rate of return I use in these calculations has been provided by Charles W. King, whose testimony accompanies my own. Mr. King also discusses class revenue responsibilities and rate design.

Q. What was your approach to analyzing the Company's revenue requirement?

A. In this case the Company is seeking increases in its own net revenues, and these increases will be superimposed on those already resulting from the spikes in the market price of gas. My objective is to recognize the legitimate needs of the Company to cover its costs, but at the same time to ameliorate any added burden on ratepayers resulting from excessive recoveries. My modifications to the Company's rate proposals reflect my objectives.

Summary of Recommendations

Q. What base rate change has the Company requested in this case?

A. Witness Rita A. Mulkern proposes a $2.8 million base rate increase using an 11.44 percent rate of return.[1]

1 See Exhibit___(RAM-1).

Q. What base rate change do you recommend?

A. I recommend a $1.4 million base rate decrease using Mr. King's recommended 7.89% rate of return as quantified in my Exhibit ___ (MJM-1).

Q. What adjustments have you made to the Company's proposals?

A. I propose the following adjustments to the Company's revenue requirement request:

- I propose to reduce the Company's depreciation rates.
- I propose to eliminate the bonuses and commissions from the Company's costs and to hold the 2003 labor cost levels equal to the projected 2002 levels.
- I propose to eliminate the SISP from benefits expense.
- I propose a 5-year rather than 3-year rate case amortization period.
- I propose to eliminate the general inflation from other unadjusted operation and maintained expenses for an Other O&M expenses.
- I have used Mr. King's recommended capital cost rates.

Q. Do you have any exhibits to support your testimony?

A. Yes. I have several exhibits to support my testimony. As I explained, Exhibit ___ (MJM-1) quantifies my recommendation. I also compared it to the Company's proposal.

Financial Analyses

Q. Have you conducted any financial analyses?

A. Yes. My first financial analysis was to examine the gross margins reflected in the Company's case. The following table provides those margins as summarized from the Company's Statement N.

Gross Margins
2001-2003[2]
($000)

Description	2001	2002	2003
Total Revenues	$95,413	$69,131	$69,149
Total O&M	89,780	63,945	64,426
Gross Margin	$5,633	$5,186	$4,723

The gross margin analysis indicates that gross margins are projected to steadily decline from 2001 to the projected 2003 test year. Overall they decline by $910,000 from $5.6 million to $4.7 million.

My next analysis was to determine the cause of these declines. It was obvious by observation that the gross margins declined due to increases to operations and maintenance expenses excluding the cost of gas ("Other O&M"). The following table summarizes those expenses.

Other O&M
2001-2003
($000)

Description	2001	2002	2003
Other O&M	$12,938	$13,829	$14,354

2 Statement N, page 1.

The Other O&M increased by $1.4 million from $12.9 million to $14.4 million. Consequently, it can be reasonably concluded that increased Other O&M is a significant driver in the Company's request for additional revenues.

My next analysis analyzed the historical trends in Other O&M. These are shown on Exhibit___(MJM-2). The chart and table reveals that from 1996 to 2000, Other O&M increased from $12.1 million to $14.4 million. This reflects a compound growth rate of 2.5 percent, which may to some appear reasonable. However, closer inspection of the chart reveals that in 2001 Other O&M ratcheted up from 2000 and then the growth was smoothed from there. The compound growth rate from 2000 to 2003 is 5.7 percent. In my opinion, a 5.7 percent expense growth rate is not reasonable, even in the context of the 2.8 percent CPI growth rate cited by the Company in its filing.

Q. What was your next financial analysis?

A. Since I am recommending a decrease to the Company's depreciation rates, my next financial analysis deals with depreciation and cash flow.

Q. How does depreciation relate to cash flow?

A. For a public utility regulated on a rate base/rate of return basis, depreciation expense produces cash flow. That is because depreciation expense is a non-cash expense which is included in the revenue requirement. The Company collects the depreciation in rates, but there is no corresponding out flow.

Q. What does the Company do with this cash flow?

A. The cash flow is available for dividends, plant additions, investments in unregulated

companies or whatever the Company chooses.

Q. Is depreciation intended to finance plant additions?

A. No. The purpose of depreciation is to provide capital recovery. Depreciation is not, nor was it ever intended to finance plant additions. Many companies, however, attempt to make the case that depreciation is intended to finance additions. Consequently, I have made certain historical comparisons of depreciation to plant additions.

My first comparison is at the total MDU level. It compares total annual cash inflows from depreciation to total annual cash outflows for construction and acquisition of plant.[3]

Comparison of Annual Depreciation Cash InFlows To Construction Outflows - MDU 1996 – 2001

Year	Depreciation	Construction/ Acquistion	Incremental Cash Flow (2) – (3)
(1)	(2)	(3)	(4)=(2)-(3)
1996	$23,932	$21,796	$2,136
1997	24,505	24,545	(40)
1998	25,279	17,564	7,715
1999	25,725	21,102	4,623
2000	27,514	17,263	10,251
2002	28,824	25,036	3,788
Total	$155,779	$127,306	$28,473

Obviously the Company has derived substantial incremental cash flow from depreciation. In fact, it is financing all of its plant additions from depreciation funds it collects from ratepayers, and still has a substantial amount of additional cash for other matters.

Q. What was your next financial analysis?

3 From Statements of Changes in Financial Position from annual FERC Reports.

A. My next financial analyses was to determine if any of this incremental cash flow was being obtained from the North Dakota gas operations. For this analysis I focused on the depreciation and additions relating solely to North Dakota's gas distribution and general plant. I did not include any common or intangible plant. This analysis, included as Exhibit___(MJM-3) reveals that the Company has obtained substantial incremental cash flow as a result of depreciation charges to its North Dakota gas customers. In fact, since 1986, the Company has collected $4.5 million more in depreciation than it has added to North Dakota plant. It seems that ratepayers rather than investors have been financing the Company's North Dakota plant through excessive depreciation.

Excessive Depreciation

Q. What is excessive depreciation?

A. An excessive depreciation rate is one that produces depreciation expense more than necessary to return a company's capital investment in an asset over the life of the asset. In other words, since service lives and depreciation rates are inversely related, a life that is too short will result in a rate that is too high, thus producing excessive depreciation.

Q. Have any courts addressed the concept of excessive depreciation?

A. Yes, the concept of excessive depreciation was explained by the U.S. Supreme Court in a landmark 1934 decision, Lindheimer v. Illinois Bell Telephone Company, as follows:

> If the predictions of service life were entirely accurate and retirements were made when and as these predictions were precisely fulfilled, the depreciation reserve would represent the consumption of capital, on a cost basis, according to the method which spreads that loss over the respective service periods.

> But if the amount charged to operating expenses and credited to the account for depreciation reserve are excessive, to that extent subscribers for the telephone service are required to provide, in effect, capital contributions, not to make good losses incurred by the utility in the service rendered and thus to keep its investment unimpaired, but to secure additional plant and equipment upon which the utility expects a return.
>
> Confiscation being the issue, the company has the burden of making a convincing showing that the amounts it has charged to operating expenses for depreciation have not been excessive. That burden is not sustained by proof that its general accounting system has been correct. The calculations are mathematical, but the predictions underlying them are essentially matters of opinion. They proceed from studies of the 'behavior of large groups' of items. These studies are beset with a host of perplexing problems. Their determination involves the examination of many variable elements and opportunities for excessive allowances, even under a correct system of accounting [are] always present. The necessity of checking the results is not questioned. The predictions must meet the controlling test of experience.[4]

The Supreme Court found that excessive depreciation results in the extraction of capital contributions from ratepayers.

Q. Is this still relevant law?

A. Yes. In fact, it is cited in the NARUC Depreciation Manual which leads me to believe it is

4 Lindheimer v. Illinois Bell Telephone Company, 292 U.S. 151, 168-170, 54 S Ct. 658, 665-666 (1934). (Emphasis added; Footnote deleted).

relevant law.[5] I cite it here to demonstrate that there is clear precedent for the concept of excessive depreciation and its effect.

Q. What leads you to conclude the Company's existing depreciation rates are excessive?

A. I conclude the Company's existing depreciation rates are excessive for several reasons. First, the Company's depreciation reserve (accumulated depreciation) is excessive. The following table compares accumulated depreciation to the plant balances by function at December 31, 2001.

Comparison of Depreciation Reserves
To Plant In-Service
Gas Utility North Dakota
December 31, 2001
($000)

Function	Plant In Service [6]	Reserve [7]	Reserve %
Distribution	$55,087	$38,958	70.7
General	6,927	3,498	50.5
Common	5,178	2,593	50.1
Total	$67,192	$45,049	67.0%

Based on my experience the reserves shown above, particularly the distribution reserve, are extraordinarily high. That suggests that prior depreciation rates have been excessive.

Q. Has the Company conducted any studies to measure the adequacy or levels of its current

5 National Association of Regulatory Utility Commissioners, Public Utility Depreciation Practices, August 1996 ("NARUC Manual"), p. 13.

6 Response to DR 1-2, p. 24.

7 Statement D, p. 1 of 2.

depreciation reserves?

A. No. According to the Company, "no specific studies have been prepared regarding the adequacy of the depreciation reserve or calculation of any theoretical depreciation reserves."[8]

Q. Why are the Company's depreciation reserves so high?

A. The Company's current depreciation rates are based on a 1991 depreciation study conducted by Stone & Webster.[9] Exhibit___(MJM-4) is a summary page from the Stone & Webster study. My first reaction to the Stone & Webster study is that the cost of removal factor for Account 380-Services is extremely high. It is a negative 140 percent factor, which means that the current depreciation rate for Services was increased substantially to recover not only the existing investment, but also another 140 percent for future cost of removal. On its face this appears to be very excessive and undoubtedly contributes greatly to the excessive reserve ratios discussed above.

Q. Did any other factors cause you to conclude that the Company's depreciation rates may be excessive?

A. Yes. Another factor which caused me to conclude that the Company's depreciation rates may be excessive was the very short lives for Accounts 376-Mains and 380-Services; they are 36 years and 34 years, respectively. I have investigated gas depreciation rates on several occasions and based on my experience, these are extremely short service lives, thus pointing to excessive depreciation rates.

---

8 Response to Data Request No. 27.

9 See Statement I.

Q. Did you conduct any additional investigations concerning these lives and net salvage ratios?

A. Yes. I conducted Geometric Mean Turnover studies ("GMT") to test the lives for Mains and Services. These studies use the additions and retirements for the last five years to test service lives. The studies are attached as Exhibit __(MJM-5). The following table compares the results of these studies to the lives underlying the current depreciation rates.

Comparison of
GMT Life Indications
to Current Life Parameters

Account	Indicated Years	Current Life Years
376-Mains	108	36
380-Services	69	34

Obviously, the current depreciation rates are excessive because the underlying service lives are way too short.

Q. How did you test the net salvage ratios?

A. I reviewed the actual net salvage history included in Ms. Mulkern's workpapers. The workpapers and a summary of the most recent 5 years of actual experience are attached as Exhibit___(MJM-6).

Q. Do you have any general comments concerning the Company's overall net salvage experience?

A. Yes. Overall, the Company's experience is positive rather than negative. This is shown on Exhibit___ (MJM-6). The Company is collecting cost of removal from ratepayers, but

actually incurring positive net salvage. Furthermore, it appears that the Company has not recorded any net salvage at all for Services.

Q. Can you posit a reason that no net salvage is being recorded for Services?

A. Yes. Based on my experience, I have learned that many companies treat the costs associated with Services replacements as Service Transfer Expense i.e., no cost of removal is recorded. That may be why this Company does not record any net salvage for Services.

Q. What do you conclude?

A. I conclude that the Company's net salvage recovery is vastly overstated. In fact, it is recovering for negative net salvage, when in fact it is experiencing positive net salvage overall. It's ratepayers are being penalized. I disagree with the Company's cost of removal recovery.

Q. Are there any other reasons you disagree with the Company's cost of removal?

A. Yes. For all fiscal years beginning after June 15, 2002, all companies must determine whether or not they have actual legal obligations to retire their assets. These are called asset retirement obligations ("ARO"). If Companies do not have such obligations, these costs will likely be expensed under the terms of a recent AICPA Statement of Position on Property, Plant & Equipment. If ARO's do exist, they must be measured at their net present value, not the future inflated value. These requirements come under the auspices of Statement of Financial Accounting Standards ("SFAS") No. 143, which constitutes generally accepted accounting principles ("GAAP") for the public accounting profession. This Company is subject to SFAS No. 143.

Q. Does GAAP control ratemaking?

A. No. GAAP does not control ratemaking. However, the FERC is presently considering changes to the Uniform System of Accounts ("USOA") to account for the impact of SFAS No. 143. It is likely, therefore, that the principles underlying SFAS No. 143 will be reflected in the regulated accounting system.

Q. Why is SFAS No. 143 relevant in this proceeding?

A. The foundation of SFAS No. 143 makes sense. If a Company proposes to charge a future cost to current operations, it makes sense that it first establish the requirement to incur such a future cost. If such an obligation is established, it also makes sense for the obligation to be stated at its net present value to ensure that current operations are not charged with future inflation. The Company's approach is in conflict with these fundamental principles.

Q. Did you inquire about the company's implementation of SFAS No. 143?

A. The Company is unable to establish whether or not it has ARO's and even if it does, it has not established the net present value of these ARO's.[10] Although at the present time the Company is reviewing the scope of SFAS No. 143, there are no internal studies, research, relevant correspondence or accounting procedures at this time.[11]

Q. What do you recommend?

A. I recommend that the Commission recognize the fundamental principles of SFAS No. 143, by requiring that before any future costs of removal are included in current charges to

---

10 Response to DRs 6 and 7, and Follow-up 2 and 3.

11 Id.

ratepayers, the Company must first establish that it has a legal obligation to incur those costs. Clearly, the Company's actual experience suggests that it does not have any such obligations. However, if the obligation to incur those costs is established, the costs should be measured at their net present value. In the meantime, I recommend the 5-year rolling average expensing approach used regularly by the Pennsylvania Public Utility Commission and recently approved in two cases by the Kentucky Public Service Commission.[12] This approach ensures that the Company recovers the net present value of its actual costs, but eliminates the inclusion of future inflation in depreciation rates. In my opinion, this approach is consistent in substance with the principles of SFAS No. 143.

Q. Have you calculated depreciation rates using your recommended approach?

A. Yes. The depreciation rates are shown on Exhibit__ (MJM-7). They merely recalculate the 1991 rates without net salvage. On page 3 I have calculated the year 2003 depreciation expense using these rates and then subtracted the average positive salvage the Company has actually experienced during the last five years.

Q. Do you consider these rates and this approach to be conservative?

A. Yes. These rates are still excessive because they are based on lives that are too short. They are conservative from the ratepayers perspective.

Labor Expenses

Q. Please explain your adjustment to Labor expense.

A. The Company proposes increase its labor expenses based on the use of an average

12 Kentucky Public Service Commission, Case Nos. 2000-373 and 2001-00244

commissions and bonuses for the 2001 to 2003 period. Presumably it makes this adjustment because the Commission required the use of an average bonus in the electric rate Case No. PO-399-01-186. In that case, the average bonus reduced the expense, as the Commission intended. In this proceeding, the use of an average bonus increases the 2003 amount because the projected bonus is less than the 2002 projected bonus.

Q. What do you recommend?

A. I recommend the elimination of the bonuses and commissions altogether. I have accepted the Company's proposed 2003 fully forecasted test year, however, in my opinion it is unreasonable to also project a bonus into that year rates. Although I am not an economist, it seems clear to me that we are in the midst of some type of recession. It is unreasonable to be granting bonuses, which in fact amounts to roughly half of the Company's overall requested increase, when the Company is proposing a rate increase to begin with.

Benefits Expense

Q. Please explain your adjustment to Benefit expense?

A. I am recommending disallowance of the SISP expense consistent with the Commissioner's decision in Case No. PU-399-01-186.

Rate Case Expense

Q. Please explain your adjustment to Rate Case Expense?

A. The Company proposes a 3-year amortization period. Given the period between rate cases, a 5-year amortization period appears more reasonable. Consequently, I recommend a 5-year amortization period.

Inflation to Other O&M Expenses

Q. Please explain your adjustment to Other O&M expenses.

A. The Company proposes to inflate those amounts by 2.8 percent. Apparently the Commission has never allowed such an adjustment in the past.[13] I do not recommend that it start now, consequently I have eliminated the 2.8 percent increase

Q. Have you summarized your O&M expense adjustments?

A. Yes. They are summarized in Exhibit __ (MJM-8), which is followed by individual detailed adjustments. Exhibit __ (MJM-9) shows the labor expense adjustment including a related adjustment to payroll taxes. Exhibit __ (MJM-10) show the elimination of the SISP from Benefits expenses. Exhibit __ (MJM-11) shows the revised amortization period for rate case expenses. Finally, Exhibit __ (MJM-12) shows the elimination of the general inflation factor to other OTM expenses.

Q. Does this conclude your testimony?

A. Yes, it does.

13 Response to Data Request No. 45.

Experience

Snavely King Majoros O'Connor & Lee, Inc.

Vice President and Treasurer (1988 to Present)
Senior Consultant (1981-1987)

Mr. Majoros provides consultation specializing in accounting, financial, and management issues. He has testified as an expert witness or negotiated on behalf of clients in more than one hundred thirty regulatory proceedings involving telephone, electric, gas, water and sewerage companies. Mr. Majoros has appeared before Federal and state agencies. His testimony has encompassed a wide variety of complex issues including taxation, divestiture accounting, revenue requirements, rate base, nuclear decommissioning, plant lives, and capital recovery. Mr. Majoros has also provided consultation to the U.S. Department of Justice.

Mr. Majoros has been responsible for developing the firm's consulting services on depreciation and other capital recovery issues into a major area of practice. He has also developed the firm's capabilities in the management audit area.

Van Scoyoc & Wiskup, Inc., *Consultant (1978-1981)*

Mr. Majoros performed various management and regulatory consulting projects in the public utility field, including preparation of electric system load projections for a group of municipally and cooperatively owned electric systems; preparation of a system of accounts and reporting of gas and oil pipelines to be used by a state regulatory commission; accounting system analysis and design for rate proceedings involving electric, gas, and telephone utilities. Mr. Majoros also assisted in an antitrust proceeding involving a major electric utility. He submitted expert testimony in FERC Docket No. RP79-12 (El Paso Natural Gas Company). In addition, he co-authored a study entitled Analysis of Staff Study on Comprehensive Tax Normalization that was submitted to FERC in Docket No. RM80-42.

Handling Equipment Sales Company, Inc., *Treasurer (1976-1978)*

Mr. Majoros' responsibilities included financial management, general accounting and reporting, and income taxes.

Ernst & Ernst, *Auditor (1973-1976)*

Mr. Majoros was a member of the audit staff where his responsibilities included auditing, supervision, business systems analysis, report preparation, and corporate income taxes.

University of Baltimore - *(1971-1973)*

Mr. Majoros was a full-time student in the School of Business.

During this period Mr. Majoros worked consistently on a part-time basis in the following positions: Assistant Legislative Auditor – State of Maryland, Staff Accountant – Robert M. Carney & Co., CPA's, Staff Accountant – Naron & Wegad, CPA's, Credit Clerk – Montgomery Wards.

Central Savings Bank, *(1969-1971)*

Mr. Majoros was an Assistant Branch Manager at the time he left the bank to attend college as a full-time student. During his tenure at the bank, Mr. Majoros gained experience in each department of the bank. In addition, he attended night school at the University of Baltimore.

DIRECT TESTIMONY OF CHARLES W. KING

RECEIVED
AUG 30 2002
ND PUBLIC SERVICE COMMISSION
EXECUTIVE SECRETARY

INTRODUCTION

Q. PLEASE STATE YOUR NAME, POSITION AND BUSINESS ADDRESS.

A. My name is Charles W. King. I am President of the economic consulting firm of Snavely King Majoros O'Connor & Lee, Inc. ("Snavely King"). My business address is 1220 L Street, N.W., Suite 410, Washington, D.C. 20005.

Q. PLEASE DESCRIBE SNAVELY KING.

A. Snavely King, formerly Snavely, King & Associates, Inc., was founded in 1970 to conduct research on a consulting basis into the rates, revenues, costs and economic performance of regulated firms and industries. The firm has a professional staff of 12 economists, accountants, engineers and cost analysts. Most of its work involves the development, preparation and presentation of expert witness testimony before federal and state regulatory agencies. Over the course of its 30-year history, members of the firm have participated in over 500 proceedings before almost all of the state commissions and all Federal commissions that regulate utilities or transportation industries.

Q. HAVE YOU PREPARED A SUMMARY OF YOUR QUALIFICATIONS AND EXPERIENCE?

A. Yes. Attachment A is a summary of my qualifications and experience.

Q. HAVE YOU PREVIOUSLY SUBMITTED TESTIMONY IN REGULATORY PROCEEDINGS?

PENGAD 800-631-6989
EXHIBIT
15-48

48 PU-399-02-183 Pages: 87
Direct Testimony of Charles W King
by Snavely King Majoros O'Connor & Lee, Inc.
Exhibit # 15
08/30/2002 CC: Comm Legal Illona, Pat, Jerry Mike

A. Yes. Attachment B is a tabulation of my appearances as an expert witness before state and federal regulatory agencies.

Q. FOR WHOM ARE YOU APPEARING IN THIS PROCEEDING?

A. I am appearing on behalf of the Advocacy Staff of the North Dakota Public Service Commission.

Q. WHAT SUBJECTS DOES YOUR TESTIMONY ADDRESS?

A. My testimony addresses four subjects. Part I develops the appropriate rate of return on the rate base associated with the North Dakota gas distribution activities of Montana-Dakota Utilities, Inc. ("MDU" or "the Company"). Part II discusses the class cost of service study submitted as Statement M and sponsored by MDU witness Tamie A. Aberle. Part III evaluates the rate design proposals made by witness Tamie Aberle and supported by witness Russell A. Feingold. Finally, Part IV addresses the alternative Distribution Delivery Stabilization Mechanism, presented by MDU witness Feingold.

PART I – RATE OF RETURN

Q. WHAT HAVE YOU FOUND TO BE THE APPROPRIATE RATE OF RETURN FOR THE COMPANY'S NORTH DAKOTA ELECTRIC OPERATIONS?

A. Based on the analyses presented in this testimony, I find that the appropriate rate of return on the Company's electric operations in North Dakota is **7.98 percent,** inclusive of a return to equity of **10.5 percent.**

Q. WHAT INFORMATION DID YOU EXAMINE IN PREPARING YOUR TESTIMONY ON RATE OF RETURN?

A. I began by reading the testimonies of MDU witnesses Craig Keller and J. Stephen Gaske and their associated exhibits and statements. I prepared a series of data requests to which the Company responded. These responses in turn prompted a further round of data requests to which the Company has since responded. I have also reviewed the rate of return portion of the Commission's April 24, 2002 decision in Case No. PU-399-01-186, which related to MDU's electric operations. Finally, I have conducted considerable independent research, which I will discuss in the course of this testimony.

Q. HOW WILL YOU STRUCTURE YOUR TESTIMONY ON RATE OF RETURN?

A. I will first discuss the capital structure of the Company, that is, the mix of debt, preferred stock and common equity. I will next quantify the cost of the Company's debt and preferred stock. I will then discuss the theory of return to equity, the methodology for estimating it, and my development of the equity return requirement of MDU. I will conclude by applying the respective cost rates to the components of the capital structure to develop the appropriate return to total capital.

A. CAPITAL STRUCTURE

Q. WHAT CAPITAL STRUCTURE DOES MDU PROPOSE TO USE IN CALCULATING ITS OVERALL RATE OF RETURN?

A. MDU witness Gaske uses a capital structure consisting of 43.039 percent long-term debt, 4.622 percent preferred stock, and 51.687 percent common equity. This capital structure conforms with that presented on page 3 of Statement F, which presents the Company's projected capital structure for the year 2003.

Q. DO YOU AGREE WITH THIS CAPITAL STRUCTURE?

A. No, I do not. There are two objections to the Company's proposed capital structure. The first is that it is a projected capital structure. It is therefore effectively a creation of the Company that has no basis in any verifiable financial statements. The second is that it includes no short-term debt.

Q. WHAT CAPITAL STRUCTURE DO YOU RECOMMEND USING?

A. I propose to use the latest actual capital structure available, which is that for the year 2001.

Q. WHY DO YOU OBJECT TO THE COMPANY'S EXCLUSION OF SHORT-TERM DEBT?

A. The makeup of the capital structure used to develop a rate of return on rate base should reflect the nature of that rate base. If the rate base consists solely of capital investments in plant and equipment that are financed by long-term debt, preferred stock and equity, then it might be appropriate to exclude short-term debt. However, the Company's rate base also consists of materials and supplies inventories, fuel stocks, and prepayments. These short-term capital commitments will be financed in part with short-term debt. For this reason, I believe it is appropriate to include short-term debt in the capital structure.

Q. WHAT WAS THE LONG-TERM DEBT DURING THE YEAR 2001?

A. MDU Statement A, page 2, shows that long-term debt was $173,843,965 on December 31, 2000 and $158,304,439 on December 31, 2001. The average for the year is $166,094,202.

Q. WHAT WAS THE SHORT-TERM DEBT DURING THE YEAR?

A. Exhibit _____(CWK-1) is part of a response to a data request that shows the quarterly amounts of short-term debt during 2001. The last page of this exhibit shows that the average amount of short-term debt outstanding during 2001 was $9,639,726.

Q. WHAT WAS THE AMOUNT OF PREFERRED STOCK DURING 2001?

A. Statements A and F identify preferred stock during the year as $16,450,000.

Q. WHAT WAS THE AMOUNT OF COMMON EQUITY DURING 2001?

A. Statement F shows that the Company's total equity is $997,932,340 of which $843,497,103 represents the "subsidiary portion." For purposes of this calculation I am accepting the Company's calculation of common equity as $154,435,237.

Q. WHAT IS MDU'S CAPITAL STRUCTURE?

A. MDU's capital structure for the year 2001 is as follows:

Table 1
MDU Capital Structure, 2001
($000)

Short-term Debt	$9,639,726	2.78%
Long-term Debt	166,094,202	47.92%
Preferred Stock	16,450,000	4.75%
Common Equity	154,435,237	44.55%
Total	$346,619,165	100.00%

B. THE COST OF DEBT AND PREFERRED STOCK

Q. WHAT DOES THE COMPANY CLAIM TO BE THE COST OF THE COMPANY'S LONG-TERM DEBT?

A. On Schedule F-1, page 1 of Statement F, the Company calculates its 2001 cost of long-term debt as 9.302 percent.

Q. IS THIS THE CORRECT COST OF THE COMPANY'S LONG-TERM DEBT?

A. No. This cost rate is the weighted average cost of the medium term secured notes and the pollution control refunding revenue bonds that represent only a portion of the long-term debt of the parent Company, MDU Resources Group, Inc. While the pollution control bonds are arguably related to the electric service activities of MDU Utilities Company, the funds raised by the secured notes are available to any of the subsidiary activities of the parent company.

Excluded from the Company's calculation of its long-term debt rate are $405.2 million in senior notes, $219.7 million in commercial paper, $25 million in a revolving line of credit, $11.8 million in term credit agreements, and $2.3 million in a pollution control note obligation.

Q. WHY HAS THE COMPANY EXCLUDED THESE OTHER COMPONENTS OF DEBT?

A. The Company claims that its parent, MDU Resources Group, incurred these components of debt on behalf of other subsidiaries than MDU Utilities Company.

Q. IS THIS A VALID REASON TO EXCLUDE THESE ELEMENTS OF DEBT FROM THE DEBT COST CALCULATION?

A. No. The funds raised by debt issues are fungible. Apparently, MDU Resources Group has applied its low-cost sources of debt to the non-regulated subsidiaries and has left the high-cost debt to be recovered from the regulated operations of

MDU Utilities Company. I regard this as an artifice to manipulate the regulatory system into covering high-cost debt without providing any recognition of the parent's lower-cost financing resources. For this reason, I recommend that all of the components of MDU Resources Group's long-term debt be included in the calculation of debt costs.

Q. WHAT IS THE COST OF LONG-TERM DEBT WHEN THESE MISSING COMPONENTS OF THE PARENT COMPANY'S PORTFOLIO ARE INCLUDED?

A. Exhibit_____(CWK-2) presents a calculation of the weighted average long-term debt cost as of December 31, 2001 as reported in the Company's Statement A, pages 11 and 12 and Statement F, Schedule F-1, page 4. It shows that the composite, weighted average cost of long-term debt is 6.167 percent.

Q. WHAT IS THE COST OF SHORT-TERM DEBT?

A. The final page of Exhibit_____(CWK-1) shows that the average cost of short-term debt during 2001 was 4.542 percent.

Q. WHAT IS THE COST OF PREFERRED STOCK?

A. MDU's Statement F shows that the cost of preferred stock is 4.63 percent.

C. THE COST OF EQUITY

Q. WHAT IS THE BASIS FOR FINDING A RATE OR RETURN TO THE EQUITY COMPONENT OF THE CAPITAL DEVOTED TO MDU'S GAS UTILITY OPERATIONS IN NORTH DAKOTA?

A. In its landmark Hope Natural Gas decision, the United States Supreme Court established the following standards for the return to equity that must be allowed a regulated public utility:

> ..the return to the equity owner should be commensurate with the returns on investments in other enterprises having corresponding risks. That return, moreover, should be sufficient to assure confidence in the financial integrity of the enterprise, so as to maintain its credit and to attract capital.[1]

It can be seen from this excerpt that there are essentially three standards for determining an appropriate return to equity. The first is the "comparable earnings" standard, that the earnings must be "commensurate with the returns on investments in other enterprises having corresponding risks." The second is that they must be sufficient to assure "confidence in the financial integrity of the enterprise," and the third is that they must allow the utility to be able to attract capital.

Q. HOW CAN THE COMPARABLE EARNINGS STANDARD BE APPLIED IN ESTIMATING THE RATE OF RETURN TO EQUITY CAPITAL?

A. There is a certain circularity to the comparable earnings standard because the competitive nature of the capital markets virtually ensures that the returns to all enterprises having corresponding risks are comparable with each other. Investors establish the price of each traded stock based on that stock's present and prospective earnings in comparison with the present and prospective earnings of all other stocks and other investments available to them. If the earnings of a firm are depressed, then investors will pay only a low price for that firm's stock. As a result, their return on the market value of that stock will be comparable to the return on the market value of the stock of other highly profitable companies which, as a consequence of their profitability, have been bid up to a very high price.

[1]Federal Power Commission et. al. vs. Hope Natural Gas Company, 320 U.S. 592, at 603.

Thus, if "return" is defined as the earnings of an equity investment relative to its current market price, then the comparable earnings test becomes a cipher. All returns are comparable with all other returns.

In public utility regulation the conventional procedure for resolving this circularity is to identify the required equity return based on the market value of a utility's stock. That return is combined with the cost of debt and preferred stock, using either the actual or a hypothetical minimum-cost capital structure. The blended return to total capital is then applied to a rate base reflective of the book value of the utility's investment. The book value is the accountant's quantification of the original cost of the utility's assets adjusted for ratepayer contributions such as deposits and deferred taxes. Under this procedure, the market price of a stock is used only to determine the return that investors expect from that stock. That expectation is then applied to the book value of the utility's investment to identify the level of earnings which regulation will allow the utility's common shareholders to recover.

Q. HOW CAN THE FINANCIAL INTEGRITY AND CAPITAL ATTRACTION STANDARDS BE APPLIED IN ESTIMATING THE RATE OF RETURN TO EQUITY CAPITAL?

A. If the utility can earn a return on its investment comparable to that required by enterprises of comparable risk, then it should have no difficulty in attracting capital and maintaining credit. Investors would have no reason to shun such a utility in favor of other investment opportunities. Thus, if the comparable earnings test is met, then the financial integrity and capital attraction standards are met as well.

Q. IN SEEKING "ENTERPRISES OF COMPARABLE RISK," WHAT IS THE RELEVANT "RISK" FOR PURPOSES OF THIS INQUIRY?

A. The purpose of this inquiry is to find the cost of the equity capital of MDU that is devoted to providing regulated gas distribution service in North Dakota. The

relevant risk is therefore that associated with providing regulated gas distribution service.

This level of risk is not the same risk as that of MDU Resources Group, Inc., the parent corporation of the company that provides the gas distribution service at issue in this inquiry. That is because regulated utility service is a relatively small proportion of the total revenue and earnings of the parent corporation, and regulated gas distribution service is an even smaller proportion, as demonstrated in Table 2:

Table 2

MDU Resources Group, Inc.
Year Ended December 31, 2001
(Dollars in Millions)

Business Segment	Revenues		Operating Income	
Electric Retail	$168.8	7.6%	$38.7	14.2%
Natural Gas Distribution	255.4	11.5%	3.6	1.3%
Total Regulated	$424.2	19.1%	$42.3	15.5%

Note: numbers may not add due to rounding.

Q. FOR PURPOSES OF THIS INQUIRY, WHAT TYPES OF ENTERPRISES HAVE COMPARABLE RISK TO MDU'S REGULATED RETAIL ELECTRIC SERVICE?

A. The enterprises likely to have business risks most comparable to MDU's gas distribution service are those engaged in the same business, that is, the distribution of natural gas to retail end-users.

One of the central difficulties of this inquiry is that the procedures for identifying the cost of equity capital require that we be able to analyze the market prices of traded stocks. This means that we must deal with stand-alone corporations whose stock is traded on public markets. We cannot look at subsidiaries, affiliates, divisions or sectors of larger companies.

For this inquiry, we must therefore find companies with traded stock whose market risk is driven principally by the earnings, both present and prospective, from providing regulated utility gas distribution service. If the risk driver is some other business, the company cannot be said to be comparable.

Since we are attempting to find a rate of return sufficient to maintain credit and attract capital, we cannot examine utilities that have poor credit ratings. Accordingly, I have established as a criterion for acceptability that the company must have an "investment grade" bond rating, which is defined as BBB or better from Standard & Poors and Baa or better from Moody's. The company must be of broadly comparable size to MDU Resources, meaning that must be a large corporation. I have established a criterion of $100 million or more in gross revenues. Finally, in order to have business risks comparable to MDU's gas distribution service, the company must derive a substantial majority of its revenue from gas distribution service.

Q. HAVE YOU IDENTIFIED SPECIFIC COMPANIES THAT YOU BELIEVE COMPARABLE TO MDU'S GAS DISTRIBUTION SERVICE?

Yes. Exhibit_____(CWK-3) shows the companies that are listed as gas distribution companies in Value Line's Investment Survey; have investment grade bonds and total operating revenues in excess of $100 million, and derive more than 75 percent of their revenue from gas distribution services.

These criteria yield the list of 11 gas distribution utilities presented on Exhibit___(CWK-3):

Atmos Energy Corp.
AGL Resources
Cascade Natural Gas Corp.
LaClede Group, Inc.
NICOR, Inc.
Northwest Natural Gas Co.
People's Energy Corp.
Piedmont Natural Gas Co.
South Jersey Industries, Inc.
Southwest Gas
WGL Holdings, Inc.

Q. HOW WILL YOU IDENTIFY THE MARKET-DETERMINED RATE OF RETURN TO THE EQUITY CAPITAL INVESTMENT IN YOUR BAROMETER GROUP OF GAS DISTRIBUTION COMPANIES?

A. I shall first apply the Discounted Cash Flow ("DCF") procedure, which I consider to be the most accurate test of a market return. I shall then consider the interest rate risk premium approach as a "sanity check" on my DCF results.

1. DISCOUNTED CASH FLOW PROCEDURE

Q. PLEASE DESCRIBE THE DISCOUNTED CASH FLOW PROCEDURE.

A. The basic premise of the Discounted Cash Flow ("DCF") procedure is that the market values each stock at the discounted present value of all future flows of cash that investors expect from purchasing that stock. The discount rate that equates those future cash flows with the market value of the stock is the investors' required rate of return.

The DCF approach is usually represented by the following formula:

$$k = {}^{d}/_{P} + g$$

where k = required rate of return
d = dividend in the immediate period
P = market price
g = expected growth rate in dividends

While the DCF method is usually presented in mathematical notation format (as above), it can also be described in narrative fashion. The formula says that the return that any investor expects from the purchase of a stock consists of two components. The first is the immediate cash flow in the form of a dividend. The second is the prospect for future growth in dividends. The sum of the rates of these two flows, present and future, equals the return that investors require. Investors adjust the price they are willing to pay for the stock until the sum of the dividend yield and the annual rate of expected future growth in dividends equals the rate of return they expect from other investments of comparable risk. The DCF test thus determines what the investing community requires from the company in terms of present and future dividends relative to the current market price.

Q. DON'T MOST INVESTORS REGARD CAPITAL APPRECIATION AS A PORTION OF THEIR EXPECTED RETURN?

A. Yes. The expectation of capital appreciation is captured in the "g" or growth portion of the DCF formula. If dividends grow, then it follows that the market price of the stock will grow as well. It is this growth that most equity investors seek, at least in part, in purchasing shares in a traded company.

Q. IS THERE A CONVENTIONAL PROCEDURE FOR CALCULATING DCF RETURNS?

A. Yes. There is a conventional procedure for calculating equity return under the DCF formula that is often referred to as the "classic" DCF calculation. The Federal Communications Commission ("FCC") has concluded that this method

should be given the greatest weight in determining the rate of return to equity.[2] I agree with this conclusion.

Q. HOW IS THE "g" OR GROWTH FACTOR IN THE DCF FORMULA IDENTIFIED UNDER THE CLASSIC DCF CALCULATION?

A According to the DCF theory, the relevant measure of "g" should be the growth in dividends. Dividends, however, are largely a function of management discretion, and they do not necessarily reflect the underlying driver of earnings. Simply by changing the dividend payout ratio, a company's management can create a rate of dividend growth that is unsustainable. For this reason, I believe that earnings per share ("EPS") is the most reliable indicator of the "g" factor.

The classic DCF calculation employs predictions of EPS growth, usually in the three to five year time horizon. Investment analysts routinely attempt to forecast future earnings of traded companies. No one forecast can be considered reliable, but presumably a consensus of forecasts might be a good indication of investors' collective expectations as regards the company's future prospects.

The two most commonly used sources of investment analysts' predictions are the Institutional Brokers Estimate System ("I/B/E/S") and a somewhat broader survey of investment analysts by Zacks Investment Research, Inc., which includes retail as well as institutional brokers.

Q. WHAT ARE THE CONSENSUS ESTIMATES OF EPS GROWTH FOR THE COMPARABLE COMPANIES THAT YOU HAVE IDENTIFIED?

A. The Zacks' five year consensus growth estimates are as follows:

[2] *Notice Initiating a Prescription Proceeding and Notice of Proposed Rulemaking,* CC Docket No. 98-166, October 5, 1998.

Table 3
Zacks Five Year Consensus EPS Forecasts

Atmos Energy Corp.	6.43%
AGL Resources	11.42%
Cascade Natural Gas Corp.	5.25%
LaClede Group, Inc.	4.25%
NICOR, Inc.	6.10%
Northwest Natural Gas Co.	6.06%
People's Energy Corp.	6.80%
Piedmont Natural Gas Co.	4.67%
South Jersey Industries, Inc.	6.00%
Southwest Gas	6.80%
WGL Holdings, Inc.	3.65%

Source: Zacks Investments Research, Inc., Company Reports.

Q. HOW DOES THE CLASSIC DCF CALCULATION DERIVE THE DIVIDEND YIELD PORTION OF THE DCF FORMULA?

A. Under the classic calculation, the dividend yield is calculated as the next year's dividend divided by an average of recent prices of the stock. The resultant yield should reasonably match the dividend yields shown by the financial reporting services.

There are several ways to predict next year's dividend. Several investors' services provide forecasts of dividends. Another, somewhat more mechanical approach is to compute the next year's dividend as the most recent dividend annualized and then increased by one half of the analysts' prediction of long-term annual growth rate in earnings per share.

Q. WHAT ARE THE NEXT YEAR'S DIVIDENDS FOR THE COMPARISON COMPANIES YOU HAVE IDENTIFIED?

A. Using the mechanical approach, I calculate the following dividends for the comparison companies.

Table 4
Next Period Dividends

Company	Dividend (1)	½ Growth	Next Year Dividend
Atmos Energy Corp.	$1.18	3.22%	$ 1.22
AGL Resources	$1.08	5.71%	$ 1.14
Cascade Natural Gas Corp.	$0.96	2.63%	$ 0.99
LaClede Group, Inc.	$1.34	2.13%	$ 1.37
NICOR, Inc.	$1.84	3.05%	$ 1.90
Northwest Natural Gas Co.	$1.26	3.03%	$ 1.30
People's Energy Corp.	$2.08	3.40%	$ 2.15
Piedmont Natural Gas Co.	$1.60	2.34%	$ 1.64
South Jersey Industries, Inc.	$1.50	3.00%	$ 1.55
Southwest Gas	$0.82	3.40%	$ 0.85
WGL Holdings, Inc.	$1.27	1.83%	$ 1.29

(1) Zacks Company Reports

Q. HOW IS THE DENOMINATOR IN THE DIVIDEND YIELD CALCULATION, THE RECENT PRICE OF THE STOCKS, IDENTIFIED?

A. Some judgement is required to establish a set of price observations that capture the investing public's current perception of value, while at the same time reflecting some stability in the market. Given the fluctuations of the markets, a price observation for a single day, week, or even month runs the risk of becoming obsolete in a very short time. Market fluctuations also mean that the use of monthly highs and lows may exaggerate the effect of some of the sharp drops and rises that the markets have experienced recently. For this reason, I believe it is best to use the average of prices over a period somewhat longer than a month. Since CBS MarketWatch routinely publishes the average of the 50 most recent trading day closing prices, I have chosen this series as the price basis for the calculation of dividend yield.

Q. WHAT IS THE DIVIDEND YIELD OF YOUR COMPARISON COMPANIES?

A. Using the foregoing dividends and the MarketWatch price averages, I calculate the dividend yields as follows:

Table 5

Next Period Dividend Yields

Company	Dividend	50-Day Avg. Price	Dividend Yield
Atmos Energy Corp.	$ 1.22	$ 21.63	5.63%
AGL Resources	$ 1.14	$ 21.76	5.25%
Cascade Natural Gas Corp.	$ 0.99	$ 19.69	5.00%
LaClede Group, Inc.	$ 1.37	$ 22.65	6.04%
NICOR, Inc.	$ 1.90	$ 35.06	5.41%
Northwest Natural Gas Co.	$ 1.30	$ 28.28	4.59%
People's Energy Corp.	$ 2.15	$ 34.00	6.33%
Piedmont Natural Gas Co.	$ 1.64	$ 34.45	4.75%
South Jersey Industries, Inc.	$ 1.55	$ 32.85	4.70%
Southwest Gas	$ 0.85	$ 22.79	3.72%
WGL Holdings, Inc.	$ 1.29	$ 24.21	5.34%

Note: 50 day prices prior to August 24, 2002. Source: CBS MarketWatch.

Q. WHAT ARE THE RESULTS FOR THE "CLASSIC" DCF FORMULATION?

A. The "classic" formulation of the DCF procedure is the sum the growth rates identified in Table 3 with the dividend yields in Table 5, as follows:

Table 6
"Classic" DCF Results

Company	Growth	Dividend Yield	DCF Return
Atmos Energy Corp.	6.43%	5.63%	12.06%
AGL Resources	11.42%	5.25%	16.67%
Cascade Natural Gas Corp.	5.25%	5.00%	10.25%
LaClede Group, Inc.	4.25%	6.04%	10.29%
NICOR, Inc.	6.10%	5.41%	11.51%
Northwest Natural Gas Co.	6.06%	4.59%	10.65%
People's Energy Corp.	6.80%	6.33%	13.13%
Piedmont Natural Gas Co.	4.67%	4.75%	9.42%
South Jersey Industries, Inc.	6.00%	4.70%	10.7%
Southwest Gas	6.80%	3.72%	10.52%
WGL Holdings, Inc.	3.65%	5.34%	8.99%
Average	6.13%	5.16%	**11.29%**

Q. ARE THERE ALTERNATIVE FORMULATIONS OF THE DCF PROCEDURE?

A. Yes. There are broadly two alternative formulations to the DCF procedure that have been used in utility rate of return studies, both reflecting different ways of estimating the "g" or growth factor. The first is based on the proposition that growth in earnings and dividends for a regulated public utility is constrained by the growth in book value per share. This is because public utility regulation has traditionally authorized earnings in relation to a "rate base" reflective of the book value of the investment devoted to utility service. The rate of growth in per-share book value is a function of (1) the earnings retention ratio, (2) the authorized rate of return and (3) dilution or accretion from sales of new stock.

The other alternative uses historical trends in growth in earnings and dividends to calculate the "g" factor in the DCF formula.

Q. WHAT IS YOUR ASSESSMENT OF THE BOOK VALUE GROWTH MODEL FOR THE COMPARABLE COMPANIES YOU HAVE IDENTIFIED?

A. The book value growth model is less useful for gas utilities than it used to be for two reasons. Although I have limited my selection of comparable utilities to those deriving over 75 percent of their revenues from gas distribution, only two of these companies generate all of their revenue from this source. The remaining eight still have some unregulated – or FERC regulated – activities for which the book value growth model does not apply as well.

Possibly more relevant is the fact that very few utilities are so closely regulated that the only source of growth in earnings is the increase in book value. Since the late 1980s, when the gas distribution utility industry generally began experiencing declining costs, there have been relatively few rate cases. MDU is a good example. MDU's last gas rate case, No. PU-399-96-325, resulted in a settlement agreement that reduced rates in December 1998. The last general gas rate increase was in November 1994 in Case No. PU-399-94-297. This suggests that MDU apparently has earned more than its authorized rate of return during the intervening years. If MDU has been able to enjoy returns above what regulation might have established as the authorized rate of return, then its "g" factor would be greater than would be indicated by the earnings growth model.

Q. RECOGNIZING THESE LIMITATIONS TO THE BOOK VALUE GROWTH MODEL, HAVE YOU DEVELOPED "g" FACTORS FOR YOUR COMPARISON COMPANIES REFLECTING THAT APPROACH?

A. Yes. Exhibit___(CWK-4) develops this approach using data forecast by Value Line for the period 2005-2007. I divide the predicted dividend by the forecast earnings and use the complement as the earnings retention ratio, that is, the proportion of earnings not distributed as dividends. I multiply this ratio by Value

Line's forecast return on book common equity to derive the growth in book value from retained earnings.

The second factor in the book value growth model is the opportunity to augment book value by selling stock at prices that exceed book value. For each company, I chart the annual percentage increase in shares of stock between 2002 and 2006 as predicted by Value Line. I then multiply the average percentage increase in shares by the percentage that recent market prices (last 50 days) have exceeded book value.

The results for this version of the DCF model are as follows:

Table 7
Book Value Growth DCF Results

Company	Earnings Retention Growth	Stock Sales Increment	Dividend Yield	DCF Return
Atmos Energy Corp.	5.73%	3.06%	5.63%	14.42%
AGL Resources	5.82%	0.46%	5.25%	11.53%
Cascade Natural Gas Corp.	7.91%	2.20%	5.00%	15.11%
LaClede Group, Inc.	4.27%	0.92%	6.04%	11.23%
NICOR, Inc.	10.55%	0.00%	5.41%	15.96%
Northwest Natural Gas Co.	5.53%	0.00%	4.59%	10.12%
People's Energy Corp.	5.75%	0.00%	6.33%	12.07%
Piedmont Natural Gas Co.	4.52%	1.97%	4.75%	11.24%
South Jersey Industries, Inc.	5.44%	2.42%	4.70%	12.57%
Southwest Gas	4.80%	0.00%	3.72%	8.52%
WGL Holdings, Inc.	5.87%	0.00%	5.34%	11.21%
Average	6.02%	1.00%	5.16%	**12.18%**

Q. HOW DO YOU INTERPRET THE RESULTS OF THIS APPROACH?

A. This application of the book value growth model is entirely dependent on Value Line's forecasts of growth between now and the period 2005-2007. Value Line, like most Wall Street analysts, tends to be quite optimistic regarding business prospects. For example, there are no examples of level or declining earnings,

even though the historical record of these companies show a number of years in which earnings have declined. There are no examples where the return to book equity is assumed to be any lower than recent years, even where the earnings (e.g. NICOR at 21.5%) are clearly above those that regulators would likely allow in formal rate cases. For these reasons, I believe that the results of the earnings growth model must be considered the upper bound of the likely return requirements of my comparison companies.

Another factor suggesting a possible up-side bias is the probability that the companies will not realize the increments in share value resulting from the sale of shares above book value. In many cases, the new shares are not sold, or if they are sold, not at market value. For example, when officers exercise stock options for which they pay prices much lower than market, the effect can be to dilute the book value of the shares, not increase them. In this analysis, however, I have assumed that every new share results in an increment in equity equivalent to the market price.

Q. WHAT IS THE RELEVANCE OF HISTORICAL GROWTH MODEL TO THE ESTIMATION OF EARNINGS REQUIREMENTS?

A. Historical trends in dividends and earnings are relevant to an estimation of the "g" factor only to the extent that investors regard them as indicators of their future expectations. Most financial reports display considerable historical data, including past earnings per share and dividends, which suggests that this information is of interest to investors and analysts. The weight that they give to the trends in these indicators is, of course, unknown and unknowable.

Q. WHAT IS THE RESULT OF THE DCF MODEL IF HISTORICAL TRENDS IN EARNINGS PER SHARE ARE USED TO ESTIMATE THE "g" FACTOR?

A. Using the record of average growth in diluted earnings per share before non-recurring items from Zacks Research Reports beginning in 1997 and running through Value Line's forecast for 2002, the DCF model yields the following estimates of earnings requirements.

Table 8

Historical 1997-2002 EPS Growth DCF Results

	EPS Growth	Dividend Yield	DCF Return
Atmos Energy Corp.	12.04%	5.63%	17.67%
AGL Resources	6.94%	5.25%	12.18%
Cascade Natural Gas Corp.	10.21%	5.00%	15.21%
LaClede Group, Inc.	-7.15%	6.04%	-1.11%
NICOR, Inc.	4.55%	5.41%	9.96%
Northwest Natural Gas Co.	5.34%	4.59%	9.93%
People's Energy Corp.	0.69%	6.33%	7.01%
Piedmont Natural Gas Co.	1.21%	4.75%	5.97%
South Jersey Industries, Inc.	10.47%	4.70%	15.17%
Southwest Gas	33.84%	3.72%	37.56%
WGL Holdings, Inc.	-6.02%	5.34%	-0.68%
Mean	6.56%	5.16%	**11.72%**
Median			**10.84%**

Q. WHAT IS YOUR ASSESSMENT OF THE USE OF HISTORICAL EARNINGS GROWTH AS AN INDICATOR OF THE "g" FACTOR IN THE DCF FORMULA?

A. I doubt that investors take seriously earnings trends that are at either the high or the low end of the earnings growth spectrum. For example, it is unlikely that anyone expects Southwest Gas to continue to experience earnings growth of 37.56 percent annually, particularly as that number is an average of annual changes that range from an increase 170 percent to a decrease of 16 percent. At the other extreme, investors clearly do not expect LaClede's earnings to continue to decline. If they did, the stock would not be experiencing a dividend yield of only

6.04 percent. Possibly there is credence to the evidence of earnings trends that reflect a consistent pattern of growth from year to year. For this reason , I would give more weight to the median growth weight than to the mean, particularly as the mean rate of growth is affected by the high number for Southwest Gas and the low numbers for LaClede and WGL.

Q. PLEASE SUMMARIZE THE RESULTS OF YOUR DCF ANALYSES.

A I have applied the "classic" DCF procedure and two modifications based on alternative ways of calculating the "g" or growth factor. The results can be summarized as follows:

Table.9
Discounted Cash Flow Analysis Results

	Classic	Book Value Growth	Historical Growth
Atmos Energy Corp.	12.06%	14.42%	17.67%
AGL Resources	16.67%	11.53%	12.18%
Cascade Natural Gas Corp.	10.25%	15.11%	15.21%
LaClede Group, Inc.	10.29%	11.23%	-1.11%
NICOR, Inc.	11.51%	15.96%	9.96%
Northwest Natural Gas Co.	10.65%	10.12%	9.93%
People's Energy Corp.	13.13%	12.07%	7.01%
Piedmont Natural Gas Co.	9.42%	11.24%	5.97%
South Jersey Industries, Inc.	10.7%	12.57%	15.17%
Southwest Gas	10.52%	8.52%	37.56%
WGL Holdings, Inc.	8.99%	11.21%	-0.68%
Average	**11.29%**	**12.18%**	**11.72%**

Q. HOW DO YOU INTERPRET THESE RESULTS?

A. As noted earlier, the "classic" form of the DCF model should be given the most weight. However, when those results are widely different from the book value growth model, there is reason to question the sustainability of the earnings

forecasts derived from Zacks survey of investment analysts. For example, Zacks' survey shows that analysts are predicting earnings growth of 11.4 percent annually for AGL. However, the pattern of earnings retention by this company indicates that it would support book value growth of only 5.9 percent. In this case, it is reasonable to assume that the classic DCF model is overestimating the earnings expectation of serious investors in this company. The reverse is true of WGL Holdings, where Zacks reports that analysts are forecasting earnings growth of only 3.65 percent, yet the rate of earnings retention will generate a growth in book value, hence earnings capability, of 5.9 percent. In other cases, e.g. LaClede, Northwest, the classic and book value growth models are within 100 basis points of each other.

Q. CAN YOU PROVIDE AN ESTIMATE OF THE DCF RETURNS FOR EACH OF YOUR COMPARISON COMPANIES?

A. While precision is impossible, I can estimate the DCF returns of each company by using the classic result as the baseline and adjusting upward or downward where there are marked differences between that result and the book value growth, and to a lesser extent, the historical growth models. Here is my best set of estimates:

Table 10
Discounted Cash Flow Results

Company	Return
Atmos Energy Corp.	12.5%
AGL Resources	14.0%
Cascade Natural Gas Corp.	11.0%
LaClede Group, Inc.	10.5%
NICOR, Inc.	12.0%
Northwest Natural Gas Co.	10.5%
People's Energy Corp.	12.5%
Piedmont Natural Gas Co.	10.0%
South Jersey Industries, Inc.	11.0%
Southwest Gas	10.0%
WGL Holdings, Inc.	9.5%
Average	**11.23%**

Q. CAN YOU EXPLAIN THE VARIATIONS AMONG THESE RETURNS?

A. Considerable light can be shed on the differences among these companies' returns by looking at two sets of data, the proportion of revenue derived from regulated gas distribution service and the proportion of common equity in the company's capital structure:

Table 11
Proportions of Gas Distribution Revenue and Equity in Capital Structure

Company	% Gas Distribution	% Equity
Atmos Energy Corp.	95.6%	39.0%
AGL Resources	87.1%	35.1%
Cascade Natural Gas Corp.	100.0%	42.4%
LaClede Group, Inc.	92.8%	41.7%
NICOR, Inc.	83.4%	49.9%
Northwest Natural Gas Co.	97.8%	45.5%
People's Energy Corp.	80.8%	39.2%
Piedmont Natural Gas Co.	100.0%	50.8%
South Jersey Industries, Inc.	100.0%	32.5%
Southwest Gas	85.4%	31.9%
WGL Holdings, Inc.	74.6%	49.8%
MDU Utilities' Gas Distribution	**100.0%**	**44.55%**

The very high return requirements of Atmos, AGL and People's Energy can be explained by their relatively low equity proportions. The less equity in the capital structure, the greater the financial risk from variations in operating income. In the case of People's Energy, there is the added risk that the proportion of gas distribution revenue is relatively low in comparison to the other members of the comparison group. The relatively low proportion of gas distribution revenue may also explain the high return for NICOR, in spite of its high equity ratio and consequent low financial risk.

The companies showing very low return requirements can also be explained. Piedmont is a clear example of a low-risk company, with 100 percent of its revenue derived from gas distribution service and an equity proportion of over 50 percent. WGL also has a low-risk capital structure. Its 75 percent gas distribution revenue percentage might suggest higher risk except that most of the non-regulated revenue is derived from Washington Gas Energy Services, a supplier of gas to the very same customers who receive gas distributed by its regulated subsidiary.

Southwest Gas appears to be an anomaly, with a very low return requirement in spite of having less than 86 percent of its revenue from gas distribution and common equity proportions of only about 32 percent. These figures are somewhat deceiving, however. Southwest Gas has a low earnings growth forecast, but it serves very fast-growing population centers in Arizona, Nevada and California. Possibly, this assurance of long-term growth reduces the perceived risk of this company.

Q. HOW DOES MDU FIT INTO THIS PICTURE?

A. Table 11 shows that MDU's gas distribution operation service, with 100 percent gas distribution revenue and an equity proportion of 44.6 percent, is at the low end of the risk spectrum. Its profile most closely corresponds to that of Piedmont Natural Gas, with a return requirement of only 10.0 percent.

Q. WHAT RATE OF RETURN DO YOU RECOMMEND FOR MDU'S GAS OPERATIONS?

A. In light of low level of MDU's business and financial risk, I believe a good case could be made for setting its rate of return to equity at the very bottom of the scale shown on Table 10, 9.5 to 10 percent. However, the rate of return set in this

proceeding is likely to remain in effect for a number of years. I therefore believe it unadvisable to lock the company into a relatively low return for an extended period during which business conditions, capital costs and the company's outlook might change. For this reason, I recommend a return at the mid-point between the average for the 11 comparison companies, 11.23 percent, and the return requirement for three lowest-risk companies, 9.5 to 10.0 percent. That mid-point between 11.23 percent and 9.75 percent is **10.5 percent.**

Q. YOUR RECOMMENDATION IS BETWEEN 220 AND 330 BASIS POINTS LOWER THAN THE DCF RETURN FOUND BY DR. GASKE. WHAT ACCOUNTS FOR THE DIFFERENCE?

A. Dr. Gaske has used a much smaller sample of proxy companies than I have, six versus 11. Five of his companies are included in my comparison group, but the sixth, Keyspan, does not belong in any comparison with MDU's gas operations. Keyspan derives only 50 percent of its revenue from gas distribution operations and undoubtedly has a higher level of risk as a consequence.

A major difference between Dr. Gaske's results and mine relates to the LaClede Group. Dr. Gaske reports that Zacks has forecast a 12 percent 5-year earnings growth rate for this company. I do not find this result. I have attached Zacks report on LaClede as of August 24, 2002 as Exhibit____(CWK-5). Page 3 of that report indicates that the analysts' forecast as of that date was that LaClede's 5-year growth will be 4.25 percent.

There are two other identifiable differences between my DCF application and that of Dr. Gaske. First, Dr. Gaske inflates his results by 4.75 percent to account for flotation costs associated with new issues of stock. Second, Dr. Gaske uses a 1.625 percent inflator to the current dividend to calculate next year's dividend.

Q. IS DR. GASKE'S ADDER FOR FLOTATION COSTS APPROPRIATE?

A. No. Flotation costs are incurred only when a company issues new stock, and then only when there is a public stock offering. Existing stock incurs no flotation cost, and even new stock incurs no such costs if it is distributed as an employee or shareholder benefit either through options or as bonuses.

The effect of Dr. Gaske's flotation cost adjustment is to increase his equity return by 60 basis points, or .60 percentage points. When multiplied by the $1.125 million book equity value of the MDU Resources, Inc., this allowance amounts to $6.75 million annually, which is substantially more than the $5.4 million in flotation costs that the Company has incurred over the past five years.[3]

If a flotation cost adder is to be used, it should be equal to a reasonable estimate of the annual flotation cost incurrence divided by the entire amount of the Company's equity. In MDU's case, annual flotation costs during the past five years have been about $1.1 million. The Company's total book equity value is $1,125 million, for a flotation cost allowance of 0.1 percent. This amount is so small as to be lost in the rounding. For this reason, I recommend that there be no explicit flotation cost adder.

In Case No. PU-399-01-186 involving MDU's electric rates, the Commission agreed with this position.[4]

Q. IS DR. GASKE'S INFLATOR OF 1.625 FOR THE CURRENT DIVIDEND APPROPRIATE?

A. No. Dr. Gaske's factor is incorrect because it assumes that the investor will not receive his/her first dividend until exactly three months from the date of purchase. The average for the next dividend increase is thus (.25+.50+.75+1.0)/4 = .625.

[3] Case No. PU-399-01-186, MDU Response to King January 22 Data Request No. 6.
[4] See Order dated April 24, 2002, ¶ 15.

My .5g factor assumes that the probability of the dividend increase is randomly distributed throughout the year following the purchase of the stock. The average delay in the dividend increase under this assumption is one-half a year, so that the appropriate factor is .5g.

The effect of this disagreement on the final result, however, is minimal.

2. INTEREST RATE RISK PREMIUM APPROACH

Q. WHAT IS THE INTEREST RATE RISK PREMIUM APPROACH?

A. While equity return requirements are difficult to estimate, bond yields and interest rates can be measured with precision and currency. Indeed, they are reported daily in business publications and weekly by the Federal Reserve Board. The interest rate risk premium approach attempts to analyze the relationship between measurable interest rates and bond yields and immeasurable equity returns.

The reason for this relationship is that fixed income investments – bonds and preferred stock – compete with common stock for investors' dollars. If interest rates fall, then (all other things being equal) investors have an increased incentive to commit their funds to the stock market. As more funds flow into stocks, their prices increase, reducing the return available from current and forecast profits. Conversely, if interest rates increase, then stock prices fall, and the return to the newly repriced equity market increases.

To be sure, the return requirements of the two forms of investment do not move in lock step. Bonds suffer inflation risk, while stocks are considered a hedge against inflation. Conversely, stocks are far more susceptible to the effects of the business cycle than bonds, so when recession threatens, the spread between bond yields and required stock returns is likely to increase. Nonetheless, over time, a

decline in bond yields should signal a corresponding (although not directly correlated) decline in equity return requirements.

Q. WHAT IS THE VALUE OF THE INTEREST RATE RISK PREMIUM APPROACH?

A. It is worthwhile to examine the trend in bond yields and interest rates over the time since earlier equity return prescriptions were made for gas utilities in North Dakota to determine whether a finding of 10.5 percent is reasonable. If it appears that bond yields have increased, but I am recommending a reduced return to equity, then there may be reason to question my finding. On the other hand, if my proposed equity return tracks with the changes in bond yields, then there is at least a "sanity check" on the propriety of my finding.

Q. WHAT IS THE RELATIONSHIP BETWEEN EQUITY RETURN ALLOWANCES AND BOND YIELDS OVER THE YEARS?

Exhibit_____(CWK-6) provides this comparison. It shows the average monthly yields to 10-year Treasury and Moody's Aaa Corporate bonds from 1990 through to the latest month 2000 and to July 2002. It also shows the three gas equity return findings by North Dakota Commission since 1990. The chart shows that bond yields have been declining generally and are now at almost their lowest level in 12 years, significantly below their position when the previous return findings were made.

The specific relationship between the equity return findings and the then-current bond yields is as follows:

Table 12
Gas Equity Return Allowances and Contemporaneous Bond Yields

Case	Utility	Date	ROE Allowed	10-Yr Treas.	Aaa Corporate
399-90-820	MDU	July 30, 1991	12.0%	8.27%	9.00%
400-95-559	NSP	June 7, 1996	12.0%	6.91%	7.71%
400-00-521	NSP	June 27, 2001	11.5%	5.28%	7.18%
399-02-183	**MDU**	August , 2002	**10.5%***	4.35%	6.45%

*Staff proposed
Source: PSC Records and Federal Reserve Statistical Releases.

Q. WHAT DO YOU CONCLUDE FROM THESE COMPARISONS?

A. I conclude that while my recommended equity return allowance is lower than any that have been approved for gas utilities in the past 12 years, this result is justified by the evidence of lower overall capital costs. Those lower capital costs are demonstrated by a dramatic reduction in bond yields relative to the experience of the past 12 years. For this reason, I conclude that my recommended equity return of 10.3 percent is reasonable.

Q. WOULD YOU PLEASE COMMENT ON DR. GASKE'S RISK PREMIUM ANALYSIS.

A. In pages 22-24 of his testimony, Dr. Gaske purports to measure the required return to equity by adding the historical difference in experienced earnings from stocks and bonds to the current levels of bond yields. These historical differences, as measured by Ibbotson Associates, go back to 1926.

I have encountered this historical risk premium approach in a number of rate-of-return proceedings and have always found it so flawed, both conceptually and statistically, as to be virtually worthless.

The historical risk premium approach calculates the experienced returns to common stocks, bonds and Treasury bills on a monthly basis since 1926. It then

assumes that the experienced differences in return between stocks and bonds represent the expected differences in return. The theory is that over a long enough period, actual return differentials between stocks and bonds will equate to required or expected return differentials.

This is a statement of faith, not experience, and it defies logic. If investors' short-term expectations are continually being frustrated (as has been the case during the last year), what possible logic supports the proposition that the sum of those failed short-term expectations represents a valid long-term representation of their expectations? Moreover, it is flatly untrue that the differential in required returns between bonds and stocks is fixed and unchanging, as this theory postulates. The perceived safety/risk relationship of bonds differs from stocks, and their relative desirability as investment vehicles changes continually depending on such factors as inflation, economic growth, and the capital structures of the enterprises issuing the securities.

Quite apart from this conceptual failing, the theory fails statistically. The standard deviations of the observations, particularly the observations of the return differences, are greater than the mean of those observations. The means therefore lack statistical significance and are useless as a predictive tool.

Q. WOULD YOU PLEASE COMMENT ON DR. GASKE'S ALTERNATIVE EQUITY INVESTMENT ANALYSIS?

A. In pages 24-26 of his testimony, Dr. Gaske purports to demonstrate that MDU should be allowed a high return by observing that the returns to book equity on the S&P 500 companies from 1977 to 2000 have averaged 21.47 percent. He also observes that the book equity returns to 746 industrial, retail and transportation companies included in *The Value Line Investment Survey* have ranged from 27.57 percent to 31.75 percent over the five years 1996-2000. He argues that the average of 29.4 percent, along with the return of 21.47 percent experienced by

S&P's 500 companies, represents a "benchmark" which suggests that the 13.25 percent he proposes for MDU is quite low.

These comparisons are utterly irrelevant. Investors in unregulated industrial, retail and transportation firms have no access to book equity value. The only value that is meaningful for investors in such firms is the market value. That is what an investor must pay to acquire the stock, and conversely, the value an investor will receive by selling the stock. Book equity value in an industrial firm is a purely historical number representing the dollars of original investment in equity capital contributed to (or retained by) the company. It has little relevance to the current market value, even for fairly capital-intensive firms. Since most stocks sell well above their book value, the return that is accessible to investor is considerably less than the 20 to 30 percent noted by Dr. Gaske.

Book values are relevant for regulated utilities because regulation makes them so. Regulation sets the earnings allowance for such companies relative to a rate base reflective of the book value of the capital invested utility operations. This condition does not apply to industrial firms.

Q. IS THERE ANY JUSTIFICATION FOR DR. GASKE'S CLAIM THAT MDU IS ENTITLED TO A RISK PREMIUM BY REASON OF ITS SMALL SIZE?

A. No. While MDU's gas operations are relatively small, those operations do not sell stock. The parent company, MDU Resources Group, Inc is the entity that sells stock on behalf of MDU's gas operations. As Schedule 2 to Dr. Gaske's Exhibit (JSG-2) shows, MDU Resources is well within the size range of Dr. Gaske's own group of proxy gas companies. There is no small company effect whatever associated with MDU's equity capital cost.

D. RETURN TO TOTAL CAPITAL

Q. WHAT IS YOUR RECOMMENDED RETURN TO MDU's TOTAL CAPITAL?

A. My recommended return to total capital is **7.98 percent**, calculated as follows:

Table 13
Return to Total Capital

Item	Proportion	Cost	Weighted Cost
Long-term Debt	47.92%	6.167%	2.96%
Short Term Debt	2.78%	4.542%	0.13%
Preferred Stock	4.75%	4.630%	0.22%
Equity	44.55%	10.50%	4.68%
Total	100.00%		**7.98%**

PART II - CLASS COST OF SERVICE STUDY

Q. WHAT IS A CLASS COST OF SERVICE STUDY?

A. A class cost of service study is an analysis of the embedded or incremental costs of providing utility services to the customers or classes of customers that either cause these costs, or to whom these costs can reasonably be allocated.

Q. WHAT IS THE PURPOSE OF A CLASS COST OF SERVICE STUDY?

A The purpose of a class cost of service study is to provide an indication of what it costs to provide utility service to each customer class. This information can be used as a guideline for determining what portion of the revenue requirement should be recovered from each customer class.

Q. HOW HAS THE COMMISSION USED THESE STUDIES IN THE PAST?

A. In prior rate applications the Commission has used class cost of service studies as guidelines for rate design and as one of the factors in setting rates for the respective classes of customers.

Q. WHAT TYPE OF CLASS COST OF SERVICE STUDY HAS MDU SUBMITTED IN THIS CASE?

A. MDU Witness Tamie Aberle has sponsored Statement M, which is an embedded cost of service study for the year ended December 31, 2001. An embedded cost of service study allocates the recorded costs of an historical year among the respective customer classes. The sum of the embedded costs reconcile generally with the revenue requirement for the same historical year. Embedded cost of service studies contrast with incremental cost studies that measure the going-

forward costs that each customer class will generate in the coming years. Incremental costs do not necessarily reconcile with the revenue requirement.

Q. PLEASE DESCRIBE BRIEFLY THE MECHANICS OF A CLASS COST OF SERVICE STUDY.

A. The first step in performing a cost of service study is to funtionalize costs according to the major functions they serve, such as gas acquisition, transportation, storage and distribution. In this particular case, the focus is almost entirely on the last of these functions, distribution, because the other functions represent costs that are calculated and recovered through the Purchased Gas Cost Adjustment.

The next step is to classify the functionalized distribution costs into three broad categories for allocation purposes:

- Capacity related costs vary with the amount of gas sendout on the peak days of the year. Examples include the sizing of distribution mains and meters to account for the maximum volume of gas handled on any one day;
- Throughput related costs vary with the total amount of gas distributed throughout the year. Uncollectible accounts is a good example of this type of cost;
- Customer related costs vary with the number of customers. Examples include the cost of meters, services and billing.

After the costs have been classified they are allocated or assigned to each customer class. These allocations and assignments are then summed by class to provide an indication of the costs of service to each customer class.

Q. ARE THERE DEFINITE RULES FOR CLASSIFYING AND ALLOCATING COSTS WHEN PERFORMING A CLASS COST OF SERVICE STUDY?

A. No. Many costs do not fall into obvious classifications, and there can be more than one method for each allocation. Implementation is influenced by the judgments of the particular analyst. This is particularly true of gas distribution costs, as I shall discuss. The National Association of Regulatory Utility Commissioners ("NARUC") has published a Gas Distribution Rate Design Manual that describes cost classification and commonly used allocation methods. It does not, however, endorse any single specific method.

Q. HOW ARE CAPACITY COSTS ALLOCATED IN THE MDU COST OF SERVICE STUDY?

A. Capacity costs are allocated according to the class distribution of sales or throughput during the peak two days of the year.

Q. HOW ARE CUSTOMER COSTS ALLOCATED IN THE MDU COST OF SERVICE STUDY?

A. Most customer costs are allocated based on the count of customers in each class. Some costs, such as meters, are weighted according to the cost of the meters required for customers consuming different quantities of gas.

Q. WHAT ARE THE LARGEST CATEGORIES OF DISTRIBUTION PLANT?

A Three categories of plant account for almost 75 percent of MDU's gas distribution plant, as follows:

Table 14
MDU Gas Distribution Plant
December 31, 2001

Mains	$ 27,079,883	39.1%
Services	12,124,678	17.5%
Meters	11,963,141	17.3%
Other Distribution	4,391,190	6.3%
General & Common	13,763,316	19.9%
Total	$ 69,322,208	100.0%

Q. HOW HAS MDU ALLOCATED THESE THREE PRINCIPAL CATEGORIES OF PLANT AMONG THE CLASSES?

A. MDU has allocated services and meters by the number of customers weighted for their different consumption levels. MDU allocates 64 percent of its mains costs on the basis of peak 2 day throughput and 36 percent on the basis of the number of customers.

Q. DO YOU AGREE WITH THIS ALLOCATION?

A. I accept the allocation of services and meters based on weighted customers, but I question the propriety of allocating mains partially on the basis of customers.

Q. WHY DO YOU QUESTION THE ALLOCATION OF MAINS BASED ON THE NUMBER OF CUSTOMERS?

The issue is whether the mains system has been built to serve customers or to deliver gas. Arguably, the purpose is both, but the value derived and the benefits received from the mains system are more related to the amount of gas delivered than the number of customers. One customer receiving twice as much gas as another customer enjoys exactly twice the BTU heating content. The two cannot be equated in terms of benefit received, yet that is what a customer allocation of mains does.

Proponents of the customer allocation argue that the purpose of the mains system is to reach customers, and that when more customers are added, the mains system has to be extended. That is true only at the very edges of the system, where gas mains are being extended to serve new developments in previously unserved areas. Even then, the added cost of mains for new customers can vary dramatically depending on the location of those customers.

The vast majority of customers are served through the existing, embedded system of gas mains. For them, the customer allocation is irrational. Consider a 1,000-foot section of main line. Suppose that in 1995, that line served a single factory. In that year, its cost would be allocated to the commercial class on the basis of a single customer – a very small allocation. Then, in 1996, the factory moves, and the property is turned into a residential development of 10 homes. The same main is then given a weighting ten times as great as its previous allocation and assigned to the residential class. Then, in 2001, a strip mall containing 10 stores replaces five of the homes. The customer weighting of the main then increases to 15, split one third to the residential and two thirds to the commercial class. Yet it has been the same main all along, and its costs have remained the same.

Assume that the main delivered the same amount of gas throughout these changes in configuration. The benefit in terms of heating content was the same for the single factory as it was for the 10 homes. The 10 homes derived the same heating value as did the five homes and 10 stores. The heating content was the value delivered, and it should be the allocator of the main's cost.

Q. WHAT ALLOCATION OF MAINS COSTS DO YOU RECOMMEND?

A. I recommend an allocation that recognizes that the purpose of the mains system is to deliver gas, not to reach a count of customers. I therefore propose that the cost of mains be allocated one half to peak 2-day throughput and one-half to total

annual sales. I have requested the Company to rerun its cost of service study based on this alternative allocation of mains costs. Exhibit____(CWK-7) presents the summary pages of this alternative cost of service study.

Q. WHAT IS THE EFFECT OF THIS ALTERNATIVE ALLOCATION OF MAINS COSTS?

A. A comparison of the class rates of return under these two allocations of mains is as follows:

Table 15
Customer Class Rates of Return
Year Ended December 31, 2001

	Customer Allocation of Mains	No Customer Allocation
Residential	3.083%	7.731%
Firm General	3.998%	2.161%
Air Force	50.281%	3.502%
Small Interruptible Sales	83.992%	38.040%
Small Interruptible Transport	169.437%	48.490%
Large Interruptible	78.644%	-0.673%
Total North Dakota	6.439%	6.442%

The customer assignment of mains costs has a very significant effect on the cost allocation. It results in excessive costs being allocated to the residential class and away from the interruptible classes. Indeed, when mains costs are reallocated as I recommend, the Large Interruptible class goes from a very high rate of return to a negative return. The Air Force return drops dramatically, while the residential class return rises above the average for the system. The only consistent finding under the two allocation procedures is that the firm general class under-recovers costs, while the two small interruptible classes over-recover.

Q. HAS THE COMMISSION PREVIOUSLY REJECTED THE CUSTOMER ALLOCATION OF MAINS COSTS?

A. Yes. In MDU's 1991 rate case and in Northern States Power's 1996 case, the Commission rejected the allocation of mains costs partially on the basis of customer counts. In each of those cases, the Commission adopted the alternative of allocating all mains costs on the basis of peak day usage.[5] I believe that allocation overstates peak demand costs by failing to acknowledge that a portion of the mains system is required to deliver even a minimum amount of gas throughout the system. That is why I recommend that half the costs be allocated on the basis of annual sales.

PART III – RATE DESIGN

Q. HOW DOES THE COMPANY'S COST OF SERVICE STUDY AFFECT RATE DESIGN?

A. In the past, the Commission has used the cost of service study as a guide to determining differentials in the rate increases or decreases among classes. The Commission has also used these studies to set ceilings on specific charges, most notably the customer charge.[6]

Q. WHAT RATE DESIGN PROPOSALS HAS THE COMPANY MADE IN THIS CASE?

A. The Company has made a number of rate design proposals, as follows:

- Increase residential and firm general service rates by 4.6 percent, reduce the small interruptible class rates by 4.1 percent, and leave the Air Force and large interruptible rates unchanged;

[5] Case No. PU-399-90-820, decided July 30, 1991, ¶ 58; Case No. PU 400-95-559, decided August 7, 1996, ¶ 42.
[6] See Case No. PU-399-90-820, decided July 30, 1991; Case No. PU 400-95-559, decided August 7, 1996; Case No. PU-400-00-521, decided June 27, 2001.

- Separate the commodity rate into a Distribution Delivery Charge and a Cost of Gas charge, eliminating the Purchased Gas Cost Adjustment;
- Eliminate the declining block rate form from the commodity charges and substitute a flat per-dekatherm ("dk") rate;
- Change the customer, or "Basic Service Charge" from a monthly to a daily charge;
- Increase the Basic Service Charges by very large percentages. For example, the residential charge increases from $6.50 to $11.70, the small firm service charge from $8.50 to $24.00 and the large firm service charge from $17.00 to $51.00.
- Eliminate the residential seasonal rate;
- Increase the penalty for failure of interruptible customers to interrupt from $10 to $50 per dk;
- Increase the return check fee to $20;
- Increase the reconnection fees for seasonal customers to match the avoided Basic Service Charges;
- Increase the reconnection charge for disconnected customers for nonpayment to $30;
- Modify the Firm Gas Extension Policy Rate 120 and 124 to reflect the Company ownership of all prospective service lines.

Q HOW WILL YOU ADDRESS THESE RATE DESIGN PROPOSALS?

A. I will first address rate design changes that should be made in the absence of any overall revenue change whatever. These are changes that should be adopted whether the Commission increases, decreases or maintains the existing level of rates. I will then address rate changes that should be made if the Commission increases, or alternatively decreases current rates.

Q. WHAT RATE DESIGN CHANGES SHOULD BE MADE REGARDLESS OF THE CHANGE IN TOTAL REVENUE APPROVED BY THE COMMISSION?

A. I recommend that the Commission accept the following rate design changes proposed by MDU:

- The commodity rate should be separated into two clearly distinct rates, the Distribution Delivery Charge and the Cost of Gas Rate.
- The declining block rates should be eliminated and the revenue collected through the higher initial block rates should be reallocated to the Basic Service Charge.
- The residential seasonal rates should be eliminated, since there are no customers on these rates.
- Penalties for failure to interrupt should be increased, since the Company apparently believes that the current penalties are not sufficient to ensure that interruptible customers respond to their calls for interruption or curtailment.
- The reconnection charges for seasonal customers should be adjusted to match the higher Basic Service Charges resulting from the elimination of declining commodity blocks.
- The Company's proposed modifications to the line extension policy should be adopted.

Q. WHY DO YOU RECOMMEND ADOPTION OF THE DISTRIBUTION DELIVERY CHARGE AND THE COST OF GAS RATE?

A. This change makes the customer's bill more understandable. Customers will be able to distinguish between the portion of their bills that accrues to MDU for providing delivery service and the portion that is a pass-through of the gas acquisition, transportation and storage costs that accrue to other parties.

Q. WHY DO YOU SUPPORT THE ELIMINATION OF DECLINING BLOCK RATES?

A. Declining block rates implicitly encourage customers to use more gas and thereby discourage conservation. To the extent that they collect fixed customer costs in the commodity rate, they misstate the cause of the costs. They also allow customers who use minor amounts of gas for non-heating purposes to escape the cost of providing the basic elements of service to them.

Q. HAVE YOU CALCULATED THE INCREASED CUSTOMER CHARGES THAT WOULD RESULT FROM ELIMINATING DECLINING BLOCK RATES?

A. Yes. Exhibit_____(CWK-8) presents the calculation of the customer charges that result if declining blocks are eliminated from the residential and firm general service rate schedules. The exhibit identifies the excess revenues recovered by the higher initial blocks. It then divides those revenues by the total customer charges to compute the increase in each customer charge that would yield the same revenue. This calculation is based on historical 2001 billing determinants adjusted for normal weather conditions.

Exhibit_____(CWK-8) shows that the elimination of declining block rates would increase the small residential Basic Service Charge from $6.50 to $8.43 and the large residential charge from $13.00 to $15.31. The small Firm Service customer charge would increase from $8.50 to $14.34, while the large Firm Service customer charge would go from $17.00 to $45.16.

These Firm General Service rate increases seem quite large, but their impact on the average customer should be negligible because the commodity rates for the initial blocks will be substantially lower.

Q. HAVE YOU DETERMINED WHETHER THESE CUSTOMER CHARGES ARE EXCESSIVE FROM A COST STANDPOINT?

A. Yes. Exhibit _____(CWK-7) shows that the average customer cost for the residential class is $10.70 and the for the Firm General Service class it is $35.91. The final column in Exhibit_____(CWK-8) shows the weighted average customer charges of each of these classes. The residential weighted average customer charge is $8.44 and the Firm General customer charge averages $22.84, both well below the average unit customer costs for these classes.

Q. ARE THERE ANY OTHER PROPOSALS THAT THE COMPANY HAS MADE THAT YOU BELIEVE THE COMMISSION SHOULD CONSIDER REGARDLESS OF THE CHANGE IN OVERALL REVENUES?

A. I recommend that the Commission consider the Company's proposal to convert the Basic Service Customer Charge from a monthly charge to a daily charge. I agree with the Company that this proposal simplifies the calculation of the Basic Service Charge when customer take service during partial months, and it permits the Company to use billing intervals other than a month. My only concern is whether it might be accepted by the average customers as a reasonable way of charging for service. Unless there are strong customer objections to this proposal, I recommend it be adopted.

Q. ARE THERE ANY COMPANY PROPOSALS YOU RECOMMEND BE REJECTED REGARDLESS OF THE CHANGE IN REVENUE?

A. Yes. I recommend that the Commission reject the Company's proposal to increase the reconnection charge for discontinued service to $30. The Company claims that this is a cost-based rate, but I believe there is a legitimate public policy reason for not increasing this rate. The customers to whom this charge applies are almost certainly the lowest income customers. Otherwise, they would not have been disconnected. Since they have to pay their arrearages anyway, they are likely suffering some difficulty getting reconnected. To impose on them yet more

cost, such as an increase in the reconnection fee, might prevent some of these customers from obtaining vital utility service.

Q. HOW DOES MDU RECOMMEND THAT A RATE INCREASE BE DISTRIBUTED AMONG CUSTOMER CLASSES?

A. MDU proposes that the rate increase be imposed on the residential and general service classes and that a rate decrease be allowed to the Small Interruptible Class. The Air Force and the Large Interruptible Classes would experience no rate change. These proposals are based on the results of the Company's cost of service study, which shows the Air Force and the Interruptible classes earning significantly higher rates of return than the firm service classes.

Q. IS THIS PROPOSAL CONSISTENT WITH PAST COMMISSION PRECEDENT?

A. No. In previous cases the Commission has recognized different rates of return among classes by permitting lower rate increases to those classes showing the highest rates of return. It has not allowed rate reductions to some classes when most customers are suffering rate increases. For example, in the NSP rate case last year, the Commission allowed an increase to the interruptible class one-half the overall increase.[7] The same treatment was adopted in MDU's 1991 gas rate increase case, when the Company sought to withhold any increase to the Air Force and interruptible classes.[8]

Q. DO YOU RECOMMEND THAT THIS TRADITOINAL TREATMENT BE APPLIED IF THERE IS A RATE INCREASE IN THIS CASE?

[7] Case No. PU-400-00-521, decided June 27, 2001, ¶ 22
[8] Case No. PU-399-90-820, decided July 30, 1991, ¶ 61

A. Yes, I do. The two cost studies in the record disagree as to the rates of return earned by the Air Force and Large Interruptible rate schedules, but they agree that the Small Interruptible class generates a much higher than average rate of return. For this reason, and consistent with Commission precedent, I recommend that the Small Interruptible class receive only half of any rate increase and that the remaining increase be distributed pro rata among the other customer classes.

Q. IF THERE WERE A RATE REDUCTION, HOW SHOULD THE RATE CHANGE BE DISTRIBUTED?

A. Again consistent with Commission precedent, all classes, regardless of their rates of return, should receive a rate reduction. However, in the case of a rate reduction, the Commission can be much more aggressive in equalizing rates of return. In the 1996 NSP gas rate reduction case, the Commission accepted a proposal to reduce small and large interruptible class margins by 25 and 40 percent, respectively, and reduce the margins for the firm service classes by only 3.5 percent.[9] If the Commission reduces MDU's rates, I recommend that the rate of return for the Small Interruptible class be reduced by 40 percent, based on the alternative rate of return study summarized in Exhibit____(CWK-7), provided that this reduction allows the remaining classes to receive at least one-half the overall percentage reduction in rates.

Q. HOW DOES MDU PROPOSE THAT ITS REQUESTED RATE INCREASE BE DISTRIBUTED AMONG RATE ELEMENTS?

A. MDU proposes to increase all the customer charges significantly, even for those classes, such as the Air Force and the Large Interruptible class, that receive no overall rate change. Even though the Small Interruptible customers are to receive a rate reduction, their customer charge would increase from $35 to $100 per month. For most residential customers, the monthly customer rate would increase

[9] Case No. PU-400-95-559, decided August 7, 1996, ¶¶ 35, 43.

from $6.50 to $11.70. Small General Service customer charges would jump from $8.50 to $24.00 and large General Service charges would go from $17.00 to $51.00.

MDU witness Russell Feingold discusses the rationale for these proposals at some length. He argues that shifting revenue recovery from the commodity to the customer component allows the Company to recover much more of its fixed costs on a non-weather sensitive basis. This also protects customers from the volatility in their gas bills caused by variations in weather. During cold winters, their bills will be somewhat lower and during warm winters, they will be somewhat higher. Their winter bills, the highest of the year, will be reduced, and their small summer bills will be increased.

Q. DO YOU AGREE WITH THE COMPANY'S RATIONALE?

A. I certainly understand the Company's rationale, and I agree with the Company's statement of its effects. However, there is a matter of rate continuity to be considered. This change will result in dramatically different bills for different types of customers. For example, I suspect that very low-use customers will find the increases in their average monthly bills extortionate. Customers accustomed to low gas bills in the summer, that possibly offset high electric bills, will be surprised by the sudden jump in their gas invoices.

Customers may also resent high monthly customer charges. When most of the cost of gas is based on the level of gas consumption, customers can avoid high gas bills by conserving gas. But no amount of conservation permits a customer to avoid a monthly customer charge. As long as this charge is not a major portion of the bill, it is likely to be acceptable to most customers. But if it looms as a major element in the cost of gas, customers will come to regard it as a tax from which there is no escape. This will not enhance MDU's reputation as a public utility concerned with its customers' good will.

For these reasons, I question the advisability of such a radical restructuring of the tariff schedules. If MDU seeks to increase the customer component of its rate schedules, it should do so over a series of rate cases, not as a drastic stoke in a single rate case.

Q. HOW DO YOU RECOMMEND ANY RATE INCREASE OR DECREASE BE DISTRIBUTED BETWEEN CUSTOMER AND COMMODITY CHARGES?

A. In the case of a rate increase, I recommend that the customer charges be increased no more than twice the overall increase. This increase allowance would be in addition to the increases in customer charges that I have recommended from the flattening of the declining block rates.

If rates are reduced, I recommend that the reductions be flowed entirely into the commodity component of each rate schedule. Customer charges should not be increased when rates are reduced, except to eliminate the declining block feature of the rate schedules.

PART IV – DISTRIBUTION DELIVERY STABILIZATION MECHANISM

Q. WHAT IS THE "DISTRIBUTION DELIVERY STABILIZATION MECHANISM?"

A. This is a proposal put forth by Company witness Russell Feingold that would substitute for the increases in the customer charges should the Commission disapprove them. It is intended to modify the effects of weather variations by adjusting bills for the difference between the actual heating degree days and heating degree days under normal weather. Following a cold winter, the excess in

each class's revenue from the greater number of heating degree days would be divided by the projected annual sales volumes in that class and credited to all customers over the following year on a per-dk basis. The revenue shortfall from a warmer than normal summer would similarly be collected through a surcharge to all customers during the subsequent year.

Q. DO YOU SUPPORT THIS PROPOSAL?

A. No. I do not. The value of a weather normalization adjustment should be to ameliorate the volatility in customer bills caused by variations in weather from season to season. Of particular concern is the effect of unusually cold winters. In such winters, ratepayers typically experience a "double whammy." First, they consume more gas than usual, which increases their bills even if the price of gas remains the same. Then, because cold winters are usually a widespread phenomenon, the demand for gas is higher across the continent, which means that the price of gas is higher. The result is a further inflation in their bills. Just this sort of inflation occurred across the country during the winter of 2000-2001.

The Company's proposal could result in a "triple whammy." If North Dakota experiences an unusually warm winter, and it is followed by an unusually cold winter, ratepayers during the cold winter, already hard-hit, would find themselves paying a surcharge to make up for the shortfall in revenue collections in the previous year. The effect of the Company's program could be to increase, not decrease the volatility in customers' bills from year to year.

The objection to the Company's proposal is its delayed effect. For a weather normalization adjustment to be beneficial to ratepayers and not just the utility, it must affect their bills when the unusual weather is occurring, not after it has occurred. For this reason, I oppose the program offered by the Company.

Q. DO YOU OBJECT TO THE CONCEPT OF A WEATHER NORMALIZATION ADJUSTMENT?

A. No. A weather normalization adjustment can be beneficial to both customers and the utility if it ameliorates the impact of unusual weather. It benefits customers if winter is unusually cold and it benefits the utility if the winter is unusually warm. To be effective, however, these benefits have to flow during the unusually cold or unusually warm winters.

Q. BUT DIDN'T THE COMMISSION REJECT JUST SUCH A REAL-TIME WEATHER NORMALIZATION ADJUSTMENT WHEN MDU PROPOSED IT IN 1992?

A. Yes. The Commission rejected MDU's weather normalization adjustment partly because it was not presented in the context of a rate case and partly because it was deemed to be too complex. Since 1992, however, a number of utilities around the country have adopted weather normalization adjustments, and they have been greeted with approval not only by commissions, but by investments analysts. These adjustments are perceived as significant risk-reduction devices that reduce the cost of capital to the utility.

Q. DOES THIS COMPLETE YOUR TESTIMONY?

A. Yes, it does.

Charles W. King

Experience

Snavely King Majoros O'Connor & Lee, Inc. Washington, DC

President (1989 to Present)
Vice President (1970 - 1989)

Mr. King, a founder of the firm and acknowledged authority on regulatory economics, brings over thirty years of experience in economic consulting to his direction of the firm's work in transportation, utility and telecommunications economics.

Mr. King has appeared as an expert witness on over 300 separate occasions before more than thirty state and nine U.S. Canadian federal regulatory agencies, presenting testimony on rate base calculations, rate of return, rate design, costing methodology, depreciation market forecasting, and ratemaking principles. Mr. King has also testified before House and Senate Committees on energy and telecommunications legislation pending before the U.S. Congress.

In telecommunications, Mr. King has testified before the Federal Communications Commission on a number of policy issues, service authorization, competitive impacts, video dialtone, and prescription of interstate depreciation rates. Before state regulatory bodies, he has presented testimony in proceedings on intrastate rates, earnings and depreciation. Mr. King recently directed analyses of the prices of services under Federal Government's FTS2000 long distance system.

In addition to his appearances as a witness in judicial and administrative proceedings, Mr. King has negotiated settlements among private parties and between private parties and regulatory offices. Mr. King also has directed depreciation studies, investment cost benefit analyses, demand forecasts, cost allocation studies and antitrust damage calculations.

In Canada, Mr. King designed and directed an extended inquiry into the principles and procedures for regulating the telecommunication carriers subject to the jurisdiction of the Canadian Transport Commission. He also was the principal investigator in the Canadian Transport Commission's comprehensive review of rail costing procedures.

EBS Management Consultants, Inc. Washington, DC

Director, Economic Development Department (1968-1970)

Mr. King organized and directed a five-person staff of economists performing research, evaluation, and planning relating to economic development of depressed areas and communities within the U.S. Most of this work was on behalf of federal, state, and municipal agencies responsible for community or regional economic development.

Principal Consultant (1966-1968)

Mr. King conducted research on a broad range of economic topics, including transportation, regional economic development, communications, and physical distribution.

W.B. Saunders & Company, Inc., Washington, DC

Staff Economist (1962-1966)

For this economic consulting firm, which later merged with EBS Management Consultants, Inc., Mr. King engaged in numerous research efforts relating primarily to economic development and transportation.

U.S. Bureau of the Budget, Office of Statistical Standards

Analytical Statistician (1961-1962)

Mr. King was responsible for the review of all federal statistical and data-gathering programs relating to transportation.

MONTANA-DAKOTA UTILITIES CO.
FIRST DATA REQUESTS
CHARLES KING ON BEHALF OF THE NORTH DAKOTA
PUBLIC SERVICE COMMISSION STAFF
DATED JULY 25, 2002
CASE NO. PU-399-02-183

Request No. 3 Reference: Statements A-F, G-L, N-O.

See Statement A. State the amount of short-term borrowings by MDU Utilities Co. and MDU Resources, Inc, respectively at the end of each month in 2000 and 2001. Identify the weighted average cost of MDU Utilities' short-term borrowing.

Response:

Please see Attachment A for Montana-Dakota's short-term borrowings. Please see Attachment B for the short-tem borrowings for MDU Resources Group, Inc. Attachment B is considered "Trade Secret" material by the Company and an Application For Trade Secret Protection has been filed with the Commission. The material will be available for review following a Commission decision.

Case No. PU-399-02-183

MOTION FOR EXTENSION OF TIME

Montana-Dakota Utilities Co. moves the Public Service Commission for an extension of time to file rebuttal testimony and to reschedule the hearing date in this proceeding. Montana-Dakota Utilities Co. received the direct testimony of Charles W. King on behalf of the Public Service Commission staff on April 7, 2003. Montana-Dakota Utilities Co. requests an extension of time to April 28, 2003 to file its rebuttal testimony and further requests the Commission to reschedule the hearing that was previously set for April 22, 2003. Montana-Dakota Utilities Co. has conferred with counsel for the Public Service Commission Staff regarding this request and counsel has stated the Staff does not object to this motion.

Dated this 8th day of April, 2003.

Respectfully submitted,

By: _____

Re: Case No. PU-399-02-183
Depreciation Investigation

Montana-Dakota Utilities Co. (Montana-Dakota), a Division of MDU Resources Group, Inc., states that it does not object to extending the final day for completion and service upon MDU and other parties of prepared testimony and exhibits from April 1, 2003, to April 8, 2003. Depending on the nature of such testimony, Montana-Dakota may need more than one week after April 8 for its rebuttal testimony. If so, Montana-Dakota will make such a request at the appropriate time.

Please acknowledge receipt by stamping or initialing the duplicate copy of this letter attached hereto and returning the same in the enclosed self-addressed stamped envelope.

Sincerely,

Donald R. Ball

Mr. William W. Binek
Hearing Administrator
Public Service Commission
600 E. Boulevard Avenue - Dept. 408
Bismarck, ND 58505

Dear Mr. Binek:

Thank you for your March 14, 2003, request of the designation of an administrative law judge from the Office of Administrative Hearings to conduct a hearing in the matter of Montana-Dakota Utilities Co. (PU-399-02-183). I hereby designate myself to be assigned as an administrative law judge to conduct the hearing in regard to this matter. Because the administrative law judge will not be making recommended findings of fact and conclusions of law, or issuing a recommended order, the person or persons who will actually be making the final administrative decision in regard to this matter (i.e., commission) must actually be in attendance at the hearing.

Please send all additional relevant documents in regard to this matter (correspondence, and other pleadings and documents) to the designated administrative law judge in care of the Office of Administrative Hearings, 1707 North 9th Street, Bismarck, North Dakota 58501-1882. I understand the hearing has been scheduled for April 22, 2003, beginning at 9:00 a.m., in the Commission's Hearing Room, 12th Floor, State Capitol, 600 E. Boulevard Avenue, Bismarck, North Dakota.

Sincerely,

Allen C. Hoberg
Director

( ) Public Agency
( ) Nonprofit Organization
( ) Other

This contract is entered into between the above two parties. This contract consists of this sheet, general provisions and specific provisions.

GENERAL PROVISIONS

CONTRACTUAL FEATURES

Legal Authority

The Contractor assures that it possesses legal authority to participate in this contract.

Assignment/Subcontracting

The Contractor may not assign this contract or any part thereof, or assign any of the monies to be paid hereunder, nor shall any part of the work done or material furnished under this contract be sublet.

The Contractor may not enter into subcontracts for any of the work contemplated under this contract unless included in the specific provisions of this contract.

Termination

The Commission, by ten days written notice listing causes and reasons, may terminate this contract in whole or in part when it is determined that the Contractor has failed to meet the conditions of the contract. The Commission will be liable only for payment provisions of this contract for services satisfactorily rendered prior to the effective date of termination.

Significant deviation from performance standards in this contract may result in reduced or terminated financial participation of the Contractor, subsequent to negotiations with the Commission.

The Contractor or the Commission may terminate this contract in whole or in part upon settlement or when both parties agree that the continuation of the contract would not produce results commensurate with further expenditures of funds. The two parties shall agree upon the termination conditions including effective date and in the case of partial terminations, that portion to be terminated.

In the event state or federal funds are reduced or terminated, the financial participation of the Commission may be reduced or terminated.

Disputes

The Contractor agrees to attempt to resolve disputes arising from this contract by administrative process and negotiations in lieu of litigation. Continued performance by the Contractor during disputes is assured.

Any dispute concerning a question of fact arising under this contract which is not settled by the informal means shall be decided by the authorized representative of the Commission who shall reduce the decision to writing and mail or otherwise furnish a copy thereof to the Contractor.

The Contractor shall be afforded an opportunity to be heard and to offer evidence in support of an appeal. Pending final decision of a dispute, the Contractor shall proceed diligently with the performance of the contract and in accordance with the decision of the Commission.

FISCAL RESPONSIBILITIES

Records

The Contractor agrees to maintain program records required by the Commission and to produce program narrative and statistical data at times prescribed by the Commission.

The Contractor agrees to maintain and retain all books, records, and other documents required by the Commission relevant to this agreement for four years after final payment. Records shall be retained beyond four years if audit findings have not been resolved.

No Claim for Additional Work

No claim for additional services not specifically herein provided, done, or furnished by the Contractor will be allowed, nor shall the Contractor do any work or furnish any material not covered by the contract, unless such work is ordered in writing by the Commission.

Time Keeping Procedures

The Contractor shall require employees and subcontractors, if applicable, whose positions are funded under this contract or included as match, to maintain adequate documentation for services provided. For positions that are funded from more than one source, an analysis of duties performed by program shall also be prepared.

Monitoring, Evaluation and Audit

The Contractor agrees to cooperate with any monitoring, evaluating and/or audit conducted by the Commission, or their designees who shall have full access to and the right to examine all books, records and other relevant documents.

The Contractor agrees to take immediate corrective action on deficiencies disclosed through program monitoring of costs disallowed in the course of an audit, review, or monitoring.

PROGRAM REQUIREMENTS

Equal Opportunity

No individual shall be excluded from participation in, denied the benefits of, subjected to discrimination under, or denied employment in the administration of or in connection with this contract because of race, color, disability, or political affiliation or belief.

The Contractor will take affirmative action to ensure that applicants are employed and that employees are treated during employment without regard to their race, color, religion, national origin, disability, age, sex, political affiliation or belief or citizenship.

Nondiscrimination

This contract and any subcontract hereunder is subject to the Age Discrimination Act of 1975, Section 504 of the Rehabilitation Act, Title VI of the Civil Rights of 1964 and the Americans with Disabilities Act of 1990.

Copyrights and Rights in Data

The contractor agrees that any plans, drawings, designs, specifications, computer programs (which are substantially paid for with federal grant or state funds), technical reports, operation manuals and other work submitted with a proposal or grant application or which are specified to be delivered under this contract or which are developed or produced and paid for under this contract (referred to in this clause as "subject data") are subject to the rights of the Commission to use, duplicate and disclose the subject data in whole or in part, in any manner for any purpose whatsoever, and have others do so. If the material is copyrightable, the contractor may copyright the material, subject to the rights in the government, but the Commission reserves a royalty-free, non-exclusive and irrevocable license to reproduce, publish and use the material, in whole or in part, and to authorize others to do so. The contractor shall include provisions appropriate to effectuate the purposes of this condition in all subcontracts expected to produce copyrightable "subject data."

SPECIFIC PROVISIONS
March 12, 2003

Purpose

In its Order of December 10, 2002 concerning the rate increase application of Montana-Dakota Utilities Co. ("MDU"), Case No. PU 399-02-183, the Commission deferred its consideration of depreciation pending the filing of a new depreciation study by MDU. MDU has since filed its depreciation study, and staff requires assistance to analyze that study and to provide written and oral testimony. The contractor will determine the appropriate depreciation rates for each of MDU depreciable gas and general plant accounts. The work will include sufficient detail as is necessary to successfully testify under cross-examination. The contractor will also address the relevance and effect of Statement of Financial Accounting Standards No. 143 to MDU's treatment of retirement costs.

All work under this contract must be completed prior to the commission's fiscal year ending June 30, 2003. More importantly, the work needs to be sufficiently complete so as to provide written testimony by April 1, 2002 and oral testimony at the technical hearing to be held April 22-25, 2003.

The specific purpose is to investigate, analyze and provide testimony proposing the proper depreciation rates for MDUs depreciable gas and general plant accounts, including:

1. Professional analysis and review of MDU's depreciation study.
2. Prepare and conduct discovery.
3. Periodic progress reports of discovery, conclusions and recommendations to keep staff updated.
4. Prepare written testimony and provide an advanced copy to staff for review prior to submitting as a formal document.
5. Prepare written and oral testimony in rebuttal to testimony of other parties in the proceeding.
6. Testify at the hearing.
7. Assist staff legal counsel in preparation of cross-examination of the witnesses of other parties to the proceedings.
8. After the hearing, assist staff legal counsel in preparation of findings of fact for a proposed Commission decision.

Compensation

The Contractor will be compensated based on periodic submittal of progress reports. Final payment will be made upon satisfactory completion of the described project work, as determined by the Commission.

In the event the case is settled or this agreement is otherwise terminated prior to completion of project work, then compensation will be awarded for work satisfactorily completed.

No part of this contract may be assigned, sublet or subcontracted.

Re: Continued Hearing
Case No. PU-399-02-183
Montana-Dakota Utilities Co.
Natural Gas Rate Increase
Application

Dear Mr. Hoberg:

Enclosed is a request for an administrative law judge in the above case. The Commission issued an order in this proceeding on December 18, 2002. The Commission agreed that Montana-Dakota Utilities Company submit a depreciation study for review as a continued issue in this proceeding.

The Commission has scheduled a hearing for April 22, 2003, beginning at 9 a.m. (CST) in the Commission's Hearing Room, 12th Floor, State Capitol, Bismarck. The administrative law judge will serve as a procedural law judge, a court reporter will be present, and the hearing will be tape recorded. A copy of the depreciation study is enclosed.

Please provide the Commission with a copy of any filings issued by your office in this matter.

If you have any questions, please contact me. Thank you.

Sincerely,

William W. Binek
Hearing Administrator

Letter to ALJ re request

by Public Service Commission

03/17/2003C. Comm Legal PUD (3) Mike AG's Office

REQUEST FOR ADMINISTRATIVE LAW JUDGE--APPEAL, APPLICATION, OR PETITION

NORTH DAKOTA OFFICE OF ADMINISTRATIVE HEARINGS

SFN 17819 (Rev. 03-2001)

Name of Agency, Board, or Commission
Public Service Commision

The above named agency, board, or commission requests designation of an administrative law judge from the Office of Administrative Hearings for the Continued Hearing, Case No. PU-399-02-183, Montana-Dakota Utilities Co., Natural Gas Rate Increase Application.

(e.g., application of [name], appeal of [name], petition of [name]). Authority for the administrative action is found in Title 49 (North Dakota Century Code and/or North Dakota Administrative Code).

Please attach related documents and correspondence.

The administrative action is more fully described as follows:
Commission issued an order in this proceeding 12/18/02. MDU has submitted a depreciation study as a continued issue in this proceeding.

It requests designation of an administrative law judge (please check one):

- ☐ **To conduct the hearing and issue recommended findings of fact, conclusions of law, and order.**
- ☑ **To serve as a procedural administrative law judge only (no recommended decision). The agency head will be present at the hearing as required by NDCC 54-57-04(6).**
- ☐ **To conduct the hearing, issue findings of fact, conclusions of law, and a final order.**

PLEASE MAKE A REQUEST FOR AN ADMINISTRATIVE LAW JUDGE AT LEAST ONE MONTH BEFORE THE HEARING.

Please list parties, including the agency if it is a Party, and Representation [attorney (or other)] if known, or Agency Contact: (Attach separate list if necessary.)

AGENCY Public Service Commission	Address 600 E Blvd. Ave. Dept. 408, Bismarck, ND	Telephone Number 328-2400
Representation William W. Binek	Address Same as Above	Telephone Number 328-4088
PARTY Montana-Dakota Utilities Co.	Address 400 N 4th Street, Bismarck, ND 58501	Telephone Number 222-7900
Representation Douglas Schulz, Counsel & Don Ball	Address 400 N 4th Street, Bismarck, ND 58501	Telephone Number 222-7900
PARTY MDU	Address Same	Telephone Number
Representation Daniel S. Kuntz, Attorney	Address P. O. Box 1695, Bismarck, ND 58502-1695	Telephone Number 223-2711

Additional Comments
The hearing will be tape recorded and a court reporter will be present.

(For agencies required to use OAH, notice of hearing will be issued by the administrative law judge, unless a procedural administrative law judge is requested. Other requesting agencies and agencies requesting a procedural administrative law judge should first contact OAH about scheduling a hearing. If notice has already been issued, attach a copy of the notice.)

Natural Gas Rate Increase
Application

Case No. PU-399-02-183

NOTICE OF HEARING and PROCEDURAL SCHEDULE

March 12, 2003

On December 18, 2002, the Public Service Commission issued an order in this proceeding. The Commission agreed that Montana-Dakota Utilities Company (MDU) submit a depreciation study for review by January 31, 2003 as a continued issue in this proceeding, subject to the standard and customary contested case process with all parties having rights of discovery, testimony, rebuttal testimony, hearing and briefing. MDU's depreciation study was to include gas and common plant facilities. Any resulting change in depreciation expense ordered by the Commission at the conclusion of the review will be reflected in rates on a prospective basis.

On January 31, 2003, MDU filed its depreciation study.

The issues in this proceeding are:

1. What is the value of MDU's property, used and useful, for the service and convenience of the public in North Dakota?
2. What is the appropriate treatment of plant retirement costs?
3. What rates and charges are necessary to provide a just and reasonable rate of return on MDU's property, used and useful, for the service and convenience of the public in North Dakota?

A hearing in this proceeding will be held beginning **April 22, 2003, at 9 a.m. CDT, in the Commission Hearing Room, 12th Floor, State Capitol, Bismarck, North Dakota**. The hearing is open to the public, but participation is limited to the parties named herein and Commission staff.

The final day for completion and service upon MDU and other parties of prepared testimony and exhibits is April 1, 2003. The final day for service of rebuttal testimony is April 14, 2003.

For more information, contact the Public Service Commission, State Capitol, Bismarck, North Dakota 58505, 701-328-2400; or Relay North Dakota 1-800-366-6888 TTY. If you require any auxiliary aids or services, such as readers, signers, or braille materials please notify Jon Mielke, Executive Secretary.

This contract is entered into between the above two pa
general provisions and specific provisions.

GENERAL PROVISIONS

CONTRACTUAL FEATURES

Legal Authority

The Contractor assures that it possesses legal authority to participate in this contract.

Assignment/Subcontracting

The Contractor may not assign this contract or any part thereof, or assign any of the monies to be paid hereunder, nor shall any part of the work done or material furnished under this contract be sublet.

The Contractor may not enter into subcontracts for any of the work contemplated under this contract unless included in the specific provisions of this contract.

Termination

The Commission, by ten days written notice listing causes and reasons, may terminate this contract in whole or in part when it is determined that the Contractor has failed to meet the conditions of the contract. The Commission will be liable only for payment provisions of this contract for services satisfactorily rendered prior to the effective date of termination.

Significant deviation from performance standards in this contract may result in reduced or terminated financial participation of the Contractor, subsequent to negotiations with the Commission.

The Contractor or the Commission may terminate this contract in whole or in part upon settlement or when both parties agree that the continuation of the contract would not produce results commensurate with further expenditures of funds. The two parties shall agree upon the termination conditions including effective date and in the case of partial terminations, that portion to be terminated.

In the event state or federal funds are reduced or terminated, the financial participation of the Commission may be reduced or terminated.

Disputes

The Contractor agrees to attempt to resolve disputes arising from this contract by administrative process and negotiations in lieu of litigation. Continued performance by the Contractor during disputes is assured.

Any dispute concerning a question of fact arising under this contract which is not settled by the informal means shall be decided by the authorized representative of the Commission who shall reduce the decision to writing and mail or otherwise furnish a copy thereof to the Contractor.

The Contractor shall be afforded an opportunity to be heard and to offer evidence in support of an appeal. Pending final decision of a dispute, the Contractor shall proceed diligently with the performance of the contract and in accordance with the decision of the Commission.

FISCAL RESPONSIBILITIES

Records

The Contractor agrees to maintain program records required by the Commission and to produce program narrative and statistical data at times prescribed by the Commission.

The Contractor agrees to maintain and retain all books, records, and other documents required by the Commission relevant to this agreement for four years after final payment. Records shall be retained beyond four years if audit findings have not been resolved.

No Claim for Additional Work

No claim for additional services not specifically herein provided, done, or furnished by the Contractor will be allowed, nor shall the Contractor do any work or furnish any material not covered by the contract, unless such work is ordered in writing by the Commission.

Time Keeping Procedures

The Contractor shall require employees and subcontractors, if applicable, whose positions are funded under this contract or included as match, to maintain adequate documentation for services provided. For positions that are funded from more than one source, an analysis of duties performed by program shall also be prepared.

Monitoring, Evaluation and Audit

The Contractor agrees to cooperate with any monitoring, evaluating and/or audit conducted by the Commission, or their designees who shall have full access to and the right to examine all books, records and other relevant documents.

The Contractor agrees to take immediate corrective action on deficiencies disclosed through program monitoring of costs disallowed in the course of an audit, review, or monitoring.

PROGRAM REQUIREMENTS

Equal Opportunity

No individual shall be excluded from participation in, denied the benefits of, subjected to discrimination under, or denied employment in the administration of or in connection with this contract because of race, color, disability, or political affiliation or belief.

The Contractor will take affirmative action to ensure that applicants are employed and that employees are treated during employment without regard to their race, color, religion, national origin, disability, age, sex, political affiliation or belief or citizenship.

Nondiscrimination

This contract and any subcontract hereunder is subject to the Age Discrimination Act of 1975, Section 504 of the Rehabilitation Act, Title VI of the Civil Rights of 1964 and the Americans with Disabilities Act of 1990.

Copyrights and Rights in Data

The contractor agrees that any plans, drawings, designs, specifications, computer programs (which are substantially paid for with federal grant or state funds), technical reports, operation manuals and other work submitted with a proposal or grant application or which are specified to be delivered under this contract or which are developed or produced and paid for under this contract (referred to in this clause as "subject data") are subject to the rights of the Commission to use, duplicate and disclose the subject data in whole or in part, in any manner for any purpose whatsoever, and have others do so. If the material is copyrightable, the contractor may copyright the material, subject to the rights in the government, but the Commission reserves a royalty-free, non-exclusive and irrevocable license to reproduce, publish and use the material, in whole or in part, and to authorize others to do so. The contractor shall include provisions appropriate to effectuate the purposes of this condition in all subcontracts expected to produce copyrightable "subject data."

SPECIFIC PROVISIONS
March 12, 2003

Purpose

In its Order of December 10, 2002 concerning the rate increase application of Montana-Dakota Utilities Co. ("MDU"), Case No. PU 399-02-183, the Commission deferred its consideration of depreciation pending the filing of a new depreciation study by MDU. MDU has since filed its depreciation study, and staff requires assistance to analyze that study and to provide written and oral testimony. The contractor will determine the appropriate depreciation rates for each of MDU depreciable gas and general plant accounts. The work will include sufficient detail as is necessary to successfully testify under cross-examination. The contractor will also address the relevance and effect of Statement of Financial Accounting Standards No. 143 to MDU's treatment of retirement costs.

All work under this contract must be completed prior to the commission's fiscal year ending June 30, 2003. More importantly, the work needs to be sufficiently complete so as to provide written testimony by April 1, 2002 and oral testimony at the technical hearing to be held April 22-25, 2003.

The specific purpose is to investigate, analyze and provide testimony proposing the proper depreciation rates for MDUs depreciable gas and general plant accounts, including:

1. Professional analysis and review of MDU's depreciation study.
2. Prepare and conduct discovery.
3. Periodic progress reports of discovery, conclusions and recommendations to keep staff updated.
4. Prepare written testimony and provide an advanced copy to staff for review prior to submitting as a formal document.
5. Prepare written and oral testimony in rebuttal to testimony of other parties in the proceeding.
6. Testify at the hearing.
7. Assist staff legal counsel in preparation of cross-examination of the witnesses of other parties to the proceedings.
8. After the hearing, assist staff legal counsel in preparation of findings of fact for a proposed Commission decision.

Compensation

The Contractor will be compensated based on periodic submittal of progress reports. Final payment will be made upon satisfactory completion of the described project work, as determined by the Commission.

In the event the case is settled or this agreement is otherwise terminated prior to completion of project work, then compensation will be awarded for work satisfactorily completed.

No part of this contract may be assigned, sublet or subcontracted.

MEMORANDUM

****

To: Commissioners Wefald, Clark, and Reinbold
Jon Mielke, Legal, PUD
From: Patrick Fahn
Date: February 17, 2003

RE: Sole Source contract for consultant – MDU depreciation study review – Case No. PU-399-02-183

On December 18, 2002, the Commission issued its order in Case No. PU-399-02-183. On January 31, 2003, Montana Dakota Utilities Co. filed its depreciation study in compliance with the Commission's order. The Commission order stated that it intends to complete its review of the depreciation study by July 31, 2003. Because of the time frame in which the Commission needs to complete its study, staff recommends that the Commission hire a consultant under the Commission's sole source procurement procedures.

Sole source procurement can be used in unique situations when the lengthy process of bid solicitation cannot be utilized. When sole source procurement is proposed, written justification must be presented to the Commission for approval.

The Commission's procedures provide the following reasons that sole source procurement may be justified:

1. The proposed item or service is available only from a single source.

2. The person or organization has the unique product or the special skills, knowledge, abilities to provide the required services (at the exclusion of others) and is considered the preeminent deliverer of that product or service at the time of selection.

3. Emergency of severe time constraints preclude issuing a formal Request for Proposal.

4. The service is available within the existing structure of state of local government.

Staff primary justification for sole source procurement is that Snavely King Majaros O'Connor & Lee, Inc., the consultant retained under competitive bidding procedures in this proceeding, already has significant information relating to MDU's investments and its financial structure and operations in North Dakota, and the MDU depreciation issues. This consultant will be able to complete the project within the 6-month time frame at a reasonable cost.

A second justification for sole source procurement in this proceeding is that the Commission intends to complete the analysis of the depreciation study within 6 months.

Re: Depreciation Study
Case No PU-399-02-183

Montana-Dakota Utilities Co. (Montana-Dakota), a Division of MDU Resources Group, Inc., herewith submits an original and seven (7) copies of the depreciation studies for its gas and common plant as required by the Order of the Commission issued on December 18, 2002 in the above referenced case.

The studies were prepared by AUS Consultants. In summary, the total company annual depreciation expense for gas plant increases by $315,635 from the current annual depreciation expense based on December 31, 2001 plant in service. The composite annual depreciation rate for gas plant goes from the current 4.52 percent to 4.70 percent. The total company annual depreciation expense for common plant increased by $499,417 from the current annual depreciation expense based on December 31, 2001 plant in service. The composite annual depreciation rate for common plant goes from the current 5.84 percent to 7.18 percent.

Please acknowledge receipt by stamping or initialing the duplicate copy of this letter attached hereto and returning the same in the enclosed self-addressed stamped envelope.

Sincerely,

Donald R. Ball

January 27, 2003

Mr. Paul Bienek
Montana-Dakota Utilities Company
400 North Fourth Street
Bismark, ND 58501

Dear Mr. Bienek:

In accordance with your authorization, we have prepared a depreciation study related to the utility plant in service of Montana-Dakota Utilities Company - Gas Division as of December 31, 2001. Our findings and recommendations, together with supporting schedules and exhibits, are set forth in the accompanying report.

Summary schedules have been prepared to illustrate the impact of instituting the recommended annual depreciation rates as a basis for the Company's annual depreciation expense as compared to the rates presently utilized. The application of the present rates to the depreciable plant in service as of December 31, 2001 results in an annual depreciation expense of $7,694,754. In comparison, the application of the proposed depreciation rates to the depreciable plant in service at December 31, 2001 results in an annual depreciation expense of $8,010,389, which is a increase of $315,635 from current rates. The composite annual depreciation rate under present rates is 4.52 percent, while the proposed proforma composite depreciation rate is 4.70 percent.

Section 2 of our report contains the summary schedules showing the results of our service life and salvage studies and summaries of presently utilized depreciation rates. The subsequent sections of the report present a detailed outline of the methodology and procedures used in the study together with supporting calculations and analyses used in the development of the results. A detailed table of contents follows this letter.

Respectfully submitted,

Earl M Robinson

EARL M. ROBINSON, CDP

MONTANA-DAKOTA UTILITIES COMPANY
Gas Division

Executive Summary

Table 1 on pages 2-1 to 2-2 is a comparative summary which illustrates the effect of instituting the revised depreciation rates. The schedule includes a comparison of the annual depreciation rates and annual depreciation expense under both present and proposed rates applied using the Straight Line Method for each depreciable property group of the Montana-Dakota Utilities Company-Gas Division (the "Company") plant in service as of December 31, 2001. Both the present and proposed depreciation rates were developed utilizing the Straight Line (SL) Method, Broad Group (BG) Procedure, and the Average Remaining Life (ARL) Technique.

Table 2 on pages 2-3 to 2-5 provides a summary of the detailed life estimates and service life parameters (Iowa Curves) utilized in preparing the Average Remaining Life depreciation rates for each property group. The schedule provides a summary of the detailed data and narrative of the study results set forth in Sections 4 through 7. The developed depreciation rates (Column L) were determined by studying the Company's historical investment data together with the interpretation of future life expectancies which will have a bearing on the overall service life of the Company's property.

Table 3 on page 2-6 contains the allocation of the Company's book depreciation reserve for selected depreciable property groups. Each of the applicable property group's book depreciation reserves were proportionally distributed to each asset sub-account group based upon the theoretical depreciation reserve. The theoretical depreciation reserve was developed using each asset category's utility plant in service as of December

31, 2001 together with the current estimated service life characteristics and net salvage factors developed per the study.

Table 4 on page 2-7 is a summary schedule showing the impact on the Company's annual depreciation expense as a result of estimating current average service lives for the applicable general plant accounts as well as changing from depreciating the property groups to a straight line amortization of the investment over a set period of years.

The various schedules comprising Table 5 on pages 2-8 to 2-26 summarize the development of the annual amortization amounts for each of the general plant accounts for which the depreciation amortization approach is being proposed. The proposal to amortize the investments within the selected general plant accounts is driven by the Company's ongoing difficulty to effectively track various of the property account investments that are in many cases related to a large quantity of items of corresponding small investment amounts. Due to the inability to effectively track the items, many times the items are no longer utilized but remain on the company's books and records as unrecorded retirements. Therefore to simplify the accounting procedure for these property items it is proposed that the investments within each vintage of the applicable property group be amortized over a predetermined time period. Once attaining the stated amortization period age the asset's original cost investment will have been fully amortized, and accordingly, will be retired from the company's books and records. The property accounts for which asset investment amortization is being proposed includes Account 391, 393, 394, 395, 397, and 398.

In the process of moving from depreciation to amortization of the selected general plant accounts, there are, by the very nature of average service life dispersion, vintage

investments within the applicable property groups which exceeds the estimated average service life / proposed amortization period. Given that each vintage of property will be amortized over the average service life, an adjustment needs to be incorporated into the change-over process to recover the under depreciated portion of the older investments. Accordingly, the variance between the amortization starting-point depreciation reserve and the Company's actual book reserve (either positive or negative) is being recorded on a straight line basis over the proposed amortization period along with the annual amortization of all other vintage investments. The amortization starting point book depreciation reserve is equal to the sum of the original cost for vintages older than the amortization period plus the calculated deprecation reserve for vintages with ages equal to or less than the amortization period .

The utilization of the recommended depreciation rates based upon the Straight Line Average Remaining Life Procedure results in the setting of depreciation rates which will continuously true up the Company's level of capital recovery over the life of each asset group. Application of this procedure, which is based upon the current best estimates of service life together with the Company's plant in service and accrued depreciation, produces annual depreciation rates that will result in the Company recovering 100 percent of its investment -- no more, no less.

It is recommended that the Company continue to apply depreciation rates and maintain its book depreciation reserve on an account-level basis. The maintenance of the book reserve on an account-level basis requires both the development of annual depreciation expense and distribution of other reserve account charges to an individual level. Maintaining the Company's depreciation records in this detail will aid in completing

the various rate studies and, most importantly, clearly identifies the Company's level of capital recovery relative to each category of plant investment.

The general drivers for the proposed depreciation rates include an assessment of the Company's historical experience with regard to achieved service lives and net salvage factors. In addition, consideration is given to current and anticipated events which are anticipated to impact the Company's ability to recover its fixed capital costs related to utility plant in service utilized to provide service to the Company's customers.

The depreciation rate for each individual account changed as a result of reflecting estimates obtained through the in-depth analysis of the Company's most recent data together with an interpretation of ongoing and anticipated future events. Some of the revisions were not significant and typically reflect fine tuning of previously utilized depreciation rates while others were more substantial in nature. Several of the accounts did reflect more significant changes (as outlined in Section 4 of this report) from the previously utilized depreciation rates.

The most notable depreciation/amortization occurred relative to Account 376 - Distribution Mains, Account 380 - Services, Account 381 - Meters, Account 392 - Transportation Equipment, and Account 396.2 - Power Operated Equipment.

The depreciation rate relative to Account 381 - Meters increased from 2.58 percent to 3.19 percent. This depreciation expense increase is the product of incorporating the estimated average service life and net salvage factors identified through an in depth analysis of the Company's historical experience and future expectations.

The depreciation rate for Account 392.2 - Transportation Equipment - Utilized increased from 5.74 percent to 21.13 percent. The proposed depreciation rate is the

product of the application of applicable service lives to each of the various property categories which comprise the overall property account. Furthermore, the depreciation rate increase is also being driven by the fact that the Company's current book depreciation reserve for this property account is low in comparison to the achieved age of the property group investment.

Conversely, several of the property groups experienced depreciation rate decreases from the current levels.

The composite depreciation rate for Account 376 - Mains declined from 4.05 percent to 3.15 percent. The decrease of the deprecation rate for this property group is a composite of a longer average service life as compared to that underlying the present depreciation rate as well as the impact of the Company's book depreciation reserve being higher than the applicable theoretical depreciation reserve.

The depreciation/amortization rate for Account 380 - Services declined from 7.60 percent to 7.03 percent and is being driven by the application of the current estimated average service life and net salvage factors.

Likewise the annual depreciation rate relative to Account 396.2 - Power Operated Equipment declined from 4.83 percent to zero (0) percent. This depreciation rate change is being driven by the Company's experienced level of average service life, achieved net salvage and corresponding current level of accrued depreciation in comparison to the current age of the property. This circumstance is the product of the Company's current experience and practice of continuously upgrading its principal Power Operating Equipment which results in high trade-in values.

Various of the remaining account/sub-accounts experienced increases and/or

declines in recommended depreciation rates to a lesser degree, as noted per Table 1 of this report. This revision in annual depreciation rates and expense is the result of both changes in the estimated service lives and salvage factors, and reflects the impact of the Company's property changes since the most recent study.

With regard to the inclusion of higher negative net salvage levels in the development of proposed depreciation rates, as noted within the discussion related to net salvage in Section 3 of the depreciation report, it is highlighted that the level of experienced net salvage should simply be a benchmark from which to estimate future net salvage. It is highly likely that the negative net salvage amounts experienced even recently will simply be the floor above which future negative net salvage levels will increase to a higher level. To appropriately and proportionately allocate the true total asset cost (original cost adjusted for net salvage) over its applicable service life, proper consideration must be given in each accounting period, to the total costs that are anticipated to occur relative to the Company's assets that provide customer service.

Applying the proposed depreciation /amortization rates to the Company's December 31, 2001 plant in service produces annual depreciation expense of $8,010,389 which is a increase of $315,635 from current depreciation rates.

The following summary compares the present and proposed composite depreciation rates for illustrative purposes only. The Composite Depreciation Rate should not be applied to the total Company investment inasmuch as the non-proportional change in plant investment as a result of property additions or retirements would render the composite rate inappropriate. The Table 1 schedule lists the recommended annual depreciation rates for each property account.

Present Depreciation Rates

Depreciable Plant In Service at December 31, 2001	$170,378,791
Annual Depreciation Expense	7,694,754
Composite Annual Depreciation Rate	4.52%

MONTANA-DAKOTA UTILITIES COMPANY

Gas Division

General

This report sets forth the results of our study of the depreciable property of the Montana-Dakota Utilities Company (the Company) as of December 31, 2001 and contains the basic parameters (recommended average service lives and life characteristics) for the proposed average remaining life depreciation rates until a subsequent service life study is completed. All average service lives set forth in this report are developed based upon plant in service as of December 31, 2001.

The scope of the study included an analysis of Company historical data through December 31, 2001, discussions with Company management staff to identify prior and prospective factors affecting the Company's plant in service, as well as interpretation of past service life data experience and future life expectancies to determine the appropriate average service lives of the Company's surviving plant. The service lives and life characteristics, resulting from the in-depth study, were utilized together with the Company's plant in service and book depreciation reserve to determine the recommended Average Remaining Life (ARL) depreciation rates related to the Company's plant in service as of December 31, 2001.

In preparing the study, the Company's historical investment data were studied using various service life analysis techniques. Further, discussions were held with the Company's management to obtain an overview of the Company's facilities and to discuss the general scope of operations together with other factors which could have a bearing on the service lives of the Company's property. Finally, the study results were tempered by information gathered during plant inspection tours of a representative portion of the Company's property.

The Company maintains a property record containing a summary of its fixed capital investments by property account. This investment data was analyzed and summarized by property group and/or sub group and vintage then utilized as a basis for the various

depreciation calculations.

Depreciation Study Overview

There are numerous methods utilized to recover property investment depending upon the goal. For example, accelerated methods such as double declining balance and sum of years digits are methods used in tax accounting to motivate additional investments. Broad Group (BG) and Equal Life Group (ELG) are both Straight Line Grouping Procedures recognized and utilized by various regulatory jurisdictions depending upon the policy of the specific agency.

The Straight Line (Group) Method of depreciation utilized in this study to develop the recommended depreciation rates is the Broad Group Procedure together with the Average Remaining Life Technique. The use of this procedure and technique is based upon recovering the net book cost (original cost less book reserve) of the surviving plant in service over its estimated remaining useful life. Any variance between the book reserve and an implied theoretical calculated reserve is compensated for under this procedure. That is, as the Company's book reserve increases above or declines below the theoretical reserve at a specific point in time, the Company's average remaining life depreciation rate in subsequent years will be increased or decreased to compensate for the variance, thereby, assuring full recovery of the Company's investment by the end of the property's life.

The Company, like any other business, includes as an annual operating expense an amount which reflects a portion of the capital investment which was consumed in providing service during the accounting period. The annual depreciation amount to be utilized is based upon the remaining productive life over which the undepreciated capital investment needs to be recovered. The determination of the productive remaining life for each property group usually includes an in-depth study of past experience in addition to estimates of future expectations.

Annual Depreciation Accrual

Through the utilization of the Average Remaining Life Technique, the Company will

recover the undepreciated fixed capital investment in the appropriate amounts as annual depreciation expense in each year throughout the remaining life of the property. The procedure incorporates the future life expectancy of the property, the vintaged surviving plant in service, and estimated net salvage, together with the book depreciation reserve balance to develop the annual depreciation rate for each property account. Accordingly, the ARL technique meets the objective of providing a straight line recovery of the undepreciated fixed capital property investment.

As indicated, the use of the Average Remaining Life Technique results in charging the appropriate annual depreciation amounts over the remaining life of the property to insure full recovery by end of life. That does not mean that once an average remaining life is estimated, it can not be changed at any point throughout the service life, but that the annual expense is calculated on a Straight Line Method rather than by the previously mentioned, "sum of the years digits" or "double declining balance" methods, etc. The "group" refers to the method of calculating annual depreciation on the summation of the investment in any one depreciable group or plant account rather than calculating depreciation for each individual unit.

Under Broad Group depreciation some units may be over depreciated and other units may be under depreciated at the time when they are retired from service, but overall, the account is fully depreciated when average service life is attained. By comparison, Equal Life Group depreciation rates are designed to fully accrue the cost of the asset group by the time of retirement. For both the Broad Group and Equal Life Group Procedures the full cost of the investment is credited to plant in service when the retirement occurs and likewise the depreciation reserve is debited with an equal retirement cost. No gain or loss is recognized at the time of property retirement because of the assumption the retired property was at average service life.

Group Depreciation Procedures

Group depreciation procedures are utilized to depreciate property when more than one

item of property is being depreciated. Such a procedure is appropriate because all of the items within a specific group typically do not have identical service lives, but have lives which are dispersed over a range of time. Utilizing a group depreciation procedure allows for a condensed application of depreciation rates to groups of similar property in lieu of extensive depreciation calculations on an item by item basis. The two more common group depreciation procedures are the Broad Group (BG) and Equal Life Group (ELG) approach.

In developing depreciation rates using the Broad Group procedure, the annual depreciation rate is based on the average of the overall group, which is then applied to the group's surviving original cost investment. A characteristic of this procedure is that retirements of individual units occurring prior to average service life will be under depreciated, while individual units retired after average service life will be over depreciated when removed from service, but overall, the group investment will achieve full recovery by the end of the life of the total property group. That is, the under recovery occurring early in the life of the account is balanced by the over recovery occurring subsequent to average service life. In summary, the cost of the investment is complete at the end of the property's life cycle, but the rate of recovery does not match the consumption pattern which was used to provide service to the company's customers.

Under the average service life procedure, the annual depreciation rate is calculated by the following formula:

$$\text{Annual Accrual Rate, Percent} = \frac{100\% - \text{Salvage}}{\text{Average Service Life}} \times 100$$

The application of the broad group procedure to life span groups results in each vintage investment having a different average service life. This circumstance exists because the concurrent retirement of all vintages at the anticipated retirement year results in truncating and, therefore, restricting the life of each successive years vintage investment. An average service life is calculated for each vintage investment in accordance with the above formula. Subsequently, a composite service life and depreciation rate is calculated relative to all vintages within the property group by weighting the life for each vintage by the

related surviving vintage investment within the group.

In the Equal Life Group, the property group is subdivided, through the use of plant life tables, into equal life groups. In each equal life group, portions of the overall property group includes that portion which experiences the life of the specific sub-group. The relative size of each sub-group is determined from the overall group life characteristic (property dispersion curve). This procedure both overcomes the disadvantage of voluminous record requirements of unit depreciation, as well as, eliminates the need to base depreciation on overall lives as required under the broad group procedure. The application of this procedure results in each sub-group of the property having a single life. In this procedure, the full cost of short lived units is accrued during their lives leaving no under accruals to be recovered by over accruals on long lived plant. The annual depreciation for the group is the summation of the depreciation accruals based on the service life of each Equal Life Group.

The ELG Procedure is superior to the BG Procedure because it allocates the capital cost of a group property to annual expense in accordance with the consumption of the property group providing service to customers. In this regard, the company's customers are more appropriately charged with the cost of the property consumed in providing them service during the applicable service period. The more timely return of plant cost is accomplished by fully accruing each unit's cost during its service life, thereby, not only reducing the risk of incomplete cost recovery, but also the procedure results in less return on rate base over the life of a depreciable group. The total depreciation expense is the same for all procedures which allocate the full capital cost to expense, but at any specific point in time, the depreciated original cost is less under the ELG procedure than under the BG procedure. This circumstance exists because under the equal life group procedure, the rate base is not maintained at a level of greater than the future service value of the surviving plant as is the case when using the average service life procedure. Consequently, the total return required from the ratepayers is less under the ELG procedure.

While the equal life group procedure has been known to depreciation experts for

many years widespread interest in applying the procedure developed only after high speed electronic computers became available to perform the large volume of arithmetic computations required in developing ELG based depreciation lives and rates. The table on the following page illustrates the procedure for calculating equal life group depreciation accrual rates and summarizes the results of the underlying calculations. Depreciation rates are determined for each age interval (one year increment) during the life of a group of property which was installed in a given year or vintage group. The age of the vintage group is shown in column (A) of the ELG table. The percent surviving at the beginning of each age interval is determined from the Iowa 10-R3 survivor curve which is set forth in column (B). The percent retired during each age interval, as shown in column (C), is the difference between the percent surviving at successive age intervals. Accordingly, the percentage amount of the vintage group retired defines the size of each equal life group. For example, during the interval 3 1/2 to 4 1/2, 1.93690 percent of the vintage group is retired at an average age of four years. In this case, the 1.93690 percent of the group experiences an equal life of four years. Likewise, 3.00339 percent is retired during the interval 4 1/2 to 5 1/2 and experiences a service life of five years. Further, 4.42969 percent experiences a six-year life; etc. Calculations are made for each age interval from the zero age interval through the end of the life of the vintage group. The average service life for each age interval's equal life group is shown in column (E) of the table.

The amount to be accrued annually for each equal life group is equal to the percentage retired in the equal life group divided by its service life. Inasmuch as additions and retirements are assumed, for calculation purposes, to occur at midyear only one-half of the equal life group's annual accrual is allocated to expense during its first and last years of service life. The accrual amount for the property retired during age interval 0 to 1/2 must be equal to the amount retired to insure full recovery of that component during that period. The accruals for each equal life group during the age intervals of the vintage group's life cycle are shown in column (F). The total accrual for a given year is the summation of the equal life

group accruals for that year. For example, the total accrual for the second year, as shown in column (G), is 11.31019 percent and is the sum of all succeeding years remaining equal life group accruals plus one half of the current years life group accrual listed in column (F). For the zero age interval year, the total accrual is equal to one half of the sum of all succeeding years remaining equal life accruals plus the amount for the zero interval equal life group accrual. The one half year accrual for the zero age interval is consistent with the half year convention relative to property during its installation year. The sum of the annual accruals for each age interval contained in column (G) total to 1.000 demonstrating that the developed rates will recover 100% of plant no more and no less. The annual accrual rate which will result in the accrual amount is the ratio of the accrual amount (11.31019 percent) to the average percent surviving during the interval, column (D), (99.74145 percent), which is a rate of 11.34% (column J). Column (J) contains a summary of the accrual rates for each age interval of the property groups life cycle based upon an Iowa 10-R3 survivor curve.

Remaining Life Technique

In the Average Remaining Life depreciation technique, the annual accrual is calculated according to the following formula where, (A) the annual depreciation for each group equals, (D) the depreciable cost of plant, less (U) the accumulated provision for depreciation, less (S) the estimated future net salvage, divided by (R) the composite remaining life of the group:

$$A = \frac{D - U - S}{R}$$

The annual accrual rate (a) is expressed as a percentage of the depreciable plant balance by dividing the equation by (D) the depreciable cost of plant times 100:

$$(a) = \frac{D - U - S}{R} \times \frac{1}{D} \times 100$$

As further indicated by the equation, the accumulated provision for depreciation by vintage is required in order to calculate the remaining life depreciation rate for each property group. In practice, most often such detail is not available; therefore, composite remaining

lives are determined for each depreciable group, i.e., property account.

The remaining life for a depreciable group is calculated by first determining the remaining life for each vintage year in which there is surviving investment. This is accomplished by solving the area under the survivor curve selected to represent the average life and life characteristic of the property account. The remaining life for each vintage is composited by dividing (D) the depreciable cost of each vintage, by (L) its average service life, and multiplying this ratio by its average remaining life (E). The composite remaining life of the group (R) equals the sums of products divided by the sum of the quotients:

$$R\ Group = \frac{\sum D/L \times E}{\sum D/L}$$

The functional level accumulated provision for depreciation, which was the basis for developing the composite average remaining life accrual and annual depreciation rate for each property account as per this report, was obtained from the Company's books and records. The functional level depreciation reserve was further allocated to each property account and sub-account based upon a detailed theoretical depreciation reserve as of December 31, 2001.

Salvage

Net salvage is the difference between gross salvage, or what is received when an asset is disposed of, and the cost of removing it from service. Salvage experience is normally included with the depreciation rate so that current accounting periods reflect a proportional share of the ultimate abandonment and removal cost or salvage received at the end of the property service life. Historical Net salvage analysis results are expressed as a percentage of the plant retired by dividing the dollars of net salvage incurred by the original cost of the plant retired. Net salvage is said to be positive if gross salvage exceeds the cost of removal, but if cost of removal exceeds gross salvage the result is then negative salvage.

The cost of removal includes such costs as demolishing, dismantling, tearing down, disconnecting or otherwise removing plant and related transportation, handling, and overheads in connection with the work, as well as environmental clean up costs associated

with the property. Salvage includes proceeds received for the sale of plant and materials or the return of equipment to stores for reuse.

Net salvage experience is studied for a period of years to determine the trends which have occurred in the past. These trends are considered together with any changes that are anticipated in the future to determine the future net salvage factor for remaining life depreciation purposes. The goal of incorporating net salvage into the annual depreciation rate is to appropriately allocate the net cost of each asset group to each accounting period. The net cost of each asset group must include not only the original cost when placed in service, but also the net salvage, positive or negative, that will be incurred at end of live. The inclusion, in the net salvage amount, of all benefits received and/or costs incurred is premised on the concept that property ownership includes the responsibility of the proper disposal of the facilities at end of life. Therefore, if current customers benefit from the property's use, the customer should pay/receive a pro rata share of all costs incurred and/or receipts generated in the retirement, abandonment and/or removal of the assets.

The analysis of net salvage is routinely based upon identification of the individual components, (i.e. gross salvage and cost of removal) included in net salvage amount. This analysis identifies that the component items experience different trends over time. That is, as property continues to age, gross salvage routinely declines, while with the passage of time cost of removal tends to increase in conjunction with ever increasing labor rates. On an aggregate basis, most historical retirements from each property group, routinely occur at an average age that is less than the average service life of the account. Accordingly, the experienced historical salvage analysis, with regard to gross salvage, will most often be overstated relative to anticipated future gross salvage. By comparison, the historical analysis will typically be understated with regard to future cost of removal. That is, in general terms, it can be assumed that with the increased passage of time, any future positive net salvage will likely be lower, while future negative net salvage will likely be higher than the overall levels experienced in the past. Because of these future events, it is important that the overall

historical net salvage experience should only be used as a benchmark for estimating future net salvage, and that salvage trends as well as other future factors be considered in the process of estimating future net salvage. Otherwise, the future net salvage estimates will clearly understate the future net negative salvage and overstate any gross salvage that will occur in conjunction with future retirements.

Service Lives

Several factors contribute to the length of time or average service life which the property achieves. The three (3) major categories under which these factors fall are: (1) physical; (2) functional, and; (3) contingent casualties.

The physical category includes such things as deterioration, wear and tear and the action of the natural elements. The functional category includes inadequacy, obsolescence and requirements of governmental authorities. Obsolescence occurs when it is no longer economically feasible to use the property to provide service to customers or when technological advances have provided a substitute of superior performance. The remaining factor of contingent casualties relates to retirements caused by accidental damage or construction activity of one type or another.

In performing the life analysis for any property being studied, both past experience and future expectations must be considered in order to fully evaluate the circumstances which may have a bearing on the remaining life of the property. This ensures the selection of an average service life which best represents the expected life of each property investment.

Survivor Curves

The preparation of a depreciation study or theoretical depreciation reserve typically incorporates smooth curves to represent the experienced or estimated survival characteristics of the property. The "smoothed" or standard survivor curves generally used are the family of curves developed at Iowa State University which are widely used and accepted throughout the utility industry.

The shape of the curves within the Iowa family are dependent upon whether the

maximum rate of retirement occurs before, during or after the average service life. If the maximum retirement rate occurs earlier in life, it is a left (L) mode curve; if occurring at average life, it is a symmetrical (S) mode curve; if it occurs after average life, it is a right ®) mode curve. In addition, there is the origin (O) mode curve for plant which has heavy retirements at the beginning of life.

Many times, actual Company data has not completed its life cycle, therefore, the survivor table generated from the Company data is not extended to zero percent surviving. This situation requires an estimate be made with regard to the remaining segment of the property group's life experience. Further, actual Company experience is often erratic, making its utilization for average service life estimating difficult. Accordingly, the Iowa curves are used to both extend Company experience to zero percent surviving as well as to smooth actual Company data.

Study Procedures

Several study procedures were used to determine the prospective service lives recommended for the Company's plant in service. These include the review and analysis of historical retirements, current and future construction, historical experience and future expectations of salvage and cost of removal as related to plant investment. Service lives are affected by many different factors, some of which can be obtained from studying plant experience, others which may rely heavily on future expectations. When physical aspects are the controlling factor in determining the service life of property, historical experience is a valuable tool in selecting service lives. In the case where changing technology or a less costly alternative develops, then historical experience is of lesser value.

While various methods are available to study historical data, the principal methods utilized to determine average service lives for a Company's property are the Retirement Rate Method, the Simulated Plant Record Method, the Life Span Method, and the Judgement Method.

Retirement Rate Method - The Retirement Rate Method uses actual Company

retirement experience to develop a survivor curve (observed life table) which is used to determine the average service life being experienced in the account under study. Computer processing provides the opportunity to review various experience bands throughout the life of the account to observe trends and changes. For each experience band studied, the "observed life table" is constructed based on retirement experience within the band of years. In some cases, the total life of the account has not been achieved and the experienced life table, when plotted, results in a "stub curve." It is this "stub curve" or total life curve, if achieved, which is matched or fitted to a standard Survivor curve. The matching process is performed both by computer analysis, using a least square technique, and by manually plotting observed life tables to which smooth curves are fitted. The fitted smooth curve provides the basis to determine the average service life of the property group under study.

Simulated Balances Method - In this method of analysis, simulated surviving balances are determined for each balance included in the test band by multiplying each year's original gross additions installed by the Company by the appropriate factor of each Standard Survivor Curve, summing the products, and comparing the results with the related year end plant balance to determine the "best fitting" curve and life within the test period. Various test bands are reviewed to determine trends or changes to indicated service lives in various bands of years. By definition, the curve with the "best fit" is the curve which produces simulated plant balances that most closely matches the actual plant balances as determined by the sum of the "least squares". The sum of the "least squares" is arrived at by starting with the difference between the simulated balances and the actual balance for a given year, squaring the difference, and the curve which produces the smallest sum (of squared difference) is judged to be the "best fit".

Period Retirements Method - The application of the Period Retirements Method is similar to the "Simulated Plant Balances" Method, except the procedure utilizes a Standard Survivor Curve and service life to simulate annual retirements instead of balances in performing the "least squares" fitting process during the test period. This procedure does

tend to experience wider fluctuations due to the greater variations in level of experienced retirements versus additions and balances thereby producing greater variation in the study results.

Life Span Method - The Life Span or Forecast Method is a method utilized to study various accounts in which the expected retirement dates of specific property or locations can be reasonably estimated. In the Life Span Method, an estimated probable retirement year is determined for each location of the property group. An example of this would be a structure account, in which the various segments of the account are "life spanned" to a probable retirement date which is determined after considering a number of factors, such as management plans, industry standards, the original construction date, subsequent additions, resultant average age and the current - as well as the overall - expected service life of the property being studied. If in the past the property has experienced interim retirements, these are studied to determine an interim retirement rate. Otherwise, interim retirement rate parameters are estimated for properties which are anticipated to experience such retirements. The selected interim service life parameters (Iowa curve and life) are then used with the vintage investment and probable retirement year of the property to determine the average remaining life as of the study date. No attempt is made to include any anticipated additions to the property subsequent to the study date. The recovery of such additions if made, is reflected when preparing subsequent depreciation studies.

Judgement Method - Standard quantitative methods such as the Retirement Rate Method, Simulated Plant Record Method, etc. are normally utilized to analyze a Company's available historical service life data. The results of the analysis together with information provided by management as well as judgement are utilized in estimating the prospective recommended average service lives. However, there are some circumstances where sufficient retirements have not occurred, or where prospective plans or guidelines are unavailable. In these circumstances, judgement alone is utilized to estimate service lives based upon service lives used by other utilities for this class of plant as well as what might

be reasonable life for this plant giving consideration to the current age and use of the facilities.

MONTANA - DAKOTA UTILITIES
Gas Division

Study Results

Account 374.20 - Rights of Way

The Company's investment in this account totals $89,641, and is presently being depreciated utilizing an annual depreciation rate of 2.58 percent. The investment's current average is 17.2 years.

Retirements totaling $1,754 have been experienced to date. Based upon a general analysis of the historical data an Iowa 65-R2.5 life and curve is estimated as the applicable service life parameters for this property group investment. Application of the recommended service life parameters to the Company's vintage investment produces an average remaining life of 49.3 years.

An analysis of the Company's historical experience relative to net salvage shows that this account has not experienced any net salvage and none is anticipated in the future. Accordingly, future net salvage is estimated at zero (0) percent and when combined together with the recommended service life parameters and Company's investment produces a recommended annual depreciation rate of .75 percent.

Account 375 - District Meas. & Regulator Station Structures

The Company's investment in this account totals $521,210, and is presently being depreciated utilizing an annual depreciation rate of 2.40 percent. The investment in the account is principally related to smaller metal structures utilized to house the Company's property at the various regulator sites. Company retirements totaling $131,348, were analyzed via the Simulated Analysis Method relative to the overall 1918-2001 experience band as well as numerous interim periods. In addition, an analysis of limited actuarial

retirement data identified that the Company's retirements have generally been occurring at an average age of 38 years. Based upon the historical analysis an Iowa 55-R2.5 life and curve is estimated for this property group. Application of the recommended service life parameters to the Company's current surviving investment produces an average remaining life 29.9 years.

The Company's historical retirement data was analyzed to identify the level of net salvage being experienced by this property. Net salvage has varied over the past thirty-four (34) year period but has averaging more than negative twenty-eight (28) percent during the 1968-2001 study period. During the more recent ten-fifteen year period net salvage has routinely occurred in the range of negative thirty (30) to more than negative one-hundred (100) percent net salvage. Based upon the available historical data and the anticipation that current salvage will continue in conjunction with future retirements, future net salvage is estimated at negative f ifty (50) percent. The resulting recommended annual depreciation rate is for this property group is 3.24 percent.

Account 376 - Mains

The Company's current investment in mains totals $78,334,154 and is being depreciated utilizing an annual depreciation rate of 4.05 percent while the current overall average age is 18.6 years. The investment in gas mains is related to several types of pipe, as well as other appurtenant equipment. Accordingly, the investment in the account has been segmented into five (5) sub-account categories which include Steel Mains, Plastic, Valves, Manholes, and Bridge & River Crossing. The Company's mains investment has continually grown over the history of the account through the present day. The compound growth rate of the account investment over the history has aggregated approximately 6.5

percent. An analysis of the Company's overall retirement data was completed via Simulated Plant Analysis Method, which identified that the property group has generally been experiencing a life of 45 years. Furthermore, the Company's investment was analyzed to identify by property group, by individual material and/or property classes. That is, the property investments were segmented between Steel Mains, Plastic Mains, Valves, Manholes, and Bridge and River Crossings. Based upon the completed analysis as well as analysis of various operating companies data an average service life parameter was estimated for each of the subcategory investments within the property group.

The Company's investment in Steel Mains totals $33,849,069, which has achieved a current average age of 27.3 years. Based upon the applicable analysis and consideration of the property group, an Iowa 45-R3 life and curve is estimated as the applicable life of the property group. Application of the estimated service life parameters to the current investment produces an average remaining life of 21.4 years.

The Company's current investment relative to Plastic - Mains is $44,012,975, while the current average age is 12.0 years. Giving consideration to the analysis on the overall historical data, as well as other industry data, an Iowa 45-R3 life and curve is estimated for this property class. The resulting average remaining life of the property group is 33.7 years.

An analysis was completed relative to the Company's historical salvage experience for the period 1968-2001 which demonstrated that the Company has consistently experienced negative salvage for this class of property. The net negative salvage has ranged from approximately negative five(5) percent to more than negative seventy (70) percent. The resulting overall average negative net salvage for the thirty-four (34) year

period was in excess of negative thirty (30) percent, while the recent salvage trend analysis produced an estimated future net salvage of greater than negative sixty (60) percent. Likewise, is anticipated that the Company will continue to experience significant negative net salvage in conjunction with retirement of its mains and that the level of negative salvage will increase in future years as a percent of the original cost due to increasing local regulations and the resulting manpower requirements being placed upon the Company's operations and continued aging of the current plant in service. That is, as the property continues to age the percent of cost of removal relative to the original cost will continue to increase while the percent of gross salvage will decline. Giving consideration to the Company's overall, as well as recent experience, future net salvage relative to this property group is currently estimated at negative sixty (60) percent.

The Company's vintage investment for each property category was applied to the applicable recommended service life and curves resulting in average remaining lives and recommended depreciation rates as summarized in the table below which aggregates to a total account average remaining life depreciation rate of 3.15 percent:

Account 376 - Distribution Mains

Acct. No.	Description	P-I-S 12-31-01	ASL/ Curve	AV Age	ARL	Net Salv. %	Depr. Rate %
376.10	Steel	$33,849,069	45-R3	27.3	21.4	(60)	2.89
376.20	Plastic	44,012,975	45-R3	12.0	33.7	(60)	3.35
376.30	Valves	391,504	40-R2.5	10.7	30.4	(60)	3.78
376.40	Manholes	69,919	45-R3	16.0	29.9	(60)	3.25
376.50	Bridges & River Crossings	10,686	45-R3	6.0	39.1	(60)	3.47
	Total Distribution Mains	78,334,154			3.15		

Account 378 - Measuring and Regulating Station Equipment - General

The investment in this account totals $1,367,334, has attained a current average age of 27.0 years, and is presently being depreciated based upon an annual depreciation rate of 2.30 percent. The measuring and regulating equipment is utilized to regulate its gas pressure within its various service areas to the appropriate level to meet the customer needs. As the Company continues to upgrade and/or modify its operating pressure within its service territory, ongoing changes will be required to the Company's existing measuring and regulating facilities.

Retirements totaling $484,531, which occurred during the 1920-2001 experience band, were analyzed via the Simulated Plant Record Method. Additional analysis of available actuarial retirement data identifies that the retirements have been occurring at an average age of 22 years over the life of the account. The level of property changes have moderated somewhat during the past several years, nevertheless, as indicated it is anticipated that changes will continue as the Company strives to upgrade its system and provide improved customer service in future years. Based upon the historical analysis, an Iowa 40-R1 life and curve is recommended for this property group and when applied to the current surviving assets produces an average remaining life of 23.3 years.

The Company's historic net salvage was studied for the period 1968-2001 which produced an overall average experience of approximately negative two (2) percent net salvage, however, this overall experience was influenced by positive salvage during earlier periods. More recent years have experienced significantly higher negative salvage levels. As noted salvage factors have varied from year to year, however, various recent years have experienced negative salvage and it is anticipated that similar negative experience will

continue into the future. Based upon the overall experience, together with the Company's net salvage trends future net salvage is currently estimated at negative thirty (30) percent. Utilization of the recommended service life and salvage parameters together with the Company's current investment produces and annual depreciation rate of 3.31 percent.

Account 379 - Measuring & Regulating Station Equipment - City Gate

The Company's investment in this account totals $1,009,137, is currently depreciated utilizing an annual depreciation rate of 2.74 percent, and has achieved a current average age of 20.7 years. Retirements totaling $444,438 which occurred during the years 1951-2001, were analyzed via the Simulated Plant Record Method. Based upon the analysis of the available historical date and general content of the account an Iowa 35-R2.5 life and curve is recommended for this property group. Application of the recommended service life parameters to the current surviving investment produces an average remaining life of 18.9 years.

Net salvage relative to the retirements which have occurred throughout the history of this account has averaged approximately twenty-two (22) percent, however, similar to Account 378 - Measuring & Regulatory Station Equipment - General, the net salvage has been declining and turning negative in recent years. Based upon the trends and expected future net salvage for this property class is estimated at negative fifteen (15) percent. Utilization of the recommended service life parameters and the negative fifteen (15) percent net salvage produces an average remaining life depreciation rate of 4.33 percent.

Account 380 - Services

The Company's current investment in Services totals $32,476,717 has achieved a current average age of 15.2 years, and is presently being depreciated utilizing an annual

depreciation rate of 7.60 percent. The investment in this account has grown significantly in recent years having approximately doubled over the past fifteen (15) plus years.

The Company's investment in services is comprised of two categories of material types, namely, Steel, Plastic as well as Farm & Fuel Lines Plastic. An analysis was performed using various reports, as well as other internal data sources, to identify the investment levels for each material type.

As indicated, the current investment in services has been identified by the three (3) material property categories. Similar to the Company's mains investment, it is anticipated that the Company will experience greater levels of property retirements relative to Services than experienced in earlier years due to increased age, as well as the Company's continuing facilities upgrades.

Of the Company's customer services in place approximately forty-nine (49) percent are steel and fifty-one (51) percent are plastic pipe material. Various of the facilities placed during the past thirty plus years are typically coated and wrapped services, while earlier years were bare steel services. However, a large majority of the services placed in more recent years are plastic services. The services range in size from smaller residential to larger industrial Service, however, the overwhelming majority of the facilities are smaller.

Overall retirements totaling $4,079,040, which occurred during the period 1920-2001 experience band, were analyzed via the Simulated Plant Analysis Method. This analysis identifies that recent retirements have generally been increasing over time. Additional analysis of available actuarial retirement data indicates that the recent retirements have been occurring at an average age of 23 years. Given that the trend has continued over a period of time and that the Company's plans are to continue upgrading its service as

required, a general average service life of forty (40) years is estimated based upon the overall experience of the account. A somewhat short life of thirty-five (35) years is estimated relative to the Farm & Fuel Lines sub-category. Application of the estimated average service life parameters (40-R2.5) to the Company's current Steel Services investment produces an average remaining life 18.8 years and the application of the Iowa 40-R3 to the Plastic Services investment produces an average remaining life of 29.0 years.

The Company's historical retirement and salvage data was analyzed for the period 1968-2001 to identify the estimated future net salvage. The Company has experienced average net salvage of approximately negative one hundred thirty-four (134) percent over the thirty-four (34) year period. Net negative salvage had declined modestly during the early 1990's but has generally escalated in more recent years. The net salvage trend analysis ranged between negative thirty-seven (37) percent to more than negative two hundred (200) percent with the overall trend being negative two hundred thirty-one (231) percent. Based upon the Company's experience and negative trends, plus giving consideration to increased labor costs in future years, future net salvage is estimated at negative one hundred seventy-five (175) percent. The resulting composite recommended annual depreciation rate for Account 380 - Services is 7.03 percent.

Account 380 - Services

Acct. No.	Description	P-I-S 12-31-98	ASL/ Curve	AV Age	ARL	Net Salv. %	Depr. Rate %
380.10	Steel	7,683,870	40-R2.5	26.2	18.8	(175)	7.14
380.20	Plastic	24,580,507	40-R3	11.8	29.0	(175)	6.97
380.30	Farm & Fuel Lines	212,340	30-R1.5	12.3	20.6	(175)	9.33
	Total Services	32,476,717					7.03

Account 381 - Meters

The investment in this account totaling $30,462,008 is presently depreciated utilizing an annual depreciation rate of 2.58 percent. The current average age of the property group is 19.3 years and has grown at a compound growth rate of approximately seventeen (17) percent over the life of the account.

Retirements totaling $5,633,345, which occurred over the 1933-2001 experience band, were analyzed via the Simulated Plant Record Method. Additional analysis of available actuarial retirements data identified that recent retirements have been occurring at an average age of 27 years. Due to the continuing increases in regulation and concern of proper metering, continued emphasis will be placed on the proper testing and/or replacement of metering facilities. The life analysis produced a life indication in the range of thirty-five (35) years, accordingly based upon the available experience an Iowa 35-R2.5 life and curve is estimated for this property class. Application of the recommended service life parameters to the Company's current surviving investment produces an average remaining life of 19.9 years.

The Company's historical salvage experience relative to the retirement of meters was analyzed for the period 1968-2001 which identifies that the amount of net salvage being achieved relative to the retirement of meters has been relatively modest. For example, while during 1968 and 1989, the Company achieved sizable amounts of positive net salvage in conjunction with retirements of its meters, more recent years experience has been approaching zero (0) percent. Based upon the historical experience and the general trend, future net salvage is currently estimated at zero (0) percent and when utilized together with the recommended service life parameters produces an annual depreciation rate of 3.19

percent.

Account 383 - Service Regulators

The Company's investment in this account totals $4,296,862, has achieved a current average age of 20.7 years, and is presently being depreciated based upon an annual depreciation rate of 2.37 percent. Additions have been placed into service for this property class continuously over the life of the account with many of the property additions being related to additions of plant in conjunction with medium pressure rebuilds and new customers. Various retirements have also occurred in conjunction with the upgrading of distribution systems to higher pressures, as well as normal ongoing retirements.

Retirements totaling $995,550, which occurred during the 1946-2001 experience band, were analyzed via the Simulated Plant Record Method. The analysis identifies that the retirements have fluctuated from year to year, but have generally been increasing over time in conjunction with the larger investment levels in this account. The overall historic life analysis indicated a life in the range of thirty (30) to thirty-five (35) years. Giving consideration to ongoing life characteristics and management's expectations, an Iowa 35-R3 life and curve is currently estimated for this property class. Application of the proposed service life parameters to the Company's current surviving investment produces an average remaining life of 18.0 years.

The Company's salvage analysis was analyzed for the period 1968-2001 and identified that the Company has experienced levels of positive net salvage, however, much of that salvage experience is attributable to various regulators being sold to plumbing contractors for installation in private company locations. This activity is applicable to the resale of limited asset items and not the net salvage which is anticipated to occur relative

to the Company's overall plant in service. Accordingly, future net salvage is estimated at ten (10) percent. The application of the proposed life and net salvage service life parameters, produces a recommended annual depreciation rate of 2.87 percent.

Account 385 - Industrial Meas. & Reg. Station Equipment

The investment in this account totaling $578,200 is presently depreciated utilizing an annual depreciation rate of 1.91 percent. The current average age of the property group is 18.7 years. The level of retirements relative to the current property in service has generally increased over time. This property within this account is typically driven by the requirements of a limited quantity of larger customers. Accordingly, the Company will continue to monitor its customer requirements, as well as regulatory requirements. These items along with technology changes may drive additional property changes.

Retirements totaling 110,892 which occurred during the 1978-2001 experience band, were analyzed via the Simulated Plant Record Method. Due to the continuing increases in regulation and concern of providing proper service to its larger customers continued emphasis will be placed on assuring that these facilities meet the requirements of its larger customers. Based upon the content of the account analysis results and general industry experience, an Iowa 35-R2 life and curve is recommended for this property group. Application of the recommended service life parameters to the Company's current surviving investment produces an average remaining life of 20.6 years.

In the past, the Company has experienced net salvage relative to the retirements of this asset class, however, most of this salvage actually has been attributable to store returns as apposed to final salvage. In more recent years this experience has turned to negative salvage. Furthermore, the future removal of such plant will require an increasing

level of labor relative to the historical original cost. Accordingly, based upon the available historical trend, as well as experience within the industry, future net salvage is currently estimated at negative fifteen (15) percent and when utilized together with the recommended service life parameters produces an annual depreciation rate of 3.77 percent.

Account 386.2 CNG Refueling Station

The Company's investment in this account totals $432,811, has achieved a current average age of 7.6 years, and is presently being depreciated based upon an annual depreciation rate of 9.35 percent. Additions have been placed into service for this property class continuously over the life of the account with many of the property additions being related to additions of plant in conjunction with meter changes.

Given the young age of the property class no retirements have been experienced to date. An average service life of an Iowa 15-R3 life and curve is estimated for this property class. Application of the proposed service life parameters to the Company's current surviving investment produces an average remaining life of 8.1 years.

Future net salvage is estimated at zero (0) percent and when utilized together with the service life parameters, produces a recommended annual depreciation rate of 3.70 percent.

Account 387.10 - Cathodic Protection Equipment

The Company's investment in this account totals $1,450,657, has achieved a current average age of 16.6 years, and is presently being depreciated based upon an annual depreciation rate of 5.21 percent. Additions have been placed into service for this property class continuously over the life of the account.

Retirements totaling $653,395 which occurred during the 1968-2001 experience

band, were analyzed via the Simulated Plant Record Method. The analysis identifies that while the retirements have varied from year to year, they have generally been increasing in more recent periods in conjunction with the larger investment levels in this account. Based upon the historical analysis results and the expectation that such activity will continue, an Iowa 20-R1.5 life and curve is currently estimated for this property class. Application of the proposed service life parameters to the Company's current surviving investment produces an average remaining life of 10.1 years.

The Company's salvage analysis was analyzed for the period 1967-2001 and the Company's net salvage experience routinely was zero approximately (0) percent. Based upon the historical data, future net salvage is estimated at zero (0) percent and when utilized together with the service life parameters, produces a recommended annual depreciation rate of 5.75 percent.

Account 387.20 - Other Equipment - Other Distribution Equipment

The Company's investment in this account total $557,184, and is being depreciated using an annual depreciation rate of 5.21 percent. Based upon this historical analysis an Iowa 25-R3 life and curve is estimated as the applicable service life parameters for this property group investment. Future net salvage relative to this investment is estimated at zero (0) percent. Application of the recommended service life parameters to the Company's investment produces an average remaining life of 17.8 years and an annual depreciation rate of 1.42 percent.

Account 390.00 - General Structures

The Company's investment in this account totals $1,922,983 which is related to the Company's several structures within its operating system. The surviving investment has

achieved a current average age of 32.9 years and is presently being depreciated based upon an annual depreciation rate of 2.34 percent.

An analysis of retirements totaling $1,655,403, which occurred during the period 1928-2001 were analyzed via the Simulated Plant Record Method, which produced an average service life in the range of 30-35 years. Accordingly, an Iowa 35-R3 life and curve was applied to the Company's surviving investment, which produced an average remaining life of 11.3 years.

While past retirements have generated positive salvage for two (2) recent years, most years within the analysis band produced varying levels of negative salvage. Future net salvage relative to the property contained in this account is estimated at negative ten (10) percent. The resulting annual depreciation rate is 4.61 percent.

Account 391.1 - Office Furniture and Equipment

The Company's investment in office furniture and fixtures totals $544,275, which has achieved a current average age of 26.7 years and is presently being depreciated utilizing an annual depreciation rate of 4.05 percent. Retirements totaling $820,808, which occurred during the 1932-2001 band, were analyzed via the Simulated Plant Record Method which produced a life indication in the range of eighteen (18) plus years. However, given the difficulty in tracking the many items with smaller investment amounts it is likely that numerous items fail to be retired when no longer in service. Accordingly, due to this ongoing difficulty in attaining proper retirements a service life of an Iowa 15-R1 life and curve is estimated for this property group plus, it is proposed that the investment within this property group be amortized over a fifteen (15) year period.

Account 391.3 - Computer Equipment - PC

The Company's current investment in this account totals $780,995, has attained a current average age of 4.4 years, and is presently being depreciated based upon an annual depreciation rate of 12.5 percent. Given the young age of the property group along with the likely under-reporting of retirements which have actually occurred to date, the achieved life indication relative to this property class is likely overstated. While an analysis of general data relative to PC computer type equipment, of which this property group is principally comprised, have general experienced an average service life in the range of eight (8) years, there are various underutilized and/or un-retired items on the Company's books. Furthermore, and more importantly, recently the Company has increased it effort to stay more current with the technological advances inherent within this asset category. This effort is being driven by the continual need for increase processing power (due to software requirements, etc) as well as the reduced cost of the newer equipment platforms. In general, it is widely known that this property class, which is significantly impacted by the technological advances, routinely requires a very high frequency of upgrades and/or replacements.

Based upon this experience and future expectation of ongoing rapid changes in future years an Iowa 5-R2 life and curve is estimated for this property. Application of the service life parameters to the Company's investment produces an average remaining life of 2.4 years. Future net salvage is estimated zero (0) percent and the resulting annual depreciation rate is 26.02 percent.

Account 392.10 - Transportation Equipment (Non-Utilized)

The present surviving investment in this account totals $147,187, has attained a

current average age of 2.8 years, and is presently being depreciated utilizing an annual depreciation rate of 5.74 percent. Retirements totaling $14,887, which occurred during the 1992-2001 experience band, were analyzed via the Simulated Plant Record Method and a life indication in the range of eight (8) years. Accordingly, an average service life of an Iowa 8-R3 is estimated, based upon the life estimate for this property group, it is recommended that each vintage investment be amortized upon a eight (8) year average life. Application of the recommended life and curve to the Company's current surviving investment produces an average remaining life of 5.3 years.

Future net salvage is estimated at fifteen (15) percent and the resulting proposed implicit annual depreciation rate is 4.36 percent.

Account 392.20 - Transportation Equipment - Utilized

The investment in this account totaling $6,080,561, which currently is depreciated utilizing an annual depreciation rate of 5.74 percent, has current attained an average age of 4.7 years.

Retirements totaling $2,872,353, which occurred during the period 1995-2001, were analyzed for the overall experience period, as well as the various other interim bands. This analysis shows that historically much of the Company's property in this account is routinely being replaced in the range if five (5) years, resulting in a service life indication of six years or less. Based upon the Company's recent experience, an Iowa 6-R3 life and curve are recommended for this account. Application of the proposed service life parameters to the Company's current surviving investment produces an average remaining life of 2.3 years.

An analysis of the Company's retirements and related salvage during the period 1968-2001 indicates that the Company has received positive salvage relative to disposal

of its automobiles in the past. The analysis identifies that the Company's average net salvage totaling $1,359,083 has averaged in the range of 17-18 percent. Based upon the overall historic experience, future net salvage of fifteen (15) percent was incorporated in developing the resulting depreciation rate for this property. Utilizing the estimated average service life and salvage factors together with the Company's current surviving investment produces an average remaining life depreciation rate of 21.13 percent.

Account 393 - Stores Equipment

The Company's investment in this account totals $186,729, has attained a current average age of 30.8 years, and is presently being depreciated utilizing an annual depreciation rate of .90 percent. The Company's investment in this account is somewhat limited and is related to general storeroom equipment located at the Company's various operations warehouses. Retirements totaling $15,323, which occurred during 1920-2001 years, were analyzed via the Simulated Plant Record Method which produced a service life indication of an Iowa 35-R3 life and curve.

An analysis of the Company's salvage experience was completed for the period 1968-2001 to identify the level of net salvage achieved with past retirements. The result of the analysis indicates that the Company has experienced only minimal net salvage. Based upon the Company's experience in many years, as well as general industry experience, future net salvage is estimated at zero (0) percent and the resulting annual amortization rate is 2.49 percent.

Account 394 - Tools, Shop and Garage Equipment

The investment in this account totaling $3,187,752 is related to tools, garage, and work equipment utilized by the Company's employees in providing service to the Company's

customers. Accordingly, the Company maintains investment in this account within four (4) separate sub-account categories which include Tools, Shop & Garage Equipment - Non Utilized, Tools, Shop and Garage Equipment Utilized, Vehicle Maintenance Equipment and Vehicle Refueling Equipment. Based upon the content of each property group and the completed analysis the average service life parameters were estimated for each of the subcategory investments.

The Company's investment in Tools, Shop & Garage Equipment - Non Utilized, totals $2,495,422. Retirements from the property group have totaled $1,1893,769 over the life of the account which have produced a life indication in the range of twenty-five (25) years. However, given the difficulty in tracking the many items with smaller investment amounts it is likely that numerous items fail to be retired when no longer in service. Accordingly, due to this ongoing difficulty in attaining proper retirements a service life of an Iowa 18-R1.5 life and curve is estimated for this property group. Furthermore, it is proposed that the investment within this property group be amortized over a eighteen (18) year period.

The Company's investment in Tools. Shop & Garage Equipment - Utilized, totals $299,810. An analysis of $1,632,696 retirements form this property category via the Simulated Plant Record Method, produced a life indication of an Iowa 20-R1 life and curve. is estimated as the applicable life of the property group. Similar to Account 394.1, given the difficulty in tracking the many items with smaller investment amounts it is likely that numerous items fail to be retired when no longer in service. Accordingly, due to this ongoing difficulty in attaining proper retirements a service life of an Iowa 18-R1 life and curve is estimated as the applicable life for this property group. Accordingly, the recommended amortization period for the asset investments is eighteen (18) years.

The current investment in Vehicle Maintenance Equipment totals only $31,177. A service life representative of an Iowa 20-R3 life and curve is estimated for this property group. Likewise, it is proposed to amortize the investments within this property groups over twenty (20) years.

The Company's investment relative to Vehicle Refueling Equipment totals only $361,344. Giving recognition to the property groups content and various analysis on Iowa 15-R3 life and curve is estimated for this property class. A fifteen (15) year amortization period is proposed for this asset class.

The Company's vintage investment for each property category was applied to the applicable recommended service life and curve, recommended amortization and resulting implicit depreciation rates as summarized in the table below.

Account 394 - Tools, Shop and Garage Equipment

Acct. No.	Description	P-I-S 12-31-00	ASL/ Curve	Amort. Period (Yrs.)	Net Salv. %	Amort. Rate %
394.10	Tools, Shop & Garage Equip-(Non-Unitized)	$2,495,422	18-R1.5	18	0	6.62
394.20	Tools, Shop & Garage Equip-(Unitized)	299,810	18-R1	18	0	2.40
394.30	Vehicles Maint. Eq.	31,177	20-R3	20	0	5.78
394.40	Vehicles Refueling Equipment	361,344	15-R3	15	0	4.72
	Total Equipment	$3,187,753				

Account 395 - Laboratory Equipment

The present surviving investment in this account totals $271,033, has attained a current average age of 21.3 years, and is presently being depreciated utilizing an annual depreciation rate of 2.32 percent. An insufficient level of historical data is available to

produce any meaningful service life indications. Based upon general industry information and future expectations for the property group, an Iowa 20-R2 life and curve is estimated for this property class. Accordingly, a future amortization period of twenty (20) years is estimated relative to this asset class. Future net salvage is estimated at zero (0) percent resulting in a current implicit annual amortization rate of 7.67 percent.

Account 396.10 - Work Equipment (Trailers)

The Company's investment in this account totals $293,543 and is being depreciated using an annual depreciation rate of 4.83 percent. Based upon this historical analysis, an Iowa 10-R2 life and curve continues to be estimated as the applicable service life parameters for this property group investment. Future net salvage relative to this minor investment is estimated at thirty-five (35) percent. The resulting recommended annual depreciation rate is 5.76 percent.

Account 396.20 - Power Operated Equipment

The Company's current investment in this account totals $4,081,768, which is currently being depreciated utilizing an annual depreciation rate of 4.83 percent. The property investment, which has attained a current average age of 11.3 years. Retirements during the recent history of the account totaling $12,672,235, were analyzed via the Simulated Plant Record Method. The analysis of the data provided a general life indication of seven (7) years. The Company routinely replaces its Power Operated Equipment on a rapid replacement schedule thereby receiving the maximum equipment trade in value and maintaining a modern and efficient work fleet. Accordingly, an average service life of an Iowa 7-R2 is recommended for this property group giving consideration to general industry lives

The Company's available historical salvage data was analyzed during the period 1968 -2001. This analysis indicates that during the period studied the Company has achieved average net salvage of approximately eighty (80) percent. However, the actual level of achieved net salvage is somewhat overstated due to the past accounting treatment of the trade-ins. That is, historically the trade-in amounts have been identified and recorded based upon the value allowed against the full retail price of the newly purchased asset as opposed to the actually lower level trade-in in price against the normal market price for the purchased equipment. While the net purchase price is the same under either scenario, the Company's historical accounting treatment of the trade-ins results in an overstatement of the net salvage being received for the traded equipment. Accordingly, based upon this analysis future net salvage for this asset class is estimated at sixty (60) percent. The Company's current book depreciation reserve relative to this property class aggregates approximately fifty-five (55) percent of original cost. However, given the recent practice of upgrading back hoes and trenchers on a short cycle the Company is currently experiencing high levels of net salvage. Flowing this activity through the normal depreciation rate calculation would presently produce a negative depreciation rate even though the depreciation reserve is significantly less than original cost. Because of this circumstance it is recommended that the depreciation rate be currently set at zero (0) percent and that no future depreciation expense be recorded until a significant change occurs to the depreciation reserve as a percent of original cost declines significant and/or the plant replacement patterns change significantly.

Accordingly the recommended annual depreciation rate for this property group is estimated at zero (0) percent.

Account 397 Communication Equipment

The Company's maintains its investment in this account in six (6) categories of communication equipment, namely Fixed Radio Equipment, Radio Equipment Mobie, Telephone, Supervisory and Telemetering Equipment, SCADA System, and Networking Equipment. An analysis was performed using various reports, as well as other company data sources, to identify the investment levels for each equipment group.

The Company's current investment in Radio Communication Equipment - Fixed totals only $481,655 for which the current depreciation rate is 3.67 percent. Based upon the property group an Iowa 15-R3 life and curve is estimated relative to this investment and is the basis of the recommended amortization period for this property group. Application of the estimated service life parameters to the current surviving investment produces a current implicit amortization rate of 7.37percent.

The Company investment in Radio Communication Equipment Mobile totals only $401,528 and is currently being depreciated at an annual rate of 3.67 percent. While the life analysis produced a general life indication of approximately twenty (20) years, an average service life of fifteen (15) years is estimated for this property group based upon rapid changing technology and operating practices. The applicable amortization period of the estimated 15-R3 life and curve to the current investment produces a current implicit amortization rate of 7.34 percent.

The remaining investment relative to General Telephone Communication Equipment totals only $90,518. An Iowa 10-R1 life and curve is estimated for this property class based upon the Company's historical and general industrial information. The resulting proposed implicit amortization rate is 9.88 percent.

The Company's investment in Supervisory and Telemetering Equipment totals only $124,167. An Iowa 10-L1 life and curve is estimated as the applicable service life characteristics. The resulting implicit amortization rate is 0.25 percent.

The Company's present in SCADA System totals only $30,894. A service life representative of an Iowa 8-R3 life and curve is estimated for this property class. The recommended current implicit amortization rate is 0 percent.

The Company's investment in Networking Equipment totals only $30,338. Giving recognition to the equipment type within the property group (which is similar to computer type equipment), an Iowa 5-R3 life and curve is estimated for this class of property. The resulting implicit annual amortization rate is 26.26 percent.

The Company's vintage investments for each property category, the applicable recommended service life parameters and recommended implicit amortization rates are summarized in the table below.

Account 397 - Communication Equipment

Acct. No.	Description	P-I-S 12-31-01	ASL/ Curve	Amort. Period (Yrs.)	Net Salv. %	Amort. Rate %
397.10	Radio Communication Equipment (fixed)	$481,655	15-R3	15	0	7.37
397.20	Radio Communication Equipment (mobile)	401,528	15-R3	15	0	7.34
397.30	General Telephone Communication Eq.	90,518	10-R1	10	0	9.88
397.50	Supervisory & Telemetering Equipment	124,167	10-L1	10	0	0.25
397.60	SCADA	30,894	8-R3	8	0	0.00
397.80	Networking Equipment	30,338	5-R3	5	0	26.26
	Total Equipment	$1,159,100				

Account 398 - Miscellaneous Equipment

The present surviving investment in this account totals $145,270, has attained a current average age of 39.0 years, and is presently being depreciated utilizing an annual depreciation rate of .59 percent. Retirements totaling $106,249, which occurred during the years 1919-2000, were analyzed via the Simulated Plant Record Method. An analysis of the Company's historical data produced a life of forty (40) plus years. This resulting life is non-typical and is likely the product of significant levels of unreported retirements. Based upon this analysis, consideration of the general account content, related under reporting of plant assets, and general industry data an average service life of twenty (20) years is estimated for the asset group. Based upon an estimated life and curve relative to the Company's current surviving investment of an Iowa 20-R2 the current implicit annual amortization rate for this property group is 1.27 percent.

Mr. Paul Bienek
Montana-Dakota Utilities Company
400 North Fourth Street
Bismark, ND 58501

Dear Mr. Bienek:

In accordance with your authorization, we have prepared a depreciation study related to the utility plant in service of Montana-Dakota Utilities Company - Common Plant as of December 31, 2001. Our findings and recommendations, together with supporting schedules and exhibits, are set forth in the accompanying report.

Summary schedules have been prepared to illustrate the impact of instituting the recommended annual depreciation rates as a basis for the Company's annual depreciation expense as compared to the rates presently utilized. The application of the present rates to the depreciable plant in service as of December 31, 2001 results in an annual depreciation expense of $2,167,043. In comparison, the application of the proposed depreciation rates to the depreciable plant in service at December 31, 2001 results in an annual depreciation expense of $ 2,666,460, which is a increase of $499,417 from current rates. The composite annual depreciation rate under present rates is 5.84 percent, while the proposed proforma composite depreciation rate is 7.18 percent.

Section 2 of our report contains the summary schedules showing the results of our service life and salvage studies and summaries of presently utilized depreciation rates. The subsequent sections of the report present a detailed outline of the methodology and procedures used in the study together with supporting calculations and analyses used in the development of the results. A detailed table of contents follows this letter.

Respectfully submitted,

Earl M Robinson

SECTION 8	
Salvage Analysis	8-1

MONTANA-DAKOTA UTILITIES COMPANY
Common Plant

Executive Summary

Table 1 on page 2-1 is a comparative summary which illustrates the effect of instituting the revised depreciation rates. The schedule includes a comparison of the annual depreciation rates and annual depreciation expense under both present and proposed rates applied using the Straight Line Method for each depreciable property group of the Montana-Dakota Utilities Company-Common Plant (the "Company") plant in service as of December 31, 2001. Both the present and proposed depreciation rates were developed utilizing the Straight Line (SL) Method, Broad Group (BG), Procedure and the Average Remaining Life (ARL) Technique.

Table 2 on pages 2-2 to 2-3 provides a summary of the detailed life estimates and service life parameters (Iowa Curves) utilized in preparing the Average Remaining Life depreciation rates for each property group. The schedule provides a summary of the detailed data and narrative of the study results set forth in Sections 4 through 7. The developed depreciation rates (Column L) were determined by studying the Company's historical investment data together with the interpretation of future life expectancies which will have a bearing on the overall service life of the Company's property.

Table 3 on page 2-4 is a summary schedule showing the impact on the Company's annual depreciation expense as a result of estimating current average service lives for the applicable general plant accounts as well as changing from depreciating the property groups to a straight line amortization of the investment over a set period of years.

The various schedules comprising Table 4 on pages 2-5 to 2-17 summarize the

development of the annual amortization amounts for each of the general plant accounts for which the depreciation amortization approach is being proposed. The proposal to amortize the investments within the selected general plant accounts is driven by the Company's ongoing difficulty to effectively track various of the property account investments that are in many cases related to a large quantity of items of corresponding small investment amounts. Due to the inability to effectively track the items, many times the items are no longer utilized but remain on the company's books and records as unrecorded retirements. Therefore to simplify the accounting procedure for these property items it is proposed that the investments within each vintage of the applicable property group be amortized over a predetermined time period. Once attaining the stated amortization period age the asset's original cost investment will have been fully amortized, and accordingly, will be retired from the company's books and records. The property accounts for which asset investment amortization is being proposed includes Account 391, 393, 394, 395, 397, and 398.

In the process of moving from depreciation to amortization of the selected general plant accounts, there are, by the very nature of average service life dispersion, vintage investments within the applicable property groups which exceeds the estimated average service life / proposed amortization period. Given that each vintage of property will be amortized over the average service life, an adjustment needs to be incorporated into the change-over process to recover the under depreciated portion of the older investments. Accordingly, the variance between the amortization starting-point depreciation reserve and the Company's actual book reserve (either positive or negative) is being recorded on a straight line basis over the proposed amortization period along with the annual amortization

of all other vintage investments. The amortization starting point book depreciation reserve is equal to the sum of the original cost for vintages older than the amortization period plus the calculated deprecation reserve for vintages with ages equal to or less than the amortization period .

The utilization of the recommended depreciation rates based upon the Straight Line Average Remaining Life Procedure results in the setting of depreciation rates which will continuously true up the Company's level of capital recovery over the life of each asset group. Application of this procedure, which is based upon the current best estimates of service life together with the Company's plant in service and accrued depreciation, produces annual depreciation rates that will result in the Company recovering 100 percent of its investment -- no more, no less.

It is recommended that the Company continue to apply depreciation rates and maintain its book depreciation reserve on an account-level basis. The maintenance of the book reserve on an account-level basis requires both the development of annual depreciation expense and distribution of other reserve account charges to an individual level. Maintaining the Company's depreciation records in this detail will aid in completing the various rate studies and, most importantly, clearly identifies the Company's level of capital recovery relative to each category of plant investment.

The general drivers for the proposed depreciation rates include an assessment of the Company's historical experience with regard to achieved service lives and net salvage factors. In addition, consideration is given to current and anticipated events which are anticipated to impact the Company's ability to recover its fixed capital costs related to utility plant in service utilized to provide service to the Company's customers.

The depreciation rate for each individual account changed as a result of reflecting estimates obtained through the in-depth analysis of the Company's most recent data together with an interpretation of ongoing and anticipated future events. Some of the revisions were not significant and typically reflect fine tuning of previously utilized depreciation rates while others were more substantial in nature. Several of the accounts did reflect more significant changes (as outlined in Section 4 of this report) from the previously utilized depreciation rates.

The most notable depreciation/amortization occurred relative to Account 367 - Transmission Mains, Account 390 - General Structures, Account 391.1 - Office Furniture and Equipment, Account 391.5 - Computer Equipment - Other and Account 392 - Transportation Equipment - Cars & Trucks.

The depreciation rate for Account 391.1 - Office Furniture and Equipment increased from 1.48 percent to 4.95 percent. The proposed depreciation rate is the product of the application of applicable service life and net salvage factor for the property account. The proposed amortization rate is more in keeping with the typical depreciation rate for this property group.

The depreciation rate relative to Account 392 - Transportation Equipment - Cars & Trucks increased from 5.74 percent to 13.33 percent. This depreciation expense increase is the product of recognizing and incorporating a more appropriate level of average service life and net salvage factor that the Company will incur relative to this property class throughout its useful service life.

Conversely, the proposed depreciation/amortization rates declined for several accounts, the most notable fo which was Account 390- Structures.

The composite depreciation rate for Account 390 - Structures decreased from 3.76 percent to 2.93 percent. The decrease of the deprecation rate for this property group is the product of the application of the estimated average service and incorporation of the current book depreciation reserve.

The annual depreciation/amortization rate relative to Account 391.5 - Computer Equipment - Other declined from 26.51 percent to 0.46 percent.

Various of the remaining account/sub-accounts experienced increases and/or declines in recommended depreciation rates to a lesser degree, as noted per Table 1 of this report. This revision in annual depreciation rates and expense is the result of both changes in the estimated service lives and salvage factors, and reflects the impact of the Company's property changes since the most recent study.

With regard to the inclusion of higher negative net salvage levels in the development of proposed depreciation rates, as noted within my discussion related to net salvage both in Section 3 of the depreciation report and my testimony, I have highlighted the fact that the level of experienced net salvage should simply be a benchmark from which to estimate future net salvage. It is highly likely that the negative net salvage amounts experienced even recently will simply be the floor above which future negative net salvage levels will increase to a higher level. To appropriately and proportionately allocate the true total asset cost (original cost adjusted for net salvage) over its applicable service life, proper consideration must be given in each accounting period, to the total costs that are anticipated to occur relative to the Company's assets that provide customer service.

Applying the proposed depreciation rates to the Company's December 31, 2001 plant in service produces annual depreciation/amortization expense of $2,666,460 which is a

increase of $499,417 from current depreciation rates.

The following summary compares the present and proposed composite depreciation rates for illustrative purposes only. The Composite Depreciation Rate should not be applied to the total Company investment inasmuch as the non-proportional change in plant investment as a result of property additions or retirements would render the composite rate inappropriate. The Table 1 schedule lists the recommended annual depreciation rates for each property account.

Present Depreciation Rates

Depreciable Plant In Service at December 31, 2001	$37,131,010
Annual Depreciation Expense	2,167,043
Composite Annual Depreciation Rate	5.84%

Proforma Proposed Depreciation Rates

Depreciable Plant In Service at December 31, 2001	$37,131,010
Annual Depreciation Expense	2,666,460
Composite Annual Depreciation Rate	7.18%

MONTANA-DAKOTA UTILITIES COMPANY

Common Plant

General

This report sets forth the results of our study of the depreciable property of the Montana-Dakota Utilities Company (the Company) as of December 31, 2001 and contains the basic parameters (recommended average service lives and life characteristics) for the proposed average remaining life depreciation rates until a subsequent service life study is completed. All average service lives set forth in this report are developed based upon plant in service as of December 31, 2001.

The scope of the study included an analysis of Company historical data through December 31, 2001, discussions with Company management staff to identify prior and prospective factors affecting the Company's plant in service, as well as interpretation of past service life data experience and future life expectancies to determine the appropriate average service lives of the Company's surviving plant. The service lives and life characteristics, resulting from the in-depth study, were utilized together with the Company's plant in service and book depreciation reserve to determine the recommended Average Remaining Life (ARL) depreciation rates related to the Company's plant in service as of December 31, 2001.

In preparing the study, the Company's historical investment data were studied using various service life analysis techniques. Further, discussions were held with the Company's management to obtain an overview of the Company's facilities and to discuss the general scope of operations together with other factors which could have a bearing on the service lives of the Company's property. Finally, the study results were tempered by information gathered during plant inspection tours of a representative portion of the Company's property.

The Company maintains a property record containing a summary of its fixed capital investments by property account. This investment data was analyzed and summarized by property group and/or sub group and vintage then utilized as a basis for the various

depreciation calculations.

Depreciation Study Overview

There are numerous methods utilized to recover property investment depending upon the goal. For example, accelerated methods such as double declining balance and sum of years digits are methods used in tax accounting to motivate additional investments. Broad Group (BG) and Equal Life Group (ELG) are both Straight Line Grouping Procedures recognized and utilized by various regulatory jurisdictions depending upon the policy of the specific agency.

The Straight Line (Group) Method of depreciation utilized in this study to develop the recommended depreciation rates is the Broad Group Procedure together with the Average Remaining Life Technique. The use of this procedure and technique is based upon recovering the net book cost (original cost less book reserve) of the surviving plant in service over its estimated remaining useful life. Any variance between the book reserve and an implied theoretical calculated reserve is compensated for under this procedure. That is, as the Company's book reserve increases above or declines below the theoretical reserve at a specific point in time, the Company's average remaining life depreciation rate in subsequent years will be increased or decreased to compensate for the variance, thereby, assuring full recovery of the Company's investment by the end of the property's life.

The Company, like any other business, includes as an annual operating expense an amount which reflects a portion of the capital investment which was consumed in providing service during the accounting period. The annual depreciation amount to be utilized is based upon the remaining productive life over which the undepreciated capital investment needs to be recovered. The determination of the productive remaining life for each property group usually includes an in-depth study of past experience in addition to estimates of future expectations.

Annual Depreciation Accrual

Through the utilization of the Average Remaining Life Technique, the Company will

recover the undepreciated fixed capital investment in the appropriate amounts as annual depreciation expense in each year throughout the remaining life of the property. The procedure incorporates the future life expectancy of the property, the vintaged surviving plant in service, and estimated net salvage, together with the book depreciation reserve balance to develop the annual depreciation rate for each property account. Accordingly, the ARL technique meets the objective of providing a straight line recovery of the undepreciated fixed capital property investment.

As indicated, the use of the Average Remaining Life Technique results in charging the appropriate annual depreciation amounts over the remaining life of the property to insure full recovery by end of life. That does not mean that once an average remaining life is estimated, it can not be changed at any point throughout the service life, but that the annual expense is calculated on a Straight Line Method rather than by the previously mentioned, "sum of the years digits" or "double declining balance" methods, etc. The "group" refers to the method of calculating annual depreciation on the summation of the investment in any one depreciable group or plant account rather than calculating depreciation for each individual unit.

Under Broad Group depreciation some units may be over depreciated and other units may be under depreciated at the time when they are retired from service, but overall, the account is fully depreciated when average service life is attained. By comparison, Equal Life Group depreciation rates are designed to fully accrue the cost of the asset group by the time of retirement. For both the Broad Group and Equal Life Group Procedures the full cost of the investment is credited to plant in service when the retirement occurs and likewise the depreciation reserve is debited with an equal retirement cost. No gain or loss is recognized at the time of property retirement because of the assumption the retired property was at average service life.

Group Depreciation Procedures

Group depreciation procedures are utilized to depreciate property when more than one

item of property is being depreciated. Such a procedure is appropriate because all of the items within a specific group typically do not have identical service lives, but have lives which are dispersed over a range of time. Utilizing a group depreciation procedure allows for a condensed application of depreciation rates to groups of similar property in lieu of extensive depreciation calculations on an item by item basis. The two more common group depreciation procedures are the Broad Group (BG) and Equal Life Group (ELG) approach.

In developing depreciation rates using the Broad Group procedure, the annual depreciation rate is based on the average of the overall group, which is then applied to the group's surviving original cost investment. A characteristic of this procedure is that retirements of individual units occurring prior to average service life will be under depreciated, while individual units retired after average service life will be over depreciated when removed from service, but overall, the group investment will achieve full recovery by the end of the life of the total property group. That is, the under recovery occurring early in the life of the account is balanced by the over recovery occurring subsequent to average service life. In summary, the cost of the investment is complete at the end of the property's life cycle, but the rate of recovery does not match the consumption pattern which was used to provide service to the company's customers.

Under the average service life procedure, the annual depreciation rate is calculated by the following formula:

$$\text{Annual Accrual Rate, Percent} = \frac{100\% - \text{Salvage}}{\text{Average Service Life}} \times 100$$

The application of the broad group procedure to life span groups results in each vintage investment having a different average service life. This circumstance exists because the concurrent retirement of all vintages at the anticipated retirement year results in truncating and, therefore, restricting the life of each successive years vintage investment. An average service life is calculated for each vintage investment in accordance with the above formula. Subsequently, a composite service life and depreciation rate is calculated relative to all vintages within the property group by weighting the life for each vintage by the

related surviving vintage investment within the group.

In the Equal Life Group, the property group is subdivided, through the use of plant life tables, into equal life groups. In each equal life group, portions of the overall property group includes that portion which experiences the life of the specific sub-group. The relative size of each sub-group is determined from the overall group life characteristic (property dispersion curve). This procedure both overcomes the disadvantage of voluminous record requirements of unit depreciation, as well as, eliminates the need to base depreciation on overall lives as required under the broad group procedure. The application of this procedure results in each sub-group of the property having a single life. In this procedure, the full cost of short lived units is accrued during their lives leaving no under accruals to be recovered by over accruals on long lived plant. The annual depreciation for the group is the summation of the depreciation accruals based on the service life of each Equal Life Group.

The ELG Procedure is superior to the BG Procedure because it allocates the capital cost of a group property to annual expense in accordance with the consumption of the property group providing service to customers. In this regard, the company's customers are more appropriately charged with the cost of the property consumed in providing them service during the applicable service period. The more timely return of plant cost is accomplished by fully accruing each unit's cost during its service life, thereby, not only reducing the risk of incomplete cost recovery, but also the procedure results in less return on rate base over the life of a depreciable group. The total depreciation expense is the same for all procedures which allocate the full capital cost to expense, but at any specific point in time, the depreciated original cost is less under the ELG procedure than under the BG procedure. This circumstance exists because under the equal life group procedure, the rate base is not maintained at a level of greater than the future service value of the surviving plant as is the case when using the average service life procedure. Consequently, the total return required from the ratepayers is less under the ELG procedure.

While the equal life group procedure has been known to depreciation experts for

many years widespread interest in applying the procedure developed only after high speed electronic computers became available to perform the large volume of arithmetic computations required in developing ELG based depreciation lives and rates. The table on the following page illustrates the procedure for calculating equal life group depreciation accrual rates and summarizes the results of the underlying calculations. Depreciation rates are determined for each age interval (one year increment) during the life of a group of property which was installed in a given year or vintage group. The age of the vintage group is shown in column (A) of the ELG table. The percent surviving at the beginning of each age interval is determined from the Iowa 10-R3 survivor curve which is set forth in column (B). The percent retired during each age interval, as shown in column (C), is the difference between the percent surviving at successive age intervals. Accordingly, the percentage amount of the vintage group retired defines the size of each equal life group. For example, during the interval 3 1/2 to 4 1/2, 1.93690 percent of the vintage group is retired at an average age of four years. In this case, the 1.93690 percent of the group experiences an equal life of four years. Likewise, 3.00339 percent is retired during the interval 4 1/2 to 5 1/2 and experiences a service life of five years. Further, 4.42969 percent experiences a six-year life; etc. Calculations are made for each age interval from the zero age interval through the end of the life of the vintage group. The average service life for each age interval's equal life group is shown in column (E) of the table.

The amount to be accrued annually for each equal life group is equal to the percentage retired in the equal life group divided by its service life. Inasmuch as additions and retirements are assumed, for calculation purposes, to occur at midyear only one-half of the equal life group's annual accrual is allocated to expense during its first and last years of service life. The accrual amount for the property retired during age interval 0 to 1/2 must be equal to the amount retired to insure full recovery of that component during that period. The accruals for each equal life group during the age intervals of the vintage group's life cycle are shown in column (F). The total accrual for a given year is the summation of the equal life

Table 5

group accruals for that year. For example, the total accrual for the second year, as shown in column (G), is 11.31019 percent and is the sum of all succeeding years remaining equal life group accruals plus one half of the current years life group accrual listed in column (F). For the zero age interval year, the total accrual is equal to one half of the sum of all succeeding years remaining equal life accruals plus the amount for the zero interval equal life group accrual. The one half year accrual for the zero age interval is consistent with the half year convention relative to property during its installation year. The sum of the annual accruals for each age interval contained in column (G) total to 1.000 demonstrating that the developed rates will recover 100% of plant no more and no less. The annual accrual rate which will result in the accrual amount is the ratio of the accrual amount (11.31019 percent) to the average percent surviving during the interval, column (D), (99.74145 percent), which is a rate of 11.34% (column J). Column (J) contains a summary of the accrual rates for each age interval of the property groups life cycle based upon an Iowa 10-R3 survivor curve.

Remaining Life Technique

In the Average Remaining Life depreciation technique, the annual accrual is calculated according to the following formula where, (A) the annual depreciation for each group equals, (D) the depreciable cost of plant, less (U) the accumulated provision for depreciation, less (S) the estimated future net salvage, divided by (R) the composite remaining life of the group:

$$A = \frac{D - U - S}{R}$$

The annual accrual rate (a) is expressed as a percentage of the depreciable plant balance by dividing the equation by (D) the depreciable cost of plant times 100:

$$(a) = \frac{D - U - S}{R} \times \frac{1}{D} \times 100$$

As further indicated by the equation, the accumulated provision for depreciation by vintage is required in order to calculate the remaining life depreciation rate for each property group. In practice, most often such detail is not available; therefore, composite remaining

lives are determined for each depreciable group, i.e., property account.

The remaining life for a depreciable group is calculated by first determining the remaining life for each vintage year in which there is surviving investment. This is accomplished by solving the area under the survivor curve selected to represent the average life and life characteristic of the property account. The remaining life for each vintage is composited by dividing (D) the depreciable cost of each vintage, by (L) its average service life, and multiplying this ratio by its average remaining life (E). The composite remaining life of the group (R) equals the sums of products divided by the sum of the quotients:

$$R\ Group = \frac{\sum D/L \times E}{\sum D/L}$$

The functional level accumulated provision for depreciation, which was the basis for developing the composite average remaining life accrual and annual depreciation rate for each property account as per this report, was obtained from the Company's books and records. The functional level depreciation reserve was further allocated to each property account and sub-account based upon a detailed theoretical depreciation reserve as of December 31, 2001.

Salvage

Net salvage is the difference between gross salvage, or what is received when an asset is disposed of, and the cost of removing it from service. Salvage experience is normally included with the depreciation rate so that current accounting periods reflect a proportional share of the ultimate abandonment and removal cost or salvage received at the end of the property service life. Historical Net salvage analysis results are expressed as a percentage of the plant retired by dividing the dollars of net salvage incurred by the original cost of the plant retired. Net salvage is said to be positive if gross salvage exceeds the cost of removal, but if cost of removal exceeds gross salvage the result is then negative salvage.

The cost of removal includes such costs as demolishing, dismantling, tearing down, disconnecting or otherwise removing plant and related transportation, handling, and overheads in connection with the work, as well as environmental clean up costs associated

with the property. Salvage includes proceeds received for the sale of plant and materials or the return of equipment to stores for reuse.

Net salvage experience is studied for a period of years to determine the trends which have occurred in the past. These trends are considered together with any changes that are anticipated in the future to determine the future net salvage factor for remaining life depreciation purposes. The goal of incorporating net salvage into the annual depreciation rate is to appropriately allocate the net cost of each asset group to each accounting period. The net cost of each asset group must include not only the original cost when placed in service, but also the net salvage, positive or negative, that will be incurred at end of live. The inclusion, in the net salvage amount, of all benefits received and/or costs incurred is premised on the concept that property ownership includes the responsibility of the proper disposal of the facilities at end of life. Therefore, if current customers benefit from the property's use, the customer should pay/receive a pro rata share of all costs incurred and/or receipts generated in the retirement, abandonment and/or removal of the assets.

The analysis of net salvage is routinely based upon identification of the individual components, (i.e. gross salvage and cost of removal) included in net salvage amount. This analysis identifies that the component items experience different trends over time. That is, as property continues to age, gross salvage routinely declines, while with the passage of time cost of removal tends to increase in conjunction with ever increasing labor rates. On an aggregate basis, most historical retirements from each property group, routinely occur at an average age that is less than the average service life of the account. Accordingly, the experienced historical salvage analysis, with regard to gross salvage, will most often be overstated relative to anticipated future gross salvage. By comparison, the historical analysis will typically be understated with regard to future cost of removal. That is, in general terms, it can be assumed that with the increased passage of time, any future positive net salvage will likely be lower, while future negative net salvage will likely be higher than the overall levels experienced in the past. Because of these future events, it is important that the overall

historical net salvage experience should only be used as a benchmark for estimating future net salvage, and that salvage trends as well as other future factors be considered in the process of estimating future net salvage. Otherwise, the future net salvage estimates will clearly understate the future net negative salvage and overstate any gross salvage that will occur in conjunction with future retirements.

Service Lives

Several factors contribute to the length of time or average service life which the property achieves. The three (3) major categories under which these factors fall are: (1) physical; (2) functional, and; (3) contingent casualties.

The physical category includes such things as deterioration, wear and tear and the action of the natural elements. The functional category includes inadequacy, obsolescence and requirements of governmental authorities. Obsolescence occurs when it is no longer economically feasible to use the property to provide service to customers or when technological advances have provided a substitute of superior performance. The remaining factor of contingent casualties relates to retirements caused by accidental damage or construction activity of one type or another.

In performing the life analysis for any property being studied, both past experience and future expectations must be considered in order to fully evaluate the circumstances which may have a bearing on the remaining life of the property. This ensures the selection of an average service life which best represents the expected life of each property investment.

Survivor Curves

The preparation of a depreciation study or theoretical depreciation reserve typically incorporates smooth curves to represent the experienced or estimated survival characteristics of the property. The "smoothed" or standard survivor curves generally used are the family of curves developed at Iowa State University which are widely used and accepted throughout the utility industry.

The shape of the curves within the Iowa family are dependent upon whether the

maximum rate of retirement occurs before, during or after the average service life. If the maximum retirement rate occurs earlier in life, it is a left (L) mode curve; if occurring at average life, it is a symmetrical (S) mode curve; if it occurs after average life, it is a right ®) mode curve. In addition, there is the origin (O) mode curve for plant which has heavy retirements at the beginning of life.

Many times, actual Company data has not completed its life cycle, therefore, the survivor table generated from the Company data is not extended to zero percent surviving. This situation requires an estimate be made with regard to the remaining segment of the property group's life experience. Further, actual Company experience is often erratic, making its utilization for average service life estimating difficult. Accordingly, the Iowa curves are used to both extend Company experience to zero percent surviving as well as to smooth actual Company data.

Study Procedures

Several study procedures were used to determine the prospective service lives recommended for the Company's plant in service. These include the review and analysis of historical retirements, current and future construction, historical experience and future expectations of salvage and cost of removal as related to plant investment. Service lives are affected by many different factors, some of which can be obtained from studying plant experience, others which may rely heavily on future expectations. When physical aspects are the controlling factor in determining the service life of property, historical experience is a valuable tool in selecting service lives. In the case where changing technology or a less costly alternative develops, then historical experience is of lesser value.

While various methods are available to study historical data, the principal methods utilized to determine average service lives for a Company's property are the Retirement Rate Method, the Simulated Plant Record Method, the Life Span Method, and the Judgement Method.

Retirement Rate Method - The Retirement Rate Method uses actual Company

retirement experience to develop a survivor curve (observed life table) which is used to determine the average service life being experienced in the account under study. Computer processing provides the opportunity to review various experience bands throughout the life of the account to observe trends and changes. For each experience band studied, the "observed life table" is constructed based on retirement experience within the band of years. In some cases, the total life of the account has not been achieved and the experienced life table, when plotted, results in a "stub curve." It is this "stub curve" or total life curve, if achieved, which is matched or fitted to a standard Survivor curve. The matching process is performed both by computer analysis, using a least square technique, and by manually plotting observed life tables to which smooth curves are fitted. The fitted smooth curve provides the basis to determine the average service life of the property group under study.

Simulated Balances Method - In this method of analysis, simulated surviving balances are determined for each balance included in the test band by multiplying each year's original gross additions installed by the Company by the appropriate factor of each Standard Survivor Curve, summing the products, and comparing the results with the related year end plant balance to determine the "best fitting" curve and life within the test period. Various test bands are reviewed to determine trends or changes to indicated service lives in various bands of years. By definition, the curve with the "best fit" is the curve which produces simulated plant balances that most closely matches the actual plant balances as determined by the sum of the "least squares". The sum of the "least squares" is arrived at by starting with the difference between the simulated balances and the actual balance for a given year, squaring the difference, and the curve which produces the smallest sum (of squared difference) is judged to be the "best fit".

Period Retirements Method - The application of the Period Retirements Method is similar to the "Simulated Plant Balances" Method, except the procedure utilizes a Standard Survivor Curve and service life to simulate annual retirements instead of balances in performing the "least squares" fitting process during the test period. This procedure does

tend to experience wider fluctuations due to the greater variations in level of experienced retirements versus additions and balances thereby producing greater variation in the study results.

Life Span Method - The Life Span or Forecast Method is a method utilized to study various accounts in which the expected retirement dates of specific property or locations can be reasonably estimated. In the Life Span Method, an estimated probable retirement year is determined for each location of the property group. An example of this would be a structure account, in which the various segments of the account are "life spanned" to a probable retirement date which is determined after considering a number of factors, such as management plans, industry standards, the original construction date, subsequent additions, resultant average age and the current - as well as the overall - expected service life of the property being studied. If in the past the property has experienced interim retirements, these are studied to determine an interim retirement rate. Otherwise, interim retirement rate parameters are estimated for properties which are anticipated to experience such retirements. The selected interim service life parameters (Iowa curve and life) are then used with the vintage investment and probable retirement year of the property to determine the average remaining life as of the study date. No attempt is made to include any anticipated additions to the property subsequent to the study date. The recovery of such additions if made, is reflected when preparing subsequent depreciation studies.

Judgement Method - Standard quantitative methods such as the Retirement Rate Method, Simulated Plant Record Method, etc. are normally utilized to analyze a Company's available historical service life data. The results of the analysis together with information provided by management as well as judgement are utilized in estimating the prospective recommended average service lives. However, there are some circumstances where sufficient retirements have not occurred, or where prospective plans or guidelines are unavailable. In these circumstances, judgement alone is utilized to estimate service lives based upon service lives used by other utilities for this class of plant as well as what might

be reasonable life for this plant giving consideration to the current age and use of the facilities.

MONTANA - DAKOTA UTILITIES

Common Plant

Study Results

Account 390.00 - General Structures

The Company's investment in this account totals $18,048,459 which is related to the Company's administrative structures within its operating system. The surviving investment has achieved a current average age of 15.5 years and is presently being depreciated based upon an annual depreciation rate of 3.76 percent.

An analysis of retirements totaling $5,708,004, which occurred during the period 1951-2001 were analyzed via the Simulated Plant Record Method, which produced an average service life in the range of 35 years. Accordingly, an Iowa 35-R3 life and curve was applied to the Company's surviving investment, which produced an average remaining life of 21.1 years.

While past retirements have generated positive salvage for two (2) recent years, most years within the analysis band produced varying levels of negative salvage. Future net salvage relative to the property contained in this account is estimated at negative ten (10) percent. The resulting annual depreciation rate is 2.93 percent.

Account 391.1 - Office Furniture and Equipment

The Company's investment in office furniture and fixtures totals $3,716,417, which has achieved a current average age of 12.7 years and is presently being depreciated utilizing an annual depreciation rate of 1.48 percent. Retirements totaling $2,716,404, which occurred during the 1932-2001 band, were analyzed via the Simulated Plant Record Method which produced a life indication in the range of twenty (20) to twenty-five (25)

years. However, due to the difficulty in tracking many relatively low cost investment it is believed the numerous items fail to be retired when no longer used in service, thereby resulting in significant levels of unrecorded retirements. Due to this scenario and the difficulty of properly tracking investments and related retirements an Iowa 15-R3 life and curve is estimated for the property class. Furthermore, it is proposed that the investment within this property group be amortized over a fifteen (15) year period. The resulting annual amortization rate is 4.95 percent

Account 391.3 - Computer Equipment - PC

The Company's current investment in this account totals $4,212,743, has attained a current average age of 3.4 years, and is presently being depreciated based upon an annual depreciation rate of 12.5 percent. Given the young age of the property group along with the likely under-reporting of retirements which have actually occurred to date, the achieved life indication relative to this property class is likely overstated. While an analysis of general data relative to PC computer type equipment, of which this property group is principally comprised, have general experienced an average service life in the range of seven (7) years there are various under utilized and/or likely un-retired items on the Company's books. Furthermore, and more importantly, recently the Company has increased its effort to stay more current with the technological advances inherent within this asset category. This effort is being driven by the continual need for increase processing power (due to software requirements, etc.) as well as the reduced cost of the newer equipment platforms. In general, it is widely known that this property class, which is significantly impacted by the technological advances, routinely requires a very high frequency of upgrades and/or replacements. Based upon this experience and future

expectation of ongoing rapid changes in future years an Iowa 5-R3 life and curve is estimated for this property which produces an average remaining life of 2.5 years. Future net salvage is estimated at zero (0) percent and the resulting depreciation rate is 23.29 percent.

Account 392.10 - Transportation Equipment-Trailers

The present surviving investment in this account totals $251,166 has attained a current average age of 14.5 years, and is presently being depreciated utilizing an annual depreciation rate of 5.74 percent. Retirements totaling $14,887, which occurred during the 1992-2001 experience band, were analyzed via the Simulated Plant Record Method and a life indication in the range of twenty (20) plus years. Accordingly, an average service life of an Iowa 20-L2 is estimated, based upon the life estimate for this property group. Application of the recommended life and curve to the Company's current surviving investment produces an average remaining life of 10.8 years.

Based upon Company experience and future expectations future net salvage is estimated at fifteen (15) percent.

In as much as the Company's current plant in service is presently fully accrued, flowing the estimated level of net salvage through the normal depreciation rate calculation would presently produce a negative depreciation rate. Based upon the expectation that the Company will be acquiring additional plant in this property category, the use of a negative deprecation is not warranted and /or rationale. Accordingly, it is recommended that the depreciation rate for this property group be set at zero (0) percent. Subsequent to the Company's addition of further plant in this property group and the reduction of the current level of deprecation reserve, a depreciation rate should be developed based upon

the above discussed depreciation parameters. Accordingly, the present annual depreciation rate is estimated at zero (0) percent.

Account 392.20 - Transportation Equipment - Cars & Trucks

The investment in this account totaling $4,429,702, which currently is depreciated utilizing an annual depreciation rate of 5.74 percent, has current attained an average age of 4.5 years.

Retirements totaling $15,861,531, which occurred during the period 1995-2001, were analyzed for the overall experience period, as well as the various other interim bands. This analysis shows that historically much of the Company's property in this account is routinely being replaced in the range if seven (7) years, resulting in a service life indication of six years or less. Based upon the Company's recent experience, an Iowa 7-R3 life and curve are recommended for this account. Application of the proposed service life parameters to the Company's current surviving investment produces an average remaining life of 3.5 years.

An analysis of the Company's retirements and related salvage during the period 1968-2001 indicates that the Company has received positive salvage relative to disposal of its automobiles in the past. The analysis identifies that the Company's average net salvage has averaged approximately twenty (20) plus percent salvage. Based upon the overall historic experience, future net salvage of twenty (20) percent was incorporated in developing the resulting depreciation rate for this property. Utilizing the estimated average service life and salvage factors together with the Company's current surviving investment produces an average remaining life depreciation rate of 13.33 percent.

Account 393 - Stores Equipment

The Company's investment in this account totals $47,386, has attained a current average age of 4.9 years, and is presently being depreciated utilizing an annual depreciation rate of 3.36 percent. The Company's investment in this account is somewhat limited and is related to general storeroom equipment located at the Company's various operations warehouses. Due to the limited investment level no retirements have occurred to date. An Iowa 30-R2 life and curve is estimated as the applicable service life.

An analysis of the Company's salvage experience was completed for the period 1968-2001 to identify the level of net salvage achieved with past retirements. The result of the analysis indicates that the Company has experienced only minimal net salvage. Based upon the Company's experience in many years, as well as general industry experience, future net salvage is estimated at zero (0) percent and the resulting annual amortization rate is 2.80 percent.

Account 394 - Tools, Shop and Garage Equipment

The investment in this account totaling $1,176,603 is related to tools, garage, and work equipment utilized by the Company's employees in providing service to the Company's customers. Accordingly, the Company maintains investment in this account within four (4) separate sub-account categories which include Tools, Shop & Garage Equipment - Non Utilized, Tools, Shop and Garage Equipment Utilized, Vehicle Maintenance Equipment and Vehicle Refueling Equipment. Based upon the content of each property group and the completed analysis the average service life parameters were estimated for each of the subcategory investments.

The Company's investment in Tools, Shop & Garage Equipment - Non Utilized,

totals $235,026. Retirements from the property group have totaled $3,075 over the life of the account which have produced of life indication in the range of twenty-five (25) years. However, given the difficulty in tracking the many items with smaller investment amounts it is likely that numerous items fail to be retired when no longer in service. Accordingly, due to this ongoing difficulty in attaining proper retirements a service life of an Iowa 18-R2 life and curve is estimated for this property group. Furthermore, it is proposed that the investment within this property group be amortized over a eighteen (18) year period.

The Company's investment in Vehicle Maintenance Equipment, totals $102,746. An Iowa 20-R3 life and curve is estimated as the applicable life of the property group. Accordingly, the recommended amortization period for the asset investments is twenty-five (25) years.

The Company's investment relative to Vehicle Refueling Equipment totals $838,830. Giving recognition to the property groups content and various analysis on Iowa 20-R3 life and curve is estimated for this property class. A twenty (20) year amortization period is proposed for this asset class.

The Company's vintage investment for each property category was applied to the applicable recommended service life and curve, recommended amortization and resulting implicit depreciation rates as summarized in the table below.

Account 394 - Tools, Shop and Garage Equipment

Acct. No.	Description	P-I-S 12-31-00	Curve	Amort. Rate Period	Net Rate %	Amort. Rate %
394.10	Tools, Shop & Garage Eq. Non-Utilized	$235,026	18-R2	18	0	6.11
394.30	Vehicle, Maintenance Equipment	102,746	20-R3	20	0	4.75

394.40	Vehicles Refueling Equipment	838,830	20-R3	20	0	4.38
	Total Equipment	$1,176,603				

Account 396.20 - Power Operated Equipment

The Company's current investment in this account totals $157,573, which is currently being depreciated utilizing an annual depreciation rate of 4.83 percent. The property investment, which has attained a current average age of 11.3 years. Retirements during the recent history of the account totaling $6,083, were analyzed via the Simulated Plant Record Method. The analysis of the data provided a general life indication of ten (10) years. Accordingly, an average service life of an Iowa 10-R2 is recommended for this property group giving consideration to general industry lives.

The Company's available historical salvage data was analyzed during the period 1968 -2001. This analysis indicates that during the period studied the Company has achieved average net salvage of approximately forty-nine (49) percent. However, the actual level of achieved net salvage is somewhat overstated due to the past accounting treatment of the trade-ins. That is, historically the trade-in amounts have been identified and recorded based upon the value allowed against the full retail price of the newly purchased asset as opposed to the actually lower level trade-in in price against the normal market price for the purchased equipment. While the net purchase price is the same under either scenario, the Company's historical accounting treatment of the trade-ins results in an over statement of the net salvage being received for the traded equipment. Accordingly, based upon this analysis future net salvage for this asset class is estimated at forty (40) percent and when combined with the recommended service life parameters in the current investment produces an average remaining life depreciation rate of 2.69 percent.

Account 397 Communication Equipment

The Company's maintains its investment in this account in five (5) categories of communication equipment, namely Fixed Radio Equipment, Radio Equipment Mobile, Telephone, Supervisory and Telemetering Equipment, and Networking Equipment. An analysis was performed using various reports, as well as other company data sources, to identify the investment levels for each equipment group.

The Company's current investment in Radio Communication Equipment - Fixed totals only $646,187 for which the current depreciation rate is 4.33 percent. While the general historical analysis produces a life in the range of twenty (20) plus years ongoing changes are occurring with technology. Accordingly, based upon the property group an Iowa 15-R3 life and curve is estimated relative to this investment and is the basis of the recommended amortization period for this property group. Application of the estimated service life parameters to the current surviving investment produces a current implicit amortization rate of 4.99 percent.

The Company investment in Radio Communication Equipment Mobile totals $1,285,023 and is currently being depreciated at an annual rate of 6.68 percent. While an analysis of the historical data in this property group produced a life indication in the range of twenty (20) years, a service life of fifteen (15) years is estimated for this property group based upon the rapidly changing technology and operating practices. Accordingly, amortization period of the estimated 15 year period produces a current implicit amortization rate of negative 4.08 percent.

The remaining investment relative to General Telephone Communication Equipment totals only $779,821. Notwithstanding the overall life indication of approximately fifteen (15) years an Iowa 10-R2life and curve is estimated for this property class based upon the

changing technology and general industrial information. The resulting proposed implicit amortization rate is 8.72 percent.

The Company's investment in Supervisory and Telemetering Equipment totals only $48,296. An Iowa 15-L1 life and curve is estimated as the applicable service life characteristics. The resulting implicit amortization rate is 0.35 percent.

The Company's investment in Networking Equipment totals $824,948. Giving recognition to the equipment type within the property group (which is similar to computer type equipment), an Iowa 5-R3 life and curve is estimated for this class of property. The resulting implicit annual amortization rate is 17.95 percent.

The Company's vintage investments for each property category, the applicable recommended service life parameters and recommended implicit amortization rates are summarized in the table below.

Account 397 - Communication Equipment

Acct. No.	Description	P-I-S 12-31-01	ASL/ Curve	Amort. Period (Yrs.)	Net Salv. %	Amort. Rate %
397.10	Radio Communication Equipment (fixed)	$646,187	15-R3	15	-10	4.99
397.20	Radio Communication Equipment (mobile)	1,285,023	15-R3	15	0	4.08
397.30	General Telephone Communication Eq.	779,821	10-R2	10	10	8.72
397.50	Supervisory & Telemetering Equipment	48,296	15-L1	15	0	0.35
397.80	Networking Equipment	824,948	5-R3	5	0	17.95
	Total Equipment	$3,584,275				

Account 398 - Miscellaneous Equipment

The present surviving investment in this account totals $592,895, has attained a

current average age of 8.2 years, and is presently being depreciated utilizing an annual depreciation rate of 2.51 percent. Retirements totaling $319,929, which occurred during the years 1919-2000, were analyzed via the Simulated Plant Record Method. Based upon this analysis, consideration of the general account content, related under reporting of plant assets, and general industry data an average service life of twenty (20) years is estimated for the asset group. Based upon an estimated life and curve relative to the Company's current surviving investment of an Iowa 20-R2 the current implicit annual amortization rate for this property group is 2.41 percent.

STAFF RESPONSE TO COMPLIANCE FILING

January 15, 2003

On December 16, 2002, Montana-Dakota Utilities Co., a Division of MDU Resources Group, Inc., (MDU) filed tariff changes to comply with the Order of the Commission dated December 10, 2002. On January 6, 2003, MDU filed a correction to the Small Interruptible Rate 71 and the Large Interruptible Rate 85.

The changes are necessary because of the new rate design that recovers the gas costs and the distribution costs in separate rate elements. In its original application, MDU overlooked the effects of the new rate design on the tariffed rates for these customers. The January 6, 2003 filing is therefore made to maintain the same quantity of margin sharing ($0.444 per dekatherm) previously approved by the Commission in Case No. PU-399-94-352.

Staff believes that MDU's filing complies with the Commission's Order.

William W. Binek
Chief Counsel

Re: Case No. PU-399-02-183
Tariff Correction

Montana-Dakota Utilities Co. (Montana-Dakota), a Division of MDU Resources Group, Inc., herewith submits an original and seven copies of the following tariff sheets:

- 2nd Revised Sheet No. 14, Small Interruptible General Gas Service Rate 71
- 1st Revised Sheet No. 27, Large Interruptible General Gas Service Rate 85

The tariffs referenced above have been filed in order to reflect the correct ceiling rate under each rate which should reflect the margin sharing amount originally authorized in Case No. PU399-94-352. The calculation is as shown on Attachment A. Montana-Dakota requests that the tariff sheets attached be effective with service rendered on and after December 12, 2002. Adjusted bills will be issued to any customer billed under the incorrect ceiling rate.

Please acknowledge receipt by stamping or initialing the duplicate copy of this letter attached hereto.

Sincerely,

Donald R. Ball

Gas Rate Schedule

NDPSC Volume 7
2nd Revised Sheet No. 14
Canceling 1st Sheet No. 14

SMALL INTERRUPTIBLE GENERAL GAS SERVICE Rate 71

Availability:

In all communities served for all interruptible general gas service customers whose interruptible natural gas load will exceed an input rate of 2,500,000 Btu per hour, metered at a single delivery point and whose use of natural gas will not exceed 100,000 dk annually. The rates herein are applicable only to customer's interruptible load. Customer's firm natural gas requirements must be separately metered or specified in a firm service agreement. Customer's firm load shall be billed at Firm General Gas Service Rate 70. For interruptible purposes, the maximum daily firm requirement shall be set forth in the firm service agreement.

Rate:

Basic Service Charge:	$100.00 per month	
Distribution Delivery Charge:	Maximum	Minimum
	$.871 per dk	$.427 per dk
Cost of Gas:	Determined Monthly- See Rate Summary Sheet for Current Rate	

The Distribution Delivery Charge shall be set forth in the service agreement required as provided in the General Terms and Conditions for service. Such rate, as adjusted to reflect changes in the cost of Purchased Gas, shall apply for the term of the agreement regardless of a change in the rates set forth above.

Minimum Bill:

Basic Service Charge.

Payment:

Billed amounts will be considered past due if not paid by the due date shown on the bill. Past due bills are subject to a late payment charge in accordance with the provisions of Rate 100, §V.11, or any amendments or alterations thereto.

Cost of Purchased Gas:

The cost of gas includes all applicable cost of gas items as defined in the Purchased Gas Cost Adjustment Rate 88 or any amendments or alterations thereto. The cost of gas component is subject to change on a monthly basis.

LARGE INTERRUPTIBLE GENERAL GAS SERVICE Rate 85

Availability:

In all communities served for all interruptible general gas service customers whose interruptible natural gas load will exceed 100,000 dk annually as metered at a single delivery point. The rates herein are applicable only to customer's interruptible load. Customer's firm natural gas requirements must be separately metered or specified in a firm service agreement. Customer's firm load shall be billed at Firm General Gas Service Rate 70. For interruption purposes, the maximum daily firm requirement shall be set forth in the firm service agreement.

This rate schedule shall not apply for service to U.S. Government installations, which are covered by separate special contracts.

The Company reserves the right to refuse the initiation of service under this rate schedule based on the availability of gas supply.

Rate:

Basic Service Charge	$675.00 per month	
Distribution Delivery Charge	Maximum $.719 per dk	Minimum $.298 per dk
Cost of Gas	Determined Monthly- See Rate Summary Sheet for Current Rate	

Minimum Bill:

Basic Service Charge.

Payment:

Billed amounts will be considered past due if not paid by the due date shown on the bill. Past due bills are subject to a late payment charge in accordance with the provisions of Rate 100, §V.11, or any amendments or alterations thereto.

Cost of Purchased Gas:

The cost of gas includes all applicable cost of gas items as defined in the Purchased Gas Cost Adjustment Rate 88 or any amendments or alterations thereto. The cost of gas component is subject to change on a monthly basis.

Dear Mr. Ball:

On December 18, 2002, the Commission approved the rates filed in compliance with the Commission's December 10th order in Case No. PU-299-02-183, Montana-Dakota Utilities Co.'s Natural Gas Rate Increase application.

Sincerely,

Sharon Helbling
Public Utilities Division

CORRECTED FINDINGS OF FACT, CONCLUSIONS OF LAW AND ORDER

December 18, 2002

Appearances

Commissioners: Susan E. Wefald, Leo M. Reinbold, Anthony T. Clark.

William W. Binek, Chief Counsel, Public Service Commission, State Capitol, 600 East Boulevard, Bismarck, ND 58505, appearing for the Public Service Commission advocacy staff.

William P. Pearce, Attorney at Law, 314 E. Thayer Ave., PO Box 400, Bismarck, ND 58502-0400, appearing for Montana-Dakota Utilities Co.

Douglas W. Schulz, Senior Attorney, MDU Resources Group, Inc., PO Box 5650, Bismarck, ND 58506-5650, appearing for Montana-Dakota Utilities Co.

Allen C. Hoberg, Director, Office of Administrative Hearings, 1707 North 9th Street - Lower Level, Bismarck, ND 58501-1882, presiding Administrative Law Judge.

Preliminary Statement

On April 12, 2002, the North Dakota Public Service Commission received an application from Montana-Dakota Utilities Co., a Division of MDU Resources Group, Inc., (MDU) to increase its natural gas rates 4.1%. The requested increase in rates would generate an additional $2,844,132 annually in North Dakota. MDU's application is based on a calendar 2003 projected test year.

MDU stated that the primary reasons for its application are increased operation and maintenance costs, depreciation, and taxes other than income, and a higher required rate of return. MDU's requested return on rate base is 11.044 percent, including a return of 13.25 percent on common equity.

105 PU-399-02-183 Pages: 35

Corrected Findings of Fact, Conclusions of Law and Order by Public Service Commission

12/18/2002 CC: Comm Legal Illona, Pat, Jerry Mike

In its application, MDU also requested a significant restructuring of its rates, including a separation of gas distribution from gas supply charges, elimination of declining block commodity charges and increases in customer charges. Additionally, MDU proposed that all increases be flowed into the firm residential and commercial rate schedules, that no change in rate levels be applied to the Air Force and large interruptible schedules, and that the small interruptible class should receive a rate reduction.

On April 24, 2002, the Commission suspended MDU's rates filed with its application. On June 5, 2002, the Commission issued its Notice of Hearing, Notice of Public Input Sessions, and Notice of Intervention Deadline.

The Notice of Hearing specified the issues to be considered at the technical hearing, which are:

1. What is the value of MDU's property, used and useful, for the service and convenience of the public in North Dakota?

2. What is MDU's rate of return on its property, used and useful, for the service and convenience of the public in North Dakota?

3. What is a just and reasonable rate of return on MDU's property, used and useful, for the service and convenience of the public in North Dakota?

4. What rates and charges are necessary to provide a just and reasonable rate of return on MDU's property, used and useful, for the service and convenience of the public in North Dakota?

5. Are MDU's proposed rate schedules designed in such a manner that they result in a basis of charge to its customers that is just and reasonable without discrimination?

6. Other relevant information or proposals concerning the proceeding.

The Notice of Hearing provided that any person wishing to intervene as a party in the proceeding must file a petition for intervention by September 9, 2002. No one petitioned to intervene as a party in the proceeding.

Public input sessions were held via video teleconference on July 15, 2002, in Bismarck, Dickinson, Williston, Minot, Devils Lake, and Jamestown. The technical hearing was held in the Commission Hearing Room at the State Capitol in Bismarck, North Dakota on October 7-8, 2002.

On December 6, 2002 MDU filed a letter indicating its understanding of and agreement with the continuation of the depreciation issue, as more fully set forth below.

The Commission, having reviewed the evidence in the record makes the following:

Findings of Fact

1. MDU is an investor owned utility company providing natural gas distribution service in North Dakota operating as a division of MDU Resources Group, Inc.

2. The parties do not dispute the following issues:

- 2003 test year for rate determination.
- Jurisdictional cost of service study.
- 2003 test year for rate base (except accumulated reserve for depreciation)
- Cost of preferred equity.
- Test year revenues.

3. The parties dispute the following issues:

- Cost of capital
- Depreciation
- Bonuses and labor expenses
- Supplemental Income Security Plan
- Rate case expense
- General inflation adjustment for expenses
- Other unadjusted operation and maintenance expenses
- Allocation of cost to customer classes
- Rate design (partially)
- Distribution Delivery Stabilization Mechanism

Test Year Rate Base

4. MDU and Staff are in agreement on the amount of rate base for the 2003 test year with the exception of accumulated reserve for depreciation. The staff adjustment to accumulated reserve for depreciation is affected by a staff adjustment to depreciation expense of $2,172,000. For reasons discussed later, the Commission does not accept staff's adjustment and finds that MDU's projected rate base for 2003 is reasonable.

5. The Commission finds the following 2003 test year rate base:

Rate Base	*(Thousands)* Balance
Plant in Service	$ 72,793
Accumulated Depreciation	49,356
Net Plant	$ 23,437
Materials and Supplies	439
Fuel Stocks	22
Prepayments	84
Other	44
Accumulated Deferred Taxes	(3,842)
Accumulated ITC's	(231)
Customer Advances	(272)
Average Rate Base	$ 19,681

Cost of Capital

6. MDU proposes a rate of return of 11.044 percent, which includes a 13.25 percent return on common equity. Staff has recommended a return of 7.98 percent, including a 10.5 percent return on common equity, inclusion of short-term debt financing and a company wide cost of long-term debt. The rates of return can be calculated as follows:

7. As demonstrated in the foregoing tables, the Staff differs from MDU with respect to the appropriate capital structure as well as the cost of the financing.

Capital Structure

8. Capital structure refers to the makeup of MDU's capital, that is, the mix of debt, preferred stock and equity. Two factors account for the disagreement between Staff and MDU. The first is Staff's inclusion of short-term debt, and the second is Staff's use of the year-end 2001 capital structure instead of MDU's projected capital structure for 2003.

9. In its initial filing, MDU excluded all short-term debt from its proposed capital structure. Staff's rate of return witness, Charles W. King, testified that the makeup of the capital structure used to develop a rate of return should reflect the nature of the rate base to which that return is applied. If the rate base consists solely of capital investments in plant and equipment financed by long-term debt, preferred stock and equity, then it might be appropriate to exclude short-term debt. But MDU's rate base also includes materials and supplies inventories, fuel stocks, and prepayments, which are short-term commitments that will be financed in part with short-term debt. For this reason, he included short-term debt in the capital structure.

10. On rebuttal, MDU witness Craig Keller argued that the items to which King referred, materials and supplies, prepayments and fuel stocks remain relatively constant, not changing materially from one month to another. While classified as short-term assets, they support long-lived assets such as plant, property, equipment and related items. They are therefore financed by long-term debt, according to Keller.

11. At the hearing, King responded to Keller by producing Exhibit 16, which shows the month-to-month amounts of each of the major elements of working capital during the 13 months from December 2000 through December 2001. That exhibit demonstrates net working capital varied from negative $53,000 in January to positive $306,000 in July. King concluded that these widely varying amounts would not have been financed with long-term debt. Keller argued that an unusual refund of a customer advance caused much of the variation shown by King.

12. The Commission finds that MDU has short-term debt and therefore finances part of its business with short-term debt. Accordingly, the Commission will include short-term debt in the determination of cost of capital.

13. The second difference in proposed capital structures relates to the use of historical verses forecasted data. King drew the amounts of debt, preferred stock and common equity from Company supplied data for calendar year 2001. He calculated average long-term debt from Exhibit 2, Statement A, page 2; short-term debt from a response to a data request (Exhibit 15, CWK-1); and preferred stock and common equity from Exhibit 2, Statements A and F, page 1.

14. The capital structure presented by MDU on Statement F, page 3 includes a projected 2003 capital structure. King objected to this use of a projection on the grounds that it is effectively a creation of MDU that has no basis in any verifiable financial statements.

15. On rebuttal, MDU witness Keller argued that NDCC § 49-05-04.1 permits MDU to use a forecast test year and that Staff witness, Michael J. Majoros, had accepted the 2003 test year as the basis for revenue requirements. Keller argued that failure to use a forecast capital structure would result in a "mismatch" with the rest of the revenue requirement calculation. Keller argued that MDU possesses a financial forecasting system that uses known debt scheduling and projects equity by forecasting earnings and deducting dividends.

16. In his oral direct testimony, King pointed out that MDU had used an historical capital structure in its recent electric case. He argued that the purpose of the future test year is to capture exogenous changes that can be objectively determined, such as inflation or the expansion of the system. There is no way of verifying that it will change in the manner MDU predicts. For this reason, King reasoned that most Commissions use recent historical capital structures. Otherwise, MDU has the opportunity to game the regulatory system by projecting a more expensive capital structure.

17. Regarding the issue of historical verses projected, we find in favor of MDU. North Dakota law provides for using a projected test year. There are no assurances that revenues, expenses or cost of capital will actually occur at projected levels. However, the staff's case is predicated on projected revenues and expenses but ignores cost of capital projections. The Commission finds in favor of using a projected capital structure rather than relying on general allegations that MDU might game the regulatory system.

Cost of Debt

18. MDU's cost of debt in 2001 is 9.302 percent, and its projected 2003 debt cost is 9.180 percent. These values are calculated on Exhibit 2, Statement F-1, pages 1 and 3. Those pages show two debt issues, First Mortgage Bonds and Pollution Control Bonds, totaling $133.5 million in 2001 and $132.6 million in 2003.

19. Statement A, pages 11 and 12 of that same exhibit reveals that there is substantially more to MDU's debt than these two issues. As of December 31, 2001, there were $405.2 million in senior notes, $219.7 million in commercial paper, a revolving line of credit of $25 million, and term credit agreements of $11.8 million. Using the cost values shown on those pages, King calculated that the blended cost of MDU's debt is 6.167 percent, more than 300 basis points lower than MDU proposes.

20. The difference between Staff and MDU revolves around what "the Company" actually is. According to MDU witness Keller, only the First Mortgage and Pollution Control bonds relate to MDU Utilities. He argues that all of the other debt pertains to Centennial Holdings, which holds title to the non-regulated operations of the parent Company, MDU Resources Group, Inc. He stated that the two sets of debt are not fungible, and assets of Centennial do not secure the first mortgage liens against electric and gas plant nor do the assets of the utility operations secure the liens against non-regulated assets. Under Keller's argument, MDU has no access to Centennial's debt and vice versa. Further, MDU asserted that it was unfair of staff to use the low cost of a blended rate and ignore the higher cost of a blended capital structure with an equity ratio of nearly 60%.

21. On cross-examination, Keller made it clear that there is no such entity as the Montana-Dakota Utilities Company. The only legal entity is the parent Company, MDU Resources Group, and only that company can issue debt. Neither the utility operation nor Centennial has any debt in its own right. Keller testified that MDU had attempted to build a "firewall" between the debts of MDU Utilities and that of Centennial. The purpose is to protect the utility operations from the effect of default on Centennial's debt. He stated that if Centennial or one of its subsidiaries should go bankrupt, then the bankruptcy judge would not be able to "collapse the corporation" and gain access to the utility's assets. Keller stated that is the reason MDU does not commingle the funds raised for the utility with those raised for Centennial.

22. On cross-examination, Keller conceded that if the bankruptcy of either MDU's regulated or its unregulated operations caused the parent to declare bankruptcy, then

the bankruptcy court would look at all of MDU's assets to satisfy creditors' claims, including those of the regulated utility.

23. King suggested that there might be another, less altruistic reason for attempting to isolate Centennial's debt from that of the utility operations. It is to ensure that ratepayers pay the very high costs of the First Mortgage bonds and receive no benefit from the Company's other, lower-cost financing resources. While the Company may have written its low-cost financing instruments to direct funds to Centennial and its subsidiaries, that was an artifice to game the regulatory system into ascribing only the highest cost debt to regulated service ratepayers. The Company could have used the Centennial funds anywhere had it written the debt instruments differently.

24. MDU's cost of debt is higher than the cost of debt reported by the other investor owned utilities operating in North Dakota. Further, it is nonsensical that the non-regulated enterprises of MDU and thereby more riskier ventures of the corporation are able to secure debt at substantially lower cost than its regulated counterpart. The timing of debt issuances may account for some differences year-to-year but overall and in the long-term one would expect that the cost of debt for the utility operations would be less and certainly not more than 300 basis points higher than the company wide average. Still, the Commission begrudgingly finds in favor of MDU based on the fact that staff was unable to show that MDU had gamed the regulatory system. Such a showing would require an analysis of the timing of plant in service additions compared to the timing of debt issuances before such a verdict could be rendered. Accordingly, the Commission finds in favor of MDU and agrees to use its proposed cost of long-term debt in this proceeding.

Cost of Equity

25. MDU's rate-of-return witness, Dr. J. Stephen Gaske, has recommended a return to equity of 13.25 percent. This return was developed using three variants of the Discounted Cash Flow ("DCF") approach, plus a series of "benchmark analyses."

26. For his DCF results, Gaske drew a distinction between "Investor Requirements" and "Cost of Capital" based on his belief that stock flotation costs, equivalent to 4.75 percent of the return, must be included in the latter. Gaske used a "proxy group" of six companies based on Moody's utility series. His DCF results for these companies were as follows:

	Investor Requirements	**Cost of Capital**
Second-stage Retention Growth	11.94%	12.51%
Basic DCF	12.61%	13.21%
Primary DCF	12.63%	13.22%

27. Gaske's benchmark analyses consisted of four risk premium comparisons using historical differences in earned returns to equity from large and, alternatively, small companies relative to current yields on U.S. Treasury bonds and corporate bonds. He

also identified the recent returns on per-share book value of S&P 500 corporations and Value Line's list of industrial companies. All of his benchmark indicators were higher than any of his DCF returns.

28. Gaske's final selection of 13.25 percent was based on his belief that the risk of MDU's gas distribution business is slightly higher than that of his proxy group of gas distribution companies. He based this belief principally on the smaller size of MDU relative to the proxy companies.

29. King recommended a very different return to equity of 10.5 percent. King followed most of the same procedures as Gaske using the DCF analyses as the principal analytical tool. Like Gaske, King used a comparison group of gas distribution companies. Also like Gaske, King used a forecast of next year's dividends for the dividend yield portion of the DCF formula. King also used both analysts' forecasts and the concept of earnings retention to calculate the growth component of that formula -- as did Gaske. Finally, both King and Gaske adjusted their final recommendations based on their assessments of the risk of MDU's gas distribution activities relative to that of the comparison companies.

30. The explanation for the dramatic 275 basis points difference between the recommendations of the two witnesses lies in the details of the application of the DCF formula. As used by both witnesses, the DCF formula is the sum of next year's dividend yield on MDU's stock and the expected future growth rate in its dividends and earnings.

31. The differences between the Gaske and King applications of the DCF formula relate to the following elements:

1. Inclusion of flotation costs;
2. Selection of comparison companies;
3. Forecast of next year's dividends;
4. Timing of analysts' forecasts;
5. Presentation of the DCF results.

Flotation Costs

32. Gaske drew a distinction between "investor requirement" and "cost of capital," with the difference being cost of issuing new shares in public stock offerings. Gaske quantified this cost as 4.75 percent, based on a representative sample of flotation costs incurred with 34 new common stock issues by natural gas transmission and distribution companies between 1992 and 2001.

33. King agreed with Gaske that flotation costs should be recovered, but he questioned the propriety of applying a ratio for these costs to the entire amount of common equity. Flotation costs are incurred only when a company issues new stock, and then only when there is a public stock offering. Existing stock incurs no flotation cost, and even new stock incurs no such costs if it is distributed as an employee or shareholder benefit either through options or as bonuses.

34. King noted that the effect of Gaske's flotation cost adjustment is to increase his equity return by 60 basis points. When multiplied by the $1.125 billion book equity value of the MDU Resources, Inc., this allowance amounts to $6.75 million annually, which is substantially more than the $5.4 million in flotation costs that the Company has incurred over the past five years.

35. King suggested that if a flotation cost adder is to be used, it should be equal to a reasonable estimate of the annual flotation cost incurrence divided by the entire amount of the Company's equity. In MDU's case, annual flotation costs during the past five years have been about $1.1 million. The Company's total book equity value is $1.125 billion, for a flotation cost allowance of 0.1 percent. This amount is so small as to be lost in the rounding. For this reason, he recommended no explicit flotation cost adder.

36. In rebuttal, Gaske distributed an exhibit that purported to demonstrate that failure to include flotation costs in the return of a company's stock trading at book value would result in the dilution of the book value of that company's shares. On cross-examination, however, Gaske admitted that all of King's comparison companies had per-share market values higher than book value, and that when such companies sell new stock, the effect is to increase book value, not dilute it. On cross-examination, Gaske admitted that his approach to the issue of flotation cost in this proceeding was the same as his approach in Commission Case No. PU-399-01-186 involving MDU's electric rates. Gaske also agreed that most regulatory Commissions do not allow a flotation cost adder.

37. The Commission rejects Gaske's flotation cost adder. Given that staff has provided evidence based on historical information, we find no need to rely on the theoretical information provided by MDU. In addition, Gaske admitted that most regulatory Commissions do not allow flotation costs. The evidence indicates a negligible amount of flotation costs were incurred during the last five years. Therefore, the Commission will not include flotation costs in the determination of return on common equity.

Selection of Comparison Companies

38. Both King and Gaske acknowledged that the heavy involvement of MDU's parent company, MDU Resources Group, Inc., in non-regulated activities effectively precluded using similar companies as the basis for finding the return to equity of its gas distribution business in North Dakota. Necessarily, this required the selection of companies whose primary business is gas distribution. Gaske picked six companies from Moody's list of natural gas distribution companies. King chose 11 companies from Value Line's Investment Survey based on the criteria that they must have investment grade bond ratings, total operating revenues over $100 million, and derive 75 percent of their revenue from gas distribution services. The two lists are as follows:

King Comparison Companies	Gaske Proxy Group
Atmos Energy Corp.	AGL Resources
AGL Resources	Keyspan Corporation
Cascade Natural Gas Corp.	LaClede Group
LaClede Group, Inc.	Northwest Natural Gas
NICOR, Inc.	People's Energy Corp.
Northwest Natural Gas Co.	WGL Holdings, Inc.
People's Energy Corp.	
Piedmont Natural Gas Co.	
South Jersey Industries, Inc.	
Southwest Gas	
WGL Holdings, Inc.	

39. Five of Gaske's six companies are also represented on King's list. The exception is Keyspan Corporation, which King excluded because that company's gas distribution operations accounted for only about one-half of its revenue. We find that King's choice of companies provides a broader and therefore more representative group of companies from which to draw indications as to the cost of equity for gas distribution operations.

Forecast of Next Year's Dividends

40. Both King and Gaske used a forecast of next year's dividends to identify the dividend yield portion of the DCF formula, and both witnesses based this forecast on a percentage of the 5-year annual earnings growth rate predicted by Zacks Investment Research, Inc. Only the percentage differed. King used a factor 1.5 on the assumption that the next dividend increase would be randomly distributed over the coming year. Gaske used a 1.625 inflator of the growth rate and argued that King's factor does not reflect the present value of next year's dividends and dividend increases. The issue is immaterial and the Commission adopts Gaske's inflation factor.

Timing of Analysts' Forecasts

41. Gaske's testimony was filed on April 12, 2002, concurrently with MDU's initial application for an increase in its gas rates. The record does not disclose when Gaske prepared his testimony, but presumably it was in the months immediately preceding the application, which would be February and March of 2002. This would be consistent with the fact that the latest month shown on Gaske's presentation of bond yields is January 2002.

42. King filed his testimony on August 30, 2002, so his information on such factors as share prices and investor expectations was gathered approximately six months after Gaske's.

43. It is not clear how these differences in timing affect the results of the respective analyses. For example, Gaske reported Zacks' consensus 5-year earning growth

forecast for the LaClede Group as 12.0 percent. By the time King prepared his testimony, that forecast had dropped to 4.25 percent. On the other hand, Gaske's forecast growth rate for AGL Resources was 7.03 percent, while that reported by King was 11.42 percent. We find it is appropriate to use King's data because it is more current.

Presentation of the DCF Results

44. Gaske performed three different DCF analyses of his proxy group of companies. One of these analyses, the "basic DCF," was identical to King's "classic DCF" analysis. Both involved combining the forecast dividend yields with Zacks' 5-year consensus forecasts of earning growth.

45. While the methods were the same, the results were quite different. Gaske's six-company proxy group yielded a median basic DCF return, prior to flotation costs, of 12.61 percent and a mean return of 12.95 percent. King, applying exactly the same procedure to his comparison group of 11 companies, found the average (mean) to be 11.29 percent.

46. For his other application of the DCF approach, King added the dividend yield to the growth rate indicated by the earnings retention growth model for each of his 11 comparison companies and found the average to be 12.18 percent. Had Gaske done the same thing, he would have added his average dividend yield of 5.14 percent to his retention growth estimate of 5.5 percent for a DCF return indication of 10.64 percent.

47. Gaske diluted his retention growth rate by mixing it one-third, with two-thirds represented by the Zacks' 5-year earnings forecasts. The result was quite close to the "basic" DCF indications. The median of his "Second-Stage Retention Growth DCF Calculation" was 11.94 percent, the mean 12.25 percent.

48. Gaske presented a third version of the DCF analysis. Gaske put forth what he called his "primary" DCF calculation. This was no calculation at all, but merely the adoption of a range of growth estimates with little support. The range was 6.75 percent to 7.75 percent, asserted by Gaske to have been based on such factors as the 5.5 percent growth in nominal Gross Domestic Product during the past decade, the expected demand growth for natural gas, and investor expectations. None of these considerations support a growth forecast in the range of 6.75 percent to 7.75 percent. The bottom of this range is well above the 5.5 percent GDP growth rate cited by Gaske as well as the 5.5 percent growth indicated by his own earnings retention calculation. The top of the range is above the 7.56 percent growth rate predicted by Zacks for the six companies used by Gaske. This "primary" DCF analysis is biased upward.

49. King also presented a third DCF calculation, but he subsequently discarded it. King calculated a growth factor for each of his 11 comparison companies based on the each company's historical earnings growth between 1997 and 2001. While the average DCF indication of 11.72 percent might appear reasonable, the variation among the individual company observations was so great as to provide little or no probative value.

50. In presenting his DCF returns, King went one step further than Gaske, and provided his estimate of the DCF return requirements of each of his comparison companies. He did not use a mechanical formula because, as he conceded in his testimony, precision is impossible. He described his procedure orally at the hearing as follows:

> ...what I have done in each case is taken the classic DCF return, which is probably the best estimator, and then turned and looked at the retention growth method. If the retention growth looks like it's totally out of whack with the forecast, and in some cases they are – simply no way that the company could be growing as fast or as slowly as the investor survey shows – I modified that classic DCF in the direction of the retention growth.

51. The results of King's procedure were as follows:

	Classic	**Book Value Growth**	**King DCF Return**
Atmos Energy Corp.	12.06%	14.42%	12.5%
AGL Resources	16.67%	11.53%	14.0%
Cascade Natural Gas Corp.	10.25%	15.11%	11.0%
LaClede Group, Inc.	10.29%	11.23%	10.5%
NICOR, Inc.	11.51%	15.96%	12.0%
Northwest Natural Gas Co.	10.65%	10.12%	10.5%
People's Energy Corp.	13.13%	12.07%	12.5%
Piedmont Natural Gas Co.	9.42%	11.24%	10.0%
South Jersey Industries, Inc.	8.15%	12.57%	11.0%
Southwest Gas	10.52%	8.53%	10.0%
WGL Holdings, Inc.	8.99%	11.21%	9.5%
Average	**11.29%**	**12.18%**	**11.23%**

52. Gaske rebutted the fact that the average of King's selected DCF results was lower than the average of either his classic or his book value growth results. This mathematical result stems from King's shrinking of the range of observations. King reduced the effect of the "outlier" highest and lowest observations. In absolute terms, the outliers on the high side diverge more from the mean than those on the low side, even when their percentage difference from the mean is the same. This mathematical distortion can be avoided by focusing on the median observation of each series, that is, the observation where five values are higher and five are lower. The classic DCF median return is 10.52 percent, the median of the book value growth series is 11.53 percent, and the median of King's selected DCF returns is 11.0 percent. Additionally, it should be noted that in arriving at his final DCF recommended returns, King adjusted seven of the classic returns upward and only four downward.

53. On rebuttal, Gaske submitted two mechanical recalculations of King's DCF results, one using a 33%/67% weighting of the book value growth and Zacks' forecasts, the other using a 50%/50% weighting. Both yielded average returns considerably higher than King's 11.23 percent. In performing these calculations, however, Gaske excluded WGL Holdings, ostensibly because, with 74.6 percent of its revenue from regulated gas distribution, it falls outside King's 75 percent criterion. As Gaske admitted on cross-examination, 74.6 percent rounds up to 75 percent. His exclusion biased the results upward because, at 8.99 percent, WGL Holdings' classic DCF return was the lowest in King's comparison group. Moreover, Gaske never explained why his mechanical weightings of King's DCF results were more accurate or valid than King's analysis.

54. Both witnesses support the use of DCF for calculating a reasonable return on equity for purposes of this proceeding. Both provided a basic DCF calculation using the same method even though there are some differences in sample sizes and the age of data. Beyond the calculation of basic DCF, both witnesses make adjustments for their own professional judgment and then are highly critical of each other's results. We find the adjustments for professional judgment are not all that intuitive and appear to be aimed at results rather than fact-finding. Accordingly, we find the use of the basic DCF calculations most useful.

Comparative Risk Adjustments

55. King and Gaske disagree about the final adjustment each witness made to the DCF returns for his comparison companies to reflect the specific risk of MDU's gas distribution operations.

56. Having found that the DCF cost of capital (inclusive of flotation cost) for his proxy companies was in the range of 12.51 and 13.22 percent, Gaske selected 13.25 percent as MDU's capital cost. This upward adjustment from the range of proxy group returns was based on Gaske's belief that MDU's overall risks are slightly above average relative to the proxy group.

57. King's adjustment was in the opposite direction. Having found that the average DCF return for his comparison group is 11.23 percent, King picked 10.5 percent for MDU, which is the midpoint between the group average return and the returns for the least risky companies in the group. The basis of this adjustment was King's belief that MDU is less risky than the comparison group.

58. In his initial testimony, Gaske discussed four types of risk: business risk, regulatory risk, financial risk and market risk. He found that MDU's regulatory and market risks are not significantly different than from those of his proxy group. MDU's financial risk is slightly greater because the bonds of MDU Resources Group are rated slightly lower than the bonds of the proxy companies. The major difference in risk, according to Gaske, relates to business risk. MDU's gas distribution operations are a fraction the size of the proxy companies. Those companies are between six and 46 times the size of MDU's gas distribution operations. Based on the historical difference

between the earned returns of small and large companies, Gaske believes that MDU's smaller size might require a return more than 100 basis points higher than the proxy group. In addition, MDU faces the competition of propane and heating oil for new and existing load in its service territory. Furthermore, its rate structure recovers a substantial portion of its fixed costs in the volumetric component of its rates, and MDU does not have a weather normalization adjustment mechanism. On this basis, Gaske concluded that MDU's North Dakota gas distribution operations face somewhat greater overall business risks than the typical company in his proxy group.

59. King based his conclusion that MDU's gas distribution business is less risky than his comparison group on two facts. First, unlike eight of the 11 comparison companies, MDU's gas distribution operations have no non-regulated business activities. Second, MDU's equity ratio is higher than all but three of his comparison companies, suggesting a lower level of financial risk. He argued that a good case could be made for setting MDU's rate of return at the bottom of the scale of DCF returns for the comparison companies. However, in light of the possibility that the return set in this case may be in effect for an extended period into the future, he selected the midpoint between the lowest returns in his comparison group and the average.

60. In his rebuttal testimony, Gaske argued that King had failed to demonstrate any strong correlation between equity return and the equity proportion or the percent gas distribution revenues in his comparison companies. Gaske presented two correlation studies of these variables. One showed a weak, but measurable correlation between the percent equity in capital structure and King's estimates of DCF returns. The other showed no correlation between equity return and percent gas distribution revenues.

61. King conceded that neither of the two risk factors cited in his testimony are predictors of relative risk, but both are elements of relative risk. A high equity ratio is an indicator of low financial risk, and MDU's equity ratio is about equal to the highest of the equity ratios within his comparison group. The relationship between financial risk and capital structure, which King cites in this portion of his testimony, was also discussed in Gaske's initial testimony at some length.

62. King noted that another element of risk is the amount of non-regulated activity. Regulated activities are less risky than non-regulated activities. When regulated earnings are short, MDU can come to the Commission for an increase in rates. If the Commission grants the rate increase, there is no question whether MDU can collect the additional revenue because of its monopoly status. That is not true of non-regulated activities, which by definition do not have the security of revenue recovery.

63. King cited two further reasons that MDU gas distribution operations have lower risk than many of his comparison companies. Gas companies operating in warmer climates face competition from electric heating that MDU, operating in a cold climate, does not encounter. He testified that in Washington, DC, the Washington Gas Light Company has lost two-thirds to three-quarters of the commercial load to the electric company. For residential customers, heat pumps can combine heating with air

conditioning and so compete with gas. King stated that stand-alone heat pump units that do not draw heat from groundwater would not work in North Dakota's climate because they have to be supplemented with electric resistance heating when temperatures fall below about 45 degrees Fahrenheit.

64. The other difference cited by King relates to the intrusion of gas suppliers into the retail gas market. Some of his comparison companies (he cited Washington Gas and Atlanta Gas Light Company) are required to deliver the gas of independent suppliers. The extreme example is Atlanta Gas Light, which no longer buys gas on behalf of its customers. Instead, merchant gas suppliers buy the gas, and Atlanta Gas Light delivers it to end users on behalf of the suppliers. He testified that Atlanta Gas went from some 600,000 customers to 11. When one of these gas suppliers went bankrupt, Atlanta Gas was "stiffed" for several million dollars. In another example cited by King, Washington Gas has lost two thirds of its commercial load to competitive suppliers. The suppliers have failed to acquire the transportation capacity that Washington Gas had maintained to serve those lost customers, and there is now a risk that in a cold winter, the suppliers will not be able get the required gas to Washington.

65. King observed that MDU does not have the active competition from suppliers that larger companies serving larger service territories have. It therefore does not face the severe business risks associated with these suppliers.

66. King stated that Gaske conducted an apples-and-oranges comparison regarding the alleged risk of small company operations. Gaske has compared the risk properties and required returns of large companies with those of small, stand-alone companies. King says that is not the proper comparison. King states that the relevant objective in this case is to find the risk characteristics of the gas operations of a large company. Being part of a large company provides the security of greater financial strength and also diversification of financial resources. King states that MDU's North Dakota gas distribution operations are not a small, stand-alone company, as are the small companies from which Gaske derives his 100 basis point small-company risk adder. MDU's North Dakota gas distribution operations are merely one part of the overall business of MDU Resources Group. That company is well within the size range of the companies in both King's and Gaske's comparison groups.

67. King stated that while MDU's gas distribution operations are small, they have a lower financial risk than do most of King's comparison companies by reason of a high equity ratio. They have no risky, non-regulated activities, as do most of the comparison companies. While MDU faces competition from propane and oil, as do virtually all gas companies, it does not confront effective competition for its heating load from electricity, as do the comparison companies that operate in warmer climates. Finally, MDU does not have the intrusion of independent gas suppliers into its retail market in anything like the degree that some of the comparison companies have. For these reasons, King's concluded that MDU has somewhat less overall risk than his comparison companies.

68. The arguments about comparative risk are interesting and depict two fairly divergent views. We find some validity in both witnesses' arguments but not to the level of certainty that the Commission can choose one over the other. Accordingly, the Commission will not adjust its DCF findings to reflect the professional judgment of either of these witnesses regarding comparative risk between MDU and the eleven proxy companies.

Gaske's "Benchmark Analyses"

69. Gaske presented two types of "benchmark analyses." In one series, he added the historical differences between Treasury bonds and corporate bonds, on the one hand, and earnings from the common stock of small and, alternatively large companies, on the other. The other benchmark analysis was to identify the recent earned return on book value of S&P's 500 companies and on Value Line's industrial companies. The results of these benchmark analyses are as follows:

Risk Premium Return Based on:	
- U.S. Treasury Bonds	
v. Large Companies	13.3%
v. Small Companies	20.2%
- Corporate Bonds	
v. Large Companies	14.8%
v. Small Companies	22.2%
Alternative Investments	
- S&P 500	21.5%
- Value Line Industrials	29.4%

70. Gaske appears to conclude from these tests that his 13.5 percent cost of capital, derived from DCF results, is quite conservative relative to these benchmark results. King argued that these comparisons are irrelevant. King argued that these results should be disregarded, because their conceptual basis is fatally flawed and the risk premium observations are without value statistically.

71. Gaske's risk premium analysis purports to measure the required return to equity by adding the historical difference in experienced earnings from stocks and bonds to the current levels of bond yields. These historical differences, as measured by Ibbotson Associates, go back to 1926. The theory is that over a long enough period, actual return differentials between stocks and bonds will equate to required or expected return differentials.

72. King observed this theory is a statement of faith, not experience, and it defies logic. If investors' short-term expectations are continually being frustrated (as has been the case during the last year), what logic supports the proposition that the sum of those failed short-term expectations represents a valid long-term representation of their expectations? King further argued that it is untrue that the differential in required

returns between bonds and stocks is fixed and unchanging, as this theory postulates. The perceived safety/risk relationship of bonds differs from stocks, and their relative desirability as investment vehicles changes continually depending on such factors as inflation, economic growth, and the capital structures of the enterprises issuing the securities.

73. King stated that quite apart from this conceptual failing, the stock to bond comparison theory fails statistically. King referred to Exhibit 34 introduced by Gaske that shows annual returns to large company stocks, small company stocks and long-term corporate bonds, and it also shows their differences. King pointed out that the standard deviation of every one of these series is greater than the mean of the observations. King argued that the means therefore lack statistical significance and are useless as a predictive tool.

74. Gaske purports to demonstrate under his alternative equity investment analysis that MDU should be allowed a high return by observing that the returns to book equity on the S&P 500 companies from 1977 to 2000 have averaged 21.47 percent. He also observes that the book equity returns to 746 industrial, retail and transportation companies included in The Value Line Investment Survey have ranged from 27.57 percent to 31.75 percent over the five years 1996-2000. He argues that the average of 29.4 percent, along with the return of 21.47 percent experienced by S&P's 500 companies, suggests that the 13.25 percent he proposes for MDU is quite low.

75. King argued that these comparisons are irrelevant. He pointed out that investors in unregulated industrial, retail and transportation firms have no access to book equity value. The only value that is meaningful for investors in such firms is the market value. That is what an investor must pay to acquire the stock, and conversely, the value an investor will receive by selling the stock. Book equity value in an industrial firm is a purely historical number representing the dollars of original investment in equity capital contributed to (or retained by) the company. It has little relevance to the current market value, even for fairly capital-intensive firms. Since most stocks sell well above their book value, the return that is accessible to investors is considerably less than the 20 to 30 percent noted by Gaske.

76. King noted that book values are relevant for regulated utilities because regulation makes them so. Regulation sets the earnings allowance for such companies relative to a rate base reflective of the book value of the capital invested in utility operations. This condition does not apply to industrial firms.

King's Risk Premium Test

77. King did not attempt to find any absolute value of equity return using the risk premium approach. He agreed that equity investment, being inherently more risky than debt, requires a higher return. But rather than attempt the difficult (and arguably impossible) task of measuring that risk premium, he looked to the trends in bond yields in comparison to past North Dakota Commission findings of equity return to gas companies. King stated that if it appears that bond yields have increased, but he has

recommended a reduced return to equity, then there may be reason to question his finding. On the other hand, if his proposed equity return track with the changes in bond yields, then there is at least a "sanity check" on the propriety of his finding.

78. King identified three gas cases during the past 12 years in which the Commission had found a rate of return to equity. He compared those rates of return with the then-current yields on 10-year Treasury bonds and Aaa Corporate bonds. He then identified the current (that is, August 2002) bond yields. The results of his research are as follows:

Case	Utility	Date	ROE Allowed	10-Yr Treas.	Aaa Corporate
399-90-820	MDU	July 30, 1991	12.0%	8.27%	9.00%
400-95-559	NSP	June 7, 1996	12.0%	6.91%	7.71%
400-00-521	NSP	June 27, 2001	11.5%	5.28%	7.18%
399-02-183	**MDU**	August, 2002	**10.5%***	4.35%	6.45%

79. The Commission takes notice of the benchmark analyses prepared by Gaske and King. Again, these benchmark analyses or reasonableness tests are intended to bolster each witness's use of DCF and their own feelings about what is or isn't a fair return on MDU's natural gas investments. We take notice of the arguments for what they are but find no compelling reason to adjust the outcome of the basic DCF calculation. In light of current economic conditions within the United States, Gaske's benchmark returns using risk premium and alternative investments are so high that they are unreasonable. On the other hand, we find no reason to try and track Commission ordered returns on equity to interest on notes or bonds either. Therefore, given the above considerations and conclusions, we find that the current market expectations for a natural gas distribution company such as MDU is an opportunity to earn 11.329% on its common equity, as follows:

Proxy Company	Div. Est.	EPS Growth	Growth Factor	Div Growth	Next Yr Div.	50-day Price	Div. Yield	DCF Return
Atmos Energy	$ 1.18	6.43%	62.5%	4.02%	$ 1.23	$ 21.63	5.67%	12.105%
AGL Resources	$ 1.08	11.42%	62.5%	7.14%	$ 1.16	$ 21.76	5.32%	16.737%
Cascade Natural	$ 0.96	5.25%	62.5%	3.28%	$ 0.99	$ 19.69	5.04%	10.286%
LaClede Group	$ 1.34	4.25%	62.5%	2.66%	$ 1.38	$ 22.65	6.07%	10.323%
NICOR	$ 1.84	6.10%	62.5%	3.81%	$ 1.91	$ 35.06	5.45%	11.548%
Northwest Natural	$ 1.26	6.06%	62.5%	3.79%	$ 1.31	$ 28.28	4.62%	10.684%
People's Energy	$ 2.08	6.80%	62.5%	4.25%	$ 2.17	$ 34.00	6.38%	13.178%
Piedmont Natural	$ 1.60	4.67%	62.5%	2.92%	$ 1.65	$ 34.45	4.78%	9.450%
South Jersey Industries	$ 1.50	6.00%	62.5%	3.75%	$ 1.56	$ 32.85	4.74%	10.737%
Southwest Gas	$ 0.82	6.80%	62.5%	4.25%	$ 0.85	$ 22.79	3.75%	10.551%
WGL Holdings, Inc.	$ 1.27	3.65%	62.5%	2.28%	$ 1.30	$ 24.21	5.37%	9.015%
Average DCF Return								11.329%

Net Regulated Income

Revenues

80. Both MDU and staff agree on projected volumes for sales and transportation customers including the associated revenues and cost of gas. We find that the projections are reasonable and adopt them for purposes of determining just and reasonable rates.

Other O&M Expense: Bonuses and 2003 Labor Expenses

81. In its application, MDU projects labor cost increases of 3.15% and 3% for 2002 and 2003, respectively. MDU argued that the increases are smaller than the present labor market. Included in the projected labor cost increases is compensation for bonuses.

82. Staff witness Majoros proposed to eliminate bonuses from the forecasted test year and to hold test year labor costs to their 2002 levels. MDU included average bonuses for the years 1999-2001 in the amount of 6.1 percent of labor costs. Applied to the $8,239,000 in labor costs in 2002, the bonus elimination by staff comes to $503,000. The 2003 labor cost increase eliminated by Majoros amounts to $236,000. These direct labor cost adjustments reduce payroll taxes by $40,000 in 2002 and $60,000 in 2003.

83. Majoros testified that given the state of the economy and the fact that MDU is requesting a rate increase, it would be unreasonable to include bonuses or 2003 wage increases in the test year revenue requirement. Majoros accepted the 2002 labor cost increase, but objected to extrapolating that increase through 2003.

84. MDU witness, Richard D. Spratt, MDU's Vice President – Human Relations, argued that bonuses are an integral part of overall compensation philosophy to remain competitive with other employers. Part of that compensation is intentionally put at risk in the form of bonuses that are paid on the basis of various goals, including MDU's overall profitability. Spratt presented the results of an industry survey that showed most

utilities pay bonuses not only to management employees, but to salaried and hourly employees as well. Spratt stated that the elimination of bonuses would risk rendering MDU uncompetitive relative to other employers.

85. Staff witness Majoros argued that bonuses should not be built into rates because they are primarily paid out based on the profitability of the company. Spratt testified that two years ago, presumably in 2000, 75 percent of MDU's employees received a 7 percent bonus. Last year, 2001, their bonus was 0.6 percent. Presumably, these bonus levels reflect the fact that in 2000, MDU earned 11.96 percent on its North Dakota Gas Operations, but in 2001, it reported only 1.6 percent.

86. C. Wayne Fox, President of MDU Utilities Company, stated that from 1994 through 2001 the Consumer Price Index has risen nearly 20 percent, and in spite of that increase MDU has been able to hold-the-line on gas rates by finding ways of operating the business more efficiently and taking advantage of new technology. MDU even reduced its rates in 1999 through improved efficiency. Fox testified that MDU has reduced its employees by 30 percent since 1994. In that year there were 248 customers per MDU employee. In 2001, one employee was serving 370 customers. MDU witness, Rita Mulkern testified that while past employee reductions are reflected in the 2001 base period data, no further reductions are forecast for 2002 and 2003.

87. We find in favor of MDU. We believe the overall wage increases projected by MDU are fair and reasonable. The Commission believes that how those raises are distributed remains the responsibility of MDU's management and therefore will not delineate between the portion attributable to a general wage increase or bonuses. Further, we do not find the practice of paying bonuses based on profitability objectionable. In fact, the payment or lack of payment of bonuses depending on profitability smoothes out earnings and at the same time puts pressure on employees to perform. We do not accept the argument that because MDU has been able to reduce its workforce and beat inflation in recent years that it should be expected to do so forever more. Accordingly, the staff adjustment to Taxes Other Than Income to eliminate related payroll taxes is also denied.

Other O&M Expense: SISP

88. The Supplemental Income Security Plan ("SISP") is a plan that provides supplemental pension benefits to key employees. "Key employees" are officers, directors and senior managers of MDU Resources and MDU Utilities. The plan is expected to cost $259,000 in 2002 and $265,000 in test year 2003.

89. SISP was initiated in 1982, but MDU never sought its inclusion in rates until Case No. PU-399-01-186. The order states that staff characterized SISP as a double pension for a few key employees and that the plan lacked symmetry. Staff cautioned the Commission against such a plan given the Enron debacle and the payments it made to key employees. In its April 24, 2002 decision in that case, the Commission accepted Staff's position. The Commission concluded that it is inappropriate for ratepayers to bear the expense of the SISP costs.

90. MDU witness, Richard A. Espland, acknowledged that his testimony was essentially the same as it was in Case No. PU-399-01-186. Espland acknowledged that SISP benefits only MDU's high salaried employees with income ranges from a low of $75,000 to its president at around $250,000 to $300,000. Espland also agreed that none of the Public Utility Commission's in the jurisdictions where MDU provides natural gas utility services have approved a ratepayer funded SISP program. The Commission took administrative notice of its Findings of Fact, Conclusions of Law and Order in Case No. PU-399-01-186.

91. We find that the inclusion of an extra pension for key employees is still inappropriate and unnecessary as a ratemaking expense. We determined that SISP was inappropriate in Case No. PU-399-01-186 and none of the arguments have changed. Accordingly, we find no reason to order differently in this case. MDU's projected expense of $265,000 for SISP costs is denied.

Other O&M Expense: Rate Case Expense

92. MDU proposes to amortize $168,000 in rate case expenses over three years at $56,000 per year. Staff witness Majoros proposes to amortize the same amount over five years at $34,000 per year, for a difference in annual cost recognition of $22,000. Mulkern suggested that if the five-year amortization is adopted, the unamortized balance should be included as a rate base addition.

93. The basis of Majoros' proposal is the historical period between rate cases. Fox stated in his direct testimony that MDU's last rate increase, in Case No. PU-399-94-297, was decided in 1994, and a rate reduction occurred in 1999 in Case No. PU-399-96-325. This represents two rate cases in eight years, or one every four years. MDU has rounded down to three, and Staff has rounded up to five.

94. We find that the recent trends of a case every four years argues for an amortization period of four years. Accordingly, the Commission finds that ratemaking expense is $42,000 per year or a reduction to the company's projection of $14,000.

Other O&M Expense: General Inflation Adjustment

95. In 2001, MDU incurred $89,780,000 in operating and maintenance expense, of which $76,842,000 represented the cost of acquiring gas. Of the remaining $12,938,000 O&M cost relating to distribution, MDU developed specific forecasts for $9,249,000 based on projected changes for various categories of costs, e.g. labor, benefits, insurance, advertising. The remaining catchall category of $3,689,000 is projected to increase 2.8 percent annually at the assumed rate of general inflation.

96. Majoros noted that the Commission had never previously allowed this sort of inflation-based adjustment; that some sort of incentive to generate efficiency should remain and that some of the catchall provision includes fixed costs that are not subject to inflation.

97. MDU argued through its witness, Ms. Mulkern that these types of expenses are subject to inflationary pressures and that past Commission decisions rejecting this adjustment are no excuse for ignoring inflation in this proceeding.

98. We reject the idea that we have ignored inflation in the past or that we would in this proceeding. Instead, MDU has recommended that the Commission give it consideration for a number of specific adjustments that go beyond the 2.8% inflation factor and then add on 2.8% for any remaining and unadjusted expense levels. According to Statement N, Page 1 of MDU's application, the company has requested an overall increase in Other O&M expenses of more than 5% per year for its projected 2003 test year in comparison to 2001 actual expenses. Finally, the Commission order in this proceeding grants an increase in Other O&M expenses that exceeds the general inflation factor of 2.8% which is not necessarily indicative of changes in natural gas distribution costs.

99. MDU's proposal to increase "other" O&M costs at the rate of inflation through 2003 is rejected. The elimination of this adjustment reduces test-year expenses by $209,000.

Depreciation

100. Staff asserted that test year depreciation expense should be reduced by $2,172,000. MDU's current depreciation expense is based on rates developed in a 1991 study performed by Stone & Webster. Staff witness Michael J. Majoros performed a series of studies that suggested MDU's depreciation rates are excessive. First, he found that annual depreciation accruals during the past five years have exceeded utility construction and acquisition by $28.5 million. When common plant construction and acquisition is added, the five-year accruals still exceeded expenditures by $409,000. While it is not the purpose of depreciation to fund construction, this comparison indicates that MDU has obtained substantial cash flow from depreciation. Majoros noted that in *Lindheimer v. Illinios Bell Telephone Company,* 292 U.S. 151 (1934), the Supreme Court found that excessive depreciation results in the extraction of capital from ratepayers.

101. Majoros next observed that as of the end of 2001, the ratio of depreciation reserve to the original cost of distribution plant is 70.7 percent. Based on his experience, he testified that this level of depreciation reserve is extraordinarily high and suggests that prior depreciation rates have been excessive. Majoros stated that the likely source of these excessive rates is the 140 percent negative salvage adjustment for Account 380 – Services.

102. Majoros adjusted MDU's salvage factors based on an inconsistency between the net salvage assumed in the Stone and Webster study and actual net salvage that MDU has experience during the past five years. The Stone & Webster study developed depreciation rates that resulted in a large recovery of "negative salvage," that is, cost of removal. Specifically, its depreciation rates were designed to recover total gas plant of $102.5 million plus negative salvage (removal) costs of $46.9 million.

103. Majoros testified that MDU's actual net salvage experience has been positive. In every year since 1997, he testified that MDU has received more in salvage value for its retired gas and common plant than it has paid in removal cost. The total cumulative 5-year net positive salvage receipts for gas plant have amounted to $1,444,452. For common plant, net positive salvage receipts have come to $5,529,260.

104. To correct for over-recovery of net salvage, Majoros proposed to adopt the Stone & Webster lives and survivor curves for each account with no net salvage overlay. The account-by-account depreciation rates would thus represent pure depreciation, that is, solely the recovery of original cost. To recognize net salvage, Majoros proposed to deduct from total annual depreciation the average annual amount of net positive salvage for gas plant, plus the net positive salvage of common plant distributed between gas and electric operations based on their respective net salvage amounts. Under Majoros' proposal, total depreciation of test year plant would be $1,937,000. The annualized positive salvage offset would be $848,000, for a net test-year depreciation expense of $1,089,000.

105. Majoros noted that, in addition to matching net salvage accruals with actual net salvage experience, his treatment of removal costs conforms to Generally Accepted Accounting Principles ("GAAP") as recently defined in Statement of Financial Accounting Standards No. 143 ("FAS 143"). That standard, which MDU must adopt this year, requires companies to determine whether they have a legal obligation to retire property and incur the cost of removal or dismantlement. If they do, they must declare the present value of the future "asset retirement obligation" costs as a liability on their books to be amortized over the remaining life of the asset. If they do not, then the American Institute of Certified Public Accounts' Statement of Position on Property, Plant and Equipment would require that these costs be expensed as they are incurred.

106. Majoros testified that MDU has not determined whether it has asset retirement obligations, or what the present value of those obligations might be. For this reason, Majoros' adjustment reflects net salvage experience as a rolling five-year average of actual net removal costs.

107. In rebuttal, MDU witness John A. Jeter, a retired accountant from Arthur Anderson & Co. argued that Majoros had not done a depreciation study, that his review of the current depreciation rates is superficial and contains many errors, and that he has no basis for proposing changes in depreciation rates. According to Jeter, the current depreciation rates are based on a comprehensive study prepared in 1991 and used beginning 1994. He argued that no adjustment of depreciation rates should be entertained until the current depreciation study underway is completed and an appropriate review has taken place.

108. Jeter asserted that the 1991 depreciation study by Stone & Webster is a much more reliable source of information regarding net salvage than a cursory look at net salvage for all accounts over a five year period. Jeter did not explain the reason, nor

did he refute Majoros' observation that the Stone & Webster study had recommended large negative salvage allowances, while MDU's actual net salvage experience has been positive in recent years.

109. Jeter disagreed with Majoros' net salvage proposal to adjust overall depreciation by $848,000 based on the past five years' actual experience. He observed that the net salvage amounts used by Majoros varied from year to year and reflected the sale of an office building for approximately $4.6 million. Jeter further contended that Majoros allocated common property net salvage based on the direct net salvage amounts of the gas and electric operations, which is not the basis used by MDU. Jeter failed however to mention how MDU does allocate these common net salvage amounts or whether the difference in methods is material.

110. MDU asked the Commission to defer any consideration of depreciation until its new depreciation study, currently being conducted by AUS Consulting, is completed by the end of this year.

111. We find it unfortunate that the depreciation study currently underway could not be completed prior to the hearing. MDU has agreed to submit the new depreciation study for review by January 31, 2003 as a continued issue in this proceeding, subject to the standard and customary contested case process with all parties having rights of discovery, testimony, rebuttal testimony, hearing and briefing. MDU's depreciation filing will include gas and common plant facilities. Any resulting change in depreciation expense ordered by the Commission at the conclusion of the review will be reflected in rates on a prospective basis.

112. The Commission anticipates that this review should take no longer than six months from the date MDU files its new depreciation study. In the interim the Commission will allow MDU to implement rates reflecting the findings and conclusions in the instant order together with MDU's current depreciation rates. The Commission recognizes that the instant decision is a final decision as to all issues except for the depreciation issue, which is continued pending the filing and review of a new study. MDU's recently filed letter reflects MDU's agreement with this understanding.

113. Staff's adjustment reducing depreciation expense by $2.172 million is rejected.

114. From the foregoing, the Commission finds that MDU's projected Net Operating Income for 2003 is as follows:

Description	MDU	Adjustments	Commission
Sales	$ 67,962	$ -	$ 67,962
Transportation	900	-	900
Other	287	-	287
Total Revenues	$ 69,149	$ -	$ 69,149
Cost of Gas	$ 50,072	$ -	$ 50,072
Other O & M Expense	14,354	(488)	13,866
Total O & M Expense	$ 64,426	$ (488)	$ 63,938
Depreciation	3,261	-	3,261
Taxes Other Than Income	1,352	-	1,352
Current Income Tax Expense	(1,961)	192	(1,769)
Deferred Income Taxes	1,612	-	1,612
Total Expenses	$ 68,690	$ (296)	$ 68,394
Net Regulated Income	$ 459	$ 296	$ 755
Income Tax Calculation:			
NOI before Income Taxes	$ 110		$ 598
Interest Deduction:			
Rate Base	$ 19,681		$ 19,681
Weighted Cost of Debt	3.951%		3.969%
Interest Expense	$ 778		$ 781
Other Deductions	$ 4,282		$ 4,282
Taxable Income	$ (4,950)		$ (4,465)
Tax Rate	39.61%		39.61%
Income Tax Expense	$ (1,961)		$ (1,769)

115. From the foregoing, the Commission calculates that MDU's additional revenue requirement for the opportunity to earn 11.329% on common equity invested in North Dakota in 2003 is:

Change in Revenue Calculation	
Rate Base	$ 19,681
Weighted Cost of Capital	9.883%
Required Return	$ 1,945
Return Earned	$ 755
Difference	$ (1,191)
Tax Factor	1.656
Required Change in Revenue	$ (1,972)
Rate Increase Required	2.9%

Sale of Corporate Building

116. In this proceeding, it came to the attention of the Commission that MDU transferred the ownership of its Schuchart Building from the utility business to a non-regulated subsidiary. According to MDU's witness Keller, the building was transferred to recognize that less and less of the corporate business is related to the utility operations. The building was transferred at net book value without the benefit of a fair market value assessment. It appears that some after-the-fact analysis has been done to suggest the transfer was fair to ratepayers. The Commission wishes to remind MDU, as it would all public utilities, that the utmost care must be taken in completing such transactions. At a time in our history when corporate activities are being heavily scrutinized, it is imperative that MDU conduct business in an open and transparent manner, such that there is not even the slightest hint of corporate greed or chicanery.

Cost Allocation and Rate Design

Class Cost of Services Study

117. A class cost of service study is an analysis of the embedded or incremental costs of providing utility services to the customers or classes of customers that either cause these costs, or to whom these costs can reasonably be allocated. The purpose of performing a class cost of service study is to provide an indication of what it costs to provide utility service to each customer class and what rate of return each class provides. In prior rate applications the Commission has not adopted any particular study but has used class cost of service studies as guidelines for rate design and as one of the factors in setting rates for the respective classes of customers.

118. MDU Witness Tammie Aberle sponsored an embedded cost of service study for the year ended December 31, 2001. This study allocated all of MDU's recorded distribution, general and gas-related common plant among seven categories of customers:

- Residential
- Firm General
- Air Force
- Small Interruptible Sales
- Small Interruptible Transport
- Large Interruptible

119. The costs allocated to the respective customer classes were in turn subdivided into three categories:

- Capacity related costs vary with the amount of gas send out on the peak days of the year. Examples include the sizing of distribution mains and meters to account for the maximum volume of gas handled on any one day.
- Throughput related costs vary with the total amount of gas distributed throughout the year. Uncollectible accounts are an example of this type of cost.

- Customer related costs vary with the number of customers. Examples include the cost of meters, services and billing.

120. The only disagreement relating to this cost of service study concerned the allocation of the cost of mains. Mains constitute 39.1 percent of MDU's gas distribution plant, but their relevance exceeds even this percentage. That is because general and common plant, which account for another 20 percent of total plant, are allocated as overheads to the direct investment, of which mains are the largest component.

121. In its initial cost of service study, Statement M of Exhibit 2, MDU allocated mains 64 percent on the basis of peak two-day throughput during the year and 36 percent on the basis of the number of customers.

122. King objected to the allocation of a portion of mains costs on a customer count basis. The arguable justification for doing so is that the purpose of the mains system is to reach customers, and that when more customers are added, the mains system has to be extended. King argued that this is true only at the very edges of the system, where gas mains are being extended to serve new developments. Even then, the added cost of mains for new customers can vary dramatically depending on the location of those customers.

123. King testified that another purpose of mains is to deliver gas. He argued that the value derived and the benefits received from the mains system are more related to the amount of gas delivered than to the number of customers. One customer receiving twice as much gas as another customer enjoys exactly twice the BTU heating content. The two cannot be equated in terms of benefit received, yet that is what a customer allocation of mains does. He illustrated his point by using the example of a section of main that changes the number and makeup of customers over a period of several years, but the amount of gas delivered remains the same. The weighting of that main in the cost of service study would change under a customer allocation, but it would remain the same (although shifted among customer classes) if the allocation were made on the basis of annual throughput.

124. King therefore asked that MDU conduct an alternative study to allocate half the mains cost according to the classes' two-day peak throughput and half on the basis of annual throughput.

125. On rebuttal, Aberle objected to King's revisions, arguing that main additions are not made only on the edges of the system to provide new service to developments, but are also required to enhance system integrity and maintain pressure throughout the system as customer additions are made. She objected that heating content has no impact on the cost of the mains system. She also objected to the use of a peak-day allocator that assigns costs to the interruptible class and a throughput allocator that assigns costs to the transmission customers. She argued that both of these allocations violate practices previously approved by the Commission. She submitted yet a third

cost of service study, one, which allocates mains, based 50 percent on throughput at the distribution level and 50 percent on peak day use by firm customers.

126. The results of the three costs of service studies show the rate of return from each customer class as follows:

	MDU Statement M	King CWK-7	Aberle TAA-4
Residential	3.083%	7.731%	6.367%
Firm General	3.998%	2.161%	1.106%
Air Force	50.281%	3.502%	69.369%
Small Interruptible Sales	83.992%	38.040%	40.905%
Small Interruptible Transport	169.437%	48.490%	57.738%
Large Interruptible	78.644%	-0.673%	27.320%
Total North Dakota	6.439%	6.442%	6.442%

127. As noted earlier, the Commission has used class cost of service studies as guidelines for rate design and as one of the factors in setting rates for the respective classes of customers. We appreciate the information provided by each of the studies because it quantifies the impact that a change in allocation factor has on the rates of return from customer classes. The studies also show that, regardless of the allocator used to allocate mains to customer classes, some customer classes are providing a much higher return on MDU's investment to serve than are other customer classes. All three studies indicate the small interruptible classes generate a much higher than average rate of return while two of the studies indicate the same is true for the air force and large interruptible classes. The third study proposed by King indicates lower rates of return from the Air Force and large interruptible classes, but we are concerned that this study may not adequately recognize the value of controlling system peaks with interruptible load.

Rate Design

128. In its initial application, MDU made a number of rate design proposals, as follows:

- Increase residential and firm general service rates by 4.6 percent, reduce the small interruptible class rates by 4.1 percent, and leave the Air Force and large interruptible rates unchanged;
- Separate the commodity rate into a Distribution Delivery Charge and a Cost of Gas charge, eliminating the Purchased Gas Cost Adjustment;
- Eliminate the declining block rate form from the commodity charges and substitute a flat per-dekatherm ("dk") rate;
- Change the customer, or "Basic Service Charge" from a monthly to a daily charge;
- Increase the Basic Service Charges by very large percentages, for example, the residential charge increases from $6.50 to $11.70, the small firm service charge from $8.50 to $24.00 and the large firm service charge from $17.00 to $51.00.

- Eliminate the residential seasonal rate;
- Increase the penalty for failure of interruptible customers to interrupt from $10 to $50 per dk;
- Increase the return check fee to $20;
- Increase the reconnection fees for seasonal customers to match the avoided Basic Service Charges;
- Increase the reconnection charge for disconnected customers for nonpayment to $30;
- Modify the Firm Gas Extension Policy Rate 120 and 124 to reflect MDU ownership of all prospective service lines.

129. King recommended that the Commission accept a number of these proposals regardless of whether MDU's overall revenue is increased, decreased, or remains unchanged. The Commission finds the following consensus proposals should be approved:

- The commodity rate should be separated into two clearly distinct rates, the Distribution Delivery Charge and the Cost of Gas Rate.
- The declining block rates should be eliminated, and the revenue collected through the higher initial block rates should be reallocated to the Basic Service Charge.
- The residential seasonal rates should be eliminated, since there are no customers on these rates.
- Penalties for failure to interrupt should be increased, since MDU believes the current penalties are not sufficient to ensure interruptible customers respond to their calls for interruption or curtailment.
- The reconnection charges for seasonal customers should be adjusted to match the higher Basic Service Charges resulting from the elimination of declining commodity blocks.
- MDU's proposed modifications to the line extension policy should be adopted.

130. King recommended that the Commission reject MDU's proposal to increase the reconnection charge for discontinued service to $30. While MDU claimed that this is a cost-based rate, King suggested that there is a legitimate public policy reason for not increasing this rate. The customers to whom this charge applies are almost certainly the lowest income customers. Otherwise, they would not have been disconnected. Since they have to pay their arrearages anyway, they are likely suffering some difficulty getting reconnected. To impose on them yet more cost, such as an increase in the reconnection fee, might prevent some of these customers from obtaining vital utility service. MDU did not respond to King's recommendation. We agree with the policy considerations asserted by King and find MDU's proposal to increase the reconnection charge for disconnected customers should be denied.

131. MDU proposed to increase the returned check charge to $20 to reflect the current going rate charged by banks and other businesses when a check is returned for non-payment. However, MDU did not present any studies or other specific information to indicate its actual cost of returned checks. We find that returned check charges

should be based on cost and absent a showing by MDU that the proposed new rate is based on cost, MDU's proposal should be denied.

Rate Allocation Among Customer Classes

132. MDU proposed that residential and firm general service customers receive a rate increase of 4.6 percent, that the Air Force and large interruptible customers receive no increase, and that the small interruptible class receives a reduction of 4.1 percent. In the past the Commission has not approved rate reductions to some classes when granting an overall increase. Consistent with past Commission practice, we will not authorize any decrease for the small interruptible class. If a class receives a decrease when other classes receive an increase, the amount of the increase to the other classes will be higher. Revenue lost from giving one class a decrease must be made up by the other classes, thus increasing their burden.

133 The Commission finds the overall results of the class cost of service studies indicate that rates of return from the residential and firm general service classes are significantly less than those from the other classes. We share the desire to move towards more equalized rates of return between customer classes. The relatively small amount of revenue increase being granted in this case provides an opportunity to increase the rates of return from the firm general and residential classes without unduly burdening customers. Therefore, we will allow MDU to assign approximately equal percentage revenue increases reflecting the overall increase authorized to the residential and firm general service customer classes and approximately zero percentage increases to the other customer classes.

Monthly Customer Charges

134. King supported MDU's proposal to eliminate declining block commodity rates on the grounds that this rate structure implicitly encourages customers to use more gas, and it thereby discourages conservation. To the extent that it collects fixed customer costs in the commodity rate, it misstates the cause of the costs. Declining block rates also allow customers who use minor amounts of gas to escape the cost of providing the basic elements of service to them. As stated above, we agree with King that the declining block rate should be eliminated to more closely reflect cost causation in rates to customers.

135. Using MDU's billing unit counts for the year 2001, King calculated the revenue-neutral increase in monthly customer charges that would result if the present declining block rate structure were eliminated from each rate schedule. Under King's revenue neutral proposal, the resulting monthly customer charges would be as follows:

	Current	**Rev. Neutral**
Small Residential	$6.50	$8.43
Large Residential	$13.00	$15.31
Small Firm Service	$8.50	$14.34
Large Firm Service	$17.00	$45.16

135. King also recommended that the Commission consider MDU's proposal to convert the customer charges from monthly to daily charges. The proposal simplifies the calculation of the charge when customers are taking gas for only part of a month. We agree and find that MDU's monthly customer charge should be converted to a daily customer charge as proposed.

136. King had misgivings about MDU's proposal to increase customer charges dramatically, even for the classes for which it was proposing rate reductions or no rate increases. MDU witness Russell Feingold contended that shifting revenue recovery from the commodity to the customer component allows MDU to recover much more of its fixed costs on a non-weather sensitive basis. He asserted that this shift also protects customers from the volatility in their gas bills caused by variations in weather.

137. King was concerned with the issue of rate continuity. The sort of changes proposed by MDU would result in dramatically different bills for different types of customers. Very low-use customers might find higher percentage increases in their average monthly bills. Customers accustomed to low gas bills in the summer, that possibly offset high electric bills, could be surprised by the increase in their summer gas invoices.

138. King was further concerned that customers may resent high monthly customer charges. When most of the cost of gas is based on the level of gas consumption, customers can avoid high gas bills by conserving gas. But no amount of conservation permits a customer to avoid a monthly customer charge. As long as this charge is not a major portion of the bill, it is likely to be acceptable to most customers. But if it looms as a major element in the cost of gas service, customers will come to regard it as a tax from which there is no escape.

139. King recommended that customer charges should not be increased by more than twice any overall percentage increase. This would be in addition to the increases in customer charges that result from the flattening of the declining block rates. King testified if rates are reduced, the reductions should be flowed entirely into the commodity component of each rate schedule. King asserts that customer charges should not be increased when rates are reduced, except to eliminate the declining block feature of the rate schedules.

140. The Commission agrees that customer charge increases should be limited and will adopt King's recommendation for residential and small firm general service customers because customer charges are a more significant portion of their bill. We find the remaining monthly customer charges proposed by MDU should be approved. The resulting customer charges are:

	Current Monthly	Proposed Monthly	Proposed Daily	Authorized Monthly	Authorized Daily [1]
Residential Service		$ 11.70	$ 0.39	$ 8.91	$ 0.29
Small Meters	$ 6.50				
Large Meters	$ 13.00				
Firm General Service					
Small Meters	$ 8.50	$ 24.00	$ 0.80	$ 15.16	$ 0.50
Large Meters	$ 17.00	$ 51.00	$ 1.70	$ 51.00	$ 1.70
Air Force					
Firm	$ 35.00	$ 135.00		$ 135.00	
Interruptible	$750.00	$1,000.00		$1,000.00	
Small Interruptible					
Sales	$ 35.00	$ 100.00		$ 100.00	
Transport [2]	$ 35.00	$ 150.00		$ 150.00	
Large Interruptible					
Sales	$450.00	$ 675.00		$ 675.00	
Transport [2]	$450.00	$ 725.00		$ 725.00	

Notes:

1. Daily = Monthly X 12 / 365.25
2. Customer charge authorized for transportation service includes roll-in of $50 nominating fee currently charged separately under existing tariff.

Distribution Delivery Stabilization Mechanism

141. MDU proposes that if the Commission disapproves of MDU's increases in customer charges, it should adopt a Distribution Delivery Stabilization Mechanism ("DDSM") as an alternative. As described by Feingold, the DDSM would modify the effects of weather variations by adjusting bills for the difference between the actual heating degree-days and heating degree-days under normal weather. Following a cold winter, the excess in each class's revenue from the greater number of heating degree days would be divided by the projected annual sales volumes in that class and credited to all customers over the following year on a per-dk basis. Similarly, the revenue shortfall from a warmer than normal winter would be collected through a surcharge in the following year.

149. King testified that the value of a weather normalization adjustment should be to ameliorate the volatility in customer bills caused by variations in weather, and particularly the effect of unusually cold winters. In such winters, ratepayers typically experience a "double whammy." First, they consume more gas than usual, which increases their bills even if the price of gas remains the same. Then, because cold winters are usually a widespread phenomenon, the demand for gas is higher across the continent, which means that the price of gas is higher. The result is a further inflation in

their bills. Just this sort of inflation occurred across the country during the winter of 2000-2001.

150. King suggested that MDU's proposal could result in a "triple whammy." If North Dakota experiences an unusually warm winter, and it is followed by an unusually cold winter, ratepayers during the cold winter, already hard-hit, would find themselves paying a surcharge to make up for the shortfall in revenue collections in the previous year. The effect of MDU's program could be to increase, not decrease the volatility in customers' bills from year to year.

151. The Commission finds that MDU's alternative proposal should be denied, primarily because of its delayed effect. For a weather normalization adjustment to be beneficial to ratepayers and not just the utility, it must affect their bills when the unusual weather is occurring, not after it has occurred.

From the foregoing Findings of Fact, the Commission makes its:

Conclusions of Law

1. The Commission has jurisdiction over the parties and the subject matter of this proceeding.

2. MDU is entitled to rates and charges necessary to provide it an opportunity to earn a reasonable rate of return on its North Dakota natural gas property, used and useful, for the service and convenience of the public in North Dakota.

3. The rates authorized by the Commission herein will provide MDU with the opportunity to earn a reasonable rate of return on its property used and useful for the service and convenience of the public in North Dakota.

4. The depreciation issue in this proceeding is continued for the purpose of filing and review of, and decision on, a new depreciation study.

5. This order constitutes a final determination of all issues in this proceeding except the depreciation issue.

From the foregoing Findings of Fact and Conclusions of Law, the Commission makes its:

Order

The Commission orders:

1. MDU may implement a rate increase for service rendered on and after December 12, 2002, sufficient to produce a total annual revenue increase of $1.972 million.

2. MDU shall file revised tariff sheets for Commission approval consistent with the foregoing findings of fact and conclusions of law.

3. MDU shall file its new depreciation study as soon as possible, but no later than January 31, 2003.

STATE OF NORTH DAKOTA

PUBLIC SERVICE COMMISSION

Montana-Dakota Utilities Co.
Natural Gas Rate Increase
Application

Case No. PU-399-02-183

CONCURRING OPINION
Commissioner Susan E. Wefald

December 18, 2002

I concur with all of the findings of facts and conclusions on law in this case except for finding 87. The Commission should not include bonus money for MDU employees as an element of a rate case.

If company profitability drives bonuses, as it appears to, then it is altogether inappropriate to include bonuses in a revenue requirement that drives a rate increase. As staff stated in its brief, "The reason MDU needs the rate increase is that it is not profitable. If it becomes profitable as result of a rate increase, that profitability will not have come about because the employees have performed particularly well. To the contrary, it will be because the employees have not performed well, and MDU needs rescue from the Commission. The revenue requirement imposed on ratepayers should not include rewards for poor performance. For this reason, bonuses should be disallowed." (page 14, Public Service Commission Staff Brief, filed November 15, 2002)

The overall wage increases projected by MDU are fair and reasonable. However, eliminating $503,000, which is equal to 6.1 percent of total approved labor costs in 2002 of $8,239,000, is prudent. This would reduce the amount of pay increase needed in 2003 by $236,000 (see finding 82). If the amount of the bonuses was eliminated, MDU would still have the ability to allocate any warranted bonus money with the remainder of the money in labor cost increases and the elimination would provide an incentive for company employees to find further cost savings and increase profitability.

Case No. PU-399-02-183

STAFF RESPONSE TO COMPLIANCE FILING

December 17, 2002

On December 16, 2002, Montana-Dakota Utilities Co., a Division of MDU Resources Group, Inc., (MDU) filed tariff changes to comply with the Order of the Commission dated December 10, 2002. The Commission's Order required MDU to implement a rate increase sufficient to provide a total annual revenue increase of $1,972,000 effective for service on and after December 12, 2002.

MDU's compliance tariffs provide a total annual revenue increase of $1,975,600. The increase is spread over residential and firm general gas bills and sales volumes and results in a 3.08% increase for those customer classes. The commodity rate has been separated into two clearly distinct rates, the Distribution Delivery Charge and the Cost of Gas charge. The Cost of Gas charge is recalculated for the month of December 2002. The declining block rate elements have been eliminated. The residential seasonal rate has been eliminated. Penalties for failure to interrupt have been increased from $10 per dk of gas used in excess of the curtail amount to $50 per dk. The reconnection charges for seasonal customers has been adjusted to match the higher Basic Service Charges. The new line extension policy has been included. Customer charges have been adjusted in accordance with the Commission's order.

As directed by the Commission's Order, MDU did not change the reconnection charge for discontinued service and did not change the returned check charge.

Staff believes that MDU's compliance filing satisfies the Commission's Order.

Re: Case No. PU-399-02-183
Compliance Tariffs - Addendum

Montana-Dakota Utilities Co. (Montana-Dakota), a Division of MDU Resources Group, Inc., herewith submits an original and seven copies of the following tariff sheets:

- 2nd Revised Sheet No. 3.1, Rate Summary Sheet, to replace the 2nd Revised Sheet No. 3.1 filed on December 13, 2002 which contained a typographical error. As referenced in Rate 100, the Reconnection charge applicable to customers disconnected for nonpayment should be stated as $12.00.
- 1st Revised Sheet No. 7.1, Rate 64. The volume number has been revised to reflect the correct Volume No. 7.
- 1st Revised Sheet No. 30, Purchased Gas Cost Adjustment Rate 88 has been revised to remove the language at the end of Paragraph 3(a) referencing hedging program gains, losses & transaction costs. As noted in the current tariff, the authority to include such costs expired on March 1, 1999, and the intent was to exclude this language from Rate 88 in this Case.

Pursuant to a request from Mr. Patrick Fahn, a schedule showing the return on storage balances and prepaid demand and commodity balances is included. This schedule is in support of the purchased gas cost adjustment included in the compliance workpapers.

Please acknowledge receipt by stamping or initialing the duplicate copy of this letter attached hereto.

AIR FORCE Rate 64

General Terms and Conditions:

1. PENALTY FOR FAILURE TO CURTAIL OR INTERRUPT – If the customer fails to curtail or interrupt their use of gas hereunder when requested to do so by the Company, any gas taken shall be billed at the Firm Service distribution delivery charge and cost of gas rates set forth above, plus either an amount equal to any penalty payments or overrun charges the Company is required to make to its interconnecting pipeline(s) under the terms of its contract(s) as a result of such failure to curtail or interrupt, or $50.00 per dk of gas used in excess of the volume of gas to which customer was requested to curtail or interrupt, whichever amount is greater. The Company, in its discretion, may shut off customer's supply of gas in the event of customer's failure to curtail or interrupt use of gas when requested to do so by the Company.

2. CONTRACT – Terms of service other than the rate shall be specified in contracts between Minot Air Force Base, and PAR and the Company.

3. The foregoing schedule is subject to Rates 100 through 124 and any amendments or alterations thereto or additional rules and regulations promulgated by the Company under the laws of the state.

PURCHASED GAS COST ADJUSTMENT Rate 88

1. **Applicability:**
This rate schedule constitutes a purchased gas cost adjustment (PGA) provision and specifies the procedure to be utilized to adjust the rates for gas sold under Montana-Dakota's rate schedules in order to reflect: (a) changes in Montana-Dakota's average cost of gas supply, (b) amortization of the Unrecovered Purchased Gas Cost Account and (c) market based pricing differential.

2. **Effective Date and Limitation on Adjustments:**
(a) The effective dates of the PGA shall be bills rendered on and after the first date of each month, unless the Commission shall otherwise order.

(b) Montana-Dakota shall file a PGA to reflect changes in its average cost of gas supply only when the amount of change in such PGA is at least 10 (ten) cents per dk. The adjustment to be effective May 1 shall be filed each year, regardless of the amount of the change.

3. **Purchased Gas Cost:**
(a) The monthly PGA shall reflect changes in Montana-Dakota's cost of gas supply as compared to the cost of gas supply approved in its most recent PGA. The cost of gas supply shall be the sum of all costs incurred in obtaining gas for general system supply. General system supply is defined as gas available for use by all customers served under retail sales rate schedules. The cost of gas supply shall include, but not be limited to, all demand, commodity, storage, gathering, and transportation charges incurred by Montana-Dakota for such gas supply, the overall rate of return on prepaid demand and commodity charges and gas storage balances required to maintain the system gas supply.

(b) The PGA shall be computed as follows:

(1) Demand costs shall include all annual gathering, transportation and storage demand charges at current rates.

(2) Commodity costs shall include all annual gathering, transportation and storage charges at current rates.

Re: Case No. PU-399-02-183
Compliance Tariffs

Montana-Dakota Utilities Co. (Montana-Dakota), a Division of MDU Resources Group, Inc., herewith submits an original and seven copies of revised tariff sheets relative to its natural gas operations in the state of North Dakota in compliance with the Commission's Order issued on December 10, 2002.

The rates set forth on the revised tariff sheets will produce additional annual revenues of $1,975,600, which is somewhat more than the authorized increase of $1,972,000 due to rounding in the rate design calculations. The revised tariffs reflect the following provisions as set forth in the Commission's Order:

Residential - An increase of 3.08% has been allocated to the Residential class which represents the overall increase as a percentage of the residential and firm general service revenues. The basic service charge for all residential customers has been set at $0.29 per day ($8.91 per month). The resulting distribution delivery charge is $.669 per dk in order to collect the total revenues allocated to the Residential class.

Firm General Service - An increase of 3.08% has been allocated to the Firm General Service class, which represents the overall increase as a percentage of the residential and firm general service revenues. The basic service charge for general service customers with meters rated less than 500 cubic feet per hour has been set at $0.50 per day ($15.16 per month) and the basic service charge for general service customers with meters rated greater than 500 cubic feet per hour has been set at $1.70 per day ($51.00 per month). The resulting distribution delivery charge is $.498 per dk in order to collect the total revenues allocated to the Firm General Service class.

Air Force - The basic service charge for the Minot Air Force Base reflects a monthly charge of $1,000.00 per month and the Perimeter Acquisition Radar (PAR) Site basic service charge has been set at $135.00 per

101 PU-399-02-183 Pages: 2
Letter re compliance tariff filing
by Montana-Dakota Utilities Co., a Division of MDU R
12/16/2002 CC: Comm Legal Illona, Pat, Jerry Mike

month. The commodity charge has been correspondingly decreased to result in no change in total revenues to be collected from this class.

Small Interruptible - A basic service charge has been set at $100.00 per month for interruptible sales customers and $150.00 per month for interruptible transportation customers. The commodity charge has been correspondingly decreased to result in no change in total revenues to be collected from this class.

Large Interruptible - A basic service charge has been set at $675.00 per month for interruptible sales customers and $725.00 per month for interruptible transportation customers. The commodity charge has been correspondingly decreased to result in no change in total revenues to be collected from this class.

The other tariff changes, as originally proposed by Montana-Dakota, are included on the attached tariffs with the exception of the following:

- The reconnection charge for customers that have been disconnected for reasons of nonpayment has been left at the current charge of $12.00.
- The NSF check charge remains at the current charge of $10.00.
- The Distribution Delivery Stabilization Mechanism will not be implemented.

A complete set of the workpapers showing the development of the new rates is also attached hereto.

Montana-Dakota will implement the rates on December 18, 2002 to be effective with service rendered on and after December 12, 2002 upon final approval in accordance with the Commission's Order issued on December 10, 2002.

Please acknowledge receipt by stamping or initialing the duplicate copy of this letter attached hereto.

SMALL INTERRUPTIBLE GENERAL GAS SERVICE Rate 71

Availability:

In all communities served for all interruptible general gas service customers whose interruptible natural gas load will exceed an input rate of 2,500,000 Btu per hour, metered at a single delivery point and whose use of natural gas will not exceed 100,000 dk annually. The rates herein are applicable only to customer's interruptible load. Customer's firm natural gas requirements must be separately metered or specified in a firm service agreement. Customer's firm load shall be billed at Firm General Gas Service Rate 70. For interruptible purposes, the maximum daily firm requirement shall be set forth in the firm service agreement.

Rate:

Basic Service Charge:	$100.00 per month	
Distribution Delivery Charge:	Maximum	Minimum
	$1.213 per dk	$.427 per dk
Cost of Gas:	Determined Monthly- See Rate Summary Sheet for Current Rate	

The Distribution Delivery Charge shall be set forth in the service agreement required as provided in the General Terms and Conditions for service. Such rate, as adjusted to reflect changes in the cost of Purchased Gas, shall apply for the term of the agreement regardless of a change in the rates set forth above.

Minimum Bill:

Basic Service Charge.

Payment:

Billed amounts will be considered past due if not paid by the due date shown on the bill. Past due bills are subject to a late payment charge in accordance with the provisions of Rate 100, §V.11, or any amendments or alterations thereto.

Cost of Purchased Gas:

The cost of gas includes all applicable cost of gas items as defined in the Purchased Gas Cost Adjustment Rate 88 or any amendments or alterations thereto. The cost of gas component is subject to change on a monthly basis.

Gas Rate Schedule

SMALL INTERRUPTIBLE GENERAL GAS SERVICE Rate 71

General Terms and Conditions:

1. PRIORITY OF SERVICE – Deliveries of gas under this schedule shall be subject at all times to the prior demands of customers served on the Company's firm general gas service rates, and the Company shall have the right to interrupt deliveries to customers under this schedule without being required to give previous notice of intention to so interrupt whenever, in Company's sole judgment, it may be necessary to do so to protect the interest of its customers whose capacity requirements are otherwise and hereby given preference. The priority of service and allocation of capacity shall be accomplished in accordance with the provisions of Rate 100, §V.10.

2. PENALTY FOR FAILURE TO CURTAIL OR INTERRUPT – If customer fails to curtail or interrupt their use of gas hereunder when requested to do so by the Company, any gas taken shall be billed at the Firm General Gas Service Rate 70 (distribution delivery charge and cost of gas), plus either an amount equal to any penalty payments or overrun charges the Company is required to make to its interconnecting pipeline(s) under the terms of its contract(s) as a result of such failure to curtail or interrupt, or $50.00 per dk of gas used in excess of the volume of gas to which customer was requested to curtail or interrupt, whichever amount is greater. The Company, in its discretion, may shut off customer's supply of gas in the event of customer's failure to curtail or interrupt use of gas when requested to do so by the Company.

3. AGREEMENT – Customer will be required to enter into an agreement for service hereunder for a minimum term of 12 months. Written notice of termination by either Company or customer must be given at least 60 days prior to the end of the initial term. Absent such termination notice, the agreement shall continue for additional terms of equal length until written notice is given, as provided herein, prior to the end of any subsequent term. Upon expiration of service, the customer may apply for and receive at the sole discretion of the Company, gas service under this rate or another appropriate rate schedule for the customer's operations.

4. OBLIGATION TO NOTIFY COMPANY OF CHANGE IN DAILY OPERATIONS – Customer will be required as specified in the service agreement to notify Company of an anticipated change in daily operations. Failure to comply with requirements specified in the service agreement may result in the assessment of penalties to the customer equal to the penalty amounts Company must pay to the interconnecting pipeline caused by customer's action.

5. METERING REQUIREMENTS –Remote data acquisition equipment required for daily measurement will be installed by the Company, at its sole discretion, prior to the initiation of service hereunder.

   The customer shall be required to provide and maintain, at no cost to Company, a 120 volt, 15 ampere, AC power supply, or other power source acceptable to the Company, and acceptable telephone service available at customer's meter location(s). Customer agrees to provide and maintain, at no cost to the Company, any necessary telephone enhancements to assure Company of a quality telephone signal necessary to properly transmit data. The customer shall pay all charges for continuous electric and telephone service associated with the Company's connection of the electronic measurement equipment, and any interruption in such services must be promptly remedied or service under this tariff will be suspended until satisfactory corrections have been made.

   The Company reserves the right to charge for each service call to investigate, repair and/or reprogram the Company's remote data acquisition equipment when the service call is the result of a failure or change in communication or power source provided by customer or damage to Company's equipment.

6. The foregoing schedule is subject to Rates 100 through 124 and any amendments or alterations thereto or additional rules and regulations promulgated by the Company under the laws of the state.

TRANSPORTATION SERVICE Rates 81 and 82

Availability:

This service is applicable for transportation of natural gas to customer's premise (metered at a single delivery point) through Company's distribution facilities. In order to obtain transportation service, customer must qualify under an applicable gas transportation service rate; meet the general terms and conditions of service provided hereunder; and enter into a gas transportation agreement upon request by the Company.

The transportation services are as follows:

Small Interruptible General Gas Transportation Service Rate 81:
Transportation service is available for all general gas service customers whose interruptible natural gas load will exceed an input rate of 2,500,000 Btu per hour, metered at a single delivery point, whose average use of natural gas will not exceed 100,000 dk annually and who, absent the request for transportation service, are eligible for natural gas service, on an interruptible basis, pursuant to Company's effective Small Interruptible General Gas Service Rate 71. Customer's firm natural gas requirements must be separately metered or specified in a firm service agreement. Customer's firm load shall be treated and billed in accordance with the provisions of Firm General Gas Service Rate 70.

Large Interruptible General Gas Transportation Service Rate 82:
Transportation service is available for all general gas service customers whose interruptible natural gas load will exceed 100,000 dk annually metered at a single delivery point, and who, absent the request for transportation service, are eligible for natural gas service, on an interruptible basis, pursuant to Company's effective Large Interruptible General Gas Service Rate 85. Customer's firm natural gas requirements must be separately metered or specified in a firm service agreement. Customer's firm load shall be treated and billed in accordance with the provisions of Firm General Gas Service Rate 70.

TRANSPORTATION SERVICE Rates 81 and 82

Rate:

Under Rate 81 or 82, customer shall pay the applicable Basic Service Charge plus a negotiated rate not more than the maximum rate or less than the minimum rate specified below. In the event customer also takes service under Rate 71 or Rate 85, the Basic Service Charge applicable under Rate 81 or Rate 82 shall be waived.

Basic Service Charge:
Rate 81 $150.00 per month
Rate 82 $725.00 per month

	Rate 81	Rate 82
Maximum Rate per dk	$0.427	$0.298
Minimum Rate per dk	$0.102	$0.061
Balancing Charge per dk	$0.300	$0.300

Fuel Charge:
Applicable to all dk transported to customers located within the distribution system. Charge does not apply to transmission level customers. See Rate Summary Sheet t for currently effective charge.

General Terms and Conditions:

1. CRITERIA FOR SERVICE: In order to receive the service, customer must qualify under one of the Company's applicable natural gas transportation service rates and comply with the general terms and conditions of the service provided herein. The customer is responsible for making all arrangements for transporting the gas from its source to the Company's interconnection with the delivering pipeline(s).

TRANSPORTATION SERVICE Rates 81 and 82

2. REQUEST FOR GAS TRANSPORTATION SERVICE:
   a. To qualify for gas transportation service a customer must request the service pursuant to the provisions set forth herein. The service shall be provided only to the extent that the Company's existing operating capacity permits.

   b. Requests for transportation service shall be considered in accordance with the provisions of Rate 100, §V.10.

3. MULTIPLE SERVICES THROUGH ONE METER:
   a. In the event customer desires firm sales service in addition to gas transportation service, customer shall request such firm volume requirements, and upon approval by Company, such firm volume requirements shall be set forth in a firm service agreement. For billing purposes, the level of volumes so specified or the actual volume used, whichever is lower shall be billed at Rate 70. Volumes delivered in excess of such firm volumes shall be billed at the applicable gas transportation rate. Customer has the option to install at their expense, piping necessary for separate measurement of sales and transportation volumes.

   b. The customer shall pay, in addition to charges specified in the applicable gas transportation rate schedule, charges under all other applicable rate schedules for any service in addition to that provided herein (irrespective of whether the customer receives only gas transportation service in any billing period).

4. PRIORITY OF SERVICE – Company shall have the right to curtail or interrupt deliveries without being required to give previous notice of intention to curtail or interrupt, whenever, in its judgment, it may be necessary to do so to protect the interest of its customers whose capacity requirements are otherwise and hereby given preference. The priority of service and allocation of capacity shall be accomplished in accordance with the provisions of Rate 100, §V.10.

5. PENALTY FOR FAILURE TO CURTAIL OR INTERRUPT – If customer fails to curtail or interrupt their use of gas hereunder when requested to do so by the Company, any gas taken above that received on customer's behalf, shall be billed at the Firm General Gas Service Rate 70 (distribution delivery charge and cost of gas), plus either an amount equal to any penalty payments or overrun charges the Company is required to make to its interconnecting pipeline(s) under the terms of its contract(s) as a result of such failure to curtail or interrupt, or $50.00 per dk of gas used in excess of the volume of gas to which customer was requested to curtail or interrupt, whichever amount is greater. The Company, in its discretion, may shut off customer's supply of gas in the event of customer's failure to curtail or interrupt use of gas when requested to do so by the Company.

6. NON-DELIVERED VOLUMES/PENALTY:
   a. In the event customer uses more gas than is being delivered to the Company's interconnection with the delivering pipeline(s) (receipt point), customer shall pay an amount equal to any penalty payments or overrun charges the Company is required to make to its interconnecting pipeline(s) under the terms of its contract(s) resulting from such action by customer. In the event that more than one customer is obtaining gas from the same shipper and/or agent at the same receipt point, any payment or overrun penalties the Company is required to make shall be allocated on a pro rata basis among such customers on the basis of each customer's use of gas in excess of available volumes.

   b. In the event the customer's gas is not being delivered to the receipt point for any reason and the customer continues to take gas, the customer shall be subject to any applicable penalties or charges set forth in Paragraph 6.a. Gas volumes supplied by Company will be charged at Firm General Gas Service Rate 70 (distribution delivery charge and cost of gas). The Company is under no obligation to notify customer of non-delivered volumes.

APPROVED NORTH DAKOTA
PUBLIC SERVICE COMMISSION
DEC 18 2002
CASE NO PU-399-02-183

c. In the event customer's transportation volumes are not available for any reason, customer may take interruptible sales service if such service is available. The availability of interruptible sales service shall be determined at the sole discretion of the Company.

7. ELECTION OF SERVICE – Prior to the initiation of service hereunder, the customer shall make an election of its requirements under each applicable rate schedule for the entire term of service. If mutually agreed to by Company and customer, the term of service may be amended. Upon expiration of service, the customer may apply for and receive, at the sole discretion of the Company, gas service under the appropriate sales rate schedule for the customer's operations.

   Transportation customers who cease service and then resume service within the succeeding 12 months shall be subject to a reconnection charge as specified in Rate 100, §V.17.

8. BALANCING:
   a. To the extent practicable, customer and Company agree to the daily balancing of volumes of gas received and delivered on a thermal basis. Such balancing is subject to the customer's request and the Company's discretion to vary scheduled receipts and deliveries within existing Company operating limitations.

      If, at the end of a billing month, the accumulated difference between actual gas deliveries to the customer and nominated (scheduled) receipts on behalf of such customer exceeds 4% of that month's scheduled receipts, resulting in a negative imbalance (i.e., deliveries exceed scheduled receipts), the customer will be assessed a balancing charge, set forth herein, on the imbalance exceeding 4%. If such imbalance is not eliminated by the end of the next monthly billing period, the customer shall then be billed, in addition to the applicable transportation rate,

Gas Rate Schedule

a penalty for the under nominated volume exceeding 4% at the Firm General Gas Service Rate 70 (distribution delivery charge and cost of gas). The accumulated difference between the actual gas deliveries to the customer and nominated (scheduled) receipts on behalf of such customer will be adjusted for the volume on which a penalty was imposed.

If, at the end of a billing month, the accumulated difference between nominated (scheduled) receipts on behalf of such customer and actual gas deliveries to the customer exceeds 4% of that month's scheduled receipts resulting in a positive imbalance (i.e., scheduled receipts exceed deliveries), the customer will be assessed a balancing charge, set forth herein, on the imbalance exceeding 4%. If such imbalance is not eliminated by the end of the next monthly billing period, (1) the Company may adjust the volume of gas received on behalf of the customer so as to eliminate the prior period over nomination exceeding 4% up to 10% and (2) the Company shall retain the over nomination of gas exceeding 10% free and clear of any adverse claims relating thereto when such accumulated difference exceeds 50 dk. The accumulated difference between the actual gas deliveries to the customer and nominated (scheduled) receipts on behalf of such customer will be adjusted for the volume retained.

b. In the event customer's imbalance causes the Company to incur a balancing penalty from its interconnecting pipeline(s), customer shall pay any penalty payments or overrun charges the Company is required to make under the terms of its contract(s) with interconnecting pipeline(s) resulting from such action by customer. In the event that more than one customer is obtaining gas from the same shipper and/or agent at the

same interconnection with a delivering pipeline, any payment or overrun penalties the Company is required to make shall be apportioned among such customers on the basis of each customer's contribution toward the imbalance.

c. Customer's nomination made to clear imbalances will be subject to the priority of service and allocation of capacity provisions set forth in Rate 100, §V.10 and the penalties for failure to curtail or interrupt use of gas set forth in Paragraph 5 of this rate schedule.

d. Termination of the gas transportation service shall not relieve Company and customer of the obligation to correct any quantity imbalances hereunder or customer of the obligation to pay money due hereunder to Company.

e. The Company may waive any penalty associated with Company adjustments to end-use customer nominations in those instances where the Company, due to operating limitations, is required to adjust end-use transportation customer nominations and such Company adjustments create a penalty situation, or preclude a customer from correcting an imbalance which results in a penalty.

9. NOMINATION VARIANCE CHARGE – The customer shall pay any payments the Company must make to its interconnecting pipeline(s), as a result of nomination variance penalties caused by customer's nomination variances. Such penalties will be allocated on the basis of each customer's contribution toward the nomination variance.

10. METERING REQUIREMENTS:
    a. Remote data acquisition equipment required by the Company for daily measurement will be purchased and installed by the Company prior to the initiation of service hereunder. The cost of the equipment and its installation shall be paid for by the customer. Such contribution in aid, as adjusted for federal and state income taxes, must be paid prior to the installation of such equipment unless otherwise agreed to by the Company. Such equipment will be maintained by the Company and will remain the sole property of the Company. Company may remove such equipment when service hereunder is terminated.

    b. The customer shall provide and maintain, at no cost to Company, a 120 volt, 15 ampere, AC power supply or other power source acceptable to the Company and acceptable telephone service available at customer's meter location(s). Customer agrees to provide and maintain, at no cost to the Company, any necessary telephone enhancements to assure Company of a quality telephone signal necessary to properly transmit data. The customer shall pay all charges for continuous electric and telephone service associated with the Company's connection of the electronic measurement equipment, and any interruption in such services must be promptly remedied or service under this tariff will be suspended until satisfactory corrections have been made.

    c. The Company reserves the right to charge for each service call to investigate, repair and/or reprogram the Company's remote data acquisition equipment when the service call is the result of a failure or change in communication or power source provided by customer or damage to Company's equipment.

11. DAILY NOMINATION REQUIREMENTS:
    a. Customer or customer's shipper or agent shall advise Company's gas nominations center, by 11:30 a.m. Central Clock Time, of the dk requirements customer has requested to be delivered at each delivery point the following day. Customer's daily nomination shall be its best estimate of the expected utilization for the gas day. Unless other arrangements are made, customer will be required to nominate for the non-business days involved prior to weekends and holidays.

    b. All nominations should include shipper and/or agent defined begin and end dates. Shippers and/or agents may nominate for periods longer than 1 day, provided the nomination begin and end dates are within the term of the service agreement.

    c. The Company has the sole right to refuse receipt of any volumes which exceed the maximum daily contract quantity and at no time shall the Company be required to accept quantities of gas for a customer in excess of the quantities of gas to be delivered to customer. If total nominated receipts exceed total deliveries at receipt points where more than one customer is receiving service, nominations will be allocated on a pro rata basis.

    d. At no time shall Company have the responsibility to deliver gas in excess of customer's nomination.

    e. In the event that more than one customer is receiving gas from the same shipper and/or agent at the same receipt point, any reduction in nominated volumes will be allocated on a pro rata basis, unless Company and shipper(s) and/or agent(s) have agreed to a predetermined allocation procedure.

TRANSPORTATION SERVICE Rates 81 and 82

12. WARRANTY – The customer, customer's agent, or customer's shipper warrants that it will have title to all gas it tenders or causes to be tendered to the Company, and such gas shall be free and clear of all liens and adverse claims and the customer, customer's agent, or customer's shipper shall indemnify the Company against all damages, costs, and expenses of any nature whatsoever arising from every claim against said gas.

13. FACILITY EXTENSIONS - If facilities are required in order to furnish gas transportation service, and those facilities are in addition to the facilities required to furnish firm gas service, the customer shall pay for those additional facilities and their installation in accordance with the Company's applicable natural gas extension policy. Company may remove such facilities when service hereunder is terminated.

14. PAYMENT – Billed amounts will be considered past due if not paid by the due date shown on the bill. Past due bills are subject to a late payment charge in accordance with the provisions of Rate 100, §V.11, or any amendments or alterations thereto.

15. BILLING ERROR – In the event an error is discovered in any bill that the Company renders to customer, such error shall be adjusted within a period not to exceed 6 months from the date the billing error is first discovered.

16. AGREEMENT – Upon request of the Company, customer may be required to enter into an agreement for service hereunder.

17. The foregoing schedule is subject to Rates 100 through 124 and any amendments or alterations thereto or additional rules and regulations promulgated by the Company under the laws of the state.

Original Sheet No. 27

LARGE INTERRUPTIBLE GENERAL GAS SERVICE Rate 85

Availability:

In all communities served for all interruptible general gas service customers whose interruptible natural gas load will exceed 100,000 dk annually as metered at a single delivery point. The rates herein are applicable only to customer's interruptible load. Customer's firm natural gas requirements must be separately metered or specified in a firm service agreement. Customer's firm load shall be billed at Firm General Gas Service Rate 70. For interruption purposes, the maximum daily firm requirement shall be set forth in the firm service agreement.

This rate schedule shall not apply for service to U.S. Government installations, which are covered by separate special contracts.

The Company reserves the right to refuse the initiation of service under this rate schedule based on the availability of gas supply.

Rate:

Basic Service Charge	$675.00 per month	
Distribution Delivery Charge	Maximum $1.003 per dk	Minimum $.298 per dk
Cost of Gas	Determined Monthly- See Rate Summary Sheet for Current Rate	

Minimum Bill:

Basic Service Charge.

Payment:

Billed amounts will be considered past due if not paid by the due date shown on the bill. Past due bills are subject to a late payment charge in accordance with the provisions of Rate 100, §V.11, or any amendments or alterations thereto.

Cost of Purchased Gas:

The cost of gas includes all applicable cost of gas items as defined in the Purchased Gas Cost Adjustment Rate 88 or any amendments or alterations thereto. The cost of gas component is subject to change on a monthly basis.

Gas Rate Schedule

LARGE INTERRUPTIBLE GENERAL GAS SERVICE Rate 85

General Terms and Conditions:

1. PRIORITY OF SERVICE – Deliveries of gas under this schedule shall be subject at all times to the prior demands of customers served on the Company's firm general gas service rates, and the Company shall have the right to interrupt deliveries to customers under this schedule without being required to give previous notice of intention to so interrupt whenever, in Company's sole judgment, it may be necessary to do so to protect the interest of its customers whose capacity requirements are otherwise and hereby given preference. The priority of service and allocation of capacity shall be accomplished in accordance with the provisions of Rate 100, §V.10.

2. PENALTY FOR FAILURE TO CURTAIL OR INTERRUPT – If customer fails to curtain or interrupt their use of gas hereunder when requested to do so by the Company, any gas taken shall be billed at the Firm General Gas Service Rate 70 (distribution delivery charge and cost of gas), plus either an amount equal to any penalty payments or overrun charges the Company is required to make to its interconnecting pipeline(s) under the terms of its contract(s) as a result of such failure to curtail or interrupt, or $50.00 per dk of gas used in excess of the volume of gas to which customer was requested to curtail or interrupt, whichever amount is greater. The Company, in its discretion, may shut off customer's supply of gas in the event of customer's failure to curtail or interrupt use of gas when requested to do so by the Company.

3. AGREEMENT – Customer will be required to enter into an agreement for service hereunder for a minimum term of 12 months. Written notice of termination by either Company or customer must be given at least 90 days prior to the end of the initial term. Absent execution of such termination notice, the agreement shall continue for additional terms of equal length until written notice is given as provided herein, prior to the end of any subsequent term. Upon expiration of service, the customer may apply for and receive, at the sole discretion of the Company, gas service under this rate or another appropriate rate schedule for the customer's operations.

LARGE INTERRUPTIBLE GENERAL GAS SERVICE Rate 85

4. OBLIGATION TO NOTIFY COMPANY OF CHANGE IN DAILY OPERATIONS - Customer will be required as specified in the service agreement to notify Company of an anticipated change in daily operations. Failure to comply with requirements specified in the service agreement may result in the assessment of penalties to the customer equal to the penalty amounts Company must pay to the interconnecting pipeline caused by customer's action.

5. METERING REQUIREMENTS –Remote data acquisition equipment required for daily measurement will be installed by the Company, at its sole discretion, prior to the initiation of service hereunder.

   The customer shall be required to provide and maintain, at no cost to Company, a 120 volt, 15 ampere, AC power supply, or other power source acceptable to the Company, and acceptable telephone service available at customer's meter location(s). Customer agrees to provide and maintain, at no cost to the Company, any necessary telephone enhancements to assure Company of a quality telephone signal necessary to properly transmit data. The customer shall pay all charges for continuous electric and telephone service associated with the Company's connection of the electronic measurement equipment, and any interruption in such services must be promptly remedied or service under this tariff will be suspended until satisfactory corrections have been made.

   The Company reserves the right to charge for each service call to investigate, repair and/or reprogram the Company's remote data acquisition equipment when the service call is the result of a failure or change in communication or power source provided by customer or damage to Company's equipment.

6. The foregoing schedule is subject to Rates 100 through 124 and any amendments or alterations thereto or additional rules and regulations promulgated by the Company under the laws of the state.

Gas Rate Schedule

PURCHASED GAS COST ADJUSTMENT Rate 88

(3) The gas commodity cost shall reflect all commodity related gas costs estimated to be in effect for the month the PGA will be in effect and annual dk requirements.

(4) The return on prepaid demand and commodity balances and storage balances shall be computed on an annual basis at the overall rate of return on rate base.

The cost per dk for the month is the sum of the above divided by annual, weather normalized dk deliveries adjusted to reflect losses.

(c) Monthly gas costs shall be calculated as follows:

(1) Demand costs for firm customers shall be apportioned to all state jurisdictions served by Montana-Dakota on the basis of the overall ratio of each state's Maximum Daily Delivery Quantity (MDDQ).

(2) Demand costs for interruptible sales customers shall be stated on a 100% load factor basis.

(3) All commodity costs and other costs associated with the acquisition of gas for general system supply shall be apportioned to each state on the basis of total dks sold in each state, regardless of the actual points of delivery of such gas.

(4) The return requirement related to prepaid demand and commodity charges and gas storage balances shall be included on a per dk basis. The prepaid demand and storage balances shall be apportioned to all states on the basis of each state's MDDQ. The prepaid commodity charges shall be apportioned to all states on the basis of annual dks sold in each state. The unit cost shall be calculated using a thirteen-month average balance and the currently authorized return on rate base.

(5) All costs related to specific end-use transactions shall not be included in the cost of gas supply determination but shall be directly billed to the customer(s) contracting for such service.

PURCHASED GAS COST ADJUSTMENT Rate 88

(d) The PGA shall be applied to each of Montana-Dakota's rate schedules recognizing differences among customer classes consistent with the cost of gas supply included in the applicable class sales rate.

4. Surcharge Adjustment:

(a) All sales rate schedules shall be subject to a Surcharge Adjustment to be effective on May 1 of each year. The Surcharge Adjustment per dk sold shall reflect amortization of the applicable balance in the Unrecovered Purchased Gas Cost Account calculated by dividing the applicable balance by the estimated dk sales for the twelve months following the effective date of the adjustment.

5. Unrecovered Purchased Gas Account:

(a) Items to be included in the Unrecovered Purchased Gas Cost Account, as calculated in accordance with Subsection 5(b) are:

(1) Charges for gas supply which Montana-Dakota is unable to reflect in a Purchased Gas Cost Adjustment by reason of the ten cent minimum limitation set forth in Subsection 2(b).

(2) Amounts of increased/decreased charges for gas supplies, which were paid during any period after the effective date of the most recent general rate case, but not yet included in sales rates.

(3) Refunds received from supplier(s) with respect to gas supply. Such refunds received shall be credited to the Unrecovered Purchased Gas Cost Account.

(4) Carrying charges or credits at a rate equal to the three-month Treasury Bill rate as published monthly by the Federal Reserve Board.

(5) Demand costs recovered from the interruptible sales customers will be credited to the residential and firm general service customers.

(b)

(1) The amount to be included in the Unrecovered Purchased Gas Cost Account in order to reflect the items specified in Subsections 5(a)(1), (2), and (3) shall be calculated as follows:

State of North Dakota
Gas Rate Schedule

PURCHASED GAS COST ADJUSTMENT Rate 88

(i) Montana-Dakota shall first determine each month the unit cost for that month's natural gas supply as adjusted to levelize demand charges.

Such adjustment to levelize supplier(s) demand charges shall be calculated as follows:

The supplier's annual (calendar or fiscal) demand charges, which are payable in equal monthly payments shall be accumulated in a prepaid account (FERC Account 165). Each month a portion of such accumulated prepaid amount shall be amortized to cost of natural gas purchased (FERC Account 804). Such monthly amortization shall be based on a rate calculated by dividing the annual supplier(s) demand charges by projected annual natural gas sales units (calendar or fiscal, as appropriate). The resulting product shall then be multiplied by the projected natural gas unit sales for the current month. Such amount shall constitute the monthly amortization of prepaid supplier(s) demand charges to cost of natural gas supply.

(ii) Montana-Dakota shall then subtract from each month's unit cost, the unit cost for gas supply which is reflected in the currently effective PGA.

(iii) The resulting difference (which may be positive or negative) shall be multiplied by the dks sold during that month under each rate schedule. The resulting amounts shall be reflected in an Unrecovered Purchased Gas Cost Account for each rate schedule.

(1) Montana-Dakota will calculate carrying charges on the amounts in the Unrecovered Purchased Gas Cost Account, Account 191, at a rate equal to the three-month Treasury Bill rate as published monthly by the Federal Reserve Board. The amount to be included in Account 191 for carrying charges shall be determined as follows:

Gas Rate Schedule

PURCHASED GAS COST ADJUSTMENT Rate 88

Each month, Account 191 shall be debited (if the balance in said account is a debit balance) and shall be credited (if the balance in said account is a credit balance) for a carrying charge; which shall be the product of (i) and (ii) below:

(i) The balance in Account 191 as of the end of the immediately preceding month, exclusive of carrying charges accrued pursuant to this Subsection (b)(2) and net of the related deferred tax amounts in Accounts 283 or 190, as appropriate.

(ii) One-twelfth of the annual interest rate as set forth in this Subsection (b)(2). The carrying charges shall be accrued in a supplementary Unrecovered Purchased Gas Cost Account for each rate schedule, and carrying charges shall not be computed on the amounts in such supplementary account.

(b) Reduction of Amounts in the Unrecovered Purchased Gas Cost Account:

(1) The amounts in the Unrecovered Purchased Gas Cost Account shall be decreased each month by an amount determined by multiplying the currently effective surcharge adjustment included in rates for that month (as calculated in Section 4) by the dks sold during that month under each rate schedule. The account shall be increased in the event the adjustment is a negative amount.

(2) The amount amortized each month shall be applied pro rata between the amounts in the Unrecovered Purchased Gas Cost Account specified in Subsections 5(a)(1), (2), (3) and (5) and the amounts in the supplementary Unrecovered Purchased Gas Cost Account specified in Subsection 5(a)(4).

6. Market-Based Pricing Differential:

(a) At the time of each surcharge adjustment, the Company will compute a credit to residential and firm general service rates based on 50% of all distribution delivery charge revenues received from small interruptible sales and large interruptible sales customers in excess of the authorized minimum distribution delivery charge rate approved in the most recent general rate case.

Original Sheet No. 41

PURCHASED PROPANE COST ADJUSTMENT Rate 99

1. **Availability:**
This rate schedule constitutes a purchased propane cost adjustment (PCA) provision and specifies the procedure to be utilized to adjust the rates for propane gas sold under Montana-Dakota's rate schedules in order to reflect: (a) changes in Montana-Dakota's average cost of propane supply and (b) amortization of the Unrecovered Purchased Propane Cost Account.

2. **Effective Date and Limitation on Adjustments:**
(a) The effective dates of the PCA shall be bills rendered on and after the first day of each month, unless the Commission shall otherwise order.

(b) Montana-Dakota shall file a PCA to reflect changes in its average cost of propane supply only when the amount of such change in PCA is at least 10 (ten) cents per dk. The adjustment to be effective May 1 shall be filed each year, regardless of the amount of the change.

3. **Purchased Propane Cost:**
(a) The monthly PCA shall reflect changes in Montana-Dakota's cost of propane supply as compared to the cost of propane supply approved in its most recent PCA . The cost of propane supply shall include, but not be limited to, all commodity and transportation charges incurred by Montana-Dakota for such propane supply.

(b) The propane commodity cost shall reflect all commodity related propane costs estimated to be incurred for the month the PCA will be in effect and estimated dk purchases.

The unit cost per dk for the month shall be the commodity costs divided by estimated dk purchases for the month.

4. **Surcharge Adjustment:**
All propane sales schedules shall be subject to a Surcharge Adjustment to be effective on May 1 each year. The Surcharge Adjustment per dk sold shall reflect amortization of the applicable balance in the Unrecovered Purchased Propane Cost Account calculated by dividing the applicable balance by the estimated dk sales for the twelve months following the effective date of the adjustment.

5. Unrecovered Purchased Propane Cost Account:

(a) Items to be included in the Unrecovered Purchased Propane Cost Account, as calculated in accordance with Subsection 5(b) are:

(1) Charges for propane supply which Montana-Dakota is unable to reflect in a Purchased Propane Cost Adjustment by reason of the ten cent minimum limitation set forth in Subsection 2(b).

(2) Amounts of increased/decreased charges for propane supplies that were paid during any period after the effective date of the most recent approved rates, but not yet included in propane sales rates.

(3) Carrying charges or credits.

(b)

(1) The amount to be included in the Unrecovered Purchased Propane Cost Account in order to reflect the items specified in Subsections 5(a)(1) and (2) shall be calculated as follows:

(i) Montana-Dakota shall first determine each month the unit cost for that month's propane supply.

(ii) Montana-Dakota shall then subtract from each month's unit cost, the unit cost for propane supply, which is reflected in the currently effective PCA.

(iii) The resulting difference (which may be positive or negative) shall be multiplied by the dks sold during that month under each propane rate schedule. The resulting amounts shall be reflected in an Unrecovered Purchased Propane Cost Account for each rate schedule.

(2) Montana-Dakota will calculate carrying charges on the amounts in the Unrecovered Purchased Propane Cost Account, Account 191, as follows:

Each month, Account 191 shall be debited (on a debit balance) or credited (on a credit balance) for a carrying charge, which shall be the product of (i) and (ii) below:

State of North Dakota
Gas Rate Schedule

I. **PURPOSE:**

These rules are intended to define good practice which can normally be expected, but are not intended to exclude other accepted standards and practices not covered herein. They are intended to ensure adequate service to the public and protect the Company from unreasonable demands.

The Company undertakes to furnish service subject to the rules and regulations of the Public Service Commission of North Dakota and as supplemented by these general provisions, as now in effect or as may hereafter be lawfully established, and in accepting service from the Company, each customer agrees to comply with and be bound by said rules and regulations and the applicable rate schedules.

II. **DEFINITIONS:**

The following terms used in this tariff shall have the following meanings, unless otherwise indicated:

AGENT – The party authorized by the transportation service customer to act on that customer's behalf.

APPLICANT – A customer requesting Company to provide service.

COMMISSION – Public Service Commission of the State of North Dakota.

COMPANY – Montana-Dakota Utilities Co.

COMPANY'S OPERATING CONVENIENCE – The utilization, under certain circumstances, of facilities or practices not ordinarily employed which contribute to the overall efficiency of Company's operations. This does not refer to the customer's convenience nor to the use of facilities or adoption of practices required to comply with applicable laws, ordinances, rules or regulations, or similar requirements of public authorities.

CURTAILMENT – A reduction of transportation or retail natural gas service deemed necessary by the Company. Also includes any reduction of transportation natural gas service deemed necessary by the pipeline.

Gas Rate Schedule

GENERAL PROVISIONS Rate 100

CUSTOMER – Any individual, partnership, corporation, firm, other organization or government agency supplied with service by Company at one location and at one point of delivery unless otherwise expressly in these rules or in a rate schedule.

DELIVERY POINT – The point at which customer assumes custody of the gas being transported. This point will normally be at the outlet of Company's meter(s) located on customer's premises.

GAS DAY – Means a period of twenty-four consecutive hours, beginning and ending at 9:00 a.m. Central Clock Time.

INTERRUPTION – A cessation of transportation or retail natural gas service deemed necessary by Company.

NOMINATION – The daily dk volume of natural gas requested by customer for transportation and delivery to customer at the delivery point during a gas day.

PIPELINE – The transmission company(s) delivering natural gas into company's system.

RATE – Shall mean and include every compensation, charge, fare, toll, rental and classification, or any of them, demanded, observed, charged or collected by the Company for any service, product, or commodity, offered by the Company to the public, and any rules, regulations, practices or contracts affecting any such compensation, charge, fare, toll, rental or classification.

RECEIPT POINT – The intertie between Company and the interconnecting pipeline(s) at which point Company assumes custody of the gas being transported.

SHIPPER – The party with whom the Pipeline has entered into a service agreement for transportation services.

III. **CUSTOMER OBLIGATION:**

1. APPLICATION FOR SERVICE – A customer desiring gas service must make application to the Company before commencing the use of the Company's service. The Company reserves the right to require a signed application or written contract for service to be furnished. All applications and contracts for service must be made in the legal name of the customer desiring the service. The Company may refuse a customer or terminate service to a customer who fails or refuses to furnish reasonable information requested by the Company for the establishment of a service account. Any customer who uses gas service in the absence of application or contract shall be subject to the Company's rates, rules, and regulations and shall be responsible for payment of all service used.

   Subject to rates, rules, and regulations, the Company will continue to supply gas service until notified by customer to discontinue the service. The customer will be responsible for payment of all service furnished through the date of discontinuance.

   Any customer may be required to make a deposit as required.

2. INPUT RATING – All new customers whose consumption of gas for any purpose will exceed an input of 2,500,000 Btu per hour, metered at a single delivery point, shall consult with the Company and furnish details of estimated hourly input rates for all gas utilization equipment. Where system design capacity permits, such customers may be served on a firm basis. Where system design capacity is limited, and at Company's sole discretion, Company will serve all such new customers on an interruptible basis only. Architects, contractors, heating engineers and installers, and all others should consult with the Company before proceeding to design, erect or redesign such installations for the use of natural gas. This will ensure that such equipment will conform to the Company's ability to adequately serve such installations with gas.

3. ACCESS TO CUSTOMER'S PREMISES – Company representatives, when properly identified, shall have access to customer's premises at all reasonable times for the purpose of reading meters, making repairs, making inspections, removing the Company's property, or for any other purpose incidental to the service.

4. COMPANY PROPERTY – The customers shall exercise reasonable diligence in protecting the Company's property on their premises, and shall be liable to the Company in case of loss or damage caused by their negligence or that of their employees.

5. INTERFERENCE WITH COMPANY PROPERTY – The customer shall not disconnect, change connections, make connections or otherwise interfere with Company's meters or other property or permit same to be done by other than the Company's authorized employees.

6. RELOCATED LINES - Where Company facilities are located on a public or private utility easement and there is a building encroachment(s), over gas facilities (Company-owned main, Company-owned service line or customer-owned service line) the customer shall be charged for line relocation on the basis of actual costs incurred by the Company including any required easements.

7. NOTIFICATION OF LEAKS – The customer shall immediately notify the Company at its office of any escape of gas in or about the customer's premises.

8. TERMINATION OF SERVICE – All customers are required to notify the Company, to prevent their liability for service used by succeeding tenants, when vacating their premises. Upon receipt of such notice, the Company will read the meter and further liability for service used on the part of the vacating customer will cease.

9. REPORTING REQUIREMENTS – Customer shall furnish Company all information as may be required or appropriate to comply with reporting requirements of duly constituted authorities having jurisdiction over the matter herein.

IV. **LIABILITY**

1. CONTINUITY OF SERVICE – The Company will use all reasonable care to provide continuous service but does not assume responsibility for a regular and uninterrupted supply of gas service and will not be liable for any loss, injury, death, or damage resulting from the use of service, or arising from or caused by the interruption or curtailment of the same.

2. CUSTOMER'S EQUIPMENT – Neither by inspection or non-rejection, nor in any other way does the Company give any warranty, express or implied, as to the adequacy, safety or other characteristics of any structures, equipment, lines, appliances or devices owned, installed or maintained by the customer or leased by the customer from third parties.

3. COMPANY EQUIPMENT AND USE OF SERVICE – The Company will not be liable for any loss, injury, death or damage resulting in any way from the supply or use of gas or from the presence or operation of the Company's structures, equipment, lines, appliances or devices on the customer's premises, except loss, injuries, death, or damages resulting from the negligence of the Company.

4. INDEMNIFICATION – Customer agrees to indemnify and hold Company harmless from any and all injury, death, loss or damage resulting from customer's negligent or wrongful acts under and during the term of service. Company agrees to indemnify and hold customer harmless from any and all injury, death, loss or damage resulting from Company's negligent or wrongful acts under and during the term of service.

5. FORCE MAJEURE – In the event of either party being rendered wholly or in part by force majeure unable to carry out its obligations, then the obligations of the parties hereto, so far as they are affected by such force majeure, shall be suspended during the continuance of any inability so caused. Such causes or contingencies affecting the performance by either party, however, shall not relieve it of liability in the event of its concurring negligence or in the event of its failure to use due diligence to remedy the situation and remove the cause in an adequate manner and with all reasonable dispatch, nor shall such causes or contingencies affecting the performance relieve either party from its obligations to make payments of amounts then due hereunder, nor

shall such causes or contingencies relieve either party of liability unless such party shall give notice and full particulars of the same in writing or by telephone to the other party as soon as possible after the occurrence relied on. If volumes of customer's gas are destroyed while in Company's possession by an event of force majeure, the obligations of the parties shall terminate with respect to the volumes lost.

The term "force majeure" as employed herein shall include, but shall not be limited to, acts of God, strikes, lockouts or other industrial disturbances, failure to perform by any third party, which performance is necessary to the performance by either customer or Company, acts of the public enemy or terrorists, wars, blockades, insurrections, riots, epidemics, landslides, lightning, earthquakes, fires, storms, floods, washouts, arrest and restraint of rulers and peoples, civil disturbances, explosions, breakage or accident to machinery or lines of pipe, line freeze-ups, sudden partial or sudden entire failure of gas supply, failure to obtain materials and supplies due to governmental regulations, and causes of like or similar kind, whether herein enumerated or not, and not within the control of the party claiming suspension, and which by the exercise of due diligence such party is unable to overcome; provided that the exercise of due diligence shall not require settlement of labor disputes against the better judgment of the party having the dispute.

The term "force majeure" as employed herein shall also include, but shall not be limited to, inability to obtain or acquire, at reasonable cost, grants, servitudes, rights-of-way, permits, licenses, or any other authorization from third parties or agencies (private or governmental) or inability to obtain or acquire at reasonable cost necessary materials or supplies to construct, maintain, and operate any facilities required for the performance of any obligations under this agreement, when any such inability directly or indirectly contributes to or results in either party's inability to perform its obligations.

V. **GENERAL TERMS AND CONDITIONS:**

1. AGREEMENT – Upon request of the Company, customer may be required to enter into an agreement for any service.

APPROVED NORTH DAKOTA
PUBLIC SERVICE COMMISSION
DEC 18 2002
CASE NO. PU-399-02-183

Montana-Dakota Utilities Co.
A Division of MDU Resources Group, Inc.
400 N 4th Street
Bismarck, ND 58501

State of North Dakota
Gas Rate Schedule

2. RATE OPTIONS – Where more than one rate schedule is available for the same class of service, the Company will assist the customer in selecting the applicable rate schedule(s). The Company is not required to change a customer from one rate schedule to another more often than once in twelve months unless there is a material change in the customer's load which alters the availability and/or applicability of such rate(s), or unless a change becomes necessary as a result of an order issued by the Commission or a court having jurisdiction. The Company will not be required to make any change in a fixed term contract except as provided therein.

3. RULES FOR APPLICATION OF GAS SERVICE:
   (a) Residential gas service is available to any residential customer for domestic purposes only. Residential gas service is defined as service for general domestic household purposes in space occupied as living quarters, designed for occupancy by one family. Typical service would include the following: separately metered units, such as single private residences, single apartments, mobile homes and sorority and fraternity houses (this is not an all-inclusive list). In addition, auxiliary buildings on the same premise as the living quarters, used for residential purposes, may be served on the residential rate.

   (b) Nonresidential service is defined as service provided to a business enterprise in space occupied and operated for nonresidential purposes. Typical service would include stores, offices, shops, restaurants, boarding houses, hotels, service garages, wholesale houses, filling stations, barber shops, beauty parlors, master metered apartment houses, common areas of shopping malls or apartments (such as halls or basements), churches, elevators, schools and facilities located away from the home site (this is not an all-inclusive list).

   (c) The definitions above are based upon the supply of service to an entire premise through a single delivery and metering point. Separate supply for the same customer at other points of consumption may be separately metered and billed.

   (d) If separate metering is not practical for a single unit (one premise) that is using gas for both domestic purposes and for conducting business (or for

(e) nonresidential purposes as defined herein), the customer will be billed under the predominate use policy. Under this policy, the customer's combined service is billed under the rate (Residential or Nonresidential) applicable to the type of service which constitutes 50% or more of the customer's total connected load.

e. Other classes of service furnished by the Company shall be defined in applicable rate schedules or in rules and regulations pertaining thereto. Service to customers for which no specific rate schedule is applicable shall be billed on the Nonresidential rates.

4. DISPATCHING – Transportation customers will adhere to gas dispatching policies and procedures established by Company to facilitate transportation service. Company will inform customer of any changes in dispatching policies that may affect transportation services as they occur.

5. RULES COVERING GAS SERVICE TO MANUFACTURED HOMES – The rules and regulation for providing gas service to manufactured homes are in accordance with the Code of Federal Regulations (24CFR Part 3280 – Manufactured Homes Construction and Safety Standards) Subpart G and H which pertain to gas piping and appliance installation. In addition to the above rules, the Company also follows the regulations set forth in the NFPA 501A, Fire Safety Criteria for Manufactured Home Installations, Sites, and Communities.

6. CONSUMER DEPOSITS – The Company will determine whether or not a deposit shall be required of an applicant for gas service in accordance with Commission rules.

   (a) The amount of such deposit shall not exceed one and one-half times the estimated amount of one month's average bill.

   (b) The Company may accept in lieu of a cash deposit a contract signed by a guarantor, satisfactory to the Company, whereby the payment of a specified sum not to exceed the required cash deposit is guaranteed. The term of such contract shall be indeterminate, but it shall automatically terminate when the customer gives notice of service discontinuance to

Gas Rate Schedule

the Company or a change in location covered by the guarantee agreement of thirty days after written request for termination is made to the utility by the guarantor. However, no agreement shall be terminated without the customer having made satisfactory settlement for any balance, which the customer owes the Company. Upon termination of a guarantee contract, a new contract or a cash deposit may be required by the Company.

A deposit shall earn interest at the rate paid by the Bank of North Dakota on a six-month certificate of deposit as of the first business day of each year. Interest shall be credited to the customer's account annually during the month of December.

Deposits with interest shall be refunded to customers at termination of service provided all billings for service have been paid. Deposits with interest will be refunded to all active customers, after the deposit has been held for twelve months, provided prompt payment record has been established.

7. METERING AND MEASUREMENT:
   (a) Company will meter the volume of natural gas delivered to customer at the delivery point. Such meter measurement will be conclusive upon both parties unless such meter is found to be inaccurate, in which case the quantity supplied to customer shall be determined by as correct an estimate as it is possible to make, taking into consideration the time of year, the schedule of customer's operations and other pertinent facts. Company will test meters in accordance with applicable state utility rules and regulations.

   (b) Transportation customers agree to provide the cost of the installation of remote data acquisition equipment to Company before transportation service is implemented.

8. MEASUREMENT UNIT FOR BILLING PURPOSES – The measurement unit for billing purposes shall be one (1) decatherm (dk), unless otherwise specified. Billing will be calculated to the nearest one-tenth (1/10) dk. One dk equals 10 therms or 1,000,000 Btu's. Dk's shall be calculated by the

Gas Rate Schedule

application of a thermal factor to the volumes metered. This thermal factor consists of:

(a) An altitude adjustment factor used to convert metered volumes at local sales base pressure to a standard pressure base of 14.73 psia, and

(b) A Btu adjustment factor used to reflect the heating value of the gas delivered.

9. UNIT OF VOLUME FOR MEASUREMENT – The unit of volume for purpose of measurement shall be one (1) cubic foot of gas at either local sales base pressure or 14.73 psia, as appropriate, and at a temperature base of sixty degrees Fahrenheit (60°F). All measurement of natural gas by orifice meter shall be reduced to this standard by computation methods, in accordance with procedures contained in ANSI-API Standard 2530, First Edition, as amended. Where natural gas is measured with positive displacement or turbine meters, correction to local sales base pressure shall be made for actual pressure and temperature with factors calculated from Boyle's and Charles' Laws. Where gas is delivered at 20 psig or more, the deviation of the natural gas from Boyle's Law shall be determined by application of Supercompressibility Factors for Natural Gas published by the American Gas Association, Inc., copyright 1955, as amended or superseded. Where gas is measured with electronic correcting instruments at pressures greater than local sales base, supercompressibility will be calculated in the corrector using AGA-3/NX-19, as amended, supercompressibility calculation. For handbilled accounts, application of supercompressibility factors will be waived on monthly-billed volumes of 250 dk or less.

10. PRIORITY OF SERVICE AND ALLOCATION OF CAPACITY – Priority of Service from Highest to Lowest:
    (a) Priority 1 – Firm sales services.
    (b) Priority 2 – Small interruptible sales and small interruptible transportation services at the maximum rate on a pro rata basis.
    (c) Priority 3 – Large interruptible sales and large interruptible transportation services at the maximum rate on a pro rata basis.

Gas Rate Schedule

GENERAL PROVISIONS Rate 100

(d) Priority 4 – Small interruptible transportation services at less than the maximum rate from the highest rate to the lowest rate and on a pro rata basis where equal rates are applicable among customers.
(e) Priority 5 – Large interruptible transportation services at less than the maximum rate from the highest rate to the lowest rate and on a pro rata basis where equal rates are applicable among customers.
(f) Priority 6 – Gas scheduled to clear imbalances.

Montana-Dakota shall have the right, in its sole discretion, to deviate from the above schedule when necessary for system operational reasons and if following the above schedule would cause an interruption in service to a customer who is not contributing to an operational problem on Montana-Dakota's system.

Montana-Dakota reserves the right to provide service to customers with lower priority while service to higher priority customers is being curtailed due to restrictions at a given delivery or receipt point. When such restrictions are eliminated, Montana-Dakota will reinstate sales and/or transportation of gas according to each customer's original priority.

11. LATE PAYMENT – Amounts billed will be considered past due if not paid by the due date shown on the bill. An amount equal to 1% per month will be applied to any unpaid balance existing at the immediate subsequent billing date, provided however, that such amount shall not apply where a bill is in dispute or a formal complaint is being processed. All payments received will apply to the customer's account prior to calculating the late payment charge. Those payments applied shall satisfy the oldest portion of the bill first.

12. RETURNED CHECK CHARGE – A charge of $10.00 will be collected by the Company for each check charged back to the Company by a bank.

13. TAX CLAUSE – In addition to the charges provided for in the gas tariffs of the Company, there shall be charged pro rata amounts which, on an annual basis, shall be sufficient to yield to the Company the full amount of any sales

use or excise taxes, whether they be denominated as license taxes, occupation taxes, business taxes, privilege taxes, or otherwise, levied against or imposed upon the Company by any municipality, political subdivision, or other entity, for the privilege of conducting its utility operations therein.

The charges to be added to the customer's service bills under this clause shall be limited to the customers within the corporate limits of the municipality, political subdivision or other entity imposing the tax.

14. UTILITY CUSTOMER SERVICES:
(a) The following services will be performed at no charge regardless of the time of performance:

(1) Fire and explosions calls.

(2) Investigate hazardous condition on customer premises, such as gas leaks, odor complaints, combustion gas fumes.

(3) Maintenance or repair of Company-owned facilities on the customer's premises.

(b) The following service calls will be performed at no charge during the Company's normal business hours:

(1) Cut-ins and cut-outs.

(2) Disconnecting of gas appliances permanently removed from service or in connection with cut-outs.

(3) Lighting pilots, inspecting, and adjusting gas equipment in connection with establishing service when working cut-in orders.

(4) Initial burner adjustment on residential gas burning appliances.

Gas Rate Schedule

(5) High bills or inadequate service complaints.

(6) Location of underground Company facilities and customer-owned gas service lines for contractors, builders, plumbers, etc.

(7) Pilot relighting, testing thermocouple for proper operation and any pilot cleaning that can be done without removing pilot assembly.

(8) Service calls for routine cut-ins, when the order is received prior to 12:00 p.m. on a regular work day, requiring service on the date the order is received, will be considered as non-chargeable regardless if work is performed outside of normal working hours.

15. UTILITY SERVICES PERFORMED AFTER NORMAL BUSINESS HOURS – For service requested by customers after the Company's normal business hours and on Saturday, Sunday, or legal holidays, a charge will be made for labor at standard overtime service rates and materials at retail prices.

    Customers requesting service after the Company's normal business hours will be informed of the after hour service rate and encouraged to have the service performed during normal business hours.

16. NOTICE TO DISCONTINUE GAS SERVICE – Customers desiring to have their gas service disconnected shall notify the Company during regular business hours, one business day before service is to be disconnected. Such notice shall be by letter, personal visit or telephone call to the Company's local business office, in communities which an office is maintained. In other communities such notice shall be given to the Company's representative who services the community or to the nearest business office. Saturdays, Sundays and legal holidays are not considered business days.

17. RECONNECTION FEE FOR SEASONAL OR TEMPORARY CUSTOMER –A customer who requests reconnection of service, during normal working hours, at a location where same customer discontinued the same service during the preceding 12-month period will be charged the Basic Service Charge applicable during the period while service was not being used or a minimum of $30.00. The minimum will be based on standard overtime rates for reconnection of service after normal business hours.

    Transportation customers who cease service and then resume service within the succeeding 12 months shall be subject to a reconnection charge of $160.00 whenever reinstallation of the required electronic measurement equipment is necessary.

18. DISCONNECTION OF SERVICE FOR NONPAYMENT OF BILLS – All amounts billed for service are due when rendered and will be considered delinquent if not paid by due date shown on the bill. If any customer shall become delinquent in the payment of amounts billed, such service may be discontinued by the Company under the applicable rules of the Commission. The Company may collect a fee of $12.00 before restoring gas service, which has been disconnected for nonpayment of service bills during normal business hours. Standard overtime rates will apply for services performed after normal business hours.

19. DISCONNECTION OF SERVICE FOR CAUSES OTHER THAN NONPAYMENT OF BILLS – The Company reserves the right to discontinue service for any of the following reasons:

    (a) In the event of customer use of equipment in such a manner as to adversely affect the Company's equipment or service to others.

    (b) In the event of tampering with the equipment furnished and owned by the Company.

    (c) For violation of or noncompliance with the Company's rules on file with the Commission.

Gas Rate Schedule

(d) For failure of the customer to fulfill the contractual obligations imposed as conditions of obtaining service.

(e) For refusal of reasonable access to property to the agent or employee of the Company for the purpose of inspecting the facilities or for testing, reading, maintaining or removing meters.

The right to discontinue service for any of the above reasons may be exercised whenever and as often as such reasons may occur, and any delay on the part of the Company in exercising such rights, or omission of any action permissible hereunder, shall not be deemed a waiver of its rights to exercise same.

Nothing in these regulations shall be construed to prevent discontinuing service without advance notice for reasons of safety, health, cooperation with civil authorities, or fraudulent use, tampering with or destroying Company facilities.

The Company may collect a reconnect fee of $12.00 before restoring gas service, which has been disconnected for the above causes.

20. UNAUTHORIZED USE OF SERVICE – Unauthorized use of service is defined as any deliberate interference such as tampering with a Company meter, pressure regulator, registration, connections, equipment, seals, procedures or records that result in a loss of revenue to the Company. Unauthorized service is also defined as reconnection of service that has been terminated, without the Company's consent.

(a) Examples of unauthorized use of service include the following, but are not limited to:

(1) Bypass piping around meter.
(2) Bypass piping installed in place of meter.

(3) Meter reversed.
(4) Meter index disengaged or removed.
(5) Service or equipment tampered with or piping connected ahead of meter.
(6) Tampering with meter or pressure regulator that affects the accurate registration of gas usage.
(7) Gas being used after service has been discontinued by the Company.
(8) Gas being used after service has been discontinued by the Company as a result of a new customer turning gas on without the proper connect request.

(b) In the Event that there has been unauthorized use of service, customer shall be charged for:

(1) Time, material and transportation costs used in investigation.
(2) Estimated charge for non-metered gas.
(3) On-premise time to correct situation.
(4) Any damage to Company property.

(c) Customer service so disconnected shall be reconnected after a customer has furnished satisfactory evidence of compliance with Company's rules and conditions of service, and paid all charges as hereinafter set forth in this procedure.

(1) All delinquent bills, if any.
(2) The amount of any Company revenue loss attributable to said tampering.
(3) Expenses incurred by the Company in replacing or repairing the meter or other appliance costs incurred in preparation of the bill, plus costs as outlined in number 20.b above.
(4) Reconnection fee applicable.
(5) A cash deposit, the amount of which will not exceed the maximum amount determined in accordance with Commission Rules.

INTERRUPTIBLE GAS SERVICE EXTENSION POLICY
Rate 119

The policy of Montana-Dakota Utilities Co. for gas extensions necessary to provide interruptible sales or interruptible transportation service to customers is as follows:

1. Contribution

   (a) Prior to construction, the customer shall contribute an amount equal to the total cost of construction including all gas main extensions, valves, service line(s), regulators, meters (excluding remote data acquisition equipment), any required payments made by the Company to the transmission pipeline to accommodate the extensions, and other costs as adjusted for federal and state income taxes.

   (b) The contribution shall be made by:

      i. A one-time payment prior to construction or,

      ii. The customer may post a bond, irrevocable letter of credit, or a written guarantee commitment in the amount of the total contribution required prior to construction. Such bond, issued by a bonding company authorized to do business in the state, letter of credit, or written guarantee commitment, shall be effective for a five-year period commencing at the plant in service date, and is subject to approval and acceptance by the Company. If at the end of the original five-year term, a contribution requirement exists for the subject project, the surety or guarantor shall pay the Company for such contribution requirement, or

      iii. Customer, upon approval by Company, may finance the amount of the required contribution subject to the following conditions: 1) maximum contribution to be financed shall be determined by the Company at its sole discretion, 2) maximum term shall be five years, 3) interest will be charged at the Company's incremental weighted cost of capital.

   (c) Upon Completion of construction, the contribution amount will be adjusted to reflect actual costs, and an additional charge may be levied ~~or a refund may be~~ made.

(d) Remote data acquisition equipment costs shall be subject to the terms and conditions specified in Transportation Service Rates 81 and 82.

2. Refund

(a) If within the five-year period from the extension(s) in service date, the total of the customer's contribution and actual margin paid to the Company equals or exceeds the total present value of the revenue requirement associated with the extension, Company shall refund the amount exceeding the revenue requirement on the following basis:

i. Annually, beginning at the 2nd anniversary of the extension(s) in service date, the Company will refund to the customer, the amount exceeding the total present value of the revenue requirement at a rate of 50% of the current year margin associated with the customer" actual throughput.

ii. Customers who have posted a bond, letter of credit, or a written guarantee commitment will be notified of any reduction in surety or guarantee requirements based on the above calculation.

iii. No refunds will be made for amounts less than $25.

(b) Interest will be calculated annually by the Company on any refund amounts and shall be equal to the average commercial paper interest rate (A1/P1), not to exceed 12 percent per annum.

(c) No refund shall be made by the Company after the five-year refund period has expired, and in no case shall the refund, excluding interest, exceed the amount of contribution made by the customer.

FIRM GAS SERVICE EXTENSION POLICY Rate 120

The policy of Montana-Dakota Utilities Co. for gas extensions necessary to provide firm sales service to customers is as follows:

(A) General Rules and Regulations Applicable to all Firm Service Extensions

1. An extension will be constructed without a contribution if the estimated capital expenditure is cost justified as defined in ¶A.3.

2. The Company may require customer or developer cost participation if the estimated capital expenditure is not cost justified.

3. The extension will be considered cost justified if the calculated maximum allowable investment equals or exceeds the estimated capital expenditure using the following formula:

   Maximum Allowable Investment =

   Annual Basic Service Charge + (Project Estimated 3rd Year Annual Dk x Distribution Delivery Charge)/LARR

   where: LARR = Levelized Annual Revenue Requirement Factor of 19.954%

4. Cost of the extension shall include the gas main extension(s), valves, service line(s), any required payments made by the Company to the transmission pipeline company to accommodate the extension(s), and other costs excluding the distribution meter and regulator.

   The service line is that portion of the gas service extending from the gas main to the connection at the house regulator and/or meter.

5. Where cost participation is required, such extension is subject to execution of the Company's standard agreement for extensions by the customer or the developer and Company.

6. A refund will be made only when there is a reduction in the amount of contribution required within a five-year period from the extension(s) in service date. Interest will be calculated annually by the Company on any refund amounts and shall be equal to the average commercial paper interest rate (A1/P1), not to exceed 12 percent per annum.

   No refund shall be made by Company after the five-year refund period and in no case shall the refund excluding interest, exceed the amount of the contribution.

7. The Company reserves the right to charge customer the cost associated with providing service to customer if service is not initiated within 12 months of such installation.

(B) Customer Extensions

Cost participation for extensions where customers will be immediately available for service is as follows:

1. Contribution

   (a) When a contribution is required, the customer(s) shall pay the Company the portion of the capital expenditure not cost justified as determined in accordance with ¶ A.3.

   (b) The contribution shall be made by:

      i. A one-time payment prior to construction, or

      ii. Payment of 25% of the contribution prior to construction and the balance in no more than twenty-four equal monthly installments. If customer discontinues service within the twenty-four month period, the balance will be due and payable upon discontinuance of service, or

      iii. Customer may post a bond, irrevocable letter of credit, or a written guarantee commitment in the amount of the required contribution prior to construction. Such bond, issued by a bonding company authorized

to do business in the state, letter of credit, or written guarantee commitment, shall be effective for the original five-year term and is subject to approval and acceptance by the Company. If at the end of the original five-year term, a contribution requirement exits in the subject project based on a recalculated maximum expenditure, the surety or guarantor shall reimburse the Company for such recalculated contribution requirement, or

iv. Customer, upon approval by Company, may finance the amount of the required contribution subject to the following conditions: 1) maximum contribution to be financed shall be determined by the Company at its sole discretion, 2) maximum term shall be five years, 3) interest will be charged at the Company's incremental weighted cost of capital.

(c) Upon completion of construction, the contribution amount will be adjusted to reflect actual costs, and an additional charge may be levied or a refund may be made.

(d) If within the five-year period from the extension(s) in service date, the number of active customers and related volumes exceeds the third-year projections, the Company shall recompute the contribution requirement by recalculating the maximum allowable investment.

(e) The recalculated contribution requirement shall be collected from the new applicant(s).

2. Refund

(a) The Company will refund to the original contributor(s) the amount required to reduce their contribution to the recalculated contribution requirement. No refunds will be made for amounts less than $25. Customers who have posted a bond, letter of credit, or written guarantee commitment will be notified of any reduction in surety or guarantee requirements.

(b) No refunds will be made until the new applicants begin taking service from the Company.

(c) If the addition of new customers will increase the contribution required from existing customer(s), the extension will be considered a new extension and treated separately.

3. Incremental Expansion Surcharge

(a) The Company, in its sole discretion, may offer an Incremental Expansion Surcharge (Surcharge) to a project consisting of 10 or more customers requesting service when the total estimated cost would otherwise have been prohibitive under the Company's present rates and gas service extension policy. If the Company and customers mutually agree that the project will be funded through a Surcharge, the project will be designated an expansion area and the Surcharge will be applicable to all connections within the expansion area. The contribution requirement to be collected under the Surcharge shall be the amount of the capital expenditure in excess of the Maximum Allowable Investment determined in accordance with ¶A.3.

i. A minimum up-front payment of $100.00 will be collected from each customer who signs an agreement to participate in the expansion.

ii. For projects that are expected to be recovered within a 5-year period, the Surcharge shall be set at a fixed monthly charge of $5.00 per month plus $1.50 per dk.

iii. For projects that are not expected to be recovered within a 5-year period, the Surcharge shall be set at a fixed monthly charge of $5.00 per month plus a commodity charge designed to provide recovery of the contribution requirement in a five-year period.

(b) The Surcharge shall remain in effect until the net present value of the contribution requirement, calculated using a discount rate equal to the overall rate of return authorized in the last rate case, is collected.

(c) The Surcharge shall apply to all customers connecting to natural gas service within the expansion area until the contribution requirement is satisfied.

(d) The net present value of the Surcharge will be treated as a contribution-in-aid of construction for accounting purposes.

(C) Developer Extensions

Cost participation may be required for extensions such as a subdivision or a mobile home court, in which a developer is installing roads, utilizes, etc., before housing is built.

1. Contribution

(a) When a contribution is required, the developer shall pay the Company the portion of the capital expenditure not cost justified as determined in accordance with ¶A.3.

(b) The contribution shall be made by:

i. A one-time payment prior to construction, or

ii. Developer may post a bond, irrevocable letter of credit, or a written guarantee commitment in the amount of the required contribution prior to construction. Such bond, issued by a bonding company authorized to do business in the state, letter of credit, or a written guarantee commitment, shall be effective for the original five-year term and is subject to approval and acceptance by the Company. If at the end of the original five-year term, a contribution requirement exists in the subject project based on a recalculated maximum expenditure, the surety shall reimburse the Company for such recalculated contribution requirement, or

iii. NEW INSTALLATION, REPLACEMENT, RELOCATION AND REPAIR OF GAS SERVICE LINES Rate 124

1. The Company will install, at its expense, a service line extending from the main to the connection at the premise regulator and/or meter for all customers connected on and after (effective date of tariff) and all replacement service lines installed on and after (effective date of tariff). The service line installed by the Company will remain the Company's property.

2. A non-refundable contribution may be required for that portion of the service line cost not supported by the expected or actual connected load. The contribution requirement will be determined based on minimum footage allowances determined annually taking into account the maximum allowable investment defined in Rate 120 and the average installed per foot cost. The Company reserves the right to charge customer the total cost of the installed service line if service is not initiated within 12 months of such installation.

3. The portion of the service line not cost justified shall be charged to the customer on the basis of direct costs to the Company. The Company may, at its option, calculate a statewide average cost per foot for such work based on its experience and may use such calculated amount for billing purposes. No minimum amount shall apply.

4. Where service line location changes are made due to building encroachments (a building is being constructed or is already located over a service line, etc.), the customer shall be charged for on the basis of direct costs incurred by the Company.

5. Whenever a service line is damaged by the customer or someone under the employ of the customer necessitating the service line to be either repaired or replaced in whole or in substantial part, such work shall be charged on a direct cost basis. If the damage was caused by independent contractors, not in the employ of the customer, the charges shall be billed directly to such contractor.

6. Service line changes necessary to increase the size and capacity of an existing service line because of increased demand shall be treated in accordance with ¶2 above.

Billed amounts will be considered past due if not paid by the due date shown on the bill. Past due bills are subject to a late payment charge in accordance with the provisions of Rate 100, §V.11, or any amendments or alterations thereto.

Cost of Purchased Propane:

The cost of propane as defined in the Purchased Propane Cost Adjustment Rate 99 or any amendments or alterations thereto. The cost of propane component is subject to change on a monthly basis.

the Company or a change in location covered by the guarantee agreement of thirty days after written request for termination is made to the utility by the guarantor. However, no agreement shall be terminated without the customer having made satisfactory settlement for any balance, which the customer owes the Company. Upon termination of a guarantee contract, a new contract or a cash deposit may be required by the Company.

A deposit shall earn interest at the rate paid by the Bank of North Dakota on a six-month certificate of deposit as of the first business day of each year. Interest shall be credited to the customer's account annually during the month of December.

Deposits with interest shall be refunded to customers at termination of service provided all billings for service have been paid. Deposits with interest will be refunded to all active customers, after the deposit has been held for twelve months, provided prompt payment record has been established.

7. METERING AND MEASUREMENT:
   (a) Company will meter the volume of natural gas delivered to customer at the delivery point. Such meter measurement will be conclusive upon both parties unless such meter is found to be inaccurate, in which case the quantity supplied to customer shall be determined by as correct an estimate as it is possible to make, taking into consideration the time of year, the schedule of customer's operations and other pertinent facts. Company will test meters in accordance with applicable state utility rules and regulations.

   (b) Transportation customers agree to provide the cost of the installation of remote data acquisition ~~electronic measurement~~ equipment to Company before transportation service is implemented.

8. MEASUREMENT UNIT FOR BILLING PURPOSES – The measurement unit for billing purposes shall be one (1) decatherm (dk), unless otherwise specified. Billing will be calculated to the nearest one-tenth (1/10) dk. One dk equals 10 therms or 1,000,000 Btu's. Dk's shall be calculated by the

(d) Priority 4 – Small interruptible transportation services at less than the maximum rate from the highest rate to the lowest rate and on a pro rata basis where equal rates are applicable among customers.
(e) Priority 5 – Large interruptible transportation services at less than the maximum rate from the highest rate to the lowest rate and on a pro rata basis where equal rates are applicable among customers.
(f) Priority 6 – Gas scheduled to clear imbalances.

Montana-Dakota shall have the right, in its sole discretion, to deviate from the above schedule when necessary for system operational reasons and if following the above schedule would cause an interruption in service to a customer who is not contributing to an operational problem on Montana-Dakota's system.

Montana-Dakota reserves the right to provide service to customers with lower priority while service to higher priority customers is being curtailed due to restrictions at a given delivery or receipt point. When such restrictions are eliminated, Montana-Dakota will reinstate sales and/or transportation of gas according to each customer's original priority.

11. LATE PAYMENT – Amounts billed will be considered past due if not paid by the due date shown on the bill. An amount equal to 1% per month will be applied to any unpaid balance existing at the immediate subsequent billing date, provided however, that such amount shall not apply where a bill is in dispute or a formal complaint is being processed. All payments received will apply to the customer's account prior to calculating the late payment charge. Those payments applied shall satisfy the oldest portion of the bill first.

12. RETURNED CHECK CHARGE – A charge of $10.00~~20.00~~ will be collected by the Company for each check charged back to the Company by a bank.

13. TAX CLAUSE – In addition to the charges provided for in the gas tariffs of the Company, there shall be charged pro rata amounts which, on an annual basis, shall be sufficient to yield to the Company the full amount of any sales,

Gas Rate Schedule

GENERAL PROVISIONS Rate 100

17. RECONNECTION FEE FOR SEASONAL OR TEMPORARY CUSTOMER –A customer who requests reconnection of service, during normal working hours, at a location where same customer discontinued the same service during the preceding 12-month period will be charged the Basic Service Charge applicable during the period while service was not being used or a minimum of $30.00. The minimum will be based on standard overtime rates for reconnection of service after normal business hours.

    Transportation customers who cease service and then resume service within the succeeding 12 months shall be subject to a reconnection charge of $160.00 whenever reinstallation of the required electronic measurement equipment is necessary.

18. DISCONNECTION OF SERVICE FOR NONPAYMENT OF BILLS – All amounts billed for service are due when rendered and will be considered delinquent if not paid by due date shown on the bill. If any customer shall become delinquent in the payment of amounts billed, such service may be discontinued by the Company under the applicable rules of the Commission. The Company may collect a fee of $12.00~~30.00~~ before restoring gas service, which has been disconnected for nonpayment of service bills during normal business hours. Standard overtime rates will apply for services performed after normal business hours.

19. DISCONNECTION OF SERVICE FOR CAUSES OTHER THAN NONPAYMENT OF BILLS – The Company reserves the right to discontinue service for any of the following reasons:

    (a) In the event of customer use of equipment in such a manner as to adversely affect the Company's equipment or service to others.

    (b) In the event of tampering with the equipment furnished and owned by the Company.

    (c) For violation of or noncompliance with the Company's rules on file with the Commission.

INTERRUPTIBLE GAS SERVICE EXTENSION POLICY
Rate 119

The policy of Montana-Dakota Utilities Co. for gas extensions necessary to provide interruptible sales or interruptible transportation service to customers is as follows:

1. Contribution

   (a) Prior to construction, the customer shall contribute an amount equal to the total cost of construction including all gas main extensions, valves, service line(s), regulators, meters (excluding remote data acquisition ~~electronic measurement~~ equipment), any required payments made by the Company to the transmission pipeline to accommodate the extensions, and other costs as adjusted for federal and state income taxes.

   (b) The contribution shall be made by:

      i. A one-time payment prior to construction or,

      ii. The customer may post a bond, irrevocable letter of credit, or a written guarantee commitment in the amount of the total contribution required prior to construction. Such bond, issued by a bonding company authorized to do business in the state, letter of credit, or written guarantee commitment, shall be effective for a five-year period commencing at the plant in service date, and is subject to approval and acceptance by the Company. If at the end of the original five-year term, a contribution requirement exists for the subject project, the surety or guarantor shall pay the Company for such contribution requirement, or

      iii. Customer, upon approval by Company, may finance the amount of the required contribution subject to the following conditions: 1) maximum contribution to be financed shall be determined by the Company at its sole discretion, 2) maximum term shall be five years, 3) interest will be charged at the Company's incremental weighted cost of capital.

   (c) Upon Completion of construction, the contribution amount will be adjusted to reflect actual costs, and an additional charge may be levied or a refund may be made.

NEW INSTALLATION, REPLACEMENT, RELOCATION AND REPAIR OF GAS SERVICE LINES Rate 124

1. The Company will install, at its expense, a service line extending from the main to the connection at the premise regulator and/or meter for all customers connected on and after (effective date of tariff) and all replacement service lines installed on and after (effective date of tariff). The service line installed by the Company will remain the Company's property.

2. A non-refundable contribution may be required for that portion of the service line cost not supported by the expected or actual connected load. The contribution requirement will be determined based on minimum footage allowances determined annually taking into account the maximum allowable investment defined in Rate 120 and the average installed per foot cost. The Company reserves the right to charge customer the total cost of the installed service line if service is not initiated within 12 months of such installation.

3. The portion of the service line not cost justified shall be charged to the customer on the basis of direct costs to the Company. The Company may, at its option, calculate a statewide average cost per foot for such work based on its experience and may use such calculated amount for billing purposes. No minimum amount shall apply.

4. Where service line location changes are made due to building encroachments (a building is being constructed or is already located over a service line, etc.), ~~because~~ the customer shall be charged for on the basis of direct costs incurred by the Company.

5. Whenever a service line is damaged by the customer or someone under the employ of the customer necessitating the service line to be either repaired or replaced in whole or in substantial part, such work shall be charged on a direct cost basis. If the damage was caused by independent contractors, not in the employ of the customer, the charges shall be billed directly to such contractor.

6. Service line changes necessary to increase the size and capacity of an existing service line because of increased demand shall be treated in accordance with ¶2 above.

Natural Gas Rate Increase
Application

Case No. PU-399-02-183

FINDINGS OF FACT, CONCLUSIONS OF LAW AND ORDER

December 10, 2002

Appearances

Commissioners: Susan E. Wefald, Leo M. Reinbold, Anthony T. Clark.

William W. Binek, Chief Counsel, Public Service Commission, State Capitol, 600 East Boulevard, Bismarck, ND 58505, appearing for the Public Service Commission advocacy staff.

William P. Pearce, Attorney at Law, 314 E. Thayer Ave., PO Box 400, Bismarck, ND 58502-0400, appearing for Montana-Dakota Utilities Co.

Douglas W. Schulz, Senior Attorney, MDU Resources Group, Inc., PO Box 5650, Bismarck, ND 58506-5650, appearing for Montana-Dakota Utilities Co.

Allen C. Hoberg, Director, Office of Administrative Hearings, 1707 North 9th Street - Lower Level, Bismarck, ND 58501-1882, presiding Administrative Law Judge.

Preliminary Statement

On April 12, 2002, the North Dakota Public Service Commission received an application from Montana-Dakota Utilities Co., a Division of MDU Resources Group, Inc., (MDU) to increase its natural gas rates 4.1%. The requested increase in rates would generate an additional $2,844,132 annually in North Dakota. MDU's application is based on a calendar 2003 projected test year.

MDU stated that the primary reasons for its application are increased operation and maintenance costs, depreciation, and taxes other than income, and a higher required rate of return. MDU's requested return on rate base is 11.044 percent, including a return of 13.25 percent on common equity.

In its application, MDU also requested a significant restructuring of its rates, including a separation of gas distribution from gas supply charges, elimination of declining block commodity charges and increases in customer charges. Additionally, MDU proposed that all increases be flowed into the firm residential and commercial rate schedules, that no change in rate levels be applied to the Air Force and large interruptible schedules, and that the small interruptible class should receive a rate reduction.

On April 24, 2002, the Commission suspended MDU's rates filed with its application. On June 5, 2002, the Commission issued its Notice of Hearing, Notice of Public Input Sessions, and Notice of Intervention Deadline.

The Notice of Hearing specified the issues to be considered at the technical hearing, which are:

1. What is the value of MDU's property, used and useful, for the service and convenience of the public in North Dakota?

2. What is MDU's rate of return on its property, used and useful, for the service and convenience of the public in North Dakota?

3. What is a just and reasonable rate of return on MDU's property, used and useful, for the service and convenience of the public in North Dakota?

4. What rates and charges are necessary to provide a just and reasonable rate of return on MDU's property, used and useful, for the service and convenience of the public in North Dakota?

5. Are MDU's proposed rate schedules designed in such a manner that they result in a basis of charge to its customers that is just and reasonable without discrimination?

6. Other relevant information or proposals concerning the proceeding.

The Notice of Hearing provided that any person wishing to intervene as a party in the proceeding must file a petition for intervention by September 9, 2002. No one petitioned to intervene as a party in the proceeding.

Public input sessions were held via video teleconference on July 15, 2002, in Bismarck, Dickinson, Williston, Minot, Devils Lake, and Jamestown. The technical hearing was held in the Commission Hearing Room at the State Capitol in Bismarck, North Dakota on October 7-8, 2002.

On December 6, 2002 MDU filed a letter indicating its understanding of and agreement with the continuation of the depreciation issue, as more fully set forth below.

The Commission, having reviewed the evidence in the record makes the following:

Findings of Fact

1. MDU is an investor owned utility company providing natural gas distribution service in North Dakota operating as a division of MDU Resources Group, Inc.

2. The parties do not dispute the following issues:

- 2003 test year for rate determination.
- Jurisdictional cost of service study.
- 2003 test year for rate base (except accumulated reserve for depreciation)
- Cost of preferred equity.
- Test year revenues.

3. The parties dispute the following issues:

- Cost of capital
- Depreciation
- Bonuses and labor expenses
- Supplemental Income Security Plan
- Rate case expense
- General inflation adjustment for expenses
- Other unadjusted operation and maintenance expenses
- Allocation of cost to customer classes
- Rate design (partially)
- Distribution Delivery Stabilization Mechanism

Test Year Rate Base

4. MDU and Staff are in agreement on the amount of rate base for the 2003 test year with the exception of accumulated reserve for depreciation. The staff adjustment to accumulated reserve for depreciation is affected by a staff adjustment to depreciation expense of $2,172,000. For reasons discussed later, the Commission does not accept staff's adjustment and finds that MDU's projected rate base for 2003 is reasonable.

5. The Commission finds the following 2003 test year rate base:

Rate Base	*(Thousands)* Balance
Plant in Service	$ 72,793
Accumulated Depreciation	49,356
Net Plant	$ 23,437
Materials and Supplies	439
Fuel Stocks	22
Prepayments	84
Other	44
Accumulated Deferred Taxes	(3,842)
Accumulated ITC's	(231)
Customer Advances	(272)
Average Rate Base	$ 19,681

Cost of Capital

6. MDU proposes a rate of return of 11.044 percent, which includes a 13.25 percent return on common equity. Staff has recommended a return of 7.98 percent, including a 10.5 percent return on common equity, inclusion of short-term debt financing and a company wide cost of long-term debt. The rates of return can be calculated as follows:

7. As demonstrated in the foregoing tables, the Staff differs from MDU with respect to the appropriate capital structure as well as the cost of the financing.

Capital Structure

8. Capital structure refers to the makeup of MDU's capital, that is, the mix of debt, preferred stock and equity. Two factors account for the disagreement between Staff and MDU. The first is Staff's inclusion of short-term debt, and the second is Staff's use of the year-end 2001 capital structure instead of MDU's projected capital structure for 2003.

9. In its initial filing, MDU excluded all short-term debt from its proposed capital structure. Staff's rate of return witness, Charles W. King, testified that the makeup of the capital structure used to develop a rate of return should reflect the nature of the rate base to which that return is applied. If the rate base consists solely of capital investments in plant and equipment financed by long-term debt, preferred stock and equity, then it might be appropriate to exclude short-term debt. But MDU's rate base also includes materials and supplies inventories, fuel stocks, and prepayments, which are short-term commitments that will be financed in part with short-term debt. For this reason, he included short-term debt in the capital structure.

10. On rebuttal, MDU witness Craig Keller argued that the items to which King referred, materials and supplies, prepayments and fuel stocks remain relatively constant, not changing materially from one month to another. While classified as short-term assets, they support long-lived assets such as plant, property, equipment and related items. They are therefore financed by long-term debt, according to Keller.

11. At the hearing, King responded to Keller by producing Exhibit 16, which shows the month-to-month amounts of each of the major elements of working capital during the 13 months from December 2000 through December 2001. That exhibit demonstrates net working capital varied from negative $53,000 in January to positive $306,000 in July. King concluded that these widely varying amounts would not have been financed with long-term debt. Keller argued that an unusual refund of a customer advance caused much of the variation shown by King.

12. The Commission finds that MDU has short-term debt and therefore finances part of its business with short-term debt. Accordingly, the Commission will include short-term debt in the determination of cost of capital.

13. The second difference in proposed capital structures relates to the use of historical verses forecasted data. King drew the amounts of debt, preferred stock and common equity from Company supplied data for calendar year 2001. He calculated average long-term debt from Exhibit 2, Statement A, page 2; short-term debt from a response to a data request (Exhibit 15, CWK-1); and preferred stock and common equity from Exhibit 2, Statements A and F, page 1.

14. The capital structure presented by MDU on Statement F, page 3 includes a projected 2003 capital structure. King objected to this use of a projection on the grounds that it is effectively a creation of MDU that has no basis in any verifiable financial statements.

15. On rebuttal, MDU witness Keller argued that NDCC § 49-05-04.1 permits MDU to use a forecast test year and that Staff witness, Michael J. Majoros, had accepted the 2003 test year as the basis for revenue requirements. Keller argued that failure to use a forecast capital structure would result in a "mismatch" with the rest of the revenue requirement calculation. Keller argued that MDU possesses a financial forecasting system that uses known debt scheduling and projects equity by forecasting earnings and deducting dividends.

16. In his oral direct testimony, King pointed out that MDU had used an historical capital structure in its recent electric case. He argued that the purpose of the future test year is to capture exogenous changes that can be objectively determined, such as inflation or the expansion of the system. There is no way of verifying that it will change in the manner MDU predicts. For this reason, King reasoned that most Commissions use recent historical capital structures. Otherwise, MDU has the opportunity to game the regulatory system by projecting a more expensive capital structure.

17. Regarding the issue of historical verses projected, we find in favor of MDU. North Dakota law provides for using a projected test year. There are no assurances that revenues, expenses or cost of capital will actually occur at projected levels. However, the staff's case is predicated on projected revenues and expenses but ignores cost of capital projections. The Commission finds in favor of using a projected capital structure rather than relying on general allegations that MDU might game the regulatory system.

Cost of Debt

18. MDU's cost of debt in 2001 is 9.302 percent, and its projected 2003 debt cost is 9.180 percent. These values are calculated on Exhibit 2, Statement F-1, pages 1 and 3. Those pages show two debt issues, First Mortgage Bonds and Pollution Control Bonds, totaling $133.5 million in 2001 and $132.6 million in 2003.

19. Statement A, pages 11 and 12 of that same exhibit reveals that there is substantially more to MDU's debt than these two issues. As of December 31, 2001, there were $405.2 million in senior notes, $219.7 million in commercial paper, a revolving line of credit of $25 million, and term credit agreements of $11.8 million. Using the cost values shown on those pages, King calculated that the blended cost of MDU's debt is 6.167 percent, more than 300 basis points lower than MDU proposes.

20. The difference between Staff and MDU revolves around what "the Company" actually is. According to MDU witness Keller, only the First Mortgage and Pollution Control bonds relate to MDU Utilities. He argues that all of the other debt pertains to Centennial Holdings, which holds title to the non-regulated operations of the parent Company, MDU Resources Group, Inc. He stated that the two sets of debt are not fungible, and assets of Centennial do not secure the first mortgage liens against electric and gas plant nor do the assets of the utility operations secure the liens against non-regulated assets. Under Keller's argument, MDU has no access to Centennial's debt and vice versa. Further, MDU asserted that it was unfair of staff to use the low cost of a blended rate and ignore the higher cost of a blended capital structure with an equity ratio of nearly 60%.

21. On cross-examination, Keller made it clear that there is no such entity as the Montana-Dakota Utilities Company. The only legal entity is the parent Company, MDU Resources Group, and only that company can issue debt. Neither the utility operation nor Centennial has any debt in its own right. Keller testified that MDU had attempted to build a "firewall" between the debts of MDU Utilities and that of Centennial. The purpose is to protect the utility operations from the effect of default on Centennial's debt. He stated that if Centennial or one of its subsidiaries should go bankrupt, then the bankruptcy judge would not be able to "collapse the corporation" and gain access to the utility's assets. Keller stated that is the reason MDU does not commingle the funds raised for the utility with those raised for Centennial.

22. On cross-examination, Keller conceded that if the bankruptcy of either MDU's regulated or its unregulated operations caused the parent to declare bankruptcy, then

the bankruptcy court would look at all of MDU's assets to satisfy creditors' claims, including those of the regulated utility.

23. King suggested that there might be another, less altruistic reason for attempting to isolate Centennial's debt from that of the utility operations. It is to ensure that ratepayers pay the very high costs of the First Mortgage bonds and receive no benefit from the Company's other, lower-cost financing resources. While the Company may have written its low-cost financing instruments to direct funds to Centennial and its subsidiaries, that was an artifice to game the regulatory system into ascribing only the highest cost debt to regulated service ratepayers. The Company could have used the Centennial funds anywhere had it written the debt instruments differently.

24. MDU's cost of debt is higher than the cost of debt reported by the other investor owned utilities operating in North Dakota. Further, it is nonsensical that the non-regulated enterprises of MDU and thereby more riskier ventures of the corporation are able to secure debt at substantially lower cost than its regulated counterpart. The timing of debt issuances may account for some differences year-to-year but overall and in the long-term one would expect that the cost of debt for the utility operations would be less and certainly not more than 300 basis points higher than the company wide average. Still, the Commission begrudgingly finds in favor of MDU based on the fact that staff was unable to show that MDU had gamed the regulatory system. Such a showing would require an analysis of the timing of plant in service additions compared to the timing of debt issuances before such a verdict could be rendered. Accordingly, the Commission finds in favor of MDU and agrees to use its proposed cost of long-term debt in this proceeding.

Cost of Equity

25. MDU's rate-of-return witness, Dr. J. Stephen Gaske, has recommended a return to equity of 13.25 percent. This return was developed using three variants of the Discounted Cash Flow ("DCF") approach, plus a series of "benchmark analyses."

26. For his DCF results, Gaske drew a distinction between "Investor Requirements" and "Cost of Capital" based on his belief that stock flotation costs, equivalent to 4.75 percent of the return, must be included in the latter. Gaske used a "proxy group" of six companies based on Moody's utility series. His DCF results for these companies were as follows:

	Investor Requirements	**Cost of Capital**
Second-stage Retention Growth	11.94%	12.51%
Basic DCF	12.61%	13.21%
Primary DCF	12.63%	13.22%

27. Gaske's benchmark analyses consisted of four risk premium comparisons using historical differences in earned returns to equity from large and, alternatively, small companies relative to current yields on U.S. Treasury bonds and corporate bonds. He

also identified the recent returns on per-share book value of S&P 500 corporations and Value Line's list of industrial companies. All of his benchmark indicators were higher than any of his DCF returns.

28. Gaske's final selection of 13.25 percent was based on his belief that the risk of MDU's gas distribution business is slightly higher than that of his proxy group of gas distribution companies. He based this belief principally on the smaller size of MDU relative to the proxy companies.

29. King recommended a very different return to equity of 10.5 percent. King followed most of the same procedures as Gaske using the DCF analyses as the principal analytical tool. Like Gaske, King used a comparison group of gas distribution companies. Also like Gaske, King used a forecast of next year's dividends for the dividend yield portion of the DCF formula. King also used both analysts' forecasts and the concept of earnings retention to calculate the growth component of that formula -- as did Gaske. Finally, both King and Gaske adjusted their final recommendations based on their assessments of the risk of MDU's gas distribution activities relative to that of the comparison companies.

30. The explanation for the dramatic 275 basis points difference between the recommendations of the two witnesses lies in the details of the application of the DCF formula. As used by both witnesses, the DCF formula is the sum of next year's dividend yield on MDU's stock and the expected future growth rate in its dividends and earnings.

31. The differences between the Gaske and King applications of the DCF formula relate to the following elements:

1. Inclusion of flotation costs;
2. Selection of comparison companies;
3. Forecast of next year's dividends;
4. Timing of analysts' forecasts;
5. Presentation of the DCF results.

Flotation Costs

32. Gaske drew a distinction between "investor requirement" and "cost of capital," with the difference being cost of issuing new shares in public stock offerings. Gaske quantified this cost as 4.75 percent, based on a representative sample of flotation costs incurred with 34 new common stock issues by natural gas transmission and distribution companies between 1992 and 2001.

33. King agreed with Gaske that flotation costs should be recovered, but he questioned the propriety of applying a ratio for these costs to the entire amount of common equity. Flotation costs are incurred only when a company issues new stock, and then only when there is a public stock offering. Existing stock incurs no flotation cost, and even new stock incurs no such costs if it is distributed as an employee or shareholder benefit either through options or as bonuses.

34. King noted that the effect of Gaske's flotation cost adjustment is to increase his equity return by 60 basis points. When multiplied by the $1.125 billion book equity value of the MDU Resources, Inc., this allowance amounts to $6.75 million annually, which is substantially more than the $5.4 million in flotation costs that the Company has incurred over the past five years.

35. King suggested that if a flotation cost adder is to be used, it should be equal to a reasonable estimate of the annual flotation cost incurrence divided by the entire amount of the Company's equity. In MDU's case, annual flotation costs during the past five years have been about $1.1 million. The Company's total book equity value is $1.125 billion, for a flotation cost allowance of 0.1 percent. This amount is so small as to be lost in the rounding. For this reason, he recommended no explicit flotation cost adder.

36. In rebuttal, Gaske distributed an exhibit that purported to demonstrate that failure to include flotation costs in the return of a company's stock trading at book value would result in the dilution of the book value of that company's shares. On cross-examination, however, Gaske admitted that all of King's comparison companies had per-share market values higher than book value, and that when such companies sell new stock, the effect is to increase book value, not dilute it. On cross-examination, Gaske admitted that his approach to the issue of flotation cost in this proceeding was the same as his approach in Commission Case No. PU-399-01-186 involving MDU's electric rates. Gaske also agreed that most regulatory Commissions do not allow a flotation cost adder.

37. The Commission rejects Gaske's flotation cost adder. Given that staff has provided evidence based on historical information, we find no need to rely on the theoretical information provided by MDU. In addition, Gaske admitted that most regulatory Commissions do not allow flotation costs. The evidence indicates a negligible amount of flotation costs were incurred during the last five years. Therefore, the Commission will not include flotation costs in the determination of return on common equity.

Selection of Comparison Companies

38. Both King and Gaske acknowledged that the heavy involvement of MDU's parent company, MDU Resources Group, Inc., in non-regulated activities effectively precluded using similar companies as the basis for finding the return to equity of its gas distribution business in North Dakota. Necessarily, this required the selection of companies whose primary business is gas distribution. Gaske picked six companies from Moody's list of natural gas distribution companies. King chose 11 companies from Value Line's Investment Survey based on the criteria that they must have investment grade bond ratings, total operating revenues over $100 million, and derive 75 percent of their revenue from gas distribution services. The two lists are as follows:

King Comparison Companies	Gaske Proxy Group
Atmos Energy Corp.	AGL Resources
AGL Resources	Keyspan Corporation
Cascade Natural Gas Corp.	LaClede Group
LaClede Group, Inc.	Northwest Natural Gas
NICOR, Inc.	People's Energy Corp.
Northwest Natural Gas Co.	WGL Holdings, Inc.
People's Energy Corp.	
Piedmont Natural Gas Co.	
South Jersey Industries, Inc.	
Southwest Gas	
WGL Holdings, Inc.	

39. Five of Gaske's six companies are also represented on King's list. The exception is Keyspan Corporation, which King excluded because that company's gas distribution operations accounted for only about one-half of its revenue. We find that King's choice of companies provides a broader and therefore more representative group of companies from which to draw indications as to the cost of equity for gas distribution operations.

Forecast of Next Year's Dividends

40. Both King and Gaske used a forecast of next year's dividends to identify the dividend yield portion of the DCF formula, and both witnesses based this forecast on a percentage of the 5-year annual earnings growth rate predicted by Zacks Investment Research, Inc. Only the percentage differed. King used a factor 1.5 on the assumption that the next dividend increase would be randomly distributed over the coming year. Gaske used a 1.625 inflator of the growth rate and argued that King's factor does not reflect the present value of next year's dividends and dividend increases. The issue is immaterial and the Commission adopts Gaske's inflation factor.

Timing of Analysts' Forecasts

41. Gaske's testimony was filed on April 12, 2002, concurrently with MDU's initial application for an increase in its gas rates. The record does not disclose when Gaske prepared his testimony, but presumably it was in the months immediately preceding the application, which would be February and March of 2002. This would be consistent with the fact that the latest month shown on Gaske's presentation of bond yields is January 2002.

42. King filed his testimony on August 30, 2002, so his information on such factors as share prices and investor expectations was gathered approximately six months after Gaske's.

43. It is not clear how these differences in timing affect the results of the respective analyses. For example, Gaske reported Zacks' consensus 5-year earning growth

forecast for the LaClede Group as 12.0 percent. By the time King prepared his testimony, that forecast had dropped to 4.25 percent. On the other hand, Gaske's forecast growth rate for AGL Resources was 7.03 percent, while that reported by King was 11.42 percent. We find it is appropriate to use King's data because it is more current.

Presentation of the DCF Results

44. Gaske performed three different DCF analyses of his proxy group of companies. One of these analyses, the "basic DCF," was identical to King's "classic DCF" analysis. Both involved combining the forecast dividend yields with Zacks' 5-year consensus forecasts of earning growth.

45. While the methods were the same, the results were quite different. Gaske's six-company proxy group yielded a median basic DCF return, prior to flotation costs, of 12.61 percent and a mean return of 12.95 percent. King, applying exactly the same procedure to his comparison group of 11 companies, found the average (mean) to be 11.29 percent.

46. For his other application of the DCF approach, King added the dividend yield to the growth rate indicated by the earnings retention growth model for each of his 11 comparison companies and found the average to be 12.18 percent. Had Gaske done the same thing, he would have added his average dividend yield of 5.14 percent to his retention growth estimate of 5.5 percent for a DCF return indication of 10.64 percent.

47. Gaske diluted his retention growth rate by mixing it one-third, with two-thirds represented by the Zacks' 5-year earnings forecasts. The result was quite close to the "basic" DCF indications. The median of his "Second-Stage Retention Growth DCF Calculation" was 11.94 percent, the mean 12.25 percent.

48. Gaske presented a third version of the DCF analysis. Gaske put forth what he called his "primary" DCF calculation. This was no calculation at all, but merely the adoption of a range of growth estimates with little support. The range was 6.75 percent to 7.75 percent, asserted by Gaske to have been based on such factors as the 5.5 percent growth in nominal Gross Domestic Product during the past decade, the expected demand growth for natural gas, and investor expectations. None of these considerations support a growth forecast in the range of 6.75 percent to 7.75 percent. The bottom of this range is well above the 5.5 percent GDP growth rate cited by Gaske as well as the 5.5 percent growth indicated by his own earnings retention calculation. The top of the range is above the 7.56 percent growth rate predicted by Zacks for the six companies used by Gaske. This "primary" DCF analysis is biased upward.

49. King also presented a third DCF calculation, but he subsequently discarded it. King calculated a growth factor for each of his 11 comparison companies based on the each company's historical earnings growth between 1997 and 2001. While the average DCF indication of 11.72 percent might appear reasonable, the variation among the individual company observations was so great as to provide little or no probative value.

50. In presenting his DCF returns, King went one step further than Gaske, and provided his estimate of the DCF return requirements of each of his comparison companies. He did not use a mechanical formula because, as he conceded in his testimony, precision is impossible. He described his procedure orally at the hearing as follows:

> ...what I have done in each case is taken the classic DCF return, which is probably the best estimator, and then turned and looked at the retention growth method. If the retention growth looks like it's totally out of whack with the forecast, and in some cases they are – simply no way that the company could be growing as fast or as slowly as the investor survey shows – I modified that classic DCF in the direction of the retention growth.

51. The results of King's procedure were as follows:

	Classic	**Book Value Growth**	**King DCF Return**
Atmos Energy Corp.	12.06%	14.42%	12.5%
AGL Resources	16.67%	11.53%	14.0%
Cascade Natural Gas Corp.	10.25%	15.11%	11.0%
LaClede Group, Inc.	10.29%	11.23%	10.5%
NICOR, Inc.	11.51%	15.96%	12.0%
Northwest Natural Gas Co.	10.65%	10.12%	10.5%
People's Energy Corp.	13.13%	12.07%	12.5%
Piedmont Natural Gas Co.	9.42%	11.24%	10.0%
South Jersey Industries, Inc.	8.15%	12.57%	11.0%
Southwest Gas	10.52%	8.53%	10.0%
WGL Holdings, Inc.	8.99%	11.21%	9.5%
Average	**11.29%**	**12.18%**	**11.23%**

52. Gaske rebutted the fact that the average of King's selected DCF results was lower than the average of either his classic or his book value growth results. This mathematical result stems from King's shrinking of the range of observations. King reduced the effect of the "outlier" highest and lowest observations. In absolute terms, the outliers on the high side diverge more from the mean than those on the low side, even when their percentage difference from the mean is the same. This mathematical distortion can be avoided by focusing on the median observation of each series, that is, the observation where five values are higher and five are lower. The classic DCF median return is 10.52 percent, the median of the book value growth series is 11.53 percent, and the median of King's selected DCF returns is 11.0 percent. Additionally, it should be noted that in arriving at his final DCF recommended returns, King adjusted seven of the classic returns upward and only four downward.

53. On rebuttal, Gaske submitted two mechanical recalculations of King's DCF results, one using a 33%/67% weighting of the book value growth and Zacks' forecasts, the other using a 50%/50% weighting. Both yielded average returns considerably higher than King's 11.23 percent. In performing these calculations, however, Gaske excluded WGL Holdings, ostensibly because, with 74.6 percent of its revenue from regulated gas distribution, it falls outside King's 75 percent criterion. As Gaske admitted on cross-examination, 74.6 percent rounds up to 75 percent. His exclusion biased the results upward because, at 8.99 percent, WGL Holdings' classic DCF return was the lowest in King's comparison group. Moreover, Gaske never explained why his mechanical weightings of King's DCF results were more accurate or valid than King's analysis.

54. Both witnesses support the use of DCF for calculating a reasonable return on equity for purposes of this proceeding. Both provided a basic DCF calculation using the same method even though there are some differences in sample sizes and the age of data. Beyond the calculation of basic DCF, both witnesses make adjustments for their own professional judgment and then are highly critical of each other's results. We find the adjustments for professional judgment are not all that intuitive and appear to be aimed at results rather than fact-finding. Accordingly, we find the use of the basic DCF calculations most useful.

Comparative Risk Adjustments

55. King and Gaske disagree about the final adjustment each witness made to the DCF returns for his comparison companies to reflect the specific risk of MDU's gas distribution operations.

56. Having found that the DCF cost of capital (inclusive of flotation cost) for his proxy companies was in the range of 12.51 and 13.22 percent, Gaske selected 13.25 percent as MDU's capital cost. This upward adjustment from the range of proxy group returns was based on Gaske's belief that MDU's overall risks are slightly above average relative to the proxy group.

57. King's adjustment was in the opposite direction. Having found that the average DCF return for his comparison group is 11.23 percent, King picked 10.5 percent for MDU, which is the midpoint between the group average return and the returns for the least risky companies in the group. The basis of this adjustment was King's belief that MDU is less risky than the comparison group.

58. In his initial testimony, Gaske discussed four types of risk: business risk, regulatory risk, financial risk and market risk. He found that MDU's regulatory and market risks are not significantly different than from those of his proxy group. MDU's financial risk is slightly greater because the bonds of MDU Resources Group are rated slightly lower than the bonds of the proxy companies. The major difference in risk, according to Gaske, relates to business risk. MDU's gas distribution operations are a fraction the size of the proxy companies. Those companies are between six and 46 times the size of MDU's gas distribution operations. Based on the historical difference

between the earned returns of small and large companies, Gaske believes that MDU's smaller size might require a return more than 100 basis points higher than the proxy group. In addition, MDU faces the competition of propane and heating oil for new and existing load in its service territory. Furthermore, its rate structure recovers a substantial portion of its fixed costs in the volumetric component of its rates, and MDU does not have a weather normalization adjustment mechanism. On this basis, Gaske concluded that MDU's North Dakota gas distribution operations face somewhat greater overall business risks than the typical company in his proxy group.

59. King based his conclusion that MDU's gas distribution business is less risky than his comparison group on two facts. First, unlike eight of the 11 comparison companies, MDU's gas distribution operations have no non-regulated business activities. Second, MDU's equity ratio is higher than all but three of his comparison companies, suggesting a lower level of financial risk. He argued that a good case could be made for setting MDU's rate of return at the bottom of the scale of DCF returns for the comparison companies. However, in light of the possibility that the return set in this case may be in effect for an extended period into the future, he selected the midpoint between the lowest returns in his comparison group and the average.

60. In his rebuttal testimony, Gaske argued that King had failed to demonstrate any strong correlation between equity return and the equity proportion or the percent gas distribution revenues in his comparison companies. Gaske presented two correlation studies of these variables. One showed a weak, but measurable correlation between the percent equity in capital structure and King's estimates of DCF returns. The other showed no correlation between equity return and percent gas distribution revenues.

61. King conceded that neither of the two risk factors cited in his testimony are predictors of relative risk, but both are elements of relative risk. A high equity ratio is an indicator of low financial risk, and MDU's equity ratio is about equal to the highest of the equity ratios within his comparison group. The relationship between financial risk and capital structure, which King cites in this portion of his testimony, was also discussed in Gaske's initial testimony at some length.

62. King noted that another element of risk is the amount of non-regulated activity. Regulated activities are less risky than non-regulated activities. When regulated earnings are short, MDU can come to the Commission for an increase in rates. If the Commission grants the rate increase, there is no question whether MDU can collect the additional revenue because of its monopoly status. That is not true of non-regulated activities, which by definition do not have the security of revenue recovery.

63. King cited two further reasons that MDU gas distribution operations have lower risk than many of his comparison companies. Gas companies operating in warmer climates face competition from electric heating that MDU, operating in a cold climate, does not encounter. He testified that in Washington, DC, the Washington Gas Light Company has lost two-thirds to three-quarters of the commercial load to the electric company. For residential customers, heat pumps can combine heating with air

conditioning and so compete with gas. King stated that stand-alone heat pump units that do not draw heat from groundwater would not work in North Dakota's climate because they have to be supplemented with electric resistance heating when temperatures fall below about 45 degrees Fahrenheit.

64. The other difference cited by King relates to the intrusion of gas suppliers into the retail gas market. Some of his comparison companies (he cited Washington Gas and Atlanta Gas Light Company) are required to deliver the gas of independent suppliers. The extreme example is Atlanta Gas Light, which no longer buys gas on behalf of its customers. Instead, merchant gas suppliers buy the gas, and Atlanta Gas Light delivers it to end users on behalf of the suppliers. He testified that Atlanta Gas went from some 600,000 customers to 11. When one of these gas suppliers went bankrupt, Atlanta Gas was "stiffed" for several million dollars. In another example cited by King, Washington Gas has lost two thirds of its commercial load to competitive suppliers. The suppliers have failed to acquire the transportation capacity that Washington Gas had maintained to serve those lost customers, and there is now a risk that in a cold winter, the suppliers will not be able get the required gas to Washington.

65. King observed that MDU does not have the active competition from suppliers that larger companies serving larger service territories have. It therefore does not face the severe business risks associated with these suppliers.

66. King stated that Gaske conducted an apples-and-oranges comparison regarding the alleged risk of small company operations. Gaske has compared the risk properties and required returns of large companies with those of small, stand-alone companies. King says that is not the proper comparison. King states that the relevant objective in this case is to find the risk characteristics of the gas operations of a large company. Being part of a large company provides the security of greater financial strength and also diversification of financial resources. King states that MDU's North Dakota gas distribution operations are not a small, stand-alone company, as are the small companies from which Gaske derives his 100 basis point small-company risk adder. MDU's North Dakota gas distribution operations are merely one part of the overall business of MDU Resources Group. That company is well within the size range of the companies in both King's and Gaske's comparison groups.

67. King stated that while MDU's gas distribution operations are small, they have a lower financial risk than do most of King's comparison companies by reason of a high equity ratio. They have no risky, non-regulated activities, as do most of the comparison companies. While MDU faces competition from propane and oil, as do virtually all gas companies, it does not confront effective competition for its heating load from electricity, as do the comparison companies that operate in warmer climates. Finally, MDU does not have the intrusion of independent gas suppliers into its retail market in anything like the degree that some of the comparison companies have. For these reasons, King's concluded that MDU has somewhat less overall risk than his comparison companies.

68. The arguments about comparative risk are interesting and depict two fairly divergent views. We find some validity in both witnesses' arguments but not to the level of certainty that the Commission can choose one over the other. Accordingly, the Commission will not adjust its DCF findings to reflect the professional judgment of either of these witnesses regarding comparative risk between MDU and the eleven proxy companies.

Gaske's "Benchmark Analyses"

69. Gaske presented two types of "benchmark analyses." In one series, he added the historical differences between Treasury bonds and corporate bonds, on the one hand, and earnings from the common stock of small and, alternatively large companies, on the other. The other benchmark analysis was to identify the recent earned return on book value of S&P's 500 companies and on Value Line's industrial companies. The results of these benchmark analyses are as follows:

Risk Premium Return Based on:	
- U.S. Treasury Bonds	
v. Large Companies	13.3%
v. Small Companies	20.2%
- Corporate Bonds	
v. Large Companies	14.8%
v. Small Companies	22.2%
Alternative Investments	
- S&P 500	21.5%
- Value Line Industrials	29.4%

70. Gaske appears to conclude from these tests that his 13.5 percent cost of capital, derived from DCF results, is quite conservative relative to these benchmark results. King argued that these comparisons are irrelevant. King argued that these results should be disregarded, because their conceptual basis is fatally flawed and the risk premium observations are without value statistically.

71. Gaske's risk premium analysis purports to measure the required return to equity by adding the historical difference in experienced earnings from stocks and bonds to the current levels of bond yields. These historical differences, as measured by Ibbotson Associates, go back to 1926. The theory is that over a long enough period, actual return differentials between stocks and bonds will equate to required or expected return differentials.

72. King observed this theory is a statement of faith, not experience, and it defies logic. If investors' short-term expectations are continually being frustrated (as has been the case during the last year), what logic supports the proposition that the sum of those failed short-term expectations represents a valid long-term representation of their expectations? King further argued that it is untrue that the differential in required

returns between bonds and stocks is fixed and unchanging, as this theory postulates. The perceived safety/risk relationship of bonds differs from stocks, and their relative desirability as investment vehicles changes continually depending on such factors as inflation, economic growth, and the capital structures of the enterprises issuing the securities.

73. King stated that quite apart from this conceptual failing, the stock to bond comparison theory fails statistically. King referred to Exhibit 34 introduced by Gaske that shows annual returns to large company stocks, small company stocks and long-term corporate bonds, and it also shows their differences. King pointed out that the standard deviation of every one of these series is greater than the mean of the observations. King argued that the means therefore lack statistical significance and are useless as a predictive tool.

74. Gaske purports to demonstrate under his alternative equity investment analysis that MDU should be allowed a high return by observing that the returns to book equity on the S&P 500 companies from 1977 to 2000 have averaged 21.47 percent. He also observes that the book equity returns to 746 industrial, retail and transportation companies included in The Value Line Investment Survey have ranged from 27.57 percent to 31.75 percent over the five years 1996-2000. He argues that the average of 29.4 percent, along with the return of 21.47 percent experienced by S&P's 500 companies, suggests that the 13.25 percent he proposes for MDU is quite low.

75. King argued that these comparisons are irrelevant. He pointed out that investors in unregulated industrial, retail and transportation firms have no access to book equity value. The only value that is meaningful for investors in such firms is the market value. That is what an investor must pay to acquire the stock, and conversely, the value an investor will receive by selling the stock. Book equity value in an industrial firm is a purely historical number representing the dollars of original investment in equity capital contributed to (or retained by) the company. It has little relevance to the current market value, even for fairly capital-intensive firms. Since most stocks sell well above their book value, the return that is accessible to investors is considerably less than the 20 to 30 percent noted by Gaske.

76. King noted that book values are relevant for regulated utilities because regulation makes them so. Regulation sets the earnings allowance for such companies relative to a rate base reflective of the book value of the capital invested in utility operations. This condition does not apply to industrial firms.

King's Risk Premium Test

77. King did not attempt to find any absolute value of equity return using the risk premium approach. He agreed that equity investment, being inherently more risky than debt, requires a higher return. But rather than attempt the difficult (and arguably impossible) task of measuring that risk premium, he looked to the trends in bond yields in comparison to past North Dakota Commission findings of equity return to gas companies. King stated that if it appears that bond yields have increased, but he has

recommended a reduced return to equity, then there may be reason to question his finding. On the other hand, if his proposed equity return track with the changes in bond yields, then there is at least a "sanity check" on the propriety of his finding.

78. King identified three gas cases during the past 12 years in which the Commission had found a rate of return to equity. He compared those rates of return with the then-current yields on 10-year Treasury bonds and Aaa Corporate bonds. He then identified the current (that is, August 2002) bond yields. The results of his research are as follows:

Case	Utility	Date	ROE Allowed	10-Yr Treas.	Aaa Corporate
399-90-820	MDU	July 30, 1991	12.0%	8.27%	9.00%
400-95-559	NSP	June 7, 1996	12.0%	6.91%	7.71%
400-00-521	NSP	June 27, 2001	11.5%	5.28%	7.18%
399-02-183	**MDU**	August, 2002	**10.5%***	4.35%	6.45%

79. The Commission takes notice of the benchmark analyses prepared by Gaske and King. Again, these benchmark analyses or reasonableness tests are intended to bolster each witness's use of DCF and their own feelings about what is or isn't a fair return on MDU's natural gas investments. We take notice of the arguments for what they are but find no compelling reason to adjust the outcome of the basic DCF calculation. In light of current economic conditions within the United States, Gaske's benchmark returns using risk premium and alternative investments are so high that they are unreasonable. On the other hand, we find no reason to try and track Commission ordered returns on equity to interest on notes or bonds either. Therefore, given the above considerations and conclusions, we find that the current market expectations for a natural gas distribution company such as MDU is an opportunity to earn 11.329% on its common equity, as follows:

Proxy Company	Div. Est.	EPS Growth	Growth Factor	Div Growth	Next Yr Div.	50-day Price	Div. Yield	DCF Return
Atmos Energy	$ 1.18	6.43%	62.5%	4.02%	$ 1.23	$ 21.63	5.67%	12.105%
AGL Resources	$ 1.08	11.42%	62.5%	7.14%	$ 1.16	$ 21.76	5.32%	16.737%
Cascade Natural	$ 0.96	5.25%	62.5%	3.28%	$ 0.99	$ 19.69	5.04%	10.286%
LaClede Group	$ 1.34	4.25%	62.5%	2.66%	$ 1.38	$ 22.65	6.07%	10.323%
NICOR	$ 1.84	6.10%	62.5%	3.81%	$ 1.91	$ 35.06	5.45%	11.548%
Northwest Natural	$ 1.26	6.06%	62.5%	3.79%	$ 1.31	$ 28.28	4.62%	10.684%
People's Energy	$ 2.08	6.80%	62.5%	4.25%	$ 2.17	$ 34.00	6.38%	13.178%
Piedmont Natural	$ 1.60	4.67%	62.5%	2.92%	$ 1.65	$ 34.45	4.78%	9.450%
South Jersey Industries	$ 1.50	6.00%	62.5%	3.75%	$ 1.56	$ 32.85	4.74%	10.737%
Southwest Gas	$ 0.82	6.80%	62.5%	4.25%	$ 0.85	$ 22.79	3.75%	10.551%
WGL Holdings, Inc.	$ 1.27	3.65%	62.5%	2.28%	$ 1.30	$ 24.21	5.37%	9.015%
Average DCF Return								11.329%

Net Regulated Income

Revenues

80. Both MDU and staff agree on projected volumes for sales and transportation customers including the associated revenues and cost of gas. We find that the projections are reasonable and adopt them for purposes of determining just and reasonable rates.

Other O&M Expense: Bonuses and 2003 Labor Expenses

81. In its application, MDU projects labor cost increases of 3.15% and 3% for 2002 and 2003, respectively. MDU argued that the increases are smaller than the present labor market. Included in the projected labor cost increases is compensation for bonuses.

82. Staff witness Majoros proposed to eliminate bonuses from the forecasted test year and to hold test year labor costs to their 2002 levels. MDU included average bonuses for the years 1999-2001 in the amount of 6.1 percent of labor costs. Applied to the $8,239,000 in labor costs in 2002, the bonus elimination by staff comes to $503,000. The 2003 labor cost increase eliminated by Majoros amounts to $236,000. These direct labor cost adjustments reduce payroll taxes by $40,000 in 2002 and $60,000 in 2003.

83. Majoros testified that given the state of the economy and the fact that MDU is requesting a rate increase, it would be unreasonable to include bonuses or 2003 wage increases in the test year revenue requirement. Majoros accepted the 2002 labor cost increase, but objected to extrapolating that increase through 2003.

84. MDU witness, Richard D. Spratt, MDU's Vice President – Human Relations, argued that bonuses are an integral part of overall compensation philosophy to remain competitive with other employers. Part of that compensation is intentionally put at risk in the form of bonuses that are paid on the basis of various goals, including MDU's overall profitability. Spratt presented the results of an industry survey that showed most

utilities pay bonuses not only to management employees, but to salaried and hourly employees as well. Spratt stated that the elimination of bonuses would risk rendering MDU uncompetitive relative to other employers.

85. Staff witness Majoros argued that bonuses should not be built into rates because they are primarily paid out based on the profitability of the company. Spratt testified that two years ago, presumably in 2000, 75 percent of MDU's employees received a 7 percent bonus. Last year, 2001, their bonus was 0.6 percent. Presumably, these bonus levels reflect the fact that in 2000, MDU earned 11.96 percent on its North Dakota Gas Operations, but in 2001, it reported only 1.6 percent.

86. C. Wayne Fox, President of MDU Utilities Company, stated that from 1994 through 2001 the Consumer Price Index has risen nearly 20 percent, and in spite of that increase MDU has been able to hold-the-line on gas rates by finding ways of operating the business more efficiently and taking advantage of new technology. MDU even reduced its rates in 1999 through improved efficiency. Fox testified that MDU has reduced its employees by 30 percent since 1994. In that year there were 248 customers per MDU employee. In 2001, one employee was serving 370 customers. MDU witness, Rita Mulkern testified that while past employee reductions are reflected in the 2001 base period data, no further reductions are forecast for 2002 and 2003.

87. We find in favor of MDU. We believe the overall wage increases projected by MDU are fair and reasonable. The Commission believes that how those raises are distributed remains the responsibility of MDU's management and therefore will not delineate between the portion attributable to a general wage increase or bonuses. Further, we do not find the practice of paying bonuses based on profitability objectionable. In fact, the payment or lack of payment of bonuses depending on profitability smoothes out earnings and at the same time puts pressure on employees to perform. We do not accept the argument that because MDU has been able to reduce its workforce and beat inflation in recent years that it should be expected to do so forever more. Accordingly, the staff adjustment to Taxes Other Than Income to eliminate related payroll taxes is also denied.

Other O&M Expense: SISP

88. The Supplemental Income Security Plan ("SISP") is a plan that provides supplemental pension benefits to key employees. "Key employees" are officers, directors and senior managers of MDU Resources and MDU Utilities. The plan is expected to cost $259,000 in 2002 and $265,000 in test year 2003.

89. SISP was initiated in 1982, but MDU never sought its inclusion in rates until Case No. PU-399-01-186. The order states that staff characterized SISP as a double pension for a few key employees and that the plan lacked symmetry. Staff cautioned the Commission against such a plan given the Enron debacle and the payments it made to key employees. In its April 24, 2002 decision in that case, the Commission accepted Staff's position. The Commission concluded that it is inappropriate for ratepayers to bear the expense of the SISP costs.

90. MDU witness, Richard A. Espland, acknowledged that his testimony was essentially the same as it was in Case No. PU-399-01-186. Espland acknowledged that SISP benefits only MDU's high salaried employees with income ranges from a low of $75,000 to its president at around $250,000 to $300,000. Espland also agreed that none of the Public Utility Commission's in the jurisdictions where MDU provides natural gas utility services have approved a ratepayer funded SISP program. The Commission took administrative notice of its Findings of Fact, Conclusions of Law and Order in Case No. PU-399-01-186.

91. We find that the inclusion of an extra pension for key employees is still inappropriate and unnecessary as a ratemaking expense. We determined that SISP was inappropriate in Case No. PU-399-01-186 and none of the arguments have changed. Accordingly, we find no reason to order differently in this case. MDU's projected expense of $265,000 for SISP costs is denied.

Other O&M Expense: Rate Case Expense

92. MDU proposes to amortize $168,000 in rate case expenses over three years at $56,000 per year. Staff witness Majoros proposes to amortize the same amount over five years at $34,000 per year, for a difference in annual cost recognition of $22,000. Mulkern suggested that if the five-year amortization is adopted, the unamortized balance should be included as a rate base addition.

93. The basis of Majoros' proposal is the historical period between rate cases. Fox stated in his direct testimony that MDU's last rate increase, in Case No. PU-399-94-297, was decided in 1994, and a rate reduction occurred in 1999 in Case No. PU-399-96-325. This represents two rate cases in eight years, or one every four years. MDU has rounded down to three, and Staff has rounded up to five.

94. We find that the recent trends of a case every four years argues for an amortization period of four years. Accordingly, the Commission finds that ratemaking expense is $42,000 per year or a reduction to the company's projection of $14,000.

Other O&M Expense: General Inflation Adjustment

95. In 2001, MDU incurred $89,780,000 in operating and maintenance expense, of which $76,842,000 represented the cost of acquiring gas. Of the remaining $12,938,000 O&M cost relating to distribution, MDU developed specific forecasts for $9,249,000 based on projected changes for various categories of costs, e.g. labor, benefits, insurance, advertising. The remaining catchall category of $3,689,000 is projected to increase 2.8 percent annually at the assumed rate of general inflation.

96. Majoros noted that the Commission had never previously allowed this sort of inflation-based adjustment; that some sort of incentive to generate efficiency should remain and that some of the catchall provision includes fixed costs that are not subject to inflation.

97. MDU argued through its witness, Ms. Mulkern that these types of expenses are subject to inflationary pressures and that past Commission decisions rejecting this adjustment are no excuse for ignoring inflation in this proceeding.

98. We reject the idea that we have ignored inflation in the past or that we would in this proceeding. Instead, MDU has recommended that the Commission give it consideration for a number of specific adjustments that go beyond the 2.8% inflation factor and then add on 2.8% for any remaining and unadjusted expense levels. According to Statement N, Page 1 of MDU's application, the company has requested an overall increase in Other O&M expenses of more than 5% per year for its projected 2003 test year in comparison to 2001 actual expenses. Finally, the Commission order in this proceeding grants an increase in Other O&M expenses that exceeds the general inflation factor of 2.8% which is not necessarily indicative of changes in natural gas distribution costs.

99. MDU's proposal to increase "other" O&M costs at the rate of inflation through 2003 is rejected. The elimination of this adjustment reduces test-year expenses by $209,000.

Depreciation

100. Staff asserted that test year depreciation expense should be reduced by $2,172,000. MDU's current depreciation expense is based on rates developed in a 1991 study performed by Stone & Webster. Staff witness Michael J. Majoros performed a series of studies that suggested MDU's depreciation rates are excessive. First, he found that annual depreciation accruals during the past five years have exceeded utility construction and acquisition by $28.5 million. When common plant construction and acquisition is added, the five-year accruals still exceeded expenditures by $409,000. While it is not the purpose of depreciation to fund construction, this comparison indicates that MDU has obtained substantial cash flow from depreciation. Majoros noted that in *Lindheimer v. Illinios Bell Telephone Company,* 292 U.S. 151 (1934), the Supreme Court found that excessive depreciation results in the extraction of capital from ratepayers.

101. Majoros next observed that as of the end of 2001, the ratio of depreciation reserve to the original cost of distribution plant is 70.7 percent. Based on his experience, he testified that this level of depreciation reserve is extraordinarily high and suggests that prior depreciation rates have been excessive. Majoros stated that the likely source of these excessive rates is the 140 percent negative salvage adjustment for Account 380 – Services.

102. Majoros adjusted MDU's salvage factors based on an inconsistency between the net salvage assumed in the Stone and Webster study and actual net salvage that MDU has experience during the past five years. The Stone & Webster study developed depreciation rates that resulted in a large recovery of "negative salvage," that is, cost of removal. Specifically, its depreciation rates were designed to recover total gas plant of $102.5 million plus negative salvage (removal) costs of $46.9 million.

103. Majoros testified that MDU's actual net salvage experience has been positive. In every year since 1997, he testified that MDU has received more in salvage value for its retired gas and common plant than it has paid in removal cost. The total cumulative 5-year net positive salvage receipts for gas plant have amounted to $1,444,452. For common plant, net positive salvage receipts have come to $5,529,260.

104. To correct for over-recovery of net salvage, Majoros proposed to adopt the Stone & Webster lives and survivor curves for each account with no net salvage overlay. The account-by-account depreciation rates would thus represent pure depreciation, that is, solely the recovery of original cost. To recognize net salvage, Majoros proposed to deduct from total annual depreciation the average annual amount of net positive salvage for gas plant, plus the net positive salvage of common plant distributed between gas and electric operations based on their respective net salvage amounts. Under Majoros' proposal, total depreciation of test year plant would be $1,937,000. The annualized positive salvage offset would be $848,000, for a net test-year depreciation expense of $1,089,000.

105. Majoros noted that, in addition to matching net salvage accruals with actual net salvage experience, his treatment of removal costs conforms to Generally Accepted Accounting Principles ("GAAP") as recently defined in Statement of Financial Accounting Standards No. 143 ("FAS 143"). That standard, which MDU must adopt this year, requires companies to determine whether they have a legal obligation to retire property and incur the cost of removal or dismantlement. If they do, they must declare the present value of the future "asset retirement obligation" costs as a liability on their books to be amortized over the remaining life of the asset. If they do not, then the American Institute of Certified Public Accounts' Statement of Position on Property, Plant and Equipment would require that these costs be expensed as they are incurred.

106. Majoros testified that MDU has not determined whether it has asset retirement obligations, or what the present value of those obligations might be. For this reason, Majoros' adjustment reflects net salvage experience as a rolling five-year average of actual net removal costs.

107. In rebuttal, MDU witness John A. Jeter, a retired accountant from Arthur Anderson & Co. argued that Majoros had not done a depreciation study, that his review of the current depreciation rates is superficial and contains many errors, and that he has no basis for proposing changes in depreciation rates. According to Jeter, the current depreciation rates are based on a comprehensive study prepared in 1991 and used beginning 1994. He argued that no adjustment of depreciation rates should be entertained until the current depreciation study underway is completed and an appropriate review has taken place.

108. Jeter asserted that the 1991 depreciation study by Stone & Webster is a much more reliable source of information regarding net salvage than a cursory look at net salvage for all accounts over a five year period. Jeter did not explain the reason, nor

did he refute Majoros' observation that the Stone & Webster study had recommended large negative salvage allowances, while MDU's actual net salvage experience has been positive in recent years.

109. Jeter disagreed with Majoros' net salvage proposal to adjust overall depreciation by $848,000 based on the past five years' actual experience. He observed that the net salvage amounts used by Majoros varied from year to year and reflected the sale of an office building for approximately $4.6 million. Jeter further contended that Majoros allocated common property net salvage based on the direct net salvage amounts of the gas and electric operations, which is not the basis used by MDU. Jeter failed however to mention how MDU does allocate these common net salvage amounts or whether the difference in methods is material.

110. MDU asked the Commission to defer any consideration of depreciation until its new depreciation study, currently being conducted by AUS Consulting, is completed by the end of this year.

111. We find it unfortunate that the depreciation study currently underway could not be completed prior to the hearing. MDU has agreed to submit the new depreciation study for review by January 31, 2003 as a continued issue in this proceeding, subject to the standard and customary contested case process with all parties having rights of discovery, testimony, rebuttal testimony, hearing and briefing. MDU's depreciation filing will include gas and common plant facilities. Any resulting change in depreciation expense ordered by the Commission at the conclusion of the review will be reflected in rates on a prospective basis.

112. The Commission anticipates that this review should take no longer than six months from the date MDU files its new depreciation study. In the interim the Commission will allow MDU to implement rates reflecting the findings and conclusions in the instant order together with MDU's current depreciation rates. The Commission recognizes that the instant decision is a final decision as to all issues except for the depreciation issue, which is continued pending the filing and review of a new study. MDU's recently filed letter reflects MDU's agreement with this understanding.

113. Staff's adjustment reducing depreciation expense by $2.172 million is rejected.

114. From the foregoing, the Commission finds that MDU's projected Net Operating Income for 2003 is as follows:

Description	MDU	Adjustments	Commission
Sales	$ 67,962	$ -	$ 67,962
Transportation	900	-	900
Other	287	-	287
Total Revenues	$ 69,149	$ -	$ 69,149
Cost of Gas	$ 50,072	$ -	$ 50,072
Other O & M Expense	14,354	(488)	13,866
Total O & M Expense	$ 64,426	$ (488)	$ 63,938
Depreciation	3,261	-	3,261
Taxes Other Than Income	1,352	-	1,352
Current Income Tax Expense	(1,961)	192	(1,769)
Deferred Income Taxes	1,612	-	1,612
Total Expenses	$ 68,690	$ (296)	$ 68,394
Net Regulated Income	$ 459	$ 296	$ 755
Income Tax Calculation:			
NOI before Income Taxes	$ 110		$ 598
Interest Deduction:			
Rate Base	$ 19,681		$ 19,681
Weighted Cost of Debt	3.951%		3.969%
Interest Expense	$ 778		$ 781
Other Deductions	$ 4,282		$ 4,282
Taxable Income	$ (4,950)		$ (4,465)
Tax Rate	39.61%		39.61%
Income Tax Expense	$ (1,961)		$ (1,769)

115. From the foregoing, the Commission calculates that MDU's additional revenue requirement for the opportunity to earn 11.329% on common equity invested in North Dakota in 2003 is:

Change in Revenue Calculation	
Rate Base	$ 19,681
Weighted Cost of Capital	9.883%
Required Return	$ 1,945
Return Earned	$ 755
Difference	$ (1,191)
Tax Factor	1.656
Required Change in Revenue	$ (1,972)
Rate Increase Required	2.9%

Sale of Corporate Building

116. In this proceeding, it came to the attention of the Commission that MDU transferred the ownership of its Schuchart Building from the utility business to a non-regulated subsidiary. According to MDU's witness Keller, the building was transferred to recognize that less and less of the corporate business is related to the utility operations. The building was transferred at net book value without the benefit of a fair market value assessment. It appears that some after-the-fact analysis has been done to suggest the transfer was fair to ratepayers. The Commission wishes to remind MDU, as it would all public utilities, that the utmost care must be taken in completing such transactions. At a time in our history when corporate activities are being heavily scrutinized, it is imperative that MDU conduct business in an open and transparent manner, such that there is not even the slightest hint of corporate greed or chicanery.

Cost Allocation and Rate Design

Class Cost of Services Study

117. A class cost of service study is an analysis of the embedded or incremental costs of providing utility services to the customers or classes of customers that either cause these costs, or to whom these costs can reasonably be allocated. The purpose of performing a class cost of service study is to provide an indication of what it costs to provide utility service to each customer class and what rate of return each class provides. In prior rate applications the Commission has not adopted any particular study but has used class cost of service studies as guidelines for rate design and as one of the factors in setting rates for the respective classes of customers.

118. MDU Witness Tammie Aberle sponsored an embedded cost of service study for the year ended December 31, 2001. This study allocated all of MDU's recorded distribution, general and gas-related common plant among seven categories of customers:

- Residential
- Firm General
- Air Force
- Small Interruptible Sales
- Small Interruptible Transport
- Large Interruptible

119. The costs allocated to the respective customer classes were in turn subdivided into three categories:

- Capacity related costs vary with the amount of gas send out on the peak days of the year. Examples include the sizing of distribution mains and meters to account for the maximum volume of gas handled on any one day.
- Throughput related costs vary with the total amount of gas distributed throughout the year. Uncollectible accounts are an example of this type of cost.

- Customer related costs vary with the number of customers. Examples include the cost of meters, services and billing.

120. The only disagreement relating to this cost of service study concerned the allocation of the cost of mains. Mains constitute 39.1 percent of MDU's gas distribution plant, but their relevance exceeds even this percentage. That is because general and common plant, which account for another 20 percent of total plant, are allocated as overheads to the direct investment, of which mains are the largest component.

121. In its initial cost of service study, Statement M of Exhibit 2, MDU allocated mains 64 percent on the basis of peak two-day throughput during the year and 36 percent on the basis of the number of customers.

122. King objected to the allocation of a portion of mains costs on a customer count basis. The arguable justification for doing so is that the purpose of the mains system is to reach customers, and that when more customers are added, the mains system has to be extended. King argued that this is true only at the very edges of the system, where gas mains are being extended to serve new developments. Even then, the added cost of mains for new customers can vary dramatically depending on the location of those customers.

123. King testified that another purpose of mains is to deliver gas. He argued that the value derived and the benefits received from the mains system are more related to the amount of gas delivered than to the number of customers. One customer receiving twice as much gas as another customer enjoys exactly twice the BTU heating content. The two cannot be equated in terms of benefit received, yet that is what a customer allocation of mains does. He illustrated his point by using the example of a section of main that changes the number and makeup of customers over a period of several years, but the amount of gas delivered remains the same. The weighting of that main in the cost of service study would change under a customer allocation, but it would remain the same (although shifted among customer classes) if the allocation were made on the basis of annual throughput.

124. King therefore asked that MDU conduct an alternative study to allocate half the mains cost according to the classes' two-day peak throughput and half on the basis of annual throughput.

125. On rebuttal, Aberle objected to King's revisions, arguing that main additions are not made only on the edges of the system to provide new service to developments, but are also required to enhance system integrity and maintain pressure throughout the system as customer additions are made. She objected that heating content has no impact on the cost of the mains system. She also objected to the use of a peak-day allocator that assigns costs to the interruptible class and a throughput allocator that assigns costs to the transmission customers. She argued that both of these allocations violate practices previously approved by the Commission. She submitted yet a third

cost of service study, one, which allocates mains, based 50 percent on throughput at the distribution level and 50 percent on peak day use by firm customers.

126. The results of the three costs of service studies show the rate of return from each customer class as follows:

	MDU Statement M	**King CWK-7**	**Aberle TAA-4**
Residential	3.083%	7.731%	6.367%
Firm General	3.998%	2.161%	1.106%
Air Force	50.281%	3.502%	69.369%
Small Interruptible Sales	83.992%	38.040%	40.905%
Small Interruptible Transport	169.437%	48.490%	57.738%
Large Interruptible	78.644%	-0.673%	27.320%
Total North Dakota	6.439%	6.442%	6.442%

127. As noted earlier, the Commission has used class cost of service studies as guidelines for rate design and as one of the factors in setting rates for the respective classes of customers. We appreciate the information provided by each of the studies because it quantifies the impact that a change in allocation factor has on the rates of return from customer classes. The studies also show that, regardless of the allocator used to allocate mains to customer classes, some customer classes are providing a much higher return on MDU's investment to serve than are other customer classes. All three studies indicate the small interruptible classes generate a much higher than average rate of return while two of the studies indicate the same is true for the air force and large interruptible classes. The third study proposed by King indicates lower rates of return from the Air Force and large interruptible classes, but we are concerned that this study may not adequately recognize the value of controlling system peaks with interruptible load.

Rate Design

128. In its initial application, MDU made a number of rate design proposals, as follows:

- Increase residential and firm general service rates by 4.6 percent, reduce the small interruptible class rates by 4.1 percent, and leave the Air Force and large interruptible rates unchanged;
- Separate the commodity rate into a Distribution Delivery Charge and a Cost of Gas charge, eliminating the Purchased Gas Cost Adjustment;
- Eliminate the declining block rate form from the commodity charges and substitute a flat per-dekatherm ("dk") rate;
- Change the customer, or "Basic Service Charge" from a monthly to a daily charge;
- Increase the Basic Service Charges by very large percentages, for example, the residential charge increases from $6.50 to $11.70, the small firm service charge from $8.50 to $24.00 and the large firm service charge from $17.00 to $51.00.

- Eliminate the residential seasonal rate;
- Increase the penalty for failure of interruptible customers to interrupt from $10 to $50 per dk;
- Increase the return check fee to $20;
- Increase the reconnection fees for seasonal customers to match the avoided Basic Service Charges;
- Increase the reconnection charge for disconnected customers for nonpayment to $30;
- Modify the Firm Gas Extension Policy Rate 120 and 124 to reflect MDU ownership of all prospective service lines.

129. King recommended that the Commission accept a number of these proposals regardless of whether MDU's overall revenue is increased, decreased, or remains unchanged. The Commission finds the following consensus proposals should be approved:

- The commodity rate should be separated into two clearly distinct rates, the Distribution Delivery Charge and the Cost of Gas Rate.
- The declining block rates should be eliminated, and the revenue collected through the higher initial block rates should be reallocated to the Basic Service Charge.
- The residential seasonal rates should be eliminated, since there are no customers on these rates.
- Penalties for failure to interrupt should be increased, since MDU believes the current penalties are not sufficient to ensure interruptible customers respond to their calls for interruption or curtailment.
- The reconnection charges for seasonal customers should be adjusted to match the higher Basic Service Charges resulting from the elimination of declining commodity blocks.
- MDU's proposed modifications to the line extension policy should be adopted.

130. King recommended that the Commission reject MDU's proposal to increase the reconnection charge for discontinued service to $30. While MDU claimed that this is a cost-based rate, King suggested that there is a legitimate public policy reason for not increasing this rate. The customers to whom this charge applies are almost certainly the lowest income customers. Otherwise, they would not have been disconnected. Since they have to pay their arrearages anyway, they are likely suffering some difficulty getting reconnected. To impose on them yet more cost, such as an increase in the reconnection fee, might prevent some of these customers from obtaining vital utility service. MDU did not respond to King's recommendation. We agree with the policy considerations asserted by King and find MDU's proposal to increase the reconnection charge for disconnected customers should be denied.

131. MDU proposed to increase the returned check charge to $20 to reflect the current going rate charged by banks and other businesses when a check is returned for non-payment. However, MDU did not present any studies or other specific information to indicate its actual cost of returned checks. We find that returned check charges

should be based on cost and absent a showing by MDU that the proposed new rate is based on cost, MDU's proposal should be denied.

Rate Allocation Among Customer Classes

132. MDU proposed that residential and firm general service customers receive a rate increase of 4.6 percent, that the Air Force and large interruptible customers receive no increase, and that the small interruptible class receives a reduction of 4.1 percent. In the past the Commission has not approved rate reductions to some classes when granting an overall increase. Consistent with past Commission practice, we will not authorize any decrease for the small interruptible class. If a class receives a decrease when other classes receive an increase, the amount of the increase to the other classes will be higher. Revenue lost from giving one class a decrease must be made up by the other classes, thus increasing their burden.

133 The Commission finds the overall results of the class cost of service studies indicate that rates of return from the residential and firm general service classes are significantly less than those from the other classes. We share the desire to move towards more equalized rates of return between customer classes. The relatively small amount of revenue increase being granted in this case provides an opportunity to increase the rates of return from the firm general and residential classes without unduly burdening customers. Therefore, we will allow MDU to assign approximately equal percentage revenue increases reflecting the overall increase authorized to the residential and firm general service customer classes and approximately zero percentage increases to the other customer classes.

Monthly Customer Charges

134. King supported MDU's proposal to eliminate declining block commodity rates on the grounds that this rate structure implicitly encourages customers to use more gas, and it thereby discourages conservation. To the extent that it collects fixed customer costs in the commodity rate, it misstates the cause of the costs. Declining block rates also allow customers who use minor amounts of gas to escape the cost of providing the basic elements of service to them. As stated above, we agree with King that the declining block rate should be eliminated to more closely reflect cost causation in rates to customers.

135. Using MDU's billing unit counts for the year 2001, King calculated the revenue-neutral increase in monthly customer charges that would result if the present declining block rate structure were eliminated from each rate schedule. Under King's revenue neutral proposal, the resulting monthly customer charges would be as follows:

	Current	**Rev. Neutral**
Small Residential	$6.50	$8.43
Large Residential	$13.00	$15.31
Small Firm Service	$8.50	$14.34
Large Firm Service	$17.00	$45.16

135. King also recommended that the Commission consider MDU's proposal to convert the customer charges from monthly to daily charges. The proposal simplifies the calculation of the charge when customers are taking gas for only part of a month. We agree and find that MDU's monthly customer charge should be converted to a daily customer charge as proposed.

136. King had misgivings about MDU's proposal to increase customer charges dramatically, even for the classes for which it was proposing rate reductions or no rate increases. MDU witness Russell Feingold contended that shifting revenue recovery from the commodity to the customer component allows MDU to recover much more of its fixed costs on a non-weather sensitive basis. He asserted that this shift also protects customers from the volatility in their gas bills caused by variations in weather.

137. King was concerned with the issue of rate continuity. The sort of changes proposed by MDU would result in dramatically different bills for different types of customers. Very low-use customers might find higher percentage increases in their average monthly bills. Customers accustomed to low gas bills in the summer, that possibly offset high electric bills, could be surprised by the increase in their summer gas invoices.

138. King was further concerned that customers may resent high monthly customer charges. When most of the cost of gas is based on the level of gas consumption, customers can avoid high gas bills by conserving gas. But no amount of conservation permits a customer to avoid a monthly customer charge. As long as this charge is not a major portion of the bill, it is likely to be acceptable to most customers. But if it looms as a major element in the cost of gas service, customers will come to regard it as a tax from which there is no escape.

139. King recommended that customer charges should not be increased by more than twice any overall percentage increase. This would be in addition to the increases in customer charges that result from the flattening of the declining block rates. King testified if rates are reduced, the reductions should be flowed entirely into the commodity component of each rate schedule. King asserts that customer charges should not be increased when rates are reduced, except to eliminate the declining block feature of the rate schedules.

140. The Commission agrees that customer charge increases should be limited and will adopt King's recommendation for residential and small firm general service customers because customer charges are a more significant portion of their bill. We find the remaining monthly customer charges proposed by MDU should be approved. The resulting customer charges are:

	Current Monthly	Proposed Monthly	Proposed Daily	Authorized Monthly	Authorized Daily [1]
Residential Service		$ 11.70	$ 0.39	$ 8.91	$ 0.29
Small Meters	$ 6.50				
Large Meters	$ 13.00				
Firm General Service					
Small Meters	$ 8.50	$ 24.00	$ 0.80	$ 15.16	$ 0.50
Large Meters	$ 17.00	$ 51.00	$ 1.70	$ 51.00	$ 1.70
Air Force					
Firm	$ 35.00	$ 135.00		$ 135.00	
Interruptible	$750.00	$1,000.00		$1,000.00	
Small Interruptible					
Sales	$ 35.00	$ 100.00		$ 100.00	
Transport [2]	$ 35.00	$ 150.00		$ 150.00	
Large Interruptible					
Sales	$450.00	$ 675.00		$ 675.00	
Transport [2]	$450.00	$ 725.00		$ 725.00	

Notes:

1. Daily = Monthly X 12 / 365.25
2. Customer charge authorized for transportation service includes roll-in of $50 nominating fee currently charged separately under existing tariff.

Distribution Delivery Stabilization Mechanism

141. MDU proposes that if the Commission disapproves of MDU's increases in customer charges, it should adopt a Distribution Delivery Stabilization Mechanism ("DDSM") as an alternative. As described by Feingold, the DDSM would modify the effects of weather variations by adjusting bills for the difference between the actual heating degree-days and heating degree-days under normal weather. Following a cold winter, the excess in each class's revenue from the greater number of heating degree days would be divided by the projected annual sales volumes in that class and credited to all customers over the following year on a per-dk basis. Similarly, the revenue shortfall from a warmer than normal winter would be collected through a surcharge in the following year.

149. King testified that the value of a weather normalization adjustment should be to ameliorate the volatility in customer bills caused by variations in weather, and particularly the effect of unusually cold winters. In such winters, ratepayers typically experience a "double whammy." First, they consume more gas than usual, which increases their bills even if the price of gas remains the same. Then, because cold winters are usually a widespread phenomenon, the demand for gas is higher across the continent, which means that the price of gas is higher. The result is a further inflation in

their bills. Just this sort of inflation occurred across the country during the winter of 2000-2001.

150. King suggested that MDU's proposal could result in a "triple whammy." If North Dakota experiences an unusually warm winter, and it is followed by an unusually cold winter, ratepayers during the cold winter, already hard-hit, would find themselves paying a surcharge to make up for the shortfall in revenue collections in the previous year. The effect of MDU's program could be to increase, not decrease the volatility in customers' bills from year to year.

151. The Commission finds that MDU's alternative proposal should be denied, primarily because of its delayed effect. For a weather normalization adjustment to be beneficial to ratepayers and not just the utility, it must affect their bills when the unusual weather is occurring, not after it has occurred.

From the foregoing Findings of Fact, the Commission makes its:

Conclusions of Law

1. The Commission has jurisdiction over the parties and the subject matter of this proceeding.

2. MDU is entitled to rates and charges necessary to provide it an opportunity to earn a reasonable rate of return on its North Dakota natural gas property, used and useful, for the service and convenience of the public in North Dakota.

3. The rates authorized by the Commission herein will provide MDU with the opportunity to earn a reasonable rate of return on its property used and useful for the service and convenience of the public in North Dakota.

4. The depreciation issue in this proceeding is continued for the purpose of filing and review of, and decision on, a new depreciation study.

5. This order constitutes a final determination of all issues in this proceeding except the depreciation issue.

From the foregoing Findings of Fact and Conclusions of Law, the Commission makes its:

Order

The Commission orders:

1. MDU may implement a rate increase for service rendered on and after December 12, 2002, sufficient to produce a total annual revenue increase of $1.972 million.

2. MDU shall file revised tariff sheets for Commission approval consistent with the foregoing findings of fact and conclusions of law.

3. MDU shall file its new depreciation study as soon as possible, but no later than January 31, 2002.

STATE OF NORTH DAKOTA

PUBLIC SERVICE COMMISSION

Montana-Dakota Utilities Co.
Natural Gas Rate Increase
Application

Case No. PU-399-02-183

CONCURRING OPINION
Commissioner Susan E. Wefald

December 10, 2002

I concur with all of the findings of facts and conclusions on law in this case except for finding 87. The Commission should not include bonus money for MDU employees as an element of a rate case.

If company profitability drives bonuses, as it appears to, then it is altogether inappropriate to include bonuses in a revenue requirement that drives a rate increase. As staff stated in its brief, "The reason MDU needs the rate increase is that it is not profitable. If it becomes profitable as result of a rate increase, that profitability will not have come about because the employees have performed particularly well. To the contrary, it will be because the employees have not performed well, and MDU needs rescue from the Commission. The revenue requirement imposed on ratepayers should not include rewards for poor performance. For this reason, bonuses should be disallowed." (page 14, Public Service Commission Staff Brief, filed November 15, 2002)

The overall wage increases projected by MDU are fair and reasonable. However, eliminating $503,000, which is equal to 6.1 percent of total approved labor costs in 2002 of $8,239,000, is prudent. This would reduce the amount of pay increase needed in 2003 by $236,000 (see finding 82). If the amount of the bonuses was eliminated, MDU would still have the ability to allocate any warranted bonus money with the remainder of the money in labor cost increases and the elimination would provide an incentive for company employees to find further cost savings and increase profitability.

Re: Case No. PU-399-02-183

The purpose of this letter is to outline Montana-Dakota's understanding of the Commission's work session discussions regarding a decision in Montana-Dakota's pending gas rate case, and identify Montana-Dakota's agreement with that understanding.

Montana-Dakota Utilities Co. (Montana-Dakota), a Division of MDU Resources Group, Inc., understands from the Commission's work sessions regarding the above case that rather than reaching a decision on the depreciation issue from the current record in the rate case, the Commission desires to consider Montana-Dakota's depreciation rates based on a study to be filed by Montana-Dakota. Montana-Dakota understands that the Commission's order in this case expected to be issued the week of December 9, 2002, will require the filing of a depreciation study by January 31, 2003 with consideration thereof continued as part of the current case. Montana-Dakota recognizes from subsequent discussions with the Commission's advisory staff that the Commission anticipates that the review of the new depreciation study and a decision on the depreciation issue should be complete within six months from the date Montana-Dakota files the new study.

Montana-Dakota further understands that the Commission considers the order to be issued next week to be a final appealable order with respect to all other issues, that the Commission's decisions on these other issues will be reflected in compliance rates to be filed by MDU upon issuance of the order, that the existing depreciation rates will remain in place and be reflected in the compliance rates during the consideration of the study, that the consideration of the study will be conducted as a contested case proceeding based upon the record developed after filing of the depreciation study with all rights of testimony and cross examination, and that any rate changes resulting from the issuance of an order after consideration of the study would be prospective only from the date of such Commission order regarding the study.

Given Montana-Dakota's understanding as noted above, Montana-Dakota would not object to the continuation of the consideration of depreciation based on the new study.

Montana-Dakota Utilities Co., a Division of MDU Resources Group, Inc. Natural Gas Rate Increase Application

Case No. PU-399-02-183

BRIEF OF MONTANA-DAKOTA UTILITIES CO.

Introduction

The Public Service Commission is entrusted with the responsibility of approving utility rates which are just and reasonable. N.D.C.C. § 49-05-06. This entails approving rates which will provide the utility with the opportunity to earn a rate of return on its property prudently invested in providing service to its customers that is "commensurate with return on investments in other enterprises having corresponding risks" and is "sufficient to assure confidence in the financial integrity of the enterprise, so as to maintain its credit and attract capital." Federal Power Commission v. Hope Natural Gas Co., 320 U.S. 591 (1944). The evidence presented by the Applicant in this case demonstrates that the rates requested are just and reasonable and are appropriate to generate the level of revenues necessary to accomplish these purposes.

Depreciation Expense

The major issue on the matter of allowable operating expenses pertains to the proper depreciation rates to be employed to determine the projected 2003 test year depreciation expense. The evidence presented by Montana-Dakota shows that the 2003 depreciation expense is $3,261,000 [Ex. 2, Statement N, p. 15]. This was determined on the basis of the depreciation rates developed in a detailed full depreciation study performed for the Company by Stone & Webster Management Consultants, Inc. in 1992 and accepted by this Commission in previous cases.

The Commission Staff witness Michael Majoros, however, asserted that those rates, despite having been previously accepted by this Commission, result in "excessive" depreciation, on the claimed grounds that negative net salvage was too high and the lives of mains and services were too short [Ex. 19, p. 10]. His conclusion was that the 2003 depreciation expense should be only $1,089,000. [Ex. 19. MJM-7, p. 3]. The difference of $2,172,000 between this amount and the Company's 2003 depreciation expense of $3,261,000 accounts for most of the discrepancy between the Company and Staff positions on revenue requirements.

Whereas the Company's computation of depreciation expense is based on the Stone & Webster depreciation study, the Staff's position is based not on any kind of study but rather simply on the following unsupported conclusory opinions:

(1) Mr. Majoros' unsupported opinion was that "based on my experience ... the depreciation reserves are extraordinarily high" [Ex. 19, p. 9]. He offered nothing to show what that "experience" was, nor what "extraordinarily high"meant, except the unsupported assertion that "the cost of removal factor in Account 380-Services is extremely high. ... On its face this [140 per cent negative salvage] appears to be very excessive." [Ex. 19, p. 9]

(2) Based again simply "on my experience" and investigation of gas depreciation rates "on several occasions," Mr. Majoros asserted that the lives for Accounts 376-Mains and 380-Services used in the Stone & Webster depreciation study are "extremely short." [Ex. 19. p. 10]. His conclusion was that instead of fairly normal service lives of 36 and 34 years, respectively, mains and services should have extremely long lives of 108 and 69 years instead, leading to lower annual depreciation expenses.

(3) Mr. Majoros contended that the negative net salvage shown by the Company was incorrect and that positive salvage has been experienced during the past five years, and speculated that the Company had not recorded any net salvage at all for services. [Ex. 19, p. 11-12].

In fact, however, as the Company's testimony demonstrated, net salvage for services is recorded, and negative net salvage has been the normal situation. [Tr. p. 316; Ex. 30]. Mr. Majoros's conclusion that positive net salvage was the normal situation was based on misconceptions resulting from looking at isolated items over a short term. As explained by Company witness Craig Keller, positive net salvage almost always results from one of three things: (1) the sale of an asset, (2) receipt of insurance proceeds, or (3) the trade in of an asset for a different asset. [Tr., p. 387].

All three of these factors are applicable to this case:

(1) Sale of an Asset. For the period in question examined by Mr. Majoros there was a sale of a substantial asset, the Schuchart Building in Bismarck, sold by the Company at book value to an affiliate. There was therefore no actual gain, although the sale proceeds show up for accounting purposes as a large amount of positive net salvage. What the Company actually did, of course, by this transaction was simply to collect its cost for the building. The offsetting adjustment in the

depreciation reserve for the retirement of this asset creates "positive" net salvage, as Mr Keller explained. As Mr. Jeter pointed out:

> "I want to make sure everybody understands there was not a gain on the sale. There was nothing that the customers are ever going to realize. This building was sold for its net cost. In other words, its original cost less the depreciation that had been accumulated on it from the time that it was placed in service." [Tr., p. 313]

(2) Receipt of Insurance Proceeds. The Company received substantial insurance proceeds for damage resulting from the severe June 2001 hailstorm in the Bismarck-Mandan area, and the surplus from the proceeds was credited to reserve salvage, which is a direct benefit to ratepayers. [Tr. p. 388].

(3) Trade-ins. The Company has a program by which it trades in equipment every other year, allowing it to acquire new equipment at little cost. As Mr. Keller pointed out, this appears as positive salvage on the one hand but is balanced and offset by the new property addition on the other hand: "There's really no net increase in plant because of those transactions. It just shows up as salvage." [Tr., p. 389].

Therefore Mr. Majoros' conclusion that Montana-Dakota normally experiences substantial net positive salvage is simply based on an erroneous interpretation of data applicable to a certain limited period or years in which extraordinary events occurred. The fatal defect in the Staff's position on depreciation is that all of Mr. Majoros' conclusions are based simply on the unsupported assertion that depreciation reserves were excessive, that net salvage was allegedly positive rather than negative, that service lives were too short, etc .

The fundamental basis of depreciation accounting is, of course, quite straightforward:

> "Depreciation is an expense which represents an allocation of the cost of utility plant over the periods that benefit from the plant's use in providing utility service. ...

> The allowance for any given year is but one step in a systematic and gradual transfer of capital costs into a series of charges to current operations during the estimated useful lives of the depreciable fixed assets. In this way, the attempt is made to apportion the costs of the assets among the years during which they perform service instead of charging them in lumps either to the year of acquisition or to the year of retirement, Thus the cost of a depreciable fixed asset is treated as a prepaid expense, to be amortized through a series of subsequent charges against current revenues." Bonbright, *Principles of Public Utility Rates* (1988), p. 271, 273

It is essential that the methodology of amortization of costs through the allowance for depreciation expenses "in addition to being systematic, must also be rational." *Id.* at p. 274. In this case there is a detailed depreciation study in place which has not been supplanted by any subsequent depreciation study. Mr Majoros does not contend that he has actually done a depreciation study of any kind comparable to the 1991 Stone & Webster study. He simply picked out a few isolated items from a limited time period which he considered "excessive" or unreasonable and eliminated a large part of the 2003 depreciation expense on that basis. As the Company's depreciation expert John Jeter, stated:

> "A proper depreciation study would involve reviewing additions, retirements, transfers, salvage, removal costs, and accumulated depreciation for the entire history of each account in gas plant and common plant for Montana-Dakota's gas distributions operations, none of which Mr. Majoros did." [Tr., p. 283] (emphasis added)

The existing Stone & Webster depreciation study provides the best evidence, and in fact the only real substantive evidence, for the proper depreciation rates to be used for this specific company. "Whether observed physical depreciation or book reserve depreciation or some other indicator is used, there must be substantial evidence that it accurately aids in determining value." Southern Union Gas Co. v. New Mexico Public Service Commission, 503 P.2d 310, 312 (N.M. 1972). There is no such evidence in the record in this case to support the Staff's position on depreciation expense.

The standard technique for obtaining such evidence of the appropriate depreciation expense is to conduct exactly the kind of thorough depreciation study that Stone & Webster did in 1991:

> "The purpose of a depreciation study is to determine the service lives of a utility's equipment, and the corresponding yearly depreciation cost of that equipment." Appeal of the Office of the Consumer Advocate, 597 A.2d 528, 597 A.2d 528 (N.H. 1991)

An actual depreciation study like the Stone & Webster study, based on the actual experience of the Company, will result in accurate and reasonable results, as opposed to simply applying a general mathematical technique as Mr. Majoros did. As the court pointed out in City of Cincinnati v. Public Utilities Commission, 86 N.E.2d 10, 34-5 (Ohio 1949):

> The city's composite percentage of annual depreciation in the amount of 1.25% would be based on an over-all life of the entire property of the company of 80 years. This is rather an absurd average life basis when we take into consideration that a great deal of the property involved is production equipment, meters, services, furniture and fixtures, all of which have a very much shorter average life span."

In the absence of a new detailed depreciation study,[1] there is simply no rational basis for abandoning the existing study by arbitrarily adjusting individual components as advocated by the Staff. In Shevin v. Yarborough, 274 So.2d 505, 512 (Fla. 1973), for example, the court found no basis had been shown for abandoning an existing depreciation rate that had been approved in prior proceedings:

> "However, the Company is using a 3.30% rate by direction of this Commission. ... While the Company needs to get its depreciation 'housekeeping' in order and we expect them to do just that, the purpose of this proceeding is not to establish depreciation rates, but to measure the reasonableness of the Company's earnings under existing rates approved or ordered by this Commission. We find no reasonable basis for adjusting to a 3% composite depreciation rate for the test year 1970 when the Company was at that time obeying an Order of this Commission requiring it to

---

[1] As the record shows, such a new depreciation study, commissioned by the Company, is now underway.

charge a rate of 3.30%."

That is precisely the case here, and the courts have regularly approved the use of the results of the pre-existing depreciation studies. *E.g.*, Scranton Steam Heat Co. v. Pennsylvania Public Utility Commission, 167 A.2d 693 (Pa. Sup. 1960) [approving the use of depreciation rates based on prior engineering studies]. In United Water Delaware, Inc. v. Public Service Commission of Delaware 1998 Del. Sup. 1, 28 [Lexis 122], the court found the evidence presented in support for changing depreciation rates from the existing ones to be insufficient for the same reasons that the Staff's evidence in this case is insufficient:

> "Substantial evidence supports the Commission's decision to maintain the current depreciation rates. ... Based on the record, the Commission properly found that United Water did not satisfy its burden of proof, because its study was less than accurate, based on an incomplete asset examination, and not supported by sufficient evidence" (emphasis added)

The fact that there is an existing depreciation study which provides the best evidence for the appropriate depreciation rates works in both directions, of course. If the Company were now arguing for higher depreciation rates than those in the study, it should not prevail in the absence of some kind of highly probative and convincing evidence that the study had been flawed. In Litchfield Park Service Co. v. Arizona Corporation Commission, 874 P.2d 988, 996 (Ariz. 1994), for example, the utility argued for a higher depreciation allowance but had no new depreciation study to support its case. The court upheld the Commission in denying any increase:

> "The Commission concluded that, in the absence of an account-by-account depreciation study, it would keep in effect for both divisions the three percent rate.... As to the propriety of the three percent rate of depreciation for the sewer division, the Commission's decision is supported by the record... [the company] has failed to show clearly and convincingly that this rate is unlawful or unreasonable."

Cost of Capital

The testimony of Montana-Dakota's expert witness Dr. J. Stephen Gaske showed that the weighted cost of capital, that is the allowed rate of return on the rate base which should be approved in this proceeding, is 11.044%. The weighted cost of capital includes the usual elements of equity capital, long-term debt and preferred stock. There is no dispute in this matter as to the 4.63% cost of Montana-Dakota's preferred stock, which accounts for 5.23% of the capital structure.

Debt Capital

The Company's undisputed testimony established that the cost of the Company's $132,600,000 in long-term debt capital, as of the 2003 projected test year, is 9.180%. [Ex 2, Statement F, Sch. F-1, p. 3]. The Staff's expert Charles King advocated the inclusion of short-term debt in Montana-Dakota's capital structure, arguing that short-term debt is used to finance materials and supplies, fuel stocks and prepayments. The Company's Controller and Chief Accounting Officer, Craig Keller, however, explained that materials and supplies, fuel stocks and prepayments, although classified on the balance sheet as short-term assets, are in fact used to support the long-lived assets, such as plant, property, equipment and related items, and that accordingly Montana-Dakota finances long-term assets with long-term debt. It is fundamental that the debt portion of the capital structure of a utility for ratemaking purposes is comprised of the long-term debt. Bonbright, *supra*, at p. 307. There is therefore no basis, either in theory or in the facts in this case, for the inclusion of short-term debt in the capital structure of Montana-Dakota.

Mr. King also advocated that the debt of Centennial Energy Holdings, Inc. [Centennial] should be taken into account when calculating the debt costs of Montana-Dakota, on the grounds that both Centennial and Montana-Dakota are subsidiaries of a common parent corporation, MDU

Resources Group, Inc. [MDU Resources]. The utility company Montana-Dakota, however, is not a separate legal entity. It is simply a division of MDU Resources. The debt capital to which Montana-Dakota has access is the debt capital of MDU Resources, as Mr. Keller explained. [Tr. p. 129-30]. He discussed in some detail how, and why the debt capital of MDU Resources is not available to Centennial and its subsidiaries:

> "Yesterday King made a statement that MDU was attempting to build, quote, a firewall around MDU to separate the debt of Centennial from MDU. And that is exactly what MDU is trying to do. And I'd like to explain to you the reasons for this and why I believe the Commission should support MDU in its efforts. ... The concern is that bad decisions made at Centennial Energy or one of its subsidiary companies could cause default or cause a bankruptcy that could roll up into Montana-Dakota or MDU. And what we're trying to do is prevent this from happening. ... [W]hat we're trying to do is protect the assets and the customers of MDU from our nonregulated businesses. And the concern we have is ...we do not want them [creditors of Centennial or its subsidiaries] to have access to the assets of the utility. We want to protect our customers from this happening. And there's some things we can do. And one of them is we need to keep separate and distinct books from Centennial, which we currently do. We need to conduct the business of the utility in a manner that is clearly distinguishable and separate from the operations of Centennial, and we do that. MDU does not participate in a money pool or comparable intercompany fund arrangement with Centennial or its subsidiaries. This means that MDU does not commingle its corporate funds with those of Centennial. It means that MDU and Centennial maintain their own distinct and separate credit facilities. Neither have access to the other's credit agreements. To further strengthen this point, MDU does not lend funds or otherwise extend credit to Centennial, and Centennial does not do the same back to MDU." [Tr. p . 380-82]

A first mortgage lien on MDU Resources' gas and electric property is what is used to secure the long-term debt financing. The only property that can be pledged under the mortgage indenture is qualifying utility property, and Centennial cannot mortgage its non-regulated assets under the indenture and has no access to the capital raised under the indenture. [Tr. p. 382]. Centennial must raise its own capital apart from the utility property of MDU Resources, and in fact Centennial is not

allowed even to use MDU Resources's name in its financing arrangements. [Tr. p. 383].

It is clear, therefore, that Montana-Dakota has no access to any of the debt of Centennial or its subsidiaries, under the terms of the Centennial debt covenant. The Centennial debt covenant governs the unsecured debt of Centennial and its subsidiaries and does not pertain to, and cannot be accessed or utilized by, the utility company. It is wholly improper, therefore, and would materially distort the determination of the cost of the Company's capital to include any of the Centennial debt or equity in calculating the cost of debt or capital structure for Montana-Dakota. The uncontroverted evidence in the record established that the actual projected cost of debt capital for Montana-Dakota for the 2003 test year is 9.180%.

Equity Capital

Dr. Gaske testified that the appropriate cost of equity capital is 13.25% [Ex. 4, p. 34], whereas Mr. King's testimony was that the appropriate rate is 10.5%. [Ex. 15, p. 2]. The primary points of difference between these two figures arise from the use of a flotation cost adjustment by Dr. Gaske, the determination of growth rates , assessment of comparable risk and the selection of comparable companies

Flotation Cost Adjustment

The basis for allowing a rate of return on equity capital, often referred to as the cost of equity capital, is that a utility company should be in a position to be able to raise equity capital by issuing common stock at any time. The generally accepted method for determining the proper cost of equity capital is the DCF (discounted cash flow) analysis employed by the expert witnesses for both Montana-Dakota and the Staff. That method is based on the premise that the stock price must be

sufficiently above book value that stock can be issued without diluting the value of existing shareholders' investments, and this requires the inclusion of an allowance for the " flotation cost," that is the cost associated with issuing stock (underwriting commissions, filing fees, etc.) that reduce the net proceeds of issuance below the total amount actually received. For example, this means that if the proceeds of an issue are 91 percent of market price, the commission should maintain market price at about 110 percent of book value (*i.e.* 1/91%). The objection raised by Mr. King that the company may not have recently raised equity capital is irrelevant, since the point is that whether the utility is actually in the process of issuing new common stock, or is planning an imminent offering of common stock, the utility must always be able to be in the position to do so:

> "This fundamental requirement of a fair rate of return is analogous to a well-understood principle that a firm, or an individual, should maintain a good credit rating even then they do not expect to be borrowing money in the near future. Regardless of whether a company can confidently predict its need to issue common stock several years in advance, it should be in the position to do so on reasonable terms at all times without dilution of the book value of the existing investors'common equity." [Ex. 4, p. 13]

This goal can only be achieved if the flotation cost adjustment is applied to the entire rate of return, and the appropriate adjustment, as testified by Dr. Gaske, is approximately 4.75 percent. The average of a representative sample of flotation costs incurred with 34 new common stock issues by natural gas transmission and distribution companies between 1992 and 2001 was 4.85%, confirming the 4.75 percent figure. [Ex. 4, JSG -2, Sch. 3]. A rate of return which does not include the flotation cost adjustment is necessarily inadequate

Comparable Companies

The group of comparable companies used by Dr. Gaske in his DCF analysis is the Moody's

gas distribution group, which is commonly used as a comparison group of companies that are representative of the gas distribution industry. [Tr., p. 429]. The Staff expert witness Mr. King has previously used the same group of comparison companies in testimony before this Commission but on this occasion he used a different group, consisting of companies that derive at least 75% of their revenues from gas distribution operations, except that he also included WGL Holdings, which does not meet this criterion. [Tr., p. 430]. As would be anticipated, many of the comparison companies used by both witnesses are the same, and only a small part of the difference between the results of the DCF studies carried out by both are accounted for by the differences in the selection of comparison companies. It is submitted, however, that Dr. Gaske's selection is more rational and is more likely to lead to a realistic result than Mr. King's which incorporates one company that does not meet his own selection criteria.

Comparable Risk

Dr. Gaske pointed out that Montana-Dakota has about average risk, or slightly above average risk, when financial risk (*i.e.* capital structure) and business risk (*i.e.* competition, small size, slow customer growth, etc.) are considered in the aggregate. He noted that his risk assessment for the Company is confirmed by the fact that MDU's first mortgage bonds have a somewhat lower than the average rating for the Moody's gas distribution group. [Tr., p. 448; Ex. 36]. Mr King asserted that Montana-Dakota is a relatively low-risk operation because it is a part of a much larger parent company, MDU Resources Group, Inc., but at the same time he alleged that one of the reasons for the Company's low risk is that only the gas distribution operations are in question in this proceeding, *i.e.* 100% of the operations. In fact, however, the contrary is true, that is Montana-Dakota's business risk for its gas distribution business is higher than that of a larger company like

Mr.King's comparison company Southwest Gas. As Dr. Gaske pointed out,

> "... he [Mr. King] says, for example, Southwest Gas may be actually less risky because it's growing rapidly. Well, in Montana-Dakota's service territory there's little or no growth at all and, in fact, if you look behind what's going on a little bit, they have a customer growth of about 1 percent per year, but a lot of that is people moving out of small towns to the larger cities. So you have a situation where they're needing to expand facilities in the city, but they still have costs that they have to recover in the smaller towns that [are experiencing] declining population. And in the long run that's a problem for the company. ... Mr. King indicated that a fast growing company like Southwest Gas has low risk. ... If you look at Montana-Dakota, it's at the other end of the spectrum."" [Tr., p. 449]

Operating and Maintenance Expenses

Supplemental Income Security Plan

Montana-Dakota introduced evidence showing that the portion of the annual cost of its Supplemental Income Security Plan (SISP) allocable to North Dakota gas operations is $265,000. [Ex. 2, Statement N, p. 8]. The SISP is a supplemental pension benefit designed to attract and retain key employees. These kinds of programs, which have in the last few years become commonplace in the utility industry as part of the overall compensation package due to changes in federal regulations pertaining to retirement benefits and Social Security benefits, are essential "to attract and retain employees in key positions." [Ex. 7, p. 3]. Mr. Espeland summarized the philosophy behind the SISP:

> "We can deliver $1,000 in a lot of different ways. We choose to offer base salary. We choose to have incentive pay so it's not a fixed cost, but it's only given if performance is there. And we choose to have benefits and other programs [like SISP] that provide for economic security. It's the most cost-effective way of doing – delivering value to the executives and to the employees at all levels. And we could easily pay them all in base salary, all in base rate. It would not be the most cost-effective or the most incentivizing for good customer service." [Tr., p. 530]

For these reasons, although this Commission chose not to do allow the SISP costs in Case No. PU-399- 01-186 earlier this year, the Company urges the Commission now to recognize the importance of programs like SISP and acknowledge that they operate to benefit the ratepayer and accordingly are just and proper operating expenses prudently incurred by the Company in providing reliable service at reasonable rates.

Labor Expense

The adjustment made by Montana-Dakota to 2001 labor costs to determine budgeted 2002 labor costs, amounting to a 3.15% increase for 2002, and the projection of 2003 labor expense by applying a 3% increase to 2002 levels, is commensurate with industry practice and experience. The undisputed evidence presented by the Company demonstrates, in fact, that such levels of annual upward labor adjustments are somewhat less than is prevalent in the present labor market. [Ex. 27, p. 4-6]. As the Company's witness Richard Spratt pointed out:

> "In an effort to provide competitive rates to our customers, Montana-Dakota has, for many years, managed its operations as economically as possible, to the point of providing very conservative wage adjustments for employees. This method of management has resulted in lower wage rates offered our employees as compared to those offered by our competition." [Ex. 27, p. 5]

Executive compensation is about 11% below, and office employee compensation is about 9% below, current industry levels. [Ex. 27, p. 5]. The Company's labor costs projected for the test year 2003 are appropriate and reasonable.

The Company testified that base pay, bonus (incentive) pay, employee benefits and the work environment are all important components of the total compensation package provided for Montana-Dakota employees. [Ex. 27, p. 2-8]. The labor costs discussed above include the projected employee bonuses, based on a three-year average of bonuses. Such bonus and incentive plans are wide-spread

through the utility industry as a means for attracting and retaining highly qualified employees. Since the availability of employee performance-based bonuses is an important and reasonable means for attracting and retaining qualified employees, it is a substantial benefit to customers.

Other Operating and Maintenance Expenses

Mr. Majoros recommendation that the operating and maintenance expenses ("other expenses") that were not specifically adjusted in the Company's testimony should be left at 2001 levels is unreasonable and unrealistic. He contended that an increase from the 2001 level of $3,689,000 to the projected 2003 test year level of $3,898,000, amounting to a 5.7% increase over two years, had not been allowed in previous cases and he saw no reason to begin now. The fact, however, is that inflation does occur and will continue to do so. No basis was offered, and none exists, for artificially holding those expenses constant over a two-year period, when in fact actual inflation continues to occur. As the Company's witness Rita Mulkern pointed out, "It is time to recognize that these costs [the "other costs" not specifically adjusted by the Company] are subject to inflationary pressures just as the other identified items have been." [Ex. 25, p. 3]. The increase from 2001 to projected 2002 is only 2.81%, and the increase from projected 2002 to projected 2003 is only another 2.81%, commensurate with the current general annual levels of inflation in every sector of the economy.

Implementation of Financial Accounting Standard No. 143

A recently promulgated Financial Accounting Standard, "Accounting for Asset Retirement Obligations" [FAS 143] is designed to require businesses to accrue for the expected retirement cost of an asset over the period of the asset's useful life through increased depreciation with higher cost

pushed toward the retirement date of an asset due to the discounting methods used, rather than using levelized depreciation as this Commission and other regulatory bodies have traditionally done. There has been considerable concern nationwide concerning the implementation of FAS 143, which is complex and will be administratively burdensome. This new standard is untested at this point and there is considerable debate as to how, when and in what manner it should be implemented for ratemaking purposes. This is not a matter which should, or reasonably can be, addressed in an ancillary manner in this rate case involving a single utility company operating in North Dakota. These complex questions, which affect all utilities and their customers, can only be properly addressed and thoroughly examined in detail in a generic rulemaking proceeding by this Commission in which all companies involved in utility operations in this state may participate and present their views on the question.

The testimony in this case shows that while FAS 143 must and will be implemented by the Company for financial reporting purposes, it is not necessary to implement the new standard immediately for regulatory and ratemaking purposes. A specific Financial Accounting Standard (FAS 71) ("Accounting for the Effects of Certain Types of Regulation") is available to provide the methodology by which utility companies can account for the differences between depreciation accounting under FAS 143 and more traditional regulatory accounting, during the period of time required to carefully study FAS 143 in the context of ratemaking purposes, so that it can be implemented in a manner that will accommodate the interests of all affected parties.

The Company requested at the opening of this case, and reiterates that request now, that the Commission refrain from requiring implementation of FAS 143 for ratemaking purposes until the matter can be studied in detail in a specific generic proceeding in which all affected utility companies

operating in North Dakota are made parties and have the opportunity for input. Only in this way, can the complex issues raised by FAS 143 in the ratemaking context be properly understood and handled. As Mr. Keller pointed out, the industry associations "are recommending a go-slow approach on FAS 143 implementation for ratemaking" [Tr., p. 386]. For these reasons, this is certainly the most appropriate manner in which to deal with the question.

Rate Design

The most widely-accepted measure of the reasonableness of utility rates for any given class of customers is the cost of service. Bonbright, *supra,* p. 389. The proposed changes in Montana-Dakota's rate design are specifically designed to more accurately reflect the various components of the cost of serving its gas distribution customers. The Company based its distribution of its total revenue requirement among the various customer classes and the pricing of the components comprising the total rate applicable to each customer class on its class cost of service study [Ex. 2, Statement M]. The primary difference between the Company's cost of service study and the cost of service study presented by Mr. King results from a difference in the allocation of the investment in distribution mains among the various rate classes. The Company's allocation of distribution mains on the basis of customers and peak day demand will more accurately reflect the elements creating the costs of service than Mr. King's allocation based on energy and peak day demand. Accordingly, it will better promote the ratemaking goal of matching rates to costs of service.

The Company's rate design proposal also includes a change in the rate structure to more accurately reflect these costs of service. The customer gas bill would be composed of three elements: (1) Basic Service Charge, (2) Distribution Delivery Charge, and (3) Cost of Gas. The

Basic Service Charge would be set at or nearly at the customer cost level for each rate class. The Basic Service Charge is reflected in the existing rate structure as the "base rate," but the level of the current base rate substantially under-recovers the actual customer cost, so that a portion of the actual customer cost is shifted to, and recovered through volumetric charges.

The Distribution Delivery Charge reflects demand and energy-related costs, as well as any customer costs not recovered in the Basic Service Charge. This portion of the rate is a flat commodity charge, and implementation of this proposal would allow the declining block rate now applicable to residential and firm general service customers to be eliminated, since the customer related costs previously collected in the initial block of the rate will be recovered instead through the Basic Service Charge. The proposed rate structure will provide relief to customers during the winter months when their heating requirements result in higher gas usage, by lowering the amounts collected on the basis of the volume of gas used. The Cost of Gas component reflects all cost of gas items which the Company passes through to its customers under the purchased gas adjustment clause.

The proposed rate structure will promote rate stability and will have the beneficial effect of allowing gas customers to better understand the basis of their bills and will promote the general underlying goal of utility rate design to attempt to match the charges to the actual cost of providing gas service to each customer, thereby eliminating, or at least minimizing, cross-subsidization among and within customer classes. All of these goals are among the "attributes of a sound rate structure, as outlined by Professor Bonbright, which include (1) "revenue stability and predictability, with a minimum of unexpected changes seriously adverse to utility customers," (2) efficiency of the rate classes and rate blocks, in discouraging wasteful use of service while promoting all justified types

and amounts of use," (3) "fairness of the specific rates in the apportionment of total cost of service among the different ratepayers so as to avoid arbitrariness and capriciousness and to attain equity," (4) "avoidance of undue discrimination in rate relationships so as to be, if possible, compensatory (*i.e.* subsidy free with no intercustomer burdens," and (5) the related, practical attributes of simplicity, certainty, convenience of payment, economy in collection, understandability, public acceptance, and feasibility of application." Bonbright, *supra*, p. 383-84.

While the Company's proposed rate structure results in an increase for the residential and firm general service customers, with no increase for the Air Force and large interruptible classes, and a decrease for small interruptible customers, this is based on an appropriate matching of rates to cost of service, and the furthering of the goals described above. The Company's proposed rate structure therefore provides for a basis of charges to its customers that is just and reasonable without undue discrimination.

CONCLUSION

The preponderance of the evidence in the record demonstrates that the Company's application for increased rates is appropriate and that the proposed rates and rate structure will allow the Company the opportunity to earn a reasonable rate of return without discrimination among customer classes.

EXECUTIVE SECRETARY

STATE OF NORTH DAKOTA

BEFORE THE PUBLIC SERVICE COMMISSION

Montana-Dakota Utilities Co., a Division of MDU Resources Group, Inc. Natural Gas Rate Increase Application

Case No. PU-399-02-183

FINDINGS OF FACT, CONCLUSIONS OF LAW AND ORDER

November____, 2002

Preliminary Statement

On April 12, 2002, Montana-Dakota Utilities Co., a Division of MDU Resources Group, Inc. [hereinafter Montana-Dakota] filed an application to increase its rates for natural gas service in an amount sufficient to generate increased total annual revenues of $2,844,132. The application of Montana-Dakota stated that the existing rates, which were approved by the Commission in 1994, are unjust, unreasonable and not compensatory, and that said rates must be increased so that Montana-Dakota may have the opportunity to earn a just and reasonable rate of return on its natural gas properties devoted to providing service to its North Dakota natural gas customers.

On June 5, 2002, the Commission issued a Notice of Hearing, Notice of Public Input Sessions, and Notice of Intervention Deadline, setting the public hearing in this matter for October 7, 2002, and scheduling informal public input sessions via interactive television on July 15, 2002, in Bismarck, Dickinson, Williston, Minot, Jamestown and Devils Lake. The public input sessions

Proposed Findings of Fact, Conclusions of Law and Order
by Montana-Dakota Utilities Co., a Division of MDU R

11/15/2002 CC: Comm Legal Illona, Pat, Jerry Mike

were held at said time and places, and several members of the public made appearances.

On August 9, 2002, Montana-Dakota filed an application seeking a protective order pertaining to the disclosure of certain trade secret information sought in data requests made by the Commission Staff. The Staff did not contest the application for trade secret protection, and the Commission entered an order granting the application on August 28, 2002.

Pursuant to the Notice of Hearing, the Commission held the public hearing at the State Capitol in Bismarck on October 7-8, 2002, on the following issues:

1. What is the value of Montana-Dakota's property, used and useful for the service and convenience of the public in providing natural gas service in North Dakota?

2. What is Montana-Dakota's rate of return on its natural gas property, used and useful for the service and convenience of the public in providing natural gas service in North Dakota?

3. What is a just and reasonable rate of return on Montana-Dakota's property, used and useful for the service and convenience of the public in providing natural gas service in North Dakota?

4. What rates and charges are necessary to provide a just and reasonable rate of return on Montana-Dakota's property, used and useful for the service and convenience of the public in providing natural gas service in North Dakota?

5. Are Montana-Dakota's rate schedules designed in such a manner that they will result in a basis of charge to its customers that is just and reasonable without discrimination?

No person intervened or sought intervention in this matter and no members of the public appeared at the public hearing.

Ths Commission, having reviewed the evidence in the record, makes the following:

FINDINGS OF FACT

Jurisdiction

1. Montana-Dakota is a division of MDU Resources Group, Inc. and is a public utility providing natural gas distribution services to approximately 83,500 customers in 76 communities in North Dakota. The customer mix is approximately 86.5 percent residential, 13.3 percent firm commercial and 0.2 percent small and large interruptible customers. The residential, firm commercial and small interruptible customers use natural gas primarily for space and water heating.

2. The rate changes in question in this proceeding do not affect the cost of purchased gas distributed by Montana-Dakota, which is separately recovered through the purchased gas adjustment provisions contained in Montana-Dakota's filed tariffs and previously approved by the Commission.

Test Year

3. The appropriate test year to be used for determining Montana-Dakota's rates in this this proceeding is 2003, the test year selected by the Company pursuant to N.D.C .C. § 49-05-04.1.

Rate Base

4. Based upon the evidence received at the public hearing, the appropriate 2003 average rate base for Montana-Dakota's North Dakota natural gas service is $19,681,000, determined as follows:

	(Thousands)		
Description	2001	2002 (Projected)	2003 (Projected) [Test Year]
Plant in Service	$68,787	$70,446	$72,793
Less: Accumulated Reserve for Depreciation	$44,629	$47,021	$49,356
Plus: Construction Work in Progress	$167		
Net Plant in Service	$24,325	$23,425	$23,437
Materials and Supplies	$402	$439	$439
Fuel Stock	$21	$22	$22
Prepayments	$19	$84	$84
Other	$151	$97	$44
Total Additions	$593	$642	$589
Accumulated Deferred Income Taxes	($4,297)	($4,090)	($3,842)
Accumulated Deferred Investment Tax Credits	($290)	$256	($231)
Customer Advances	($377)	$272	($272)
Total Deductions	($4,964)	($4,618)	($4,345)
Rate Base	**$19,954**	**$19,449**	**$19,681**

Cost of Capital

5. The Commission finds that the appropriate year to be used for the determination of the capital structure and cost of capital for Montana-Dakota is the test year 2003.

6. Montana-Dakota's present capital structure consists of long-term debt, preferred stock and common stock (common equity). The Commission finds that the projected 2003 test year capital structure consists of 43.039% long-term debt, 5.274% preferred stock and 51.687% common equity,

and that said capital structure is appropriate and reasonable for the determination of rates herein.

7. The cost rate of Montana-Dakota's $16,250,000 in preferred stock was not disputed in this proceeding, and the Commission finds that it is 4.622%.

8. Expert testimony on behalf of the Staff and on behalf of Montana-Dakota was presented pertaining to the determination of the cost of the Company's $133,500,000 in long-term debt capital. The Staff's expert King advocated the inclusion of short-term debt in Montana-Dakota's capital structure, arguing that short-term debt is used to finance materials and supplies, fuel stocks and prepayments. Montana-Dakota's witness Keller, however, testified that materials and supplies, fuel stocks and prepayments, although classified on the balance sheet as short-term assets, are in fact used to support the long-lived assets, such as plant, property, equipment and related items, and that accordingly these items are financed with long-term debt. The Commission accordingly finds that short-term debt should not be included in the capital structure of Montana-Dakota.

9. Mr. King also advocated that the debt of Centennial Energy Holdings, Inc. [Centennial] should be taken into account when calculating the debt costs of Montana-Dakota, on the grounds that both Centennial and Montana-Dakota are subsidiaries of a common parent corporation, MDU Resources Group, Inc. The evidence presented by the Company however, demonstrated that Montana-Dakota has no access to any of the debt of Centennial or its subsidiaries, under the terms of the Centennial debt covenant. The Centennial debt covenant governs the unsecured debt of Centennial and its subsidiaries and does not pertain to, and cannot be accessed or utilized by the utility company. The Commission finds that it would be improper to include any of the Centennial debt or equity in calculating the cost of debt or capital structure for Montana-Dakota. Accordingly, the Commission finds the appropriate cost of debt capital for Montana-Dakota to be

9.180%, as testified to by the Company.

10. Expert testimony on behalf of the Staff and on behalf of Montana-Dakota was presented pertaining to the determination of the cost of Montana-Dakota's $159,245,775 in equity capital. The required rate of return on common equity must be set so as to ensure that the return is adequate to attract capital and is commensurate with returns available on other alternative investments having similar levels of risk. The Commission finds, based on analysis of business, regulatory, financial and market risks faced by comparable gas distribution companies, and upon recognizing that it is appropriate to include the 4.75% flotation cost adjustment testified to by Montana-Dakota's expert witness Dr. J. Stephen Gaske, that the appropriate cost of equity capital for Montana-Dakota for its gas distributions operations for the test year 2003 is 13.250%.

11. Accordingly, the Commission finds that the overall rate of return on rate base which should be allowed for Montana-Dakota in this proceeding is 11.044%, determined as follows:

Source of Capital	Capital Ratio	Cost Rate	Overall Rate of Return
Long-term Debt	43.039%	9.180%	3.951%
Preferred Stock	5.274%	4.622%	0.244%
Common Equity	51.687%	13.250%	6.849%
TOTAL	**100.000%**		**11.044%**

12. In order to achieve this rate of return Montana-Dakota requires additional natural gas revenues in the amount of $2,844,132.

Sales and Transportation Volumes

13. The Commission finds that the test year 2003 projected gas sales and transportation

volumes for all customer classes, as set forth in the Company's Statement N (contained in Exhibit 2) are reasonable and they are adopted for purposes of determination of just and reasonable rates.

Operating and Maintenance Expenses

Labor Expense

14. The adjustment made by Montana-Dakota to 2001 labor costs to determine budgeted 2002 labor costs, amounting to a 3.15% increase for 2002, and the projection of 2003 labor expense by applying a 3% increase to 2002 levels, was shown to be commensurate with industry practice and experience. In fact the evidence showed that such levels of annual upward labor adjustments are somewhat less than is prevalent in the present labor market. The Commission accordingly finds the labor costs projected for the test year 2003 to be appropriate and reasonable.

Bonus

15. The Company testified that base pay, bonus (incentive) pay and employee benefits are all important components of the total compensation package provided for Montana-Dakota employees. The labor costs in Finding No. 14 above include the projected employee bonuses, based on a three-year average of bonuses. The evidence showed that such bonus and incentive plans are wide-spread through the utility industry as a means for attracting and retaining highly qualified employees. The Commission specifically finds that the availability of employee performance-based bonuses is an important and reasonable means for attracting and retaining qualified employees, and that this will be a benefit to customers.

Pension and Post-Retirement Benefits

16. Montana-Dakota introduced evidence showing that its pension and post-retirement

benefit costs will increase substantially in 2003, in an amount of $240,000 applicable to North Dakota operations ($150,000 in pension expense and $90,000 in post-retirement expense), due to the decline in asset returns from the abnormally high returns received in recent years and the decline in discount rates to reflect current long-term interest rates, both of which result in increased pension and benefit costs. The Commission finds this adjustment to be appropriate and accordingly allows this item of $240,000 as an operating expense increase over the projected 2002 levels.

17. Montana-Dakota introduced evidence showing that the portion of the annual cost of its Supplemental Income Security Program (SISP) allocable to North Dakota gas operations is $265,000. The SISP program is a supplemental pension benefit designed to attract and retain key employees. The Commission declined to allow this as a recoverable operating expense in Case No. PU-399-01-186, decided on April 24, 2002. The Company has reargued its position in the present case and demonstrated that such plans are common in the industry and that the SISP program is beneficial to Montana-Dakota customers and serves the public interest by helping to insure high-quality management of the Company. Accordingly, the Commission has determined this adjustment to be appropriate and allows this item of $265,000 as an operating expense.

Medical and Dental Expense

18. The Company's testimony shows that expenses for medical/dental coverage will increase to $1,003,000 for 2003, and this was not disputed by the Staff. The Commission finds this to be an appropriate level for this element of operating expenses.

Rate Case Expense Amortization

19. The Commission Staff witness Michael Majoros advocated the amortization of rate case expense over a five-year period, rather than the three-year period used by the Company, on the

grounds that the Company had not filed a general gas rate increase application for a number of years. The Company, however, testified that it would be unlikely that future applications would be as infrequent, in view of the fact that it has achieved most of the economies and cost savings that are feasible, so that general inflation will tend to drive the future frequency of rate applications. The Commission finds that a three-year amortization is appropriate and reasonable in the circumstances.

Inflation Adjustment for Other Operation and Maintenance Expenses

20. The Staff witness Majoros recommended that the operating and maintenance expenses ("other expenses") that were not specifically adjusted in the Company's testimony should be left at 2001 levels, arguing that an increase from the 2001 level of $3,689,000 to the projected 2003 test year level of $3,898,000, amounting to a 5.7% increase over two years, was not justified, as the Commission has not allowed such an adjustment in the past. As the Company pointed out, however, no basis was offered for holding those expenses constant over a two-year period, when in fact real inflation continued to occur. The increase from 2001 to projected 2002 is only 2.81%, and the increase from projected 2002 to projected 2003 is only another 2.81%. The Commission finds such increases to be reasonable in the light of general inflationary tendencies, and accordingly approves the Company's projection for 2003.

Institutional Advertising Expense

21. The Company included $76,000 in institutional advertising expense for the test year 2003, the same amount as stated for 2002. This is apparently primarily for community-involvement related advertising. The Commission finds that this expense falls under the types of advertising expenses which are recoverable as operating expenses under N.D.A.C. § 69-09-01-29(1)(e)(7) because such advertising benefits customers and serves the public.

Depreciation

22. The Company's projected depreciation expense for 2002 and for the 2003 test year were calculated using the depreciation rates derived in a full depreciation study performed for the Company by Stone & Webster Management Consultants, Inc. in 1992, except that the Company's internal studies were used for depreciation on computer network equipment, work equipment and transportation equipment. The proper treatment of depreciation necessitates thoroughly analyzing and reviewing additions, retirements, transfers of plant, positive and negative salvage, and accumulated depreciation for the entire history of each account in gas plant and common plant for the Company's distribution operations. The record contains no such detailed information, and the Commission finds that there is no basis for changing the current depreciation rates as determined in the 1992 depreciation study. A new depreciation study, now underway by a consultant engaged by the Company, will, when completed, be able to provide the basis for any appropriate changes in future proceedings. Accordingly, the depreciation expense figures presented by the Company are approved.

Financial Accounting Standard No. 143

23. A recently promulgated Financial Accounting Standard, "Accounting for Asset Retirement Obligations" [FAS 143] is designed to require companies to accrue for the expected retirement cost of an asset over the asset's useful life through increased depreciation, with higher cost pushed toward the retirement date of an asset due to the discounting methods used, rather than using levelized depreciation as this Commission and other regulatory bodies have traditionally done. It is not disputed that implementation of FAS 143 is complex and will be administratively

burdensome. The testimony in the record shows that while FAS 143 must and will be implemented at this time for financial reporting purposes, it is not necessary to implement the new standard immediately for regulatory and ratemaking purposes, as a specific Financial Accounting Standard (FAS 71) ("Accounting for the Effects of Certain Types of Regulation") provides the methodology for accounting for the differences.

The Company requested in this case that the Commission refrain from requiring implementation of FAS 143 for ratemaking purposes until the matter can be studied in detail in a specific generic proceeding in which all affected utility companies operating in North Dakota are made parties and have the opportunity for input. The Commission agrees that this is appropriate and according does not require the use of FAS 143 for ratemaking purposes in this proceeding.

Rate Design

24. The Company filed a class cost of service study and used the results of this study as a guide in distributing the total revenue requirements among the various customer classes and for pricing the components comprising the total rate applicable to each customer class. Staff witness King also filed a class cost of service study in this case. The primary difference between the two studies results from a difference in the allocation of the investment in distribution mains among the various rate classes. The Company advocates that distribution mains are most appropriately allocated on the basis of customers and peak day demand, in order to properly reflect the elements creating the costs. Mr. King, on the other hand, uses an allocation factor of energy and peak day demand. The Commission finds the Company's allocation methodology to be most appropriate and

adopts the class cost of service study as presented in Statement M of the Company's application.

25. The Company has proposed a change in its rate structure to more accurately reflect the components of the cost of serving its gas customers. The customer gas bill would be composed of three elements: (1) Basic Service Charge, (2) Distribution Delivery Charge, and (3) Cost of Gas. The basic service charge would be set at or nearly at the customer cost level for each rate class as identified in the Company's Class Cost of Service Study filed in this proceeding. The Basic Service Charge is reflected in the existing rate structure as the "base rate," but the level of the current base rate substantially under-recovers the actual customer cost, so that a portion of the actual customer cost is recovered in volumetric charges.

The Distribution Delivery Charge primarily reflects demand-related costs, as well as any customer costs not recovered in the Basic Service Charge. This portion of the rate is proposed as a flat commodity charge, and the declining block rate now applicable to residential and firm general service customers will be eliminated, as the customer related costs previously collected in the initial block of the rate will be recovered instead through the Basic Service Charge. The Cost of Gas component simply reflects the actual cost of gas which the Company passes through to its customers through the purchased gas adjustment clause.

The Commission finds that this change in the Company's proposed rate structure will promote rate stability and will have the beneficial effect of allowing gas customers to better understand the basis of their bills and will promote the general goal of rate design to match the charges to the actual cost of providing gas service to each customer. This in turn, will have the effect of sending appropriate price signals to customers and promoting conservation and the efficient use of resources.

25. The Basic Service Charge for residential service under the Company's rate proposal will be $0.39 per day, which is $11.70 for a 30-day month. The proposed rate structure will result in an average increase of approximately $2.00 per month for a typical residential customer.

26. In accordance with the Company's class cost of service study results, the Commission recognizes that the Company's allocation of the rate increase results in an increase for the residential and firm general service customers, with no increase for the Air Force and large interruptible classes, and a decrease for small interruptible customers and finds this allocation to be appropriate. Further, the Commission believes that the Company is correct in its position that the proposed allocation of the rate increase and proposed rate structure will provide relief to customers during the winter months when their heating requirements result in higher gas usage, by lowering the amounts collected on the basis of the volume of gas used, and the Commission finds that the proposed rate structure will help to eliminate cross-subsidization between and among customer classes.

27. The Commission accordingly finds that the Company's proposed rate structure provides for a basis of charges to its customers that is just and reasonable without discrimination,

28. The Company proposed a number of tariff changes as presented in Appendix B of its application that were not objected to by the Staff. The Commission finds these proposed tariff changes to be appropriate and that they should be adopted as proposed.

From the foregoing Findings of Fact, the Commission makes the following:

Conclusions of Law

1. The Commission has jurisdiction over the parties to and the subject matter of this proceeding.

2. Montana-Dakota's present gas rates are inadequate to provide the Company an opportunity to earn a reasonable rate of return on its property used and useful for the service and convenience of the public in providing natural gas distribution service to its customers in North Dakota.

3. The rates proposed by the Company herein will provide Montana-Dakota with the opportunity to earn a reasonable rate of return on its property used and useful for the service and convenience of the public in providing natural gas distribution service to its customers in North Dakota.

4. The application herein should be granted.

From the foregoing Findings of Fact and Conclusions of Law, the Commission makes the following

ORDER

It is hereby ordered that the Application of Montana-Dakota Utilities Co. for authority to increase its rates for natural gas distribution service to its North Dakota customers by substituting the proposed rate schedules referred to in Article V of the application in place of the rate schedules now in effect, be, and the same hereby is, granted, said new rates to become effective _____, 2002.

PUBLIC SERVICE COMMISSION

Montana-Dakota Utilities Co., A Division of MDU Resources Group, Inc.
Gas
Rates

Case No. PU-399-02-183

BRIEF

PRELIMINARY STATEMENT

On April 12, 2002, the North Dakota Public Service Commission received an application from Montana-Dakota Utilities Co., a Division of MDU Resources Group, Inc., (MDU) to increase its natural gas rates in North Dakota by $2,844,132 annually. MDU's application is based on a calendar 2003 projected test year.

In its application and supporting testimony and exhibits, MDU has requested an increase in its rates for gas distribution service of $2,844,132, or approximately 4.1 percent based on a forecast 2003 test year. MDU's requested return on rate base is 11.044 percent, inclusive of a return of 13.25 percent on the 51.687 percent of total capital that MDU asserted to be represented by common equity.

MDU also requested a significant restructuring of its rates, including a separation of gas distribution from gas supply charges, elimination of declining block commodity charges and dramatic increases in customer charges. Additionally, MDU has proposed that all increases be flowed into the firm residential and commercial rate schedules, that no change in rate levels be applied to the Air Force and large interruptible schedules, and that the small interruptible class should receive a rate reduction.

On April 24, 2002, the Commission suspended MDU's rates filed with its Natural Gas Rate Increase Application. On June 5, 2002, the Commission issued its Notice of Hearing Notice of Public Input Sessions, and Notice of Intervention Deadline. Public input sessions were held via video teleconference on July 15, 2002, in Bismarck, Dickinson, Williston, Minot, Devils Lake, and Jamestown. The technical hearing was

90 PU-399-02-183 Pages. 48
Brief
by Public Service Commission
11/15/2002 CC: Comm Legal Illona, Pat, Jerry Mike

held in the Commission Hearing Room at the State Capitol in Bismarck, North Dakota on October 7-8, 2002.

The Notice of Hearing specified the issues to be considered at the technical hearing, which are:

1. What is the value of MDU's property, used and useful, for the service and convenience of the public in North Dakota?

2. What is MDU's rate of return on its property, used and useful, for the service and convenience in North Dakota?

3. What is a just and reasonable rate of return on MDU's property, used and useful, for the service and convenience of the public in North Dakota?

4. What rates and charges are necessary to provide a just and reasonable rate of return on MDU's property, used and useful, for the service and convenience of the public in North Dakota?

5. Are MDU's proposed rate schedules designed in such a manner that they result in a basis of charge to its customers that is just and reasonable without discrimination?

6. Other relevant information or proposals concerning the proceeding.

The Notice of Hearing provided that any person wishing to intervene as a party in the proceeding must file a petition for intervention by September 9, 2002. No one petitioned to intervene as a party in the proceeding.

STATEMENT OF ISSUES

I. STANDARDS AND GUIDELINES USED TO ESTABLISH THE FAIR RATE OF RETURN FOR MDU.

II. REVENUE REQUIREMENTS:

A. DEPRECIATION

B. ELIMINATION OF BONUSES AND 2003 LABOR EXPENSES

C. ELIMINATION OF SISP COSTS

D. RATE CASE EXPENSE AMORTIZATION PERIOD
E. GENERAL INFLATION ADJUSTMENT AND OTHER UNADJUSTED O&M EXPENSES
F. RATE OF RETURN
III. COST OF CAPITAL
A. CAPITAL STRUCTURE
B. COST OF DEBT
C. COST OF EQUITY
1. Flotation Cost
2. Selection of Comparison Companies
3. Forecast of Next Year's Dividends
4. Timing of Analysts' Forecasts
5. Procedure for Computing Retention Growth
6. Presentation of the DCF Results
7. Adjustment of Comparison Company Results for MDU's Risk
a. Gaske's "Benchmark Analyses
b. King's Risk Premium Test
IV. COST ALLOCATION AND RATE DESIGN
A. CLASS COST OF SERVICES STUDY
B. RATE DESIGN
C. DISTRIBUTION DELIVERY STABILIZATION MECHANISM
V. CONCLUSION

ARGUMENT

I. STANDARDS AND CRITERIA TO BE USED TO ESTABLISH THE FAIR RATE OF RETURN.

The Commission has the power under North Dakota law to establish rates for MDU under N.D.C.C. §§ 49-02-03 and 49-05-06. Those statues read as follows:

49-02-03. Power of public service commission to establish rates. -- The commission shall supervise the rates of all public utilities. It shall have the power, after notice and hearing, to originate, establish, modify, adjust, promulgate and enforce tariffs, rates, joint rates, and charges of all public utilities. Whenever the commission, after hearing, shall find any existing rates, tariffs, joint rates, or schedules unjust, unreasonable, insufficient, unjustly discriminatory, or otherwise in violation of any of the provisions of this title, the commission by order shall fix reasonable rates, joint rates, charges, or schedules to be followed in the future in lieu of those found to be unjust, unreasonable, insufficient, unjustly discriminatory, or otherwise in violation of any provision of law.

49-05-06. Hearing by commission on proposed change of rates. Whenever a notice or any schedule stating an individual or joint rate, classification, contract, practice, or rule, increasing or decreasing, or resulting in an increase or decrease in any rate, is filed with the commission, the commission may suspend by motion the rate, classification, contract, practice, or rule but the period of suspension may not extend more than seven months beyond the time when it would otherwise go into effect. Upon complaint or upon its own initiative without complaint the commission may order a hearing, upon due notice, concerning the propriety of the rate, classification, contract, practice, or rule. On such hearing, the commission shall establish the rates, classifications, contracts, practices, or rules proposed, in whole or in part, or others in lieu thereof, which it finds to be just and reasonable. At any such hearing, the burden to show that the increased rate or proposed change of rate, classification, rule, or practice is just and reasonable is upon the public utility applying for the increase. All such rates, classifications, contracts, practices, or rules, not suspended, on the expiration of thirty days from the time of filing with the commission, or of such lesser time as the commission may grant, become effective rates, classifications, contracts, practices, or rules, subject to the power of the commission, after a hearing had on its own motion or upon complaint, to alter or modify the same.

The United States Supreme Court has set forth appropriate standards and guidelines for determining rates that a public utility is permitted to earn. Those guidelines are set forth in *Federal Power Commission v. Hope Natural Gas Co.,* 302 U.S. 603 (1944), and *Bluefield Water Works and Improvement Company v. Public Service Commission of West Virginia,* 262 U.S. 679 (1923). These cases generally hold that the utility's return should be sufficient to maintain the utility's financial integrity, attract needed capital, and fairly compensate investors for risks they have assumed. The North Dakota Supreme Court has also held that an investor-owned utility is entitled

to earnings sufficient to pay its expenses and provide a fair and reasonable return to its investors. *Montana-Dakota Utilities Co., v. Public Service Commission,* 413 N.W.2d 308 (N.D. 1987).

Under our system of economic regulation of public utilities, referred to as ratemaking, the utility is required to serve customers and to charge just and reasonable rates for the service it provides, and the Commission's obligation is to enable the utility to earn a fair return on its investment. Determination of the appropriate rate base is essential for the determination of a fair return. In order to establish the just and reasonable rates of public utilities under North Dakota law, the Commission is required to determine the value of the property used and useful for the service and convenience of the public. *Application of Montana-Dakota Utilities Co.,* 102 N.W.2d 329, 334 (N.D. 1960); N.D.C.C. § 49-06-01. "The value of the property of a public utility, as determined by the public service commission for ratemaking purposes, shall be the money honestly and prudently invested therein by the utility less accrued depreciation." N.D.C.C. § 49-02-06.

In the present case MDU uses a projected average 2003 test year for purposes of deriving a revenue requirement. This is consistent with the general rule that normally the utility's average rate base and not a year-end valuation should be used. *Application of Montana-Dakota Utilities Co.,* 102 N.W.2d 329, 335 (N.D. 1960). The Court, quoting from a New Hampshire Supreme Court decision, stated that "rate base should relate to the period for which the earnings are being tested in order to reach a just result." MDU witness, Rita Mulkern, stated that rates from this proceeding will be in effect for 2003, and the closer that revenues, expenses and rate base reflect the levels to be experienced in 2003, the better the match will be and the better opportunity MDU will have to earn its authorized return. MDU is using a future test year as authorized by N.D.C.C. § 49-05-04.1.

II. REVENUE REQUIREMENTS

C. Wayne Fox, President of MDU Utilities Company, stated that the primary reasons for MDU's application are increased operation and maintenance costs, depreciation, and taxes other than income, and a higher required rate of return.[1]

Fox testified that MDU's last gas rate increase was in November 1994 in the amount of $565,000 annually, and that on January 15, 1999, MDU reduced its rates by $800,000.[2] During this period, 1994 through 2001, the consumer price index increased by almost 20 percent, but Fox testified that MDU had found ways of operating more efficiently and of taking advantage of new technologies so that it could hold the line on its gas rates.[3]

As recently as the year 2000, MDU's North Dakota gas operations earned a return of 11.92 percent[4]. However, in 2001, MDU's fully adjusted return was only 5.297 percent, and MDU's forecasts indicate that in 2002 and 2003 its return will fall to 4.298 and 2.332 percent, respectively.[5] During cross-examination, Fox asserted that the past improvements in labor efficiency have "flattened out" in the last year or so.[6] Apparently, MDU expects that flattening out to continue through 2003.

The Commission's Adversary Staff ("Staff") does not agree. In contrast to MDU's rate increase, Staff proposes that MDU's test year 2003 rates be decreased by $1,402,000. This reduction is based on a rate of return on rate base of 7.980 percent, inclusive of a 10.5 percent return on 44.55 percent equity proportion of total capital and a much lower cost of debt.

Staff witness Michael J. Majoros, Jr. identified six reasons for the $4,246,000 difference between MDU's proposed rate increase and the Staff's recommended rate reduction:

- A reduction in depreciation rates;
- Elimination of bonuses from MDU's costs and holding the 2003 labor costs equal to the projected 2002 levels;

[6] Tr. Oct. 7, p. 46

- Elimination of the Supplemental Income Security Plan ("SISP") costs;
- A 5-year rather than 3-year rate case cost amortization period;
- Elimination of general inflation adjustment from "other" unadjusted operation and maintenance ("O&M") expenses; and
- Use of King's 7.89 percent return on rate base in lieu of MDU's proposed 11.044 percent return.

A. DEPRECIATION

Majoros' depreciation adjustment is the largest single adjustment proposed by Staff, amounting to a reduction of $2,172,000 in test year expense.[7] MDU's current depreciation expense is based on rates developed in a 1991 study performed by Stone & Webster.[8] Majoros performed a series of studies, which suggested to him that these depreciation rates are much too high. First, he found that annual depreciation accruals during the past five years had exceeded utility construction and acquisition by $28.5 million. When common plant construction and acquisition is added, the five-year accruals still exceeded expenditures by $409,000.[9] While it is not the purpose of depreciation to fund construction, this comparison indicates that MDU has obtained substantial cash flow from depreciation.[10] Majoros noted that in *Lindheimer v. Illinois Bell Telephone Company,* 292 U.S. 151 (1934), the Supreme Court found that excessive depreciation results in the extraction of capital from ratepayers.[11]

Majoros next observed that as of the end of 2001, the ratio of depreciation reserve to the original cost of distribution plant came to 70.7 percent. Based on his experience, this level of depreciation reserve is extraordinarily high and suggests that prior depreciation rates have been excessive. Majoros stated that the likely source of these excessive rates is the 140 percent negative salvage adjustment for Account 380 – Services[12] and the very short service lives of 36 and 34 years, respectively for

---

[7] The difference between $3,261,000 and $1,089,000 as shown on Exhibit 19, MJM-1, page 3.
[8] Exhibit 19, page 10.
[9] Exhibit 20.
[10] Exhibit 19, page 6.
[11] Id., page 8.
[12] Late Filed Exhibit 1 explains the source of the 140% negative salvage for the Service account. It compares the original cost of retired services with the cost of removal. The composite ratio of original cost to removal cost for all Services removed between 1996 and 2000 is 138%. The removed services date back to 1926, but all of the removal costs were incurred since 1996. The ratio is so high because it compares dollars spent up to 75 years ago with dollars spent only since 1996. The result is a ratio that captures the inflation that has taken place over the past 75 years. When that ratio is then applied to current plant balances to calculate depreciation expense, it effectively projects that same rate of inflation to the end of the current plant's life. Ratepayers are

Account 376 – Mains and Account 380 – Services.[13] He supported his observation with respect to service lives by a geometric mean turnover analysis, which indicated a 108-year average service life for Mains and a 69-year service life for Services.[14]

Majoros did not, however, adjust any of the service lives of MDU's plant. His sole adjustment was to the salvage factors. This adjustment was based on an obvious inconsistency between the net salvage assumed in the Stone and Webster study and actual net salvage that MDU has experience during the past five years.

The Stone & Webster study developed depreciation rates that resulted in a large recovery of "negative salvage," that is, cost of removal. Specifically, its depreciation rates were designed to recover total gas plant of $102.5 million plus negative salvage (removal) costs of $46.9 million.[15] Even the $21.7 million in common plant was presumed to require recovery of an additional $1 million in net negative salvage costs.

Yet, MDU has not experienced negative net salvage. To the contrary, MDU's actual net salvage experience has been positive. In every year since 1997, MDU has received more in salvage value for its retired gas and common plant than it has paid in removal cost. The total cumulative 5-year net positive salvage receipts for gas plant have amounted to $1,444,452. For common plant, net positive salvage receipts have come to $5,529,260.[16]

To correct for this obvious over-recovery of net salvage, Majoros proposed to adopt the Stone & Webster lives and survivor curves for each account with no net salvage overlay. The account-by-account depreciation rates would thus represent pure depreciation, that is, solely the recovery of original cost. To recognize net salvage, Majoros proposed to deduct from total annual depreciation the average annual amount of net positive salvage for gas plant, plus the net positive salvage of common plant distributed between gas and electric operations based on their respective net salvage amounts. Total depreciation of test year plant would be $1,937,000. The annualized

---

thus being forced to pay for future inflation that presumably will match past inflation. By charging ratepayers now for inflation in the future, this practice fails to recognize the much higher present value of current ratepayer dollars over the Company's future removal cost dollars.

[13] Exhibit 19, page 10.
[14] Id. page 11.
[15] Id. MJM-4, page 1.
[16] Id., MJM-6

positive salvage offset would be $848,000, for a net test-year depreciation expense of $1,089,000.[17]

Majoros noted that in addition to matching net salvage accruals with actual net salvage experience, his treatment of removal costs conforms with Generally Accepted Accounting Principles ("GAAP") as recently refined in Statement of Financial Accounting Standards No. 143 ("FAS 143"). That standard, which MDU must adopt this year, requires companies to determine whether they have a legal obligation to retire property and incur the cost of removal or dismantlement. If they do, they must declare the present value of the future "asset retirement obligation" costs as a liability on their books to be amortized over the remaining life of the asset. If they do not, then the American Institute of Certified Public Accounts' Statement of Position on Property, Plant and Equipment would require that these costs be expensed as they are incurred.[18]

Majoros testified that MDU has not determined whether it has asset retirement obligations, let alone what the present value of those obligations might be. For this reason, it is appropriate to reflect net salvage experience as a rolling five-year average of actual net removal costs. That is what his adjustment does.[19]

In rebuttal, MDU presented the testimony of John A. Jeter, a retired accountant from Arthur Anderson & Co.[20] Jeter argued that Majoros had not done a depreciation study, that his review of the current depreciation rates is superficial and contains many errors, and that he has no basis for proposing changes in depreciation rates. According to Jeter, the current depreciation rates are based on a comprehensive study prepared in 1991 and used beginning 1994. He argues that no adjustment of depreciation rates should be entertained until the current depreciation study is completed and an appropriate review has taken place.[21]

Much of Jeter's testimony focused on Majoros' evidence that MDU's depreciation appears to be excessive and that its service lives are too short. He argued that Majoros had not done the sort of comprehensive study of service lives that Stone & Webster had performed. On cross-examination, however, he admitted that since Majoros had

[17] Id., MJM-7, page 3.
[18] Id., page 12.
[19] Id., pages 13-14.
[20] Exhibit 22.
[21] Id., page 24.

not changed service lives, his criticisms of Majoros' service life discussion were irrelevant to the outcome of this case.[22]

Jeter's only defense of MDU's negative net salvage assumptions was to assert that the 1991 depreciation study by Stone & Webster is a much more reliable source of information regarding net salvage than a cursory look at net salvage for all accounts over a five year period.[23] He never explained why, nor did he refute Majoros' observation that the Stone & Webster study had recommended large negative salvage allowances, while MDU's actual net salvage experience has consistently been positive.

Jeter's principal response to Majoros' net salvage discussion was to attack his proposal to adjust overall depreciation by $848,000 based on the past five years' actual experience. He argued that the net salvage amounts used by Majoros varied from year to year and that they reflected the sale of an office building for approximately $4.6 million. In something of a reach, Jeter noted that the electric net salvage amounts, not at issue in this case, included an insurance adjustment.[24]

Jeter also argued that Majoros has allocated common property net salvage based on the direct net salvage amounts of the gas and electric operations, which is not the basis used by MDU. He failed to mention how MDU does allocate these common net salvage amounts. He concluded that "the proposed adjustment is not supported by any evidence and should not be approved."[25]

The variability of net salvage from year to year is the very reason Majoros used a five-year average of net salvage experience. Jeter never explained why it should be the basis for rejecting Majoros' adjustment.

Jeter's statement that the Majoros depreciation adjustment is "not supported by any evidence" is incorrect. During his re-cross examination, Jeter read the following passage from the NARUC Public Utilities Depreciation Manual, dated August 1, 1996:

> When estimating future net salvage, every effort should be made to ensure that the estimate is as accurate as possible. Normally, the process would start by analyzing past salvage and cost-of-removal data

[22] Tr. Oct 8, page 353.
[23] Exhibit 22, page 16.
[24] Id.
[25] Id., page 23.

and by using the results of this analysis to project future gross salvage and costs of removal.[26]

That is exactly what Majoros did. He analyzed past salvage and cost-of-removal data and found that over the past five years salvage has consistently been greater than cost of removal for both gas plant and common plant. His adjustment reflects that undeniable and fully supported finding.

MDU would very much like to sweep this issue under the rug. To this end, it has employed two tactics. The first is to urge the Commission to defer any consideration of depreciation until its new depreciation study, currently being conducted by AUS Consulting, is completed by the end of this year.[27] The second is to contend that over-depreciation is good for ratepayers. Had Majoros' adjustment been implemented in 1995, MDU's revenue requirement would be higher than it is now. [28]

Both of these ploys should be ignored. One would suppose that MDU, knowing that it was going to file a rate case in advance of the coming winter's heating season, would have arranged to produce a depreciation study in time to be incorporated into this case. It did not do so. Instead, it apparently proposes to saddle the Commission with a separate, single-issue rate proceeding sometime next year. Notwithstanding MDU's excuses for its delay in producing the study, one is left with the suspicion that MDU may have feared the very results suggested by Majoros – that the current depreciation rates are too high. If so, then the present rate case would have been severely compromised.

No element of MDU's revenue requirement should be exempted from this case. Specifically, MDU should not be permitted to continue to charge ratepayers depreciation expense that is clearly excessive. A new depreciation study will not alter the fact that in recent years net salvage has consistently been positive, while the current depreciation rates incorporate a very large allowance for negative salvage. A new depreciation study should reflect that fact. Indeed, if a new depreciation study were to claim that forecast removal costs are higher than forecast salvage proceeds, then it should be dismissed as inconsistent with demonstrated Company experience.

---

[26] Tr. Oct 8, page 375.
[27] Exhibit 22, page 4.
[28] Id., page 11.

MDU's other argument is even less worthy of Commission consideration. It is that the cumulative effect of overcharging depreciation is to reduce the rate base to the point where the reduction in return and income allowances exceeds the overstated depreciation expense. Jeter multiplied Majoros' $2.172 million depreciation expense reduction by the 8 years since 1995 to derive a presumed increment in the rate base of $17.376 million. He then calculates that at MDU's proposed 11.044 percent return and 39.61 percent tax rate, the revenue requirement increase from this rate base increment would be $3.2 million, which is more than Majoros' depreciation expense reduction of $2.172 million.[29]

This calculation is wrong both mathematically and conceptually. It is wrong mathematically because, as Jeter admitted on cross-examination, MDU's plant in 1995 was smaller than it is now, so Majoros' adjustment would have been less.[30] It is incorrect to multiply Majoros $2.172 million adjustment, which applies to a 2003 test year, by the eight years between 1995 and 2002.

The calculation is conceptually wrong because there is no justification for charging ratepayers excessive depreciation, quite regardless of the effect on the rate base. As the Supreme Court found in *Lindheimer*, excessive depreciation results in the extraction of capital from ratepayers. It is improper from a legal, a regulatory, an economic, and an accounting standpoint.

B. ELIMINATION OF BONUSES AND 2003 LABOR EXPENSES

Majoros has proposed to eliminate bonuses from the forecast test year and to hold test year labor costs to their 2002 levels. MDU had included average bonuses for the years 1999-2001 in the amount of 6.1 percent of labor costs. Applied to the $8,239,000 in labor costs in 2002, the bonus elimination comes to $503,000. The 2003 labor cost increase eliminated by Majoros amounts to $236,000. These direct labor cost adjustments reduce payroll taxes by $40,000 in 2002 and $60,000 in 2003.[31]

Majoros testified that given the state of the economy and the fact that MDU is requesting a rate increase, it would be unreasonable to include bonuses in the revenue

[29] Id., page 11.
[30] Tr. Oct 8, page 349.
[31] Calculated from the data presented on Exhibit 19, MJM-9, pages 1 and 2.

requirement.[32] As regards labor costs, Majoros charted the overall pattern of operating and maintenance costs since 1996. These costs remained relatively stable through the year 2000, but they have since taken a sharp upturn, and MDU projects a 5.7 percent increase each year from 2000 through 2003. This rate of increase exceeds predicted inflation of 2.8 percent annually.[33] Majoros accepted the 2002 labor cost increase, but objected to extrapolating that increase through 2003.

On rebuttal, Richard D. Spratt, MDU's Vice President – Human Relations, argued that bonuses are an integral part of his Company's overall compensation philosophy to remain competitive with other employers. Part of that compensation is intentionally put at risk in the form of bonuses that are paid on the basis of various goals, including MDU's overall profitability. Spratt presented the results of an industry survey that showed most utilities pay bonuses not only to management employees, but to salaried and hourly employees as well. Spratt stated that the elimination of bonuses would risk rendering MDU uncompetitive relative to other employers.[34]

The issue before the Commission is not whether MDU should pay bonuses or increase salaries. Staff agrees with Spratt that MDU must remain competitive with other employers, and that bonuses and raises are legitimately part of that effort. The issue that the Commission must decide is whether such bonuses and raises properly should be included as elements of a rate increase.

As acknowledged by Fox, the reason for this rate increase application is the apparent collapse of MDU's ability to wring further efficiency out of its operations.[35] For six years, from 1994 through 2000, MDU was able to sustain an annual rate of inflation of approximately three percent without ever increasing its distribution rates. Indeed, it reduced its rates in 1999. It did this through improved efficiency. Fox testified that MDU reduced its employees by 30 percent since 1994. In that year there were 248 customers per MDU employee. In 2001, one employee was serving 370 customers.[36]

Then suddenly, beginning in 2001, MDU's lost its ability to stay ahead of inflation, so it must now come before this Commission to ask for a rate increase.

---

[32] Exhibit 19, page 15.
[33] Id., page 5 and MJM-2.
[34] Exhibit 27.
[35] Tr. Oct. 7, page 46.
[36] Id.

MDU's rate increase application not only implies but asserts that this loss of efficiency will continue through 2003. Mulkern testified that while all of the past employee reductions are reflected in the 2001 base period data, no further reductions are forecast for 2002 and 2003.[37]

During her examination of Mulkern, Commissioner Wefald alluded to the possibility that the Commission might want to give MDU an incentive to practice savings and to find ways to achieve new savings.[38] Staff commends this objective.

MDU's rate increase application provides no incentives whatever to improve efficiency. The deterioration in productivity improvement during the years 2001 and 2002 is simply extrapolated into 2003. MDU should not be encouraged to perpetuate its own loss of efficiency. While the 2002 increases in labor costs might be allowed because they have already happened, no further deterioration of labor productivity should be built into the revenue requirement imposed on ratepayers. For this reason, the 2003 labor cost increase should be disallowed.

The same objective of incentivizing MDU to regain its previous levels of productivity improvement applies to bonuses, only here the incentives apply directly to employees. Apparently, a significant portion of MDU's bonuses is granted on the basis of MDU's overall profitability. Spratt testified that two years ago – presumably in 2000 – 75 percent of MDU's employees received 7 percent bonus. Last year, 2001, their bonus was 0.6 percent.[39] Presumably, these bonus levels reflected the fact that in 2000, MDU earned 11.96 percent on its North Dakota Gas Operations,[40] but in 2001, it earned only1.6 percent.[41]

If profitability drives bonuses, as it appears to, then it is altogether inappropriate to include bonuses in a revenue requirement that drives a rate increase. The reason MDU needs the rate increase is that it is not profitable. If it becomes profitable as a result of a rate increase, that profitability will not have come about because the employees have performed particularly well. To the contrary, it will be because the employees have not performed well, and MDU needs rescue from the Commission.

[39] Tr. Oct. 8, page 510.
[40] Exhibit 10.
[41] Exhibit 10, corrected at Tr. Oct 7, page 58.

The revenue requirement imposed on ratepayers should not include rewards for poor performance. For this reason, bonuses should be disallowed.

C. ELIMINATION OF SISP COSTS

The Supplemental Income Security Plan ("SISP") is a plan that provides supplemental pension benefits to key employees. "Key employees" are officers, directors and senior managers of MDU Resources and MDU Utilities. The plan is expected to cost $259,000 in 2002 and $265,000 in test year 2003.[42]

SISP was initiated in 1982, but MDU never sought its inclusion in revenue requirement until Case No. PU-399-01-186. In its April 24, 2002 decision in that case, the Commission accepted Staff's observation that this plan benefits only the top few employees, those that are already quite well paid. The Commission concluded that it is inappropriate for ratepayers to bear the expense of the SISP costs.[43]

MDU witness, Richard A. Espland, acknowledged that his testimony was essentially the same as it was in Case No. PU-399-01-186.[44] Espland acknowledged that SISP benefits only MDU's high salaried employees with income ranges from a low of $75,000 to its president at around $250,000 to $300,000.[45] Espland also agreed that none of the Public Utility Commission's in the jurisdictions where MDU provides natural gas utility services have approved a ratepayer funded SISP program.[46] The Commission took administrative notice of the Findings of Fact, Conclusions of Law and Order in Case No. PU-399-01-186.

If exclusion of SISP was appropriate in Case No. PU-399-01-186, it is even more appropriate in this case. That earlier case was a Staff-initiated proceeding to reduce MDU's electric rates. This case is a Company-initiated rate increase proceeding. As noted earlier, the need to increase rates after an eight-year period of price stability is indicative of management's failure to maintain its previous rate of productivity improvement. The management personnel who are most responsible for this failure are the very employees who benefit from SISP. This is not the time to reward them at

[42] Exhibit 19, MJM-10.
[43] Case No. PU-399-01-186, Findings of Fact, Conclusions of Law and Order, April 24, 2002, ¶68.

[45] Tr. Oct. 7, page 151
[46] Tr. Oct. 7, pages 151-152

ratepayers' cost. For this reason, the SISP expense should be disallowed again in this case.

D. RATE CASE EXPENSE AMORTIZATION

MDU proposes to amortize $168,000 in rate case expenses over three years at $56,000 per year. Majoros proposes to amortize the same amount over five years at $34,000 per year, for a difference in annual cost recognition of $22,000.[47] Mulkern suggested that if the five-year amortization is adopted, the unamortized balance should be included as a rate base addition.[48]

The basis of Majoros' proposal is the historical period between rate cases.[49] Fox stated that MDU's last rate increase proceeding was Case No. PU-399-94-297 decided in 1994, and a rate reduction occurred in 1999 in Case No. PU-399-96-325.[50] This represents two rate cases in eight years, or one every four years. MDU has rounded down to three, and Staff has rounded up to five.

There are two important reasons for adopting a longer, rather than a shorter amortization period for rate case expenses. The first is that once an amortization becomes embedded in the revenue requirement, it remains there until a new revenue requirement has been calculated. Thus, if the Commission accepts MDU's requested three-year amortization, and MDU does not participate in a rate case for another five years, then it has effectively over-recovered its expenses by a factor of 67 percent (5/3). If the reverse occurs, where MDU amortizes rate case costs over five years but has a rate case in three, the amortization can be continued in the new rate case, so that MDU ultimately recovers its costs, but only its costs.

The second reason for a longer amortization period is to provide a disincentive for MDU to initiate rate cases. It is a very small disincentive, but it is nonetheless symbolic. MDU should have to wait for five years to recover its rate case costs rather than the much shorter three years that it seeks.

Mulkern's proposal to include the unamortized balance of the rate base expenses faces practical and philosophical problems. Practically, it is impossible to

[47] Exhibit 19, MJM-11.
[48] Exhibit 25, page 2.
[49] Exhibit 19, page 15.

identify the amount that should be included in rate base because it declines each year. There would have to be some sort of annual adjustment in rates to recognize this declining amount. Philosophically, it would be difficult to explain to ratepayers why they should pay a return, which includes shareholder profits, on costs MDU incurred to increase their rates. Mulkern's proposal should be dismissed as unworkable.

E. GENERAL INFLATION ADJUSTMENT AND OTHER UNADJUSTED O&M EXPENSES

In 2001, MDU incurred $89,780,000 in O&M expenses, of which $76,842,000 represented the cost of acquiring gas. Of the remaining $12,938,000 O&M cost relating to distribution, MDU developed specific forecasts for $9,249,000 based on projected changes for various categories of costs, e.g. labor, benefits, insurance, advertising. This left a catch-all category of $3,689,000 of "other" O&M costs, which MDU assumed would increase between 2001 and 2003 by 2.8 percent annually, the assumed rate of general inflation[51]

Majoros noted that the Commission had never previously allowed this sort of inflation-based adjustment, and he recommended that it not start now.[52] The elimination of this adjustment reduces test-year expenses by $209,000.

This adjustment raises the same issues that were discussed with respect to labor costs, but adds some others. As with labor costs, MDU is projecting into the test year its apparent failure to maintain the rate of efficiency improvement that it was able to sustain during the years 1994-2000. As with labor costs, there should be some incentive to resume the search for productivity improvements that permit MDU to remain profitable without rate increases.

Additionally, there is some question whether these particular costs are subject to inflation. Of the $3,689,000 in 2001 costs within this "other" O&M category, $1,709,000 is non-labor Administrative and General costs. Presumably, this includes such things as office building rent and depreciation, office materials and supplies, and office furniture. Many of these costs are fixed in nature and would not increase with inflation.

---

[50] Exhibit 3, page 6.
[51] Exhibit 2, Statement N, page 14.
[52] Exhibit 19, page 16.

The second largest component of the "other" O&M category, accounting for $981,000 in 2001, is Customer Accounts, a portion of which is accounts receivable.[53] Accounts receivable would vary not by general inflation, but by the overall size of the total amount billed to customers, including the cost of gas. As demonstrated graphically in Mulkern's rebuttal exhibit RAM-2, gas prices spiked in the last months of 2000 and the first months of 2001, but have since moderated, falling to levels equal or below their 1999 values.[54] The level of accounts receivable would have followed this same pattern, but with several months' delay. They, too, would have spiked in 2001, and then declined as prices returned to their earlier levels. This means that accounts receivable were probably much higher in 2001 than in 2002 or 2003. It is wrong to project them to increase from 2001 through 2003 at the rate of overall inflation.

For these reasons, MDU's proposal to increase "other" O&M costs at the rate of inflation through 2003 should be rejected.

F. RATE OF RETURN

MDU has proposed a post-tax rate of return of 11.044 percent, which includes a 13.25 percent return on common equity. Staff has recommended a return of 7.98 percent, including a 10.5 percent return on common equity. Staff's position regarding the appropriate rate of return is fully explained in the next section of this brief.

III. COST OF CAPITAL

As stated previously, MDU has proposed a post-tax rate of return of 11.044 percent, which includes a 13.25 percent return on the 51.687 percent of its capital represented by common equity. Staff has recommended a return of 7.98 percent, including a 10.5 percent return on 44.55 percent of MDU's capital that it finds to be represented by common equity. Using MDU's 39.61 percent federal and state income tax rate,[55] the pre-tax rates of return can be calculated as follows.

[53] Tr. Oct 8, page 469.
[54] Exhibit 25, RAM-2.
[55] Exhibit 2, Statement N, page 20.

MDU:[56]

	Cost	Proportion	Post-Tax	Tax	Pre-tax
Long-term Debt	9.180%	43.039%	3.951%		3.951%
Preferred Stock	4.662%	5.274%	0.334%	0.090%	0.244%
Common Equity	13.250%	51.687%	9.562%	2.713%	6.849%
Total		100.000%	13.847%		11.044%

Staff:[57]

	Cost	Proportion	Post-Tax	Tax	Pre-tax
Long-term Debt	6.167%	47.92%	2.96%		2.96%
Short-term Debt	4.542%	2.78%	0.13%		0.13%
Preferred Stock	4.630%	4.75%	0.31%	.09%	0.22%
Common Equity	10.50%	44.55%	6.53%	1.85%	4.68%
Total		100.00%	9.93%		7.98%

The difference between the two pre-tax rates of return is 3.917 percent. When applied to MDU's projected test year rate base of $19,681,000,[58] this difference amounts to $771,000. When applied to the Staff's recommended rate base of $20,768,000,[59] the difference comes to $813,000.

As demonstrated in the foregoing tables, the Staff differs from MDU with respect to all of the components that make up the rate of return: the capital structure, the cost of debt, and the cost of equity.

A. CAPITAL STRUCTURE

Capital structure refers to the makeup of MDU's capital, that is, the mix of debt, preferred stock and equity. Two factors account for the disagreement between Staff and MDU. The first is Staff's inclusion of short-term debt, and the second is Staff's use of year-end 2001 capital structure instead of MDU's projection of its capital structure into 2003.

In its initial filing, MDU excluded all short-term debt from its proposed capital structure. Staff's rate of return witness, Charles W. King, testified that the makeup of the capital structure used to develop a rate of return should reflect the nature of the rate

[56] Exhibit 4, page 3.
[57] Exhibit 15, page 34.
[58] Exhibit 2, Statement N, page 1.

base to which that return is applied. If the rate base consists solely of capital investments in plant and equipment financed by long-term debt, preferred stock and equity, then it might be appropriate to exclude short-term debt. But MDU's rate base also includes materials and supplies inventories, fuel stocks, and prepayments, which are short-term commitments that will be financed in part with short-term debt. For this reason, he included short-term debt in the capital structure.[60]

On rebuttal, MDU witness Craig Keller argued that the items to which King referred, materials and supplies, prepayments and fuel stocks remain relatively constant, not changing materially from one month to another. While classified as short-term assets, they support long-lived assets such as plant, property, equipment and related items. They are therefore financed by long-term debt, according to Keller.[61]

At the hearing, King responded to Keller by producing Exhibit 13, which shows the month-to-month amounts of each of the major elements of working capital during the 13 months from December 2000 through December 2001. That exhibit demonstrates that net working capital varied from negative $53,000 in January to positive $306,000 in July. These widely varying amounts could not possibly have been financed with long-term debt.

As noted, the second difference between the Staff's and MDU's capital structure relates to the use of historical vs. forecast data. King drew the amounts of debt, preferred stock and common equity from Company supplied data for calendar year 2001. He calculated average long-term debt from Exhibit 2, Statement A, page 2; short-term debt from a response to a data request (Exhibit 15, CWK-1); and preferred stock and common equity from Exhibit 2, Statements A and F, page 1.

MDU's capital structure was presented on Statement F, page 3 as its projected 2003 capital mix. King objected to this use of a projection on the grounds that it is effectively a creation of MDU that has no basis in any verifiable financial statements.[62]

On rebuttal, MDU witness Keller argued that NDCC § 49-05-04.1 permits MDU to use a forecast test year and that Staff's other witness, Majoros, had accepted the 2003 test year as the basis for revenue requirements. Failure to use a forecast capital

---

[59] Exhibit 19, MJM-1, page 1.
[60] Exhibit 15, page 4.
[61] Exhibit 23, page 2.

structure would result in a "mismatch" with the rest of the revenue requirement calculation.[63] Keller argued that MDU possesses a financial forecasting system that uses known debt scheduling and projects equity by forecasting earnings and deducting dividends.

In his oral testimony, King pointed out that MDU had used an historical capital structure in its recent electric case. He argued that the purpose of the future test year is to capture exogenous changes that can be objectively determined, such as inflation or the expansion of the system. By contrast, the capital structure is a creation of MDU's management. There is no way of verifying that it will change in the manner MDU predicts. For this reason, most commissions use recent historical capital structures. Otherwise, MDU has the opportunity to game the regulatory system by projecting a more expensive capital structure, one with greater equity than now exists.[64] A comparison of MDU's 2001 capital structure with its forecast 2003 capital structure reveals that this is exactly what MDU has done in this case. For this reason, an historical capital structure should be used in this case.

B. COST OF DEBT

MDU's claimed cost of debt in 2001 is 9.302 percent, and its projected 2003 debt cost is 9.180 percent. These values are calculated on Exhibit 2, Statement F-1, pages 1 and 3. Those pages show only two debt issues, First Mortgage Bonds and Pollution Control Bonds, totaling $133.5 million in 2001 and $132.6 million in 2003.

Yet, Statement A, pages 11 and 12 of that same exhibit reveals that there is substantially more to MDU's debt than these two issues. As of December 31, 2001, there were $405.2 million in senior notes, $219.7 million in commercial paper, a revolving line of credit of $25 million, and term credit agreements of $11.8 million. Using the cost values shown on those pages, King calculated that the blended cost of MDU's debt is 6.167 percent, more than 300 basis points lower than MDU proposes.[65]

It turns out that the difference between Staff and MDU revolves around what "MDU" actually is. According to MDU witness Keller, only the First Mortgage and

---

[62] Exhibit 15, page 4.
[63] Exhibit 23, page 4.
[64] Tr. Oct. 7, page 183.

Pollution Control bonds relate to MDU Utilities. All of the other debt pertains to Centennial Holdings, which holds title to the non-regulated operations of the parent Company, MDU Resources Group, Inc. ("MDU Resources"). The two sets of debt are not fungible. MDU has no access to Centennial's debt and vice versa.

On cross-examination, however, Keller made it quite clear that there is no such entity as the Montana-Dakota Utilities Company. The only legal entity is the parent Company, MDU Resources, and only that company can issue debt. Neither the utility operation nor Centennial have any debt in their own right.[66]

Keller testified orally that MDU Resources Group had attempted to build a "firewall" between the debt of MDU Utilities and that of Centennial. The purpose, he argued, was to protect the utility operations from the effect of default on Centennial's debt. If Centennial or one of its subsidiaries goes bankrupt, then the bankruptcy judge would not be able to "collapse the corporation" and gain access to the utility's assets. For this reason, MDU Resources does not commingle the funds raised for the utility with those raised for Centennial.[67]

These are laudable objectives, but it is not clear how far they go. On cross-examination, Keller conceded that if the bankruptcy of either MDU Resources' regulated or its unregulated operations caused the parent to declare bankruptcy, then the bankruptcy court would look at all of MDU Resources' assets to satisfy creditors' claims, including those of the regulated utility.[68]

King suggested that there might be another, less altruistic reason for attempting to isolate Centennial's debt from that of the utility operations. It is to ensure that ratepayers pay the very high costs of the First Mortgage bonds and receive no benefit from MDU Resources' other, lower-cost financing resources.[69] While MDU Resources may have written its low-cost financing instruments to direct funds to Centennial and its subsidiaries, that was an artifice to "game" the regulatory system into ascribing only the

---

[65] Exhibit 15, CWK-2.
[66] Tr. Oct 7, page 129.
[67] Tr. Oct 8, pages 380-383.
[68] Tr. Oct 8, page 393.
[69] Exhibit 15, page 7.

highest cost debt to regulated service ratepayers. MDU Resources could have used the Centennial funds anywhere had it written the debt instruments differently.[70]

In the end, all of MDU Resources' debt is secured by all of MDU Resources' assets. This means that in the end, all of its debt is fungible. For this reason, it is appropriate to use the blended cost of all of MDU Resources' debt as the cost of debt for MDU's utility operations.

C. COST OF EQUITY

MDU's rate-of-return witness, J. Stephen Gaske, recommended a return to equity of 13.25 percent. This return was developed using three variants of the Discounted Cash Flow ("DCF") approach, plus a series of "benchmark analyses."

For his DCF results, Gaske drew a distinction between "Investor Requirements" and "Cost of Capital" based on his belief that stock flotation costs, equivalent to 4.75 percent of the return, must be included in the latter. Because MDU's parent company, MDU Resources Group, Inc. is heavily engaged in non-regulated activities, Gaske used a "proxy group" of six companies based on Moody's utility series. His DCF results for these companies were as follows:[71]

	Investor Requirements	Cost of Capital
Second-stage Retention Growth	11.94%	12.51%
Basic DCF	12.61%	13.21%
Primary DCF	12.63%	13.22%

Gaske's benchmark analyses consisted of four risk premium comparisons using historical differences in earned returns to equity from large and, alternatively, small companies relative to current yields on U.S. Treasury bonds and corporate bonds. He also identified the recent returns on per-share book value of S&P 500 corporations and Value Line's list of industrial companies. All of his benchmark indicators were higher than any of his DCF returns.[72]

[70] Tr. Oct. 7, page 185.
[71] Exhibit 4, page 32.
[72] Id.

Gaske's final selection of 13.25 percent was based on his belief that the risk of MDU's gas distribution business is slightly higher than that of his proxy group of gas distribution companies. He based this belief principally on the smaller size of MDU relative to the proxy companies. Small size, argued Gaske, translates into greater risk.[73]

King recommended a very different return to equity: 10.5 percent.[74] Paradoxically, King followed most of the same procedures as Gaske, at least with respect DCF analyses, which was the principal analytical tool used by both witnesses. Like Gaske, King used a comparison group of gas distribution companies. Also like Gaske, King used a forecast of next year's dividends for the dividend yield portion of the DCF formula. King also used both analysts' forecasts and the concept of earnings retention to calculate the growth component of that formula – as do Gaske. Finally, both King and Gaske adjusted their final recommendations based on their assessments of the risk of MDU's gas distribution activities relative to that of the comparison companies.

The explanation for the dramatic 275 basis point (2.75%) difference between the recommendations of the two witnesses lies in the details of the application of the DCF formula. As used by both witnesses, the DCF formula is the sum of next year's dividend yield on MDU's stock and the expected future growth rate in its dividends and earnings.

The differences between the Gaske and King applications of the DCF formula relate to the following elements:

1. Inclusion of flotation costs;
2. Selection of comparison companies;
3. Forecast of next year's dividends;
4. Timing of analysts' forecasts;
5. Computation of earnings retention growth;
6. Presentation of the DCF results; and
7. Adjustment of comparison companies results to reflect MDU's risk.

---

[73] Id., page 34.
[74] Exhibit 15, pages 2 and 27.

1. Flotation Costs

As noted earlier, Gaske drew a distinction between "investor requirement" and "cost of capital," with the difference being cost of issuing new shares in public stock offerings. Gaske quantified this cost as 4.75 percent, based on a representative sample of flotation costs incurred with 34 new common stock issues by natural gas transmission and distribution companies between 1992 and 2001.[75]

King agreed with Gaske that flotation costs should be recovered, but he questioned the propriety of applying a ratio for these costs to the entire amount of common equity. Flotation costs are incurred only when a company issues new stock, and then only when there is a public stock offering. Existing stock incurs no flotation cost, and even new stock incurs no such costs if it is distributed as an employee or shareholder benefit either through options or as bonuses.[76]

King noted that the effect of Gaske's flotation cost adjustment is to increase his equity return by 60 basis points, or .60 percentage points. When multiplied by the $1.125 million book equity value of the MDU Resources, Inc., this allowance amounts to $6.75 million annually, which is substantially more than the $5.4 million in flotation costs that MDU has incurred over the past five years.[77]

King suggested that if a flotation cost adder is to be used, it should be equal to a reasonable estimate of the annual flotation cost incurrence divided by the entire amount of MDU's equity. In MDU's case, annual flotation costs during the past five years have been about $1.1 million. MDU's total book equity value is $1,125 million, for a flotation cost allowance of 0.1 percent. This amount is so small as to be lost in the rounding. For this reason, he recommended that there be no explicit flotation cost adder.[78]

During the rebuttal phase of the hearing, Gaske distributed an exhibit that purported to demonstrate that failure to include flotation costs in the return of a company's stock trading at book value would result in the dilution of the book value of that company's shares.[79] On cross-examination, however, Gaske admitted that all of

[75] Exhibit 4, page 12 and JSG-2, Schedule 3.
[76] Exhibit 15, page 28.
[77] Id.
[78] Id.
[79] Exhibit 31.

King's comparison companies had per-share market values higher than book value, and that when such companies sell new stock, the effect is to increase book value, not dilute it.[80]

In Case No. PU-399-01-186, involving MDU's electric rates, the Commission rejected Gaske's flotation cost adder.[81] It should do so again.

2. Selection of Comparison Companies

As noted earlier, both witnesses acknowledged that the heavy involvement of MDU's parent company, MDU Resources Group, Inc., in non-regulated activities effectively precluded using that company as the basis for finding the return to equity of its gas distribution business in North Dakota. Necessarily, this required the selection of companies whose primary business is gas distribution. Gaske picked six companies from Moody's list of natural gas distribution companies.[82] King chose 11 companies from Value Line's Investment Survey based on the criteria that they must have investment grade bond ratings, total operating revenues over $100 million, and derive more than 75 percent of their revenue from gas distribution services.[83] The two lists are as follows:

King Comparison Companies[84]	Gaske Proxy Group[85]
Atmos Energy Corp.	AGL Resources
AGL Resources	Keyspan Corporation
Cascade Natural Gas Corp.	LaClede Group
LaClede Group, Inc.	Northwest Natural Gas
NICOR, Inc.	People's Energy Corp.
Northwest Natural Gas Co.	WGL Holdings, Inc.
People's Energy Corp.	
Piedmont Natural Gas Co.	
South Jersey Industries, Inc.	
Southwest Gas	
WGL Holdings, Inc.	

[80] Tr. Oct 8, page 454.
[81] See Order dated April 24, 2002, ¶ 15.
[82] Exhibit 4, page 13.
[83] Exhibit 15, page 11.
[84] Id., page 12.
[85] Exhibit 4, JSG-2, Schedule 2, page 1.

Five of Gaske's six companies are also represented on King's list. The exception is Keyspan Corporation, which King excluded because that company's gas distribution operations accounted for only about half its revenue.[86] The addition of six more gas distribution companies in King's sample provides a broader and therefore more representative group of companies from which to draw indications as to the cost of equity for gas distribution operations.

3. Forecast of Next Year's Dividends

Both witnesses used a forecast of next year's dividends to identify the dividend yield portion of the DCF formula, and both witnesses based this forecast on a percentage of the 5-year annual earnings growth rate predicted by Zacks Investment Research, Inc. Only the percentage differed. King used a factor 1.5 on the assumption that the next dividend increase would be randomly distributed over the coming year.[87] Gaske used a 1.625 inflator of the growth rate and argued that King's factor does not reflect the present value of next year's dividends and dividend increases.[88] King responded that if he were to reflect the time value of next year's dividend, rather than simply its numerical value, he would reduce the inflator, not increase it as Gaske has done.[89]

In any case, the effect on the final DCF results of this .125 difference in the inflator for the next year's dividend is negligible.[90]

4. Timing of Analysts' Forecasts

One difference between the two witnesses' analyses that was probably unavoidable was their timing. Gaske's testimony was filed on April 12, 2002, concurrently with MDU's initial application for an increase in its gas rates. The record does not disclose when Gaske prepared his testimony, but presumably it was in the months immediately preceding the application, which would be February and March of

[86] Exhibit 17.
[87] Tr. Oct 7, page 188.
[88] Exhibit 24, page 14.
[89] Tr. Oct. 7, pages 188-189.
[90] Id.

2002. This would be consistent with the fact that the latest month shown on Gaske's presentation of bond yields is January 2002.[91]

King filed his testimony on August 30, 2002, so his information on such factors as share prices and investor expectations was gathered approximately six months after Gaske's.

It is not clear how these differences in timing affect the results of the respective analyses. For example, Gaske reported Zacks' consensus 5-year earning growth forecast for the LaClede Group as 12.0 percent.[92] By the time King prepared his testimony, that forecast had dropped to 4.25 percent.[93] On the other hand, Gaske's forecast growth rate for AGL Resources was 7.03 percent, while that reported by King was 11.42 percent. Whatever the effect, King's analysis reflects much more recent data than Gaske's and should be given greater weight.

5. Procedure for Computing Retention Growth

Both witnesses used the same two methods for forecasting the growth component of the DCF formula. One was Zacks Investment Research's consensus forecasts of 5-years' earnings growth. The other was the rate at which the retention of earnings would permit the book value of each share to increase over the coming five years. Both witnesses used Value Line's company reports for this procedure, although again King had access to later reports than did Gaske.

The only methodological difference between the two analyses was King's inclusion of a factor to account for the sale of new stock at market values higher than book value. This inclusion added 100 basis points to the earnings retention growth model developed by King.[94] Although Gaske did not include this factor in his retention growth model, he did not object to King's use of it.

6. Presentation of the DCF Results

Gaske purported to perform three different DCF analyses of his proxy group of companies. One of these analyses, the "basic DCF," was identical to King's "classic

[91] Exhibit 4, JSG-2, Schedule 1, page 2.
[92] Id., page 5.
[93] Exhibit 15, page 15.

DCF" analysis. Both involved combining the forecast dividend yields with Zacks' 5-year consensus forecasts of earning growth.

While the methods were the same, the results were quite different. Gaske's six-company proxy group yielded a median basic DCF return, prior to flotation costs, of 12.61 percent and a mean return of 12.95 percent.[95] King, applying exactly the same procedure to his comparison group of 11 companies, found the average (mean) to be 11.29 percent.[96]

For his other application of the DCF approach, King added the dividend yield to the growth rate indicated by the earnings retention growth model for each of his 11 comparison companies and found the average to be 12.18 percent.[97] Had Gaske done the same thing, he would have added his average dividend yield of 5.14 percent[98] to his retention growth estimate of 5.5 percent[99] for a DCF return indication of 10.64 percent.

Gaske did not. Instead, he diluted his retention growth rate by mixing it one third, with two-thirds represented by the Zacks' 5-year earnings forecasts. The result, not surprisingly, was quite close to the "basic" DCF indications. The median of his "Second-Stage Retention Growth DCF Calculation" was 11.94 percent, the mean 12.25 percent.

Both witness presented a third version of the DCF analysis, but neither should be given any weight. Gaske put forth what he called his "primary" DCF calculation. This was no calculation at all, but merely the adoption of a range of growth estimates pulled from thin air with no support in the data Gaske presents. The range was 6.75 percent to 7.75 percent, asserted by Gaske to have been based on such factors as the 5.5 percent growth in nominal Gross Domestic Product during the past decade, the expected demand growth for natural gas, and investor expectations.[100]

None of these considerations support a growth forecast in the range of 6.75 percent to 7.75 percent. The bottom of this range is well above the 5.5 percent GDP growth cited by Gaske, as well as the 5.5 percent growth indicated by his own earnings

---

[94] Id., page 20.
[95] Exhibit 4, JSG-2, Schedule 2, page 7.
[96] Exhibit 15, page 18.
[97] Id. page 20. King refers to this model as the "book value growth" procedure.
[98] Exhibit 4, JSG-2, Schedule 2, page 2.
[99] Id.
[100] Id., pages 20-21.

retention calculation. The top of the range is above the 7.56 percent growth rate predicted by Zacks for the six proxy group companies used by Gaske.[101] This "primary" DCF analysis is without foundation in the data, and it is clearly biased upward.

King also presented a third DCF calculation, but he subsequently discarded it. Noting that analysts' reports always include considerable historical data and therefore might regard history as relevant, King calculated a growth factor for each of his 11 comparison companies based on the each company's historical earnings growth between 1997 and 2001. While the average DCF indication of 11.72 percent might appear reasonable, the variation among the individual company observations was so great as to provide little or no probative value – as King conceded in his testimony.[102]

In presenting his DCF returns, King went one step further than Gaske, and that was to provide his estimate of the DCF return requirements of each of his comparison companies. He did not use a mechanical formula because, as he conceded in his testimony, precision is impossible.[103] He described his procedure orally at the hearing as follows:

> ...what I have done in each case is taken the classic DCF return, which is probably the best estimator, and then turned and looked at the retention growth method. If the retention growth looks like it's totally out of whack with the forecast, and in some cases they are – simply no way that the company could be growing as fast or as slowly as the investor survey shows – I modified that classic DCF in the direction of the retention growth.[104]

[101] Id., JSG-2, Schedule 2, page 7.
[102] Exhibit 15, pages 22, 23.
[103] Id., page 24.
[104] Tr. Oct. 7, page 190.

The results of this procedure were as follows:[105]

	Classic	Book Value Growth	King DCF Return
Atmos Energy Corp.	12.06%	14.42%	12.5%
AGL Resources	16.67%	11.53%	14.0%
Cascade Natural Gas Corp.	10.25%	15.11%	11.0%
LaClede Group, Inc.	10.29%	11.23%	10.5%
NICOR, Inc.	11.51%	15.96%	12.0%
Northwest Natural Gas Co.	10.65%	10.12%	10.5%
People's Energy Corp.	13.13%	12.07%	12.5%
Piedmont Natural Gas Co.	9.42%	11.24%	10.0%
South Jersey Industries, Inc.	8.15%	12.57%	11.0%
Southwest Gas	10.52%	8.53%	10.0%
WGL Holdings, Inc.	8.99%	11.21%	9.5%
Average	**11.29%**	**12.18%**	**11.23%**

In his rebuttal testimony, Gaske made much of the fact that the average of King's selected DCF results was lower than the average of either his classic or his book value growth results.[106] That is the mathematical consequence of King's shrinking of the range of observations. King reduced the effect of the "outlier" highest and lowest observations. In absolute terms, the outliers on the high side diverge more from the mean than those on the low side, even when their percentage difference from the mean is the same.

This mathematical distortion can be avoided by focusing on the median observation of each series, that is, the observation where five values are higher and five are lower. The classic DCF median return is 10.52 percent, the median of the book value growth series is 11.53 percent, and the median of King's selected DCF returns is 11.0 percent. Additionally, it should be noted that in arriving at his final DCF recommended returns, King adjusted seven of the classic returns upward and only four downward.

On rebuttal, Gaske submitted two mechanical recalculations of King's DCF results, one using a 33%/67% weighting of the book value growth and Zacks' forecasts, the other using a 50%/50% weighting. Both yielded average returns considerably

[105] Exhibit 15, pages 23, 24.
[106] Exhibit 24, page 10.

higher than King's 11.23 percent.[107] In performing these calculations, however, Gaske excluded WGL Holdings, ostensibly because, with 74.6 percent of its revenue from regulated gas distribution, it falls outside King's 75 percent criterion.[108] As Gaske admitted on cross-examination, 74.6 percent rounds up to 75 percent.[109] His exclusion biased the results upward because, at 8.99 percent, WGL Holdings' classic DCF return was the lowest in King's comparison group. Moreover, Gaske never explained why his mechanical weightings of King's DCF results were more accurate or valid than King's analysis.

7. Adjustment of Comparison Company Results for MDU's Risk

Possibly the starkest disagreement between Gaske and King relates to the final adjustment each witness made to the DCF returns for his comparison companies to reflect the specific risk of MDU's gas distribution operations.

Having found that the DCF cost of capital (inclusive of flotation cost) for his proxy companies was in the range of 12.51 and 13.22 percent, Gaske selected 13.25 percent as MDU's capital cost. This upward adjustment from the range of proxy group returns was based on Gaske's belief that MDU's overall risks are slightly above average relative to the proxy group.[110]

King's adjustment was in the opposite direction. Having found that the average DCF return for his comparison group is 11.23 percent, King picked 10.5 percent for MDU, which is the midpoint between the group average return and the returns for the least risky companies in the group. The basis of this adjustment was King's belief that MDU is less risky than the comparison group.[111]

In his initial testimony, Gaske discussed four types of risk: business risk, regulatory risk, financial risk and market risk. He found that MDU's regulatory and market risks are not significantly different than from those of his proxy group. MDU's

[107] Id., JSG-4, Schedule 1.
[108] Id., page 12.
[109] Tr. Oct. 8, page 455. King also testified that most of WGL's non-regulated revenue is derived from Washington Gas Energy Services, a supplier of gas to the very same customers who receive gas from its regulated subsidiary. Exhibit 15, page 26.
[110] Exhibit 4, page 34.
[111] Exhibit 15, pages 26, 27.

financial risk is slightly greater because the bonds of MDU Resources Group, Inc. are rated slightly lower than the bonds of the proxy companies.[112]

The major difference in risk, according to Gaske, relates to business risk. MDU's gas distribution operations are a fraction the size of the proxy companies. Those companies are between six and 46 times the size of MDU's gas distribution operations. Based on the historical difference between the earned returns of small and large companies, Gaske believes that MDU's smaller size might require a return more than 100 basis points (1.00 percent) higher than the proxy group. In addition, MDU faces the competition of propane and heating oil for new and existing load in its service territory. Furthermore, its rate structure recovers a substantial portion of its fixed costs in the volumetric component of its rates, and MDU does not have a weather normalization adjustment mechanism. On this basis, Gaske concluded that MDU's North Dakota gas distribution operations face somewhat greater overall business risks than the typical company in his proxy group.[113]

King based his conclusion that MDU's gas distribution business is less risky than his comparison group on two facts. First, unlike eight of the 11 comparison companies, MDU's gas distribution operations have no non-regulated business activities. Second, MDU's equity ratio is higher than all but three of his comparison companies, suggesting a lower level of financial risk. He argued that a good case could be made for setting MDU's rate of return at the bottom of the scale of DCF returns for the comparison companies. However, in light of the possibility that the return set in this case may be in effect for an extended period into the future, he selected the midpoint between the lowest returns in his comparison group and the average.

In his rebuttal testimony, Gaske argued that King had failed to demonstrate any strong correlation between equity return and the equity proportion or the percent gas distribution revenues in his comparison companies. Gaske presented two correlation studies of these variables.[114] One showed a weak, but measurable correlation between

[112] Exhibit 4, pages 29.31.
[113] Id. pages 27-29.
[114] Exhibit 24, pages 22-26.

the percent equity in capital structure and King's estimates of DCF returns. The other showed no correlation between equity return and percent gas distribution revenues.[115]

In his oral testimony at the hearing, King conceded that neither of the two risk factors cited in his testimony are predictors of relative risk, but both are elements of relative risk. A high equity ratio is an indicator of low financial risk, and MDU's equity ratio is about equal to the highest of the equity ratios of within his comparison group.[116] The relationship between financial risk and capital structure, which King cites in this portion of his testimony, was also discussed in Gaske's initial testimony at some length.[117]

King noted that another element of risk is the amount of non-regulated activity. Regulated activities are less risky than non-regulated activities. When regulated earnings are short, MDU can come to the Commission for an increase in rates. If the Commission grants the rate increase, there is no question whether MDU can collect the additional revenue because of its monopoly status. That is not true of non-regulated activities, which by definition do not have the security of revenue recovery that low-risk regulated activities have.[118]

King also cited two further reasons that MDU gas distribution operations have lower risk than many of his comparison companies. Gas companies operating in warmer climates face competition from electric heating that MDU, operating in a cold climate, does not encounter. He testified that in Washington, DC, the Washington Gas Light Company has lost two-thirds to three-quarters of the commercial load to the electric company. For residential customers, heat pumps can combine heating with air conditioning and so compete with gas.[119] King stated that stand-alone heat pump units that do not draw heat from groundwater will not work in North Dakota's climate because they have to be supplemented with electric resistance heating when temperatures fall below about 45 degrees Fahrenheit.[120]

[116] Tr. Oct. 7, page 190.
[117] Exhibit 4, page 30.
[118] Tr. Oct. 7, page 191.
[119] At the hearing, Gaske submitted Exhibit 35, which contained some Washington Gas Light Company Internet advertisements for gas heating. These advertisements confirm that Washington Gas faces stiff competition from electricity for its residential heating load.
[120] Tr. Oct. 7, page 218

The other difference cited by King relates to the intrusion of gas suppliers into the retail gas market. Some of his comparison companies (he cited Washington Gas and Atlanta Gas Light Company) are required to deliver the gas of independent suppliers. The extreme example is Atlanta Gas Light, which no longer buys gas on behalf of its customers. Instead, merchant gas suppliers buy the gas, and Atlanta Gas Light delivers it to end users on behalf of the suppliers. He testified that Atlanta Gas went from some 600,000 customers to 11. When one of these gas suppliers went bankrupt, Atlanta Gas was "stiffed" for several million dollars.[121]

In another example cited by King, Washington Gas has lost two thirds of its commercial load to competitive suppliers. The suppliers have failed to acquire the transportation capacity that Washington Gas had maintained to serve those lost customers, and there is now a risk that in a cold winter, the suppliers will not be able get the required gas to Washington.[122]

King observed that MDU does not have anything like the active competition from suppliers that larger companies serving larger service territories have. It therefore does not face the severe business risks associated with these suppliers.[123]

As regards the alleged risk of small company operations, King suggested that Gaske has conducted an apples-and-oranges comparison. He has compared the risk properties and required returns of large companies with those of small, stand-alone companies. That is not the proper comparison. The relevant objective in this case is to find the risk characteristics the gas operations of a large company. Being part of a large company provides the security of greater financial strength and also diversification of financial resources.[124]

MDU's North Dakota gas distribution operations are not a small, stand-alone company, as are the small companies from which Gaske derives his 100 basis point small-company risk adder. MDU's North Dakota gas distribution operations are merely one part of the overall business of MDU Resources Group, Inc. That company is well within the size range of the companies in both Gaske's and King's comparison groups.

---

[121] Tr. Oct. 7, page 193.
[122] Id.
[123] Id.
[124] Id., pages 193, 194.

While MDU's gas distribution operations are small, they have a lower financial risk than do most of King's comparison companies by reason of a high equity ratio. They have no risky, non-regulated activities, as do most of the comparison companies. While MDU faces competition from propane and oil, as do virtually all gas companies, it does not confront effective competition for its heating load from electricity, as do the comparison companies that operate in warmer climates. Finally, MDU does not have the intrusion of independent gas suppliers into its retail market in anything like the degree that some of the comparison companies have. For these reasons, King's conclusion that MDU has somewhat less overall risk than his comparison companies is altogether reasonable.

a. Gaske's "Benchmark Analyses"

Gaske presented two types of "benchmark analyses." In one series, he added the historical differences between Treasury bonds and corporate bonds, on the one hand, and earnings from the common stock of small and, alternatively large companies, on the other. The other benchmark analysis was to identify the recent earned return on book value of S&P's 500 companies and on Value Line's industrial companies. The results of these benchmark analyses are as follows:[125]

Risk Premium Return Based on:	
- U.S. Treasury Bonds	
v. Large Companies	13.3%
v. Small Companies	20.2%
- Corporate Bonds	
v. Large Companies	14.8%
v. Small Companies	22.2%
Alternative Investments	
- S&P 500	21.5%
- Value Line Industrials	29.4%

It is not evident that Gaske used these results in setting his rate of return. At the conclusion of his testimony he appears to conclude from these tests that his 13.5

[125] Exhibit 4, page32.

percent cost of capital, derived from DCF results, is quite conservative relative to these benchmark results. Whatever their use, these results should be disregarded, because their conceptual basis is fatally flawed and the risk premium observations are without value statistically.

Gaske's risk premium analysis purports to measure the required return to equity by adding the historical difference in experienced earnings from stocks and bonds to the current levels of bond yields. These historical differences, as measured by Ibbotson Associates, go back to 1926.[126] The theory is that over a long enough period, actual return differentials between stocks and bonds will equate to required or expected return differentials.

King observed that this theory is a statement of faith, not experience, and it defies logic. If investors? short-term expectations are continually being frustrated (as has been the case during the last year), what possible logic supports the proposition that the sum of those failed short-term expectations represents a valid long-term representation of their expectation? King further argued that it is untrue that the differential in required returns between bonds and stocks is fixed and unchanging, as this theory postulates. The perceived safety/risk relationship of bonds differs from stocks, and their relative desirability as investment vehicles changes continually depending on such factors as inflation, economic growth, and the capital structures of the enterprises issuing the securities.[127]

Quite apart from these conceptual failing, the theory fails statistically. Gaske introduced Exhibit 34, which shows annual returns to large company stocks, small company stocks and long-term corporate bonds. It also shows their differences. The standard deviation every one of these series is greater than the mean of the observations. The means therefore lack statistical significance and are useless as a predictive tool.

At the conceptual level, Gaske's alternative equity investment analysis fares no better. Gaske purports to demonstrate that MDU should be allowed a high return by observing that the returns to book equity on the S&P 500 companies from 1977 to 2000

[126] Id., pages 22-24.
[127] Exhibit 15, pages 31, 32.

have averaged 21.47 percent. He also observes that the book equity returns to 746 industrial, retail and transportation companies included in The Value Line Investment Survey have ranged from 27.57 percent to 31.75 percent over the five years 1996-2000. He argues that the average of 29.4 percent, along with the return of 21.47 percent experienced by S&P's 500 companies, suggests that the 13.25 percent he proposes for MDU is quite low.[128]

King argued that these comparisons are utterly irrelevant. He pointed out that investors in unregulated industrial, retail and transportation firms have no access to book equity value. The only value that is meaningful for investors in such firms is the market value. That is what an investor must pay to acquire the stock, and conversely, the value an investor will receive by selling the stock. Book equity value in an industrial firm is a purely historical number representing the dollars of original investment in equity capital contributed to (or retained by) MDU. It has little relevance to the current market value, even for fairly capital-intensive firms. Since most stocks sell well above their book value, the return that is accessible to investor is considerably less than the 20 to 30 percent noted by Gaske.[129]

King noted that book values are relevant for regulated utilities because regulation makes them so. Regulation sets the earnings allowance for such companies relative to a rate base reflective of the book value of the capital invested utility operations. This condition does not apply to industrial firms.[130]

b. King's Risk Premium Test

In contrast to Gaske, King did not attempt to find any absolute value of equity return using the risk premium approach. He agreed that equity investment, being inherently more risky than debt, requires a higher return. But rather than attempt the difficult (and arguably impossible) task of measuring that risk premium, he looked to the trends in bond yields in comparison to past North Dakota Commission findings of equity return to gas companies. If it appears that bond yields have increased, but he has recommended a reduced return to equity, then there may be reason to question his

[128] Exhibit 4, pages 24-26.
[129] Exhibit 15, page 33.
[130] Id.

finding. On the other hand, if his proposed equity return tracks with the changes in bond yields, then there is at least a "sanity check" on the propriety of his finding.[131]

King identified three gas cases during the past 12 years in which the Commission had found a rate of return to equity. He compared those rates of return with the then-current yields on 10-year Treasury bonds and Aaa Corporate bonds. He then identified the current (that is, August 2002) bond yields. The results of his research are as follows:[132]

Case	Utility	Date	ROE Allowed	10-Yr Treas.	Aaa Corporate
399-90-820	MDU	July 30, 1991	12.0%	8.27%	9.00%
400-95-559	NSP	June 7, 1996	12.0%	6.91%	7.71%
400-00-521	NSP	June 27, 2001	11.5%	5.28%	7.18%
399-02-183	**MDU**	August, 2002	**10.5%***	4.35%	6.45%

While King's recommended equity return is lower than any that have been approved for gas utilities in the past 12 years, this result is justified by the evidence of lower overall capital costs. Those lower capital costs are demonstrated by a dramatic reduction in bond yields relative to their level when the previous gas rate cases were decided. For this reason, King's recommended equity return of 10.5 percent is reasonable.

IV. COST ALLOCATION AND RATE DESIGN

A. CLASS COST OF SERVICES STUDY

A class cost of service study is an analysis of the embedded or incremental costs of providing utility services to the customers or classes of customers that either cause these costs, or to whom these costs can reasonably be allocated. The purpose of a class cost of service study is to provide an indication of what it costs to provide utility service to each customer class. In prior rate applications the Commission has used

[131] Id., page 30.
[132] Id., page 31.

class cost of service studies as guidelines for rate design and as one of the factors in setting rates for the respective classes of customers.[133]

MDU Witness, Tamie Aberle, sponsored an embedded cost of service study for the year ended December 31, 2001.[134] This study allocated all of MDU's recorded distribution, general and gas-related common plant among seven categories of customers:

- Residential
- Firm General
- Air Force
- Small Interruptible Sales
- Small Interruptible Transport
- Large Interruptible

The costs allocated to the respective customer classes were in turn subdivided into three categories:

- Capacity related costs that vary with the amount of gas sendout on the peak days of the year. Examples include the sizing of distribution mains and meters to account for the maximum volume of gas handled on any one day.
- Throughput related costs that vary with the total amount of gas distributed throughout the year. Uncollectible accounts is a good example of this type of cost.
- Customer related costs that vary with the number of customers. Examples include the cost of meters, services and billing.

The only controversy relating to this cost of service study concerned the allocation of the cost of mains. Mains constitute 39.1 percent of MDU's gas distribution plant, but their relevance exceeds even this percentage.[135] That is because general and common plant, which account for another 20 percent of total plant, are allocated as overheads to the direct investment, of which mains are the largest component.

---

[133] See, for example, Case No. PU-399-90-820, Order dated July 30, 1991, ¶¶56-63; Case No. PU-400-95-559, Order dated August 7, 1996, ¶¶35-43.
[134] Exhibit 2, Statement M.
[135] Exhibit 15, page 38.

In its initial cost of service study, Statement M of Exhibit 2, MDU allocated mains 64 percent on the basis of peak two-day throughput during the year and 36 percent on the basis of the number of customers.

King objected to the allocation or a portion of mains costs on a customer count basis. The arguable justification for doing so is that the purpose of the mains system is to reach customers, and that when more customers are added, the mains system has to be extended. King argued that this is true only at the very edges of the system, where gas mains are being extended to serve new developments in previously unserved areas. Even then, the added cost of mains for new customers can vary dramatically depending on the location of those customers.[136]

King suggested that there is another purpose of mains, which is to deliver gas. He argued that the value derived and the benefits received from the mains system are more related to the amount of gas delivered than to the number of customers. One customer receiving twice as much gas as another customer enjoys exactly twice the BTU heating content. The two cannot be equated in terms of benefit received, yet that is what a customer allocation of mains does. He illustrated his point by using the example of a section of main that changes the number and makeup of customers over a period of several years, but the amount of gas delivered remains the same. The weighting of that main in the cost of service study would change under a customer allocation, but it would remain the same (although shifted among customer classes) if the allocation is made on the basis of annual throughput.[137]

King therefore requested MDU to conduct an alternative study that allocates half the mains cost according to the classes' two-day peak throughput and half on the basis of annual throughput. This study was attached to King's testimony.[138]

On rebuttal, Aberle objected to King's revisions, arguing that main additions are not made only on the edges of the system to provide new service to developments, but are also required to enhance system integrity and maintain pressure throughout the system as customer additions are made. She objected that heating content has no impact on the cost of the mains system. She also objected to the use of a peak-day

[136] Id., page 39.
[137] Id. page 39.
[138] Id., CWK-7.

allocator that assigns costs to the interruptible class and a throughput allocator that assigns costs to the transmission customers. She argued that both of these allocations violate practices previously approved by the Commission.[139] She submitted yet a third cost of service study, one which allocates mains based 50 percent on throughput at the distribution level and 50 percent on peak day use by firm customers.[140]

The results of the three cost of service studies are as follows:

	Statement M	King CWK-7	Aberle TAA-4
Residential	3.083%	7.731%	6.367%
Firm General	3.998%	2.161%	1.106%
Air Force	50.281%	3.502%	69.369%
Small Interruptible Sales	83.992%	38.040%	40.905%
Small Interruptible Transport	169.437%	48.490%	57.738%
Large Interruptible	78.644%	-0.673%	27.320%
Total North Dakota	6.439%	6.442%	6.442%

As among these three studies, the least credible is the Statement M study. Aberle is no doubt correct that the existing mains system must be expanded from time to time to accommodate new customers. She did not mention that this expansion may also be due to increased demand from existing customers. It is not the number of customers that drives these enhancements, but their peak demands on the system. This effect is reflected in the peak two-day allocator used in all three studies. The basic layout of the existing mains system is there to deliver gas to customers. Admittedly, neither the amount of gas delivered nor the number of customers determines the size, hence the cost, of this basic layout of mains. In the absence of a cost-causing element, the next best alternative allocator is one that which reflects the value of the service provided. The value of gas service is best measured by the total amount of gas delivered through the distribution system.

As between CWK-7 and TAA-4, it must be acknowledged that Aberle's allocators are more appropriate. Accordingly, Staff recommends that TAA-4 be adopted as the basis for cost allocation among customer classes. The principal effect is that the Air Force and the Large Interruptible classes are shown to have much higher rates of

[139] Exhibit 26, pages 3, 4.
[140] Id., TAA-4.

return than the two principal classes, residential and firm general. In all three studies, the small interruptible customers generate a much higher than average rate of return.

B. RATE DESIGN

In its initial application, MDU made a number of rate design proposals, as follows:[141]

- Increase residential and firm general service rates by 4.6 percent, reduce the small interruptible class rates by 4.1 percent, and leave the Air Force and large interruptible rates unchanged;
- Separate the commodity rate into a Distribution Delivery Charge and a Cost of Gas charge, eliminating the Purchased Gas Cost Adjustment;
- Eliminate the declining block rate form from the commodity charges and substitute a flat per-dekatherm ("dk") rate;
- Change the customer, or "Basic Service Charge" from a monthly to a daily charge;
- Increase the Basic Service Charges by very large percentages, for example, the residential charge increases from $6.50 to $11.70, the small firm service charge from $8.50 to $24.00 and the large firm service charge from $17.00 to $51.00.
- Eliminate the residential seasonal rate;
- Increase the penalty for failure of interruptible customers to interrupt from $10 to $50 per dk;
- Increase the return check fee to $20;
- Increase the reconnection fees for seasonal customers to match the avoided Basic Service Charges;
- Increase the reconnection charge for disconnected customers for nonpayment to $30;
- Modify the Firm Gas Extension Policy Rate 120 and 124 to reflect MDU ownership of all prospective service lines.

King recommended that the Commission accept a number of these proposals regardless of whether MDU's overall revenue is increased, decreased, or remains unchanged. These consensus proposals are as follows:[142]

- The commodity rate should be separated into two clearly distinct rates, the Distribution Delivery Charge and the Cost of Gas Rate.

[141] Exhibit 9.
[142] Exhibit 15, page 43.

- The declining block rates should be eliminated, and the revenue collected through the higher initial block rates should be reallocated to the Basic Service Charge.
- The residential seasonal rates should be eliminated, since there are no customers on these rates.
- Penalties for failure to interrupt should be increased, since MDU apparently believes that the current penalties are not sufficient to ensure that interruptible customers respond to their calls for interruption or curtailment.
- The reconnection charges for seasonal customers should be adjusted to match the higher Basic Service Charges resulting from the elimination of declining commodity blocks.
- MDU's proposed modifications to the line extension policy should be adopted.

King supported MDU's proposal to eliminate declining block commodity rates on the grounds that this rate structure implicitly encourages customers to use more gas, and it thereby discourages conservation. To the extent that it collects fixed customer costs in the commodity rate, it misstates the cause of the costs. Declining block rates also allow customers who use minor amounts of gas for non-heating purposes to escape the cost of providing the basic elements of service to them.[143]

Using MDU's billing unit counts for the year 2001, King calculated the revenue-neutral increase in monthly customer charges that would result if the present declining block rate structure were eliminated from each rate schedule, as follows:[144]

	Present	Proposed
Small Residential	$6.50	$8.43
Large Residential	$13.00	$15.31
Small Firm Service	$8.50	$14.34
Large Firm Service	$17.00	$45.16

King also recommended that the Commission consider MDU's proposal to convert the customer charges from monthly to daily charges. While this proposal simplifies the calculation of the charge when customers are taking gas for only part of a month, it may not be well received by the average customer as a way of charging for

[143] Id., page 44.
[144] Id., CWK-8.

service. At the hearing, Commissioner Wefald expressed some concern in this regard.[145]

King recommended that the Commission not accept MDU's proposal to increase the reconnection charge for discontinued service to $30. While MDU claimed that this is a cost-based rate, King suggested that there is a legitimate public policy reason for not increasing this rate. The customers to whom this charge applies are almost certainly the lowest income customers. Otherwise, they would not have been disconnected. Since they have to pay their arrearages anyway, they are likely to be suffering some difficulty getting reconnected. To impose on them yet more cost, such as an increase in the reconnection fee, might prevent some of these customers from obtaining vital utility service.[146] MDU did not respond to King's recommendation.

King also took issue with MDU's proposed distribution of any rate increase among customer classes. MDU proposed that residential and firm general service customers receive a rate increase of 4.6 percent, that the Air Force and large interruptible customers receive no increase, and that the small interruptible class receive a reduction of 4.1 percent.[147] King pointed out that the Commission's past practice has been to recognize differences in class rates of return by approving lower rate increases to classes with the highest rates of return. It has not approved rate reductions to some classes when most customers are suffering rate increases.[148] All classes, regardless of their rates of return, should receive some rate increase if overall revenues are increased and a rate reduction if overall revenues are reduced.

King had similar misgivings about MDU's proposal to increase customer charges dramatically, even for the classes for which it was proposing rate reductions or no rate increases. MDU witness, Russell Feingold, argued that shifting revenue recovery from the commodity to the customer component allows MDU to recover much more of its fixed costs on a non-weather sensitive basis. He asserted that this shift also protects customers from the volatility in their gas bills caused by variations in weather.[149]

[149] Exhibit 8.

While King understood MDU's rationale, he was concerned with the issue of rate continuity. The sort of changes proposed by MDU will result in dramatically different bills for different types of customers. Very low-use customers might find the increases in their average monthly bills extortionate. Customers accustomed to low gas bills in the summer, that possibly offset high electric bills, could be surprised by the sudden jump in their gas invoices.[150]

King was concerned that customers may also resent high monthly customer charges. When most of the cost of gas is based on the level of gas consumption, customers can avoid high gas bills by conserving gas. But no amount of conservation permits a customer to avoid a monthly customer charge. As long as this charge is not a major portion of the bill, it is likely to be acceptable to most customers. But if it looms as a major element in the cost of gas, customers will come to regard it as a tax from which there is no escape. King suggested that this will not enhance MDU's reputation as a public utility concerned with its customers' good will.[151]

For these reasons, Staff questions the advisability of dramatic increases in the customer charges. If MDU seeks to increase the customer component of its rate schedules, it should do so over a series of rate cases, not as a drastic stoke in a single rate case. In the meantime, customer charges should not be increased by more than twice the overall increase. This ceiling on customer charge increases would be in addition to the increases in customer charges that result from the flattening of the declining block rates. If rates are reduced, the reductions should be flowed entirely into the commodity component of each rate schedule. Customer charges should not be increased when rates are reduced, except to eliminate the declining block feature of the rate schedules.

C. DISTRIBUTION DELIVERY STABILIZATION MECHANISM

If the Commission disapproves of MDU's dramatic increases in customer charges, MDU proposes that, as an alternative, the Commission adopt a Distribution Delivery Stabilization Mechanism ("DDSM"). As described by Feingold, the DDSM

[150] Exhibit 15, page 48.
[151] Id.

would modify the effects of weather variations by adjusting bills for the difference between the actual heating degree days and heating degree days under normal weather. Following a cold winter, the excess in each class's revenue from the greater number of heating degree days would be divided by the projected annual sales volumes in that class and credited to all customers over the following year on a per-dk basis. The revenue shortfall from a warmer than normal winter would similarly be collected through a surcharge to all customers during the subsequent year.[152]

The status of this proposal is unclear. Staff has gone part of the way toward MDU's objective of increasing customer charges. Staff has recommended that the commodity rates be flattened, and the revenue previously collected in the high initial blocks be recovered through increased customer charges. Staff has also recommended that any overall revenue increase be tilted toward the increased customer charges, and any overall rate decrease be flowed through entirely to the commodity charges. At the hearing, Aberle, MDU's rate design witness, could not say whether these concessions to MDU's target of increasing customer charges relative to commodity charges were sufficient to persuade MDU to withdraw the DDSM proposal.[153]

The proposal should be disregarded in any case. As King testified, the value of a weather normalization adjustment should be to ameliorate the volatility in customer bills caused by variations in weather, and particularly the effect of unusually cold winters. In such winters, ratepayers typically experience a "double whammy." First, they consume more gas than usual, which increases their bills even if the price of gas remains the same. Then, because cold winters are usually a widespread phenomenon, the demand for gas is higher across the continent, which means that the price of gas is higher. The result is a further inflation in their bills. Just this sort of inflation occurred across the country during the winter of 2000-2001.[154]

King suggested that MDU's proposal could result in a "triple whammy." If North Dakota experiences an unusually warm winter, and it is followed by an unusually cold winter, ratepayers during the cold winter, already hard-hit, would find themselves

[152] Exhibit 8, page 12-20
[153] Tr. Oct 8., page 498.
[154] Exhibit 15, page 50.

paying a surcharge to make up for the shortfall in revenue collections in the previous year. The effect of MDU's program could be to increase, not decrease the volatility in customers' bills from year to year.[155]

The objection to MDU's proposal is its delayed effect. For a weather normalization adjustment to be beneficial to ratepayers and not just the utility, it must affect their bills when the unusual weather is occurring, not after it has occurred. For this reason, Staff opposes the program offered by MDU.

V. CONCLUSION

Staff requests that the Commission adopt the recommendations presented by Staff witnesses in this case. We believe the adjustments recommended are fair and reasonable to both MDU and its ratepayers.

Dated this 15th day of November, 2002.

STATE OF NORTH DAKOTA

PUBLIC SERVICE COMMISSION

RECEIVED
NOV 15 2002
ND PUBLIC SERVICE COMMISSION
EXECUTIVE SECRETARY

Montana-Dakota Utilities Co.
Natural Gas Rate Increase
Application

Case No. PU-399-02-183

STAFF PROPOSED FINDINGS OF FACT, CONCLUSIONS OF LAW AND ORDER

November 15, 2002

Appearances

Commissioners: Susan E. Wefald, Leo M. Reinbold, Anthony T. Clark.

William W. Binek, Chief Counsel, Public Service Commission, State Capitol, 600 East Boulevard, Bismarck, ND 58505, appearing for the Public Service Commission advocacy staff.

William P. Pearce, Attorney at Law, 314 E. Thayer Ave., PO Box 400, Bismarck, ND 58502-0400, appearing for Montana-Dakota Utilities Co.

Douglas W. Schulz, Senior Attorney, MDU Resources Group, Inc., PO Box 5650, Bismarck, ND 58506-5650, appearing for Montana-Dakota Utilities Co.

Allen C. Hoberg, Director, Office of Administrative Hearings, 1707 North 9th Street - Lower Level, Bismarck, ND 58501-1882, presiding Administrative Law Judge.

Preliminary Statement

On April 12, 2002, the North Dakota Public Service Commission received an application from Montana-Dakota Utilities Co., a Division of MDU Resources Group, Inc., (MDU) to increase its natural gas rates in North Dakota by $2,844,132 annually. MDU's application is based on a calendar 2003 projected test year.

In its application and supporting testimony and exhibits, MDU requests an increase in its rates for gas distribution service of $2,844,132, or approximately 4.1 percent based on a forecast 2003 test year. The primary reasons for MDU's application are increased operation and maintenance costs, depreciation, and taxes other than income, and a higher required rate of return. MDU's requested return on rate base is 11.044 percent, inclusive of a return of 13.25 percent on the 51.687 percent of total capital that MDU asserted to be represented by common equity.

89 PU-399-02-183 Pages: 35

Staff Proposed Findings of Fact,
Conclusions of Law and Order
by Public Service Commission

11/15/2002 CC: Comm Legal Illona, Pat, Jerry Mike

Staff proposes that MDU's test year 2003 rates be decreased by $1,402,000. This reduction is based on a rate of return on rate base of 7.980 percent, inclusive of a 10.5 percent return on 44.55 percent equity proportion of total capital and a much lower cost of debt.

MDU also requested a significant restructuring of its rates, including a separation of gas distribution from gas supply charges, elimination of declining block commodity charges and dramatic increases in customer charges. Additionally, MDU has proposed that all increases be flowed into the firm residential and commercial rate schedules, that no change in rate levels be applied to the Air Force and large interruptible schedules, and that the small interruptible class should receive a rate reduction.

On April 24, 2002, the Commission suspended MDU's rates filed with its Natural Gas Rate Increase Application. On June 5, 2002, the Commission issued its Notice of Hearing Notice of Public Input Sessions, and Notice of Intervention Deadline. Public input sessions were held via video teleconference on July 15, 2002, in Bismarck, Dickinson, Williston, Minot, Devils Lake, and Jamestown. The technical hearing was held in the Commission Hearing Room at the State Capitol in Bismarck, North Dakota on October 7-8, 2002.

The Notice of Hearing specified the issues to be considered at the technical hearing, which are:

1. What is the value of MDU's property, used and useful, for the service and convenience of the public in North Dakota?

2. What is MDU's rate of return on its property, used and useful, for the service and convenience of the public in North Dakota?

3. What is a just and reasonable rate of return on MDU's property, used and useful, for the service and convenience of the public in North Dakota?

4. What rates and charges are necessary to provide a just and reasonable rate of return on MDU's property, used and useful, for the service and convenience of the public in North Dakota?

5. Are MDU's proposed rate schedules designed in such a manner that they result in a basis of charge to its customers that is just and reasonable without discrimination?

6. Other relevant information or proposals concerning the proceeding.

The Notice of Hearing provided that any person wishing to intervene as a party in the proceeding must file a petition for intervention by September 9, 2002. No one petitioned to intervene as a party in the proceeding.

The Commission, having reviewed the evidence in the record makes the following:

Findings of Fact

1. MDU is an investor owned utility company operating as a division of MDU Resources Group, Inc. providing natural gas distribution service in North Dakota.

2. The parties do not dispute the:

- 2003 test year for rate determination.
- Jurisdictional cost of service study.
- 2003 test year for rate base (except accumulated reserve for depreciation)
- Cost of preferred equity.
- Test year revenues.

3. The parties dispute the following issues:

- Cost of capital
- Depreciation
- Bonuses and labor expenses
- Supplemental Income Security Plan
- Rate case expense
- General inflation adjustment for expenses
- Other unadjusted operation and maintenance expenses
- Allocation of cost to customer classes
- Rate design
- Distribution Delivery Stabilization Mechanism

Test Year Rate Base

4. MDU and Staff are in agreement on the amount of rate base for the 2003 test year with the exception of accumulated reserve for depreciation. The staff adjustment for this issue is affected by a staff adjustment to depreciation expense of $2,172,000. This adjustment to depreciation expense increases rate base by $1,086 for the 2003 test year.

5. The Commission finds the following 2003 test year rate base:

Average Rate Base	**(Thousands)**	**(Thousands)**
Description	2003 Company Test Year	Staff Adjustments
Plant in Service	$72,793	
Accum. Res. for Depreciation	$49,356	$1,086
Avg. Net Plant in Service	$23,437	
Constr. Work in Progress	$0	
Materials & Supplies	$439	
Fuel Stocks	$22	
Prepayments	$84	
Other	$44	
Accum. Def. Income Taxes	($3,842)	
Accum. Invest. Tax Credits	($231)	
Customer Advances	($272)	
Average Rate Base	$19,681	$20,767

Cost of Capital

6. MDU proposes a post-tax rate of return of 11.044 percent, which includes a 13.25 percent return on the 51.687 percent of its capital represented by common equity. Staff has recommended a return of 7.98 percent, including a 10.5 percent return on 44.55 percent of MDU's capital that it finds to be represented by common equity. Using MDU's 39.61 percent federal and state income tax rate, the pre-tax rates of return can be calculated as follows:

MDU:

	Cost	**Proportion**	**Post-Tax**	**Tax**	**Pre-tax**
Long-term Debt	9.180%	43.039%	3.951%		3.951%
Preferred Stock	4.662%	5.274%	0.334%	0.090%	0.244%
Common Equity	13.250%	51.687%	9.562%	2.713%	6.849%
Total		100.000%	13.847%		11.044%

Staff:

	Cost	Proportion	Post-Tax	Tax	Pre-tax
Long-term Debt	6.167%	47.92%	2.96%		2.96%
Short-term Debt	4.542%	2.78%	0.13%		0.13%
Preferred Stock	4.630%	4.75%	0.31%	.09%	0.22%
Common Equity	10.50%	44.55%	6.53%	1.85%	4.68%
Total		100.00%	9.93%		7.98%

7. The difference between the two pre-tax rates of return is 3.917 percent. When applied to MDU's projected test year rate base of $19,681,000, this difference amounts to $771,000. When applied to the Staff's recommended rate base of $20,768,000, the difference comes to $813,000.

8. As demonstrated in the foregoing tables, the Staff differs from MDU with respect to all of the components that make up the rate of return: the capital structure, the cost of debt, and the cost of equity.

Capital Structure

9. Capital structure refers to the makeup of MDU's capital, that is, the mix of debt, preferred stock and equity. Two factors account for the disagreement between Staff and MDU. The first is Staff's inclusion of short-term debt, and the second is Staff's use of year-end 2001 capital structure instead of MDU's projection of its capital structure into 2003.

10. In its initial filing, MDU excluded all short-term debt from its proposed capital structure. Staff's rate of return witness, Charles W. King, testified that the makeup of the capital structure used to develop a rate of return should reflect the nature of the rate base to which that return is applied. If the rate base consists solely of capital investments in plant and equipment financed by long-term debt, preferred stock and equity, then it might be appropriate to exclude short-term debt. But MDU's rate base also includes materials and supplies inventories, fuel stocks, and prepayments, which are short term commitments that will be financed in part with short-term debt. For this reason, he included short-term debt in the capital structure.

11. On rebuttal, MDU witness Craig Keller argued that the items to which King referred, materials and supplies, prepayments and fuel stocks remain relatively constant, not changing materially from one month to another. While classified as short-term assets, they support long-lived assets such as plant, property, equipment and related items. They are therefore financed by long-term debt, according to Keller.

12. At the hearing, King responded to Keller by producing Exhibit 13, which shows the month-to-month amounts of each of the major elements of working capital during the 13 months from December 2000 through December 2001. That exhibit

demonstrates that net working capital varied from negative $53,000 in January to positive $306,000 in July. King concluded that these widely varying amounts would not have been financed with long-term debt.

13. The second difference between the Staff's and MDU's capital structure relates to the use of historical vs. forecast data. King drew the amounts of debt, preferred stock and common equity from Company supplied data for calendar year 2001. He calculated average long-term debt from Exhibit 2, Statement A, page 2; short-term debt from a response to a data request (Exhibit 15, CWK-1); and preferred stock and common equity from Exhibit 2, Statements A and F, page 1.

14. MDU's capital structure was presented on Statement F, page 3 as its projected 2003 capital mix. King objected to this use of a projection on the grounds that it is effectively a creation of MDU that has no basis in any verifiable financial statements.

15. On rebuttal, MDU witness Keller argued that NDCC § 49-05-04.1 permits MDU to use a forecast test year and that Staff witness, Michael J. Majoros, had accepted the 2003 test year as the basis for revenue requirements. Keller argued that failure to use a forecast capital structure would result in a "mismatch" with the rest of the revenue requirement calculation. Keller argued that MDU possesses a financial forecasting system that uses known debt scheduling and projects equity by forecasting earnings and deducting dividends.

16. In his oral direct testimony, King pointed out that MDU had used an historical capital structure in its recent electric case. He argued that the purpose of the future test year is to capture exogenous changes that can be objectively determined, such as inflation or the expansion of the system. By contrast, the capital structure is a creation of MDU's management. There is no way of verifying that it will change in the manner MDU predicts. For this reason, most commissions use recent historical capital structures. Otherwise, MDU has the opportunity to game the regulatory system by projecting a more expensive capital structure, one with greater equity than now exists. A comparison of MDU's 2001 capital structure with its forecast 2003 capital structure reveals that this is exactly what MDU has done in this case. For this reason, an historical capital structure should be used in this case.

Cost of Debt

17. MDU's claimed cost of debt in 2001 is 9.302 percent, and its projected 2003 debt cost is 9.180 percent. These values are calculated on Exhibit 2, Statement F-1, pages 1 and 3. Those pages show only two debt issues, First Mortgage Bonds and Pollution Control Bonds, totaling $133.5 million in 2001 and $132.6 million in 2003.

18. Statement A, pages 11 and 12 of that same exhibit reveals that there is substantially more to MDU's debt than these two issues. As of December 31, 2001, there were $405.2 million in senior notes, $219.7 million in commercial paper, a

revolving line of credit of $25 million, and term credit agreements of $11.8 million. Using the cost values shown on those pages, King calculated that the blended cost of MDU's debt is 6.167 percent, more than 300 basis points lower than MDU proposes.

19. The difference between Staff and MDU revolves around what "the Company" actually is. According to MDU witness Keller, only the First Mortgage and Pollution Control bonds relate to MDU Utilities. All of the other debt pertains to Centennial Holdings, which holds title to the non-regulated operations of the parent Company, MDU Resources Group, Inc. The two sets of debt are not fungible. MDU has no access to Centennial's debt and vice versa.

20. On cross-examination, however, Keller made it quite clear that there is no such entity as the Montana-Dakota Utilities Company. The only legal entity is the parent Company, MDU Resources Group, and only that company can issue debt. Neither the utility operation nor Centennial has any debt in its own right.

21. At the hearing, Keller testified that MDU had attempted to build a "firewall" between the debt of MDU Utilities and that of Centennial. The purpose, he argued, was to protect the utility operations from the effect of default on Centennial's debt. He stated that if Centennial or one of its subsidiaries should go bankrupt, then the bankruptcy judge would not be able to "collapse the corporation" and gain access to the utility's assets. Keller stated that is the reason MDU does not commingle the funds raised for the utility with those raised for Centennial.

22. These are laudable objectives, but it is not clear how far they go. On cross-examination, Keller conceded that if the bankruptcy of either MDU's regulated or its unregulated operations caused the parent to declare bankruptcy, then the bankruptcy court would look at all of MDU's assets to satisfy creditors' claims, including those of the regulated utility.

23. King suggested that there might be another, less altruistic reason for attempting to isolate Centennial's debt from that of the utility operations. It is to ensure that ratepayers pay the very high costs of the First Mortgage bonds and receive no benefit from the Company's other, lower-cost financing resources. While the Company may have written its low-cost financing instruments to direct funds to Centennial and its subsidiaries, that was an artifice to "game" the regulatory system into ascribing only the highest cost debt to regulated service ratepayers. The Company could have used the Centennial funds anywhere had it written the debt instruments differently.

24. In the end, all of MDU Resources' debt is secured by all of MDU Resources' assets. This means that in the end, all of its debt is fungible. For this reason, the Commission finds it appropriate to use the blended cost of all of MDU Resources' debt as the cost of debt for MDU's utility operations.

Cost of Equity

25. MDU's rate-of-return witness, Dr. J. Stephen Gaske, has recommended a return to equity of 13.25 percent. This return was developed using three variants of the Discounted Cash Flow ("DCF") approach, plus a series of "benchmark analyses."

26. For his DCF results, Gaske drew a distinction between "Investor Requirements" and "Cost of Capital" based on his belief that stock flotation costs, equivalent to 4.75 percent of the return, must be included in the latter. Because MDU's parent company, MDU Resources Group, Inc., is heavily engaged in non-regulated activities Gaske used a "proxy group" of six companies based on Moody's utility series. His DCF results for these companies were as follows:

	Investor Requirements	**Cost of Capital**
Second-stage Retention Growth	11.94%	12.51%
Basic DCF	12.61%	13.21%
Primary DCF	12.63%	13.22%

27. Gaske's benchmark analyses consisted of four risk premium comparisons using historical differences in earned returns to equity from large and, alternatively, small companies relative to current yields on U.S. Treasury bonds and corporate bonds. He also identified the recent returns on per-share book value of S&P 500 corporations and Value Line's list of industrial companies. All of his benchmark indicators were higher than any of his DCF returns.

28. Gaske's final selection of 13.25 percent was based on his belief that the risk of MDU's gas distribution business is slightly higher than that of his proxy group of gas distribution companies. He based this belief principally on the smaller size of MDU relative to the proxy companies.

29. King recommended a very different return to equity: 10.5 percent. King followed most of the same procedures as Gaske using the DCF analyses as the principal analytical tool. Like Gaske, King used a comparison group of gas distribution companies. Also like Gaske, King used a forecast of next year's dividends for the dividend yield portion of the DCF formula. King also used both analysts' forecasts and the concept of earnings retention to calculate the growth component of that formula -- as did Gaske. Finally, both King and Gaske adjusted their final recommendations based on their assessments of the risk of MDU's gas distribution activities relative to that of the comparison companies.

30. The explanation for the dramatic 275 basis point (2.75%) difference between the recommendations of the two witnesses lies in the details of the application of the DCF formula. As used by both witnesses, the DCF formula is the sum of next year's dividend yield on MDU's stock and the expected future growth rate in its dividends and earnings.

31. The differences between the Gaske and King applications of the DCF formula relate to the following elements:

1. Inclusion of flotation costs;
2. Selection of comparison companies;
3. Forecast of next year's dividends;
4. Timing of analysts' forecasts;
5. Computation of earnings retention growth;
6. Presentation of the DCF results; and
7. Adjustment of comparison companies results to reflect MDU's risk.

Flotation Costs

32. Gaske drew a distinction between "investor requirement" and "cost of capital," with the difference being cost of issuing new shares in public stock offerings. Gaske quantified this cost as 4.75 percent, based on a representative sample of flotation costs incurred with 34 new common stock issues by natural gas transmission and distribution companies between 1992 and 2001.

33. King agreed with Gaske that flotation costs should be recovered, but he questioned the propriety of applying a ratio for these costs to the entire amount of common equity. Flotation costs are incurred only when a company issues new stock, and then only when there is a public stock offering. Existing stock incurs no flotation cost, and even new stock incurs no such costs if it is distributed as an employee or shareholder benefit either through options or as bonuses.

34. King noted that the effect of Gaske's flotation cost adjustment is to increase his equity return by 60 basis points, or .60 percentage points. When multiplied by the $1.125 million book equity value of the MDU Resources, Inc., this allowance amounts to $6.75 million annually, which is substantially more than the $5.4 million in flotation costs that the Company has incurred over the past five years.

35. King suggested that if a flotation cost adder is to be used, it should be equal to a reasonable estimate of the annual flotation cost incurrence divided by the entire amount of the Company's equity. In MDU's case, annual flotation costs during the past five years have been about $1.1 million. The Company's total book equity value is $1,125 million, for a flotation cost allowance of 0.1 percent. This amount is so small as to be lost in the rounding. For this reason, he recommended no explicit flotation cost adder.

36. In rebuttal, Gaske distributed an exhibit that purported to demonstrate that failure to include flotation costs in the return of a company's stock trading at book value would result in the dilution of the book value of that company's shares. On cross-examination, however, Gaske admitted that all of King's comparison companies had per-share market values higher than book value, and that when such companies sell new stock,

the effect is to increase book value, not dilute it. On cross-examination, Gaske admitted that his approach to the issue of flotation cost in this proceeding was the same as his approach in Commission Case No. PU-399-01-186[1] involving MDU's electric rates. Gaske also agreed that most regulatory commissions do not allow a flotation cost adder.

37. The Commission rejects Gaske's flotation cost adder.

Selection of Comparison Companies

38. Both King and Gaske acknowledged that the heavy involvement of MDU's parent company, MDU Resources Group, Inc., in non-regulated activities effectively precluded using that company as the basis for finding the return to equity of its gas distribution business in North Dakota. Necessarily, this required the selection of companies whose primary business is gas distribution. Gaske picked six companies from Moody's list of natural gas distribution companies. King chose 11 companies from Value Line's Investment Survey based on the criteria that they must have investment grade bond ratings, total operating revenues over $100 million , and derive more than 75 percent of their revenue from gas distribution services. The two lists are as follows:

King Comparison Companies	**Gaske Proxy Group**
Atmos Energy Corp.	AGL Resources
AGL Resources	Keyspan Corporation
Cascade Natural Gas Corp.	LaClede Group
LaClede Group, Inc.	Northwest Natural Gas
NICOR, Inc.	People's Energy Corp.
Northwest Natural Gas Co.	WGL Holdings, Inc.
People's Energy Corp.	
Piedmont Natural Gas Co.	
South Jersey Industries, Inc.	
Southwest Gas	
WGL Holdings, Inc.	

39. Five of Gaske's six companies are also represented on King's list. The exception is Keyspan Corporation, which King excluded because that company's gas distribution operations accounted for only about half its revenue. We find that King's choice of companies provides a broader and therefore more representative group of companies from which to draw indications as to the cost of equity for gas distribution operations.

[1] Order dated April 24, 2002, ¶ 15

Forecast of Next Year's Dividends

40. Both King and Gaske used a forecast of next year's dividends to identify the dividend yield portion of the DCF formula, and both witnesses based this forecast on a percentage of the 5-year annual earnings growth rate predicted by Zacks Investment Research, Inc. Only the percentage differed. King used a factor 1.5 on the assumption that the next dividend increase would be randomly distributed over the coming year. Gaske used a 1.625 inflator of the growth rate and argued that King's factor does not reflect the present value of next year's dividends and dividend increases. King responded that if he were to reflect the time value of next year's dividend, rather than simply its numerical value, he would reduce the inflator, not increase it as Gaske has done. The effect on the final DCF results of this .125 difference in the inflator for the next year's dividend is negligible. The Commission finds that, since the .125 difference in the inflator for the next year's dividend is negligible, no adjustment will be made for this issue.

Timing of Analysts' Forecasts

41. Gaske's testimony was filed on April 12, 2002, concurrently with MDU's initial application for an increase in its gas rates. The record does not disclose when Gaske prepared his testimony, but presumably it was in the months immediately preceding the application, which would be February and March of 2002. This would be consistent with the fact that the latest month shown on Gaske's presentation of bond yields is January 2002.

42. King filed his testimony on August 30, 2002, so his information on such factors as share prices and investor expectations was gathered approximately six months after Gaske's.

43. It is not clear how these differences in timing affect the results of the respective analyses. For example, Gaske reported Zacks' consensus 5-year earning growth forecast for the LaClede Group as 12.0 percent. By the time King prepared his testimony, that forecast had dropped to 4.25 percent. On the other hand, Gaske's forecast growth rate for AGL Resources was 7.03 percent, while that reported by King was 11.42 percent. We find it is appropriate in this proceeding to use King's analysis that reflects more recent data than Gaske's analysis.

Procedure for Computing Retention Growth

44. Both King and Gaske used the same two methods for forecasting the growth component of the DCF formula. One was Zacks Investment Research's consensus forecasts of 5-years' earnings growth, and the other was the rate at which the retention of earnings would permit the book value of each share to increase over the coming five years. Both witnesses used Value Line's company reports for this procedure, although

again, King had access to later reports than did Gaske. The only methodological difference between the two analyses was King's inclusion of a factor to account for the sale of new stock at market values higher than book value. This inclusion added 100 basis points to the earnings retention growth model developed by King. Although Gaske did not include this factor in his retention growth model, he did not object to King's use of it.

Presentation of the DCF Results

45. Gaske purported to perform three different DCF analyses of his proxy group of companies. One of these analyses, the "basic DCF," was identical to King's "classic DCF" analysis. Both involved combining the forecast dividend yields with Zacks' 5-year consensus forecasts of earning growth.

46. While the methods were the same, the results were quite different. Gaske's six-company proxy group yielded a median basic DCF return, prior to flotation costs, of 12.61 percent and a mean return of 12.95 percent. King, applying exactly the same procedure to his comparison group of 11 companies, found the average (mean) to be 11.29 percent.

47. For his other application of the DCF approach, King added the dividend yield to the growth rate indicated by the earnings retention growth model for each of his 11 comparison companies and found the average to be 12.18 percent. Had Gaske done the same thing, he would have added his average dividend yield of 5.14 percent to his retention growth estimate of 5.5 percent for a DCF return indication of 10.64 percent.

48. Gaske diluted his retention growth rate by mixing it one third, with two-thirds represented by the Zacks' 5-year earnings forecasts. The result was quite close to the "basic" DCF indications. The median of his "Second-Stage Retention Growth DCF Calculation" was 11.94 percent, the mean 12.25 percent.

49. Gaske presented a third version of the DCF analysis. Gaske put forth what he called his "primary" DCF calculation. This was no calculation at all, but merely the adoption of a range of growth estimates pulled from thin air with no support in the data Gaske presents. The range was 6.75 percent to 7.75 percent, asserted by Gaske to have been based on such factors as the 5.5 percent growth in nominal Gross Domestic Product during the past decade, the expected demand growth for natural gas, and investor expectations. None of these considerations support a growth forecast in the range of 6.75 percent to 7.75 percent. The bottom of this range is well above the 5.5 percent GDP growth cited by Gaske, as well as the 5.5 percent growth indicated by his own earnings retention calculation. The top of the range is above the 7.56 percent growth rate predicted by Zacks for the six proxy group companies used by Gaske. This "primary" DCF analysis is biased upward.

50. King also presented a third DCF calculation, but he subsequently discarded it. King calculated a growth factor for each of his 11 comparison companies based on the each company's historical earnings growth between 1997 and 2001. While the average DCF indication of 11.72 percent might appear reasonable, the variation among the individual company observations was so great as to provide little or no probative value -- as King conceded in his testimony.

51. The Commission finds that neither of these third DCF calculations should be given any weight.

52. In presenting his DCF returns, King went one step further than Gaske, and provided his estimate of the DCF return requirements of each of his comparison companies. He did not use a mechanical formula because, as he conceded in his testimony, precision is impossible. He described his procedure orally at the hearing as follows:

> ...what I have done in each case is taken the classic DCF return, which is probably the best estimator, and then turned and looked at the retention growth method. If the retention growth looks like it's totally out of whack with the forecast, and in some cases they are – simply no way that the company could be growing as fast or as slowly as the investor survey shows – I modified that classic DCF in the direction of the retention growth.

53. The results of King's procedure were as follows:

	Classic	Book Value Growth	King DCF Return
Atmos Energy Corp.	12.06%	14.42%	12.5%
AGL Resources	16.67%	11.53%	14.0%
Cascade Natural Gas Corp.	10.25%	15.11%	11.0%
LaClede Group, Inc.	10.29%	11.23%	10.5%
NICOR, Inc.	11.51%	15.96%	12.0%
Northwest Natural Gas Co.	10.65%	10.12%	10.5%
People's Energy Corp.	13.13%	12.07%	12.5%
Piedmont Natural Gas Co.	9.42%	11.24%	10.0%
South Jersey Industries, Inc.	8.15%	12.57%	11.0%
Southwest Gas	10.52%	8.53%	10.0%
WGL Holdings, Inc.	8.99%	11.21%	9.5%
Average	**11.29%**	**12.18%**	**11.23%**

54. Gaske rebutted the fact that the average of King's selected DCF results was lower than the average of either his classic or his book value growth results. This mathematical result stems from King's shrinking of the range of observations. King reduced the effect of the "outlier" highest and lowest observations. In absolute terms, the outliers on the high side diverge more from the mean than those on the low side,

even when their percentage difference from the mean is the same. This mathematical distortion can be avoided by focusing on the median observation of each series, that is, the observation where five values are higher and five are lower. The classic DCF median return is 10.52 percent, the median of the book value growth series is 11.53 percent, and the median of King's selected DCF returns is 11.0 percent. Additionally, it should be noted that in arriving at his final DCF recommended returns, King adjusted seven of the classic returns upward and only four downward.

55. On rebuttal, Gaske submitted two mechanical recalculations of King's DCF results, one using a 33%/67% weighting of the book value growth and Zacks' forecasts, the other using a 50%/50% weighting. Both yielded average returns considerably higher than King's 11.23 percent. In performing these calculations, however, Gaske excluded WGL Holdings, ostensibly because, with 74.6 percent of its revenue from regulated gas distribution, it falls outside King's 75 percent criterion. As Gaske admitted on cross-examination, 74.6 percent rounds up to 75 percent. His exclusion biased the results upward because, at 8.99 percent, WGL Holdings' classic DCF return was the lowest in King's comparison group. Moreover, Gaske never explained why his mechanical weightings of King's DCF results were more accurate or valid than King's analysis.

Adjustment of Comparison Company Results for MDU's Risk

56. King and Gaske disagree about the final adjustment each witness made to the DCF returns for his comparison companies to reflect the specific risk of MDU's gas distribution operations.

57. Having found that the DCF cost of capital (inclusive of flotation cost) for his proxy companies was in the range of 12.51 and 13.22 percent, Gaske selected 13.25 percent as MDU's capital cost. This upward adjustment from the range of proxy group returns was based on Gaske's belief that MDU's overall risks are slightly above-average relative to the proxy group.

58. King's adjustment was in the opposite direction. Having found that the average DCF return for his comparison group is 11.23 percent, King picked 10.5 percent for MDU, which is the midpoint between the group average return and the returns for the least risky companies in the group. The basis of this adjustment was King's belief that MDU is less risky than the comparison group.

59. In his initial testimony, Gaske discussed four types of risk: business risk, regulatory risk, financial risk and market risk. He found that MDU's regulatory and market risks are not significantly different than from those of his proxy group. MDU's financial risk is slightly greater because the bonds of MDU Resources Group are rated slightly lower than the bonds of the proxy companies. The major difference in risk, according to Gaske, relates to business risk. MDU's gas distribution operations are a fraction the size of the proxy companies. Those companies are between six and 46

times the size of MDU's gas distribution operations. Based on the historical difference between the earned returns of small and large companies, Gaske believes that MDU's smaller size might require a return more than 100 basis points (1.00 percent) higher than the proxy group. In addition, MDU faces the competition of propane and heating oil for new and existing load in its service territory. Furthermore, its rate structure recovers a substantial portion of its fixed costs in the volumetric component of its rates, and MDU does not have a weather normalization adjustment mechanism. On this basis, Gaske concluded that MDU's North Dakota gas distribution operations face somewhat greater overall business risks than the typical company in his proxy group.

60. King based his conclusion that MDU's gas distribution business is less risky than his comparison group on two facts. First, unlike eight of the 11 comparison companies, MDU's gas distribution operations have no non-regulated business activities. Second, MDU's equity ratio is higher than all but three of his comparison companies, suggesting a lower level of financial risk. He argued that a good case could be made for setting MDU's rate of return at the bottom of the scale of DCF returns for the comparison companies. However, in light of the possibility that the return set in this case may be in effect for an extended period into the future, he selected the midpoint between the lowest returns in his comparison group and the average.

61. In his rebuttal testimony, Gaske argued that King had failed to demonstrate any strong correlation between equity return and the equity proportion or the percent gas distribution revenues in his comparison companies. Gaske presented two correlation studies of these variables. One showed a weak, but measurable correlation between the percent equity in capital structure and King's estimates of DCF returns. The other showed no correlation between equity return and percent gas distribution revenues.

62. King conceded that neither of the two risk factors cited in his testimony are predictors of relative risk, but both are elements of relative risk. A high equity ratio is in indicator of low financial risk, and MDU's equity ratio is about equal to the highest of the equity ratios of within his comparison group. The relationship between financial risk and capital structure, which King cites in this portion of his testimony, was also discussed in Gaske's initial testimony at some length.

63. King noted that another element of risk is the amount of non-regulated activity. Regulated activities are less risky than non-regulated activities. When regulated earnings are short, MDU can come to the Commission for an increase in rates. If the Commission grants the rate increase, there is no question whether MDU can collect the additional revenue because of its monopoly status. That is not true of non-regulated activities, which by definition do not have the security of revenue recovery that low-risk regulated activities have.

64. King cited two further reasons that MDU gas distribution operations have lower risk than many of his comparison companies. Gas companies operating in warmer climates face competition from electric heating that MDU, operating in a cold climate, does not encounter. He testified that in Washington, DC, the Washington Gas Light

Company has lost two-thirds to three-quarters of the commercial load to the electric company. For residential customers, heat pumps can combine heating with air conditioning and so compete with gas.[2] King stated that stand-alone heat pump units that do not draw heat from groundwater will not work in North Dakota's climate because they have to be supplemented with electric resistance heating when temperatures fall below about 45 degrees Fahrenheit.[3]

65. The other difference cited by King relates to the intrusion of gas suppliers into the retail gas market. Some of his comparison companies (he cited Washington Gas and Atlanta Gas Light Company) are required to deliver the gas of independent suppliers. The extreme example is Atlanta Gas Light, which no longer buys gas on behalf of its customers. Instead, merchant gas suppliers buy the gas, and Atlanta Gas Light delivers it to end users on behalf of the suppliers. He testified that Atlanta Gas went from some 600,000 customers to 11. When one of these gas suppliers went bankrupt, Atlanta Gas was "stiffed" for several million dollars.[4] In another example cited by King, Washington Gas has lost two thirds of its commercial load to competitive suppliers. The suppliers have failed to acquire the transportation capacity that Washington Gas had maintained to serve those lost customers, and there is now a risk that in a cold winter, the suppliers will not be able get the required gas to Washington.[5]

66. King observed that MDU does not the active competition from suppliers that larger companies serving larger service territories have. It therefore does not face the severe business risks associated with these suppliers.

67. King stated that Gaske conducted an apples-and-oranges comparison regarding the alleged risk of small company operations. Gaske has compared the risk properties and required returns of large companies with those of small, stand-alone companies. King says that is not the proper comparison. King states that the relevant objective in this case is to find the risk characteristics of the gas operations of a large company. Being part of a large company provides the security of greater financial strength and also diversification of financial resources. King states that MDU's North Dakota gas distribution operations are not a small, stand-alone company, as are the small companies from which Gaske derives his 100 basis point small-company risk adder. MDU's North Dakota gas distribution operations are merely one part of the overall business of MDU Resources Group. That company is well within the size range of the companies in both King's and Gaske's comparison groups.

68. King stated that while MDU's gas distribution operations are small, they have a lower financial risk than do most of King's comparison companies by reason of a high equity ratio. They have no risky, non-regulated activities, as do most of the comparison companies. While MDU faces competition from propane and oil, as do virtually all gas

[2] At the hearing, Gaske submitted Exhibit 35, which contained some Washington Gas Light Company Internet advertisements for gas heating. These advertisements confirm that Washington Gas faces stiff competition from electricity for its residential heating load.

[5] Id.

companies, it does not confront effective competition for its heating load from electricity, as do the comparison companies that operate in warmer climates. Finally, MDU does not have the intrusion of independent gas suppliers into its retail market in anything like the degree that some of the comparison companies have. For these reasons, King's conclusion that MDU has somewhat less overall risk than his comparison companies is altogether reasonable.

69. We agree with King's conclusions and find that MDU has less overall risk than his comparison companies.

Gaske's "Benchmark Analyses"

70. Gaske presented two types of "benchmark analyses." In one series, he added the historical differences between Treasury bonds and corporate bonds, on the one hand, and earnings from the common stock of small and, alternatively large companies, on the other. The other benchmark analysis was to identify the recent earned return on book value of S&P's 500 companies and on Value Line's industrial companies. The results of these benchmark analyses are as follows:

Risk Premium Return Based on:	
- U.S. Treasury Bonds	
v. Large Companies	13.3%
v. Small Companies	20.2%
- Corporate Bonds	
v. Large Companies	14.8%
v. Small Companies	22.2%
Alternative Investments	
- S&P 500	21.5%
- Value Line Industrials	29.4%
