Subject: Case No. PU-439-03-295 - Utility Valuation

Hi Gloria

Per my conversation with Illona, the $47.64 in this case will not be billed due to the number of parties involved (31).

If you have any questions, please give me a call. Thank you.

Re: Qwest Corporation
Local Competition Investigation
Case No. PU-439-03-295
OAH File No. 20030389

Dear Mr. Binek:

On November 26, 2003, you requested the designation of an administrative law judge from this office to preside as a procedural hearing officer in the matter of Qwest Corporation (PU-439-03-295) - a local competition case. A hearing was scheduled for May 10-14, 2005. However, on February 25, 2004, the Commission granted a motion to stay this proceeding. On January 11, 2006, in response to my inquiry, you informed me that an indefinite stay was still in effect. On May 22, 2006, in response to my inquiry, you informed me that the Commission closed this case on February 9, 2006. Accordingly, I am closing our file on this matter and returning that portion of the record I have in my possession to you. Enclosed are copies of documents that have been transmitted to us, as well as originals and copies of documents received while the file was in our possession, for filing with the official agency record of this matter.

Thank you for your attention to this matter.

Sincerely,

Allen C. Hoberg
Administrative Law Judge

Case No. PU-439-03-295

ORDER CLOSING INVESTIGATION

February 8, 2006

Under section 251(c)(3) of the Telecommunications Act of 1996, incumbent local exchange carriers (ILECs) have the duty to provide nondiscriminatory access to telecommunications network elements on an unbundled basis to competitive local exchange carriers. The Federal Communications Commission (FCC) is required to determine specific unbundled network elements (UNEs) that must be provided.

In December 2001, the FCC initiated a proceeding to re-examine the network element unbundling obligations of ILECs. On February 20, 2003 the FCC adopted its Triennial Review Order (*TRO*), including a new list of UNEs. For a significant group of issues, the FCC required state commissions to complete their analyses and reviews within nine months from the effective date of the *TRO*. The *TRO* was appealed to the United States Court of Appeals for the District of Columbia Circuit (Court).

On June 18, 2003 the Commission opened an investigation to address issues related to the *TRO*. On February 13, 2004 the Commission issued an Interim Stay of the procedural schedule to provide time for parties to respond concerning the implications of a stay until the Court made its decision. A March 2, 2004 Court decision on appeal vacated many of the FCC's rules and vacated the FCC's delegation of authority to state commissions. On April 14, 2004 the Commission continued indefinitely the stay in this proceeding.

On December 14, 2005 the Commission issued a notice that it intended to close this investigation and provided opportunity for comments by January 20, 2006 concerning the implications of closing the proceeding. No comments were received in opposition to closing the investigation.

The Commission finds it is appropriate to close the investigation.

Order

The Commission orders this proceeding is closed.

ORDER CLOSING INVESTIGATION

February 8, 2006

Under section 251(c)(3) of the Telecommunications Act of 1996, incumbent local exchange carriers (ILECs) have the duty to provide nondiscriminatory access to telecommunications network elements on an unbundled basis to competitive local exchange carriers. The Federal Communications Commission (FCC) is required to determine specific unbundled network elements (UNEs) that must be provided.

In December 2001, the FCC initiated a proceeding to re-examine the network element unbundling obligations of ILECs. On February 20, 2003 the FCC adopted its Triennial Review Order (*TRO*), including a new list of UNEs. For a significant group of issues, the FCC required state commissions to complete their analyses and reviews within nine months from the effective date of the *TRO*. The *TRO* was appealed to the United States Court of Appeals for the District of Columbia Circuit (Court).

On June 18, 2003 the Commission opened an investigation to address issues related to the *TRO*. On February 13, 2004 the Commission issued an Interim Stay of the procedural schedule to provide time for parties to respond concerning the implications of a stay until the Court made its decision. A March 2, 2004 Court decision on appeal vacated many of the FCC's rules and vacated the FCC's delegation of authority to state commissions. On April 14, 2004 the Commission continued indefinitely the stay in this proceeding.

On December 14, 2005 the Commission issued a notice that it intended to close this investigation and provided opportunity for comments by January 20, 2006 concerning the implications of closing the proceeding. No comments were received in opposition to closing the investigation.

The Commission finds it is appropriate to close the investigation.

Order

The Commission orders this proceeding is closed.

RE: Case No. PU-439-03-295

Dear Mr. Noack:

Enclosed is a copy of a statement approved by the Public Service Commission for expenses incurred in Case No. PU-439-03-295.

This statement was originally sent on December 1, 2004 and our records indicate that payment has not been received. N.D.C.C. § 49-21-01.7 requires that expenses for these proceedings be billed by the Public Service Commission and must be paid for by the telecommunications company involved in the proceeding.

Please send your check made payable to the Public Service Commission for the amount due as soon as possible to clear this account.

Thank you.

Sincerely,

William W. Binek
Chief Counsel

MOTION

December 14, 2005

Public Service Commission
Local Competition
Investigation

Case No. PU-439-03-295

I move the Commission issue a Notice of Intent to Close Investigation in the Public Service Commission's Local Competition Investigation, Case No. PU-439-03-295.

PJF

STATE OF NORTH DAKOTA
PUBLIC SERVICE COMMISSION

Public Service Commission
Local Competition
Investigation

Case No. PU-439-03-295

NOTICE OF INTENT TO CLOSE INVESTIGATION

December 14, 2005

Under section 251(c)(3) of the Telecommunications Act of 1996, incumbent local exchange carriers (ILECs) have the duty to provide nondiscriminatory access to telecommunications network elements on an unbundled basis to competitive local exchange carriers (CLECs). The Federal Communications Commission (FCC) is required to determine specific unbundled network elements (UNEs) that must be provided.

In December 2001, the FCC initiated a proceeding to re-examine the network element unbundling obligations of ILECs. On February 20, 2003 the FCC adopted its Triennial Review Order (*TRO*), including a new list of UNEs. For a significant group of issues, the FCC required state commissions to complete their analyses and reviews within nine months from the effective date of the *TRO*. The *TRO* was appealed to the United States Court of Appeals for the District of Columbia Circuit (Court).

On June 18, 2003 the Commission opened an investigation to address issues related to the *TRO*. On February 13, 2004 the Commission issued an Interim Stay of the procedural schedule to provide time for parties to respond concerning the implications of a stay until the Court made its decision. A March 2, 2004 Court decision on appeal vacated many of the FCC's rules and vacated the FCC's delegation of authority to state commissions. On April 14, 2004 the Commission continued indefinitely the stay in this proceeding.

The Commission is seeking comments concerning the implications of closing this proceeding. **Comments are due by January 20, 2006**.

For more information contact the Public Service Commission, State Capitol, Bismarck, North Dakota 58505, 701-328-2400; or Relay North Dakota 1-800-366-6888 TTY. If you require any auxiliary aids or services, such as readers, signers, or Braille materials please notify Illona Jeffcoat-Sacco, Executive Secretary.

RE: Public Service Commission Local Competition Investigation - PU-439-03-295
Pending motions – Renewal
OAH File No. 20030389

Dear Mr. Witt:

In light of the stay in this proceeding, I do not believe that it is necessary at this time to rule on AT&T's March 2, 2004, "Motion to Strike..." When the stay is lifted and this proceeding continues at some future date, Qwest and other parties will be given an opportunity to respond and there will be a ruling on the motion.

This posture, inaction on currently pending motions, applies to all other pending motions, too.

When the stay is lifted and this proceeding continues at some future date, any party with a motion pending before the Commission will renew, briefly, in writing, the motion, if they expect a ruling on that motion. Then, all parties wishing to respond will have ten days from the date of the written renewal of the motion to respond, before a ruling is made on the motion.

Thank you for your attention to this matter. Copies of this letter will be served on all of the parties in this matter.

Sincerely,

Allen C. Hoberg
Administrative Law Judge
Hearing Officer

March 18, 2004

Ms. Illona Jeffcoat-Sacco, Executive Secretary
N.D. Public Service Commission
600 E Boulevard Avenue
Bismarck, ND 58505-0480

Dear Ms. Jeffcoat-Sacco:

As you are aware, on March 2, 2004 the D.C. Circuit Court of Appeals issued its decision after review of the FCC's Triennial Review Order, vacating many of the FCC's rules on UNEs (unbundled network elements) provided pursuant to Section 251 of the Telecommunication Act. In light of the Court's decision, we have developed a product offering that will enable CLECs to continue to use the Qwest network to provide service to their customers.

Consistent with FCC Chairman Powell's remarks at NARUC encouraging industry cooperation, we have sent the enclosed letter to all of our existing CLEC customers that use UNE-P. We intend to work with our CLEC customers to quickly negotiate revisions to their interconnection agreements and to implement this alternative product as seamlessly and as cost effectively as possible.

If you have any questions, please contact me at 222-6813.

Sincerely,

Mel Kambeitz
Director

Announcement Date: 12-Mar-04
Effective Date: Not Applicable
Document Number: INTC.03.12.04.A.001080.Unbundling_Order
Notification Category: Interconnection Contract & Product

Target Audience: Selected CLECs
Subject: D.C. Circuit Court – Decision
Unbundling services

Please route to those in your company who have responsibility for your Interconnection Contract Agreement and Product purchases.

With the recent D.C. Circuit Court of Appeals decision we know there is much confusion in the telecommunications marketplace, particularly as it pertains to the continued availability of mass market switching. We want to assure you that we are committed to keeping you and your customers on the Qwest network. With this goal in mind, we have established a team of individuals who are prepared to discuss creative solutions to your wholesale service needs.

Under the terms of the Court's decision, many of the FCC's unbundling regulations, specifically those relating to mass market switching, will be vacated in 60 days. Qwest representatives are ready to discuss with you various options to seamlessly transition your UNE-P service to other service options, including a service that is comparable in structure and functionality to UNE-P.

Qwest would like to meet with you to assure the functionality, affordability and continuity of the wholesale services you obtain from us. We believe that these discussions can establish a mutually beneficial business relationship that will form the cornerstone of a long term partnership in the provision of local telecommunications services.

Qwest supports competition in all communications markets. Millions of customers in the Qwest region receive local telephone services from competitive providers. We owe it to these customers to proactively remove the market uncertainty for those carriers that provide local service using UNE-P. If you would like to meet with a Qwest representative to discuss these options in greater detail, please call your sales representative, «FName» «LName» on «AM_Phone».

ADMINSTAFFLOG

Announcement Date: 12-Mar-04
Effective Date: Not Applicable
Document Number: INTC.03.12.04.A.001080.Unbundling_Order
Notification Category: Interconnection Contract & Product

Target Audience: Selected CLECs
Subject: D.C. Circuit Court – Decision Unbundling services

With the recent D.C. Circuit Court of Appeals decision we know there is much confusion in the telecommunications marketplace, particularly as it pertains to the continued availability of mass market switching. We want to assure you that we are committed to keeping you and your customers on the Qwest network. With this goal in mind, we have established a team of individuals who are prepared to discuss creative solutions to your wholesale service needs.

Under the terms of the Court's decision, many of the FCC's unbundling regulations, specifically those relating to mass market switching, will be vacated in 60 days. Qwest representatives are ready to discuss with you various options to seamlessly transition your UNE-P service to other service options, including a service that is comparable in structure and functionality to UNE-P.

Qwest would like to meet with you to assure the functionality, affordability and continuity of the wholesale services you obtain from us. We believe that these discussions can establish a mutually beneficial business relationship that will form the cornerstone of a long term partnership in the provision of local telecommunications services.

Qwest supports competition in all communications markets. Millions of customers in the Qwest region receive local telephone services from competitive providers. We owe it to these customers to proactively remove the market uncertainty for those carriers that provide local service using UNE-P. If you would like to meet with a Qwest representative to discuss these options in greater detail, please call your sales representative, «FName» «LName» on «AM_Phone».
SUBJECT : Interconnection Notice: GN: DC Circuit Court Unbundling Order - Services
Notification Type :Contract,SGAT,Interconnection Contract,
States :AZ,CO,IA,ID,MN,MT,ND,NM,NE,OR,SD,UT,WA,WY
Business Types :CLEC,

RECEIVED
MAR 22 2004
ND PUBLIC SERVICE COMMISSION
EXECUTIVE SECRETARY

March 19, 2004

Ms. Illona Jeffcoat-Sacco
Executive Secretary
ND Public Service Commission
600 East Boulevard Avenue -- 12th Floor
Bismarck, ND 58505-0480

Re: Local Competition Investigation -- Case No. PU-439-03-295

Dear Ms. Jeffcoat-Sacco:

On February 25, 2004, the Commission approved a motion to stay this proceeding for a period not to exceed 60 days. Notwithstanding the stay, AT&T Communications of the Midwest, Inc. ("AT&T") filed a motion on March 2, 2004 to strike portions of the prefiled testimony and exhibits of Qwest witnesses Dennis Pappas and Lynn Notarianni. Although Qwest resists AT&T's motion, it believes a response to the motion is unnecessary and inappropriate during the pendency of the stay. If the Commission disagrees and intends to consider AT&T's motion during the stay, we request that Qwest be so advised and be given a reasonable opportunity to respond to the motion.

If the stay is lifted and this proceeding continues at some future date, Qwest requests that it be given a reasonable opportunity to respond to AT&T's motion. The lack of a response to AT&T's motion during the stay should not be construed as a concurrence by Qwest to the motion or a waiver by Qwest of its right to respond to the motion.

Sincerely,

Daniel S. Kuntz

Case No. PU-439-03-295

AT&T'S MOTION TO STRIKE PORTIONS OF TESTIMONY AND EXHIBITS OF QWEST WITNESSES DENNIS PAPPAS AND LYNN NOTARIANNI

AT&T Communications of the Midwest, Inc. ("AT&T") moves to strike portions of the testimony and exhibits of Qwest witnesses Dennis Pappas and Lynn Notarianni. Mr. Pappas and Ms. Notarianni improperly submit and rely on testimony filed with the Washington Utilities and Transportation Commission by an independent consultant, Ms. Lorraine Barrick, on behalf of Qwest. Based on Qwest's filing, it appears to AT&T that Qwest does not intend for Ms. Barrick to be a witness in this North Dakota proceeding. As such, this Public Service Commission ("Commission") should strike Ms. Barrick's Washington testimony and exhibits from this case, and strike those portions of Mr. Pappas and Ms. Notarianni's testimony that rely on Ms. Barrick's Washington testimony.[1]

In support of this Motion, AT&T states:

1. Ms. Barrick's Washington testimony appears as Exhibit DP-25 to Mr. Pappas and Ms. Notarianni's direct testimony in this case.[2] In addition to Ms. Barrick's

[1] On February 25, 2004, the Commission entered an order staying these proceedings for an indefinite period of time. AT&T files this motion to preserve its rights, but does not ask the Commission to rule on this motion immediately.

[2] Direct Testimony of Dennis Pappas and Lynn Notarianni on behalf of Qwest Corporation (January 23, 2004) ("Pappas/Notarianni North Dakota Testimony").

testimony, Exhibit DP-25 includes the "Report of Lorraine Barrick," with attachments. AT&T moves the Commission to strike Exhibit DP-25 in its entirety, as well as the following portions of Mr. Pappas and Ms. Notarianni's testimony, which rely on Ms. Barrick's Washington testimony and suggest that Ms. Barrick is testifying in this North Dakota proceeding:

a. page 17, lines 19-29;

b. page 54, lines 6-8 (starting with "Representatives from . . .");

c. page 78, lines 9-15;

d. page 79, lines 5-21;

e. page 80, lines 1-10;

f. page 136, line 13 (strike "Both Hitachi Consulting and");

g. page 143, line 15 (strike "and Ms. Lorraine Barrick")

h. page 148, lines 12-17 (starting with "Ms. Lorraine Barrick . . .")

i. page 151, lines 8-22;

j. page 152, lines 1-5; and

k. page 153, lines 7-8 (strike "as well as the review and test of the BCHP by an independent third party.").

2. Ms. Barrick is a certified public accountant and the sole proprietor of Lorraine Barrick LLC.[3] Qwest hired Ms. Barrick to review its Batch Hot Cut process. Ms. Barrick received assistance in her review from a team of consultants with Hitachi Consulting.[4]

[3] Direct Testimony of Lorraine Barrick on behalf of Qwest Corporation, Washington Utilities and Transportation Commission, Docket No. UT-033044, at p.1 (attached as Exhibit DP-25 to Pappas/Notarianni North Dakota Testimony).
[4] *Id.*

3. Ms. Barrick's testimony, report and exhibits in Washington describe her review of Qwest's proposed Batch Hot Cut process. According to Ms. Barrick, the scope of her work for Qwest included:

- Gaining an understanding of the existing hot cut process;
- Studying Qwest's hot cut performance to date;
- Reviewing the proposed [Batch Hot Cut] process, as well as public CLEC comments and concerns regarding that process;
- Comparing the current hot cut process to the proposed [Batch Hot Cut] process;
- Developing a testing plan to be used to judge the quality and efficiency of the proposed [Batch Hot Cut] process;
- Making recommendations for process improvement; and
- Observing commercial tests of the [Batch Hot Cut] process.[5]

4. Qwest identified Ms. Barrick as an outside expert witness and filed her testimony in Triennial Review proceedings in six states in the Qwest region: Washington, Oregon, Utah, Arizona, Colorado and Minnesota. However, in North Dakota, Qwest has simply attached Ms. Barrick's Washington testimony and exhibits to the testimony of Mr. Pappas and Ms. Notarianni.[6]

5. The Commission should strike Ms. Barrick's testimony from the record in this proceeding. Qwest has not designated Ms. Barrick as a witness and, as such,

---

[5] *Id.* at 2.

[6] Qwest also attached Ms. Barrick's testimony, report and exhibits to Mr. Pappas's testimony in Iowa, New Mexico and Nebraska.

AT&T and the other parties to this case will be denied an opportunity to cross-examine Ms. Barrick in this North Dakota proceeding.

6. There is no provision of North Dakota administrative law that allows one witness to submit the testimony of another witness. Instead, North Dakota law prohibits Qwest's submission of Ms. Barrick's testimony, report and exhibit as part of Mr. Pappas and Ms. Notarianni's presentation in this case. This Commission's Rules of Procedure state:

> . . . Written testimony of any witness may be received when properly supported by the oral testimony of its author on direct examination **subject to cross-examination** and motion to strike.[7]

7. This is not the case of a Qwest employee adopting the testimony of another Qwest employee. Ms. Barrick is an independent consultant. Cross-examination of Mr. Pappas and Ms. Notarianni will not be sufficient to meaningfully challenge Ms. Barrick's testimony and report. Mr. Pappas and Ms. Notarianni cannot testify to Ms. Barrick's methodology, her mental impressions and the bases of her conclusions and recommendations. In Washington, AT&T and other parties have planned extensive cross-examination of Ms. Barrick. However, in North Dakota, by submitting Ms. Barrick's testimony and report as an exhibit, Qwest has prevented all parties and the Commission from cross-examining Ms. Barrick.

[7] N.D. Admin. Code § 69-02-05-02 (emphasis added).

CONCLUSION

8. Qwest improperly submitted Ms. Barrick's Washington testimony, report and exhibits into the record of this North Dakota proceeding. Ms. Barrick is not a witness in this case and, as such, AT&T and other parties will not have an opportunity to cross-examine Ms. Barrick before this Commission. Qwest's use of Ms. Barrick's testimony is inconsistent with North Dakota law. As such, AT&T respectfully moves the Commission for an order striking Mr. Pappas and Ms. Notarianni's Exhibit DP-25 in its entirety. In addition, AT&T respectfully requests that the Commission strike the following portions of Mr. Pappas and Ms. Notarianni's testimony:

a. page 17, lines 19-29;

b. page 54, lines 6-8 (starting with "Representatives from . . .");

c. page 78, lines 9-15;

d. page 79, lines 5-21;

e. page 80, lines 1-10;

f. page 136, line 13 (strike "Both Hitachi Consulting and");

g. page 143, line 15 (strike "and Ms. Lorraine Barrick")

h. page 148, lines 12-17 (starting with "Ms. Lorraine Barrick . . .")

i. page 151, lines 8-22;

j. page 152, lines 1-5; and

k. page 153, lines 7-8 (strike "as well as the review and test of the BCHP by an independent third party.").

Respectfully submitted this 2nd day of March, 2004.

Case No. PU-439-03-295

AT&T'S RESPONSE TO QWEST'S MOTION TO STRIKE AT&T TESTIMONY REGARDING ELECTRONIC LOOP PROVISIONING

AT&T Communications of the Midwest, Inc. ("AT&T") responds to Qwest's motion to strike portions of the direct testimony of AT&T's witness, Robert V. Falcone, concerning Electronic Loop Provisioning ("ELP").[1] The Public Service Commission ("Commission") should deny Qwest's motion to strike for the following reasons:

1. Mr. Falcone's ELP testimony is relevant to this proceeding because AT&T's ELP proposal provides a benchmark against which Qwest's batch hot cut process can be measured. AT&T's ELP proposal demonstrates the level of performance a batch hot cut process must achieve in order to cure the impairment found by the Federal Communications Commission ("FCC").

2. The FCC gave state commissions wide discretion to develop solutions to the hot cut impairment problem. Although the FCC did not adopt AT&T's ELP proposal at the federal level, the Triennial Review Order ("TRO") does not prohibit state commissions from adopting ELP, or comparing ELP to Qwest's batch hot cut proposals. The FCC stated the batch process should provide customers of competitive

[1] Qwest cites Mr. Falcone's Arizona testimony in the first footnote to its Motion to Strike. For purposes of this response, AT&T assumes Qwest is moving this Commission to strike portions of Mr. Falcone's testimony in North Dakota.

200 PU-439-03-295 Pages: 8
Response to Qwest's Motion to Strike AT&T's Testimony Re Elec Loop
by AT&T Communications of the Midwest, Inc

local exchange carriers ("CLECs") with the same experience as Qwest's customers, and AT&T's ELP proposal provides an effective guide to the level of performance needed to reduce impairment. Mr. Falcone's ELP testimony is relevant to this Commission's batch hot cut analysis, even if the Commission does not adopt AT&T's ELP proposal.

3. The FCC identified a number of inherent difficulties in the incumbent local exchange carriers' ("ILECs") current hot cut processes (TRO, ¶422) and recognized those barriers are the result of the ILECs' historical local monopoly. TRO, ¶465. The FCC also recognized that customers feel these deficiencies and CLECs are likely to lose customers as a result of these problems. TRO, ¶¶ 466.

4. In contrast to the current batch hot cut proposals by the ILECs (which involve the physical and manual transfer of a customer's line from an ILEC to a CLEC switch), the FCC recognized that when an ILEC connects and disconnects a customer, it makes an efficient software change, as opposed to a manual change. TRO, ¶465. The FCC directed states to review evidence of reliable performance and implement a batch hot cut process that is *as efficient* as the ILECs own process. TRO, ¶ 512 fn. 1574 (state commissions should ensure that ILEC to CLEC transfers are made "as promptly and as efficiently as" ILEC transfers using unbundled local switching).

5. Although a batch hot cut process may mitigate impairment, it will not eliminate the current state of impairment. TRO, ¶¶423, 475. Indeed, the FCC recognized that CLECs could continue to be impaired after implementation of the batch hot cut process required by the TRO. TRO, ¶¶512, 526 (requiring continuing review of impairment). Mr. Falcone's ELP testimony is relevant not only to measure Qwest's

batch hot cut proposals, but also to identify a remedy to the impairment that will continue if Qwest's proposals are adopted and implemented.

6. In its motion to strike, Qwest relies on the FCC's determination that "an ELP process . . . would require significant and costly upgrades to the existing local network . . ." Qwest's Motion to Strike at pp. 5 (quoting TRO, ¶491). However, the FCC based its order solely on the record that it reviewed. The TRO, which requires a state-specific and more granular analysis than the study conducted at the federal level, does not prohibit states from examining the benefits of ELP in the context of this case. In fact, the FCC specifically noted it would reexamine ELP if the hot cut processes it mandated do not adequately handle necessary volumes. TRO, ¶491.

7. Next, Qwest cites SBC's suggestion that the ELP proposal would be costly. Qwest's Motion to Strike at p. 5 (citing TRO, ¶491). SBC estimated that the entire cost to implement ELP could be greater than $100 billion. TRO, ¶491 fn. 1524. This was a single, nationwide estimate of costs; and, although the FCC cited this estimate in the TRO, it does not reflect the cost that Qwest would incur. More importantly, regardless of SBC's cost estimate, ELP's performance levels are relevant to this proceeding as a comparison to Qwest's batch hot cut proposals.

8. Qwest also relies on the Oregon ALJ's decision to remove ELP from the Oregon "issue list." The Oregon ALJ's decision was based primarily on the "extensive amount of work" that needs to be done in the proceeding without the addition of the ELP issue, not on a determination that ELP was irrelevant. *See* Qwest's Motion to

Strike at pp. 5-6 (quoting Transcript of Oregon Prehearing Conference).[2] The Oregon Commission has scheduled one week of hearings in this case, while the North Dakota hearing is scheduled for two weeks. There is adequate time in this proceeding to compare Qwest's batch hot cut proposal to ELP.

CONCLUSION

9. The FCC decided not to adopt ELP at the time it heard the case, based on the record in its proceeding. However, the TRO does not prohibit states from considering or even adopting ELP. The FCC directed state commissions to "approve and implement a batch cut migration process – a seamless, low-cost process for transferring large volumes of mass market customers . . ." TRO, ¶423. ELP is relevant to this proceeding because it provides a useful measure of the performance of Qwest's hot cut proposal. The Commission should receive testimony describing ELP because that testimony is relevant to the adequacy of Qwest's proposal and the Commission's analysis.

AT&T respectfully requests that the Commission deny Qwest's motion to strike portions of Mr. Falcone's testimony.

[2] The Nebraska Public Service Commission denied Qwest's motion to strike on February 25, 2004. The Public Utility Commission of Oregon granted Qwest's motion to strike on February 24, 2004. The Washington Utilities and Transportation Commission granted Qwest's motion to strike on February 13, 2004. The Washington Commission found, "given the number of issues the parties have presented in their prefiled testimony, there is no time to spend on issues [such as ELP] that the FCC has not directed states to investigate or address." Washington Commission's "Prehearing Conference Order; Order Granting Qwest's Motion to Modify Order No. 08 and Strike Portions of Testimony; Denying Qwest's Request for a Delay in the Procedural Schedule," at pp. 6-7, ¶18, dated February 13, 2004.

RESPECTFULLY SUBMITTED this 26th day of February, 2004.

RE: Working Session on Request for Temporary Stay
Local Competition Investigation, Case No. PU-439-03-295

Date: February 13, 2004

On February 12, 2004, the Commission received electronically a request for a temporary stay of the procedural schedule and discovery in this proceeding. The motion was filed by USLink, Inc, McLeod USA Telecommunications services, Inc, IdeaOne TelecomGroup, LLC and Integra Telecom of North Dakota, Inc. (CLECs). The Request is for the Commission to stay this case until such time as the D.C. Circuit Court issues a written order in the pending TRO appeal.

The CLECs have requested the stay because of the uncertainty surrounding the appeal that has been argued before the D.C Circuit Court. There seems to be a strong feeling within the industry as a whole that the D.C. Circuit will find that the FCC overstepped its authority in delegating impairment determinations for mass market switching to state commissions.

Qwest had called Illona on the afternoon of February 11th to advise that a request for a stay would be filed by a couple of CLECs. Qwest indicated to Illona that it will not be objecting to the request and will not object if a stay puts the proceeding out past 9 months. (See Illona's e-mail February 11, 2004). Qwest suggested that an interim stay right away might be appropriate with a formal decision at the next regular meeting because some discovery responses and rebuttal testimony is due soon.

The CLECs position is that this proceeding imposes substantial burdens on them, and they are facing rapidly approaching deadlines for filing responses to discovery and rebuttal testimony. The CLECs state that because of the substantial concerns and questions raised by the Court, it is likely that the Court decision will have a significant impact on the TRO proceeding in this docket. The CLECs state they are not aware of any party opposing this motion, and that Qwest has agreed to extend its discovery response deadlines consistent with such stay.

On February 11th the Commission received a state TRO proceeding update from Brad Ramsey. Brad stated that at the last Tcom Conference call he was asked his opinion whether the oral argument before the D.C. Circuit provided sufficient impetus for delaying ongoing "9 mo" proceedings. Brad's response was that it did not.

Brad provides these opinions in his memo:

- The FCC's delegation of authority to the states to determine impairment issues will likely be reversed and there is likely to be a request to the Supreme Court by the states or the FCC or other party for stay of the reversal. Brad advises that the States and NARUC support the stay request.
- A delay of state proceedings will undermine the request for stay because it adds to the ILEC arguments that states don't want to move forward with the task.
- Brad recommends the states continue their TRO proceedings for that reason and also that, even if state authority to determine impairment is removed, the FCC may request that states TRO proceeding records be forwarded to support any FCC determinations of impairment.
- At arguments before the DC Circuit, there was no indication real questioning of the impairment standards adopted by the FCC.

Staff thinks a decision on the stay must be made in light of pressing February 15 deadline for discovery and February 17 deadline for rebuttal testimony. Staff is recommending an interim stay for a short period to allow parties to respond to the CLEC request for stay. The Commission could hold a special meeting today to grant an interim stay. The interim stay would request comments from the parties to address the current TRO schedule and the implications on a stay until the DC Court makes its decision on the FCC TRO order. The deadline for comments could be February 20, a Commission worksession could be February 23, and Commission action on the request for stay could be February 25. If the Commission chooses to deny the request for stay, the deadlines for discovery and rebuttal testimony could be extended two weeks beyond the date of that action.

Case No. PU-439-03-295

ORDER GRANTING TRADE SECRET PROTECTION

February 25, 2004

On January 15, 2004, Qwest Corporation (Qwest) filed an application for a protective order limiting the disclosure of trade secret information provided in response to discovery requests served by the Commission in this proceeding. Qwest provides the general description of the nature of the information sought to be protected, as follows:

General Description of the Nature of the Information Sought to be Protected

A. Confidential Attachment A to Qwest's response to Switching Request A-14 (Qwest 14) provides summary information about Qwest's residential and business customers, and the revenues gained by serving those customers.
B. Confidential Attachment A to Qwest's response to Switching Request A-15 (Qwest 15) describes costs of switches purchased by Qwest from 1999 to the present and initial line counts for those switches.
C. Confidential Attachment A to Qwest's response to Switching Request A-17 (Qwest 17) describes each Qwest switch in North Dakota and its capabilities.
D. Confidential Attachment A to Qwest's response to Loop Migration Request A-14 (Qwest 31) describes the number of Qwest technicians trained and capable of transferring a line from an ILEC switch to the CLEC facility as a part of the hot cut process.
E. Confidential Attachment A to Qwest's response to Loop Migration Request A-18 (Qwest 35) describes the staffing arrangements for North Dakota wire centers, and the dispatching central office locations from which roving technicians would be sent.

Qwest states that Confidential Attachment A to Qwest's response to Switching Request A-14 (Qwest 14) reflects specifics regarding Qwest's revenue information that it is not required to disclose in public reports, and information about customers and customer revenues that is confidential to both Qwest and its customers.

Qwest states that the information in Confidential Attachment A to Qwest's response to Switching Request A-15 (Qwest 15) and Confidential Attachment A to

193 PU-439-03-295 Pages: 3
Order Granting Trade Secret Protection
by Public Service Commission
02/25/2004 CC: Comm Legal PUD (3) ALJ

Qwest's response to Switching Request A-17 (Qwest 17) is an important part of its cost and network structure and provides information about the location and services available to its North Dakota customers.

Qwest states that Confidential Attachment A to Qwest's response to Loop Migration Request A-14 (Qwest 31) and Confidential Attachment A to Qwest's response to Loop Migration Request A-18 (Qwest 35) provides a view into Qwest's management, staffing and cost structures.

Qwest states that the information it seeks to protect is proprietary to Qwest and its customers and is available only to those Qwest employees and representatives who have a need to know the information to perform their duties and responsibilities. Qwest states that it does not disclose this information outside the company except under the terms of strict agreements or orders to maintain the confidentiality of the information.

Qwest states that competitors or potential competitors of Qwest that provide local exchange service and other telecommunications service would obtain economic value from the disclosure or use of the information. Competitors and potential competitors of Qwest in North Dakota include AT&T, McLeod Telemanagement, Inc., MCIWorldCom, Consolidated Communications Network, Sprint Corporation, IdeaOne Telecom Group and any other provider of telecommunications services in North Dakota or any of the other states in which Qwest operates.

N.D.C.C. Section 47-25.1-01(4) defines "trade secret" as:

> "Trade secret" means information, including a formula, pattern, compilation, program, device, method, technique, or process, that:
>
> a. Derives independent economic value, actual or potential, from not being generally known to, and not being readily ascertainable by other persons who can obtain economic value from its disclosure or use; and
>
> b. Is the subject of efforts that are reasonable under the circumstances to maintain its secrecy.

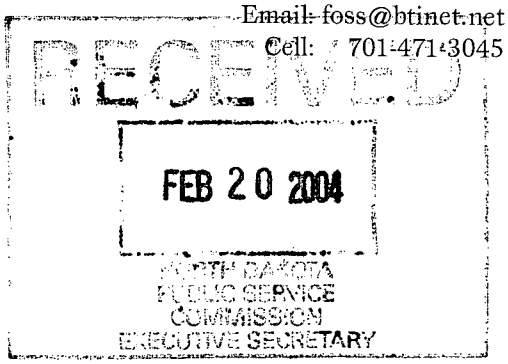
Commission staff (Staff) filed a response to Qwest's request for trade secret protection. Staff believes that Qwest's application satisfies the requirements of N.D.C.C. Chapter 47-25.1 which allows the Commission to grant trade secret protection in this proceeding, and that the information Qwest seeks to protect qualifies as "trade secret" as that term is defined in N.D.C.C. § 47-25.1-04. Staff position is that responses to discovery requests are not at this time a part of the Commission's official record, but once filed with the Commission are records that are open to the public unless protected as trade secret documents.

The Commission's process provides a means for interested parties to review trade secret documents upon signing a nondisclosure agreement.

Order

The Commission Orders:

1. Qwest Corporation's application for trade secret protection is GRANTED.



2. This Order does not constitute precedent for subsequent trade secret decisions by the Commission.

MCI'S MOTION TO STRIKE AND RESPONSE TO QWEST CORPORATION'S COMMENTS ON MOTION TO TEMPORARILY STAY PROCEDURAL SCHEDULE

MCI WorldCom Communications Inc. and MCImetro Access Transmission Services, LLC (collectively "MCI") respectively submit this motion to strike in response to the comments of Qwest regarding the motion of US Link, McLeod, Integra, and Idea One for a delay in the procedural schedule and discovery in the above-captioned matter.

Qwest asserts, at page 2 of its comments, that "In fact, in contrast to AT&T and MCI, Qwest has been urging the Commissions to finish their cases within this 9-month timeframe . . . ." This is a complete misstatement of MCI's position. MCI has **never** advocated that the state proceedings not be completed within the timeframe established under the Triennial Review Order.

Qwest does correctly note, at page 5 of its comments, that MCI has not objected in other states where a similar request for a stay of proceedings has been made. Here, consistent with the position that MCI has taken in other states. MCI does not oppose the request for a stay, nor does it support that request.

QWEST CORPORATION'S COMMENTS ON MOTION TO TEMPORARILY STAY PROCEDURAL SCHEDULE AND DISCOVERY

Qwest supports the motion of US Link, McLeod, Integra, and Idea One for a 60-day delay in the schedule for this proceeding, and a temporary stay of discovery.

1. Oral Argument Before The DC Circuit Signaled That The TRO's Delegation of the Mass Market Switching Cases Would Be Rejected.

As the Commission is aware, the Federal Communications Commission's ("FCC") Triennial Review Order ("TRO") is on appeal to the D.C. Circuit Court of Appeals. At issue in the appeal, among other issues, is the question of whether the FCC has jurisdiction under the Telecommunications Act of 1996 to delegate to the states the responsibility of conducting the impairment analysis which is at the core of this docket. On January 28, 2004, the D.C. Circuit Court of Appeals heard oral argument on the appeal of the FCC's Triennial Review Order. Observers of the court hearing seem to all be in agreement that the Court will find that the FCC did not have authority to delegate to the States the decision of what constitutes "impairment" and thus what network elements have to continue to be unbundled pursuant to the Telecommunications Act of 1996.

The date upon which the Court will release its decision is uncertain. However, the D.C. Circuit issued an expedited schedule for briefing leading up to the January 28, 2004 oral argument; thus, it is reasonable to expect a decision on the appeal within the net 30 to 60 days.

2. *The Requested Postponement Prevents Wasted or Counterproductive Proceedings While Maintaining Needed Flexibility to Act Promptly Once Appellate Proceedings Are Concluded.*

The current proceedings before the State Commissions are complex and resource intensive. Qwest is very cognizant of the demands being placed upon the Commissions, other parties, and itself by virtue of the TRO's directive that the state cases need to be completed within 9 months, or by July 2, 2004. In fact, in contrast to AT&T and MCI, Qwest has been urging the Commissions to finish their cases within this 9-month timeframe, presuming that the TRO is lawful and effective. However, given the course of the oral argument at the Court, and the overwhelming view that delegation is most likely to be found "unlawful", the Motion to Stay is an eminently practical solution.

First, if the delegation is found to be "unlawful" in the Court decision, then the States will lose all jurisdiction to move forward. If the guidelines and presumptions made by the FCC are overturned, or some portion of them, the basis for the state cases and the requisite testimony submitted to date will become meaningless as well. Any money and resources spent on these cases will then become a waste. Given the state

budget constraints and the parties' economic situations, waiting to see what the Court decision has to say before moving forward makes good sense.[1]

Second, no interest is served by continuing these proceedings in the hope that some portion of the factual record might be useful to the FCC in the future, even if the DC Circuit rejects the delegation of the mass market impairment decision to the states. Some have commented that the FCC may rely on the State record in making its decision on remand. However, the FCC has made no indication that they will or even can rely on the States in the remand proceeding, and further proceedings at this time may well answer a question that will not be asked on remand, and leave unanswered questions that will need to be resolved on remand. If delegation and the guidelines and presumptions in the TRO are found unlawful, and if the FCC then asks for State assistance, new and different state proceedings likely would be needed in the future. No one can yet know what issues might be relevant on a remand, how those issues might fit into a determination of impairment, or what facts might be relevant to such a determination, before appellate proceedings are completed. Without this knowledge, further proceedings could be a waste, or even be counterproductive and introduce unnecessary confusion into any state or FCC proceedings on remand.

To avoid prematurely answering the difficult questions of what facts or legal issues might be relevant on remand, and how those facts might fit into an impairment determination, the Motion to Stay presents a practical solution. If the Commission moves all procedural dates out 60 days and puts discovery on hold until the Decision is

---

[1] Outside of this 9-month mass market switching case, there are several provisions of the TRO that require ILECs' and CLECs' compliance. Regardless of whether a stay is granted in this mass market switching case, Qwest will ensure that its actions and agreements comply with the TRO's mandates for as long as they remain the law of the land.

released, if there appears to be jurisdiction and value to continuing, the procedural dates will be in place to continue. In the meantime, the States' and the parties' resources can be conserved.

3. *The Requested Stay Does Not Conflict With The Commission's Obligation to Act on the Mass Market Switching Case.*

The requested stay can be granted without prejudice to the Commission's obligation to act promptly to resolve the mass market switching case. First, there is no requirement for the Commission or any party to this proceeding to request a stay of the 9-month deadline from the FCC. The procedural framework for the 9-month cases is different from the 90-day proceedings. In the 90-day proceedings, the TRO specifically directed States to file with the FCC within the 90-day timeframe, if they believed there was enough evidence to overturn the FCC presumption of no impairment. Then, the FCC would make the final decision about impairment in the enterprise market.

In contrast, in the 9-month proceedings, the FCC delegated the final decision on impairment for the mass-market switching, high capacity loops, and transport areas to the States. Even assuming that delegation is upheld, the only repercussion in the TRO for going beyond the 9-month timeframe is that a party may file with the FCC claiming a "failure to act." See TRO, ¶ 527. The Commission should harbor no concern that any such motion will be filed. ***Even if the DC Circuit decision upholds delegation to the States, Qwest will not claim "failure to act" based on the 60 day delay.*** Qwest understands that the sole purpose of moving the dates 60 days and halting discovery is to conserve resources while at the same time maintaining jurisdiction to promptly restart and complete proceedings, consistent with the resolution of appellate proceedings, as and if necessary.

Indeed, Qwest is the only party that could conceivably be prejudiced by any delay. If these proceedings are delayed, the only result is that the status quo is maintained, and CLECs will continue to be able to obtain UNE-P at the mass market level. While Qwest certainly believes that carriers and competition are not impaired without access to UNE-P at the mass market level, in the interest of justice and conservation of resources, Qwest is willing to accept the short pause requested in order to receive guidance from the DC Circuit's opinion.

4. No Party Objects to the Stay, and Most States in the Qwest Region Have Stayed Proceedings.

Importantly, Qwest is aware of no party that has or will object to the requested stay. In other states, some parties, notably MCI and AT&T, have not objected, but have simply remained silent. This is certainly understandable, as no party – and this includes Qwest and probably many state commissions – want to be seen as prejudging the DC Circuit's decision. However, waiting for guidance from the DC Circuit's guidance on the key issue of delegation makes practical sense and exhibits appropriate deference to the DC Circuit as well as the FCC.

Beyond considerations of appearance, however, the fact that several smaller CLECs have requested the stay, others have openly commented in support of the stay, and that no party objects to the stay, should speak loudly to the Commission. The Commission should respond favorably, and thus encourage the cooperative efforts of the parties to these proceedings to conserve resources and proceed carefully.

Further, although not binding on this Commission, the Commissions of most states in Qwest's region where 9-month cases are pending have approved similar stays or postponements. The Commissions in Arizona, Nebraska, Oregon, Utah, Minnesota,

and Colorado[2] have all granted extensions or delays of at least 30 days to allow the parties, staff, and the Commission's resources to be conserved pending the D.C. Circuits decision, while at the same time making sure that proceedings move forward with all due speed.

In view of these considerations – the uncertainty of the appeal of the TRO and the issues, if any, that might remain after the appellate process, the other practicalities presented in the Motion to Stay, the lack of any prejudice to any party if a stay is granted, the lack of any objection to the requested stay, and the clear trend of state commission decisions granting such stays, Qwest supports the Motion to Stay.

Dated this 19th day of February, 2004.

Respectfully submitted,

STATE OF NORTH DAKOTA

PUBLIC SERVICE COMMISSION

Public Service Commission
Local Competition
Investigation

Case No. PU-439-03-295

INTERIM STAY AND NOTICE OF WORKING SESSION

February 13, 2004

On February 12, 2004, the Commission received a request for a temporary stay of the procedural schedule and discovery in this proceeding pending issuance of a written order from the United States Court of Appeals for the District of Columbia in the appeal of the Federal Communications Commission's (FCC) Triennial Review Order (TRO) from USLink, Inc. McLeod USA Telecommunications Services, Inc, IdeaOne Telecom Group, LLC, and Integra Telecom of North Dakota, Inc. (collectively CLECs). The CLECs further request an expedited order to temporarily stay the February 17, 2004 deadline to file batch cut testimony, pending a final decision on this motion to stay the Commission's TRO proceeding.

The CLECs have requested the stay because of the substantial burden on all parties and perhaps nonparties in relation to a February 15 deadline for discovery from Qwest and burden on parties in relation to the February 17, 2004 deadline to file batch cut testimony.

The CLECs state that, given the substantial concerns and questions raised by the Court, it is likely that the Court decision will have a significant impact on the TRO proceeding in this docket, possibly requiring the proceeding to be abandoned, appreciably altered or restarted.

The Commission has determined that an interim stay should be granted to allow time for parties to respond to the motion, and the implications of a stay until the Court makes its decision. The deadline for comments will be February 19, 2004.

A **working session** on this matter will be held beginning **9 a.m. CST, February 23, 2004** in the Commission hearing room, State Capitol, 12th Floor, Bismarck, North Dakota 58505. For more information contact the Public Service Commission, State Capitol, Bismarck, North Dakota 58505, 701-328-2400; or Relay North Dakota 1-800-366-6888 TTY. If you require any auxiliary aids or services, such as readers, signers, or Braille materials please notify Jon Mielke, Executive Secretary.

Order

The Commission orders:

1. This proceeding is stayed on an interim basis through February 25, 2004.
2. The deadline for responding to discovery from Qwest is stayed on an interim basis.
3. The deadline for filing rebuttal testimony on the hot cut process is stayed on an interim basis.
4. Comments on the stay request are due February 19, 2004.

Case No. PU-439-03-295

MOTION OF USLINK, INC.; MCLEODUSA TELECOMMUNICATION SERVICES, INC.; IDEAONE TELECOM GROUP, LLC; AND INTEGRA TELECOM OF NORTH DAKOTA, INC. TO TEMPORARILY STAY PROCEDURAL SCHEDULE AND DISCOVERY

USLink, Inc.; McLeodUSA Telecommunications Services, Inc.; IdeaOne Telecom Group, LLC; and Integra Telecom of North Dakota, Inc. (collectively, "CLECs") hereby request that the North Dakota Public Service Commission ("Commission") temporarily stay the procedural schedule and discovery in the above-captioned case ("TRO Case") pending issuance of a written order from the United States Court of Appeals for the District of Columbia ("Court") in the appeal of the Federal Communications Commission's ("FCC") Triennial Review Order ("TRO"). The CLECs further request an expedited order to temporarily stay the February 17 deadline to file batch cut testimony, pending a final decision on this motion to stay the TRO proceedings.

As grounds for this request, CLECs state:

1. This proceeding has imposed a substantial burden, particularly in relation to discovery, on all parties and many nonparties. The burdens have fallen particularly hard on smaller carriers, such as the CLECs filing this motion, who do not have the resources to respond to the voluminous discovery requests seeking detailed information about their business operations. Much of the discovery to date seeks highly confidential, competitively sensitive details of the CLECs' business operations, posing a serious risk of harm to their business

181 PU-439-03-295 Pages: 22
Motion to Temporarily Stay Procedural Schedule & Discovery by USLink, McLeodUSA, IdeaOne & Integra
02/12/2003 CC: Comm Legal PUD (3) ALJ

interests, in spite of the protections built into the Protective Order. Given their relatively small size, the CLECs do not have large legal or regulatory departments to handle the burdens of this proceeding. Therefore, they must hire outside counsel at considerable expense or forego other activities and proceedings to attempt to meet these burdens. Moreover, the CLECs operations personnel must devote substantial time and resources to evaluate and respond to the multiple discovery requests and filings of the other parties. This inevitably diverts resources from the CLECs' day-to-day business operations. Such a diversion of resources does not serve the interests of the CLECs or their North Dakota customers.

2. The CLECs and other parties currently face rapidly approaching deadlines to respond to discovery, including a February 15 deadline to respond to discovery from Qwest. The CLECs and other parties also face a fast-approaching deadline of February 17 to file rebuttal testimony regarding the batch hot cut process.

3. The TRO, under which the above-captioned case is being conducted, is currently on appeal before the Court. At issue in the pending appeal, among other issues, is the question of whether the FCC has jurisdiction under the Telecommunications Act of 1996 to delegate to the states the responsibility of conducting the impairment analysis, which is at the core of the TRO Case.

4. The Court heard oral argument in the pending appeal on January 28, 2004. Although impressions of observers to the oral argument are not conclusive, reports from many observers indicate that the Court expressed serious concern over whether the FCC had the authority to delegate impairment determinations for mass market switching to the State Commissions. Observations regarding the oral argument can be found in the January 28, 2004 issue of TR Daily, a copy of which is attached as Exhibit A.

5. Given the substantial concerns and questions raised by the Court, it is likely that the Court decision will have a significant impact on the TRO proceeding in this docket, possibly requiring the proceeding to be abandoned, appreciably altered or restarted. As a result, motions seeking to stay state commission TRO proceedings have already been filed in other states such as Colorado, Washington and Nebraska. Copies of those filings are attached as Exhibits B, C and D respectively. Similarly, the Virginia Commission has issued an Order, staying its TRO proceedings indefinitely. *See* Exhibit E.

6. In light of the substantial uncertainty associated with the pending federal appeal, it appears reasonable to stay the proceeding until that uncertainty is resolved by an Order from the Court. Therefore, in order to avoid the unnecessary expenditure of considerable time and resources by the Commission and all parties, the CLECs request that the Commission temporarily stay discovery in the above-captioned docket until the Court issues an Order in the pending TRO appeal. If the state TRO proceeding is still viable under the Court Order, then the CLECs propose that a new schedule be set, consistent with the intervals in the current schedule.

7. The CLECs are not aware of any party opposing this motion. In addition, Qwest has agreed to extend its discovery response deadlines consistent with such a stay.

WHEREFORE, the CLECs respectfully request that the Commission stay the above-captioned case until such time as the United States Court of Appeals for the District of Columbia issues a written Order in the pending TRO appeal. To avoid the unnecessary expenditure of time and resources to the greatest extent possible, the CLECs respectfully request expedited

consideration of this motion and an expedited order temporarily staying the February 17, 2004 deadline to file batch cut testimony.

Dated this 12th day of February 2004.

Respectfully submitted,

By: _____

JUDGES CRITICIZE `TRIENNIAL REVIEW' ORDER
FOR DELEGATING TOO MUCH AUTHORITY TO STATES

Federal appeals court judges today criticized the FCC for delegating such broad authority to state public utility commissions in its "triennial review" order (TRO), which has been challenged by all segments of the industry since its release last August. The appeals court, however, questioned what the alternative would be if state authority was vacated.

In oral arguments this morning before the U.S. Court of Appeals in Washington, FCC attorney John Ingle was riddled with hostile questioning from the three-judge panel as to why the Commission believed that it was lawful to punt to the states the power to play such a major role in determining which network elements competitive carriers should continue to have access to and whether they'll continue to be able to provide local exchange service using the unbundled network element-platform (UNE-P).

"There's nothing in the statute nor in case law to support state delegation," Judge Harry T. Edwards said in response to Mr. Ingle's argument that the Commission stands to prevail on its decision to delegate authority. "You could have delegated to any guy or girl on the street" that proved to be helpful to the Commission in tackling the difficult issues in the triennial review, he added. Judge Edwards said it was "amusing" the way the Commission says in one section of the TRO that the states have no authority over unbundling but "lo and behold, the FCC delegates its authority to the states."

Where the Commission says in the TRO that states have no authority is an "overstatement," Mr. Ingle said. He pointed to the power granted to states in section 252 of the 1996 Telecommunications Act over arbitration proceedings for interconnection agreements. Judge Edwards, however, cut off Mr. Ingle, saying that he was overreaching. Just because Congress gave states specific authority over arbitrating interconnection agreements doesn't mean that they have authority under section 251c) unbundling rules, Judge Edwards said. "That 251 argument is hurting your case."

"Some of your arguments are out of context," said Judge A. Raymond Randolph. "We need to determine what the statute says, and the end of the argument is that the FCC has to make the decision." Judge Edwards added, "This is what we told you in USTA," referring to the same three-judge panel's 2002 pro-Bell decision in "U.S. Telecom Association v. FCC," in which the court remanded the Commission's unbundling rules. The rules were previously remanded in 1997.

Don Verrilli, counsel for competitive local exchange carriers (CLECs), tried to explain to the court that the FCC didn't delegate actual decision-making authority to the states but rather delegated a fact-finding role to the state commissions, which addresses the court's previous ruling in USTA v. FCC that the Commission must undertake a granular analysis of unbundling rules.

Despite clear frustration with the Commission for delegating authority to the states in determining unbundling for mass-market switching, transport facilities, high-capacity loops, and dark fiber, the court pressed counsel for the Bell companies to provide an alternative remedy should state authority be vacated.

"Assuming we agree with you, what remedy would we have," Judge Edwards asked Michael K. Kellogg, counsel for USTA and the four Bell companies, who led off the two-hour oral argument. "Where does that leave your clients," he asked. "In limbo?"

Senior Judge Stephen F. Williams said, "If we agree with you on the delegation issue, do we say that all the rules are vacated?"

Mr. Kellogg said that the court should vacate certain aspects of the TRO (not the broadband aspects, he noted), remand the rules to the Commission, and provide "even more specific guidance" than the court did in USTA v. FCC. As for where that would leave the Bell companies, Mr. Kellogg acknowledged that there are various agreements at the state commissions.

In addition to addressing the state delegation issue, the judges also

questioned the Commission's decision to maintain discounted access to incumbent local exchange carrier (ILEC) facilities, especially UNE-P, for CLECs and interexchange carriers (IXCs).

Judge Williams specifically questioned whether the FCC, in keeping the ILEC facilities unbundled, had made a determination that IXC's are indeed impaired without access to network elements at TELRIC [total-element long-run incremental cost] rates. He said it may be "farfetched" to determine that IXC's are impaired. Mr. Ingle said the FCC had made this impairment finding "in general" with respect to CLECs and IXCs.

Judge Williams further raised questions over whether a competitor should be able to use the network access requirements under section 271 of the Act to combine ILEC network elements when unbundling obligations no longer exist under section 251c)(3).

"With regard to UNE platform, it seems fairly clear that the court is not comfortable with the FCC's having delegated much of its role to the states," said Anna-Maria Kovacs of Regulatory Source Associates LLC. "The court also did not appear convinced that hot cuts pose an insurmountable entry barrier." She added, "Thus, it seems most likely to us that the impairment decision will be placed back directly in the FCC's hands for market-by-market determination that goes beyond the hot cut issue."

Analysts with Legg Mason Wood Walker, Inc., said "The judges were more guarded about a potential remedy, bolstering our sense that this remains a potential problem for Bell attempts to gain more near-term relief, even if they win a positive ruling." They added, "The judges didn't dismiss the possibility that FCC could still assign the states some sort of fact-finding role. We also expect the case to be appealed, possibly to the full D.C. Circuit, and then to the Supreme Court." "In short, it was a good day for the Bells and a bad one for the IXCs and many CLECs, but the question of a remedy and timing remains a key variable," Legg Mason added.

James Bradford Ramsay, general counsel to the National Association of Regulatory Utility Commissioners, said he was interested in the judges questioning of the incumbent carrier side as to an alternative to the state authority. "What do we do? What's the remedy?" Mr. Ramsay asked. "It may be a bad day for the CLECs but it's far from clear that it's a good day for the ILECs. . . . They might not get very much more relief." He added, "If they do in fact wipe the delegation [requirement], it's very likely that the states will transfer their records" to the FCC.

Although most the questioning from the judges focused on the state delegation issue, Jonathan Askin, general counsel for the Association for Local Telecommunications Services (ALTS), said, "Whether the FCC is the arbiter, or has the right to delegate some decision-making or fact-finding authority to the states, does not affect the self-evident proposition that the 'local loop' is the paradigmatic 'bottleneck' facility which must be made equally available to all competitors if consumers are to see the ultimate benefits of a competitive telecommunications marketplace."

"Even if the court vacates and remands the FCC's decision, CLECs will continue to be able to provide service and attract customers," added John Windhausen Jr., president of ALTS. "CLECs' access to the Bell and other ILEC networks is governed by intercarrier interconnection contracts." He said, "These contracts are approved by the states and cannot be changed until the state utility commissions decide to change them."

A spokeswoman for WorldCom, Inc., said, "We are hopeful that the D.C. court of appeals will rule in favor of maintaining the FCC's local

competition rules, protecti[illegible]che benefits of consumer choice[illegible] lower rates and better customer service." - Margaret Boles, mboles@tr.com

JUDGES' VIEWS ON BROADBAND ISSUES
AREN'T CLEAR AT `TRIENNIAL REVIEW' HEARING

The "triennial review" order's broadband provisions, which largely benefited incumbent local exchange carriers, today took a back seat to the question of whether the FCC wrongly gave state commissions too much authority over whether to retain the unbundled network element platform (UNE-P). Both parts of the order were the focus of oral arguments today in the U.S. Court of Appeals in Washington (see separate story).

Because the direction of the appeals court judges was so clear on UNE-P, whether they will also reject the FCC's decisions against broadband unbundling may be a closely watched issue as lawyers on all sides await the court's decision, which is expected as early as February.

Three broadband issues in particular got some attention during today's oral arguments - the decision of FCC not to require the Bells to unbundle new broadband facilities and whether the Commission wrongly decided that section 271 of the Telecommunications Act of 1996 does not require the Bells to provide CLECs access to the "checklist" items at nondiscriminatory rates, and rules for hybrid copper-fiber.

Unlike the state delegation issue, where the court largely showed its hand, observers were left with little to go on in predicting how justices might rule on this equally critical set of issues. "It's really hard to read the tea leaves because the bench was kind of quiet," one observer said. "One of the reasons for the court's silence could be if they're going to reverse the FCC on UNE-P, they're going to send the decision back on broadband as well for an economic analysis."

"We did not get a clear sense of the courts' views on the broadband portion of the order," analyst Anna-Maria Kovacs said in a research report. "There were far fewer questions than there were on the UNE platform portion, and they were far less insistent. There was some discomfort expressed with the FCC's national rules in the broadband arena. However, there also seemed to be some indication of a willingness to grant deference to the FCC."

An ILEC attorney said on the whole he was pleased with how the oral arguments unfolded on the broadband issues from the standpoint of his side. "The judges didn't raise any concerns with fiber-to-the-home or with linesharing, it was only with the unbundling of hybrid copper loops that they raised some concerns," the source said. "There was some question about whether the FCC fully explained its justification for the unbundling decision. We think on balance the record is going to be there."

In an exchange that is getting some attention, Judge A. Raymond Randolph questioned Michael K. Kellogg, an attorney for the ILECs on what he saw as a potential contradiction in his arguments.

Judge Randolph noted that in the first part of the morning's argument, Mr. Kellogg had contended that the FCC was wrong to cite a national finding of impairment as justification for mandating a state-by-state review of UNE-P. The justice noted that he later contended the FCC was perfectly correct to find nonimpairment nationally to justify not requiring broadband unbundling.

"In the first hour, you argued that [analysis] had to be market-by-

BEFORE THE PUBLIC UTILITIES COMMISSION
OF THE STATE OF COLORADO

REGARDING THE UNBUNDLING OBLIGATIONS OF INCUMBENT LOCAL EXCHANGE CARRIERS PURSUANT TO THE TRIENNIAL REVIEW ORDER -- INITIAL COMMISSION REVIEW.	)	DOCKET NO. 03I-478T
REGARDING ADOPTION OF A BATCH HOT CUT PROCESS PURSUANT TO 47 C.F.R. § 51.319(d)(2)(ii).	)	DOCKET NO. 03I-485T

MOTION OF THE COLORADO OFFICE OF CONSUMER COUNSEL TO TEMPORARILY STAY DISCOVERY IN THE CAPTIONED DOCKETS AND EXTEND ALL PROCEDURAL DATES BY APPROXIMATELY TWO MONTHS AND REQUEST TO SHORTEN RESPONSE TIME TO THIS MOTION

The Colorado Office of Consumer Counsel ("OCC"), through its counsel, submits its motion requesting that the Colorado Public Utilities Commission ("PUC" or the "Commission") temporarily stay discovery and amend the procedural schedules set by the Commission in Docket Nos. 03I-478T and 03I-485T by extending all procedural deadlines by approximately 60 days. As grounds for this request, the OCC states:

1. On October 31, 2003, the Commission issued Decision No. C03-1225, Order Opening Docket and Establishing Procedural Requirements in Docket No. 03I-478T (the "TRO" docket). The procedural schedule allowed three rounds of prefiled testimony from the parties with Qwest Corporation ("Qwest") filing its Direct Testimony on January 26, all other parties filing Answer Testimony on March 1 and filing of Rebuttal and Cross-Answer Testimony on March 22, 2004. Ten days of hearing were reserved beginning April 12, 2004. Subsequently, the Commission granted motions filed on behalf of several parties allowing all parties to file testimony concurrently on all three

filing dates. The Commission also moved the hearings to the weeks of April 19 and April 26, 2004.

2. On November 5, 2003, the Commission issued Decision No. C03-1250, Order Opening Docket and Procedural Directives, in Docket No. 03I-485T (the "Batch Hot Cut" or "BHC" docket). This order allowed all parties to file direct testimony on January 23 and reply testimony on February 17, 2004. By Decision No. R04-0112-I, issued on January 30, 2004, Administrative Law Judge Dale E. Eisley set the hearings in the BHC docket for April 28, 29, and 30, 2004, or if necessary, May 3, 4 and 5, 2004.

3. The OCC is a party in both the TRO and the BHC dockets. At this point in time, after the filing of direct testimony in both dockets, the OCC is inundated, having to review the testimony of 18 witnesses in the TRO and 7 witnesses in the BHC. In addition, the OCC is reviewing responses to data requests propounded by several parties in the TRO docket and preparing follow-up data requests in preparation for the next round of testimony in both dockets. Suspending the procedural schedule in both dockets will allow the OCC staff adequate time to review and analyze this data.

4. As the Commission may be aware, the Federal Communications Commission's ("FCC") Triennial Review Order is on appeal to the District of Columbia Circuit Court of Appeals. At issue in the appeal, among other issues, is the question of whether the FCC has jurisdiction under the Telecommunications Act of 1996 to delegate to the states the responsibility of conducting the impairment analysis which is at the core of both the TRO and BHC dockets.

5. Oral argument was held in the appeal of the FCC's TRO on January 28, 2004. Although impressions of observers to the oral argument are not conclusive, reports

from several observers indicate that the Court expressed concern over whether the FCC had the authority to delegate impairment determinations for mass market switching to the State Commissions. The OCC believes that it is likely that the Court decision will have a significant impact on the PUC TRO and BHC proceedings, which could require these proceedings to be abandoned, appreciably altered or restarted.

6. The D.C. Circuit Court issued an expedited briefing schedule leading up to the January 28, 2004 oral argument; thus, it is reasonable to expect a decision on the appeal in the near future. Therefore, in order to avoid the unnecessary expenditure of considerable time and resources by the Commission and all parties, the OCC requests that the Commission temporarily stay discovery in the captioned dockets until March 29, 2004 and suspend the TRO and BHC procedural schedules, for approximately two months. This interval will allow time for the Commission to take into consideration any decision issued during that time by the D.C. Circuit Court in the appeal of the FCC's TRO order. The date proposed for propounding new discovery in both dockets preserves the interval between direct testimony and the next round of testimony in each docket.

7. The OCC requests that the Commission amend the procedural schedule in the TRO and BHC dockets as follows:

March 29:	Discovery resumes
April 19:	Batch Hot Cut Rebuttal Testimony
May 3:	TRO Answer Testimony
May 24:	TRO Rebuttal Testimony
June 21:	TRO and BHC hearings run consecutively for 10 business days.
July 26:	TRO Statements of Position

8. The OCC requests that the Commission shorten response time to this motion to Tuesday, February 10, 2004, at noon. In support of this request, the OCC states that on Thursday, February 05, 2004, Counsel for the OCC provided an electronic copy of this motion, as filed, to counsel for all parties who filed direct testimony in either the TRO or the BHC dockets as well as to all persons listed on the pleadings service list in both dockets. Therefore, all active parties have sufficient notice of this motion so that they can file a response, if they choose to do so, by noon on Tuesday, February 10, 2004. If the Commission grants the request for shortened response time, the Commission may consider this motion at its weekly meeting on February 11, 2004.

WHEREFORE, the OCC requests that the Commission amend the procedural schedules in Dockets 03I-478T and 03I-485T as related in detail above and shorten response time to this motion to noon on February 10, 2004.

Dated this 5th day of February 2004.

Respectfully Submitted,

KEN SALAZAR

Re: Docket No. UT-033044 - Triennial Review
Request for Delay

Dear Ms. Washburn:

Qwest hereby requests a 60-day delay in the schedule for this proceeding, and a temporary stay of discovery. This request was discussed today at the prehearing conference, and Qwest is now submitting its request in writing.

As the Commission is aware, the Federal Communications Commission's ("FCC") Triennial Review Order ("TRO") is on appeal to the D. C. Circuit Court of Appeals. At issue in the appeal, among other issues, is the question of whether the FCC has jurisdiction under the Telecommunications Act of 1996 to delegate to the states the responsibility of conducting the impairment analysis which is at the core of this docket. Oral argument was held on January 28, 2004. Although impressions of observers to the oral argument are not conclusive, reports from several observers indicate that the Court expressed concern over whether the FCC had the authority to delegate impairment determinations for mass market switching to the state commissions. It is likely that the Court decision will have a significant impact on this proceeding, which could require this proceeding to be abandoned, appreciably altered, or restarted.

At issue for this Commission is the extraordinary amount of time and effort that will be expended by all parities to this proceeding leading up to and including the currently scheduled March hearings. Thousands of pages of testimony and exhibits have been filed by 29 witnesses, and cross examination will likely exceed the allotted two week hearing schedule. With the likely possibility that the proceedings could be abandoned or altered by the Court, Qwest believes that a significant expenditure of resources can be stemmed by simply delaying the docket.

The D.C. Circuit Court issued an expedited schedule for briefing leading up to the January 28, 2004 oral argument; thus, it is reasonable to expect a decision on the appeal in the near future. Therefore, in order to avoid the unnecessary expenditure of considerable time and resources by the Commission and all parties, Qwest requests that the Commission temporarily stay discovery (both responses and new requests) in this case until April 12, 2004 and suspend the TRO and BHC procedural schedules, for approximately two months. This interval will allow time for the Commission to take into consideration any decision issued during that time by the D.C. Circuit Court in the appeal of the TRO. Qwest requests that the Commission amend the procedural schedule in this dockets follows:

April 12, 2004:	Discovery resumes
May 7, 2004:	File BHC Rebuttal Testimony and TRO Rebuttal Testimony
June 7 – 11 and June 28 – July 2, 2004:	Hearings

For the Commission's additional information, Qwest states that other parties have filed similar requests for delay in Colorado and Nebraska, and that the New Mexico Commission is considering delay on its own motion. No decision has been made in any of those states as of this time.

Finally, Qwest notes that no party opposed this delay at the prehearing conference and that no party will be prejudiced by this delay, as any delay in determination of the issues in this matter simply means that the status quo, including provision of UNE-P, remains in place during the interim. Qwest further commits that it will not claim a "failure to act" under paragraph 527 of the TRO in connection with the delay sought herein.

Sincerely,

Lisa A. Anderl

FILED

FEB 6 2004

NEBRASKA PUBLIC SERVICE COMMISSION

In the Matter of The Commission, on its own motion, seeking to conduct a 9-month proceeding as contemplated by the Federal Communications Commission in its Triennial Review order adopting new rules for network unbundling obligations.	))))))	APPLICATION NO. C-3026 **MOTION FOR TEMPORARY STAY**

ALLTEL Nebraska, Inc. ("ALLTEL"), through its legal counsel, respectfully submits this Motion requesting that the Nebraska Public Service Commission (the "Commission") temporarily stay discovery and amend the procedural schedule set by the Commission in this Application by extending all procedural deadlines by approximately 60 days. As grounds for this request, ALLTEL states as follows:

1. On October 28, 2003, the Commission issued its Procedural Order No. 1 (the "Procedural Order") in this Application and established a schedule for this proceeding. Subsequently, on December 31, 2003, the Hearing Officer entered an Order extending the deadlines for completion of discovery. Further, on January 28, 2004, the Hearing Officer entered an Order granting leave to AT&T Communications of the Midwest, Inc. and TCG Omaha, Inc. (collectively "AT&T") and to MCImetro Access Transmission Services and MCI Worldcom Communications, Inc. (collectively "MCI") to serve discovery requests in excess of the 50-interrogatory limit, and such Order also modified the discovery schedule.

2. The Procedural Order also established a schedule for the filing of prepared testimony in this case, direct testimony being currently due on March 1, 2004 and filing of rebuttal testimony being scheduled for April 5, 2004. The Commission has scheduled hearings in this matter for the period of April 26 through May 7, 2004.

3. The only interested incumbent local exchange carriers that have filed notices herein framing the scope of the cases to be presented to the Commission are Qwest Corporation ("Qwest") and ALLTEL. Both Qwest and ALLTEL have notified the Commission of their intentions to present mass market switching cases in this proceeding. AT&T, MCI and McLeod Telecommunications Services, Inc. ("McLeod") are the primary competitive local exchange carriers that have, to date, actively participated in this proceeding.

4. As the Commission may be aware, the Triennial Review Order ("TRO") entered by the Federal Communications Commission ("FCC") is on appeal to the District of Columbia Circuit Court of Appeals (the "Circuit Court Appeal").[1] At issue in the Circuit Court Appeal, among other issues, is the question of whether the FCC has jurisdiction under the Telecommunications Act of 1996 to delegate to the states the responsibility for conducting the impairment analysis that is at the core of this proceeding.

5. Oral argument was held in the Circuit Court Appeal on January 28, 2004. Although impressions by observers of the oral argument are not conclusive, press reports by several observers indicate that the Court of Appeals expressed significant concern as to whether the FCC possesses the authority to delegate impairment determinations for mass market switching to the state commissions. It is likely that the decision in the Circuit Court Appeal will have a significant impact on the TRO and therefore, this proceeding, which could require this proceeding to be abandoned, appreciably altered or recommenced.

---

[1] *United States Telecom Association v. Federal Communications Commission,* Cases No. 00-1012, 00-1015, 03-1310, 03-1424, et al., before the United States Circuit Court of Appeals for the District of Columbia.

6. The District of Columbia Circuit Court of Appeals issued an expedited briefing schedule leading up to the January 28, 2004 oral argument. Thus, it appears to be reasonable to expect a decision in the Circuit Court Appeal in the near future. Therefore, in order to avoid the unnecessary expenditure of considerable time and resources by the Commission and all parties, as well as certain non-parties, ALLTEL requests that the Commission temporarily stay discovery in this Application, and suspend the schedule established by the Procedural Order, for approximately two months to specific dates to be determined by the Hearing Officer or the Commission. This interval will allow time for the Commission to take into consideration any decision issued during that time in the Circuit Court Appeal. If the Court rules sooner rather than later in this interval and does not make determinations that drastically alter the scope or need for this proceeding then the Commission could certainly recommence this proceeding with new procedural time frames.

7. Legal counsel for ALLTEL has been in communication with legal counsel for Qwest, AT&T, MCI and McLeod with regard to their respective positions concerning this Motion. ALLTEL's legal counsel has been advised that AT&T will neither support nor oppose the Motion; that MCI does not support the Motion; that McLeod does support the Motion; and that Qwest will not oppose the Motion.

8. Due to the pendency of a significant number of discovery requests served among parties and on non-parties to this proceeding, the current schedule for responding to such discovery requests, and the significant burden on parties, non-parties, the Commission and its Staff to process all pending discovery matters, ALLTEL submits that the best interests of all concerned will be served by the Commission's favorable ruling on

this Motion at its Grist meeting scheduled for February 11, 2004. In support of this request, ALLTEL states that on Friday, February 6, 2004, legal counsel for ALLTEL provided an electronic copy of this Motion to all persons on the service list maintained by the Commission for this proceeding.

WHEREFORE, ALLTEL requests that the Commission temporarily stay discovery in this proceeding and suspend the schedule established by the Procedural Order for approximately two months to specific dates to be determined by the Hearing Officer or the Commission.

Dated this 6th day of February 2004.

Respectfully Submitted,

ALLTEL Nebraska, Inc.

COMMONWEALTH OF VIRGINIA

EXHIBIT E

STATE CORPORATION COMMISSION

AT RICHMOND, JANUARY 30, 2004

APPLICATION OF

VERIZON VIRGINIA INC. AND
VERIZON SOUTH INC.

CASE NO. PUC-2003-00170

For authority to cease providing unbundled switching in certain markets and unbundled dedicated transport on certain routes as unbundled network elements under 47 U.S.C. § 251(c)(3)

ORDER

On November 5, 2003, Verizon Virginia Inc. and Verizon South Inc. (collectively, "Verizon") filed an application with the State Corporation Commission ("Commission") requesting that the Commission grant Verizon authority to discontinue providing the unbundled switching element for mass market customers in limited geographic areas, as well as the bundled dedicated transport element on certain enumerated routes as unbundled network elements under 47 U.S.C. § 251(c)(3). Verizon asks the Commission to find that carriers are not impaired without access to unbundled switching in the markets listed in Verizon's testimony and that carriers are not impaired without access to unbundled dedicated transport for the routes enumerated in Verizon's testimony.

Verizon states that the Federal Communications Commission's ("FCC") Triennial Review Order ("TRO") assigned to state commissions the task of the targeted, granular unbundling analysis using the FCC's federal guidelines to make impairment determinations for certain network elements. Verizon asserts that its application and accompanying testimony demonstrate that the FCC's non-impairment standards have been satisfied for unbundled switching and dedicated transport in the identified markets.

On December 3, 2003, we issued a Preliminary Order that, among other things, required publication of notice, permitted interested persons to file notices of participation, and invited initial and reply briefs on certain preliminary questions attendant to the Commission's authority in this matter.

On January 9, 2004, the Commission's Staff ("Staff"), Verizon, AT&T Communications of Virginia, LLC ("AT&T"), Sprint Communications Company of Virginia, Inc., Central Telephone Company of Virginia and United Telephone-Southeast, Inc. (collectively, "Sprint"), MCI Worldcom Communications of Virginia, Inc. ("MCI"), and Cavalier Telephone, LLC ("Cavalier") filed initial briefs. On January 23, 2004, Staff, Verizon, and MCI filed reply briefs.

AT&T, Sprint, and MCI state that the FCC's delegation of authority to the states in this matter is lawful. Conversely, Verizon contends that the FCC's delegation is unlawful. Verizon explains that the TRO is on appeal to the United States Court of Appeals, wherein Verizon has sought a writ of mandamus arguing that the FCC's delegation to the states of authority to make unbundling determinations is illegal.

However, Verizon also asserts that the Commission should not exercise its discretion to "defer" this issue under § 56-265.4:4(B)(4) of the Code of Virginia. Verizon states that the interests of all parties in the Commonwealth are best served by the Commission acting promptly in this case, that the Commission's refusal to hear this case would keep Virginia in unbundling purgatory even longer, and that the Commission's analysis and findings likely would be the basis for an impairment decision by the FCC if the TRO's delegation of authority to the states is found to be unlawful by federal courts.

Staff also concludes that the FCC lacks authority to delegate this matter to state commissions. Staff states that while express statutory authority is not necessarily required for

delegation, the federal 1996 Telecommunications Act ("Act") explicitly permits the FCC to delegate certain matters but contains no express authorization allowing the FCC to delegate its obligations regarding impairment findings under § 251(d)(2) of the Act. Staff asserts that there is little reason for the Commission to act where its jurisdiction is not firmly established. Staff urges the Commission to wait for the final federal appellate ruling on this question before proceeding further in this matter.

In addition, Staff is unaware of any substantive ruling that the Commission can reach in this proceeding that is not subject to change as a result of the pending federal appeals of the TRO. Verizon, AT&T, and Sprint also suggest that any determination reached by the Commission in this case is subject to change, or may be mooted, by the pending appeals. However, Verizon contends that the real question the Commission must decide at this point is whether we should "discharge the responsibilities of" a state commission under § 56-265.4:4(B)(4) of the Code of Virginia or exercise our discretion to defer this case. Verizon asserts that the Commission is clearly in the best position to decide what is best for the Commonwealth and respectfully urges the Commission to quickly take this case and make the necessary trigger determinations.

NOW UPON CONSIDERATION of Verizon's application, the pleadings, and the applicable law, we are of the opinion and find that this case shall be continued pending further order of the Commission.

We find it has not been established that the FCC's delegation of authority to the Commission in this matter is lawful. Indeed, Verizon, the applicant in this proceeding, firmly asserts that the FCC's delegation of authority to this Commission is illegal. Staff also concludes that the FCC lacks authority to delegate this matter to the Commission. Consequently, we will

defer acting on Verizon's request in its application until it is established that the Commission has appropriate jurisdiction under the Act to perform the actions delegated by the FCC in the TRO.

Accordingly, IT IS HEREBY ORDERED THAT this matter is continued pending further order of the Commission.

AN ATTESTED COPY hereof shall be sent by the Clerk of the Commission to all persons on the official Service List in this matter. The Service List is available from the Clerk of the State Corporation Commission, c/o Document Control Center, 1300 East Main Street, First Floor, Tyler Building, Richmond, Virginia 23219.

Case No. PU-439-03-295

STAFF RESPONSE TO QWEST'S APPLICATION REQUESTING TRADE SECRET PROTECTION FOR RESPONSES TO COMMISSION'S PRELIMINARY DISCOVERY REQUESTS

On January 15, 2004, Qwest Corporation (Qwest) filed an application for a protective order limiting the disclosure of trade secret information provided by Qwest in response to discovery requests served by the Commission in this proceeding. Qwest provides the general description of the nature of the information sought to be protected, as follows:

General Description of the Nature of the Information Sought to be Protected.

The information sought to be protected is:

A. Confidential Attachment A to Qwest's response to Switching Request A-14 (Qwest 14) provides summary information about Qwest's residential and business customers, and the revenues gained by serving those customers.

B. Confidential Attachment A to Qwest's response to Switching Request A-15 (Qwest 15) describes costs of switches purchased by Qwest from 1999 to the present and initial line counts for those switches.

C. Confidential Attachment A to Qwest's response to Switching Request A-17 (Qwest 17) describes each Qwest switch in North Dakota and its capabilities.

D. Confidential Attachment A to Qwest's response to Loop Migration Request A-14 (Qwest 31) describes the number of Qwest technicians trained and capable of transferring a line from an ILEC switch to the CLEC facility as a part of the hot cut process.

E. Confidential Attachment A to Qwest's response to Loop Migration Request A-18 (Qwest 35) describes the staffing arrangements for North Dakota wire centers, and the dispatching central office locations from which roving technicians would be sent.

Qwest states that all of the information it seeks to protect is confidential and proprietary to Qwest and is not publicly disclosed. Qwest states that in a competitive telecommunications marketplace, the information sought to be protected is highly sensitive and its public disclosure would place Qwest at a competitive disadvantage.

Specifically, with regard to Confidential Attachment A to Qwest's response to Switching Request A-14 (Qwest 14), Qwest states that the information reflects specifics regarding Qwest's revenue information that it is not required to disclose in public reports, and information about customers and customer revenues that is confidential to both Qwest and its customers.

Specifically, with regard to Confidential Attachment A to Qwest's response to Switching Request A-15 (Qwest 15) and Confidential Attachment A to Qwest's response to Switching Request A-17 (Qwest 17), Qwest states that the information is an important part of its cost and network structure and provides information about the location and services available to its North Dakota customers.

Specifically, with regard to Confidential Attachment A to Qwest's response to Loop Migration Request A-14 (Qwest 31) and Confidential Attachment A to Qwest's response to Loop Migration Request A-18 (Qwest 35), Qwest states that this information, if disclosed publicly, would disadvantage Qwest as it provides a view into Qwest's management, staffing and cost structures.

Qwest states that the information it seeks to protect is proprietary to Qwest and its customers and is available only to those employees and representatives who have a need to know the information to perform their duties and responsibilities, and that it does not disclose this information outside the company except pursuant to the terms of strict agreements or orders to maintain the confidentiality of the information.

Qwest states that competitors or potential competitors of Qwest that provide local exchange service and other telecommunications service would obtain economic value

from the disclosure or use of the information. Competitors and potential competitors of Qwest in North Dakota include AT&T, McLeod Telemanagement, Inc., MCIWorldCom, Consolidated Communications Network, Sprint Corporation, IdeaOne Telecom Group and any other provider of telecommunications services in North Dakota or any of the other states in which Qwest operates.

The present application deals with responses to discovery requests. Responses to discovery requests are not at this time a part of the Commission's official record, but once filed with the Commission are records that are open to the public unless protected as trade secret documents. Staff believes that Qwest's application satisfies the requirements of N.D.C.C. Chapter 47-25.1 which allows the Commission to grant trade secret protection in this proceeding, and that the information Qwest seeks to protect qualifies as "trade secret" as that term is defined in N.D.C.C. § 47-25.1-04. The Commission's process provides a means for interested parties to review trade secret documents upon signing a nondisclosure agreement.

For reasons set forth above staff recommends that the Commission grant Qwest's Application Requesting Trade Secret Protection in this case.

Dated February 13, 2004.

NORTH DAKOTA PUBLIC SERVICE COMMISSION EXECUTIVE SECRETARY

Public Service Commission Local Competition Investigation	Case No. PU-439-03-295

MOTION FOR RECONSIDERATION

Qwest Corporation ("Qwest") moves the Hearing Officer for reconsideration of its Order dated February 4, 2004 regarding discovery requests in this proceeding. Specifically, Qwest asks the Hearing Officer to reconsider that portion of the Order denying Qwest's Motion for the Public Service Commission to Issue Information Requests to nonparty CLECs.

On January 15, 2004, Qwest filed its motion for the Commission to issue Information Requests to nonparty Competitive Local Exchange Carriers ("CLECs") that are certified or registered to provide local exchange telecommunications service in North Dakota and which have not intervened as parties in this proceeding. The motion was made based upon discussions between the parties and the Commission Staff at the workshop held in this proceeding on November 24, 2003. At the workshop, the participants discussed mechanisms to obtain information from nonparty CLECs that would be needed by the Commission to properly consider and determine the issues in the case. That information includes the extent to which CLECs are providing local exchange telecommunications services to residential and business customers in North

175 PU-439-03-295 Pages: 4
Motion for Reconsideration
by Qwest Corporation by Dan Kuntz, Attorney
02/11/2004 CC: Comm Legal PUD (3) ALJ

Dakota exchanges through switching equipment owned or controlled by the CLEC.[1] While the parties can obtain and present such information to the Commission for themselves and for each other through written discovery and testimony, there is not a convenient discovery method to obtain necessary information from nonparty CLECs providing the relevant telecommunications services. In the absence of the Commission exercising its power to obtain this information from the nonparty CLECs through Information Requests, the parties would be required to issue subpoenas and conduct depositions of nonparty CLECs under Rule 30(b)(6), N.D.R.Civ.P. This would be unduly expensive and inconvenient to both the parties and the nonparty CLECs.

The workshop participants agreed that a preferable method to obtain such information was through the issuance of Information Requests by the Commission to nonparty CLECs. Parties were invited to submit proposed Information Requests to the Commission for consideration in issuing requests to nonparty CLECs. This proposal was addressed in the Commission's discovery order dated on January 14, 2004:

> At the Commission's TRO workshop on November 12, 2003, the parties discussed developing and submitting, jointly or individually, an abbreviated discovery request for CLECs that have not intervened in this proceeding. The Commission has not received any abbreviated discovery request proposals for Commission distribution to non-intervening CLECs.

In response to the Commission's order, Qwest filed its Motion to Issue Information Requests on January 15, 2004.

The RTCG companies subsequently sought to limit direct discovery requests from MCI and Qwest including discovery requests regarding their CLEC affiliates. In

---

[1] In the *Matter of Review of Section 251 unbundling Obligations of Incumbent Local Exchange Carriers*, CC Docket No. 01-338, *In the Matter of the Implementation of the Local Competition Provisions of the Telecommunications Act of 1996*, CC Docket No. 96-98, *In the Matter of Deployment of Wireline Services Offering Advanced Telecommunications Capability*, CC Docket No. 98-147, Report and Order on Remand and Further Notice of Proposed Rulemaking, ¶ 135 (rel. Aug. 21, 2003).

reply to the RTCG companies, Qwest suggested that as an alternative to Qwest's discovery, the RTCG affiliates could respond to the shortened list of Information Requests that Qwest proposed to the Commission. While responses by the RTCG affiliates to either the written discovery or the Information Requests was acceptable to Qwest, there is nonetheless a separate need for nonparty CLECs to provide the information in response to Qwest's Information Requests. Discovery directed to nonparty CLECs is not a reasonable alternative to the Information Requests because of the cost and inconvenience.

No party has objected to Qwest's proposed Information Requests to the nonparty CLECs. Accordingly, Qwest asks the Hearing Officer to reconsider that portion of its Order denying Qwest's Motion to Issue Information Requests to nonparty CLECs or alternatively to schedule oral argument on Qwest's motion.

Dated this 11th day of February, 2004.

Respectfully submitted,

STATE OF NORTH DAKOTA
PUBLIC SERVICE COMMISSION

Public Service Commission **Local Competition Investigation**	**Case No. PU-439-03-295**

MOTION TO STRIKE AT&T TESTIMONY REGARDING ELECTRONIC LOOP PROVISIONING

Qwest Corporation ("Qwest") hereby moves to strike the portions of AT&T witness Robert V. Falcone's January 23, 2004 Direct Testimony that are addressed to "electronic loop provisioning" (or "ELP").[1] Mr. Falcone spends over a third of his batch hot cut testimony advocating a loop unbundling proposal that he *concedes* the FCC explicitly rejected.[2] The *Triennial Review Order* specifically declined to have state commissions consider ELP as part of their nine-month cases,[3] and AT&T's attempt to reintroduce these excluded issues through Mr. Falcone's testimony is improper.

---

1 Direct Testimony of Robert V. Falcone filed on Behalf of AT&T Communications of the Mountain States, Inc. and TCG Phoenix (Collectively "AT&T"), *In the Matter of ILEC Unbundling Obligations as a Result of the Federal Triennial Review Order*, Docket No. T-00000A-03-0369 (Ariz. Corp. Comm'n filed January 23, 2004) ("Falcone Direct"). In particular, Qwest seeks to strike page 2, lines 19-21 (from "and describes" through the end of the paragraph); page 3, lines 10-12 (from "Finally" through the end of the paragraph); page 35, line 13 through page 55, line 17 in its entirety; and the first two paragraphs of Exhibit 2.

2 *See* Falcone Direct at 53:1-5 ("In response to AT&T's advocacy regarding electronic loop provisioning to the FCC, the RBOCs complained that ELP would cost hundreds of millions of dollars and take years to implement — and the FCC did not adopt [AT&T's] approach.") (capitalization altered); *id.* at 54 n.53 (conceding that "the FCC has not yet adopted and required the implementation of AT&T's Electronic Loop Provisioning architecture") (italics omitted).

3 Report and Order, *Review of the Section 251 Unbundling Obligations of Incumbent Local Exchange Carriers,* 18 FCC Rcd 16978 ¶ 491 (2003) ("*Triennial Review Order*").

Background

As the FCC explained,[4] and as Mr. Falcone agrees,[5] AT&T's "electronic loop provisioning" proposal seeks to have incumbent LECs such as Qwest "packetize" their networks from end to end. The proposal would require Qwest to make massive upgrades to its outside loop plant and central office equipment (or simply replace that plant and equipment outright) in order to carry *all* calls —voice as well as data — in a packet-switched protocol instead of the circuit-switched protocol used today.[6] Qwest would be required to disconnect all of its feeder facilities from its circuit switches and reconnect them to new ATM-protocol "gateways," which would in turn connect to all CLEC switches as well as back to Qwest's own equipment.[7] Although AT&T's proposal has never been tested or proved workable on any large scale, the theory behind this hypothetical network architecture is to enable voice traffic from a given customer to be packet switched to a CLEC's network without physically connecting the customer's loop to that CLEC's switch.

AT&T presented this same proposal to the FCC in the proceedings leading up to the *Triennial Review Order*. The FCC rejected it in the plainest terms possible. The FCC noted that "the evidence in the record suggests that an ELP process, to be effective, would require significant and costly upgrades to the existing local network at

---

4 *See Triennial Review Order* ¶ 491 ("AT&T's ELP proposal proposes to 'packetize' the entire public switched telephone network for both voice and data traffic . . . .").

5 *See* Falcone Direct at 45:22-46:1 ("Under ELP . . . equipment would be deployed or upgraded to digitize and packetize *all* traffic, not just the traffic in the high-frequency portion of the loop, as with the ILECs' current NGDLC architecture.") (emphasis in original).

6 *See id.* at 45:17-19 (conceding that ELP would require upgrades to "ILEC outside loop plant, ILEC central offices, and equipment used by all local carriers . . . that choose to use a traditional circuit-switched network to carry voice traffic").

7 *See id.* at 47:6-23.

both the remote terminal and central office."[8] The FCC credited an estimate that "to 'packetize' the entire public switched telephone network for both voice and data traffic" would cost "more than $100 billion."[9] In addition, the FCC credited arguments that "AT&T's proposal would entail a fundamental change in the manner in which local switches are provided and would require dramatic and extensive alterations to the overall architecture of every incumbent LEC local telephone network."[10] Finally, the FCC concluded that ELP simply had not been proven workable: "[T]he record in this proceeding does not support a determination that electronic provisioning is currently feasible."[11]

For all these reasons, the FCC "decline[d] to require ELP at this time."[12] The FCC also rejected AT&T's related "impairment" argument, which suggested "that unbundled switching for voice-grade loops is essential until incumbent LECs offer an electronic loop provisioning (ELP) method of transferring large volumes of local customers in the mass market from one carrier to another."[13] Instead, the FCC directed state commissions to adopt batch hot cut processes that retain the manual cutovers contained in the existing hot cut process, but realize "efficiencies associated with performing tasks once for multiple lines that would otherwise have been performed on a line-by-line basis."[14] The FCC made clear that adoption of such a process could

"mitigate[]" the "loop access barriers contained in the record,"[15] even though it was fully aware that this batch hot cut process would still have a manual form of loop provisioning at its core.

AT&T filed the testimony of Robert Falcone on Hot Cut and Batch Migration Processes on January 23. The testimony proffers the very same impairment argument (and the very same non-solution) that the FCC rejected. Mr. Falcone argues that this Commission should find "impairment" so long as Qwest uses *any* type of hot cut process — even if it adopts exactly the kind of batch hot cut process the *Triennial Review Order* contemplates.[16] He then spends twenty pages arguing that the Commission should adopt the same electronic loop provisioning proposal that the *Triennial Review Order* rejected.[17] Mr. Falcone concedes, as he must, that "the FCC did not adopt [AT&T's] approach"[18] and "has not . . . required the implementation of AT&T's Electronic Loop Provisioning architecture."[19] Yet he nevertheless suggests that the same FCC order that explicitly *rejects* ELP somehow also *authorizes* state commissions to adopt whatever cures for "impairment" they happen to see fit — including the very same ELP proposal the FCC specifically refused to require.[20]

---

15 *Id.* ¶ 487.

16 *See* Falcone Direct at 35:14-21; *id.* at 55:10-13 ("Even the best manual processes that could be operationalized today, including batch migration processes, cannot satisfy the requirements needed to eliminate the CLECs' operational impairment in attempting to compete for mass-market customers.").

17 *See id.* at 35:21-55:17.

18 *Id.* at 53:1-5 ("In response to AT&T's advocacy regarding electronic loop provisioning to the FCC, the RBOCs complained that ELP would cost hundreds of millions of dollars and take years to implement — and the FCC did not adopt [AT&T's] approach.") (capitalization altered).

Discussion

1. As Mr. Falcone himself is forced to concede, the identified portions of AT&T's testimony proffer exactly the same electronic loop provisioning arguments that the FCC unambiguously rejected. AT&T presented the same impairment theory and ELP proposal to the FCC that it is presenting here, and the FCC explicitly "decline[d] to require ELP at this time."[21]

The *Triennial Review Order* expressly finds that "the record in this proceeding does not support a determination that electronic provisioning is currently feasible,"[22] and notes that "an ELP process . . . would require significant and costly upgrades to the existing local network," crediting estimates that it would cost over $100 billion to implement nationwide.[23] Far from implying that state commissions must find impairment in their nine-month cases unless they adopt electronic loop provisioning (as Mr. Falcone suggests), the *Triennial Review Order* specifically *rejected* that argument, and instead directed state commissions to adopt batch hot cut processes in their nine-month cases that would continue to rely on the manual transfer of loops.[24] AT&T's testimony completely disregards the *Triennial Review Order*'s instructions for the nine-month cases and asks the state commissions to spend their time on an inquiry the *TRO* specifically rejected. It should therefore be stricken from the record.

The ALJs hearing the Oregon *TRO* cases have already rejected AT&T's attempt to ignore the *TRO* and inject its ELP proposal back into these dockets. When AT&T

---

21 *Triennial Review Order* ¶ 491.

22 *Id.* ¶ 488 n.1517.

23 *Id.* ¶ 491.

24 *Id.* ¶ 488.

proposed an issues list in Oregon that included a question asking whether "electronic loop provisioning [can] obviate the need for a hot cut process,"[25] the ALJs specifically directed AT&T to remove it. Electronic loop provisioning, they held, was "beyond the specific areas of inquiry set forth in the TRO."[26] In the words of the presiding Judge,

> Issue 29, for example, regarding electronic loop provisioning, there's a very specific discussion by the FCC on that [in the *TRO*], where they decline to address that at this point in time. And I don't see, given the extensive amount of work, we're going to have to do in the next nine months, how the Oregon Commission can possibly deal with that issue in the context of this proceeding.[27]

Given the *Triennial Review Order*'s unambiguous holdings with respect to ELP, the ALJs' ruling was exactly right. This Commission should rule the same and strike the identified portions of Mr. Falcone's testimony.

2. As noted above, Mr. Falcone is forced to concede that, while AT&T presented its ELP proposal to the FCC, "the FCC did not adopt [AT&T's] approach,"[28] and in fact "the FCC has not . . . required the implementation of AT&T's Electronic Loop Provisioning architecture."[29] Mr. Falcone nevertheless suggests that the *Triennial Review Order* gives state commissions unbounded remedial authority to adopt whatever "mitigating measure[s]" they see fit to address whatever impairments they identify —

---

[25] Letter from Steven H. Weigler, AT&T, to Samuel J. Petrillo, ALJ, *et al.*, Docket UM 1100, at Attachment A, p. 4 ¶ 29 (Or. Pub. Util. Comm'n Oct. 13, 2003).

[26] Transcript of Prehearing Conference, *Investigation To Determine, Pursuant to Order of the Federal Communications Commission, Whether Impairment Exists in Particular Markets If Local Circuit Switching for Mass Market Customers Is No Longer Available As an Unbundled Network Element*, Docket UM 1100, at 6:8-9 (Or. Pub. Util. Comm'n Oct. 15, 2003).

[28] Falcone Direct at 53:1-5 (capitalization altered).

[29] *Id.* at 54 n.53.

even measures like ELP that the FCC has specifically rejected.[30] The Commission should reject this argument as well.

It is nonsense to suggest that the same FCC order that explicitly rejects ELP as unworkable, unproven, and prohibitively expensive somehow also authorizes state commissions to require that very same thing. More generally, AT&T's suggestion that the *Triennial Review Order* gave state commissions plenary authority to adopt whatever remedial measures they see fit is incorrect. The only paragraph of the *Triennial Review Order* that AT&T cites for this proposition says just the opposite: "In this section, we ask state commissions to take *certain* actions designed to alleviate impairment in the markets over which they exercise jurisdiction."[31] And the next paragraphs specify exactly what those "certain" actions are. The FCC "conclude[s] that the loop access barriers contained in the record may be mitigated through the creation of a batch cut process," and accordingly orders that "State commissions must approve, within nine months of the effective date of this Order, a batch cut migration process to be implemented by incumbent LECs that will address the costs and timeliness of the hot cut process."[32] Nothing in the *Triennial Review Order* gives the states a roving mandate to ferret out and fix alleged impairments, let alone permits them to disregard the one remedy the FCC specifies in favor of another that the FCC specifically rejected.

Again, AT&T's argument has already been rejected elsewhere. In Oregon, AT&T sought to expand that docket's issues list to include a question asking generically what remedial actions that state's commission might take to alleviate impairments, citing the

---

30 *Id.* (citing *Triennial Review Order* ¶ 486).

31 *Triennial Review Order* ¶ 486 (emphasis added).

32 *Id.* ¶¶ 487-88.

same (inapposite) part of the *Triennial Review Order* that it cites here. The ALJs rejected AT&T's request as contrary to the *Order*: "The inquiry posed in Paragraphs 460 and 486 requires States to take *certain* actions to alleviate impairment in markets, *but does not give them authority to consider issues or adopt remedial obligations beyond those specified by the FCC.*"[33] The ALJs correctly acknowledged that the "certain actions" the FCC specified all relate to the adoption of a batch hot cut process.[34] This Commission should likewise reject AT&T's arguments.

Conclusion

AT&T's attempt to ignore the *Triennial Review Order*'s explicit rejection of its electronic loop provisioning proposal and smuggle ELP back into the nine-month cases is improper. Qwest respectfully asks the Commission to strike from the record the portions of Mr. Falcone's January 23 testimony identified in footnote 1.

---

[33] Ruling, *Investigation To Determine, Pursuant to Order of the Federal Communications Commission, Whether Impairment Exists in Particular Markets If Local Circuit Switching for Mass Market Customers Is No Longer Available As an Unbundled Network Element*, Docket UM 1100, at 2 (Or. Pub. Util. Comm'n Nov. 14, 2003) (emphasis added).

[34] *Id.* (noting that the *Triennial Review Order* paragraph authorizing states to take "certain" remedial actions "immediately precedes the FCC's discussion of the batch hot cut process that the States must approve within nine months of the effective date of the TRO").

Dated: Monday, February 09, 2004.

SUSAN K. RICHTER
Notary Public, STATE OF NORTH DAKOTA
My Commission Expires JUNE 15, 2004

STATE OF NORTH DAKOTA

PUBLIC SERVICE COMMISSION

Public Service Commission
Local Competition
Investigation

Case No. PU-439-03-295

ORDER
February 4, 2004

On January 14, 2004, the Commission issued a discovery order in regard to Qwest's discovery requests of party ILECs. Since the issuance of that order Qwest filed a January 15, 2004, Motion to Issue Information Requests, asking, in the alternative to its discovery requests of party ILECs, that the Commission issue Information and Document Requests, which were attached to its motion, to all CLECs certified or registered to provide local exchange telecommunications service in North Dakota and which have not intervened as parties in this proceeding. The parties have apparently made all of their responses and replies to the motion and the Hearing Officer has been asked to rule on the motion. *See* N.D. Admin. Code § 69-02-02-08.

This is discovery and the "[p]arties may obtain discovery regarding any matter, not privileged, which is relevant to the subject matter involved in the pending action, whether it relates to the claim or defense of the party seeking discovery or to the claim or defense of any other party ... It is not ground for objection that the information sought will be inadmissible at the trial if the information sought appears reasonably calculated to lead to the discovery of admissible evidence." N.D.R.Civ. P. 26 (b)(1). The Commission has broad authority to obtain information it deems necessary with regard to its proceedings. *See* N.D.C.C. § 49-02-02; N.D. Admin. Code § 69-02-01-08. However, the ALJ agrees with counsel for the RLECs that this action should be adjudicated in regard to the real parties in interest, the parties in this action, if possible.

There is an alternative to Qwest's Motion, first proposed by Qwest only in regard to party ILECs, one dealt with, but not entirely, by the Commission's January 14, 2004, Order. The Commission did not directly rule whether RTCG members (rural ILECs), which are parties to

Order

by Office of Administrative Hearings by Allen Hoberg, Al
02/06/2004 CC: Comm Legal Illona . .

this proceeding and subject to discovery, should be required to answer Qwest's discovery requests to the extent that they are providing Qualified Services by themselves or through affiliate CLECs. Under the rules of civil procedure regarding discovery, they may be required to respond to that request. The information sought appears to be relevant and reasonably calculated to lead to the discovery of admissible evidence. The alternative is for the Commission to issue Information Requests to nonparty CLECs, which is authorized under N.D.C.C. § 49-02-02 and N.D. Admin. Code § 69-02-01-08, but not advisable.

Accordingly, the Public Service Commission orders that the Qwest's January 15, 2004, Motion to Issue Information Request is DENIED, but only because the alternative sought by Qwest is the better approach in discovery. RTCG members (rural ILECs) which are parties to this proceeding and subject to discovery, are required to answer Qwest's discovery requests to the extent that they are providing Qualified Services by themselves or through affiliate CLECs. Any appropriate specific objection to a specific request may be invoked under the rules of civil procedure. Any appropriate trade secret protection may be sought or invoked in accordance with Commission rules. *See* N.D. Admin. Code ch. 69-02-09. Of course, violations of trade secret protection may be pursued under N.D.C.C. ch. 47-25.1.

Case No. PU-439-03-295

ORDER GRANTING AMENDED INTERVENTION

January 28, 2004

On October 24, 2003, the Rural Telephone Company Group (RTCG) filed a Petition to Intervene in this proceeding on behalf of the Rural Telephone Company Group (RTCG). The RTCG is comprised of BEK Communications Cooperative, Consolidated Communications Networks, Inc., Consolidated Telcom, Dakota Central Telecommunications Cooperative, Dakota Central Telcom I, Inc., Dickey Rural Telephone Cooperative, Dickey Rural Communications, Inc., Dickey Rural Access, Inc., Griggs County Telephone Co, Inter-Community Telephone Company, L.L.C., Midstate Telephone Company, Midstate Communications Inc., Moore and Liberty Telephone Company, North Dakota Telephone Company, Northwest Communications Cooperative, Polar Communications Mutual Aid Corporation, Polar Telecommunications, Inc., Polar Telcom, Inc., Red River Rural Telephone Association, Red River Telecom, Inc., Reservation Telephone Cooperative, SRT Communications, Inc., Turtle Mountain Communications, Inc., United Telephone Mutual Aid Corporation, and West River Telecommunications Cooperative.

On November 20, 2003 the Commission granted the RTCG's petition to intervene.

On January 14, 2004 the Commission granted the request of Consolidated Communications Networks, Inc. to withdraw as an interventor.

By letter dated January 15, 2004 the RTCG indicated that it had erroneously included Dakota Central Telecom I, Inc, as an intervening member of the RTCG rather than Daktel Communications, L.L.C., and asked to substitute Daktel Communications, L.L.C. for Dakota Central Telecom I, Inc.

Order

The Commission orders:

1. The petition of the Rural Telephone Company Group, to amend its intervention in this proceeding is granted and Daktel Communications, L.L.C. is substitute for Dakota Central Telecom I, Inc.

158 PU-439-03-295 Pages: 2

PUBLIC SERVICE COMMISSION LOCAL COMPETITION INVESTIGATION
CASE NO. PU-439-03-295

We are responding to an email of last week requesting comment before the staff meeting of the PSC to discuss the discovery issues pending before the PSC which are on the administrative agenda for Wednesday, January 28.

1. **RURAL ILECS**

First of all, we do not think anyone objects to the Rural ILECs being excluded from MCI and Qwest discovery and only requiring answers where the RLEC is providing Qualified Services in a Qwest service area. MCI has responded in writing saying so and Qwest has responded by saying they have no objection as long as the RLECs respond with information on behalf of their affiliated CLECs.

We represent three ILECs who have affiliated CLECs. We honor the separate corporate existence of each entity and the CLECs are separate legal entities. Two of the CLECs are parties to this proceeding; one is no longer. The question of this third CLEC, which is an affiliate of Consolidated Telecom, is subject to a pending motion by Qwest to allow discovery on non-party CLECs.

It is the position of the RLECs, and we think the correct interpretation of Rule 17 of the North Dakota Rules of Civil Procedure, that any action should be prosecuted by the real party in interest. With respect to the new discovery sought by Qwest, the real party in interest is the CLEC, not the ILEC.

157 PU-439-03-295 Pages. 4
Response to e-mail re discovery
by Rural Telephone Company Group by Don Negaard,
01/28/2004 CC: Comm Legal PUD (3) ALJ .

Another example is another ILEC-affiliated CLEC in this matter, IdeaOne. We do not represent this CLEC, and they are making a separate appearance in this matter. It would not seem logical that each ILEC that owned a piece of IdeaOne should be required to answer on behalf of that entity.

We represent to the PSC and to the other parties that the two CLECs who are parties to this matter have responded and will respond on their own behalf to discovery. Although not a party any longer, the Consolidated-affiliated CLEC would, as a separate entity, respond to any PSC-generated discovery. We object to any effort to impose an obligation on a legal entity to answer the discovery of a different, separate legal entity.

2. CLEC DISCOVERY

There is a concern amongst the two CLECs who are parties to this matter, Polar Telcom, Inc., and Daktel Communications, L.L.C., that the discovery being sought in this matter is not necessary for the PSC to perform the analysis the FCC has delegated to the states. Although the title of the case is "Local Competition Investigation," the case is not really about that at all. This case is a proceeding to investigate whether there is impairment to competitors in Qwest's service areas.

The FCC stated in its TRO that the policy of the regulators in this country has been and should be to encourage investment in facilities that provide competition. (See comments in paragraph 22 at pages 22-23 of the TRO discussing prior FCC orders and Section 252(d)(2) mandates from Congress.)

The FCC also stated that the key question is not a micro-analysis of entry that has occurred but whether it has occurred using non-incumbent ILEC facilities. "We decline to determine impairment based on a certain level of retail competition because Section 252(d)(2) requires us to ask whether requesting carriers are "impaired," not whether certain thresholds of retail competition have been met." (FCC TRO paragraph 1140, page 78.) As noted by these two CLECs in their answers filed with the PSC, they are competing using their own facilities and do not believe they are impaired in doing so.

The FCC stated that more analysis would be conducted, where appropriate. These CLECs believe the fact they are competing in two communities using their own facilities is evidence enough. They have taken the initiative by investing in their facilities rather than using UNEs.

The danger this proceeding poses to these two CLECs, and any other CLEC that is asked questions that require sensitive data to be shared with competitors and potential

competitors, is that the very investment they have taken the initiative to make is at risk when their investment in competitive entry and their entire business plan is placed on public record. They appreciate that the Commission's Rules require non-disclosure to be signed by persons asking for access to this information, but as a practical matter they have no means of enforcement of the Rule if a competitor should improperly use the information requested. It would be very difficult to prove.

In its TRO, the FCC stated it did not wish to engage in an analysis of competitors but rather in an analysis of whether barriers to entry currently exist. These two CLEC parties submit this question has been answered by the fact of their business decision, not in the detail of their current operations.

3. NON-PARTY DISCOVERY

The PSC should limit the discovery on non-parties to questions that are relevant for the same policy reasons as those noted above. Due to the possibility of recurring proceedings and with due regard to non-parties that are competing as CLECs in today's market, the discovery should be limited to determining in which Qwest markets non-parties are competing using non-Qwest facilities and Qwest facilities. The analysis should end there, without a micro-analysis of a non-party's business and operating plans.

Again, the non-parties that are participating using facilities available to them can state what facilities are being used and what general types of customers are being served. There is no need to eviscerate the patient to see how the patient is doing. To lay the internal workings wide open after the CLEC has invested a considerable amount of resources in developing a business plan and customer goodwill discourages similar investment in the future.

For these reasons, the Rural ILECs and two affiliated CLECs resist extensive discovery requests.

CONCLUSION

There seems to be no debate that the Rural ILECs should not be required to answer any discovery in this matter unless they are providing Qualified Services in a Qwest service area. The issue of CLEC discovery should be treated totally different and separate from this issue.

The two CLECs who are parties to this matter resist and request that they not be obligated to respond to discovery that requires a micro-analysis of their operations. We believe a

hearing would be helpful on this issue if discussions amongst the parties are not productive.

The RTCG requests that discovery to non-party CLECs be limited in scope for the same reasons that CLEC discovery be limited. Again, a hearing would be helpful on these issues if discussions are not productive.

I. INTRODUCTION

Q. PLEASE STATE YOUR NAME FOR THE RECORD.

A. My name is Robert V. Falcone.

Q. BY WHOM ARE YOU EMPLOYED AND IN WHAT CAPACITY?

A. I am a self-employed telecommunications and management consultant retained by AT&T to assist with its efforts on the TRO hearings in the states.

Q. PLEASE BRIEFLY DESCRIBE YOUR EDUCATIONAL BACKGROUND AND EMPLOYMENT EXPERIENCE.

A. I hold a B.S. in Business Administration from Adelphi University, Garden City, New York. Additionally, I attended a number of technical and business related courses offered by the AT&T School of Business when I was employed by AT&T on a full time basis. My career with AT&T began in 1970, working in a large central office in New York City. One of my first assignments with AT&T, which lasted for about eight-months, was a frameman. In this assignment my responsibility was to install and remove cross connections on various central office frames. For the next seven years I worked as a switchman in a central office performing switch provisioning and maintenance activities. In 1978, I was promoted to a first level manager responsible for the software administration of the New York City 4ESS switching complexes. As a first level manager I subsequently held various assignments in AT&T's operations and engineering departments. In 1986, I was promoted to a second level manager responsible for AT&T's access engineering in the Northeast. I also held assignments as a product

implementation manager in Bell Laboratories, project manager for the implementation of a new circuit switched network in Canada in a joint venture with Unitel of Canada and implementation manager for AT&T's conversion of its access network to SS7 out-of-band signaling. In 1994, I was promoted to a District Manager responsible for headquarters support of AT&T's local market network implementation. In 1997, I was promoted to a Division Manager responsible for supporting the AT&T regions with local market entry initiatives. I retired from AT&T in June of 1998. After retiring from AT&T, I have worked as a self-employed consultant for numerous clients, including AT&T, CompTel, BearingPoint (formerly KPMG Consulting) and Liberty Consulting. While working as a subcontractor with BearingPoint I was the group leader for BearingPoint's Systems Engineering Organization on the incumbent local exchange carrier ("ILEC") Operational Support System ("OSS") testing team. In this role I was responsible for the test planning, test bed development and test execution for BearingPoint's various ILEC OSS Section 271 testing efforts, including the Regional "ROC" test of Qwest's OSS.

Q. WHAT ISSUES DOES THIS TESTIMONY ADDRESS?

A. This testimony describes the current hot cut process, addresses the adequacy of certain components of Qwest's batch process and describes a long-term solution that is necessary to remove the impairment CLECs face without access to unbundled local switching.

Q. HOW IS YOUR TESTIMONY ORGANIZED?

A. First, I describe the current hot cut process. Second, I discuss the findings of the Federal Communications Commission ("FCC") in the Triennial Review Order ("*TRO*")[1] regarding the current hot cut process. I summarize the FCC's conclusion that CLECs are impaired without access to unbundled local switching as a result of economic and operational impairment, among other things, related to the hot cut process and describe certain aspects of the FCC's directions to the Commission regarding the FCC's finding of impairment. Third, my testimony provides recommendations on evaluating the proposed batch process. Fourth, I discuss the deficiencies and inadequacies in Qwest's proposal. Finally, I discuss why an electronic provisioning process is necessary to truly eliminate the impairment.

II. BACKGROUND: THE HOT CUT PROCESS

Q. WHAT IS A HOT CUT?

A. Whenever a customer seeks to move his or her local service from one switch-based carrier to another, the connection between the customer's loop and the original carrier's switch must be broken and a new connection must be established between that loop and the new carrier's switch. Because the customer's loop is lifted or "cut" while it is still in active service (*i.e.*, the loop is "hot"), the process used to transfer loops has become known as a "hot cut." The hot cut process

[1] *In the Matter of Review of the Section 251 Unbundling Obligations of Incumbent Local Exchange Carriers; Implementation of the Local Competition Provisions of the Telecommunications Act of 1996; Deployment of Wireline Services Offering Advanced Telecommunications Capability,* CC Docket Nos. 01-338, 96-98, 98-147, Report and Order and Order on Remand and Further Notice of Proposed Rulemaking, FCC 03-36 (rel. Aug. 21, 2003) (hereinafter *"TRO"*).

involves two separate changes to the customer's service that must be coordinated to occur at approximately the same time: (1) the manual transfer of the customer's loop from one carrier's network to another's (the loop cut); and (2) the porting of the customer's telephone number (including the timing of the associated software changes and disconnection of the original carrier's switch translations), so that inbound calls to the customer can be routed to the new carrier's switch using the customer's existing telephone number.

Q. DOES A HOT CUT CAUSE THE CUSTOMER TO LOSE SERVICE?

A. Yes. This occurs in two ways. The first is a complete loss of dial tone. From the time the customer's loop is disconnected from the ILEC's switch until it is reconnected to the competitive local exchange carrier's ("CLEC") switch, the customer has no dial tone and is completely out of service. Second, from the time the customer's loop is reconnected to the CLEC's switch until the customer's number is successfully ported to the CLEC's switch, the customer cannot receive any incoming calls. That is because, until the appropriate change message is received by the Number Portability Administration Center ("NPAC"), the NPAC database indicates that calls should be routed to the ILEC's switch. If calls are sent to the ILEC's switch after the customer's loop has been physically moved, they are unable to complete.

Q. HOW DID THE FCC ADDRESS THE ISSUE OF HOT CUTS?

A. In the *TRO*, the FCC reviewed substantial data provided by both ILECs and CLECs and found, on a national basis, that competing carriers providing voice service to mass market customers are impaired without access to unbundled local

circuit switching.[2] This finding was based, in part, on clear evidence regarding the economic and operational barriers caused by the hot cut process.[3] The FCC recognized that "whether a customer was previously being served by the competitive LEC using unbundled local switching (*i.e.*, using UNE-P), or by the incumbent itself, a hot cut must be performed [if unbundled local switching is no longer available]."[4] I will address the details of the FCC's impairment finding with respect to hot cuts later in my testimony.

Q. HOW DOES THE HOT CUT PROCESS DIFFER FROM PROVIDING SERVICE USING UNE-P?

A. UNE-P is a simple process that is ordered and provisioned electronically. With UNE-P, there is no need to perform any physical work in the ILEC's central office or outside loop plant to migrate an existing ILEC customer to a CLEC that is providing service using UNE-P. The migration from ILEC-retail to CLEC-UNE-P service only requires the ILEC to make software changes. Thus, there is little chance for error and the customer does not have to lose service during the migration, because the service is being provided through the use of the ILEC's switch. This eliminates the need for a physical transfer of the customer's loop, as well as the need to port the customer's telephone number to another switch. Consequently, CLECs offering service via UNE-P may almost always provide service to the customer very quickly, often on the same day the customer signs-up for service with the CLEC.

---

[2] *TRO* at ¶459.
[3] *Id.*; *see also TRO* at ¶ 473 ("Our national finding of impairment is based on the combined effect of all aspects of the hot cut process on competitors' ability to serve mass market voice customers.").
[4] *Id.* at ¶ 465.

A hot cut, in sharp contrast, is a complex, highly manual process. It requires significant coordination between both the ILEC and a CLEC. Both carriers must perform multiple tasks in the hot cut ordering and provisioning processes, and both parties must coordinate these operations in the proper, agreed-upon sequence. If the many steps of the hot cut process are not performed in that exact sequence -- and properly coordinated between both carriers -- and if the ILEC does not complete its downstream processes correctly and timely, the customer will experience a service outage that is much longer than the unavoidable outage associated with this process.

Q. PLEASE DESCRIBE THE ADDITIONAL STEPS OF MIGRATING A CUSTOMER FROM AN ILEC TO AT&T USING A HOT CUT AS OPPOSED TO THE UNE-P PROCESS.

A. When a CLEC uses its own switch to serve mass market local customers with a UNE-L architecture, the processes needed to change local carriers are much more complex, manual and costly than for UNE-P, requiring physical work to transfer the customer's loop from one carrier's switch to another's. For example, the CLEC must assign the customer to facilities in its switch and equipment; both the CLEC and the ILEC must conduct a series of number porting activities; and the ILEC must perform numerous manual provisioning and testing activities in its central office and sometimes in the field. A summary of all the additional technical steps involved in a hot cut is contained in **Exhibit 1** attached to my testimony. Not only are there significantly more steps involved in a hot cut, but

also those steps must be coordinated if a cut is to be successful in limiting the time the customer is out of service.

III. THE FCC'S FINDINGS REGARDING THE CURRENT HOT CUT PROCESS

Q. WHAT DEFICIENCIES DID THE FCC FIND WITH THE CURRENT HOT CUT PROCESS?

A. The FCC made numerous findings regarding the inadequacy of the current hot cut process. These findings confirm the concerns AT&T has raised about hot cuts in the past and demonstrate why AT&T moved away from UNE-L hot cuts as a method to provide service to its customers.

First, the FCC recognized that deficiencies in the hot cut process are seen and felt by customers. It found that the problems and delays associated with hot cuts "prevent[ ] the competitive LEC from providing service in a way that mass market customers have come to expect."[5] This is a substantial problem because "competition is meant to benefit consumers, and not create obstacles for them."[6]

Second, the FCC recognized that CLECs are likely to lose customers as a result of these problems. "Service disruptions also will influence customer perceptions of competitive LECs' ability to provide quality service, and thus affect competitive LECs' ability to attract customers."[7] Specifically, the FCC found that the "record

[5] *TRO* at ¶ 466.
[6] *Id.* at ¶ 467.
[7] *Id.* at ¶ 466.

shows that customers experiencing service disruptions generally blame their provider, even if the problem is caused by the incumbent."[8]

Third, the FCC recognized that many of the problems with hot cuts are inherent in the process. The FCC concluded, based on the evidence presented, that "hot cut capacity is limited by several factors, such as the labor intensiveness of the process, including substantial incumbent LEC and competitive resources devoted to coordination of the process, the need for highly trained workers to perform the hot cuts, and the practical limitations on how many hot cuts the incumbent LECs can perform without interference or disruption."[9]

Fourth, the FCC focused specifically on the unavoidable limitations on the volume of hot cuts the ILECs could perform. The FCC found that CLECs were impaired because hot cuts could not be performed in the volumes that would occur in the mass market: "[h]aving reviewed the record evidence, we find that it is unlikely that incumbent LECs will be able to provision hot cuts in sufficient volumes absent unbundled local circuit switching in all markets."[10] The FCC specifically rejected ILEC arguments that the FCC's findings in section 271 proceedings regarding hot cuts demonstrated lack of operational impairment. The FCC correctly found that the number of hot cuts in the current market environment "is not comparable to the number that incumbent LECs would need to perform if unbundled switching were not available for all customer locations

[8] *Id.* at ¶ 467.
[9] *Id.* at ¶ 465.
[10] *Id.* at ¶ 468.

served with voice-grade loops."[11] Thus, the issue here is that there is "an *inherent limitation* in the number of manual cut overs that can be performed, which poses a barrier to entry that is likely to make entry into a market uneconomic."[12]

Finally, the FCC concluded that ILEC promises, regarding the ability to perform some volume of hot cuts that had never been requested, cannot be relied upon to demonstrate adequate performance. Specifically, the FCC found that "incumbent LECs' promises of future hot cut performance [are] insufficient to support a FCC finding that the hot cut process does not impair" CLECs.[13]

In short, the FCC found "ample testimony in the record" on the CLECs' operational and economic difficulties with hot cuts.[14] It recognized that "hot cuts frequently lead to provisioning delays and service outages and are often priced at rates that prohibit facilities-based competition for the mass market."[15]

Q. PLEASE SUMMARIZE THE FCC'S NATIONAL FINDING OF IMPAIRMENT REGARDING THE HOT CUT PROCESS.

A. Based in large part on its conclusions outlined above, the FCC made a "national finding that competitive carriers providing service to mass market customers are impaired without unbundled access to local circuit switching" and set out a plan to help mitigate the "inherent difficulties" with the ILECs' hot cut processes.[16] The FCC's plan included asking the state commissions to "approve and implement a batch cut migration process – a *seamless, low-cost process for*

[11] *Id.* at ¶ 469.
[12] *Id.* (emphasis added).
[13] *Id.* at n. 1437.
[14] *Id.* at ¶ 466.
[15] *Id.*
[16] *Id.* at ¶¶ 422-423.

transferring large volumes of mass market customers . . . ."[17] This batch cut process must "render the hot cut process more efficient and reduce per-line hot cut costs."[18] It must also "address the costs and timeliness of the hot cut process."[19]

Q. WHAT DOES THE FCC MEAN BY "BATCH CUT PROCESS"?

A. The FCC defined a batch cut process as a seamless, low-cost process for transferring large volumes of mass market customers.[20] The FCC found that "the hot cut process could be improved if cut-overs were done on a bulk basis, such that the timing and volume of the cut over is better managed," and the non-recurring costs reduced.[21] Indeed, the FCC found that "such improvements are likely to be *essential* to overcome the operational impairment that competitors face in serving mass market customers. *Without such improvement*, the record shows that *carriers are likely to be unable to economically serve a market characterized by low margins.*"[22]

Q. DID THE FCC FIND CURRENT ILEC PROCESSES FOR CONVERTING CUSTOMERS IN BULK TO BE SUFFICIENT?

A. No. The FCC found that "[p]roject managed cut-overs involve the conversion of a number of lines at one time, pursuant to provisioning requirements and intervals negotiated by the incumbent and the competitive LEC. We find that these approaches are not sufficiently developed or widespread enough to adequately

[17] *Id.* at ¶ 423 (emphasis added).
[18] *Id.* at ¶ 460.
[19] *Id.* at ¶ 488.
[20] *Id.* at ¶ 487.
[21] *Id.* at ¶ 474.
[22] *Id.* (emphasis added).

address the impairment created by the loop cut over process. The evidence in the record demonstrates that the carriers that have used project-managed cut-overs have used them only for business customers, and only after acquiring the customer through a means that offered the use of incumbent LEC loops and switches in combination."[23]

The FCC also noted "the record evidence indicates that incumbent LECs are not well-equipped to handle hot cut volumes even with the existence of a procedure to manage bulk migrations on a project-managed basis."[24]

Q. DID THE FCC OFFER ANY DIRECTION FOR STATE COMMISSIONS REGARDING BATCH CUT PROCESSES?

A. The FCC found that a seamless, low-cost batch cut process for moving mass market customers from one carrier to another is necessary, ***at a minimum***, for carriers to compete effectively in the mass market.[25] The FCC's Order directs state commissions to approve, within nine months of the effective date of the Order, a batch cut migration process to be implemented by the incumbent LECs that will address the costs and timelines of the hot cut process.[26] More specifically, it requires state commissions to do the following:

- Adopt a batch cutover "increment" for migrating customers served by unbundled loops combined with unbundled local circuit switching to

[23] *Id.* at ¶ 474.
[24] *Id.* at ¶ 487, n. 1516.
[25] *Id.* at ¶ 487.
[26] *Id.* at ¶ 488. A state commission may decline to institute a batch cut process, provided that it instead issues *detailed* findings regarding the volume of UNE-L migrations that could be expected if competitive LECs were no longer entitled to unbundled local circuit switching, that the incumbent can be expected to meet that demand in a timely and efficient manner using the existing hot cut process, and that the non-recurring costs associated with the hot cut process are not an entry barrier. *Id.* at ¶ 490. Failure to develop a process, however, does not relieve the state commission of its obligation to analyze whether requesting carriers are impaired without access to unbundled switching.

unbundled stand-alone loops. In other words, states should decide the appropriate volume of loops that should be included in the "batch."

- In conjunction with incumbent LECs and competitive LECs, approve specific processes to be employed when performing a batch cut. The FCC "expect[s] these processes to result in efficiencies associated with performing tasks once for multiple lines that would otherwise have been performed on a line-by-line basis."

- Determine whether the ILEC is capable of migrating batch cutovers in a timely manner.

- Adopt TELRIC rates for the batch cut process. These rates should reflect the efficiencies associated with batch migration of loops to a competitive LEC's switch, either through a reduced per-line rate or through volume discounts.[27]

Q. ARE THERE OTHER ISSUES RELATED TO BATCH CUTS THAT THE FCC DIRECTED THIS COMMISSION TO CONSIDER?

A. Yes. The FCC also directed state commissions to consider whether (or the extent to which) temporary or "rolling access" to UNE-P would address all identified impairment.[28] Rolling access to UNE-P is not adequate to "cure" the many operational and economic issues for the reasons described in other AT&T testimony. However, should the Commission make a finding that all economic and operational impairment would be eliminated by a batch hot cut process, AT&T believes the use of rolling UNE-P is required. Indeed, AT&T is not aware of any methodology for transferring "batches" of customers that would not require the customers to first be acquired by the CLEC.[29] Therefore any batch migration process developed by this Commission should be based on the

[27] *TRO* at ¶ 489.
[28] *TRO* at ¶ 524.
[29] The FCC stated that "we find that the availability of unbundled local switching – even on a temporary basis – may enable competitors to acquire customers, aggregate them, and migrate them to the carriers' own switch in a manner *that would not be feasible if the customers each had to be migrated individually* upon signing up with the competitive LEC." *TRO* at ¶ 522 (emphasis added).

assumption that the CLEC has already acquired the customer using UNE-P before moving it to a UNE-L/CLEC switch network configuration. Further, as acknowledged by the FCC, "competitive LECs may face difficulties in accumulating enough customers to justify batch line migration processing *in both new central offices* and existing collocations."[30] Accordingly, if rolling access is established by this Commission, it should include sufficient time for CLECs to accumulate enough customers to justify collocation, and enough time to then establish the collocation in new central offices or to augment existing collocation arrangements where necessary.

IV. RECOMMENDATIONS ON EVALUATING THE BATCH PROCESS

Q. DID THE FCC IDENTIFY A STANDARD AGAINST WHICH AN ILEC'S HOT CUT PROCESS SHOULD BE MEASURED?

A. Yes. In describing a hot cut process that demonstrated "consistently reliable performance," the FCC recognized that for the migration of customers, UNE-P should be the standard of performance. The FCC stated: "This review is necessary to ensure that customer loops can be transferred from the incumbent LEC main distribution frame to a competitive LEC collocation *as promptly and efficiently as incumbent LECs can transfer customers using unbundled local circuit switching*."[31] Thus, the appropriate comparison must be whether the ILEC can move customers served by UNE-L at the same volumes and performance levels as UNE-P. This is perfectly logical, since CLECs would be forced to

[30] *Id.* at ¶ 522 (emphasis added).
[31] *TRO* at n. 1574 (emphasis added).

abandon UNE-P and substitute UNE-L if they were denied access to unbundled local switching.

Moreover, such a standard is required in order to provide parity to all carriers that seek to provide a bundle of both local and long distance services to mass market customers. ILECs today can (and do) add large numbers of long distance customers through the electronic PIC process, which is very comparable to the electronic provisioning process used to provide UNE-P service. If CLECs cannot have the same ability to add local customers, they are seriously impaired in their ability to provide similar bundled offers. Indeed, the RBOCs themselves have recognized that the ability to offer such bundles is a major competitive advantage in fending off CLECs and/or winning back CLEC local customers. Further, since the FCC's impairment standard requires a review of all costs and revenues a CLEC would incur, including long distance, CLECs must have the same ability to offer local/long distance bundles as the ILEC.

Q. WHAT CHARACTERISTICS SHOULD BE INCLUDED IN ANY BATCH CUT PROCESS CONSIDERED BY THIS COMMISSION?

A. While any batch process will still continue to contain the same manual steps as the current process, making it difficult to significantly reduce the economic and operational impairment, the development of a batch cut process by this Commission would be of some benefit to competition, because it would facilitate CLECs' use of non-ILEC facilities in the limited situations where it is otherwise feasible to do so. From AT&T's perspective, the process should, at a minimum, address the elements contained in **Exhibit 2** attached.

Q. WILL THE IMPLEMENTATION OF A BATCH PROCESS ELIMINATE ECONOMIC IMPAIRMENT?

A. No. First, the efficiency gains realized from a manual batch process will likely be too incremental to result in substantial reduction of the overall costs required to extend mass market loops to CLEC switches. And even if the ILEC charges for hot cuts were reduced, that would affect only one of many additional costs that only CLECs face in attempting to provide service using non-ILEC switches. Critically, a batch provisioning process does not relieve any of the economic impairment that results from the collocation, collocation equipment and backhaul costs that a CLEC must incur to connect the ILEC loop to its switch.

Q. WILL THE IMPLEMENTATION OF A BATCH PROCESS ELIMINATE OPERATIONAL IMPAIRMENT?

A. No. The batch hot cut process does not eliminate any of the manual steps necessary to perform a hot cut. It also does not eliminate the need to physically change out the customer's facilities for those customers that are on Integrated Digital Loop Carrier ("IDLC"). Any process that relies on multiple manual steps to achieve a customer migration to another carrier is going to be subject to human error and therefore is unsatisfactory for serving the mass market.

V. QWEST'S BATCH PROCESS

Q. CAN YOU DESCRIBE QWEST'S CURRENT BATCH PROPOSAL?

A. No. AT&T spent 8 days in meetings reviewing and discussing Qwest's proposal. Qwest's initial proposal evolved over time. Qwest made a new, conditional

proposal near the end of discussions, and AT&T is not sure if that proposal is still outstanding or was withdrawn because the CLECs did not accept all of the conditions. However, notwithstanding the proposal Qwest ultimately submits, there are a number of issues that were discussed and that Qwest and the CLECs agreed are at impasse. These impasse issues are fundamental to any batch process Qwest proposes.

Q. WHY DO YOU CLAIM THAT THE IMPASSE ISSUES ARE FUNDAMENTAL?

A. Because the impasse issues go to the very basis of the FCC's finding of impairment. The FCC stated:

> "we find the overall impact of the current hot cut process raises competitor's costs, lowers the quality of service, and delays the provisioning of services, thereby preventing them [CLECs] from serving the mass market in the large majority of locations."[32]

Qwest's current batch hot cut proposal will further raise the CLECs' internal costs, will lower the quality of the hot cut process and will further delay the provisioning of service.

The FCC told the states to decide the appropriate volume of loops to be included in the batch, approve specific, efficient, and cost effective processes to be used when performing a batch, and determine whether the ILEC is capable of migrating customers using the process in a timely manner.[33] All of the impasse issues are directly related to these issues. Qwest's proposal, therefore, falls far short of the goals sought to be achieved by the FCC.

[32] *TRO* at ¶ 473.
[33] *TRO* at ¶ 489.

A. Size of the Batch

Q. WERE THE CLECS AND QWEST ABLE TO COME TO AN AGREEMENT ON THE SIZE OF THE BATCH?

A. No. Qwest's initial proposal was that the minimum size of the batch should be 25 loops. The maximum size of the batch would be 100 loops. The total per central office would be 100 loops per day for all CLECs. Therefore, if a CLEC puts in an order for 100 loops in one batch, that is the entirety of the loops that could be cut that day in the central office using the batch process.

Q. DID QWEST'S PROPOSAL CHANGE DURING THE MEETINGS?

A. It would be more accurate to say it became more refined. Qwest would not change its original proposal of a maximum batch of 100 loops per day per central office. It did not agree to lower the 25 loop minimum order size for a batch, but it did agree to process the batch even if some of the 25 loops were rejected from the batch.

Q. DOES AT&T DISAGREE WITH THE REQUIREMENT THAT THE BATCH INCLUDE AT LEAST 25 LOOPS?

A. Yes. There is no reason that there should be a minimum batch size. Once the order is placed, efficiencies should begin on the second cut. In fact, Qwest's current hot cut rates are reduced beginning with the second hot cut on an order, even if technically a multi-loop order is not considered a batch. Qwest argues there would be no efficiencies if, for example, it had to have central office or field technicians cut over less than 25 loops. However, under the current process, it

has to dispatch central office or field technicians if there is an order for one loop. Therefore, an order containing more than one loop would save a trip or trips to an unmanned central office. Even in manned central offices Qwest has admitted there are efficiencies to be gained from the elimination of some processes for a multi-loop order.[34]

The Qwest proposal is voluntary, not mandatory, according to Qwest. Therefore, Qwest may receive multiple orders from a CLEC on the same day or over a number of days for the same central office that will have different installation intervals, because it does not have 25 loops to submit as a batch. Qwest does not explain how this is more efficient, nor can it.

Q. DOES AT&T AGREE WITH THE 100 LOOP MAXIMUM PER BATCH?

A. No. AT&T has concerns that Qwest's proposal unnecessarily limits a CLEC's flexibility.

AT&T does not agree with the reasons Qwest provided to limit the size of the batch. Qwest makes two primary arguments against increasing the maximum number of loops that can be cut over in a day. The first is that no CLEC should need to do more than 100 in a central office in a day. In support of that argument, Qwest has stated that it can adequately transition the existing UNE-P base to UNE-L over the transition period established by the FCC[35] using the maximums

[34] Qwest Batch Hot Cut Forum, TR 281-282 (Dec. 2, 2003): "For example, just to walk over to analyze the orders and for the technician to pull all that stuff together, if they do that once for 25 orders, that's cheaper than if they did it once for each order and kept doing it over and over again for each separate order. So there's some real savings that are realized by the CO tech for that; a lot of analysis stuff; they only have to do entries into the system one time, they don't have to keep doing them multiple times." This is true whether it is 25 orders or 2 orders. It is simply a matter of degree.

[35] *TRO* at ¶ 532.

established by Qwest. Its second primary argument is that diseconomies of scale are created if it has more than one two-person team working on hot cuts in a central office at the same time. Qwest claims that if there is more than one two person team of technicians working on hot cuts at the same time, their central office technicians will be running into one another when doing work on the frames.

Qwest's second argument should also be rejected. Even if it were true that there are diseconomies of scale when more than one two-person team is migrating unbundled loops in a central office, Qwest could overcome that problem by simply having more than one shift in which it works batch hot cuts.

Q. SHOULD THE FOCUS BE ON TRANSITIONING THE EMBEDDED BASE OF UNE-P CUSTOMERS?

A. No. Though the batch process, if priced correctly and implemented in such a manner that it does not increase the risk of an extended outage for the CLEC's customers, may be used to facilitate the migration of the embedded base, AT&T believes that Qwest is inappropriately fixating on the transition of the existing base of UNE-P customers and failing to take into account migration of new UNE-L customers from Qwest to the CLECs or from CLEC to CLEC.[36] Without UNE-P, UNE-L volumes will significantly increase over current levels and increase the need and use of a batch process.

[36] A customer being served by a switch-based CLEC using UNE-L may lose that customer to another switch-based CLEC using UNE-L.

The FCC noted that CLECs have used UNE-L to serve small market segments, however, "no competitive carrier relies on hot cuts to offer services to significant numbers of customers served by voice grade loops."[37] The FCC further noted that some ILECs limited the number of hot cuts they would perform per day or per central office.[38] The FCC found an "inherent limitation in the number of manual cut overs that can performed, which poses a barrier to entry that is likely to make entry into a market uneconomic."[39] Qwest has not explained why its "limitation" passes muster and the limitations cited by the FCC did not. It cannot, because the FCC has equated any limitation to an entry barrier.

In addition, even for the embedded base, Qwest's argument is overly presumptuous, and it should be rejected. Qwest is presuming to know that CLECs will never find efficiencies in having more than 100 loops cut over in an office in a single day. In fact, if a CLEC has 200 UNE-P lines in a central office, it would be more efficient for the CLEC to have those lines converted at one time rather than in two or more days. Qwest's refusal to increase the maximum number of lines prevents CLECs from gaining efficiencies they could obtain.

Q. WHAT ABOUT QWEST'S SECOND CONCERN REGARDING TECHNICIANS RUNNING INTO EACH OTHER? IS THIS A VALID CONCERN?

A. The second issue raised by Qwest is the issue of technicians running into each other while working on the frames. First, most of the more active central offices

[37] *TRO* at ¶ 468.
[38] *Id.*
[39] *TRO* at ¶ 469.

are very large with large main distribution frames ("MDF"). Generally speaking in these offices this should not be a problem. Qwest's response is that it uses intermediate frames ("ICDFs"), and the other ILECs do not. It claims it is more difficult for multiple teams of technicians to be working on the ICDF at the same time than it is on the MDF. Any limitation due to the use of an ICDF was created by Qwest, and Qwest's decision to interject an ICDF should not be used to make the batch process less advantageous to the CLECs.

CLECs initially opposed the Qwest requirement of an ICDF. During the section 271 proceedings they argued for the ability to connect directly to the MDF. Qwest fought this for years. CLECs had no choice but to use the ICDF. Subsequently, Qwest relented, but a lot of CLEC infrastructure was already in place, and the use of a direct connection to the MDF is priced higher by Qwest, making its use less favorable. Since Qwest built in whatever limitations that it claims exist, it should find a method around them. This it can do by simply extending the limited hours it plans to do batch hot cut work.

Q. WHAT IS AT&T'S RECOMMENDATION ON THE MINIMUM SIZE OF THE BATCH?

A. Two. However, that recommendation is made in the absence of critical information. The first key piece of information that is lacking is the knowledge of whether CLECs will have access to rolling UNE-P as a customer acquisition tool. The second key piece of information is the price of a batch hot cut. Without rolling access to UNE-P, the minimum should be two. However, if rolling UNE-P is allowed then the minimum may be central office specific. In central offices

where there is a great deal of activity, a minimum of 10 or 20 lines may be reasonable, as it should not take a CLEC long to build up this quantity to qualify for a batch hot cut project. In smaller offices, where migration activity is likely to be nominal, the minimum needed to qualify for a batch job may remain as little as two or three lines. Of course, the price the Commission determines for the batch hot cut will significantly influence whether a CLEC uses the process and the economics of varying batch sizes.

Q. WHAT IS AT&T'S RECOMMENDATION ON THE MAXIMUM SIZE OF A BATCH?

A. Given that even the most efficiently designed batch hot cut process that can be developed using current technologies will still not eliminate any of the manual work associated with the customer migration process or the associated economic and operational barriers, AT&T understands why Qwest has to set a maximum limit on the number it can do. As opposed to the electronic methods used to transfer an unlimited number of customers to a new long distance carrier or to a new local carrier using UNE-P, CLECs will always be gated by any hot cut process. The "seamless, low cost" design envisioned by AT&T just cannot be achieved using technologies (the MDF) that were patented in the 19th century. AT&T's concern with the 100 per day per central office limit is that there is no flexibility with Qwest's proposal. Any CLEC who has outstanding orders for large batch jobs is going to be able to preclude other CLECs from being able to initiate a batch job in the same office. Any maximums set must consider that

there will be multiple CLECs trying to compete for customers in the same office and all will need to be able to avail themselves of the batch process.

Recognizing that, from a capacity perspective, this inherently manual process cannot be significantly improved, AT&T recommends that the maximum size of the batch be increased to 200 loops per central office per day. This assumes two shifts of Qwest technicians performing batch hot cuts.

B. The Specific Process

Q. YOU INDICATED EARLIER YOU COULD NOT DESCRIBE QWEST'S BATCH PROCESS. WERE THERE ANY IMPASSE ISSUES THAT ARE RELATED TO THE PROCESS?

A. Yes. There are a number of impasse issues. First, Qwest wants to limit the time of day the hot cuts in a batch are performed from 3 a.m. to 11 a.m. Second, Qwest has proposed creating a new web-based tool to communicate order status. Third, Qwest has disqualified IDLC and line split loops from a batch. Fourth, the standard five-day interval should be maintained. Fifth, the process does not allow migration by telephone number ("TN") and street address name ("SANO").

1. The Time When the Hot Cuts are Performed

Q. WHAT TIME OF DAY DOES AT&T WISH THE HOT CUT TO BE PERFORMED?

A. First of all, AT&T does not want the time for performing the actual hot cut[40] to be restricted from 3 a.m. to 11 a.m. Considering that the bulk of the manual work associated with a loop migration involves the pre-wiring and testing, which Qwest has agreed to perform prior to the day of the actual hot cuts, the actual lift and lay is all we are talking about. CLECs should be able to identify the specific time of day for performing the lift and lay. AT&T recognizes there may be more than one request for a particular time, but the CLEC should be able to request a time for the cut to accommodate the needs of its customers. Qwest responded to this request for flexible cutover times by stating that the CLEC can check the web-based status tool to determine when a batch has started or a CLEC could use a process that Qwest identified as "trap and trace." Although Qwest's proposals will tell the CLEC when the process has started, they require the CLECs to take affirmative steps to obtain the information. Furthermore, Qwest's proposals do not permit the CLECs to select the window when the cuts are performed, which may limit the CLEC's ability to use the batch process for select customers.

[40] By actual hot cut AT&T means the action of putting the customer out of service by removing the customer's existing connecting to the Qwest switch and connecting the customer's loop to the CLEC's collocated equipment

Q. WHY DOES AT&T WANT THE ABILITY TO SCHEDULE THE CUTS ANY TIME OF DAY?

A. Because hot cuts put customers out of service and prevent customers from making and receiving telephone calls, all customers are affected by the cutover process. Businesses are very concerned about being out of service during their business hours. Qwest's response is that there are other options available to CLECs to do coordinated cuts. This is yet another restriction on a process envisioned by the FCC to make the hot cut process more efficient. The fact is, AT&T is not asking to do a coordinated cut; it simply wants to be able to schedule the time of the cut. Qwest's second argument is that it reduces efficiency. AT&T disagrees. First, Qwest has not provided any evidence to demonstrate that it would be less efficient to schedule a batch of 5 or 95 loops at 1 a.m. rather than 9 a.m. It is AT&T's position that it is more efficient to do a batch of these loops at 1 a.m. than 5 -95 separate coordinated cuts. A batch should be more efficient at any time of the day than doing a similar number of loops on an individual case basis.

2. CLEC Notification

Q. WHAT IS AT&T'S CONCERN WITH THE WEB-BASED TOOL YOU MENTIONED?

A. One of the issues with any hot cut process is notification to the CLECs of the commencement and completion of the actual hot cut. Under the existing hot cut procedures, for a basic hot cut, the CLEC is notified by telephone when the cut is complete. For coordinated cuts, Qwest notifies the CLEC by telephone call when a hot cut is commenced and completed. Qwest proposes to develop a new web-

based tool that CLECs will have to periodically check to determine the status of the batch orders. This means that a CLEC will have to constantly review the web-based tool to confirm order completion, since the CLEC cannot port the numbers with NPAC until the process is completed. A telephone call upon completion of the hot cut is the current method used to notify the CLEC of order status.

Q. IS AT&T SUGESTING SOME OTHER METHOD OF NOTIFICATION?

A. As I noted, Qwest presently contacts the CLECs by telephone of the completion of a hot cut. For this same notification associated with batch hot cut jobs Qwest originally proposed sending an email. After a number of concerns were raised by the CLECs, Qwest proposed the web-based tool. Though such a tool may be a step in the right direction, the current design being put forth by Qwest places additional monitoring obligations on CLECs that do not exist now. In addition, it requires CLECs to use a tool that does not take advantage of existing CLEC OSS development. Whatever efficiencies Qwest may obtain through the use of this web-based tool are achieved at the expense of the CLECs.

Q. WHY DO YOU SAY THAT QWEST'S PROPOSAL DOES NOT TAKE ADVANTAGE OF EXISTING OSS?

A. CLECs have expended considerable sums to design and build OSS that are compatible with Qwest's OSS. Qwest provides two interfaces – an IMA GUI and IMA EDI. The GUI is web-based. The EDI is not. AT&T, for example, uses EDI. Instead of receiving a message using EDI, AT&T will have to review the web-based tool. It would be more efficient for the CLECs to receive messages over EDI. Additionally, such a notification method would be "pushed" out to the

CLECs upon completion of the hot cut as opposed to the CLECs having to have someone continually request updates to the web-based tool to determine whether or not their customer's line has been cutover to trigger them to port the customer's number. Either Qwest's web-based solution or the EDI solution will require some development effort on the parts of Qwest and CLECs. As a general matter, if AT&T is going to be performing development work, it would rather have the work performed as part of its existing EDI systems rather than on a web based, proprietary, Qwest system.

3. IDLC and Line Split Loops

Q. YOU TESTIFIED THAT QWEST HAS DISQUALIFIED IDLC LOOPS AND LINE SPLIT LOOPS FROM THE BATCH PROCESS. HOW DOES THAT AFFECT THE BATCH PROCESS?

A. It means, for example, that existing UNE-P customers served by loops using IDLC cannot be converted to UNE-L as part of the batch process. Qwest, once again, claims a loss of efficiency. However, once again, Qwest is placing conditions on the batch process that are not presently imposed on basic and coordinated cuts.

Qwest suggests that these lines can be handled using the present processes. AT&T believes this is unacceptable for a number of reasons. The number of IDLC loops in some central offices is not insignificant. Not only will CLECs be prevented from using the batch process for these loops, all the inherent limitations of the current process will continue to exist. The FCC specifically found that the

inherent difficulties of the current hot cut process creates impairment requiring CLEC access to unbundled local switching.[41] The batch process ultimately adopted is supposed to be a low-cost and cost-effective one.[42] CLECs with customers served by IDLC loops will be denied the cost savings of the batch process. In addition, a CLEC will have to develop or modify internal systems and processes to identify that a loop is served by IDLC and then employ separate processes and work flows depending upon the response.

4. Standard Interval

Q. WHAT SHOULD THE INTERVAL BE FOR THE BATCH PROCESS?

A. The current standard interval for an unbundled loop hot cut order when there are 1 – 8 lines at a single location is 5 days.[43] Qwest is proposing that the more efficient batch hot cut process standard interval be 7 days. It is an oxymoron to assert that a "more efficient" hot cut process takes longer to execute than the existing process. In addition, this too is a difficult question to answer without first knowing whether CLECs will have access to rolling UNE-P and the price of the batch hot cut process. Without access to UNE-P as a customer acquisition tool, the batch hot cut interval cannot exceed the current interval for a hot cut of five days for orders of 1-8 lines. There is no limit on the number of hot cut orders a CLEC can place with less than 8 loops and still receive the 5-day standard

[41] *TRO* at ¶ 422.
[42] *TRO* at ¶¶ 423 & 489.
[43] The vast majority of hot cuts will require less than 8 lines at a single location.

interval.[44] Consequently, there is no reason a more efficient process should be longer than the less efficient loop-by-loop process.

Q. IF THE CLEC IS ALREADY SERVING THE CUSTOMER USING UNE-P, DOES IT MATTER WHAT THE INTERVAL IS?

A. During any transition of existing UNE-P customers from UNE-P to UNE-L, the interval is less critical. However, if the batch process is expected to be used for the acquisition of new CLEC UNE-L customers, then 5 days is the maximum a new customer should have to wait to switch to the new CLEC.

5. Migration by TN and SANO

Q. EXPLAIN WHAT YOU MEAN BY MIGRATION BY TN AND SANO.

A. Currently, on a conversion from UNE-P to UNE-L, Qwest requires that the CLEC populate many address-related fields on the LSR. Once the CLEC submits the LSR, Qwest compares those many address-related fields to its own internal information. If the information does not match Qwest's internal information, the order is rejected. In contrast, when a customer is migrated from Qwest retail to CLEC UNE-P, the CLEC need not populate all of the address-related fields on the LSR. Instead, the CLEC only needs to provide on the LSR the customer's telephone number and street address number (the street address number field on the LSR is called the SANO). It is less work for the CLEC to create an LSR using only the customer's telephone number and SANO, and the order is less prone to errors and rejection than if the CLEC had to populate all of the address

[44] Though there is no advertised limit to the number of orders, Qwest really has never been put to the test to determine if they would be able to provide a 5-day interval considering today's modest hot cut volumes.

related fields. For a transfer of CLEC UNE-P customer to a UNE-L platform, since the customer is already an existing customer of the CLEC, MCI proposed, and AT&T supports, that the use of the customer's TN and SANO be sufficient. This would speed up the order process for the CLECs and eliminate the problem of orders being rejected or dropping out for manual handling where the address-related information on the LSR does not exactly match the address information in Qwest's internal systems. In other words, it would permit the CLECs to be more efficient, assuming the process is reasonably priced. Qwest has acknowledged there is no technical limitation that prevents Qwest from modifying its interfaces to do migrations by TN and SANO.

Q. IF QWEST HAS AGREED THERE IS NO TECHNICAL LIMITATION, WHAT IS THE PROBLEM?

A. MCI wants the process to be agreed to by Qwest as part of the batch process and ordered as a regulatory change to ensure the change is made along with all the other changes that will need to go through the change management process ("CMP") to implement the batch process. MCI submitted its proposal to CMP in December 2003. However, there is no assurance that MCI's proposal will be prioritized high enough to be included in the next release. By making the MCI request a requirement of any batch process, it could be considered a regulatory change and be given priority under the CMP guidelines.

Q. SHOULD MCI'S PROPOSAL BE A REQUIREMENT OF ANY BATCH PROCESS?

A. Yes. There is no question the change can be done. By incorporating MCI's proposal, the CLEC will be able to process orders more quickly and fewer orders will drop out of the batch. This is more efficient for both parties, and it makes it more likely that a CLEC will use the batch hot cut process.

C. Timely Processing of Hot Cuts

Q. HAS QWEST PROVIDED ANY EVIDENCE THAT IT CAN HANDLE THE VOLUMES OF BATCH CUTS THAT WILL BE NECESSARY DURING THE TRANSITION FROM UNE-P TO UNE-L?

A. Qwest did provide some exhibits that it claimed demonstrated that it can handle the volumes necessary to transition from UNE-P to UNE-L. However, the data included in the exhibits was very limited. It did not incorporate any Qwest winbacks, CLEC-to-CLEC hot cuts or regular hot cuts that are not part of the batch, at the option of the CLEC or by design. Nor did Qwest include any of the normal day-to-day activity that occurs on its frames, such as troubleshooting and repairing customer service problems and installation of new service.

The FCC found the inability of the ILECs to process sufficient volumes of hot cuts as a real impairment.[45] Qwest's evidence is insufficient to overturn the FCC's initial finding of impairment.

[45] *TRO*, ¶¶ 468-469.

Q. HAS QWEST OFFERED TO PROVIDE ANY EVIDENCE THAT THE PROCESS IT PROPOSES WILL WORK?

A. No. One could argue that the process has not been established, so there is nothing to test. The question then becomes, once the process is adopted, should Qwest be required to demonstrate that the process works. AT&T would answer the question affirmatively.

Q. WHAT KIND OF DEMONSTRATION DO YOU PROPOSE?

A. AT&T believes the batch process should be tested by an independent third party by migrating a significant number of Qwest's retail customers from one Qwest switch to another Qwest switch using the proposed process.

D. Rates

Q. UP TO NOW THERE HAS BEEN NO DISCUSSION OF RATES. DID QWEST GIVE THE CLECS ANY IDEA WHAT THE FINAL PROCESS WOULD COST?

A. Not specifically, and this caused considerable frustration on the CLECs' part. During the first set of meetings AT&T and the other CLECs asked what the rate would be under Qwest's initial proposal. Qwest responded that it had not done a cost study. The CLECs advised Qwest that it was impossible for CLECs to evaluate Qwest's initial proposal and the different issues if they did not have some idea of what the cost would be. Qwest finally responded, stating that if its proposal was adopted, there may be a cost savings of approximately 20 to 30%,

possibly 40%, off of the original hot cut study cost of approximately $75.[46] After further discussion, Qwest stated the number could be around $45 per loop. However, according to Qwest, any changes to the proposed process would reduce efficiency and raise costs. The batch process has gone through so many iterations it is impossible for anyone to guess what the final process would cost the CLECs. The FCC expects the ultimate process to be a low-cost, cost-effective one. There is no assurances this will happen, and Qwest's proposed rates for the "more efficient" batch hot cut process could conceivably be higher than the rates for the "less efficient" loop-by-loop process.

Qwest made it quite clear that it believes the rates set by state commissions for basic and coordinated cuts are too low. However, if the state commissions set a rate that exceeds the current rates, there will be no incentive for the CLECs to use the batch process, and the CLECs will continue to use the current processes. Furthermore, the impairment the FCC determined to exist because of the current hot cut processes will continue to exist. The result will be that Qwest must continue to provide unbundled local switching at TELRIC rates.

Q. WHAT DOES AT&T RECOMMEND THE COMMISSION DO WITH RESPECT TO SETTING RATES?

A. The first concern is setting the proper rate. If the rate is set too high any batch process the Commission ultimately establishes may not be useful to the CLECs. It is AT&T's understanding based on statements made by Qwest that it will be

[46] It should be noted that the current price for a coordinated hot cut without cooperative testing is generally around $60 and the price for a basic installation of a new loop is around $55.

filing a cost study with its direct case. Not only will the CLECs be seeing Qwest's final proposal for the first time, they will also be seeing the cost study for the first time. AT&T's cost experts are already working on economic impairment and business case *TRO* issues in all of Qwest' jurisdictions. It will be very difficult to adequately review Qwest's cost study during the limited time provided in this proceeding. If there is considerable disagreement over the study, it may be best to adopt an interim rate subject to true up and subsequently schedule sufficient time to more thoroughly review the study and adopt permanent rates.

E. Performance Measures

Q. HAS QWEST RECOMMENDED ANY METHOD OF EVALUATING ITS PERFORMANCE UNDER ANY BATCH PROCESS THAT IS ADOPTED?

A. No. Qwest did not recommend a method for evaluating the batch process except for deferring the matter to long-term PID administration. This is a mystery to AT&T because the FCC stated that the state commission may require that ILECs "comply with an average completion metric, including any further disaggregation of existing loop performance metrics (*i.e.*, quality or maintenance and repair metrics), for provisioning high volumes of loops."[47] Qwest said performance measures and metrics were not an issue for the batch forum, and any discussion on performance metrics should be handled in long-term PID administration meetings.[48] CLECs subsequently asked Qwest which of the existing PIDs would apply to loops provisioned under the batch process. After much prodding from

[47] *TRO* at ¶ 489.

[48] Qwest did state that it recommends that specific measures regarding the batch process be addressed in long-term PID administration and that batch process measures be moved to the top of the list.

the CLECs, Qwest did say that the loops in a batch would be covered by the analog loop performance measures but the CLECs would have to review each PID to see if there were exclusions that would apply.[49]

Q. WHAT, IF ANYTHING, DOES AT&T RECOMMEND THE COMMISSION DO WITH RESPECT TO PERFORMANCE MEASURES?

A. The Commission should make it clear to Qwest that the loops in a batch should be included in the current PIDs, unless excluded by specific language in a specific PID. The parties should be directed to address measurements related to the batch process in long-term PID administration. In addition, once the performance measurements are developed, the Commission should require PAP modifications to provide financial incentives for Qwest to meet its batch hot cut performance obligations.

VI. ELECTRONIC LOOP PROVISIONING

Q. WILL A BATCH HOT CUT PROCESS ELIMINATE THE IMPAIRMENT THAT CLECs EXPERIENCE WHEN THEY COMPETE FOR LOCAL SERVICE CUSTOMERS?

A. As I stated earlier, no. Experience with the development of long distance competition has shown that effective mass market competition is critically dependent on customers' ability to change carriers quickly, accurately and inexpensively. Both the current method of performing hot cuts and the one contemplated by the *TRO* are manual processes. Both are labor-intensive and,

[49] Qwest did state that it believed OP-4, OP-7 and OP-13 would not apply to the batch process.

thus, considerably more expensive and error-prone than an electronic, or software-controlled, process such as, for example, the processes already in place that allows virtually unlimited numbers of mass market customers to change local providers, when UNE-P is used, or long distance providers overnight. As has proven to be the case with long distance competition, competitors will not have a reasonable opportunity to compete for customers' local telephone patronage until there is a quick, accurate and inexpensive way for them to switch carriers.

Q. IS TECHNOLOGY CHANGING IN WAYS THAT WILL HELP MAKE IT EASIER TO SHIFT CUSTOMER LOOPS FROM ONE LOCAL CARRIER TO ANOTHER?

A. Yes. We are in the midst of a "generational" change from the analog generation, distribution and transmission of signals from the customer's premises to the central office and switched through the use of circuit-switching technology to a fully digital generation, distribution and transmission of signals all the way to the customer using packet switch technology. Because the industry is in the midst of this transition, the Public Switched Telephone Network ("PSTN") is a combination of "legacy" and modernized technologies that the ILECs have cobbled together in the most efficient way feasible *for them to be the sole providers of service to mass market end-users.* This is the most crucial point for regulators to understand in addressing loop migration issues going forward: the ILECs have begun the transition to a digital, packet network design that achieves its greatest efficiency *with one provider of service—the incumbent.* If there is ever to be effective facilities-based local competition, regulators will have to

implement what a combination of antitrust litigation and regulatory oversight forced in the long-distance market: a transition to a network design that achieves economic and engineering efficiency for multiple carriers.

Q. HOW CAN REGULATORS ENSURE THAT CONSUMERS WILL BE ABLE TO MOVE AS EASILY AMONG LOCAL CARRIERS AS THEY ALREADY DO AMONG LONG DISTANCE CARRIERS?

A. There is a means available that uses currently available technology and is adaptable to the differing ILEC approaches to loop provisioning. This is a process that AT&T has generically referred to as "electronic loop provisioning" ("ELP"). This approach allows the provisioning of loops used for local service to be operationally and competitively neutral, making it the local service counterpart of "equal access" in the long distance market. ELP would take advantage of technology that can digitize and packetize end-user signals (both voice and data) so that the signals can be readily routed from one LEC service provider to another. In this environment, consumers would be able to change their local carrier seamlessly, and no carrier would have inordinate advantages in competing for a mass market customer's business. This is in sharp contrast to the current, hard-wired, manual connections from customer premises to ILEC central offices. Implementation of such an electronic provisioning process would create permanent virtual circuits that could use software commands to shift loops from one carrier to another quickly and inexpensively, with no loss or degradation of service.

Q. ARE THERE OTHER BENEFITS THAT ELP WOULD CREATE THAT WOULD LESSEN CLEC ECONOMIC AND/OR OPERATIONAL IMPAIRMENT?

A. Yes. Today, because mass-market customers are primarily serviced *via* analog-voice grade loops, CLECs must deploy a capital intensive backhaul infrastructure that digitizes, multiplexes and concentrates signals so that they can be reliably and efficiently transported to a CLEC's switching center. In a digital, packet local access network, which is what ELP would create, the need for such collocation and equipment is mitigated to a large extent because end-user signals would be handed off to the carrier in a digital rather than analog format.

Q. THIS CASE IS ABOUT THE CONTINUED AVAILABILITY OF THE LOCAL SWITCHING UNBUNDLED NETWORK ELEMENT. WHY SHOULD REGULATORS GET INVOLVED IN SUCH AN EXERCISE NOW?

A. In the *TRO*, the FCC found, on a national basis, that CLECs are impaired in their provision of local exchange service by the expense, delay and service degradation caused by the current, manual process of shifting loops from an ILEC switching platform to switching provided by competing carriers. The FCC thus directed the states to determine whether, and to what extent, that impairment could be reduced by the implementation of a "batch" process for manually shifting loops from ILEC switching to non-ILEC switching. This should logically prompt state regulators to question whether, in an age of digital processing, any manual, labor-intensive, and error-prone system for customer migration will ever be efficient

enough, both economically and technically, to support robust local exchange competition.

To ask the question, however, is to suggest its answer: there will only be an opportunity for effective local competition when local loop migrations are as efficient, swift and economical as changing local carriers through the use of UNE-P or changing long distance carriers through use of the PIC process.

Q. HAVEN'T THE ILECs BEGUN DIGITIZING THE LOCAL DISTRIBUTION NETWORK?

A. Yes. Increasingly, ILECs have deployed digital loop carrier ("DLC") equipment, often located away from the central office and closer to the customer premises. The DLC and associated equipment converts the communications signals coming over copper loops into a digital format, so they can be transported more efficiently to the ILEC LSO.

In a generic DLC configuration, a copper loop runs from the customer's premise to a serving area interface ("SAI"). This portion of the loop is known as the distribution plant. The SAI is a point where the copper distribution "sub-loop" from a number of customers terminates. Typically, the loops are cross-connected to additional copper facilities that connect the SAI to a Remote Terminal ("RT"). RTs are often located in enclosures in the ILEC's outside plant – *i.e.*, the RT is located somewhere between the customer premise and the ILEC LSO. A Remote Terminal typically houses the DLC and other equipment that converts analog

voice communications into a digital format.[50] There, all communications from loops on the DLC are multiplexed (to increase the efficiency of use of costly transmission facilities) and are transmitted to the ILEC LSO through facilities (either fiber or copper wire) commonly known as the "feeder" portion of the local loop. With some DLC systems (called integrated DLC or "IDLC"), traffic carried over the feeder plant is terminated directly onto the ILEC's local circuit switch, and is not demultiplexed. In such arrangements, an individual customer's traffic arrives at the central office commingled with other customers' traffic in a manner that is either difficult or costly to separate, or both.

Q. HOW DOES THE INTRODUCTION OF DIGITAL TECHNOLOGY IN THE LOCAL DISTRIBUTION PLANT AFFECT THE EASE OF TRANSFERRING LOOPS AMONG CARRIERS?

A. Where IDLC architecture is employed, it is even more difficult to switch a customer's voice-grade loop to a competing carrier's facilities. To switch a customer's IDLC loop to another carrier, the incumbent carrier must be able to separate that customer's traffic from the other traffic that is commingled on the feeder facility. Unfortunately, the available processes for removing the customer's loop from the IDLC can be even more cumbersome than where the loop runs directly to the LSO. One common method is to remove the customer's loop from the IDLC equipment in the RT and place it back onto an old "spare"

[50] Where the copper loops are sufficiently short, DLC equipment can just as easily be placed in the ILEC LSO. This is what CLECs must do in order to access a voice-grade loop via a hot cut. They place in their collocation arrangements the DLC equipment that digitizes and multiplexes traffic from voice-grade loops for backhaul to their switches. The duplication of DLCs in both ILEC and CLEC networks is one of the inefficiencies that electronic loop provisioning would eliminate.

copper loop that extends from the customer's premises to the central office. This method, however, requires an additional set of manual processes – in addition to the hot cut described above. This is often disadvantageous to both the customer and its new carrier, because any spare copper loop has necessarily been placed out of service, often because it offers inferior quality to the digital service provided over the IDLC loop. Moreover, where IDLC has been employed from the outset, such as in newly constructed areas, there may simply be no spare copper loop at all. Another disadvantage is that spare copper loop necessarily is longer than a DLC loop, lowering the loop's available bandwidth, compared to a DLC loop.

Other methods for removing a loop from IDLC so that it could be made available to a competitor are equally daunting. For example, the ILEC could install demultiplexing equipment before the feeder facility terminates into the ILEC circuit switch. That would demultiplex *all* of the traffic from a DLC-fed feeder and re-convert the traffic from a digital to an analog format. Traffic from the particular loop used to serve the customer won by the competing carrier would then be separated through the hot cut procedure from traffic carried on the other loops, and then connected to the competing carrier's facilities in collocated space. But then the CLEC would have to convert the analog signal *again* to digital format, using its own DLC, before transporting it to the CLEC switch. There are obvious inefficiencies, both economic and engineering, in the multiple signal conversions and duplicate DLC equipment that the carriers have to deploy in this scenario.

Thus, regardless of whether a voice-grade loop is connected to IDLC or terminates directly to the MDF in an ILEC central office, CLECs that compete for local service must endure a difficult process that necessarily requires extensive manual work on the ILEC's facilities, resulting in a greater expense and, often, lower-quality service.

Q. IS THERE ANYTHING ABOUT THE WAY ILECs ARE MANAGING THE TRANSITION TO A PACKETIZED ACCESS NETWORK THAT WOULD ASSIST IN MAKING VOICE-GRADE LOOP MIGRATION MORE EFFICIENT?

A. Fortunately, yes. In order to see how loop migration could be rendered seamless and electronic, it is helpful to examine how ILECs are introducing advanced services, such as Digital Subscriber Line ("DSL") service, into their local networks. Such an examination presents one path to electronically based loop migrations, so long as the ILECs engineer their transition to a packet-based architecture in a manner that includes the prospect of multiple carriers, rather than creating a two-class system in which ILEC service is provided over modern, digital access facilities and CLECs are relegated to the oldest and least efficient access facilities.

Q. HOW ARE SOME ILECs INTRODUCING "NEXT GENERATION DIGITAL LOOP CARRIER" ("NGDLC") TECHNOLOGY INTO THEIR NETWORKS?

A. The ILECs are increasingly deploying NGDLC technology, to enable them to provide both DSL and plain old telephone service ("POTS") on the same copper loop. This architecture is illustrated in the figure below:

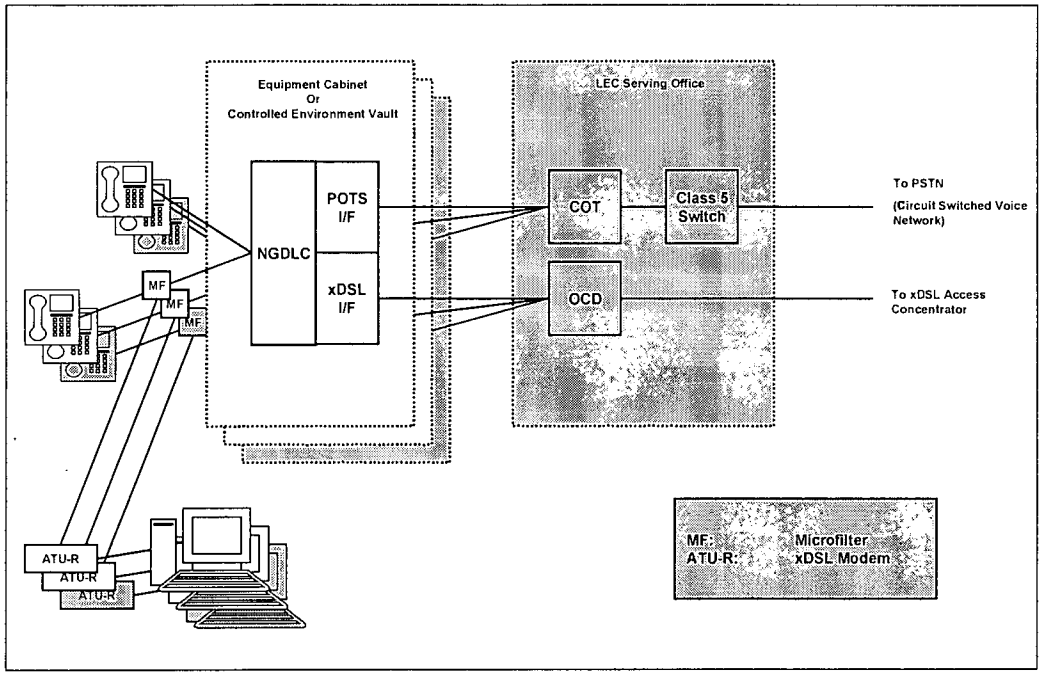

FIGURE 1: Typical ILEC NGDLC Architecture (Basic)

Traffic originating with customers (at left) is transmitted over copper loops to a Remote Terminal equipped with NGDLC equipment. At this crucial step in the process, voice traffic, which occupies the low-frequency spectrum of the loop, is treated differently from high-speed data traffic, which occupies the high-frequency spectrum of the loop. Typically, the NGDLC takes end-user voice signals and (i) converts the analog voice signals to a digital format, (ii) multiplexes those signals using a time division multiplexing ("TDM") protocol (thus commingling voice traffic from many loops) and (iii) directs them to their own, separate fiber feeder facility that is connected to the ILEC LSO. At that point, the commingled signals are directed to a Central Office Terminal (COT)

and from there to the ILEC's circuit switch. For high-speed data traffic, the NGDLC buffers, concentrates and multiplexes the traffic, using the Asynchronous Transmission Mode ("ATM") protocol, and directs the data signals to a separate fiber feeder facility that transmits them to the ILEC Central Office, where they are cross-connected to an Optical Concentration Device ("OCD") or ATM module. From there, the data signals are transported to the ILEC's data network.

Q. SO, IN THE CONTEXT OF PROVIDING DSL SERVICE, ARE THE ILECs CREATING TWO SEPARATE FEEDER SYSTEMS, ONE FOR VOICE AND ONE FOR DATA?

A. Yes. This is the beginning of what I was referring to above when I spoke of a "two-class" system for voice and data. In addition to the different processing and routing of the types of traffic, there are separate feeder facilities for each. And there are not simply two feeders – one for voice and one for data – but, for reliability purposes, each of those feeders requires a back-up, so four feeder facilities must be in place for the system to operate reliably.

Q. HOW IS THE HIGH-SPEED DATA TRAFFIC HANDLED IN THE REMOTE TERMINAL?

A. Figure 1 above shows the Remote Terminal where the NGDLC equipment processes and sends data to an Optical Concentration Device in the ILEC LSO, using ATM transmission protocol. The ATM access architecture establishes a "permanent virtual circuit" ("PVC") between the end user's premises and the OCD in the ILEC central office. PVCs are "virtual," rather than physical, because they are defined in the software of networking devices. The virtual connection is

"permanent" only in the sense that it is a static connection between two points so long as the controlling software directs it to be. Such connections or paths can readily be changed or redefined through the use of software commands. As a result, the NGDLC system provides a software-controlled cross-connection between an input and output port based upon cell header information and an internal -- but updateable -- table that identifies which two ports should be connected. The physical circuits attached to the ports need not change, but the destination of the traffic they carry can be changed by software commands that alter the headers in the ATM cells. In short, once physical loop connections become "virtual," traffic destinations and, thus, routing, can be changed electronically through the use of software commands, rather than by "hands on the network" (*i.e.*, the dispatch of technicians to undertake physical rearrangement of circuits).

Q. WHAT CHANGES TO THE NETWORK WOULD THE DEPLOYMENT OF ELECTRONIC LOOP PROVISIONING REQUIRE?

A. The upgrades necessary to implement ELP architecture divide into three segments: ILEC outside loop plant, ILEC central offices, and equipment used by all local carriers (CLECs and ILECs) that choose to use a traditional circuit-switched network to carry voice traffic.

Q. HOW WOULD THE ILEC'S OUTSIDE PLANT NEED TO BE MODIFIED TO ACCOMPLISH ELECTRONIC LOOP PROVISIONING?

A. Under ELP, the key difference is that equipment would be deployed or upgraded to digitize and packetize *all* traffic, not just the traffic in the high-frequency

portion of the loop, as with the ILECs' current NGDLC architecture. The packetization would be performed by "true" Next Generation DLC ("tNGDLC") equipment, which includes a functionality known as a voice cell processing. Where an ILEC has already deployed a remote DLC, that equipment would be upgraded to tNGDLC. Where customer loops terminate at the ILEC central office, tNGDLC functionality would be deployed at the CO.

The tNGDLC and its associated voice cell processor will digitize and convert voice signals into cells (or, for terminating calls, from cells into a bit stream, and then an analog voice signal). Thus, unlike current NGDLC, tNGDLC will process all traffic into the ATM packet format. This will enable end-users to continue using their existing CPE for traditional voice service.[51]

After being packetized by the tNGDLC equipment, all of a customer's traffic is transported over a multiplexed fiber facility to the ILEC CO (or within the CO for tNGDLC that is deployed in the CO itself). This is a significant improvement over the outside plant architecture that ILECs have deployed for DSL services. The architecture in place today -- which uses an ATM facility to transport data and a time-division-multiplexed ("TDM") facility for voice transmissions -- is an inefficient and costly design, because it uses two parallel facilities (each of which is typically backed-up with an alternative facility) to transport traffic between the very same points – the RT and the central office. By contrast, where all the traffic

[51] Customers that want advanced services, such as additional derived voice lines, DSL-based services, and/or other high-speed data services, would need to install compatible CPE, and the associated DLC equipment would need the appropriate line card electronics. This is similar to the requirement that customers who today subscribe to DSL-based service must install a DSL modem to work with their computer.

is packetized, as with ELP architecture, one common feeder facility can carry commingled voice and high-speed data traffic between the tNGDLC and the ATM module.

Q. HOW WOULD THE ILEC CENTRAL OFFICE CHANGE TO ACCOMMODATE LOOP EQUAL ACCESS?

A. To implement loop equal access, feeder facilities would not connect directly to the ILEC circuit switch. Rather, as with data traffic in the current ILEC NGDLC environment, the fiber feeder would be cross-connected to an ATM module (the ATM module is analogous to the OCD under an ILEC NGDLC architecture). That module serves as a multiplexer that allows both sub-tending tNGDLC equipment and loop facilities to be shared among all local carriers' networks. The ATM module serves as the point of demarcation between the ILEC loop plant and the networks of all local carriers, including the ILEC.

Thus, the ATM module would serve as the "gateway" for carriers to access their retail customers' loops. This is appropriate because, as with "ordinary" NGDLC technology, the ATM module is the point at which all of the packetized communications converge for all the loops served by the feeder facility. For originating traffic, the ATM module would sort out the commingled traffic carried by sub-tending tNGDLC and associated feeder facilities and direct it to the customer's chosen carrier, whether ILEC or CLEC. For terminating traffic, the ATM module would sort cells received from various carriers so that they are "cross-connected" – by the software-controlled PVC – to the correct RT and customer facility.

Each local carrier seeking to serve customers whose loops terminate at an LSO, including the ILEC, would connect appropriate facilities to the ATM module to transport its end-user traffic to its own network. By connecting to the ATM module, any CLEC could readily access the facilities used to serve all end-users connected to the central offices where the ATM is located. All competing carriers, including the ILEC, would be assigned one or more physical ports on the ATM module so that it could direct traffic from their end-users for transport to their network based upon the PVCs established for their customer-carrier combinations. Depending on how the ELP architecture is deployed,[52] the ATM port could represent the only "collocation" that would be required to serve customers at certain ILEC LSOs, thus reducing the CLEC's "backhaul penalty." Even where a CLEC may be required, or would desire, to collocate as it does today, much of the electronics necessary in today's collocation would be eliminated.

The ATM module and the associated tNGDLC located at the RT allow a customer to switch local carriers electronically, with no manual or physical changes to the underlying facilities, because, as described earlier, ATM technology creates a permanent virtual circuit for each customer. If a customer wishes to change service providers, software commands directed to the ATM module and the associated tNGDLC electronics at the RT allow the existing path to one carrier's network to be re-directed to a different carrier's network.

[52] For example, a tandem ATM module could be deployed that would aggregate signals from many sub-tending ATM modules located at different ILEC LSOs, thus significantly reducing a competitor's collocation needs.

Q. HOW WOULD ALL CARRIERS HAVE TO ADAPT TO DEALING WITH THE PACKETIZED VOICE TRAFFIC STREAMS THAT ARE NECESSARY TO ENSURE LOOP EQUAL ACCESS?

A. All local carriers that choose to serve customers using a traditional circuit-switched network would need to deploy ATM-compatible equipment as a "voice gateway" (also known as "VoATM gateways"). For transmissions from the circuit-switched PSTN that will be terminated to the customer, the VoATM gateway converts TDM-based voice traffic to ATM cells. For originating traffic, the VoATM gateway processes the voice packets to meet the GR-303 or GR-8 protocol, which are the typical interface requirements for connecting the local loop to a Class 5 switch. DLCs equipped with these interfaces are commonly found in local carriers' networks. Vendors of VoATM gateways use a GR-303 or GR-8 interface to preserve the carriers' investment in Class 5 switching equipment. As a result, despite the modernization of the loop architecture, end users will continue to have access to all Class 5 switch features without any modification to the switching network itself.

Q. WHAT EXACTLY WILL ELECTRONIC LOOP PROVISIONING ACCOMPLISH?

A. Nothing less than "loop equal access"; that is, the ability for a customer to choose any facilities-based local exchange carrier without excessive delays in effecting a change of carrier, without losing service for any period of time, and without degrading service quality. As with long distance equal access, this can be anticipated to unleash a flood of investment by those eager to capitalize on a truly

open telecommunications market and place significant competitive pressure on market prices for all telecommunications services.

Even from the narrow perspective of the ILEC community itself, current, manual methods of shifting loops from one carrier to another violate a basic rule of telephone engineering: "no hands on the network." It is a well-established decision rule in general engineering practices, including those of the telecommunications industry, that, whenever possible, it is preferable to implement a system that requires less, rather than more, manual intervention – since such intervention is costly, slow, and prone to introduce errors and problems into the network that would not have occurred if there were no "hands on the network."

From the perspective of overall network efficiency – as well as of each carrier's individual efficiencies – ELP also provides a big advantage. Recall that, under current conditions, where ILECs have placed DLC in their distribution network, there is inefficient repeated multiplexing and demultiplexing when a CLEC receives the traffic from the ILEC at its collocation space. Under ELP, a CLEC can receive its traffic in a fully multiplexed form and transport it in that form as far into its network as it finds desirable and economic. Thus, there is no need for separate DLC equipment in ILEC central office collocation space.

A similar benefit to all carriers is the fact that, in many central offices, CLECs will simply not need traditional collocation space. To transport traffic to their switches, they can simply build, purchase or lease transmission to the ATM modules in a number of ILEC central offices, concentrate their traffic as they

collect it and then deliver it to their serving switch. Again, this reduces the demand for central office floor space, as well as the expense CLECs incur in renting and maintaining collocation space. If an ILEC established a fiber ring to connect all ATM modules in a given geographic area, CLECs would need only "tap into" one spot on the ring to collect their packetized traffic from all central offices on the ring. This is efficient for both CLEC and ILEC, and reduces wasteful, duplicative and costly "backhaul" than CLECs using UNE-L must now undertake.

Further, while using existing technology, electronic loop provisioning would permit customers to have better access to higher-speed and advanced services, which CLECs need not forgo because of the impracticability of replicating some or all of the existing ubiquitous loop distribution network. There are no services that ELP would eliminate – and many that it would enable. In addition, ELP of the kind AT&T describes above would permit the potential standardization of wireline broadband interfaces, which, in turn, could encourage new broadband applications and new advanced services networks.

But, make no mistake, at its core, AT&T's ELP proposal is designed to make local exchange competition possible in the face of the virtually unconquerable obstacles presented by the task of replicating, in its entirety, the ILEC local loop plant: a task that would be necessary for CLECs to address the mass market without using ILEC loops. And, as AT&T has shown and as the FCC has found as a matter of law (*TRO* at ¶¶ 464-475), the lack of equal access to loops is the

main impediment today to the development of effective local exchange competition.

Q. BUT ISN'T ELP A SPECULATIVE DEPLOYMENT OF UNTESTED TECHNOLOGY?

A. Not at all. Every aspect of AT&T's electronic loop provisioning proposal uses equipment that is available from vendors today, and technology and functionality that carriers are using today. For example, in AT&T Laboratories, AT&T has developed a laboratory trial that demonstrates the technical feasibility of ELP. The trial employs the use of a Zhone MALC tNGDLC, a Lucent CBX-500 ATM module, and a Pardyme/Jetstream VoATM gateway. Moreover, large portions of the current outside plant deployed in the ILECs' distribution and feeder systems will remain in place, unchanged. Best of all, carriers will remain free to stick with current, circuit-switching technology, migrate to advanced switching, including so-called "soft switches," or use any combination of technologies that they find practical and economic.

Q. IN RESPONSE TO AT&T'S ADVOCACY REGARDING ELECTRONIC LOOP PROVISIONING TO THE FCC, THE RBOCs COMPLAINED THAT ELP WOULD COST HUNDREDS OF MILLIONS OF DOLLARS AND TAKE YEARS TO IMPLEMENT – AND THE FCC DID NOT ADOPT YOUR APPROACH. DOESN'T THAT SUGGEST THAT STATES SHOULD STEER CLEAR OF YOUR NOTION OF LOOP EQUAL ACCESS?

A. No. As state regulators well know, the RBOCs (and other ILECs) *always* exaggerate the costs of changes to their networks that they do not originate themselves – especially ones that will facilitate competition. State regulators, moreover, know of the hundreds of millions of dollars that CLECs and their investors have spent in attempting to make a success of their entry into local exchange markets – and how little they have to show for it to date, because of RBOC intransigence and their continual operation of the levers of monopoly power. Regulators want to protect not only the investment by CLECs and their shareholders and investors, but regulators' own considerable investment of time, money and effort in making competition work – and they are beginning to see that, without loop equal access, all that investment may go down the drain.

Secondly, AT&T is not contending that loop equal access can be accomplished in a "flash cut." It took years for long distance equal access to be fully implemented at a substantial cost, but the rewards in lowered prices and, even more important, growth in the use of telecommunications have tremendously benefited state and local economies (in addition to the growth of the US GNP). AT&T is not

recommending an attempted "flash cut" to electronic loop provisioning, but the "digital train" is leaving the station – and it is leaving without the voice communications that form the bulk of most consumers' use of the telephone network.

Finally, as outlined above, what is happening "under the radar" is the development of two separate, but unequal, networks within the national public switched telephone network: a high-speed, state-of-the-art data network that the RBOCs are scheming to keep entirely to themselves and a lower-tech, rapidly obsolescing voice network that they are slowly and begrudgingly beginning to share with competitors. AT&T is convinced that a future of telecom "haves" and "have nots" could be avoided with some smart investment today and regulatory prodding to facilitate its accomplishment.[53]

By contrast, the loop equal access future that AT&T envisions evokes the well-established adage, "A rising tide raises all boats." Loop equal access – and the electronic loop provisioning architecture described in this testimony – will bring a future where all telecommunications traffic – from POTS ("plain old telephone service") to PANS ("powerfully amazing new services") – will ride on the technologically most advanced platform that ingenious minds can invent, and where the powerful economic engine of competition ensures that those services

[53] Although it is true that the FCC has not yet *adopted* and required the implementation of AT&T's Electronic Loop Provisioning architecture, state regulators should not overlook the fact that the FCC did not forbid the states from investigating or adopting it themselves. And it is clear that, in the *TRO*, the FCC did direct the states to consider *all* sources of "impairment" to CLECs' competitive entry and to take measures to mitigate or eliminate them, consistent with the Order's rulings. *TRO* at ¶ 486. AT&T's ELP proposal is just such a necessary "mitigating measure."

are delivered at the lowest cost, in the most efficient manner, and with the fastest pace of innovation that the economy can support.

VII. CONCLUSION

Q. PLEASE SUMMARIZE YOUR TESTIMONY.

A. The process of migrating customers to a CLEC-owned switch using an ILEC loop, the so-called "hot cut process," is extremely dependent on manual work, rendering the process prohibitively expensive, highly error prone with resulting impacts to customer service, and not scalable to handle reasonable commercial volumes. As such, CLECs will remain impaired by any manual hot cut or loop migration process. Even the best manual processes that could be operationalized today, including batch migration processes, cannot satisfy the requirements needed to eliminate the CLECs' operational impairment in attempting to compete for mass-market customers. Accordingly, this Commission should develop and approve a comprehensive review process to insure any process put forth by Qwest will deliver as advertised and could evaluate the extent to which CLECs remain impaired. Furthermore, the Commission should evaluate and adopt AT&T's ELP proposal as a solution to removing CLEC impairment.

Q. DOES THIS CONCLUDE YOUR TESTIMONY?

A. Yes.

Exhibit 1

STEPS NECESSARY TO COMPLETE A HOT CUT

Before AT&T even submits an order for a hot cut, AT&T must conduct activities in addition to those activities required for a UNE-P migration.

- AT&T negotiates a due date with the customer based on the standard intervals for loop migrations that are lengthier than UNE-P intervals. For business customers, a cutover time must also be negotiated to ensure the service outage does not impact the operation of the customer's business.
- AT&T conducts an inventory of facilities and electronically assigns the customer's loop to specific facilities in AT&T's switch, to equipment located in ATT-owned collocation space and to a Connecting Facility Assignment ("CFA") that will be used by the ILEC to connect the customer's loop to AT&T's collocated equipment.
- AT&T accesses the ILEC's LFACs database to confirm that the availability of the CFA information in both companies' databases match.

After completing these activities, AT&T prepares and submits the Local Service Request ("LSR"). After submission of the LSR, the ILEC begins its activities.

- The ILEC checks its CFA database to ensure the CFA on the order matches its inventory.
- The ILEC issues the number portability "trigger" order by setting switch triggers which will ensure the customer receives intra-switch calls between the period of time the CLEC ports the number to its switch until the ILEC disconnects the telephone number in its switch.
- The ILEC inputs the order into its backend systems to create the internal service orders that will be needed to accomplish the migration.

Then the ILEC returns the Firm Order Confirmation ("FOC") to AT&T. Unlike UNE-P, after receiving the FOC, AT&T and the ILEC cannot rely on the electronic systems to flawlessly provision the service. Instead, a complicated set of activities occurs, activities that must be coordinated if the cut is to be successful for the customer.

- AT&T confirms with the customer the specific time and date when the hot cut is scheduled to take place based on the information in the FOC.

- AT&T verifies that dial tone is being delivered from its switch to the CFA in the collocation cage.
- AT&T alerts the National Number Portability Administration Center ("NPAC") that reprogramming is needed to move the customer's telephone number from the ILEC to AT&T by sending an electronic "create" message to the Administrator. This begins the process of porting the customer's telephone number. This "create" message prompts NPAC to send a message to the ILEC to ensure the ILEC consents. The ILEC responds with a confirm message to NPAC.

After AT&T completes these activities, the ILEC completes other activities necessary to a hot cut that are not required for a UNE-P conversion.

- The ILEC determines whether the facilities currently being used by the customer can be reused. For example, if the customer is on Integrated Digital Carrier Loop ("IDLC"), the facilities cannot be reused and spare non-IDLC facilities must be identified and assigned to this customer.
- The ILEC pre-wires the cross-connection frames.
- The ILEC confirms the presence of dial tone from AT&T's switch at the main distribution frame..
- Upon receipt of the "create" message from NPAC, the ILEC will send a "concur" message back to NPAC.
- The ILEC verifies that the proper phone number is on the loop that is to be cut over.

After these activities, the ILEC contacts AT&T to determine whether the cut can proceed as scheduled. During this call the ILEC may also provide essential information such as test results. Assuming nothing has gone wrong, on the day of the cut over, the ILEC and AT&T will continue their activities.

- The ILEC ensures it has the correct line for the cut.
- The ILEC verifies dial tone on the line at the ILEC MDF.
- The ILEC monitors the line and, when idle, removes at the MDF the old cross connection jumper that connected the customer's loop to the ILEC's switch and terminates the pre-wired cross connection from the CLEC's CFA to the customer's loop.

- The ILEC provisioning center contacts AT&T to advise that the conversion is complete.
- AT&T then conducts its own tests to ensure that all lines have been successfully migrated.
- If testing is successful, AT&T sends an "activate" message to NPAC advising that the customer's number should be ported to AT&T's switch.

The cut, however, is still not complete.

- Upon receipt of the activate message from NPAC, the ILEC completes the disconnect order and sends an "unlock" message for the E911 database administration to allow AT&T access to the E911 database record for the ported number.
- Then AT&T migrates the 911 record by updating the Automatic Location Indicator ("ALI") database to identify AT&T as the local service provider. This ALI information supports the Public Safety Answer Point ("PSAP") which receives 911 calls.
- The ILEC must remove the old cross connections from its frame to free up the ILEC's switch port for another customer.

Only then is the hot cut complete.

MINIMUM REQUIREMENTS FOR BATCH HOT CUT PROCESS[1]

OVERALL

- As an initial matter, because it is based primarily on manual work, the batch process should be recognized as an interim solution with limited opportunities for improvement over the current individual hot cut process. Therefore, to more effectively reduce CLEC impairment, the Commission should develop a plan with specific timeframes to move to an electronic solution that requires fundamental changes to the ILECs' network architecture that currently creates operational and economic barriers to competitive entry to serve mass market customers.

- Any hot cut issue raised by any party that is not solved through the development and implementation of a batch process should be documented for further review by the Commission.

APPLICABILITY/SCOPE

- The batch process must include all mass market customers, all types of loops used to serve such customers and all types of transfers between all LECs. Thus, the process should be insensitive to the identity of the previous carrier and the technology that carrier uses to provide service. In addition, the process should not require CLECs to perform any pre-order activity to "qualify" that an unbundled loop can be migrated. In addition to existing UNE-P customers served over copper and UDLC at a minimum, the process must apply to:

    - IDLC loops
    - UNE-L based line splitting
    - CLEC to CLEC migrations

VOLUME/CAPACITY

- The batch process must support efficient migration of a sufficient quantity of unbundled loops (equivalent to LD PIC changes/UNE-P volumes/churn of ILEC win-backs/CLEC to CLEC) to support a fully competitive mass market at quality levels no less than those achieved when using UNE-P.

- Size of batch

    - The batch should be sized to permit the CLEC and ILEC to achieve cost efficiencies.

---

[1] Many of the issues identified in this exhibit are currently under discussion between the parties at the Qwest Batch Hot Cut Workshops that begin on December 1, 2003.

- The batch (as well as the number of batches per day) should be sized to accommodate the overall number of migrations required to achieve the scale needed to handle mass volumes.

PROCESS REQUIREMENTS

- The batch process must operate in conjunction with an existing electronic customer acquisition process (*i.e.*, UNE-P).

- The ILEC should provide CLECs the capability to identify which UNE-P customers/lines are eligible for a batch on a mechanized and batch basis (*e.g.*, the CLEC should not be required to do one-by-one prospective queries to determine if the conditions necessary to include a specific line in a batch are or are not met). The ILEC should also establish the electronic ability to provide a specific batch of potential telephone numbers to a CLEC when the conditions for a batch have been met.

- After receiving the notification from the ILEC that the conditions for a batch cut over are met, the CLEC must have sufficient lead-time to advise its customers of the need to reprogram features such as voice mail and speed dialing. .

- The CLEC should have the ability to schedule hot cuts and batch hot cuts at any point in a twenty-four hour day with the costs insensitive to the scheduled time of the hot cut (as in an electronic system such as UNE-P).

- "Batches" should be CLEC specific, *i.e.*, each "batch" should only apply to one CLEC.

- The batch process must be developed to provide equivalent OSS functionality to UNE-P transactions, including:

    - Equivalent electronic pre-ordering and ordering capability
    - Equivalent levels of flow-through for ordering and provisioning systems to increase accuracy and lower costs.
    - Directory Listings must remain as-is when converting from UNE-P to UNE-Loop

- Real-time electronic notification must be available for order status, testing status, and notification of individual loop cut completion.

- The Commission should include in its analysis the feasibility of interim automation of hot cut provisioning as part of the batch process.

CUSTOMER CARE

- There must be a self-executing process to immediately switch customers back to UNE-P if an individual cut fails, with follow-up electronic communication from the ILEC to the CLEC indicating the cause of the failure, how the ILEC will remedy the failure and when the customer can be migrated to an unbundled loop. The rolling interval for affected loops/customers should restart.

ECONOMIC

- The batch process design must result in significant cost reduction for all involved parties.

VALIDATION, TESTING AND QUALITY ASSURANCE

- ILECs must prove they have systemic capability to handle the provisioning of hot cuts at volumes anticipated across all its markets in the absence of unbundled local switching. Therefore, once designed, the batch cut process must be subject to both pre-implementation and post implementation testing. Pre-implementation testing should include third party "time and motion" study of the hot cut process, and third party-monitored ILEC testing using its own collocation and migration of significant numbers of its own customers through hot cuts from direct connection to its switch to its collocation equipment installed to operate as a pseudo-CLEC specifically for this test. Post-implementation "testing" would include on-going commission review to determine if the batch hot cut process meets the needs of commercial mass markets in a manner that permits effective and efficient competition.

- The Commission must direct the ILEC to investigate, report and eliminate any negative impacts of large scale migration from UNE-P to UNE-L from the following:

    - E-911 "unlocks"
    - Number porting
    - Repair databases
    - Billing system migrations, such as from Carrier Access Billing System ("CABS") to Customer Record Information System ("CRIS")
    - Provisioning systems such as Trunks Integrated Records Keeping System ("TIRKS")
    - Directory listing and assistance

- The Commission must direct the ILEC to investigate, report and eliminate any negative impact of large-scale migration from UNE-P to UNE-L on local network interconnection trunking and tandem performance.

- The Commission must direct the ILEC to report at a central office level the current number of working IDLC access lines and the spare parallel copper or UDLC facilities available to migrate these lines to should the IDLC loop customers wish to change their local service provider. It should also provide its plans to provide an unbundled loop when spare parallel copper or UDLC facilities are not available.

- The process must include a method to insure CFA inventories between and among ILECs and CLECs are initially accurate and remain reconciled.

- Competitors must be guaranteed easy access to collocation sites, including the right to use reasonably qualified contractors (*i.e.*, ILEC should not be allowed to dictate the identity of contractors, provided they meet a reasonable skill set)

PERFORMANCE STANDARDS AND ASSURANCE

- Batch cut and other associated loop performance standards should be equivalent to performance for migrating a customer from retail to UNE-P.

- Key performance measurement factors must be in place:

    - Continue to measure at the most granular level feasible for each activity (FOC, rejection, missed appointment, cuts on time, service outage, etc.)
    - Create new measures for key activities unique to batch process, e.g. percentage of batches started on time and completed on time.
    - Eliminate current exclusions in performance measures for projects/batches
    - Create, if not currently in place, measures for percent service outages during conversion, and average recovery time of outages
    - Revise/establish benchmarks to drive performance that protects end-users

- Self-executing financial consequences must be in place for ILEC failures to meet required performance standards. For all conversion service outages, these consequences should be commensurate with the average net revenue times the average life of the customer

Following are additional requirements should the Commission establish only temporary access to UNE-P:

- There must be exceptions to any established time limits that customers may remain in UNE-P "acquisition mode" pending placement into a batch for transition to UNE-L. These include:

    - The time needed to add new CLEC equipment (*e.g.*, DLC in collocation) or to augment CLEC facilities (e.g. transport) when the expansion or

augmentation is not complete for reasons beyond its reasonable planning or control

- The time needed to augment collocation space
- Cases of ILEC collocation space exhaust
- The ILEC's inability to migrate customers to UNE-L within prescribed time frames
- ILEC failure to meet non-discriminatory service standards, including increased incidences of customer outages as a result of the manual hot cut process.

RE: Public Service Commission Local Competition Investigation
Case No. PU-439-03-295

Dear Commissioners:

Enclosed for filing is an original and seven copies of IdeaOne Telecom Group, LLC's APPLICATION FOR TRADE SECRET PROTECTION. The trade secret material is enclosed in a separate, sealed envelope marked "Trade Secret - Private."

Also enclosed is an original and seven copies of IDEAONE TELECOM GROUP, LLC'S RESPONSES TO PRELIMINARY DISCOVERY REQUESTS - QWEST ROC STATE TRO PROCEEDINGS (Public Copy).

If you have any questions please feel free to contact me.

Very truly yours,

Steven E. Noack

PUBLIC SERVICE COMMISSION

Public Service Commission
Local Competition
Investigation

Case No. PU-439-03-295

APPLICATION FOR TRADE SECRET PROTECTION

IdeaOne Telecom Group, LLC ("IdeaOne") hereby requests trade secret protection in this administrative proceeding.

In response to the North Dakota Public Service Commission's discovery request, IdeaOne requests confidential trade secret protection for its answers to the following interrogatories:

A.3
A.5
C.2

In support of its application, IdeaOne provides the following information as required by North Dakota Administrative Code § 69-02-09-01.

1. General description of the nature of the information sought to be protected.

   Interrogatory A.3 requests the total number of voice grade equivalent lines that are provided to IdeaOne's customers from Qwest Co-location Wire Center in Fargo, North Dakota.

   Interrogatory A.5 requests the number of residential and business voice grade lines from the Qwest Co-location Wire Center in Fargo, North Dakota.

   Interrogatory C.2 requests the cost of IdeaOne's switch and the number of lines equipped.

2. Explanation of why the information derives independent economic value, actual potential, from not being generally known to other persons.

   The information sought respecting customers is proprietary market information

respecting the very core of IdeaOne's business. It identifies the number of lines and the breakdown its business and residential lines.

The information sought respecting IdeaOne's switch cost and number of lines equipped is proprietary financial information respecting capital investment and capacity.

IdeaOne will negotiate and seek confidentiality agreements with all participants of this proceeding. It needs the same protection at the PSC level to prevent future competitors or any other interested party from obtaining this information and using it in a competitively detrimental manner to IdeaOne.

Any marketing and financial information which can be accessed publicly may be used by competitors and potential competitors of IdeaOne to determine IdeaOne's business plan, including targeted customer base, marketing strategies, financial weaknesses and strengths. This information may be utilized to undercut IdeaOne's position in the marketplace.

3. Explanation why the information is not readily ascertainable by proper means by other persons.

IdeaOne is a privately held limited liability company and is not required by law to prepare financial information for public disclosure or to otherwise disclose its information to the public. This information is not published in any public format or otherwise made available to any party. Consequently, the proprietary nature of this information should not be compromised through IdeaOne's participation in the local competition investigation.

4. General description of the persons or entities that would obtain economic value from disclosure or use of the information.

Any current competitor or future competitor of IdeaOne would obtain economic value from this information. In the highly competitive telecommunications environment, there are numerous potential new entrants into the telecommunications marketplace such as: new CLEC's, cable TV providers, internet providers, and wireless companies. Within the Fargo-Moorhead area, there are numerous potential telecommunications providers poised to enter the market.

5. Specific description of known competitors and competitor's goods and services that are pertinent to the tariff or rate filing.

This information does not relate to a tariff or rate filing. Nevertheless, all current telecommunication providers in the Fargo/Moorhead market and all future competitors would derive value by having access to such information.

6. Description of the efforts used to maintain the secrecy of the information.

As set forth in Paragraph 3 above, IdeaOne is not required to disseminate this information to the public. Indeed, the information is not available to any persons other than the Company's management. In this proceeding, IdeaOne will not release this information in a discovery format to any participant unless such participant enters into a mutually acceptable confidentially agreement.

Based upon all of the information provided above, the Commission should grant to IdeaOne, its request for trade secret protection for the information specified. Thus, IdeaOne respectfully requests that the Commission approve this Application for Trade Secret Protection and issue an appropriate protective order preventing disclosure of IdeaOne's information to the public.

Dated this 21st day of January, 2004.

NORTH DAKOTA PUBLIC SERVICE COMMISSION

DOCKET NO. PU-439-03-295

DIRECT TESTIMONY OF

PATTY LYNOTT

On Behalf of

MCLEODUSA TELECOMMUNICATIONS SERVICES, INC.

RECEIVED
JAN 23 2004
NORTH DAKOTA
PUBLIC SERVICE
COMMISSION
EXECUTIVE SECRETARY

I. Introduction and Qualifications

1. **Q: Please state your name, business affiliation and address.**

A: My name is Patty Lynott. I am Director of Service Delivery-Line for McLeodUSA Incorporated, parent company of McLeodUSA Telecommunications Services, Inc. (McLeodUSA). My business address is 6400 C Street SW, PO Box 3177, Cedar Rapids, Iowa 52406-3177.

2. **Q: Please describe your business experience and background.**

A: I obtained a Bachelor of Arts degree from Loras College, Dubuque, Iowa, with a major in Communications/Public Relations and a minor in Computers. I started my business career in the Provisioning and Service Delivery fields at Teleconnect, which was subsequently purchased by MCI. I joined McLeodUSA in 1993 and have worked in Service Delivery, Network Operations, Provisioning and ILEC Relations. I have 17 years of experience in the telecommunications industry.

148 PU-439-03-295 Pages: 20
Direct Testimony of Patty Lynott
by McLeodUSA Telecommunications Services, Inc. by
01/23/2004 CC: Comm Legal PUD (3) ALJ

3. **Q: Please describe your responsibilities as Director, Service Delivery-Line.**

A: I am responsible for all aspects of customer service delivery, including order entry, order management, coordination, provisioning, installation, testing and activation. I am responsible for managing a staff of approximately 150 employees. My duties also include setting departmental goals and expectations to achieve established corporate financial and operational targets. Finally, I am responsible for driving continuous process improvements in service delivery intervals, quality of delivered service and productivity.

II. Purpose of Testimony

4. **Q: What is the purpose of your direct testimony?**

A: The purpose of my direct testimony is to address three issues with respect to the Batch Hot Cut (BHC) process. First, I will highlight several key issues to McLeodUSA that remain in dispute resulting from the BHC collaborative that have been conducted on a Qwest region-wide basis with ILECs, CLECs, State Commissioners and staff over the past 2 months. Second, I will address the issue of whether the BHC process, if approved by the North Dakota Commission should apply to all North Dakota markets served by Qwest or only the Metropolitan Statistical Areas (MSA) where Qwest is challenging the FCC's impairment finding in the unbundled switching case. Third, I will discuss the results of testing the proposed Qwest BHC processes by McLeodUSA during the past month.

5. **Q: What are the key issues in McLeodUSA's view that remain in dispute from the BHC collaborative?**

A: From a macro level, there are several key issues that are critical to accomplish the FCC's goal of devising an efficient, economical and seamless migration process that minimizes customer impact and maximizes effective and irreversible competition among CLECs and ILECs. Let me briefly list several key issues and then address each issue in more detail.

First, a BHC process must be economical. The FCC correctly identified a major impairment for facilities-based CLECs is the high non-recurring charges (NRCs) charged by ILECs.

Second, a BHC process must be scaleable and efficient in order to handle the volume of migrating (1) the existing, embedded UNE-P base, (2) future Qwest Retail-to-CLEC UNE-L orders, (3) CLEC to CLEC and (4) new customers that have never had service. In our opinion, a scalable and efficient process includes having the ability to cut large volumes of customers in one (1) central office (CO) per CLEC with minimal impact to customers. This would provide an opportunity for providers to wholesale local services to other carriers. An automated end-to-end process that results in shorter intervals for the customer is key to scalability.

Third, a BHC process should include intervals that are in parity with the ILEC's current UNE-P and retail intervals. Without parity, the value of a BHC process is significantly diluted.

Fourth, a BHC process must encompass IDLC loops and customer loops that have been requested for the first time. Degradation of voice service and unacceptable customer downtime result if CLECs do not have continued access to IDLC loops. Customers requesting new service at a location where there are no facilities to reuse should also be included in this process.

Fifth, a BHC process should be tested and performance measures should be established and easily incorporated into an approved remedy plan before a State Commission makes a finding of non-impairment.

Let me now address each of these issues in more detail that have been identified during the BHC collaborative meetings held during the last few months.

6. **Q: Do the NRCs proposed by Qwest in this Batch Hot Cut process meet your definition of "economical?"**

A: None of us know yet. Qwest's pricing and cost studies for the BHC process will not be filed until January 23, 2004. Based on the predominantly labor-intensive BHC process being proposed by Qwest, which is very similar to today's current hot cut process, I believe it is very likely that the proposed BHC NRCs will be a disputed issue.

Because competitive providers will not see Qwest's proposed pricing of NRCs until January 23, 2004, thereby limiting time to review, conduct additional discovery and investigate whether the proposed pricing is TELRIC-compliant, McLeodUSA urges the Commission to conduct a

separate proceeding to establish TELRIC-compliant NRCs for the BHC process.

To make UNE-L facilities-based service economically viable to the point that a valid finding of non-impairment can be made, McLeodUSA believes that the NRCs for any BHC process must at least be much closer, if not comparable, to the current UNE-P NRCs. Current NRCs for UNE-P and UNE-L in North Dakota are $57.85 and $59.81, respectively.

In addition, final Commission-approved NRCs for batch hot cuts must apply to (1) the embedded UNE-P base, (2) new Retail to CLEC customers, (3) CLEC to CLEC orders and (4) new customers with new service. The Commission must require Qwest's cost studies to address all four of these scenarios.

The FCC correctly identified that the current NRCs charged to CLECs to convert a customer from UNE-P to UNE-L are an economic barrier to facilities-based competition. Indeed, the current level of NRCs for UNE-L conversions formed one of the primary underpinnings of the FCC's national finding of impairment in the mass market switching case.

7. **Q: Do you contend that Qwest's proposed BHC process is <u>not</u> scaleable?**

A: Yes. We do not believe that Qwest's BHC process is scaleable based on past experience, results of recent testing of Qwest's proposed process that I will discuss in detail later in my testimony and practical, common sense.

First, our company's experience with Qwest's current process, which involves a much smaller number of lines compared to the future volume of lines if UNE-P goes away, demonstrates that its current process is not scaleable. McLeodUSA has previously submitted orders to convert the embedded base in 47 COs in Colorado in 2003. Our average order included between 25-50 lines per CO per day. Frequently, Qwest would delay our conversions due to "resource constraints." McLeodUSA has submitted Retail to Une-L orders totaling 100 lines per day per CO in the past, and Qwest has denied these orders due to "resource constraints."

Furthermore, McLeodUSA has experienced poor quality on orders in other States when converting a retail customer from Qwest to McLeodUSA. The reason is due to Qwest focusing resources on converting the embedded UNE-P/M base for McLeodUSA. If UNE-P goes away, there will be a huge volume of embedded UNE-P lines that will need to be converted. Qwest's resources are constrained today. Its resources will be further constrained in the future.

Second, based on results from our recent testing of Qwest's proposed BHC process, we do not believe that Qwest can meet its 100-line per day per CO promise. I will further discuss our tests later in my testimony.

Third, common sense leads to the conclusion that Qwest's process is not scaleable. Qwest proposes a daily cap of 100 lines in total per central office for all CLECs. Such a limitation would prevent providers from even considering the opportunity to wholesale local services to other carriers. In

addition, State Commissions should require that any BHC process be available for new customers ordering new service. Qwest agrees that its BHC process applies to (1) the embedded UNE-P base, (2) new Retail to CLEC customers and (3) CLEC to CLEC orders. Expanding this process to include new customers ordering new service will increase the number of lines that must be processed. Churn in the mass market customer base is considerable and must also be incorporated into any analysis regarding the potential scalability of any proposed BHC process.

Finally, McLeodUSA believes that any pre-order, order or post-order functionality to support any BHC process must be developed in both EDI and GUI. Qwest has proposed to build the functionality of a status tool that identifies if an order is jepped, when the cut has started or is completed in a Web-based tool. Such a tool, however, is not tied to EDI, and Qwest has not agreed to develop the same functionality in EDI. McLeodUSA should not be forced to go outside of its primary OSS interface in order to utilize this BHC process. Having dual systems creates inefficiencies in the process.

8. **Q: You previously mentioned intervals as a key issue to your Company when converting a customer onto McLeodUSA's switch and service. Does Qwest's proposed interval satisfy McLeodUSA?**

A: No. Qwest is currently proposing a 7-business day interval. This is too long. Instead, McLeodUSA believes that Qwest should set provisioning standards and intervals that are at parity with the existing UNE-P and retail

processes in North Dakota. Qwest's current interval for UNE-P is 3 business days. Qwest's current interval for UNE-L non-coordinated hot cuts is 5 business days based on the existing Interconnection agreement. Therefore, Qwest's 7-business day proposed interval is a step backward in our goal to lower barriers to competition.

Furthermore, Qwest currently offers a product called "Quick Loop" that reuses existing facilities and converts lines to UNE-L in only three (3) days. Our understanding is that the Quick Loop product applies to all orders, except those that require (1) a coordinated hot cut, (2) a dispatch of a Qwest technician or (3) involve an IDLC loop. This current Quick Loop product is more efficient (3 days) than Qwest's proposed BHC proposal (7 days). McLeodUSA strongly recommends to Commissions to include customers that have never had service as part of the Quick Loop product. Quick Loop would provide an opportunity to wholesale mass market service to other providers.

I think it is also important to emphasize that McLeodUSA has extensive experience with converting lines from UNE-P to UNE-L. In 2003, we completed approximately 99,000 conversions from our embedded UNE-P customer base, of which approximately 2,900 lines were in North Dakota. McLeodUSA completed these conversions in a 5 business day interval for coordinated hot cuts for business and residential customers. Therefore, Qwest's BHC proposal, which is supposed to result in a more efficient

process, results in a less efficient process. This result should be unacceptable to State Commissions.

Finally, let me propose a solution that would reduce Qwest's proposed interval from seven (7) days to four (4) days. In Exhibit 10 filed by Qwest in the collaborative meetings, Qwest proposes a 7-Business day interval. On day 1 the CLECs are asked to have translations ready for the cut. If there are any discrepancies on CFAs, Qwest will notify the CLEC on day 3 by noon and the CLEC could submit their supplemental changes by 7 PM on day 3. This would eliminate 1 day in the process. Qwest's Exhibit 10 also shows no work being performed on Day 5 and Day 6. These two additional days could be eliminated in the process, thereby reducing the interval from 7 days to 4 days.

9. **Q: Does McLeodUSA contend that the scope of the BHC must include IDLCs and new customer lines?**

A: Yes. A BHC process must include both IDLCs and new customers with new lines for several reasons. First, customer downtime will increase without IDLC access. McLeodUSA believes that timeframes for performance of the batch cuts should be based upon the preferences of end user customers, not traditional business hours. Qwest contends that IDLCs should not be included in a BHC process, because IDLCs require Qwest to send out a dispatch. In contrast, SBC must also send out a dispatch with IDLC cuts, but SBC correctly recognizes that IDLCs must be included in the scope of any BHC process.

In addition, customers that are currently on IDLCs loops and being converted onto UDLC loops or home-run copper loops experience downtime of up to four (4) hours today. McLeodUSA suggests that customers should have the option of experiencing this downtime in off-hours that better meet their business needs. Qwest should be required to provide an off-hours option to minimize any customer impact.

Second, customers experience degradation of voice service and quality without IDLC access. When a customer on a connected-through copper loop or a UDLC system switches to McLeodUSA as a local service provider, that customer would typically remain on the same physical loop, and thus the quality of the loop received by McLeodUSA would generally be the same as the quality of the loop used by the RBOC to serve that same customer. When a customer currently served by IDLC chooses to switch to McLeodUSA, however, that customer is removed from the IDLC and moved to either a connected-through copper loop, or a UDLC system.

The result is that customers experience a substantial degradation in service quality, for both voice and dial-up data service applications, such as fax machines, modems, and credit card validation machines. For standard voice services, moving the customer off IDLC typically results in reduced voice volume and clarity, leading to an increased number of customer complaints. Degradation affects not just what Qwest might characterize as "broadband" service, but standard dial-up services and facsimile transmissions as well. For example, a customer moved from IDLC to

UDLC will experience a minimum of one "new" digital-to-analog (D/A) conversion, and is very likely to experience reduced modem speeds. It is also important to recognize that the loop qualification and makeup data does not provide a mechanism to anticipate these problems, since that data only pertains to the makeup of the customer's existing loop. In cases where the customer is moved from IDLC to either UDLC or a connected-through copper loop, no information is available to competitors about the characteristics of the loop to which the customer will be moved. The real-world effects, on both customers and competitors, of the refusal to allow access to IDLC-provided loops are tremendous.

Due to the resulting degradation of service, McLeodUSA has had to reconvert customers back onto UNE-P. McLeodUSA has experienced this degradation of service in some other Qwest states. McLeodUSA proposes that facilities be reused when a customer is on an IDLC, so that the same level of service the customer experienced with Qwest is the same service they receive with all CLECs.

Finally, McLeodUSA also proposes that new customers that have never had service at their location also be included in the BHC process. This will ensure parity of service to all customers.

10. **Q: Do you believe that testing of a BHC process must be performed prior to a Commission making a final determination on impairment?**

A: Of course. Testing of any new process of this magnitude must be performed in order to ensure that consumers are not negatively impacted. McLeodUSA strongly suggests that all systems that Qwest is proposing and the new process be tested and results measured and provided to all CLECs and commissions prior to releasing this as a certified process. McLeod also strongly suggests that thru the LTPA additional measurements be incorporated as needed.

11. **Q: Regarding testing, you mentioned earlier that McLeodUSA has performed tests on Qwest's proposed BHC processes during the past month. What are your findings and recommendations?**

A: McLeodUSA accepted Qwest's offer to test its proposed BHC process. Let me first explain our reasoning and then describe the tests, the results of those tests and finally our recommendations to State Commissions.

McLeodUSA agreed to test Qwest's proposed BHC process, because we have a genuine desire to promote effective and irreversible competition by obtaining a result that leads to a scaleable, economic and efficient process to convert (1) the current embedded UNE-P base, (2) future Qwest retail to CLEC UNE-L orders, (3) CLEC to CLEC orders and (4) new orders for customers with new service. We participated in these tests with good-faith intentions and a willingness to test the proposed process, suggest recommendations for improvements and then retest the process to see if a workable and affordable solution was possible.

During a 4-week period starting in December, 2003, McLeodUSA participated in two different tests with Qwest to convert current lines from UNE-P to UNE-L. Trial #1 occurred from December 10 through December 18 and consisted of converting 25 lines per day in the Pillsbury, MN, central office. During this time, Qwest converted a total of 50 lines. We prepared a timeline, see Exhibit ___ (PL-1), that describes the steps followed by McLeodUSA and Qwest. The test lasted five business days, using the industry practice of counting the day an order was submitted as Day 0. On Day 0 (December 10), McLeodUSA issued LSRs (Local Service Requests) for 25 lines to be converted from UNE-P to UNE-L service in the Pillsbury CO. On December 11, we issued LSRs for an additional 25 lines in this same CO. On Day 0, Qwest issued a Service Order, completed the assignments and issued FOC (firm order commitment) dates to McLeodUSA. On Day 1, Qwest created a spreadsheet in the QCCC. No work was performed from Day 2 through Day 4. Finally, on Day 5, Qwest (1) checked for CLEC dial tone, (2) conducted the pre-wiring, (3) performed the manual lift and lay process, (4) checked Qwest and CLEC dial tone, (5) updated the Order status via an email to McLeodUSA and (6) completed the Order. All of these procedures were consistent with the BHC process proposed by Qwest.

12. **Q:** **What were the results from Test #1 to convert 50 lines in total?**

A: The length of time to accomplish the highly manual process of converting 25 lines totaled approximately 4 hours. McLeodUSA never received any

validation that all orders submitted in the batch were included on the Qwest spreadsheet created in the QCCC and sent to the CO. Consequently, the Qwest technician incorrectly sorted the spreadsheet by cable pair, which resulted in redoing the pre-wiring. Qwest supposedly queried an access data base every 30 minutes, but McLeodUSA did not receive updates every 30 minutes on the status of the batch. Qwest notified McLeodUSA at the beginning and end of the batch cuts, but not when individual lines were completed. The result of not receiving real time notification that the cut was completed was that customers were unable to receive incoming calls for up to 90 minutes.

13. **Q:** **Notwithstanding the results from Test #1, did McLeodUSA agree to participate in a subsequent testing with Qwest? If so, what were the results?**

A: Yes. After Test #1, we offered Qwest a list of ways to improve the process, including, but not limited to, reducing the time that customers were not able to receive incoming phone calls, adding a validation step to ensure that all orders get included on the spreadsheet prepared at the QCCC and receiving more timely updates on the status of the batch. Based, in part, on representations from Qwest that process improvements would be implemented, McLeodUSA participated in a second test.

Trial #2 began on January 12, 2004, and consisted of converting 26 lines in Burlington, Iowa, and 25 lines in Boise, Idaho. We prepared a second timeline, see Exhibit ____ (PL-2), that describes the process and

steps completed by both McLeodUSA and Qwest. In comparing Exhibits 1 and 2, you will notice that the only process change implemented by Qwest dealt with the timing of performing the pre-wiring and checking for dial tone. In Trial #2, Qwest conducted the pre-wiring and checked for dial tone on Day 3. On Day 5, between 3 am – 11 am, Qwest performed (1) the manual lift and lay process, (2) checked for dial tone, (3) updated the Order status via an email to McLeodUSA and (4) completed the conversion process.

One key data point that we tracked very closely involved the length of time it took Qwest to convert each batch of 25 lines. Qwest had one team of 2 central office technicians (COTs) located in both Boise and Burlington working our 25-line orders. For each 25-line Order, it took Qwest the following lengths of time to perform these 3 key functions to complete the orders:

1. Pre-wiring took approximately 2 hours.
2. Lift and Lay and completing out orders in WAFA took approximately 1 hour, 20 minutes.
3. Disconnect the Jumpers took 15 minutes.

Therefore, the time for Qwest to convert 25 lines totaled over 3.5 hours. Extrapolating this result, it would take Qwest approximately 7 hours to convert 50 lines and 14 hours to convert 100 lines.

It is interesting to note that Qwest proposes in its BHC process that it can convert 100 lines per day per CO with a team of two (2) dedicated

technicians during an 8-hour period from 3 am – 11 am, Monday through Friday. Based on our results in Trial #2, Qwest's proposed 8-hour window would limit it to converting a maximum of 50 - 60 lines per day per CO. Furthermore, McLeodUSA recently converted 75 lines per day in the Burlington CO under the current UNE-L process with a 5-business day interval. This would lead to the conclusion that the current process is more scaleable than the proposed BHC process. Consequently, we caution State Commissions about the feasibility of Qwest's ability to convert 100 lines per CO per day.

I also want to highlight some positives that Qwest changed in Trial #2. Qwest implemented the dial tone check after the pre-wire, which eliminated the quality error in Trial 1. Qwest also performed the pre-wire on DVA (Day 2-3) in Qwest's Exhibit 10 to allow the CLECs an opportunity to fix any dial tone issues that occur before the day of cut.

14. **Q:** **Is there any other current product offered by Qwest that would be more efficient and economical to CLECs?**

A: Yes. Quick Loop is a product offered by Qwest that reuses existing facilities and converts lines to UNE-L in only three (3) days. The Quick Loop product applies to all orders, except those that: (1) require a coordinated hot cut, (2) require a technician dispatch or (3) involve an IDLC loop. We prepared a time line, see Exhibit ____ (PL-3), that describes this current Quick Loop product, which is more efficient (3 days) than Qwest's proposed BHC proposal (7 days). Until a more efficient and

cost effective BHC process is devised, McLeodUSA strongly advocates that CLECs should be permitted to use Qwest's Quick Loop product to convert (1) the embedded UNE-P base, (2) future Qwest retail to UNE-L orders, (3) CLEC to CLEC orders and (4) new service for new customers. That being said, McLeodUSA does not believe that the Quick Loop product is adequate for BHC purposes.

15. **Q: Based on your results of testing Qwest's proposed BHC processes, what are McLeodUSA's recommendations to State Commissions?**

A: We make the following recommendations. First, Qwest's BHC process is too manual and, therefore, is not scaleable. Our tests concluded that the Qwest process can only convert a maximum of 50 - 60 lines per day per central office. Second, the scope of any batch hot cut process must include (1) the embedded UNE-P base, (2) future Qwest retail to UNE-L orders, (3) CLEC to CLEC orders and (4) new service for new customers. Third, Qwest's Quick Loop product is more efficient (3 days) than the proposed BHC process (7 days). It is critical that State Commissions ensure that the Quick Loop product applies to all four types of orders listed above. Finally, because we have not yet seen Qwest's proposed NRCs, we reserve the right to comment after further analysis.

16. **Q: Finally, Qwest might contend that the establishment of a BHC process is unnecessary for some, but not all, of its markets in North Dakota. Qwest's contention is likely based on the fact that Qwest is not contesting the FCC's national finding of impairment relating to ILEC**

provisioning of unbundled switching to serve "mass market" residential customers in all North Dakota markets. Do you agree with Qwest's contention that a BHC process should apply only in certain MSAs?

A: No. Regardless of where Qwest challenges the FCC's national impairment finding for unbundled switching to serve "mass market" customers, all customers and competition throughout North Dakota will benefit by applying an efficient, economical and seamless BHC process in all markets served by Qwest.

McLeodUSA serves "mass market" customers in many of the additional North Dakota markets located throughout North Dakota. We serve these customers and utilize both the UNE-P and the UNE-L platforms. It is clear that policy makers are keen on encouraging UNE-L "facilities-based" competition and less reliance on UNE-P. McLeodUSA has been working towards this goal. By the end of 2003, McLeodUSA serves approximately one million access lines, of which 66% are UNE-L. In North Dakota, we have over 6,000 lines on UNE-L. In order to justify continued investment, however, competitive providers need a batch hot cut process in all markets throughout North Dakota that is efficient, economical and seamless. Without a BHC process across all Qwest markets throughout North Dakota at reasonable NRCs, the economics will likely favor continued use of UNE-P in those additional markets over UNE-L. To date, McLeodUSA has approximately 6,300 UNE-P lines in

North Dakota. Again, a ruling that Qwest does not have to make the BHC process available to a CLEC outside of the non-impairment means that Qwest would be successfully forcing its competitor to use a less efficient, more costly process to compete with Qwest. Moreover, when the time comes to challenge the impairment finding in other markets, there will be that many more UNE-P CLEC customers to migrate that have been installed in the interim rather than on a UNE-L platform. That result clearly seems contrary to the clear goal of promoting facilities-based competition.

17. **Q: Does this conclude your prepared direct testimony?**

A: Yes.

STATE OF NORTH DAKOTA
PUBLIC SERVICE COMMISSION

Public Service Commission
Local Competition
Investigation

Case No. PU-439-03-295

NOTICE OF INTENT TO CLOSE INVESTIGATION

December 14, 2005

Under section 251(c)(3) of the Telecommunications Act of 1996, incumbent local exchange carriers (ILECs) have the duty to provide nondiscriminatory access to telecommunications network elements on an unbundled basis to competitive local exchange carriers (CLECs). The Federal Communications Commission (FCC) is required to determine specific unbundled network elements (UNEs) that must be provided.

In December 2001, the FCC initiated a proceeding to re-examine the network element unbundling obligations of ILECs. On February 20, 2003 the FCC adopted its Triennial Review Order (*TRO*), including a new list of UNEs. For a significant group of issues, the FCC required state commissions to complete their analyses and reviews within nine months from the effective date of the *TRO*. The *TRO* was appealed to the United States Court of Appeals for the District of Columbia Circuit (Court).

On June 18, 2003 the Commission opened an investigation to address issues related to the *TRO*. On February 13, 2004 the Commission issued an Interim Stay of the procedural schedule to provide time for parties to respond concerning the implications of a stay until the Court made its decision. A March 2, 2004 Court decision on appeal vacated many of the FCC's rules and vacated the FCC's delegation of authority to state commissions. On April 14, 2004 the Commission continued indefinitely the stay in this proceeding.

The Commission is seeking comments concerning the implications of closing this proceeding. **Comments are due by January 20, 2006.**

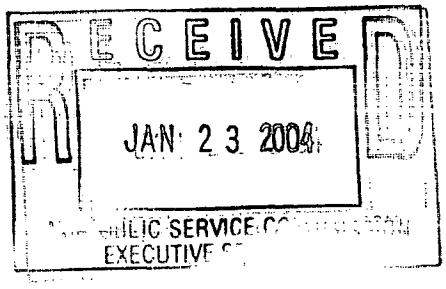
RE: Case No. PU-439-03-295
Public Service Commission
Local Competition Investigation

Dear Mr. Mielke:

Enclosed for filing are an original and seven copies of the following:

1. Joint Direct Testimony of Sherry Lichtenberg and Timothy J. Gates On Behalf of WorldCom, Inc. ("MCI") dated January 23, 2004.

2. Qualifications of Timothy J. Gates, Exhibit ____ (TJG-1)



3. Certificate of Service for both documents.

Please advise me if you have any questions about this.

Thank you.

Sincerely Yours,
Marilyn Foss

I. INTRODUCTION

Q. MS. LICHTENBERG, PLEASE STATE YOUR NAME, OCCUPATION AND EMPLOYER FOR THE RECORD.

A. My name is Sherry Lichtenberg. I am currently employed by MCI as Senior Manager, Operational Support Systems Interfaces and Facilities Development.

Q. MR. GATES, PLEASE STATE YOUR NAME, OCCUPATION AND BUSINESS ADDRESS.

A. My name is Timothy J Gates. I am a Senior Vice President with QSI Consulting. My business address is 917 West Sage Sparrow Circle, Highlands Ranch, Colorado 80129.

Q. WHAT IS QSI CONSULTING, INC. AND WHAT IS YOUR POSITION WITH THE FIRM?

A. QSI Consulting, Inc. ("QSI") is a consulting firm specializing in traditional and non-traditional utility industries, econometric analysis and computer aided modeling. I currently serve as Senior Vice President.

Q. MS. LICHTENBERG, PLEASE DESCRIBE YOUR EDUCATIONAL AND PROFESSIONAL BACKGROUND AS IT RELATES TO YOUR TESTIMONY IN THIS PROCEEDING.

A. I have twenty-two years of experience in the telecommunications market, fifteen years with AT&T and seven with MCI. I joined MCI in 1996 as a member of the initial team responsible for the development of MCI's local service products, both UNE-P and facilities based. Prior to joining MCI, I held a number of positions at AT&T, including working in the General Departments organization, where I developed methods and procedures and billing and ordering systems for use by the Bell Operating Companies. I was Pricing and Proposals Director for AT&T

Government Markets, and Executive Assistant to the President and Staff Director for AT&T Government Markets. I also held a number of positions in Product and Project Management. My current role with MCI includes designing, managing and implementing MCI's local telecommunications services to residential and small business customers on a mass-market basis nationwide. I support both UNE-P product development and our testing and planning for facilities based competition via UNE-L. I have testified in numerous proceedings before the FCC and state public service commissions including multiple 271 proceedings, network modernization proceedings and a variety of DSL proceedings. In addition, I have worked with the MCI contracts organization to negotiate our interconnection agreements with the incumbents.

Q. MR. GATES PLEASE DESCRIBE YOUR EDUCATIONAL BACKGROUND AND WORK EXPERIENCE.

A. I received a Bachelor of Science degree from Oregon State University and a Master of Management degree in Finance and Quantitative Methods from Willamette University's Atkinson Graduate School of Management. Since I received my Masters, I have taken additional graduate-level courses in statistics and econometrics. I have also attended numerous courses and seminars specific to the telecommunications industry, including both the NARUC Annual and NARUC Advanced Regulatory Studies Programs.

Prior to joining QSI, I was a Senior Executive Staff Member at MCI WorldCom, Inc. ("MWCOM"). I was employed by MCI and/or MWCOM for 15 years in various public policy positions. While at MWCOM I managed various functions, including tariffing, economic and financial analysis, competitive

analysis, witness training and MWCOM's use of external consultants. Prior to joining MWCOM, I was employed as a Telephone Rate Analyst in the Engineering Division at the Texas Public Utility Commission and earlier as an Economic Analyst at the Oregon Public Utility Commission. I also worked at the Bonneville Power Administration (United States Department of Energy) as a Financial Analyst doing total electric use forecasts while I attended graduate school. Prior to doing my graduate work, I worked for ten years as a forester in the Pacific Northwest for multinational and government organizations. Exhibit TJG-1 to this testimony is a summary of my work experience and education.

Q. MS. LICHTENBERG, HAVE YOU EVER TESTIFIED BEFORE THIS COMMISSION ("COMMISSION")?

A. No. However, I have testified on telecommunications issues before numerous state commissions, including Texas, California, Nevada, Illinois, Michigan, Indiana, Wisconsin, Ohio, Maryland, Delaware, Pennsylvania, New York, Georgia, Florida, South Carolina, North Carolina, Alabama, Tennessee, and Washington DC, as well as the FCC.

Q. MR. GATES, HAVE YOU EVER TESTIFIED BEFORE THIS COMMISSION?

A. Yes, I have testified before this Commission or filed comments in proceedings before this Commission as stated in the list of proceedings found in Exhibit TJG-1. I have testified more than 200 times in 42 states and filed comments with the FCC on various public policy issues ranging from costing, pricing, local entry and universal service to strategic planning, merger and network issues. As noted

above, a list of proceedings in which I have filed testimony or provided comments is attached hereto as Exhibit TJG-1.

Q. ON WHOSE BEHALF WAS THIS TESTIMONY PREPARED?

A. This joint testimony was prepared on behalf of WorldCom, Inc. and its regulated subsidiaries ("MCI").

II. PURPOSE AND BACKGROUND

Q. WHAT IS THE PURPOSE OF YOUR TESTIMONY?

A. The purpose of our testimony is threefold:

(1) we describe for the Commission FCC rule §51.319(d)(2)(ii) and explain the manner by which the Commission can best fulfill its obligations included therein,

(2) we briefly discuss the relationship between rule §51.319(d)(2)(ii) which is the focus of this proceeding, and §51.319(d)(2)(iii) as it relates to impairment faced by CLECs without access to unbundled local switching, and

(3) we evaluate Qwest's "Batch Hot Cut ("BHC") Proposal" in relation to the requirements of rule §51.319(d)(2)(ii) (and to a lesser extent, the impact of Qwest's proposal on issues related to impairment).

III. SUMMARY OF CONCLUSIONS

Q. CAN YOU BRIEFLY SUMMARIZE YOUR PRIMARY CONCLUSIONS?

A. Yes. Our primary conclusions can be categorized and summarized as follows:

Mechanization

(1) The FCC has found that incumbent local exchange carrier ("ILEC") hot cut processes as they currently exist are a source of impairment for carriers attempting to use their own facilities to serve mass market customers. Specifically, the FCC pointed to the overly manual nature of existing hot cut processes as the primary

culprit.[1] Indeed, the FCC specifically identifies the overly manual nature of existing hot cut processes as the primary obstacle to sufficient scalability, sufficient reliability relative to service quality, and affordability. As such, in an effort to improve upon the existing process, the Commission's chief objective in this case should be to encourage a hot cut process that removes, to the utmost extent possible, manual intervention.

Limitations on Order Types

(2) Through MCI's participation in the Qwest Batch Hot Cut Forum, it has become clear that the final proposal Qwest intends to submit with its testimony in this proceeding will exclude some very important order types. Thus, while Qwest proposes to improve its hot cut processes it does not intend to make those improved processes available to some of the most important order types required by CLECs. For example, it appears that Qwest will exclude any order that would require a hot cut (i) from one UNE-L CLEC to another, (ii) for a loop over which a customer's data service is being provided, even if the customer's voice service relies upon the same loop, (iii) to an Enhanced Extended Link ("EEL") and then to a collocation in a second central office so that a carrier can serve customers from a central office where it has no collocation arrangements, (iv) for loops served over integrated digital loop carrier ("IDLC") systems, and (v) customers with line splitting. These types of exclusions will vitiate the benefits of the improved process.

Efficient and Cost-Based

(3) The FCC specifically identified the current non-recurring rates associated with hot cuts as a major factor in its finding of impairment.[2] Likewise, it directed state commissions to reassess hot cut rates based upon its TELRIC rules and to examine efficiencies that might be gained by offering hot cuts in a "batch."[3] To this point, Qwest has provided no cost information or a rate proposal related to its improved hot cut processes. As such, little can be said about Qwest's proposal in this regard except that CLECs will have very limited time to review it. Nonetheless, the

[1] See *In the Matter of Review of the Section 251 Unbundling Obligations of Incumbent Local Exchange Carriers, Implementation of the Local Competition Provisions of the Telecommunications Act of 1996, and Deployment of Wireline Services Offering Advanced Telecommunications Capability*, CC Docket Nos. 01-338, 96-98 & 98-147, Report and Order and Order on Remand and Further Notice of Proposed Rulemaking, FCC 03-36, (rel. Aug. 21, 2003) ("*Triennial Review Order*" or "*TRO*"). *TRO* ¶465.
[2] *Id.*, ¶470.
[3] §51.319(d)(2)(ii)(A)(4).

rates associated with any process ultimately approved by the Commission will be of paramount importance. One of the primary benefits of the UNE-platform ("UNE-P") is that CLECs can acquire customers in a low cost fashion given the relatively efficient nature of the process. If an improved hot cut process is meant to elevate UNE-L to an operational level sufficient to replace UNE-P for purposes of mass market service delivery, the rates for a hot cut must be highly comparable to those available under UNE-P today (and as such, the process must be of comparable efficiency).

Scalability

(4) The FCC has tasked this Commission with approving an improved hot cut process within a 9 month timeframe. Qwest, in hopes of convincing this Commission that its new process will overcome impairment so that it no longer must unbundle its local switching facilities, has conceptualized an improved process it will ask this Commission to approve. Part and parcel of Qwest's new process will be dramatic system enhancements, re-designed process engineering and a commitment to meet CLEC demands for cuts (meant to provide the necessary scalability for Qwest's largely manual process) but only those hot cuts negotiated and agreed to as part of the "transition plan," despite the fact that that planning process remains a mystery. The Commission must bear in mind that none of Qwest's proposed improvements have been tested; indeed, none of them have even been designed let alone constructed at this point. As such, even if MCI agreed with Qwest's proposed processes verbatim (which it does not), MCI would still have major concerns regarding Qwest's ability (or its incentive) to effectively follow through on a proposal constructed primarily of promises. As such, the manner by which any process ultimately approved by the Commission is tested for commercial use at volumes that would result in a market without UNE-P is of critical importance. Likewise, the performance metrics and penalties that will govern the process over time are of equal importance.

Testing and Monitoring

(5) In simplest terms, in its *Triennial Review Order* the FCC found that CLECs should be allowed to continue purchasing and using UNE-P, because important obstacles existed with respect to their ability to use their own facilities to serve the mass market. Primary amongst those obstacles was the hot cut process that would be required to change a customer from one network to

another absent UNE-P. The FCC found that the hot cut process was time consuming, had a high probability of error (and hence, increased the number of service impacting problems), that it was expensive and ultimately, that it was not scalable to meet the needs of a competitive marketplace the size of that created via UNE-P. Having come to that conclusion, the FCC tasked state commissions with improving the hot cut process to overcome these problems. In fulfilling that task, this Commission should keep squarely in mind that the hot cut process and the UNE-P provisioning process (and Qwest's retail provisioning process) are all meant to accomplish exactly the same task: i.e., connect the customer's loop to the switch that will provide it local service, and that that process cannot be said even to "exist" until it has been developed, tested, and is in use by CLECs. As such, if a facilities-based service model like UNE-L is ever to achieve the type of competitive entry achieved via UNE-P (or if it is to be an effective manner of competing with Qwest's retail services), the hot cut process must be as timely, reliable, scalable and economically viable as both the UNE-P provisioning process, and Qwest's retail provisioning process. As such, while Qwest will undoubtedly tout the many improvements it has made to its existing hot cut process, the Commission must resist evaluating Qwest on how far it has come in improving a relatively poor process, but instead, keep its eye on how far Qwest must still go to reach either of these benchmarks. In doing so, the Commission should always ask itself the following questions when evaluating Qwest's improved process: Will the improved hot cut process work as effectively as either the UNE-P provisioning process or Qwest's retail provisioning process? Will it be as timely? Will it be as reliable? Will it be as scalable? Will it be as economically viable? Unless the answer to each of these questions is "Yes," in MCI's opinion, the improvement process is incomplete.

IV. BATCH HOT CUT REQUIREMENTS

Q. WHAT IS A "HOT CUT" AND WHY ARE HOT CUTS SO IMPORTANT RELATIVE TO THE FCC'S *TRIENNIAL REVIEW ORDER*?

A. At footnote 1409 of its *Triennial Review Order* (¶465), the FCC describes the hot cut process as it is currently accomplished by ILEC's in today's environment:

> 1409...a hot cut is a largely manual process requiring incumbent LEC technicians to manually disconnect the customer's loop, which was hardwired to the incumbent LEC switch, and physically re-wire it to the competitive LEC switch, while simultaneously

> reassigning (*i.e.*, porting) the customer's original telephone number from the incumbent LEC switch to the competitive LEC switch..... From the time the technician disconnects the subscriber's loop until the competitor reestablishes service, the subscriber is without service. Simultaneously, incumbent LEC and competitor technicians must coordinate to ensure that the subscriber's telephone number is "ported" to the competitor's switch so that inbound calls are properly routed to the requesting carrier's switch. This process necessarily disconnects service to the customer for a brief period of time, as the physical connection between the loop and the incumbent LEC switch is broken and then a new connection with the competitive LEC switch is made. [references and cites removed]

Hot cuts are important relative to the FCC's *Triennial Review Order* because the FCC found the largely manual, coordinated hot cut process described above to be a major source of impairment for carriers attempting to serve mass market customers using their own facilities. Hence, state commissions were directed by the FCC to identify ways in which ILECs should improve upon these processes.

Q. HAS MCI PARTICIPATED IN THE QWEST REGION BATCH HOT CUT FORUM IN AN EFFORT TO NARROW ISSUES RELATED TO AN IMPROVED HOT CUT PROCESS FOR QWEST?

A. Yes, it has. MCI has participated actively in the Batch Hot Cut Forum.[4] MCI has participated in these collaborative meetings in an effort to help state commissions, and Qwest, identify ways in which the existing hot cut process can be improved to overcome the economic and operational impairment recognized by the FCC. More specifically, and as we discussed throughout the Batch Hot Cut Forum, MCI's primary concern is with the impact of these new processes on consumers. Indeed, Qwest has agreed to implement a number of the proposals made by MCI,

[4] MCI also participated in BHC collaborative meetings in the SBC and Verizon territories. BellSouth has opposed the collaborative approach used in other regions of the country.

including an on-line scheduling system and an order tracking application that will reduce the need for coordination via telephone calls.

Q. THEN WHY DOES MCI STILL HAVE CONCERNS ABOUT THE QWEST BATCH HOT CUT PROCESS?

A. As we discussed throughout the Batch Hot Cut Forum, MCI's primary concern is with the impact of these new processes on consumers, particularly those consumers with MCI DSL, those served by IDLC, and those customers that are migrating from one CLEC to another.

Q. WILL THE HOT CUT PROCESSES PROPOSED BY QWEST SERVE TO OVERCOME THE OPERATIONAL OR ECONOMIC OBSTACLES RECOGNIZED BY THE FCC RELATIVE TO IMPAIRMENT?

A. No, unless Qwest in its testimony in this proceeding introduces major improvements to its "Final Proposal" provided to the BHC Forum website on January 9, 2004, the resultant processes will not serve to overcome the operational obstacles identified by the FCC. With respect to economic obstacles contributing to impairment, little can be said at this time since Qwest will be presenting its proposed rates for its "improved" hot cut processes (and providing supporting cost documentation) for the first time in its testimony filed in this docket simultaneously with ours.

Q. IS IT REALISTIC TO THINK THAT QWEST COULD DEVELOP A HOT CUT PROCESS CAPABLE OF EFFECTIVELY STREAMLINING THE PROCESS TO ACCOMMODATE VOLUMES CURRENTLY ACHIEVED BY UNE-P IN A 9 MONTH TIMEFRAME?

A. Probably not. The UNE-P provisioning process was developed over 2-3 years of constant work, with the assistance of numerous CLECs, state commissions, consumer groups, and notably, the cooperation of the regional Bell operating

companies ("RBOCs") who were actively seeking §271 approval. Likewise, the automated and efficient processes used by ILECs to provision their own retail services (designed specifically to avoid the type of loop cutover work at issue in this proceeding) were developed over an even longer period. To assume that Qwest, or any ILEC, could achieve similar results in a 9-month timeframe for its hot cut process used to support UNE-L, probably isn't realistic. This is especially true since the parties have had to engage in a debate as to the form of the BHC process. This is not to say that the Batch Hot Cut Forum was not worthwhile, since many agreements were crafted in that process. Moreover, even where agreement could not be achieved, the parties developed a level of understanding that will be valuable in limiting the litigation on the impasse issues.

Q. IS MCI INTERESTED IN AN IMPROVED HOT CUT PROCESS TO BE APPROVED BY THIS COMMISSION CONSISTENT WITH THE FCC'S SCHEDULE, EVEN IF SUCH A PROCESS DOES NOT OVERCOME ALL OF THE OBSTACLES LEADING TO IMPAIRMENT?

A. Yes, but it is clear that a finding of "no impairment" cannot be made without having this process in place, fully tested at commercial volumes and with metrics to ensure continued performance over time. MCI is very interested in any improvements that can be made to the hot cut process either within 9 months, or any time thereafter. MCI is committed to serving mass market customers on its own facilities where it is operationally and economically viable, and is encouraging state commissions to eliminate operational and economic obstacles that stand in its way in that regard. In a telecommunications market reliant so heavily on bundled products, a company's long term viability cannot be sustained in a scenario wherein it relies almost exclusively upon the facilities of its primary

competitor (e.g. UNE-P). To ensure that CLECs can move to this service delivery method without harming customers, MCI recommends that the Commission maintain the national finding of impairment throughout all telecommunications markets in the state until such time as UNE-L can realistically replace UNE-P as a tool for serving mass market customers.

V. QWEST'S BATCH HOT CUT PROCESS

Q. SHOULD THE COMMISSION LIMIT ITS INVESTIGATION TO THE BATCH HOT CUT PROCESS ONLY?

A. No. In an effort to alleviate some of the operational barriers to UNE-L recognized by the FCC, the TRO requires that the states approve a batch hot cut process ("Transition Batch Hot Cut Process") to transition existing UNE-P customers to UNE-L by cutting over unbundled loops in high volumes from Qwest to CLECs.[5] The FCC expected that such a process would enable groups of UNE-P customers to be transitioned to UNE-L simultaneously in batches, thus "result[ing] in efficiencies associated with performing tasks once for multiple lines that would otherwise have been performed on a line-by-line basis."[6] Yet although the FCC recognized that such "a seamless, low-cost batch cut process for switching mass market customers from one carrier to another is necessary, at a minimum, for carriers to compete effectively in the mass market," it did not view this transitioning process as a panacea.[7] Indeed, because this Transition Batch Hot Cut Process only addresses the issue of transitioning to UNE-L the embedded

[5] Id. at ¶¶ 487-490.
[6] Id.
[7] *See, e.g.*, TRO ¶ 423 describing the batch process as mitigating, not necessarily eliminating impairment, ¶487.

base of customers that competitors like MCI have acquired on UNE-P, it is merely one discrete piece of the much larger puzzle that must be assembled before UNE-L can be seen as a viable service delivery method. In practical terms, eliminating the operational barriers associated with the every day hot cut process ("Mass Market Hot Cut Process") – which will be used to move customers to and from multiple carriers in a dynamic competitive market – is far more critical than implementing a Transition Batch Hot Cut Process that is only useful for simultaneously moving batches of UNE-P customers to UNE-L.

Q. DOES MCI HAVE ANY CONCERNS AT THIS TIME ABOUT HOW QWEST IS ADDRESSING BATCH HOT CUTS?

A. Yes. While the Batch Hot Cut Forum was useful in many respects, it is clear that many issues remain unresolved or at impasse.

Q. IS MCI AT IMPASSE ON MOST ISSUES RELATING TO THE PROPOSED QWEST BHC PROCESS?

A. No. To say that MCI is at impasse on most issues would be incorrect. Qwest appears to have made movement in the right direction by listening to the concerns of the CLECs and including some recommended features. For instance, Qwest has agreed to develop a "due date scheduler" and an online order status tool – both of which were recommended by MCI and other CLECs. Nevertheless, and despite the progress made during the Batch Hot Cut Forum, there are issues at impasse and others that are not well defined.

Q. PLEASE SUMMARIZE MCI'S GENERAL CONCERNS WITH QWEST'S PROPOSAL.

A. As discussed earlier in this testimony, MCI's concerns can be summarized into the following categories: (1) Mechanization -- the process must be substantially

more mechanized than existing processes, (2) Limitations on Order Types -- it must be available to all types of transactions a CLEC is likely to encounter in a world where UNE-P no longer exists, (3) Scalability -- it must be capable of handling dramatically increased order volumes without inserting additional delay and/or error into the process, (4) Testing and Monitoring -- it must be governed by performance measures and penalties consistent with the commercial volumes it will be required to support and finally (5) Efficient and Cost Based -- it must be comparable in terms of quality, timeliness, reliability and cost to existing UNE-P provisioning methods or more importantly, Qwest's own retail provisioning processes. We will address each of these areas with respect to Qwest's proposal in this proceeding. Prior to discussing these broad issues, however, we will specifically address the impasse issues that are of concern to MCI.

VI. IMPASSE ISSUES

Q. HOW MANY IMPASSE ISSUES RESULTED FROM THE REGIONAL BATCH HOT CUT FORUM?

A. Based on the record in that Forum, it appears that 19 issues were at impasse for various reasons. MCI was not at impasse on all 19 issues, and our testimony will only address those issues with which MCI has disagreement with Qwest.

Q. PLEASE ADDRESS EACH IMPASSE ISSUE WITH WHICH MCI HAS A CONCERN, AND PROVIDE MCI'S PROPOSED RESOLUTION.

A. We will identify each issue below using the issue number from the BHC forum, final issues matrix, and then discuss the impasse issue and MCI's recommendations.

VII. ISSUE P-5 – IDLC LOOPS

Q. PLEASE DESCRIBE THIS ISSUE AND THE POSITIONS OF THE PARTIES.

A. The issue was phrased, "Whether the Batch Hot Cut process should include loops provisioned over IDLC". Qwest argued that IDLC loops are handled using the standard hot cut process. MCI and other CLECs argue that IDLC loops must be included in the BHC, especially since a large percentage of loops are served over IDLC facilities. Moreover, the extent to which the CLECs are denied a BHC process for a substantial portion of the network seriously calls into question whether economies of scale will be sufficient enough to warrant any attempt on the part of CLECs to implement UNE-L for the remainder of the market, even for those customers for which the hot cut process might be available.

Q. DOES QWEST PROVIDE LOOPS OVER IDLC?

A. Yes, as is reflected in MCI's direct operational impairment testimony, Qwest has a significant number of loops provided over IDLC. That testimony also quantifies the amount of IDLC used by Qwest in this state.

Q. SINCE A SIGNIFICANT NUMBER OF QWEST'S LINES ARE SERVED VIA IDLC SYSTEMS, HOW DOES THAT IMPACT THE BHC PROCESS?

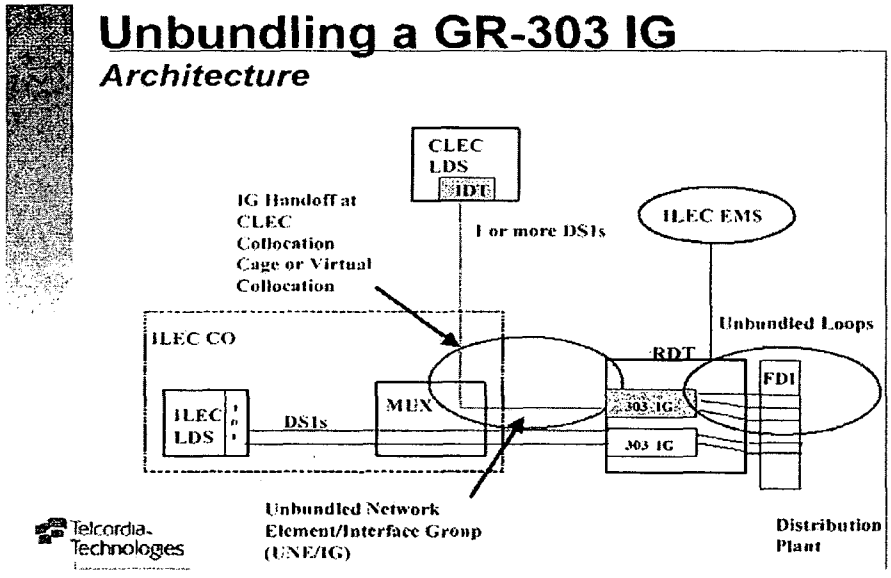
A. Because of these technological challenges associated with unbundling IDLC loops, Qwest has consistently suggested that UNE-L requests for loops served via IDLC must "fall out" of any provisioning process (including "batch" hot cuts) and be provisioned via an extremely expensive and time-consuming manual process. These issues must be addressed and resolved before a finding of non impairment can be entered.

Q. BUT HASN'T QWEST SAID IN THE BATCH HOT CUT FORUM THAT IT WILL CUT OVER THE UNE-P IDLC LOOPS?

A. Yes. But Qwest has indicated that it will not include the IDLC loops in the batch process and will only cut over 10 IDLC loops per day, per "manager's area." According to Mr. Pappas during the Batch Hot Cut Forum, Qwest "...would convert ten UNE-Ps that are on IDLC today, per day, at a single RT [remote terminal]."[8] For example as noted in the BHC forum, in Fort Collins, Colorado, the manager's area would include the cities of Fort Collins, Loveland, Greeley and Berthoud.[9] To be fair, however, Mr. Pappas did note that more urban areas might have a "manager's area" that was limited to one central office. It is clear that converting a dozen or so UNE-P loops a day will not be sufficient given the number of IDLC loops Qwest has in the state.

Q. CAN IDLC BE UNBUNDLED DIGITALLY AS YOU DISCUSS ABOVE?

A. Yes, despite arguments to the contrary from Qwest and the other ILECs, it is technically feasible to routinely unbundle IDLC in a digital format without losing the inherent "integrated" advantages enjoyed by the ILECs' bundled products. Indeed, the FCC in its *Triennial Review Order* noted: "We recognize that it *is* technically feasible (though not always desirable for either carrier) to provide unbundled access to hybrid loops served by Integrated DLC systems."[10] (Emphasis added).



The most advanced IDLC systems engineered and deployed today (GR-303 compliant) have that capability. BellCore (now Telcordia) who developed

[8] See Batch Hot Cut Forum, December 2, 2003, transcript at page 384.
[9] Id. at 390.
[10] See TRO at ¶ 297, n.855.

the GR-303 interface, describes at least two methods by which GR-303 compliant IDLC can be unbundled electronically without requiring a dispatch.

Q. PLEASE DESCRIBE THOSE METHODS.

A. The first method entails the establishment of separate interface groups at the IDLC remote terminal so that a distinct interface group is assigned to a CLEC and passed through a multiplexing device in the central office for purposes of accessing individual lines at the DS0 or DS1 level. This particular unbundling strategy has been discussed for years by industry bodies and has been supported by Telcordia in the past in numerous symposiums. Indeed the following diagram depicting the manner by which this process would work was constructed by Telcordia and provided to the industry in one of its GR-303 symposiums.

Source: Telcordia's GR-303 Access Symposium binder, Tab 4, August 11, 1999.

Q. DO OTHER METHODS OF UNBUNDLING IDLC EXIST?

A. Yes, Telcordia also describes another method relative to sharing GR-303 Interface Groups between the ILEC and the CLEC, using a sidedoor port on the ILEC's

digital switch for purposes of accessing individual DS0s for transfer to the CLEC's switch. The diagram below shows the use of a GR-303 interface group sharing ILEC and CLEC traffic wherein all CLEC traffic is routed through a sidedoor port, supporting a DS1 or DS0 unbundling scenario. This drawing is also taken from Telcordia documentation, this time from Telcordia's most recent issue of *Notes on the Network*, a leading source of engineering documentation relevant to today's telecommunication network. [11]

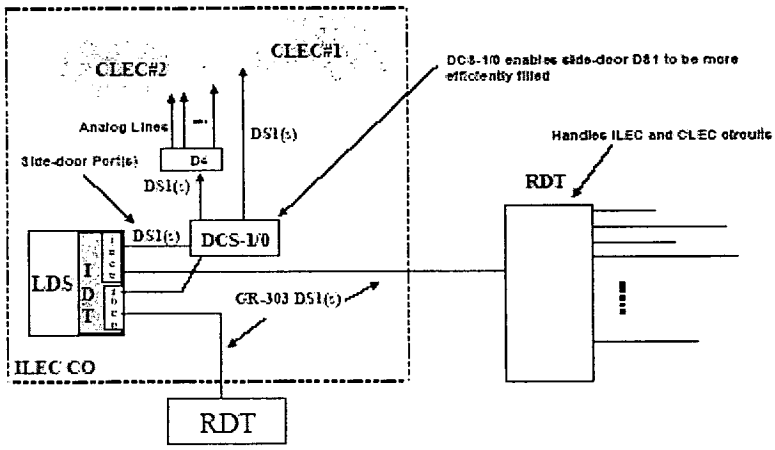


Figure 12-36. IDLC Unbundling Using Sidedoor Port

In the scenario above, unbundled CLEC loops are provisioned as non-locally switched circuits within the IDLC system. Telcordia describes this application as follows:

> While the digital system cross-connect ("DCS"), DCS-1/0, is shown in the figure, it is not a requirement of this architecture. The advantage of using a DCS-1/0 is realized if the CLEC is not fully utilizing a DS1 from the ILEC local digital switch (LDS) to the CLEC, and multiple switch modules with individual digital control units (IDCU) are used by the ILEC. If a DCS-1/0 is placed between the LDS DS1 sidedoor port and the CLEC DS1s, it would permit full utilization of the sidedoor LDS/IDCU hardware by enabling CLEC DS0s to be rearranged in the DCS-1/0 and placed

[11] Examples taken from: Telcordia Notes on the Networks Issue 4, October 2000.

on the individual CLEC DS1s. (See *Notes on the Networks* at Section 12-56)(acronym definitions added).

Q. IN ADDITION TO THE SIMPLE FACT THAT CLECS CAN GAIN ACCESS TO UNBUNDLED CIRCUITS VIA THIS UNBUNDLING METHOD, ARE THERE OTHER ADVANTAGES TO THIS TYPE OF DIGITAL UNBUNDLING?

A. Yes. Not only would either of these methods provide a CLEC unbundled access to the same customer loops the customer enjoys today, without a technician dispatch, it would also mitigate (if not eliminate) the need for manual intervention in the loop provisioning process (*i.e.*, the "hot cut"). Because GR-303 IDLC systems are largely software driven and do not rely upon manual copper wire manipulation for purposes of cross-connecting the derived circuits they support, unbundled loops could be provisioned to a CLEC on an electronic basis, free of any costly or time consuming technician dispatch. As such, this type of IDLC unbundling would go a long way toward providing non-discriminatory access to unbundled loops, and also toward removing impairment caused by the labor intensive and cumbersome hot cut processes supported by Qwest. In short, this type of unbundling once implemented, tested and proven in a commercial setting, would go a long way toward removing the impairment currently faced by mass-market CLECs without access to unbundled local switching.

Q. ARE THERE COMPLEXITIES ASSOCIATED WITH UNBUNDLING IDLC IN THE FASHION YOU HAVE DESCRIBED ABOVE?

A. Yes. Though unbundling IDLC is unarguably feasible, the work required to establish necessary processes and techniques to unbundle IDLC in this fashion in a commercial setting has never been undertaken in earnest by the ILECs. They have simply been provided no incentive to support this type of process that will

only serve to enhance competition in the local market they currently dominate. As such, time and effort must be put toward making this technology a reality. Below we list a number of the obstacles that must be overcome on the road to efficiently unbundling IDLC for purposes of removing impairment:

A. Since each CLEC circuit requires a nailed up DS0, absent additional software functionality or other processes, the ILEC may encounter blocking over the IDLC system as other circuits compete for DS0 channels.

B. The number of sidedoor ports that can be engineered varies depending on the LDS supplier and no standard appears to have emerged. Hence, a concerted effort on the part of the ILEC may be required to standardize this technology for this purpose.

C. There is limited support in existing special services design systems and databases to support sidedoor port circuits. Again, this results primarily from the fact that the vendors design systems based upon the needs of their primary customers and the ILECs have had little incentive in the past to pursue this type of unbundling technology. Hence, this issue could undoubtedly be overcome by the vendors if provided the proper incentive.

D. Other issues regarding security for an IDLC system providing multiple interface groups to multiple CLECs need to be addressed. Likewise, numerous other details associated with sharing test resources, alarms, etc., would require additional development.

Q. WHY SHOULD THE INDUSTRY WORK TOWARD OVERCOMING THESE OBSTACLES?

A. UNE-P allowed CLECs to overcome the many issues we have described above relative to hot cuts and loop provisioning—issues that had heretofore largely stymied local competition via UNE-L. If the FCC and/or this Commission realistically intend for UNE-L to take the place of UNE-P as a competitive service delivery vehicle, then these same problems must be overcome in a different way. we have identified the manner by which that can be accomplished above.

Unbundling IDLC will not be easy. It will require the hard work of the ILECs, the CLECs and, most importantly, state public utility commissions. However, until it is accomplished, CLECs will be impaired without access to UNE switching and UNE-P. It is MCI's hope that addressing the problems in that order (*i.e.*, first fix the IDLC unbundling issue as well as the manual hot cut issue, then decide whether impairment remains) will provide the type of incentive necessary for proper ILEC involvement (contrasted with their general nay-saying relative to these options in the past).

Q. WHAT CONFIDENCE CAN THE COMMISSION HAVE THAT IDLC CAN BE UNBUNDLED AND THAT THESE ISSUES YOU HAVE IDENTIFIED ABOVE CAN BE OVERCOME?

A. Though these issues are real, and real effort will be required to address them, it is important to remind the Commission that Telcordia developed the specifications for the GR-303 platform for unbundling, and has demonstrated their commitment to resolving the issues associated with unbundling, by providing the methods described above. Telcordia has even organized and spearheaded symposia related to unbundling GR-303 equipment. In the final analysis, these types of issues are really no different than the myriad of issues the industry has been addressing for several years relative to the evolution of the network and unbundling in general. The arguments the ILECs make in opposition to IDLC unbundling should remind the Commission of similar arguments the same ILECs made almost 10 years ago when they argued that loops in general could not be unbundled save catastrophic repercussions to the entire network. Those catastrophic events failed to materialize and the same will undoubtedly hold true relative to IDLC unbundling.

Finally, Bell South and SBC include IDLC in their batch hot cut processes. Bell South will use GR303 and other techniques when available. At the very least, Qwest should agree to include IDLC circuits in the batch process even if these circuits must first be cutover only where spare copper is available.

Q. WHAT IS MCI'S PROPOSED RESOLUTION TO THIS ISSUE?

A. The Commission should require Qwest to include IDLC loops in BHC orders.

Q. SHOULD THE HOT CUT PROCESSES ULTIMATELY IMPLEMENTED BY THE COMMISSION EXCLUDE ANY PARTICULAR ORDER TYPES?

A. Generally, no. While there might be a legitimate reason to exclude some particular order type, such exclusion should be the exception as opposed to the rule. Qwest from what we have seen to date appears to make such exclusions common place, thus mitigating the potential benefits of improved hot cut processes. To the extent their efforts are successful, the process in which we are currently engaged is likely to be for naught. If that is the result of this process, then CLECs will have to use the existing hot cut processes.

Q. WHY IS THIS ISSUE IMPORTANT?

A. To the extent CLECs intend to implement a UNE-L strategy, the economics require them to move their embedded base of UNE-P customers to UNE-L. Customers served by UNE-P today are not homogeneous with relation to service type, customer type, or loop type. As such, if Qwest is successful in maintaining the numerous exclusions it has proposed relative to its hot cut processes, there will be a large number of existing UNE-P customers who will not be able to be cutover with the hot cut process. Further, to maintain their customers over any

length of time on a going forward basis, CLECs need to be able to address all customer types represented in their market. That would include, at a minimum, all types of lines that are currently contained within their embedded base.

Q. CAN YOU PROVIDE SOME EXAMPLES OF EXCLUSIONS AND EXPLAIN WHY THEY WOULD DISRUPT THE CLEC'S BUSINESS IF MAINTAINED?

A. Yes, we can provide three of the most important examples. First, Qwest has for the most part stated that its "batch" hot cut processes will not support customer loops currently provided via IDLC facilities (as discussed above), at least not within the same timeframe or at the same costs as other loops. Second, we understand that Qwest will exclude any line that is currently being used for both voice and data services (line sharing or line splitting) from these processes (see below). Third, we also understand that Qwest does not intend to support hot cuts where the receiving carrier is not collocated in the office where an end user's loop is terminated, *i.e.*, it will not allow for hot cuts to take place where EELs are used to gain access to end users by taking the loop from the MDF and connecting it to a collocation at another central office where it can then be transferred to the carrier's switch (or in many circumstances, it has simply not developed the processes needed to provide BHCs in a situation where a carrier uses an EEL).

By including these – and potentially other – prohibitions on the use of BHC processes, Qwest has substantially reduced the percentage of current and future customers' loops that could potentially benefit from the processes which are being designed to mitigate impairment. As such, even with the BHC process advocated by Qwest, CLECs will remain impaired when attempting to serve any

of the mass market customers who happen to fall into these categories, which could easily be well over half of all such customers. For example, it has been our experience that in some central offices, many mass market customers are served via IDLC. Moreover, the extent to which the CLECs are denied a BHC process for a substantial portion of the network seriously calls into question whether economies of scale will be sufficient enough to warrant any attempt on the part of CLECs to implement UNE-L for the remainder of the market, even for those customers for which the hot cut process might be available.

Q. PLEASE DESCRIBE MCI'S PROPOSAL RELATED TO EELS.

A. MCI should be allowed to submit an order that requests a loop housed in Qwest Central Office A, be "cut" to a collocation facility (i.e., an MCI CFA), in Central Office B. When Qwest receives such an order, it should provision on MCI's behalf, as part of its hot cut pre-wiring function, a DS0 EEL extending from Central Office A to MCI's CFA in Central Office B. All ANI testing should be completed via the DS0 EEL, and on DD-2 Qwest should cut the requested loop to the EEL so that MCI dial tone from its collocation in Central Office B is provided to the customer via his/her loop located in Central Office A. Non-recurring charges specific to an EEL/Hot Cut should be computed and presented to state public utility commissions for review before approval.

VIII. ISSUE P-6A and B – LINE SPLIT LOOPS

Q. PLEASE DESCRIBE THIS ISSUE AND THE POSITION OF THE PARTIES.

A. Issue P-6a is described, "Whether the Batch Hot Cut process should include line split loops." Issue P-6b is described, "Whether the Batch Hot Cut process should include UNE-P with ancillary DSL." Qwest argues that including line split loops would eliminate some of the efficiencies of the BHC. The CLECs argue that line split loops are required per the TRO. In addition, CLECs point out that Qwest, among all the other ILECs, is the only one that actually has a process to migrate a line split UNE-P line to a line split UNE-L line without disrupting the customer's data services. Thus, Qwest has the process CLECs need but refuses to implement it as part of its batch process.

Q. WHAT IS MCI'S PROPOSED RESOLUTION TO THIS DISPUTE?

A. The Commission should require Qwest to include line split loops in the BHCs. At ¶ 211 of the TRO it states,

> We also require incumbent LECs to provide competitive LECs the ability to line split, which allows two competitive LECs to split the loops so that one carrier can provide narrowband service and the other can provide broadband service.

There is no good reason to preclude line split loops from the BHC process. Indeed, at ¶ 252 of the TRO the FCC encouraged the ILECs to use the collaborative process to address any OSS changes that might be necessary to support line splitting.

Q. DO YOU ANTICIPATE SITUATIONS IN THAT A UNE-P CUSTOMER WITH LINE SPLITTING WILL MIGRATE TO A UNE-L SCENARIO?

A. Yes. Today there are customers in line splitting scenarios where the voice service is provided via UNE-P. It is likely that a CLEC will want to move that voice

service from UNE-P to UNE-L if UNE-P is no longer available. In that scenario there is no reason to eliminate the loop from the BHC.

Data services are becoming an ever-increasing part of full-service communications packages offered not only by CLECs, but also by Qwest and the other ILECs. And, digital subscriber line ("DSL") growth rates are still dramatic as literally thousands of new DSL subscribers join the ranks of the broadband subscribership every day. As such, it is becoming far more common to encounter subscribers who have DSL services on their existing loop, but want to change either their entire service package, or just their voice services, to another carrier. Either of these scenarios is likely to require a hot cut. Yet, again, Qwest does not plan to support this type of hot cut in its improved processes.

Q. QWEST INDICATES THAT SUCH A SCENARIO WOULD BE CHANGING THE SERVICE FROM A NON-DESIGN SERVICE TO A DESIGN SERVICE, THEREBY ELIMINATING EFFICIENCIES THAT THE BHC WAS DESIGNED TO CAPTURE. DO YOU AGREE?

A. No. The customer was previously receiving voice and data over a loop that was capable of providing the service. Eliminating the ILEC local switching does not eliminate the loop. As such there is no need to "design" the loop since it was already in service and providing both voice and data. The "design" issue is a red-herring and should be ignored. Qwest should be required to include these loops in the BHC.

Q. WHAT IF THERE ARE OTHER TECHNICAL ISSUES ASSOCIATED WITH INCLUDING THE LINE SPLIT LOOPS IN THE BHC?

A. If there are other situations that require attention, then Qwest should work to resolve those issues and not simply refuse to do so. During the Batch Hot Cut

Forum, Mr. Zulevic from Covad explained to the parties how simple the actual cut of line split loop would be.[12] There is no technical reason not to include line split loops in the BHC.

IX. ISSUE P-12 – MIGRATION BY TELEPHONE NUMBER

Q. PLEASE DESCRIBE THIS ISSUE AND THE POSITION OF THE PARTIES.

A. MCI has asked for the capability of migrating a customer by telephone number ("TN") and street address number ("SANO"). Qwest considers this issue outside the BHC implementation process but specifically noted that "...there is no technical limitation precluding Qwest from modifying the edits in its integrated mediated access ("IMA") systems to allow CLECs to enter TN and SANO for UNE-P to UNE-Loop conversions."[13]

Q. HOW DOES MIGRATION BY TN AND SANO BENEFIT THE INDUSTRY?

A. Migration by TN and SANO saves the CLEC considerable time on each local service request ("LSR") by not having to enter the entire customer address. It also eliminates potential errors in the LSR associated with typos or other unique aspects of address notations (i.e., "St." versus "Street"). By saving time for the CLEC and avoiding errors on LSRs (and avoiding the resulting rejects), the industry and the consumer benefit. Since there is no technical limitation precluding Qwest from processing LSRs with TN and SANO, the Commission should require Qwest to do so.

Q. DOES QWEST OPPOSE MIGRATION BY TN AND SANO?

[12] See Batch Hot Cut Forum Exhibit 4.
[13] See Batch Hot Cut Forum Issues List; Issue P-12; Qwest Response dated 12/10/03.

A. Qwest has indicated that it will not oppose MCI Change Request Nos. CR SCR061302-01 and SCR022703-18 that deal with the migrate by TN and SANO issue. [14]

Q. DOES THAT RESOLVE THIS ISSUE?

A. No. The Change Management process can be very time consuming with no guaranty of success. Further, Qwest has indicated that resources for updating IMA releases have been reduced dramatically. The industry should not have to wait for such important enhancements when there is no technical reason not to implement them.

Q. IF THE COMMISSION ORDERS QWEST TO MAKE THIS CHANGE DOES THAT EXPEDITE THE CHANGE MANAGEMENT PROCESS?

A. Yes. When a change is required by a regulatory order the change requests becomes a "regulatory" change request and it then takes priority over non-regulatory CRs. Having an order from this Commission directing Qwest to implement Migration by TN and SANO by a certain date and before any finding of "no impairment", if any, were to become effective for any area within the state will aid the CLECs in their attempts to get this important capability in place sooner.

X. ISSUE P-23 – NOTIFICATION OF BATCH COMPLETION

Q. PLEASE DESCRIBE THIS ISSUE AND THE POSITION OF THE PARTIES.

A. MCI has asked Qwest to consider updating the web-based order status tool more often than once every 30 minutes. MCI recommends that the status tool update at

[14] Id.

least every 10 - 15 minutes so as to limit the amount of time the customer is unable to receive calls.

XI. ISSUE P-27c – LEVEL OF MECHANIZATION

Q. PLEASE DESCRIBE THIS ISSUE AND THE POSITION OF THE PARTIES.

A. MCI has recommended that Qwest investigate the use of automated or robotic frames for central office activities. This type of mechanization is an excellent way to increase capacity and efficiencies which were specific goals of the *Triennial Review Order* for the BHC process. Qwest states that it has evaluated such technologies but has chosen not to implement them.

Q. WHY IS MECHANIZATION IMPORTANT?

A. Each of the obstacles described by the FCC in the *TRO* related to the hot cut process (i.e., timeliness, scalability, reliability, seamlessness and cost) can be addressed with increased mechanization. Indeed, the primary advantage of the UNE-P provisioning process when compared to the hot cut process is the level of mechanization. If done correctly, little or no manual intervention is required to move a customer from one carrier's service to another via UNE-P. This substantially increased level of mechanization in the UNE-P process bears substantial fruit, for example:

(1) The time required to move the customer from one carrier to another is dramatically reduced, from several days to just a few minutes.

(2) The rate of error in the process is dramatically reduced. The largest single component leading to service disruption in the hot cut process is human error.

(3) The process is highly scalable given that software/hardware resources are easily supplemented.

(4) The process is relatively inexpensive. The single most expensive component of any provisioning function is human intervention.

It is this increased level of mechanization, and the resultant benefits, that have made UNE-P such a successful competitive platform. And, unless state regulators are willing to see the substantial progress made by competitors with UNE-P evaporate without it, the hot cut process will need to exhibit the same types of efficiencies.

Q. DOES QWEST RELY HEAVILY UPON MECHANIZATION FOR PURPOSES OF INCREASING THE EFFICIENCY (AND LOWERING THE COSTS) OF ITS RETAIL PROVISIONING PROCESSES?

A. Absolutely. In fact, the FCC at ¶ 465 of its *TRO* made a point of noting the discrepancy between an ILEC's primarily software-driven retail provisioning process, and the manually intensive nature of existing hot cut processes in an effort to illuminate the competitive disadvantage CLECs would face absent access to unbundled local switching (or a dramatically improved/mechanized hot cut process):

> The barriers associated with the manual hot cut process are directly associated with incumbent LECs' historical local monopoly, and thus go beyond the burdens universally associated with competitive entry. Specifically, the incumbent LECs' networks were designed for use in a single carrier, non-competitive environment and, as a result, the incumbent LEC connection between most voice-grade loops and the incumbent LEC switch consists of a pair of wires that is generally only a few feet long and hardwired to the incumbent LEC switch. Accordingly, for the incumbent, connecting or disconnecting a customer is generally merely a matter of a software change. In contrast, a competitive carrier must overcome the economic and operational barriers associated with manual hot cuts. Our finding concerning operational and economic barriers associated with loop access

reflects these significant differences between how the incumbent LEC provides service and how competitive LECs provide service using their own or third-party switches. [emphasis added]

It is important to note that the FCC, in the excerpt above, singles out the disparity between the software driven nature of the ILEC's retail process, compared to the manual nature of the hot cut process, as the primary basis for its finding regarding operational and economic impairment.

Q. DOES TECHNOLOGY EXIST THAT COULD BE USED TO AUTOMATE ACTIVITIES ASSOCIATED WITH BHCS?

A. Yes, and many of the ILECs utilize these technologies for purposes of provisioning retail products with the specific intention of removing manual work steps from their provisioning process. For example, Verizon employs the two most common types of technology that can be used to cutover a loop without manual intervention: (1) automated or mechanized frame systems and (2) electronic loop provisioning via GR-303.[15] There are numerous vendors that provide these automated loop provisioning systems and, not surprisingly, each vendor describes in detail how its system can obviate the need for manual intervention in the cutover process. Examples of vendors who provide electromechanical and micro-relay type frame systems include NHC (www.nhc.com) and Simplernetworks (www.simplernetworks.com), respectively. There are many others as well.[16]

[15] GR-303 is a Bellcore (now "Telcordia") standard around which multiple equipment vendors build "next generation digital loop carrier" systems ("NGDLC").

[16] Other providers include Avaya (Automated Main Distributing Frame System), Oki (Smart MDF) and CON-X (ILEC Central Office Solutions).

Q. PLEASE EXPLAIN THE LIMITATIONS CURRENTLY HINDERING THIS TECHNOLOGY FOR MORE WIDESPREAD USE.

A. For the most part, it appears the largest hindrance with respect to these automated systems is incentive, not technology. Unless required to provide a UNE-L provisioning process approaching the automated efficiency of their retail or UNE-P based services, Qwest has little incentive to consider a technology that will make UNE-L a more viable option. Indeed, Qwest is motivated to delay the implementation of such advances, claiming such advancements are unnecessary, too costly or impossible. As long as Qwest can convince state commissions that the substantially limited manual processes, and the enormous non-recurring charges they require, are sufficient, Qwest has little incentive to automate the process or improve it to any degree beyond that required on a regulatory basis. As such, Qwest spends the majority of its time identifying the limitations of existing equipment rather than describing how it could improve or implement innovative alternatives.

Q. HAS VERIZON DEPLOYED AUTOMATED DISTRIBUTION FRAMES?

A. Yes. In a hearing that was completed just last week, the Verizon witnesses confirmed that the company does use automated distribution frames, albeit not necessarily for BHC purposes. The text of the transcript states:

> Q So for all three of these processes, the provisioning is manual; the movement of the frame is manual?
> A (Witness Maguire) Yes.
> (Witness McLaughlin) With one correction, except in those offices where we do have auto MDFs employed that may have CLEC equipment connected -- my answer was except for those offices where we may have MDFs employed in New

York State that have CLEC equipment connected to them, it would be a manual process.

Q Mr. McLaughlin, what's an automated distribution frame?

A (Witness McLaughlin) It's a mechanical cross connect device that has terminated Verizon equipment for the most part and Verizon cable facilities to it.

Q You caught me off guard, because I was -- had this outline, and we were going to talk about automated distribution frames later, but as long as you mentioned it, let me explore that last answer to that previous question. Does Verizon offer distribution frames today for hot cuts in New York?

A (Witness Nawrocki) Verizon has offered automated MDFs on selected offices. I'm not aware that we have utilized these devices specifically for hot cuts. Typically these devices are in small offices without colocation.[17]

Q So I have two answers which I think are conflicting, and that's why I pursued it. I want to make sure I have the right answer. Between the answer Mr. McLaughlin gave or the answer that Mr. Nawrocki gave, I just want to confirm that there is no CLEC equipment that is attached to automated distribution frames in New York.

A (Witness McLaughlin) My answer was except where they may. I do not have positive information one way or the other.

Q Mr. Nawrocki or anyone else on the panel, is there such a case in New York where a CLEC is attached to an automated distribution frame?

A (Witness Nawrocki) I'm not aware that we have these devices in any office colocation, but I wouldn't disallow it.

Q What do you mean you "wouldn't disallow it"?

A (Witness Nawrocki) To my knowledge, all these devices are in very small or middle offices without colocation. There may be an isolated case, not to my knowledge, where we have some --

[17] Before the State of New York Public Service Commission; Case No. 02-C-1425; Proceedings on Motion of the Commission to Examine the Process and Related Costs of Performing Migration on a More Streamlined (e.g., bulk) Basis; Evidentiary Hearing, Tuesday, January 13, 2004. Cross of Verizon Witnesses McLaughlin and Nawrocki by MCI attorney Curtis Groves.

some telekeyed equipment in the office.

Q If you had that situation, take it hypothetically, do you have plans to use automated distribution frames to perform hot cuts?

A (Witness Maguire) Yes.

Q You do?

A (Witness Maguire) If there is colocation and there are automatic distribution frames, as Mr. McLaughlin pointed out, then we will use that technology to perform hot cuts but, to expand a little bit, I'm not aware of any situation where we have ADFs and colocation.

Q Have you ever tried an application to use ADFs for hot cuts?

A (Witness McLaughlin) Not to my knowledge.

As the Commission can see by this exchange in New York, the technology does exist to automate much of the frame work that is done today by technicians. Qwest's refusal to consider such technology is at odds with the FCC's direction to resolve the overly manual nature of existing hot cut processes. Indeed, the FCC specifically identifies the overly manual nature of existing hot cut processes as the primary obstacle to sufficient scalability, sufficient reliability relative to service quality, and affordability.

Q. ARE THERE ANY RECOMMENDATIONS YOU CAN MAKE TO THE COMMISSION REGARDING THE LONG TERM USE OF TECHNOLOGY TO REDUCE LABOR TIMES, EXPENSES AND THE POTENTIAL FOR ERROR IN THE HOT CUT PROCESS?

A. Yes. If policy makers truly intend for UNE-L to replace UNE-P, such that millions of loops will be "ported" from one carrier to another on a regular basis, technology that automates the loop cutover function is the only way to reach that objective in an efficient manner. Today's "hot cut processes" as briefly described above remain largely manual, labor intensive, and can be made only marginally

more efficient with system and process related improvements.[18] While many of these process and system changes are important and can lead to a more efficient, scalable and low cost hot cut methodology, they completely ignore the largest manually intensive step in the process, *i.e.*, the work of the frame technician to actually cutover the loop.

XII. ISSUE P-29 – COORDINATION OF SYSTEM CHANGES WITH CMP

Q. PLEASE DESCRIBE THIS ISSUE AND THE POSITION OF THE PARTIES.

A. MCI has stated repeatedly that the system changes resulting from the Batch Hot Cut Forum should be made outside of the Change Management Program ("CMP"). Qwest argues that the changes that result from the TRO should be handled through the normal CMP process.

Q. PLEASE EXPLAIN WHY THE CMP IS NOT THE APPROPRIATE FORUM TO ADDRESS CHANGES RESULTING FROM THE TRO.

A. The TRO requirements are unique and extensive. There is currently a backlog of change requests ("CR") that will compete with any changes resulting from the TRO processes. This backlog, combined with Qwest's reduced resources and the time consuming nature of the CMP, means that some important changes will not be made, or that some changes will be delayed.

MCI recommends that the TRO changes be addressed together in a unique release. McLeod also requested that system enhancements associated with the

[18] Qwest has listened to the suggestions of the CLECs and is proposing to implement an electronic "scheduler" and a web based status tool. To the extent Qwest is successful in developing these tools, all parties should benefit from enhanced efficiencies.

BHC process be moved outside CMP as a separate release.[19] Including all the BHC changes (including migrate by TN and SANO) into one release will provide the focus and resources required to implement these changes. If the BHC changes are not done together, the industry risks having some capabilities delayed while others are implemented. Such a disjointed implementation will surely frustrate the intent of the TRO and will not eliminate the finding of impairment.

Q. PLEASE EXPLAIN.

A. The BHC process does not exist unless and until the systems are in place, working and tested under commercial volumes. If all of the features are not present because of CMP priorities, then the system is not yet viable or available as promised. In such a situation, the finding of impairment must remain.

Q. IS THERE A WAY TO AVOID THE DELAYS YOU'VE DISCUSSED?

A. Yes. If the Commission decides that these changes must be evaluated through the CMP, then the Commission should require Qwest to address all the BHC issues together and ensure that they are implemented together as a regulatory change request. Further, the Commission should order Qwest to implement, test and demonstrate that the processes are commercially viable by a certain date and before any finding of "no impairment", if any, were to become effective for any area within the state. Finally, MCI agrees with Covad's suggestion that Qwest allocate additional dedicated resources to address system changes related to the TRO.

[19] See Batch Hot Cut Forum Issues Matrix; Issue P-29.

XIII. ISSUE SC-1 / SC-5 – HANDLING ANTICIPATED VOLUMES

Q. PLEASE DESCRIBE THIS ISSUE AND THE POSITION OF THE PARTIES.

A. This issue relates directly to scalability. Scalability refers to the ILECs' ability to perform BHCs with increases in volumes. The CLECs have raised concerns as to whether Qwest can handle the many transactions that will occur as the result of a find of no impairment and the other day-to-day operations. Qwest claims that it can handle the volumes as it has calculated them over the period allowed for conversion.

Q. WHAT DOES SCALABLE MEAN WITH RESPECT TO THE BHC PROCESS?

A. Scalability refers to the ILECs' ability to perform BHCs with increases in volumes. The BHC process must be capable of handling the migration of the embedded base of UNE-P lines to UNE-L, in addition to expected churn and other cut orders. Scalability is achieved by eliminating manual intervention. As such, and as discussed earlier in this testimony, an automated end-to-end process should be the goal of ILECs seeking scalability for BHCs. Unfortunately, Qwest has ignored the new technologies available today and instead relies almost entirely upon its traditional manual processes.

Q. QWEST CLAIMS THAT ITS BHC PROPOSAL IS SCALABLE. DO YOU AGREE?

A. No. Qwest has eliminated the scalability issue by artificially limiting the size of the batch orders (minimum of 25) and the number of cuts (100) that will be done in any central office on a given day. In other words, Qwest proposes a cap of 100 cuts per day, per central office for all CLECs. So, in Qwest's view, scalability is

not an issue as long as it can cut 100 loops a day in a central office. This approach, however, forces the CLECs to conform to these arbitrary limitations. As you can imagine, given Qwest's intransigent approach to BHCs, the CLECs will have little or no ability to focus cuts in central offices where growth is occurring or in any other prudent or economic manner.[20] More importantly, Qwest's agreements on batch hot cuts are apparently in some way connected to the "transition planning process," but this process remains a mystery.

Q. HASN'T QWEST MADE STATEMENTS TO THE EFFECT THAT THESE HOT CUT MIGRATIONS WILL NOT POSE ANY PROBLEMS?

A. Yes. The industry, however, including Qwest, has had no experience with large volumes of hot cuts. The FCC based its finding of impairment for unbundled local switching on this fact:

> Competitive carriers have shown that, although they have used hot cuts to serve certain small segments of the market, no competitive carrier relies on hot cuts to offer service to significant numbers of customers served by voice-grade loops. Having reviewed the record evidence, *we find that it is unlikely that incumbent LECs will be able to provision hot cuts in sufficient volumes* absent unbundled local circuit switching in all markets.[21] (emphasis added)

Q. HAVE OTHER ILECS EXPRESSED CONFIDENCE IN THEIR ABILITY TO HAVE A SCALABLE PROCESS IN PLACE?

A. Yes. For example, in New York, even based upon its own calculations, Verizon anticipates the need to hire and train literally thousands of new employees just to

[20] During the BHC Forum, for example Qwest indicated that there were 52 CLECs in Colorado. It is mind boggling to think that Qwest's "transition planning" approach combined with its arbitrary 100 cuts per day, per central office, for all CLECs will not result in frustration and inefficiency.
[21] See TRO at ¶ 468.

accommodate the increased volume of hot cut demands.[22] Qwest, on the other hand, has no plans to increase staff whatsoever in order to deal with these needs and instead will dedicate only two central office technicians per central office to do the BHCs. For that reason, Qwest is proposing to limit its BHCs to 100 per central office per day – a number that will be insufficient in many central offices unless the cuts are spread entirely over the timeframe identified by the FCC. In smaller central offices, a team of two technicians may be understandable. In larger central offices, however, Qwest could certainly bring more technicians to the task and accomplish far more than 100 BHCs per day. As the Commission is aware, when the migration of the embedded base begins, the largest central offices will have substantially more BHC requests – perhaps several hundred per CLEC per central office per day. The fact that Qwest, unlike other ILECs, does not see the need to "gear up" in order to accommodate the BHC requests should be a cause for the Commission's concern.

Q. WHAT IS THE MAJOR OBSTACLE TO A SCALABLE HOT CUT PROCESS ON THE PART OF QWEST?

A. The major bottleneck in the hot cut processes advocated by Qwest exists at the MDF or ICDF.[23] As described before, from an operational standpoint (absent installation and implementation of new technology that we discussed earlier), in a UNE-L environment each customer must be rewired manually for purposes of connecting the UNE loop to the receiving CLEC's collocation cage or EEL

[22] See Verizon's Panel Testimony filed October 24, 2003, New York Case No. 02-C-1425, Exhibit V-A, Force Load Model.

[23] Qwest has stated in the Batch Hot Cut Forum that the Qwest CLEC Coordination Center ("QCCC") in Omaha can handle well in excess of 3,600 cut a day. As such, the QCCC does not appear to be a limiting factor.

arrangement. This raises another important factor specific to scalability, *i.e.*, differences between large hot cut jobs undertaken today (or in the past) by Qwest versus the very different hot cut requirements they will face in a market without UNE-P. Currently, large project hot cuts typically involve one or a limited number of individual multi-line business customers wherein the cut, though potentially impacting many loops, is specific to a given customer. Frequently, the loop MDF connections for these groups of multiple lines are centrally located on the frame and typically all of the customers' loops are relatively concentrated geographically on the frame, because they terminate at the same premises. Conversely, a hot cut for a large group of residential, single line customers will generally appear at random frame locations. It is easy to envision frame technicians working on a number of individual large business hot cuts concentrated on a given termination block, however, it is equally as easy to envision the potentially chaotic situation that could develop as a result of multiple technicians working simultaneously on a number of large residential single line hot cut projects involving loops appearing in random locations on the frame. Therefore, even if Qwest were willing to increase its staffing to achieve more hot cuts per day in the short term, such staffing increases should not be considered to be a total or permanent solution to the problem. Such a solution will likely only be achieved through a change in technologies.

Q. TO THE EXTENT UNE-L BECOMES MORE WIDELY IMPLEMENTED, WILL CHURN IMPACT QWEST'S ABILITY TO KEEP UP WITH THE DEMAND FOR HOT CUTS?

A. Absolutely. Churn will become increasingly important and will ultimately drive the rate at which UNE-L migrations grow. MCI has provided its churn rates in its customer impact testimony to give the Commission a sense of the impact churn may have. Moreover, other CLECs may have provided churn rates in discovery responses that should be considered as well. While Qwest would have the Commission ignore CLEC-to-CLEC UNE-L migrations, it should not. In fact, the FCC specifically cited such migrations as a potential area of impairment.[24] Based upon Qwest's statements in the Batch Hot Cut Forum, Qwest does not intend to support CLEC-to-CLEC migrations within its BHC process unless they can be done with no truck roll or other complications. If a CLEC-to-CLEC migration has any complications whatsoever, then the migration must be done using the existing hot cut processes. As such, once a customer is served by a CLEC on UNE-L facilities, the ability of that particular customer to move to another carrier in the future without significant service-impacting problems is in serious doubt. All of the issues which lead to the FCC's finding of impairment without unbundled local switching come into play in such a situation and are compounded by the fact that a third carrier is now involved. Yet Qwest, which by the very nature of its control of the local loop is critical to the process, appears content (indeed, resolute) to leave this issue unaddressed.

[24] See TRO at ¶¶ 471 and 476.

Clearly, if the Commission intends for a customer's loop to be truly portable in a UNE-L environment, this critical issue must be addressed and included in all hot cut processes evaluated, designed, tested, implemented and certified by the Commission. The Commission should recognize that Qwest's ability to meet the demand for BHCs would be impacted by the total number of activities that Qwest must perform to accommodate all types of cuts, regardless of whether those activities occur in a "batch" scenario.

Q. DO YOU HAVE ANY FINAL COMMENTS ON THE SCALABILITY ISSUE?

A. Yes. Qwest notes that "transition planning" will occur prior to the beginning of the migration from UNE-P to UNE-L. It is unclear what this process would entail. Qwest has provided no information on how those meetings might be conducted. Will they be separate meetings with each CLEC? Will they be large industry meetings with all CLECs present? If the parties (whoever that may include) cannot reach agreement on when and where to cut over loops, how will such disagreements be resolved? It seems the entire BHC process and viability is based on a process that Qwest has not yet defined.[25]

XIV. ISSUE V-3 – SIZE OF A BATCH

Q. PLEASE DESCRIBE THIS ISSUE AND THE POSITION OF THE PARTIES.

[25] There is a reference to the Transition Planning at page 3 of BHC Forum Exhibit 9 Section 2, but it says simply, "Transition Planning is expected to take place between Qwest and the CLECs prior to implementation of the Batch Hot Cut Process." While it states that "the transition schedule will establish a central office time line to convert the embedded base within 21 month transition schedule put forth by the FCC in TRO." the devil is in the details.

A. As noted above, Qwest has limited the minimum size of the batch to 25 loops, although it will allow the batch to go through if 5 loops fall out of the batch.[26] MCI has argued that there should be no minimum size of the batch. Other CLECs agree that a minimum batch size is arbitrary.

Q. MIGHT THERE BE TIMES WHEN A CLEC WILL WANT TO SUBMIT A BATCH THAT IS SMALLER THAN 25?

A. Certainly. There is no reason to arbitrarily limit the minimum size of the batch. If a CLEC has five lines it would like to process as a batch, it should be allowed to do so.

Q. QWEST INDICATES THAT IT WILL LOSE EFFICIENCIES IF THE MINIMUM BATCH SIZE IS REDUCED. PLEASE RESPOND.

A. Qwest's statement regarding efficiencies is a pricing issue not an operational one. If the efficiencies are less with a smaller batch then that should be reflected in the price. MCI has consistently stated its expectation that prices will vary with the size of the batch, thereby reflecting the efficiencies and cost savings associated with each.

Q. HOW DO YOU PROPOSE TO SETTLE THIS ISSUE?

A. CLECs should be allowed to submit batch orders of any size. To the extent the size impacts the efficiencies that Qwest may obtain, then those efficiencies should be reflected in the price.

Q. THIS ISSUE ALSO DEALT WITH THE MAXIMUM BATCH SIZE FOR A CENTRAL OFFICE ON A GIVEN DAY. WHAT IS MCI'S RECOMMENDATION IN THIS REGARD?

[26] Qwest states that the batch must include at least 25 lines for a specific CLEC in one central office.

A. MCI recommends a maximum batch size per central office of at least 200 lines. These types of volumes should be achievable by Qwest and would allow CLECs more flexibility if planning their conversions over time.

XV. ISSUE S-2 – INTERVAL FOR THE BATCH

Q. PLEASE DESCRIBE THIS ISSUE AND THE POSITION OF THE PARTIES.

A. Qwest has recommended a seven (7) business day interval for BHCs.[27] The CLECs are requesting a quicker interval ranging from three to five business days.

Q. PLEASE EXPLAIN WHY A SEVEN BUSINESS DAY INTERVAL IS NOT ACCEPTABLE.

A. As stated in the beginning of this testimony, UNE-P is the standard by which a BHC process is judged. Today, Qwest is completing UNE-P orders in three (3) business days or less days. Moreover, UNE-P "conversion as is" for an existing customer can be done on the same day the LSR is received if it is received before noon.[28] Non-coordinated cuts are done in five (5) business days. Finally, as discussed during the BHC Forum, Qwest currently offers a "Quick Loop" service with an interval of 3 business days. With the Quick Loop product, a batch of one to eight lines are cut in three days, eight to sixteen lines are cut in four days and 16 to 24 lines are cut in five days. Given the efficiencies supposedly gained through the "improved" BHC process, certainly Qwest should be able to migrate UNE-P customers to UNE-L in no more than 5 business days. Indeed, during the last day of the Batch Hot Cut Forum the parties had extensive discussions about

[27] See Batch Hot Cut Forum Exhibit 10.
[28] See, Exhibit C to Qwest SGAT.

how to reduce the 7 day interval – by reducing times for both CLEC and Qwest activities.

The BHC process is supposed to be a more efficient process than the current process. The scheduler and the web based status tool should add significant efficiencies and time savings. Indeed, Qwest has estimated a 30 to 40 percent savings for the BHC process. Further, if Qwest is successful in eliminating the many different types of loops (IDLC, line split, ADSL, CLEC to CLEC, etc.) there is no reason why Qwest cannot achieve a five business day interval. The five business day interval should be more than sufficient with all loop types included.

XVI. ISSUE R-1 / R-2 – RATE STRUCTURE AND PRICE

Q. PLEASE DESCRIBE THIS ISSUE AND THE POSITION OF THE PARTIES.

A. At the outset of the Batch Hot Cut Forum, the CLECs stated that is was difficult if not impossible to opine on the BHC proposal without information on price. The trade-offs Qwest was proposing (dialtone check on due date versus dialtone check on due date minus two, for example) could not be evaluated in a vacuum without prices. That vacuum still exists since Qwest has not provided its proposed rates for the BHC process.

Q. EXPLAIN YOUR CONCERNS RELATIVE TO HOT CUT COSTS.

A. The *Triennial Review Order* requires states to "...approve and implement a batch cut process that will render the hot cut process more efficient and reduce per-line

hot cut costs."[29] The FCC specifically identified the current non-recurring rates associated with hot cuts as a major factor in its finding of impairment.[30] Likewise, it directed state commissions to reassess hot cut rates based upon its TELRIC rules and to examine efficiencies that might be gained by offering hot cuts in a "batch."[31]

Q. DO YOU KNOW WHY THE FCC HAS FOCUSED THE STATES ON THE COST OF HOT CUTS?

A. Yes. It is clear that the existing hot cut process is not efficient and it is expensive. Indeed, the FCC states, "The record contains evidence that hot cuts frequently lead to provisioning delays and service outages, and are often priced at rates that prohibit facilities-based competition for the mass market."[32] It is for this reason that the FCC required the states to implement an efficient BHC process to overcome these costs and operational problems. Otherwise, the finding of impairment will remain.

Q. WHAT DID THE FCC FIND WITH RESPECT TO THE CURRENT HOT CUT PROCESS?

A. At paragraph 473 of the *Triennial Review Order* the FCC states, "...we find the overall impact of the current hot cut process raises competitors' costs, lowers their quality of service, and delays the provisioning of service, thereby preventing them from serving the mass market in the large majority of locations."

Q. DOES THE INDUSTRY HAVE EXPERIENCE WITH DETERMINING THE COSTS OF HOT CUTS?

---

[29] See TRO at ¶ 460.
[30] *Id.*, ¶470.
[31] §51.319(d)(2)(ii)(A)(4).
[32] See TRO at ¶ 465.

A. Yes. After substantial time and effort, CLECs and state commissions waded through a plethora of ILEC data to conclude that UNE-P provisioning costs were closer to $1 in a migration situation, as opposed to the more than $100 originally advocated by the ILECs. The lesson to be learned from that experience is that ILECs, including Qwest, have an observed propensity to dramatically exaggerate the costs associated with provisioning UNEs and from my experience in reviewing ILEC cost studies in general, and Qwest cost studies specifically, their estimates tend to be based on cost studies that incorporate inefficient procedures or technologies. Likewise, their studies are generally defined by duplicative work steps, exaggerated estimated work times and many other errors all tending toward non-recurring charges substantially in excess of efficiently incurred costs. Although we have yet to see a price proposal for Qwest's hot cut processes, the same will undoubtedly be true of the cost studies that accompany the price proposal. For that reason, it is critical that the Commission understand that the hot cut process will, for the most part, take the place of a UNE-P migration. (*i.e.*, the method by which most mass market customers are changed from one carrier to another today). To the extent non-recurring costs for the hot cut process substantially exceed existing UNE-P migration charges, UNE-L will suffer from an economic disadvantage relative to UNE-P and relative to the ILEC's retail services that are, in large part, similar to a UNE-P migration. MCI is concerned that existing hot cut costs – to the extent they might be applied in the future – and any hot cut charges which may be determined in future proceedings will be inappropriately based upon inefficient processes and technologies and, as a

consequence, set at rates which are too high to allow for economic use of the UNE-L strategy for mass market customers.

Q. WAS IT POSSIBLE TO DEVELOP PRICES AND COST STUDIES BEFORE THE QWEST BHC PROPOSAL WAS FINALIZED?

A. Perhaps not. But it would have been helpful to have prices for the Qwest proposal as it was initially set forth. With that information in place, it would have been easier to estimate the impact of changing the existing proposal.

Q. DID QWEST PROVIDE A RANGE OF POSSIBLE COSTS?

A. Yes. Mr. Brigham provided a very rough cost estimate of $75 for a hot cut and suggested that a BHC might be provided for about $45 per line.[33] He said that Qwest had not done a cost study, but that he was providing the number as an estimate only. Again, it is impossible to provide an opinion on Qwest's hot cut proposal absent a price for the service. Based on Qwest's comments during the Batch Hot Cut Forum, we expect to see proposed rates supported by cost studies in Qwest's testimony in this proceeding. We will comment on those prices and costs in our rebuttal if at all possible.

Q. DO YOU HAVE CERTAIN EXPECTATIONS ASSOCIATED WITH THE PROPOSED PRICES?

A. Yes. The FCC directed state commissions to reassess hot cut rates based upon its TELRIC rules and to examine efficiencies that might be gained by offering hot cuts in a "batch."[34] As such, we expect to see TELRIC compliant cost studies that reflect the efficiencies and improvements in Qwest's BHC process.

---

[33] See Batch Hot Cut Forum Transcript at page 317 on December 2, 2003.
[34] §51.319(d)(2)(ii)(A)(4).

XVII. ISSUE T-1 – WORKABILITY OF BHC PROPOSAL

Q. PLEASE DESCRIBE THIS ISSUE AND THE POSITION OF THE PARTIES.

A. The issue relates to Qwest's ability to demonstrate that the BHC proposal actually works. The CLECs have argued for some type of testing and monitoring to determine whether the systems work as designed and whether they can work under commercial loads going forward. Qwest has refused to agree to any testing or monitoring other than the existing performance indicators ("PIDs").

Q. IS QWEST'S BHC PROPOSAL MADE UP OF A COMBINATION OF PROCESS CHANGES THAT CAN BE ACCOMPLISHED WITHOUT SIGNIFICANT LEAD TIME, AS WELL AS ENHANCEMENTS THAT WILL REQUIRE FURTHER DEVELOPMENT AND TIME?

A. Yes, it is. Qwest's hot cut proposal is, in our opinion, made up of three primary components:

(1) process and system changes that can be made in a reasonable period of time without substantial likelihood of problems,

(2) process and system changes that will require some industry involvement and could take time to work through the Change Management Process ("CMP"), and

(3) enhancements that show promise toward reducing costly coordination time and providing increased functionality, but which are largely available today only in conceptual format and for which substantial work must be undertaken both to (a) finalize the specifics of the enhancement and then (b) implement the enhancement through the CMP process.

Q. DO YOU HAVE CONCERNS REGARDING ANY OF THESE ENHANCEMENTS?

A. In large part we believe many of the enhancements proposed by Qwest would improve its hot cut processes. Our primary concern is that attempting to conceptualize, design, test and then adopt enhancements of this type (and

magnitude) in a 9 month timeframe is fraught with the potential for disaster. For example, Qwest has suggested that it will design and implement a scheduling tool that will allow CLECs to reserve blocks of time within which they could schedule their hot cut jobs. This scheduling tool is, in concept, an improvement over Qwest's existing process and was requested by MCI and other CLECs. The scheduling tool will eliminate the need to negotiate with Qwest, and it should provide CLECs with some amount of certainty as to the timeframe within which they'll be able to connect customers to their network, and it should allow Qwest to better match its force and load requirements. However, it is clear from the collaborative process that this scheduling tool is still very much "on the drawing board." The same is true of the web-based order status too. Qwest is still conceptualizing how these new systems will work, which systems it will support, what the interface will look like and be capable of, and the business rules surrounding its use. Simply put, the scheduling tool and the web-based order status tools are along way from a reality at this point, and it seems unlikely that Qwest will be able complete its design, implementation and testing within the few months that remain in the FCC's original 9 month window.

Q. ARE THERE OTHER MAJOR SYSTEMS CHANGES THAT SHARE THIS SAME FATE?

A. Yes, there are several. Qwest has stated that it will be updating its web-based order status tool at various points throughout the order provisioning process. Qwest will also be implementing various "timers" and email exchanges and it is not yet clear whether those systems will be updated in time to implement the BHC.

Q. WITH THIS MAJOR SYSTEM WORK AHEAD OF IT, IS IT LIKELY QWEST WILL BE ABLE TO FULLY IMPLEMENT EVEN THE PROCESS IT IS PROPOSING WITHIN THE 9 MONTH WINDOW AVAILABLE IN THIS CASE?

A. No. MCI has offered to work with Qwest's developers to ensure that the system meets MCI's and other CLECs' needs. Hopefully this collaborate effort with speed development and avoid potential problems going forward.

Q. ARE THERE OTHER PROMISES MADE BY QWEST RELATIVE TO ITS HOT CUT PROCESSES ABOUT WHICH YOU ARE SKEPTICAL?

A. Yes. As we discussed above, in our opinion, Qwest's hot cut process can be sufficiently scalable only if it is mechanized to a substantially larger degree than that proposed by Qwest. Given Qwest's unwillingness to investigate and deploy automation, MCI is skeptical about Qwest's ability, as well as its incentive, to follow through on its commitments.

Q. WHAT ARE YOU ATTEMPTING TO PORTRAY TO THE COMMISSION IN YOUR DISCUSSION ABOVE?

A. One of the Commission's most important roles in this proceeding will be to identify all of the enhancements in Qwest's hot cut process that exist today largely as promises. The Commission must then design and implement the proper testing, measurement criteria and incentive structure necessary to ensure that Qwest delivers on those promises. In MCI's mind, the tools most important to this initiative will be (1) a rigorous testing requirement that will test the capabilities of Qwest's processes/systems at a commercial scale comparable to that it would experience given a finding of no impairment, (2) applicable performance metrics aimed at measuring the extent to which Qwest's proposed processes/systems actual perform as promised over time and (3) an incentive

structure that compensates CLECs fairly for any poor performance on Qwest's part. Further, within this proceeding, the Commission should develop some sense of the hot cut volumes Qwest is likely to face given a finding of "no impairment" so as to make itself comfortable with Qwest's ability to accommodate those volumes using the process the Commission ultimately adopts. Using that information the Commission should likewise estimate the increased workforce Qwest would need to procure, train and place in order to meet its promises related to scalability. Finally, the Commission should require of Qwest an implementation plan related to those force enhancements.

Q. DOES THIS CONCLUDE YOUR TESTIMONY?

A. Yes, it does.

QSI CONSULTING
Market Solutions • Litigation Support

Qualifications of Timothy J Gates
Exhibit ____ (TJG-1)

Q. PLEASE DESCRIBE YOUR PROFESSIONAL EXPERIENCE.

A. Prior to my current position with QSI Consulting, I was a Senior Executive Staff Member in MCI WorldCom's ("MCIW") National Public Policy Group. In this position, I was responsible for providing public policy expertise in key cases across the country and for managing external consultants for MCIW's state public policy organization. In certain situations, I also provided testimony in regulatory and legislative proceedings.

Prior to my position with MCIW in Denver, I was an Executive Staff Member II at MCI Telecommunications ("MCI") World Headquarters in Washington D.C.. In that position I managed economists, external consultants, and provided training and policy support for regional regulatory staffs. Prior to that position I was a Senior Manager in MCI's Regulatory Analysis Department, which provided support in state regulatory and legislative matters to the various operating regions of MCI. In that position I was given responsibility for assigning resources from our group for state regulatory proceedings throughout the United States. At the same time, I prepared and presented testimony on various telecommunications issues before state regulatory and legislative bodies. I was also responsible for managing federal tariff reviews and presenting MCI's position on regulatory matters to the Federal Communications Commission. Prior to my assignment in the Regulatory Analysis Department, I was the Senior Manager of Economic Analysis and Regulatory Policy in the Legal, Regulatory and Legislative Affairs Department for the Midwest Division of MCI. In that position I developed and promoted regulatory policy within what was then a five-state operating division of MCI. I promoted MCI policy positions through negotiations, testimony and participation in industry forums.

Prior to my positions in the Midwest, I was employed as Manager of Tariffs and Economic Analysis with MCI's West Division in Denver, Colorado. In that position I was responsible for managing the development and application of MCI's tariffs in the fifteen MCI West states. I was also responsible for managing regulatory dockets and for providing economic and financial expertise in the areas of discovery and issue analysis. Prior to joining the West Division, I was a Financial Analyst III and then a Senior Staff Specialist with MCI's Southwest Division in Austin, Texas. In those positions, I was responsible for the management of regulatory dockets and liaison with outside counsel. I was also responsible for discovery, issue analysis, and for the development of working relationships with consumer and business groups. Just prior to joining MCI, I was employed by the Texas Public Utility Commission as a Telephone Rate

Analyst in the Engineering Division responsible for examining telecommunications cost studies and rate structures.

I was employed as an Economic Analyst with the Public Utility Commissioner of Oregon from July, 1983 to December, 1984. In that position, I examined and analyzed cost studies and rate structures in telecommunications rate cases and investigations. I also testified in rate cases and in private and public hearings regarding telecommunications services. Before joining the Oregon Commissioner's Staff, I was employed by the Bonneville Power Administration (United States Department of Energy) as a Financial Analyst, where I made total regional electric use forecasts and automated the Average System Cost Review Methodology. Prior to joining the Bonneville Power Administration, I held numerous positions of increasing responsibility in areas of forest management for both public and private forestry concerns.

Q. PLEASE DESCRIBE YOUR EDUCATIONAL CREDENTIALS.

A. I received a Bachelor of Science degree from Oregon State University and a Master of Management degree in Finance and Quantitative Methods from Willamette University's Atkinson Graduate School of Management. I have also attended numerous courses and seminars specific to the telecommunications industry, including the NARUC Annual and Advanced Regulatory Studies Program.

Q. WHAT ARE YOUR CURRENT RESPONSIBILITIES?

A. Effective April 1, 2000, I joined QSI Consulting as Senior Vice President and Partner. In this position I provide analysis and testimony for QSI's many clients. The deliverables include written and oral testimony, analysis of rates, cost studies and policy positions, position papers, presentations on industry issues and training.

Q. PLEASE IDENTIFY THE JURISDICTIONS IN WHICH YOU HAVE TESTIFIED.

A. I have filed testimony or comments on telecommunications issues in Alabama, Arizona, California, Colorado, Delaware, Georgia, Florida, Idaho, Illinois, Indiana, Iowa, Kansas, Kentucky, Louisiana, Maryland, Massachusetts, Michigan, Minnesota, Mississippi, Montana, Nebraska, New Hampshire, New Jersey, New Mexico, New York, North Carolina, North Dakota, Oklahoma, Oregon, Pennsylvania, Rhode Island, South Carolina, South Dakota, Tennessee, Texas, Utah, Washington, West Virginia, Wisconsin and Wyoming. I have also filed comments with the FCC and made presentations to the Department of Justice.

I have testified or presented formal comments in the following proceedings and forums:

Alabama:

October 18, 2000; Docket No. 27867; Adelphia Business Solutions Arbitration with BellSouth Telecommunications; Direct Testimony on Behalf of Adelphia.

January 31, 2001; Docket No. 27867; Adelphia Business Solutions Arbitration with BellSouth Telecommunications; Rebuttal Testimony on Behalf of Adelphia.

Arizona:

PUBLIC SERVICE COMMISSION

Public Service Commission) Case No. PU-439-03-295
Local Competition Investigation)

AN APPLICATION REQUESTING TRADE SECRET PROTECTION

Qwest Corporation ("Qwest") requests the North Dakota Public Service Commission, pursuant to Chapter 69-02-09 of the North Dakota Administrative Code, to issue a protective order limiting the disclosure of trade secret information provided by Qwest in direct testimony and exhibits regarding the Batch Hot Cut Process filed with the North Dakota Public Service Commission in this investigative proceeding.

The trade secret information has been appropriately marked and is submitted in a sealed envelope with this filing.

1. **General Description of the Nature of the Information Sought to be Protected.**

The information sought to be protected is:

A. Pages 30-31 of the Direct Testimony of Dennis Pappas and Lynn Notarianni regarding quantities of conversions of UNE-P to a switching platform provided by Qwest for an individual CLEC.

B. Confidential Exhibit DP-18 to the Direct Testimony of Dennis Pappas and Lynn Notarianni regarding specific CLEC requests to Qwest for manual look-up.

C. Confidential Exhibit DP-19 to the Direct Testimony of Dennis Pappas and Lynn Notarianni regarding quantities of Line Splitting provided by Qwest for CLECs identified by state and CLEC.

D. Confidential Exhibit 14 to Exhibit DP-25 to the Direct Testimony of Dennis Pappas and Lynn Notarianni regarding central office codes for the central office facilities that performed the Batch Hot Curt process during the recent commercial test of the process.

2. An Explanation of Why the Information Derives Independent Economic Value, Actual or Potential, From Not Being Generally Known to Other Persons.

Pages 30 and 31 of the Direct Testimony of Dennis Pappas and Lynn Notarianni provide information regarding quantities of conversions from UNE-P to a switching platform performed by Qwest for a specific CLEC. This information is confidential and proprietary to the CLEC and is not publicly disclosed by Qwest. In a competitive telecommunications marketplace, this type of information is highly sensitive and its public disclosure would place the CLEC at a competitive disadvantage. If disclosed publicly, the information would disadvantage the CLEC as the information reflects specifics regarding the CLEC's business activities.

Confidential Exhibit DP-18 to the Direct Testimony of Dennis Pappas and Lynn Notarianni contains information regarding instances of manual look-up provided by Qwest for specific CLECs. This information is confidential and proprietary to the CLECs and is not publicly disclosed by Qwest. In a competitive marketplace, CLEC specific information is highly sensitive and its public disclosure might place the CLEC at a competitive disadvantage. If disclosed publicly, this information could disadvantage the CLEC

regarding its business activities.

Confidential Exhibit DP-19 to the Direct Testimony of Dennis Pappas and Lynn Notarianni contains information regarding quantities of line splitting provided by Qwest for individual CLECs by state. This information is confidential and proprietary to the CLECs and Qwest and is not publicly disclosed by Qwest. In a competitive telecommunications marketplace, this type of information is highly sensitive and its public disclosure would place the CLEC and Qwest at a competitive disadvantage. If disclosed publicly, this information would disadvantage the CLEC and Qwest because it provides information about the CLEC's and Qwest's business activities.

Confidential Attachment 14 to Exhibit DP-25 to the Direct Testimony of Dennis Pappas and Lynn Notarianni contains information regarding the central office facilities that performed the Batch Hot Cut process during the recent commercial test of the process. Identification of the facilities would identify the CLEC that participated with Qwest in the testing process. The information contained in the exhibit would aid competitors of the CLEC. This information is confidential and proprietary to the CLEC and is not publicly disclosed by Qwest. In a competitive telecommunications marketplace, this type of information is sensitive and its public disclosure could place the CLEC at a competitive disadvantage. If disclosed publicly, this information could disadvantage the CLEC as it provides information regarding the CLEC's business activity.

3. An Explanation of Why the Information is Not Readily Available by Proper Means to Other Parties.

The information at issue is proprietary to Qwest and the affected CLECs and is available only to those employees and representatives of Qwest who have a need to know the information to perform their duties and responsibilities. Qwest does not disclose this

information outside the company except pursuant to the terms of strict agreements or orders to maintain the confidentiality of the information.

4. The General Description of the Persons or Entities that Would Obtain Economic Value from Disclosure or Use of the Information.

Competitors or potential competitors of Qwest and the affected CLECs would obtain economic value from disclosure or use of the information.

5. Specific Description of Known Competitors or Competitor's Goods and Services that are Pertinent to the Information.

Competitors and potential competitors of Qwest and the affected CLECs in North Dakota include AT&T, McLeod Telemanagement, Inc., MCI WorldCom, Consolidated Communications Network, Sprint Corporation, IdeaOne Telecom Group and any other provider of telecommunications services in North Dakota or any of the other states in which Qwest operates.

6. Description of the Efforts Used to Maintain the Secrecy of the Information.

See No. 3 above.

Dated this 23rd day of January, 2004.

Respectfully submitted,

By: _____

EXECUTIVE SUMMARY

Purpose of Testimony

The purpose of my testimony is to present the nonrecurring Total Element Long Run Incremental Cost ("TELRIC") study used to support the price for Qwest's Batch Hot Cut ("BHC") installation option. In addition, I will present batch hot cut volume estimates demonstrating that Qwest can handle projected batch hot cut order volumes.

TELRIC Principles

The Qwest TELRIC studies identify the *forward-looking* direct costs that are caused by the provision of an interconnection service or network element in the *long run*, plus the forward-looking incremental cost of shared facilities and operations. These studies identify *total element* costs—the average incremental cost of providing the entire quantity of the element. The assumptions, methods, and procedures used in the Qwest cost studies are designed to yield the forward-looking *replacement* costs of reproducing the telecommunications network.

Qwest's TELRIC studies are in complete compliance with the Telecommunications Act of 1996, and are consistent with the FCC's TELRIC principles, as defined in the FCC's First Interconnection Order. The TELRIC cost data presented in my testimony should be utilized to set the price for batch hot cuts.

The Qwest BHC TELRIC Study

Methodology - The Qwest BHC nonrecurring cost study identifies the one-time costs that are incurred at the time a customer's UNE loop is provisioned using the BHC process. These costs result from a CLEC batch order and are labor-related. In addition, the BHC nonrecurring cost study includes the costs Qwest will incur to develop the mechanized systems necessary to support the BHC process, such as the "appointment scheduler" and "batch status tool."

The BHC cost study identifies costs for the activities depicted in the "Proposed Batch Hot Cut Provisioning Flow" provided in Exhibit DP-10 of Mr. Pappas' testimony. The study identifies costs for activities that always must be performed manually (e.g., pre-wiring at the CO frames) and activities that must be performed manually when an order "falls out" of a mechanized process. Based on input from subject matter experts ("SMEs"), the cost study estimates the *work time* associated with each *manual* activity and the *probability* that each manual activity will occur, along with the appropriate labor rate. The time estimates, probabilities and labor rates are used to develop the direct nonrecurring cost of each work activity using the following formula:

Activity time * Probability of Occurrence* Labor Rate = Cost of Activity

The costs for all BHC activities are then aggregated into a total BHC direct nonrecurring cost, and annual cost factors are applied to estimate shared and common costs.

BHC Cost Results - The nonrecurring BHC cost study is provided in Exhibit TKM-1. The BHC nonrecurring cost (TELRIC plus Common) is $45.96 per loop installed.

Analysis of Work Activities - My testimony provides an analysis of the work activities, work times and probabilities for each work center that will be involved when a BHC loop is requested by a CLEC. The study identifies costs for following work centers:

- Interconnection Service Center ("ISC")
- Loop Provisioning Center
- Design Center
- Central Office Resource Administration Center ("CORAC")
- Central Office Technicians
- CLEC Coordination Center ("QCCC")

As described in my testimony, Qwest will experience efficiencies via the BHC process that reduce the cost as compared to the basic loop installation option. Central Office technician time is reduced, and QCCC work is significantly reduced.

Volumes Data

Exhibit TKM-2 provides an estimate of the aggregate Qwest UNE-P migration volumes that would be experienced over the FCC's 27 month migration period. Exhibit TKM-3 provides an analysis of the potential UNE-L volumes in the highest volume office in North Dakota. My testimony describes each of these exhibits in detail, and explains how this data should be used. The testimony of Mr. Pappas and the attached Hitachi Consulting report will draw conclusions from the data and explain how the data should be used in evaluating Qwest BHC proposal.

Recommendation

The Commission should accept the TELRIC study filed by Qwest as basis for the BHC nonrecurring rate.

I. IDENTIFICATION OF WITNESS

Q. PLEASE STATE YOUR NAME, BUSINESS ADDRESS AND POSITION WITH THE QWEST CORPORATION.

A. My name is Teresa K. (Terri) Million. My business address is 1801 California Street, Room 2050, Denver, Colorado 80202. I am employed by Qwest Services Corporation as a Staff Director in the Public Policy organization. In this position, I am responsible for preparing testimony and testifying about Qwest Corporation's cost studies in a variety of regulatory proceedings.

Q. PLEASE DESCRIBE YOUR EDUCATIONAL BACKGROUND AND EMPLOYMENT EXPERIENCE.

A. I received a Juris Doctor from the University of Denver, College of Law in 1994 and am licensed to practice law in the state of Colorado. I also have a Master of Business Administration from Creighton University and a degree in Animal Science from the University of Arizona.

I have more than 20 years experience in the telecommunications industry with an emphasis in tax and regulatory compliance. I began my career with Qwest, (formerly Northwestern Bell Telephone Company and U S WEST) in 1983. Between 1983 and 1986 I administered Shared Network Facilities Agreements between Northwestern Bell and AT&T that emanated from divestiture. I held a variety of positions within the U S WEST, Inc. tax department over the next ten years, including tax accounting, audit, and state and federal tax research and planning. In 1997, I assumed a position with responsibility for affiliate transactions compliance, specifically compliance with section 272 of the Telecommunications

Act of 1996 (the "Act"). 47 U.S.C. §272. In September 1999, I began my current assignment as a cost witness. In this position, I am responsible for managing cost issues, developing cost methods and representing Qwest in proceedings before regulatory commissions.

Q. HAVE YOU PREVIOUSLY SUBMITTED TESTIMONY BEFORE THIS COMMISSION?

A. No.

Q. HAVE YOU TESTIFIED BEFORE OTHER STATE REGULATORY COMMISSIONS?

A. Yes. I have presented cost testimony before commissions on the issue of determining rates for unbundled network elements ("UNEs") in Arizona, Idaho, Montana, New Mexico, South Dakota, Washington and Wyoming. In addition, I have submitted testimony related to section 272 of the Act in Arizona, Colorado and Nebraska. I have also filed cost testimony in Colorado related to Operator Services.

I. IDENTIFICATION OF WITNESS

Q. PLEASE STATE YOUR NAME, BUSINESS ADDRESS AND POSITION WITH THE QWEST CORPORATION.

A. My name is Teresa K. (Terri) Million. My business address is 1801 California Street, Room 2050, Denver, Colorado 80202. I am employed by Qwest Services Corporation as a Staff Director in the Public Policy organization. In this position, I

am responsible for preparing testimony and testifying about Qwest Corporation's cost studies in a variety of regulatory proceedings.

I have more than 20 years experience in the telecommunications industry with an emphasis in tax and regulatory compliance. I began my career with Qwest, (formerly Northwestern Bell Telephone Company and U S WEST) in 1983. Between 1983 and 1986 I administered Shared Network Facilities Agreements between Northwestern Bell and AT&T that emanated from divestiture. I held a variety of positions within the U S WEST, Inc. tax department over the next ten years, including tax accounting, audit, and state and federal tax research and planning. In 1997, I assumed a position with responsibility for affiliate transactions compliance, specifically compliance with section 272 of the Telecommunications Act of 1996 (the "Act"). 47 U.S.C. §272. In September 1999, I began my current assignment as a cost witness. In this position, I am responsible for managing cost issues, developing cost methods and representing Qwest in proceedings before regulatory commissions.

Q. HAVE YOU PREVIOUSLY SUBMITTED TESTIMONY BEFORE THIS COMMISSION?

A. No.

Q. HAVE YOU TESTIFIED BEFORE OTHER STATE REGULATORY COMMISSIONS?

A. Yes. I have presented cost testimony before commissions on the issue of determining rates for unbundled network elements ("UNEs") in Arizona, Idaho, Montana, New Mexico, South Dakota, Washington and Wyoming. In addition, I have submitted testimony related to section 272 of the Act in Arizona, Colorado and Nebraska. I have also filed cost testimony in Colorado related to Operator Services.

II. PURPOSE OF TESTIMONY

Q. WHAT IS THE PURPOSE OF YOUR TESTIMONY?

A. The purpose of my testimony is to present the nonrecurring Total Element Long Run Incremental Cost ("TELRIC") study used to support the price for Qwest's Batch Hot Cut ("BHC") installation option.

Q. PLEASE IDENTIFY THE OTHER QWEST WITNESSES WHO ARE FILING TESTIMONY IN THIS PROCEEDING, AND DESCRIBE HOW THEIR TESTIMONY RELATES TO YOUR TESTIMONY.

A. Mr. Dennis Pappas is providing testimony that describes Qwest's proposed BHC process in detail. Mr. Pappas also presents and describes the proposed BHC provisioning flow Exhibit DP-10, which identifies the work activities required to perform a batch hot cut. Ms. Lynn Notariani provides testimony describing the Operational Support Systems ("OSS") expenditures that Qwest will incur to

implement the additional mechanization necessary to support the BHC process. The costs of the BHC work activities identified by Mr. Pappas and the OSS expenditures identified by Ms. Notariani are incorporated in Qwest's nonrecurring TELRIC study.

III. SUMMARY OF TELRIC PRINCIPLES

Q. PLEASE SUMMARIZE THE OVERALL ECONOMIC PRINCIPLES THAT ARE APPLIED IN QWEST'S TELRIC STUDIES.

A. TELRIC asks what it would cost to replace and operate the telephone network today using the most efficient technology that is reasonably available now, taking as given both the basic geographical design of the network and the characteristics of the world outside the network. Qwest's TELRIC studies identify the forward-looking direct costs that are caused by the provision of an interconnection service or network element in the long run, plus the forward-looking incremental cost of shared facilities and operations. The studies identify total element costs—the average incremental cost of providing the entire quantity of the element.

Q. DO TELRIC STUDIES IDENTIFY RECURRING AND NONRECURRING COSTS?

A. Yes. Recurring costs are the ongoing costs associated with providing a service. These costs are generally investment-related and include both capital costs and operating expenses. Recurring costs are often presented as a flat cost per month or per unit of usage (e.g., minute of use) and are incurred throughout the time period the service is provided to a customer. Nonrecurring costs include the one-time costs that are incurred at the time a customer establishes, disconnects or changes

service. These costs normally result from a customer order and are *predominantly* labor-related.

In this proceeding, Qwest is filing a *nonrecurring* cost study for BHC installations. The assumptions, methods, and procedures used in Qwest's nonrecurring cost study are designed to yield the actual forward-looking nonrecurring costs that Qwest is likely to incur in provisioning unbundled loops using the BHC process.

Q. DO QWEST TELRIC STUDIES CONTAIN REALISTIC FORWARD-LOOKING ASSUMPTIONS?

A. Yes. A TELRIC study must provide a realistic estimate of forward-looking costs. Therefore, Qwest's TELRIC studies focus on the latest technologies and methods of operations that are currently available. Only technologies that are commercially available and currently being used in the industry are included in the studies. Theoretical future technologies are not considered because it is impossible to know how much those technologies will cost, how they will be configured, and whether they will, in fact, ever be commercially available on a scale necessary for Qwest's network. Thus, Qwest's nonrecurring BHC cost study considers the actual provisioning methods and OSS that are either in place today or scheduled to be implemented, rather than theoretical provisioning methods based on unproven technologies.

Q. YOU MENTIONED THAT QWEST'S TELRIC STUDIES IDENTIFY DIRECT COSTS AND THE COST OF SHARED FACILITIES AND OPERATIONS. PLEASE DISCUSS THIS FURTHER.

A. Direct costs are the costs that would be avoided if the network element or service were not offered. In the nonrecurring BHC cost study, the direct costs include the cost of labor to perform specific BHC activities, and the cost of BHC-specific OSS enhancements. Shared (directly attributable) costs are the costs that are generally caused by the provision of a group of elements. In the nonrecurring BHC cost study, the shared costs include support assets expenses, such as office space and computers. Both direct and shared (directly attributable) costs are included in Qwest's TELRIC studies, consistent with the TELRIC definition provided by the FCC in the First Interconnection Order.[1]

Q. DO QWEST'S TELRIC STUDIES INCLUDE COMMON COSTS?

A. Yes. As discussed above, Qwest's nonrecurring studies identify the TELRIC, which includes the direct and shared (directly attributable) costs, for unbundled network elements ("UNEs"). In addition, the study separately identifies an allocation of forward-looking common overhead costs, consistent with the FCC's definition of forward-looking economic cost.[2] These costs (e.g., legal, planning, executive, etc.) are not associated with a specific network element, but represent

---

[1] First Report and Order, *In the Matter of the Implementation of the Local Competition Provisions of the Telecommunications Act of 1996,* CC Docket Nos. 96-98 & 95-185, FCC 96-325 (rel. Aug. 6, 1996) ("*First Interconnection Order*") In paragraph 682 of the *First Interconnection Order*, the FCC stated: "We conclude that, under a TELRIC methodology, incumbent LECs' prices for interconnection and unbundled network elements shall recover the forward-looking costs directly attributable to the specified element, as well as a reasonable allocation of forward-looking common costs. . . . Directly attributable forward-looking costs include the incremental costs of facilities and operations that are dedicated to the element. Such costs typically include the investment costs and expenses related to primary plant used to provide that element. Directly attributable forward-looking costs also include the incremental costs of shared facilities and operations. Those costs shall be attributed to specific elements to the greatest extent possible. For example, the costs of conduits shared by both transport and local loops, and the costs of central office facilities shared by both local switching and tandem switching, shall be attributed to specific elements in reasonable proportions. More broadly, certain shared costs that have conventionally been treated as common costs (or overheads) shall be attributed directly to the individual elements to the greatest extent possible."

[2] 47 CFR §51.505

general costs of doing business. These are real costs that Qwest will continue to efficiently incur on a forward-looking basis. Thus, the nonrecurring BHC cost study includes an allocation of common costs.

Q. HOW SHOULD THE QWEST NONRECURRING BHC COST STUDY BE UTILIZED IN THIS PROCEEDING?

A. The nonrecurring TELRIC study I am presenting should be utilized to set the price for the BHC installation option. The nonrecurring charge for loops installed using the BHC process should be set equal to the TELRIC plus Common cost identified in the BHC cost study, consistent with the FCC's TELRIC pricing methodology.

IV. THE BATCH HOT CUT ("BHC") NONRECURRING COST STUDY

A. Background

Q. WHY IS QWEST PROPOSING A BATCH HOT CUT INSTALLATION OPTION IN THE CURRENT PROCEEDING?

A. In the Triennial Review Order ("TRO")[3] the FCC discusses the need for a batch hot cut process. In the order, the FCC expresses concern that the ILECs' current hot cut processes are limited by their highly manual, resource intensive and customer-impacting nature, and are priced at rates that present barriers to facilities-based competition for mass markets. The FCC also states that its prior finding in section 271 orders—that the ILECs' hot cut processes are adequate—does not allow it to

[3] *In the Matter of Review of the Section 251 Unbundling Obligations of Incumbent Local Exchange Carriers; Implementation of the Local Competition Provisions of the Telecommunications Act of 1996; Deployment of Wireline Services Offering Advanced Telecommunications Capability;* Report and Order and Order on Remand and Further Notice of Proposed Rulemaking, CC Docket Nos. 01-338, 96-98, 98-147, FCC 03-36 (Rel. August 21, 2003) ("TRO") at ¶ 465.

conclude that those current processes can accommodate competition in the mass markets.[4] Thus, the FCC concludes that the loop hot cut issues "may be mitigated through the creation of a batch [hot] cut process"[5] and orders state commissions to approve "within nine months of the effective date of [the TRO], a batch cut migration process to be implemented by incumbent LECs that will address the costs and timelines of the hot cut process."[6] To that end, the FCC requires state regulators to approve both the specific processes and appropriate volume of loops associated with a batch hot cut process, and adopt TELRIC rates for the process they approve.[7]

As explained in detail in Mr. Pappas' testimony, in order to address the FCC's requirements, Qwest, the CLECs and the state commissions have conducted a joint Batch Hot Cut forum to establish a BHC process for Qwest's in-region states. While parties in the forum did not agree on all issues, the proposal outlined by Mr. Pappas is in large part responsive to the issues raised, and agreements reached, in the forum. The BHC cost study Qwest I am providing estimates the nonrecurring cost for the BHC process outlined by Mr. Pappas, and thus reflects many of the agreements reached at the forum.

Q. PLEASE BRIEFLY DESCRIBE THE FORUM PROCESS.

A. On or about November 12, 2003, Qwest submitted its proposal for the BHC process to the state commissions and the CLEC community. The CLECs, in turn, submitted their comments and concerns about the process to the states. The first BHC forum

---

4 *Id.* at ¶ 469.
5 *Id.* at ¶ 487.
6 *Id.* at ¶ 488.
7 *Id.* at ¶ 489.

was held on December 1-3, 2003 and the last forum was held on January 6-8, 2004. In these forums, the parties held detailed discussion regarding the BHC process, and an issues list was developed reflecting the parties' positions on the key issues. The final issues list, which is attached as Exhibit DP-1 of Mr. Pappas' testimony, identifies the issues on which the parties reached agreement, as well as the issues that remain at impasse.

Q. HOW HAS THE BHC FORUM PROCESS IMPACTED THE DEVELOPMENT OF QWEST'S NONRECURRING BHC COST STUDY?

A. As noted earlier, Qwest provided its initial BHC proposal on or about November 12, 2003. The process originally proposed by Qwest was designed to provide the CLECs with an alternative that combined maximum efficiency and the lowest possible cost in a batch process. For example, the originally proposed process minimized the work activities and times in the central office, which constitutes the majority of the BHC cost. This was accomplished by eliminating duplicative testing and limiting the number of trips the Central Office Technicians ("COTs") would make to the frame to do pre-wiring and cuts.[8] As Mr. Brigham suggested during the forum, based on a rough estimate of the process as originally proposed, Qwest's TELRIC plus common costs would have been at or below an average of $40-$45 per loop.

As I will discuss in detail below, because of a number of changes Qwest made to the process at the request of the CLECs, Qwest's TELRIC plus common cost for the currently proposed BHC process has increased to $45.96 per loop. This cost is

[8] As described later in my testimony, Qwest originally proposed that both the pre-wiring and hot cut activities be performed on the due date.

still considerably lower than Qwest's cost for the basic loop installation that is available today.[9]

B. General Methodology

Q. WHAT COSTS DOES QWEST'S NONRECURRING BHC TELRIC STUDY IDENTIFY?

A. The Qwest BHC nonrecurring cost study identifies the one-time costs that are incurred at the time a customer's UNE loop is provisioned using the BHC process. These costs result from a CLEC batch order and are labor-related. For example, the BHC study includes the labor costs for a central office technician to run a jumper to connect a loop to a CLEC switch. In addition, the BHC nonrecurring cost study includes the costs Qwest will incur to develop the mechanized systems necessary to support the BHC process, such as the "appointment scheduler" and "batch status tool" ("BST") described in Ms. Notariani's testimony.

Q. PLEASE SUMMARIZE THE GENERAL PROCEDURES THAT QWEST HAS USED TO CALCULATE THE NONRECURRING BHC COSTS

A. Qwest calculated the nonrecurring BHC costs utilizing the following process:

1. The cost analyst, working with a team of experts, identified the one-time activities necessary to perform a BHC installation. The general activities are depicted in the "Proposed Batch Hot Cut Provisioning Flow" provided in Exhibit DP-10 of Mr. Pappas' testimony. Based on this flow, the

[9] As discussed later in my testimony, Qwest estimates the cost of basic installation to be approximately $75 for the first loop and $60 for each additional loop at a customer location. In the states where Qwest is filing its BHC study states have ordered basic installation rates for the first loop between $4.33 and $65.00.

analyst and the team of experts identified specific manual activities required for each step of the process. Establishing unbundled loop service for a customer using the BHC installation option requires activities to be performed by the Interconnection Service Center ("ISC"), the Qwest CLEC Coordination Center ("QCCC"), Central Office Technicians ("COTs") and other groups. Working with the OSS SME, the analyst also identified the OSS costs directly related to the BHC installation process.

2. Based on input from subject matter experts ("SMEs"), the cost analyst estimated the *work time* associated with each of these manual activities, and the *probability* that each activity will occur. For example, the cost analyst evaluated Qwest ISC processes to determine the time needed for service representatives to review an unbundled loop local service request ("LSR"). The analyst also identified the probability that this manual work will be required, based on the estimated ISC "flow through" that is likely to be achieved.

3. The cost analyst then determined, based on current labor data, the appropriate labor rate for the personnel performing each work activity.

4. The time estimates, probabilities and labor rates were used to develop the direct nonrecurring cost of each work activity using the following formula:

Activity time * Probability of Occurrence* Labor Rate = Cost of Activity

5. The nonrecurring costs for each separate activity were aggregated into a direct nonrecurring cost for each step of the BHC process. For example, an aggregate cost for all of the activities performed by the central office technician was developed. The costs for all BHC activities were then aggregated into a total BHC direct nonrecurring cost.

6. Annual cost factors were applied to assign additional administrative and other costs to the direct nonrecurring costs, resulting in the nonrecurring TELRIC. Consistent with the FCC's TELRIC methodology, the expense factors in Qwest's study are based on Qwest's recent costs, with adjustments to those costs to account for known or anticipated changes in productivity and inflation. An appropriate share of common costs was also allocated to derive the total TELRIC + Common costs for the BHC installation.

Q. YOU MENTIONED THAT NONRECURRING COST STUDIES IDENTIFY THE COST OF MANUAL ACTIVITIES. ARE SOME OF THE STEPS IN THE BHC PROCESS MECHANIZED?

A. Yes. Many of the steps required to process a BHC order are mechanized. Mechanized portions of the process are also referred to as "flow through" steps.

Q. DOES QWEST INCLUDE COSTS FOR THESE MECHANIZED FLOW-THROUGH STEPS IN ITS NONRECURRING BHC COST STUDY?

A. No. The Qwest BHC cost study only includes the nonrecurring cost for manual work activities that are likely to be performed by its employees as part of the process. Thus, for example, the study assumes that the process for a CLEC to

submit an LSR to Qwest's ISC is a mechanized flow-through step, where the order may be mechanically entered into the Service Order Processor ("SOP") without ISC intervention. However, while a high percentage of BHC orders will flow though, there is also a percentage of orders that will "fall out," requiring manual handling by the ISC. Thus, the cost analyst, with the help of a team of experts, determines: (1) the manual work activities that would be performed by ISC personnel, and the amount of time required for each activity, in the event that an LSR required manual handling, and (2) what percentage of orders will not "flow through" the mechanized system and would require manual handling. If, for example, 15 of every 100 loop orders submitted to the ISC will fall out for manual handling, the cost analyst calculates a 15% probability of manual handling (i.e., 85% flow through) for ISC activities.[10] Thus, the cost analyst includes only 15% of the ISC time identified in the nonrecurring cost of each order. No time is included for the 85% of orders that flow through the ISC.[11]

Q. DOES THIS MEAN THAT THE NONRECURRING STUDY ONLY REFLECTS TIMES FOR ACTIVITIES ASSOCIATED WITH ORDERS THAT FALL OUT OF THE MECHANIZED PROCESS?

A. No. In addition to times related to fall out, there are work activities included in the nonrecurring study that are always performed manually. For example, the work steps performed by the COT to run jumpers and test circuits are inherently manual processes. Those processes are required for each and every order submitted as part

[10] In the BHC cost study, an 85% flow though is assumed. However, when an order requires manual handling, all manual steps may not be required. Thus, additional probabilities of occurrence may be developed for specific activities when fall out occurs.

[11] As described below, the study does include the costs of developing new OSS for the BHC process that eliminate some manual processing. It does not include the costs of the mechanized processing of an order.

of the BHC process. On the other hand, certain manual steps such as analyzing the spreadsheet or traveling across the office to the frame, are performed for the entire batch at one time. Therefore, the times for those types of activities are spread across the entire batch of 25 orders. Qwest has assumed 25 orders per batch in this calculation because that is the minimum number of orders that could be submitted in a batch.

Certain manual steps may not occur for every order or every batch that is submitted. For example, because Qwest's BHC technician teams will not be located in every CO, the study assumes that the teams of COTs will be required to travel to COs some of the time, although not all of the time. The cost for that travel is spread across the entire batch of 25 orders. If Qwest were required to travel to COs to perform work for minimum batches of 2, as suggested by the CLECs, the cost for travel would be much higher because it would be spread over fewer orders.

Q. YOU MENTIONED THAT THE COST ANALYST WORKS WITH EXPERTS FAMILIAR WITH A NONRECURRING PROCESS TO DEVELOP TIME AND PROBABILITY ESTIMATES FOR USE IN THE COST STUDY. HOW WERE THOSE ESTIMATES DEVELOPED FOR THE BHC PROCESS?

A. Teams of experts, including those that participated in the Batch Hot Cut Forum and worked with the CLECs to define the BHC process, also provided input to the cost analyst for the nonrecurring cost study. In addition, I was able to provide the cost analyst with direction regarding the steps included in the cost study as a result of my own participation in the forum, as well as countless other discussions with these and other experts about the BHC process. While there is no existing process

exactly like the BHC process against which the experts can measure and compare, there are many steps within the BHC process that are similar or the same as steps that currently exist in other installation options. Therefore, for those steps the experts were able to review previous estimates to assist in developing specific task times and probabilities necessary in the BHC process. For the new steps that are proposed in the BHC process Qwest's experts relied on years of experience with provisioning processes, generally, to estimate the times and probabilities.

Q. IN DEVELOPING THE BHC WORK TIMES, DID QWEST CONSIDER THE OBSERVATIONS OF HITACHI CONSULTING IN THE FOUR BATCH HOT CUT TRIALS, AS PRESENTED IN MR. PAPPAS' TESTIMONY?

A. Yes. The report provided by Hitachi provides work time observations for some BHC functions, based on the BHC trials recently performed in four central offices within the Qwest region. These observations are contained in an exhibit to the Hitachi Consulting report, and include the timing of the following work activities: (1) pre-wiring at the IDF and MDF, (2) performing dial tone checks and (3) performing the lift and lay on the due date. Qwest reviewed this information, and has considered these observations in developing its work times for these activities.

Q. HOW HAS QWEST UTILIZED THE HITACHI TIME ESTIMATES IN THE BHC COST STUDY?

A. The Hitachi observations represent a limited set of observations in a small subset of offices, and do not purport to represent a full "time and motion" study. Nonetheless, the information was used by the SMEs in the development of work times for the central office-based activities. The SMEs considered the Hitachi data,

their own experience and observations, and their knowledge of other offices (e.g., office layout) to determine the overall average work activity times that would be experienced throughout the Qwest region. Time estimates must consider the wide variety of central offices in which batch hot cuts will be performed. For example, some offices have a very simple layout, with the MDF, IDF and CO technician office in close proximity. Other offices have the MDF, IDF and CO technician offices on different floors, or even different buildings. Similarly, some offices have a few very small frames, other offices have long frames, positioned in several rows. Finally, in some offices the vertical and horizontal sides of the IDF face in opposite directions, while in others they both face the same direction making them easier to wire. In sum, there is a wide variety of physical layouts in offices, and this must be reflected in the cost study. Thus, the Hitachi report observations are helpful in validating the development of BHC cost study times by Qwest SMEs, but the specific times, which represent a small sample, were not used as the sole basis of the work times in the BHC cost study.

Q. DOES THE NONRECURRING COST STUDY INCLUDE THE COSTS OF DISCONNECTING SERVICE?

A. Yes. The nonrecurring costs include the cost to establish and disconnect service. This is necessary because there are no charges assessed when a UNE or interconnection service is disconnected. Since the disconnection will occur in the future, the disconnection costs are discounted using the 13.07% cost of money and an assumed service life of 2.5 years. Thus, disconnect costs are multiplied by 74% to yield a discounted cost.

Q. ARE YOU PROVIDING THE NONRECURRING BHC TELRIC STUDY AS AN EXHIBIT TO YOUR TESTIMONY?

A. Yes. The nonrecurring BHC cost study Exhibit TKM-1 (Study ID #8158) is provided as an Excel workbook on the compact disc ("CD") that accompanies this testimony. In addition the CD contains the Expense Factors Model and User Manual. The BHC nonrecurring TELRIC is $45.96 per loop installed.

C. Expense Factors

Q. ARE EXPENSE FACTORS APPLIED TO THE DIRECT BHC COSTS?

A. Yes. As described above, expense factors are applied to the direct costs to derive the TELRIC and the TELRIC plus Common costs. This application is consistent with the FCC's TELRIC methodology.

Q. WHAT FACTORS ARE APPLIED?

A. As delineated in the cost study, expense factors for marketing, support asset expenses, and uncollectibles are applied to the direct costs to develop the TELRIC. A common factor is applied to the TELRIC to derive the TELRIC plus Common amount. It should be noted that capital cost factors, maintenance expense factors and network operations factors are not applied in the nonrecurring BHC study since the study does not include investments.

Q. ARE NORTH DAKOTA SPECIFIC COST FACTORS USED IN THE STUDY?

A. No. Qwest has recently updated its factors methodology, and has not yet calculated state specific factors for all states. Therefore, for North Dakota, Qwest has utilized

the factors developed for Washington as a proxy. It is important to note that annual cost factors--especially the factors used in nonrecurring costs studies—do not change significantly between states. Therefore, Qwest believes the use of Washington factors in North Dakota is reasonable.

Q. PLEASE DESCRIBE THE MAJOR FEATURES OF THE EXPENSE FACTOR MODULE.

A. The Expense Factors Module includes several features that make it easy to understand the factor application process and to audit the results. In the Factors Module:

- Expenses and investments are pulled directly from Qwest's standard accounting reports.

- Trending of expenses and investments has been replaced with specific user-defined efficiency and inflation inputs.

- The factor calculation process starts with standard accounting report results (i.e., the books of the firm). Directly assigned costs (i.e., costs that are included elsewhere) and costs that are not applicable to TELRIC studies are removed, and these subtractions are explicitly displayed in the Factors Module. This provides the user with a clear understanding of which costs are included and which costs are not included in the factors.

- All calculations are contained in one workbook.

Please refer to the Expense Factor Module documentation provided on the CD for a detailed description of the factors and an explanation of the factor methodology.

Q. DOES THE EXPENSE FACTORS MODULE ENSURE THAT DOUBLE COUNTING OF COSTS DOES NOT OCCUR?

A. Yes. The model is designed to help the user insure that double counting (or omission) of expenses does not occur. The cost factors are based on historical cost relationships and use the books of account as a starting point. All costs on the books of Qwest are accounted for—costs are explicitly removed if directly assigned in another study or if not applicable to TELRIC studies. The user can clearly see the total costs (booked costs), the removed costs, and the costs that remain in the factors. Thus, for example, the user can see that the business office (e.g., ISC) costs that are separately identified in a nonrecurring cost study are removed from the factors and are not double counted. Likewise, the BHC-related OSS costs included directly in the nonrecurring costs will be removed from future factors calculations.[12]

D. BHC OSS Costs

Q. WHAT OSS COSTS ARE INCLUDED IN THE NONRECURRING COST STUDY FOR THE BHC INSTALLATION OPTION?

A. As I indicated above, the BHC nonrecurring study includes direct costs to develop and establish new OSS specifically to enhance the BHC process. These OSS enhancements include the "appointment scheduler" tool and the BST described in Ms. Notariani's testimony. The OSS enhancements also include the development

[12] Since these expenses are being incurred today, they are not included in the expense factors applied in the BHC cost study, which are based on 2001 expenses.

of the spreadsheet function, which allows the QCCC to pull batch installation data from the Work Force Administrator ("WFA"), and to provide this information to the Central Office Resource Administration Center ("CORAC"), and ultimately the CO technician, in an organized manner that allows the CO technician to be more efficient.

Q. PLEASE DESCRIBE HOW THE OSS COSTS WERE CALCULATED IN THE BHC COST STUDY.

A. First, the total costs for each OSS enhancement were identified. These OSS cost estimates are based on the level of effort ("LOE") documentation discussed in Ms. Notariani's testimony. Qwest has estimated that the total cost to develop and implement the "appointment scheduler" tool and the BST is $900,000, as described in Ms. Notariani's testimony. The estimated cost to develop and implement the mechanization of the spreadsheet for the CO technicians is a little more than $41,500. In each case, the primary cost driver is programmer labor.

These OSS costs are one-time development costs. In the BHC cost study, these costs are spread over the estimated Qwest BHC order volumes—on a levelized basis—for the 27 month implementation schedule envisioned by the FCC.[13] Please see tab labeled "BHC System Enhancement Summary" in the BHC cost study for a spreadsheet that details these calculations. The "per order" OSS costs are added to the other direct nonrecurring costs in the BHC study. Thus, the cost of the BHC OSS development is recovered, along with the nonrecurring installation costs, in the BHC nonrecurring charge per loop.

[13] These volumes, which are described later in my testimony, are included in Exhibit TKM-2.

Q. YOU HAVE EXPLAINED THAT THE NONRECURRING BHC COST STUDY INCLUDES COSTS QWEST WILL INCUR TO DEVELOP THE MECHANIZED SYSTEMS NECESSARY TO SUPPORT THE BHC PROCESS. ARE THE COSTS OF QWEST'S OTHER MECHANIZED SYSTEMS INCLUDED IN THE DIRECT NONRECURRING COST OF THE BHC INSTALLATION OPTION?

A. No. Qwest will only include the systems costs incurred *specifically in support of the BHC process* in its direct nonrecurring costs. This includes the costs to develop the appointment scheduler tool and the batch status tool described in detail in the Notariani testimony, as well as costs to develop the spreadsheet that will be used by CO technicians. The costs of other mechanized systems used in support of Qwest's overall loop provisioning process such as the service order processor ("SOP"), Work Force Administration ("WFA") and TIRKS systems, that also support the BHC process, are not included in the direct BHC nonrecurring costs—they are captured indirectly and are spread among Qwest's retail and wholesale services via expense factor loadings.

Q. WHY DOES QWEST INCLUDE THE BHC OSS COSTS IN NONRECURRING COSTS FOR BATCH HOT CUTS INSTEAD OF INCLUDING THEM IN EXPENSE FACTORS?

A. The costs for the development of OSS specifically developed for the BHC process are included in the direct BHC nonrecurring costs for two reasons. First, there is no way to include these costs in the annual cost factors used in the BHC cost study, since these factors are based on expenses incurred in 2001. These expenditures—which will be incurred predominantly in 2004—are not included in 2001 expenses,

and are thus not included in factors. In addition, it is important to note that the factor development process removes expenses that are recovered elsewhere from the factors. Thus, these OSS costs would be removed from the factors that will be used in the future to assign costs based on 2004 expenses—eliminating any potential double counting of costs. It should also be noted that Qwest has traditionally removed other CLEC-related OSS expenditures from the factors calculation in anticipation of recovering those costs separately.

Second, and most importantly, the costs for OSS enhancements that are directly related to the BHC process should be recovered from BHC customers because it is these customers who have caused these costs to be incurred. It would violate the principle of cost causation to allocate these costs to all retail and wholesale services via factors. In fact, were it not for requests from the CLECs during the Batch Hot Cut Forum, Qwest would not have developed these tools. Qwest's initial proposal for the BHC process did not include either the scheduling tool or the web-based batch status tool and, in fact, Qwest initially intended to provide status notification to the CLECs via e-mail. In the forums, several of the CLECs expressed concern over Qwest's proposal to send status updates automatically through e-mail. For example, Ms. Sprague from McLeod USA stated that she did not want to receive e-mails because of concerns about firewall issues.[14] Ms. Lichtenberg from MCI proposed that "the way to avoid these e-mail – you know, do I get the e-mail, does somebody remember to hit send, is by using an on-line tool…"[15] Therefore, it was at the urging of the CLECs through discussions that took place during the forum that Qwest was convinced to develop these tools for use with the BHC process. As

[14] Sprague, Tr., Dec. 2, 2003 at pg. 238.
[15] Lichtenberg, Tr., Dec. 2. 2003 at pg. 243.

with the FCC's decision to allow ILECs an additional charge for OSS costs related to line sharing, the principle of cost-causation dictates that the OSS costs related to the BHC process be assigned to BHC orders.[16]

E. Analysis of Nonrecurring Cost Activities

Q. HOW DOES THE BHC INSTALLATION OPTION COMPARE TO QWEST'S EXISTING BASIC INSTALLATION OPTION?

A. I will discuss the major differences between the basic loop installation option and the BHC option below. However, there is one important difference between the BHC installation option and the existing basic installation option that is not discussed below. The existing basic hot cut assumes that outside plant technicians will be dispatched 6% of the time due to the installation of new loops at locations where no customer has had service previously, or where no facilities are available for reuse. The BHC process specifically excludes orders requiring the dispatch of an outside plant technician, which reduces costs.

Q PLEASE IDENTIFY THE WORK CENTERS INCLUDED IN THE BHC STUDY.

A. The BHC cost study identifies the work activities, task times and probabilities for each of the work centers represented on the BHC process flows (Exhibit DP-10) that are described in detail in Mr. Pappas' testimony. These work centers include:

---

[16] Fourth Report and Order, CC Docket No. 96-98 (rel. December 9, 1999), at ¶ 144, states "We find that incumbent LECs should recover in their line sharing charges those reasonable incremental costs of OSS modification that are caused by the obligation to provide line sharing as an unbundled network element."

- Interconnection Service Center ("ISC")
- Loop Provisioning Center
- Design Center
- Central Office Resource Administration Center ("CORAC")
- Central Office Technicians
- CLEC Coordination Center ("QCCC")

I will discuss the work activity times required for processing a BHC order in each work center, along with the probabilities that each activity will occur. The work centers and activities in the BHC study correspond with the "Proposed Batch Hot Cut Provisioning Flow" ("BHC flow") document that is attached to the testimony of Mr. Pappas as Exhibit DP-10.

1. Interconnection Service Center ("ISC")

Q. PLEASE DESCRIBE THE INTERCONNECTION SERVICE CENTER ("ISC") WORK ACTIVITIES, PROBABILITIES AND TIME ESTIMATES INCLUDED IN THE BHC COST STUDY.

A. The ISC is the center that processes Local Service Requests ("LSRs") submitted by the CLECs via Interconnection Mediated Access ("IMA") Graphical User Interface ("GUI") or IMA Electronic Data Interchange ('EDI'). The cost study assumes that 85% of the LSR orders flow through the ISC electronically, with no need for manual intervention. The orders that flow through are electronically entered into the Service Order Processor ("SOP"). For orders that fall out for manual handling, a service delivery coordinator ("SDC") in the ISC performs a variety of tasks, including but not limited to reviewing the LSR for completeness, verifying the

connecting facility assignment ("CFA"), analyzing the request and determining critical dates, typing the firm order confirmation ("FOC"), inputting the order to the SOP, and handling calls from other groups involved with the order. Some of these tasks occur each time an order is manually handled, and some occur only a portion of the time that an order is handled. The probabilities that individual tasks must be performed when an order falls out for manual handling in the ISC are contained in the "Details Output" tab of the cost study under Probability #1. The total applied time for processing an order in the ISC is 5.71 minutes.[17]

Q. DOES QWEST GAIN EFFICIENCIES IN THE ISC AS A RESULT OF THE BHC PROCESS?

A. No. The submission of LSRs to the ISC is highly mechanized in the current hot cut installation options offered by Qwest, and there are no additional efficiencies to be gained in this center for batch orders. When an order requires manual handling, essentially the same activities must be performed for a batch hot cut and a basic hot cut. With regard to flow through, for the types of loop orders that are "eligible" for the mechanized process Qwest consistently achieves a 96% or higher flow through rate as captured in PID measurement PO-2B. However, it is important to note that not all loop orders that are eligible for the batch hot cut process are also eligible for flow through. The types of orders that are not eligible for ISC flow through (and thus not included in PID measurement PO-2B) include Centrex orders and CLEC to CLEC migration orders (UNE-L to UNE-L).[18] These orders must be submitted to the ISC and processed manually, even when submitted in batches. Qwest's current

[17] The applied time is the weighted work time based on the actual time estimates and the probabilities, i.e., the sum of work time * probability for each activity.

[18] The order types that are not eligible for flow through are listed on the Qwest website at http://www.qwest.com/wholesale/clecs/ordering.html

flow through rate for processing all types of loop orders—including both those eligible and ineligible for flow through—is approximately 48%. While it is likely that the actual flow through for BHC orders may approach 48%, Qwest has conservatively assumed an 85% flow through in the BHC cost study—the same flow though used in the basic loop nonrecurring cost study.

2. Loop Provisioning Center

Q. PLEASE DESCRIBE THE LOOP PROVISIONING CENTER ("LPC") WORK ACTIVITIES, PROBABILITIES AND TIME ESTIMATES INCLUDED IN THE BHC COST STUDY.

A. The LPC group becomes involved with an order when the assigned facilities are inconsistent with the address provided on the customer service record or the assigned facilities cannot be reused and alternative facilities must be investigated. In those cases, the cost study assumes that in a 7.5 hour day, with a stretch objective that each employee will clear 40 requests in a day, it will take on average 11.25 minutes to clear a request for manual assistance. The probability that an order will be handled manually in the LPC is 5% for a total applied work time in this center of 0.56 minutes.

Q. DOES QWEST GAIN EFFICIENCIES IN THE LPC AS A RESULT OF THE BHC PROCESS?

A. Yes. Because the BHC process only applies in cases where the CLEC is able to reuse loop facilities, the probability that an order will drop out for manual handling is assumed to be 5%, which is less than the 15% assumed for the current hot cut processes.

3. Design Center

Q. PLEASE DESCRIBE THE DESIGN CENTER WORK ACTIVITIES, PROBABILITIES AND TIME ESTIMATES INCLUDED IN THE BHC COST STUDY.

A. An order may fall out of the order process at the design step for a variety of reasons including incorrect information in the order, incorrect loop input, or incorrect circuit design. There are several different activities that a designer may need to perform, including screening the order, logging information into the generic order control ("GOC"), designing the circuit and distributing the work order record detail ("WORD") document. A designer may need to perform only one of these functions, or may need to perform several, when a particular order falls out. Therefore, the cost study assumes a different probability of manual handling for each activity. For example, it is expected that design center work will be required 10% of the time, but that the specific activity of "circuit design" will only be needed on 5% of orders (i.e., half of the orders that fall out).

In addition, even if the order flows through the design center initially there are circumstances when the order must be supplemented to correct a CFA. Per the batch hot cut process, this occurs when the COT discovers a "no dial tone" condition during pre-wiring, and the CLEC issues a supplemental order to change the CFA. Although this expected to occur for only 10% of the orders, it will require circuit design and distribution of the WORD document for each supplement. The total applied time for manually processing an order in the design center is slightly more than one minute.

Q. DOES QWEST GAIN EFFICIENCIES IN THE DESIGN CENTER AS A RESULT OF THE BHC PROCESS?

A. Yes. As a result of the assumption that the BHC process only applies in cases where the CLEC is able to reuse facilities, the expectation is that an order will require manual handling on average about 2% to 5% of the time for any given task due to fall out and 10% of the time for circuit design and distribution of supplemental orders. This results in a significantly lower fall out than is assumed in the current hot cut processes, which also includes manual handling for new installations (i.e., locations without previously existing service).

4. Central Office Resource Administration Center ("CORAC")

Q. PLEASE DESCRIBE THE CORAC WORK ACTIVITIES, PROBABILITIES AND TIME ESTIMATES INCLUDED IN THE BHC COST STUDY.

A. The CORAC is the group that receives the mechanically generated spreadsheet for a batch from the QCCC, and mechanically organizes the pre-wiring and hot cut activity at the frame to achieve efficiency. The CORAC loads the work to the COTs to ensure that the BHC CO technician teams are scheduled at the appropriate COs. The work activities to create the spreadsheet entries result when an order falls out of the mechanized process. The activities associated with the spreadsheet are unique to the BHC process and are designed to minimize the time spent by the COTs to pre-wire circuits and perform "lift and lay" functions during the batch hot cut. The applied time estimate for activities performed in this center is 0.23 minutes.

5. Central Office Technicians

Q. PLEASE DESCRIBE THE CO TECHNICIAN WORK ACTIVITIES, PROBABILITIES AND TIME ESTIMATES INCLUDED IN THE BHC COST STUDY.

A. As discussed in detail in Mr. Pappas' testimony, the COTs will work in teams of two to perform batches of hot cuts in the most efficient manner possible. The work performed by the COTs is entirely manual in nature (i.e., there is no flow through), and must be performed for each loop. Primary work tasks included in the cost study include (1) pre-wiring at the Intermediate Distribution Frame ("IDF") and the Main Distribution Frame ("MDF") or COSMIC frame, (2) performing dial tone tests and (3) performing the lift and lay functions during the hot cut. The cost study also includes times for the COT to analyze the spreadsheet that is sent to the COTs from the CORAC, time to travel between offices, time to walk to the frame, time to update information in the work force administration ("WFA") system, and time to remove the old jumpers on the due date. The cost study assumes that the COTs will perform pre-wiring and dial tone tests by the designed, verified and assigned ("DVA") date, and the lift and lay and additional testing on the due date. In addition, the cost study assumes that when a no dial tone condition is found on DVA date, and a supplemental order is issued by the CLEC to change the CFA, the COTs will need to perform additional pre-wire activities. The total applied time assumed in the cost study for the COT function is 20.22 minutes.

Q. WHAT TRAVEL TIME IS ASSUMED IN THE STUDY?

A. The Qwest BHC cost study included 20 minutes of travel time when the team of technicians must travel to a central office to perform batch hot cuts. Depending on the location of the CO the team of 2 technicians works from, in relation to the

location of the CO where the team performs batch hot cuts, the travel time could be anywhere from 10 minutes to well over an hour. Qwest's nonrecurring cost study assumes the teams will travel an average of only 20 minutes to 50% of the COs.

Q. DID QWEST'S INITIAL PROPOSAL FOR THE BHC PROCESS INCLUDE THESE SAME ASSUMPTIONS?

A. No. In its original BHC proposal submitted in November, 2003 (and discussed in the December, 2003 workshops), Qwest proposed that the COTs would perform all of the pre-wire, testing and lift and lay work on the due date, to gain efficiencies. In part, this proposal was a response to the testimony of other parties (CLECs) in various cost dockets, where they have argued that Qwest installation procedures follow "duplicative" steps, and that there is too much "testing" and "verifying." CLECs have consistently argued that Qwest's cost studies assume inefficient processes. For example, in Washington MCI witness Sydney Morrison stated in his testimony "there should be no reason to repetitively verify, validate or check data after its initial establishment in the system or systems."[19]

In response to these pleas from CLECs, Qwest designed a process that created efficiencies. For example, in the original Qwest BHC proposal, it is assumed that since the BHC process includes only reused facilities (i.e., existing customers with facilities that are currently working), it would be more efficient to perform the pre-wire and lift and lay work all on the same day and eliminate duplicative testing, multiple trip to the frame, etc. This process also responded to the FCC's statement

[19] Docket No. UT-003013, Part D, Morrison Direct testimony at pg. 28, lines 16-18.

in the TRO that the objectives for establishing a BHC process include increased efficiencies and reduced cost.[20]

At the BHC forum Mr. Finnegan, representing AT&T, claimed that "what we said or may have said or what Qwest has said in a cost docket, I don't know that that's necessarily relevant."[21] However, during the forum it became evident that the CLECs believed that consolidating the work into a single process on a single day would be unacceptable. For example Mr. Finnegan stated, "One of the concerns AT&T has, and I'm sure other CLECs have as well, is the elimination of the due date minus two prewiring and testing. And I understand from some discussions yesterday Qwest was proposing to eliminate that step to gain some efficiencies and presumably reduce the cost."[22] Ms. Lichtenberg also stated "MCI concurs with AT&T that we need this dial tone check as due date minus two."[23] After weighing, as Mr. Finnegan said, "the potential customer disruption disadvantage [against] any advantage in the price reduction,"[24] Qwest modified its proposal, and agreed to perform the pre-wiring and lift and lay procedures on separate days and to perform dial tone tests on both days. Of course, the requirement to perform these tasks at separate times adds additional work time and cost to the process. Qwest specifically informed the CLECs at the BHC Forum that it believed that moving pre-wiring from due date to DVA would increase the associated NRC by approximately $4. The CLECs agreed to close this issue understanding this cost differential.

[24] Finnegan, Tr., Dec. 2, 2003 at pg. 248.

Q. DOES QWEST GAIN EFFICIENCIES IN THE CENTRAL OFFICE AS A RESULT OF THE BHC PROCESS?

A. Yes. By assigning teams of two to the BHC process and performing the activities for a batch 25 lines at a time, there are areas where efficiencies are gained. For example, Qwest's current standard hot cut process assumes 5 minutes to analyze an order because of the number of separate pages on which a COT must look to find the information relevant to the cut. In the BHC process, the COT will receive a spreadsheet with the data for the entire batch organized in a manner that is easily analyzed. The Qwest BHC study assumes 12.5 minutes to analyze the entire batch, which computes to 0.5 minutes per order. In addition, by having teams of two, the time to perform pre-wiring is reduced. Further, the per loop costs of travel to the CO (and travel to the frame) is reduced when technicians perform work on 25 lines at a time. Overall, the time required in the CO for the BHC process is lower than it is for the current hot cut processes.

6. CLEC Coordination Center ("QCCC")

Q. PLEASE DESCRIBE THE WORK ACTIVITIES, PROBABILITIES AND TIME ESTIMATES INCLUDED IN THE COST STUDY FOR THE PROJECT COORDINATOR IN THE QCCC.

A. The work activities in the QCCC have changed significantly as a result of the BHC process. In fact, the BHC process eliminates many of the activities that the QCCC performs for standard hot cuts. The tasks in the QCCC now relate to the generation of the spreadsheet and its distribution to the CORAC, so that it may be used to manage the work in the CO. In addition, there are still manual work activities

involved when a supplemental order is submitted, or if the CLEC requests an order to be "thrown back" to Qwest after the lift and lay is completed.

Q. DOES QWEST GAIN EFFICIENCIES IN THE QCCC AS A RESULT OF THE BHC PROCESS?

A. Yes. First, the mechanized tools developed for this process (e.g., appointment scheduler, BST and spreadsheet) have reduced the amount of time spent on customer contact and updating documentation in WFA. Since the CLEC can check the status tool to see when hot cuts are performed, the need for phone calls is eliminated. Second, the fact that there will be no CFA changes on the due date reduces the work times significantly. The total time estimated for the QCCC is now under 2 minutes. This compares to more than 16 minutes in the current basic hot cut process.

V. STATE-SPECIFIC RATE ISSUES

Q. HOW DOES THE BHC INSTALLATION OPTION COMPARE TO QWEST'S EXISTING BASIC INSTALLATION OPTION?

A. In addition to the changes to the processes that I have discussed above, there is one important difference between the BHC installation option and the existing basic installation option. The existing basic hot cut assumes that outside plant technicians will be dispatched 6% of the time due to the installation of new loops at locations where no customer has had service previously, or where no facilities are available for reuse. Therefore, although there are similarities in the two processes, they are not the same.

Q. IS QWEST'S EXISTING NONRECURRING RATE FOR THE BASIC INSTALLATION OPTION BASED ON THE ASSUMPTIONS CONTAINED IN THE COST STUDY IT FILED PREVIOUSLY IN NORTH DAKOTA?

A. No. Although the North Dakota Commission established an interim rate of $105.79[25] for the first line in the AT&T Arbitration docket, as part of its section 271 filing, Qwest voluntarily reduced its basic installation rate to $55.27. This resulted from benchmarking the North Dakota rate against the same rate in Colorado that was determined to be TELRIC-compliant by the FCC.[26]

Q. DOES QWEST'S NONRECURRING RATE IN NORTH DAKOTA ALLOW IT TO RECOVER THE COSTS IT ESTIMATES FOR THE BASIC LOOP INSTALLATION OPTION?

A. No. During the AT&T Arbitration, Qwest was awarded a cost for the basic loop installation option of $105.79 per order for the first loop. While Qwest has improved its processes and now calculates a rate of approximately $75 per order for a basic hot cut, the current $55.27 rate in North Dakota falls short of recovering Qwest's estimated cost for this process.

Q. IS QWEST'S PROPOSED NONRECURRING RATE FOR THE BHC INSTALLATION OPTION LESS THAN ITS CURRENT RATE FOR THE BASIC LOOP INSTALLATION OPTION IN NORTH DAKOTA?

A. Yes. As discussed above, Qwest's proposed nonrecurring rate for the BHC installation option is $45.96 based on time estimates of just under 43 minutes of processing time. This means that Qwest's time estimate for the BHC process is

[25] AT&T Arbitration, Docket No. PU-453-96-497, 6/23/97.
[26] Sixth Revised, Second Amended SGAT Exhibit A, Docket No. PU-314-00-282, 10/16/02.

approximately 52% of its current time estimate for the basic loop installation process. In addition, this represents a reduction of $9.31 per order below the rate accepted by the North Dakota Commission in Docket No. PU-314-00-282.

V. VOLUME DATA

Q. ARE YOU PROVIDING INFORMATION REGARDING ESTIMATED VOLUMES FOR UNE-P MIGRATIONS?

A. Yes. Exhibit TKM-2 provides an estimate of the aggregate Qwest UNE-P migration volumes that would be experienced over the FCC's 27 month migration period. Exhibit TKM-3 provides an analysis of the potential UNE-L volumes in the highest volume office in North Dakota. I will describe each of these exhibits in more detail below, and will explain how this data should be used. The testimony of Mr. Pappas and the attached Hitachi Consulting report will draw conclusions from the data and explain how the data should be used in evaluating Qwest BHC proposal.

A. QCCC Volumes

Q. WHAT IS THE PURPOSE OF EXHIBIT TKM-2?

A. The purpose of Exhibit TKM-2 is to estimate total *incremental* UNE-L volumes that would be experienced by the Qwest CLEC Coordination Center (QCCC) over the 27 month conversion process, due to the discontinuance of UNE-P. It includes (1) the estimated volume of embedded UNE-P migrations over a 21 month conversion period, along with (2) an estimate of the growth in UNE-L that, if relief had not been granted, would have been experienced as growth in UNE-P. The

exhibit does not include the volume of orders that are UNE-L today, since these orders are assumed to be part of the "business as usual" scenario—these volumes are not a result of the relief sought by Qwest.[27] The exhibit provides overall Qwest volumes, rather than state-specific or central office-specific volumes, since the QCCC in Omaha handles all unbundled loop volumes in all 14 states. In addition, the exhibit only identifies estimated volumes in areas where Qwest has sought relief from its switching obligations.

Q. WHY DOES QWEST ASSUME A 27 MONTH UNE-P CONVERSION TIMEFRAME?

A. As stated in Qwest's initial comments filed in the states on or about November 12, 2003, the FCC set a transition schedule for moving the embedded base of UNE-P lines to unbundled loops (UNE-L). CLECs must submit 1/3 of their embedded UNE-P lines for conversion 13 months after the state commission decision; 1/3 of their UNE-P lines 20 months after the state commission decision; and the last 1/3 of their UNE-P lines 27 months after the state commission decision.[28] Assuming a July 2, 2004 decision from the state commission, that means 1/3 of the embedded base will convert between August 2005 and February 2006; 1/3 of the embedded base will convert between March 2006 and September 2006, and the remainder will convert before April 2007.[29] The FCC also stated that state commission decisions

---

[27] All UNE-L orders will be eligible for the BHC process, including the "business as usual" UNE-L orders. However, the purpose of this case is to determine if Qwest can handle UNE-L volumes as a result of relief; that is, whether it can handle the conversion volume, and growth in orders that were previously UNE-P.

[28] 47 C.F.R. §51.319(d)(4)(A).

[29] *TRO* ¶ 532.

eliminating unbundled switching as a UNE will become effective on December 2, 2004.[30]

Q. PLEASE DESCRIBE THE FORMULAE USED TO ESTIMATE VOLUMES IN EXHIBIT TKM-2.

A. As stated in Qwest's earlier comments, in order to calculate the expected monthly volumes in each state, the state commissions should apply the following formulas based on the volumes of UNE-P lines and UNE-L lines in each individual state:

- January 2005 – July 2005: [Inward unbundled loop volume (growth) eligible for the batch hot cut process * percent of UNE-P lines in markets where Qwest is challenging the impairment finding]
- August 2005 – April 2007: [Inward unbundled loop volume (growth) eligible for the batch hot cut process * percent of UNE-P lines in markets where Qwest is challenging the impairment finding] + [Embedded UNE-P base amortized over 21 months * percent of UNE-P lines in markets where Qwest is challenging the impairment finding]

Q. PLEASE DESCRIBE THE CALCULATIONS.

A. Exhibit TKM-2 estimates future volumes of UNE-P migrations and growth in the entire Qwest region using the above formula. With a starting estimated base volume of 800,000 UNE-P lines as of 12-31-03, the analysis assumes growth of 475,000 UNE-P lines in the Qwest 14 state region for 2004, which averages to 39,583 added UNE-P lines per month. Thus, the estimated UNE-P quantities as of 12-31-04 would be 1,275,000.

---

[30] 47 C.F.R. §51.319(d)(4).

As noted above, if Qwest is granted relief, and is no longer required to provide unbundled switching in the challenged market areas, it is assumed that Qwest will no longer be required to offer UNE-P in these areas as of December, 2004. Thus, after December, 2004, the volume analysis includes UNE-L volumes due to (1) the migration of the embedded UNE-P base and (2) estimated growth. The analysis assumes a 21 month migration of UNE-P lines to UNE-L beginning in August 2005, and ending in April 2007.

The analysis also considers the fact that Qwest is not challenging its obligation to provide unbundled switching in certain markets, and that Qwest will continue to offer UNE-P in these markets. The initial volumes in the analysis (e.g., 1,275,000 UNE-P lines) are based on *all* Qwest UNE-P lines, and therefore must be adjusted to remove the market areas where Qwest is not seeking relief. Qwest has not yet determined, for all states, the specific markets in which it will seek relief; however, it has determined that it will not seek relief in four states: Idaho, South Dakota, Montana and Wyoming. Thus, in this analysis, UNE-P migration and UNE-L growth volumes in these states have been removed. In addition, Qwest does not anticipate that it will seek relief in all areas in the remaining states. Thus, on a preliminary basis, Qwest estimates that it will seek relief for approximately 64% of its UNE-P lines in the 14 state region. As Qwest determines the specific areas in each state for which relief will be requested, this analysis may be updated.

Q. PLEASE PROVIDE AN EXAMPLE OF HOW THE MONTHLY VOLUMES WERE DETERMINED.

A. To illustrate the monthly volumes calculations, please refer to the calculations for August, 2005. This is the first month where conversions of the embedded base

would occur. Qwest estimates that there will be 659.31 thousand "embedded base" UNE-P lines as of August 1, 2005, when the conversion of the embedded base begins, along with 275.50 thousand UNE-L lines added from January through July, 2005 (that would previously have been UNE-P lines), for a total of 934.81 lines in service. The UNE-L volumes for August would include the inward orders due to growth and the inward orders due to conversion of the embedded base. Qwest has estimated the net growth in UNE-L lines that would have been UNE-P lines to be 15.96 thousand. However, the net growth in lines is not representative of inward order volumes, since there will be outward (disconnect) volumes each month. If the starting in service lines is 934.81 thousand, and the net growth is 15.96 thousand, the end of month service line count is 950.77 thousand. Since we have estimated the churn rate to be 3%, this means that (659.31 * .03) = 19.78 thousand of the embedded base lines will disconnect. In addition, there will be churn on the accumulated aggregation of growth lines (from January, 2005 to August, 2005), which is equal to (275.50 * .03) = 8.26 thousand. Thus, we can determine the inward movement (UNE-L line orders) via the following formula:

BOM lines in service + inward movement –outward movement (churn) = EOM lines in service

934.81 + inward movement – (19.78 + 8.26) = 950.77 thousand

Or

Inward movement = EOM lines in service –BOM lines in service + outward movement

Inward movement = 950.77 - 934.81 +19.78 +8.26 = 44.00 thousand

The quantity of orders resulting from the conversion of the embedded base is (1 / 21) * 659.31 = 31.40. If this is added to the inward volume quantity, the result is

31.40 thousand + 44.00 thousand = 75.40 thousand. This is the estimated inward movement (orders) for UNE-L in August, 2005.

Q. WHAT DO YOU CONCLUDE?

A. Exhibit TKM-2 shows that the maximum inward quantity of UNE-L orders resulting from Qwest being granted switching relief in requested areas will occur in August, 2005, and is estimated to be 75.40 thousand. If we assume 21 business days in a month, this equates to approximately 3600 orders per day. The impact of this is discussed in Mr. Pappas' testimony.

Q. IS THIS ANALYSIS VERY CONSERVATIVE?

A. Yes. First, the analysis assumes that 100% of the UNE-P lines in unimpaired areas will convert to UNE-L. Second, it assumes that all orders will utilize the batch hot cut process. Thus, while this analysis estimates the maximum QCCC volumes that could be experienced, it is likely that a lower quantity of UNE-L BHC volumes will actually be experienced.

B. Central Office Volumes

Q. WHAT IS THE PURPOSE OF EXHIBIT TKM-3?

A. Exhibit TKM-3 estimates the volume of UNE-L orders that will be experienced per day in the busiest central office in North Dakota, if Qwest is relieved of its unbundled switching obligations in the areas requested. This exhibit shows that Qwest will be able to handle the inward UNE-L orders, for both growth and embedded UNE-P base conversions, in the highest volume office in North Dakota.

In the highest volume office, Qwest will be able to handle anticipated volumes with a maximum order quantity of 100 lines per day per office.

Q. PLEASE DESCRIBE THE CALCULATIONS IN EXHIBIT TKM-3.

A. In this exhibit, Qwest evaluates volumes in the highest volume office in North Dakota, based on inward UNE-P quantities between January and September, 2003. Qwest analyzed each central office in North Dakota and determined which office had the highest monthly volume of UNE-P orders. The analysis considers UNE-P orders, because these are the orders that will become UNE-L orders if Qwest is granted switching relief.

The exhibit shows that the average monthly volume in the highest volume office in North Dakota is 874 lines per month, and the highest embedded UNE-P line count as of September, 2003 is 7,234. The 874 volume is divided by 21 to derive a daily UNE-P (now UNE L) volume of 42 per day. The embedded base of 7,234 is divided by 21 months, and 21 days, to derive an embedded UNE-P base conversion volume per day of 16. The two results are added together to yield a total volume of 58 per day. This shows that, even in the highest volume office in North Dakota, Qwest will not need to process more than 100 orders per day over the course of the 21 month conversion time period.

The exhibit also shows the number of days that will be necessary to convert the embedded UNE-P base. It is readily apparent that the conversion can be accomplished well within the 21 month conversion timeframe.

Q. YOU MENTIONED THAT YOU EVALUATED THE HIGHEST VOLUME OFFICE IN NORTH DAKOTA FOR JANUARY THOUGH SEPTEMBER, 2003, AND USED A SEPTEMBER, 2003 EMBEDDED UNE-P LINE COUNT. WHY DIDN'T YOU ADJUST THE UNE-P EMBEDDED BASE TO REFLECT A JANUARY 2005 TIMEFRAME?

A. Since it is very hard to estimate growth on a per central office basis, Qwest did not attempt to estimate line growth by central office.[31] One might argue that the state average projected growth rate should be applied. For example, one might argue that the Qwest growth rates estimated in Exhibit TKM-2 should be utilized to update the UNE-P embedded base lines. This growth rate would project a growth of approximately 60% between September, 2003 to December, 2004. However, in reality, the growth rates in each office are likely to vary substantially. For this reason, Qwest did not use this growth rate to update the embedded base in Exhibit TKM-3.

Q. IF A 60% GROWTH RATE WERE APPLIED TO THE BUSIEST CENTRAL OFFICE, WOULD IT CHANGE THE CONCLUSIONS REACHED IN EXHIBIT TKM-3?

A. No. If the embedded UNE-P quantities were increased from 7,234 to 11,575 (a 60% increase), the conversion amount per day would be 11,575 / 21months /21 days = 26.25 orders per day. This would increase the total volume per day to 68, still well below 100.

[31] Volumes can vary greatly from month to month, and it is difficult to project growth in a particular office. For example, an office may grow from 100 to 2000 UNE-P lines over a nine month time period- a 2000% growth. This does not mean that it will continue to experience 2000% growth in the future.

VI. CONCLUSION

Q. WHAT ACTION SHOULD THE COMMISSION TAKE IN THIS PROCEEDING.

A. The Commission should adopt a nonrecurring price for the BHC installation option based on the TELRIC data provided in my testimony. Consistent with the FCC's TELRIC rules, the Qwest nonrecurring cost study identifies the forward-looking cost to provision UNE loops via a batch process using the most efficient technology that is reasonably available now. This study provides the most reliable TELRIC data available for Qwest's operations in North Dakota.

Q. DOES THIS CONCLUDE YOUR TESTIMONY?

A. Yes, it does.

A. PURPOSE, SCOPE, AND APPLICATION

This study estimates forward-looking nonrecurring total element long run incremental costs Qwest will incur to provide Batch Hot Cut of Unbundled Analog Loops. Nonrecurring costs represent the one-time costs that are incurred in order to establish and disconnect the service. The study identifies the costs for various work activities involved in providing the service. The study results represent fully allocated 2004 costs and may be used for pricing and other management decisions.

B. DESCRIPTION OF SERVICE

Batch Hot Cut is an installation option available for "batches" of at least 25 loops per CLEC located in the same CO, and up to 100 existing analog loops per CO per day, which do not require the dispatch of a Qwest outside field technician. The Batch Hot Cut process is for the conversion of the embedded base of UNE-P customers and for the conversion and migration of existing analog (voice) service to unbundled analog loops. The cost is per loop.

C. STUDY METHODOLOGY

The Nonrecurring Cost Program (NRC) performs mechanized cost calculations associated with the one time labor expense resulting from a customer request for service. Inputs to the calculations include: labor time, probability of occurrence, labor rate, and expense factors. Formatting commands performed by the program generate Total Element Long Run Increment Cost (TELRIC) results.

Following is a description of the required data inputs:

Time Estimates:
The time estimate is the average amount of time required to perform a particular work function. Time estimates are obtained from subject matter experts who represent the groups doing the work.

Probabilities:
A probability is the percentage of time Qwest performs a particular work function in the provision of a particular service offering. Probabilities are developed from reports and from the input of Subject Matter Experts.

Labor Rates:
Labor rates are based on incurred expense data from the general ledger journal file. The labor rates consist of costs that can be attributed to the function being performed and are forward looking based on the wage/salary index and the consumer price index. Components that make up labor rates include: basic wages, management/supervision/clerical support, benefits, other miscellaneous costs and as appropriate, motor vehicle and general purpose tools.

Expense Factors:
The program applies expense factors to the direct cost. The factors include Commercial Marketing, Network Support, Directly Attributable, and Common.

Once the service provisioning process has been identified, the appropriate times, Probabilities, and labor rate/work group identifies are formatted into NRC Program input data sheets. The process specific input files are then inserted into the NRC Program. The program

user selects run options on a menu, and the NRC program then accesses the appropriate input from the NRC program workbook spreadsheets to calculate cost results.

C. STUDY METHODOLOGY (Cont'd)

The cost calculations consist of Labor Time times Probability of Occurrence times Labor Rate equals Direct Cost. Added to the Direct cost are appropriate Expense Factors that calculate and display **Total Direct (TELRIC)** Total Element Long Run Incremental Cost, **Direct *plus* Network Support, Direct *plus* Network Support *plus* Attributable**, and **Fully Allocated Costs**. (See *Section D, Description of Total Element Long Run Incremental Costs* for detailed description of the various cost levels).

D. DESCRIPTION OF TOTAL ELEMENT LONG RUN INCREMENTAL COSTS

Qwest performs Total Element Long Run Incremental Cost (TELRIC) studies to estimate the economic cost of providing network elements. The Qwest TELRIC studies identify the forward-looking costs associated with the provision of the total quantity of a network element in the long run. The *forward-looking* Qwest TELRIC studies identify the costs that are likely to be incurred in the future, and consider the latest forward-looking technologies and methods of operation that are currently available. These studies are *not* embedded or historical, and do not measure the impact of prior investment decisions by the corporation. The Qwest TELRIC studies also identify the *long run* costs associated with providing a network element—reflecting a time period over which all inputs (including changes in the size of facilities, levels of investment, etc.) can be adjusted.

The Qwest cost study format disaggregates the cost results, on a unitized basis, into the following components:

Investment-Based Costs and Element-Specific Expenses are direct costs. Investment Based Costs are associated with recurring cost elements and include the capital costs (e.g., depreciation, return, and taxes) property taxes, and maintenance costs associated with the investment required for provisioning a network element. Element-specific Expenses are other network element costs such as billing and for non-recurring costs, the labor-related expenses associated with the provision of a network element.

Marketing is a direct product group cost. Marketing costs include product management and sales expenses that Qwest's accounting records typically allow tracking down to a particular product or service group.

Support Assets and Expenses include various administrative costs such as the cost of general-purpose computers and business fees. These costs are not directly associated with a specific network element. However, these costs vary with the provision of all network elements, and are not common to the entire firm.

Total Element Long Run Incremental Costs (TELRIC) represent the sum of all direct and directly assigned / allocated costs (e.g., Investment-Based Costs and Element-Specific Expenses, Marketing, Network Support Assets and Expenses. This measure of costs includes the forward-looking costs incurred in the provision of a network element. This measure of costs is consistent with TELRIC as defined by the FCC.

Indirect and Common Costs are associated with the enterprise as a whole. These costs do vary based on the total size of the firm, but may not vary with the provisioning of individual network elements. These costs are avoidable only with the elimination of the entire firm, and are sometimes referred to as *general overhead costs.*

D. DESCRIPTION OF TOTAL ELEMENT LONG RUN INCREMENTAL COSTS (Cont'd)

Fully Allocated Costs represent the sum of Total Element Long Run Incremental Cost plus Common Costs (TELRIC + CC).

E. STUDY ASSUMPTIONS

The cost factors used in this study are based on 13.07% cost of money.

I. IDENTIFICATION OF WITNESSES

. WHO IS SPONSORING THIS TESTIMONY?

A. This testimony is sponsored by two witnesses, Dennis Pappas and Lynn Notarianni..

Q. WHICH PORTIONS OF THIS TESTIMONY IS EACH WITNESS RESPONSIBLE FOR?

A. Mr. Pappas is responsible for the portions of this testimony addressing the requirements of the *Triennial Review Order* (or "*TRO*"), Qwest's existing processes for migrating loops from Qwest's switches to a CLEC's switch, the overall design of a new batch hot cut process ("BHCP") that Qwest is proposing as an additional provisioning option for CLECs, and the particular operational and network questions that CLECs have raised with respect to this new process. Mr. Pappas will also describe how the BHCP was designed with considerable input and assistance from CLECs (including AT&T, Covad, Eschelon, MCI, and McLeod) and commission staffers from across Qwest's region. Finally, Mr. Pappas will explain how the new BHCP alleviates any concern that Qwest's procedures for and performance in provisioning stand-alone unbundled loops would make it uneconomic for CLECs to serve mass-market customers without unbundled ILEC switching — the *Triennial Review Order*'s definition of "impairment."

Ms. Notarianni is responsible for the portions of this testimony describing Qwest's existing and planned operational support systems ("OSS"), that support the

batch hot cut processes, including the CLEC pre-ordering and ordering systems. Ms. Notarianni will explain the OSS modifications Qwest is proposing as part of the BHCP to enable CLECs to order larger quantities of stand-alone unbundled loops more efficiently and to keep track of the status of those orders and Qwest's progress in cutting the ordered loops over to the CLEC's switches. Ms. Notarianni will also describe the Change Management Process ("CMP") this Commission approved as part of its review of Qwest's section 271 application and explain how these OSS changes will be implemented in conjunction with the CMP.

Q. MR. PAPPAS, PLEASE STATE YOUR NAME, EMPLOYER, AND BUSINESS ADDRESS.

A. My name is Dennis Pappas. I am employed by Qwest Corporation as a Director in the Technical-Regulatory Group of the Local Network Organization. My business address is 700 W. Mineral Avenue, Room MNH19.15, Littleton, Colorado 80120.

Q. MR. PAPPAS, PLEASE DESCRIBE YOUR WORK EXPERIENCE, TECHNICAL TRAINING, AND PRESENT RESPONSIBILITIES.

A. I have worked in the telecommunications industry for 25 years. Between 1996 and 2001, I was directly associated with Interconnection and Wholesale Product Marketing. My first responsibilities in this area were as State Interconnection Manager for Colorado and Wyoming, a position that involved project management of all collocation activity. I later became a team leader for the Unbundled Loop and

Collocation product teams. Subsequently, I became the Director of the Wholesale Product Marketing team and, during that time, led multiple groups in developing new products and processes for provisioning interconnection products and services for competitive local exchange carriers ("CLECs"). Subsequent to that assignment, I was the General Manager for Qwest Wholesale Emerging Diversified Markets and had responsibility for approximately 75 CLEC accounts. In late 2000, I left Qwest to accept a position as Vice President of Services at TESS Communications, which was a facilities-based CLEC in Colorado and Arizona that provided a suite of services, including telecommunications, data, long distance and CATV, to approximately 1,200 end users. In early 2001, I assumed the role of President of TESS with responsibility for the day-to-day operations of the company. I left TESS in that same year and returned to Qwest, where I again worked on the unbundled loop product team and began participating as a witness in a number of section 271 workshops. In December 2001, I accepted my current position as Director in the Technical Regulatory Group, Local Network Organization.

Prior to the years I worked in the area of interconnection, I held multiple titles and positions requiring expertise in network operations, including, for example, Staff Manager and Regional Service Manager in the Local Networks Organization. In the 14 years prior to those assignments, I worked in Network as an Installation and Maintenance Technician (I&M Technician) and an Outside Plant Technician. I have my Bachelor's degree in Business Administration and a Masters in Telecommunications from the University of Denver.

Q. MS. NOTARIANNI, PLEASE STATE YOUR NAME, EMPLOYER AND BUSINESS ADDRESS.

A. My name is Lynn M.V. Notarianni. I am a Director for Qwest Global Wholesale Markets at Qwest Services Corporation, a unit of Qwest. My business address is 930 15th Street, Denver, Colorado 80202.

My 19-year telecommunications career began in 1984 when I was hired by U S WEST Communications, Inc. I have been employed by this company continuously since 1984. During my career, I have gained extensive experience by working in several U S WEST and Qwest organizations, including Information Technologies, Network, Mass Markets, and Advanced Technologies. Within each organization, I held management positions and often had major responsibility for managing persons involved in the development and/or implementation of Operations Support Systems (OSS). Currently, I oversee Qwest's 271 third-party OSS test, deliver departmental testimony on OSS-related matters, and act as a liaison to other Qwest organizations that deal with IT solutions to regulatory issues. I also represent Qwest at state commission- and FCC-sponsored workshops and other forums.

Throughout my career, I have garnered both technical and business knowledge. I began my U S WEST career in 1984, as a manager working with end-to-end automation of U S WEST's provisioning systems in Network Systems Engineering. I was also a database administrator in User Support Computer Center

Operations. In 1986, I oversaw software development for automation of complex switch translations and switch feature development, the latter of which was a joint venture between U S WEST and NEC-Japan.

Continuing as a member of the technical staff in Network Systems Engineering (1987-89), I was responsible for systems architecture, requirements analysis, and design work in the areas of Customer Service Negotiation and Provisioning, which are customer solutions-oriented business areas. I also acted as a "subject matter expert" (SME) for my department to make sure that U S WEST business functions and data needs were represented in the Bellcore Enterprise Architecture. Additionally, I dealt with quality assurance issues pertaining to end-to-end service ordering and provisioning activities.

From the beginning of 1990 through the end of 1991, I continued to perform in a quality assurance role as a core team member of the Service Order Quality team; there, as a systems analyst, I helped develop and implement 14 recommendations to improve the service order provisioning process. During that same time period, I managed all aspects of development of a Network Systems Architecture project, where I was the Steering Committee lead and a lead systems engineer. Again, I acted as a SME for Network at Bellcore's Service Activation Process Study forum.

I ascended to the post of Director in 1992 for Mass Markets and Operations Processes. I managed and provided technical expertise for large projects, including the U S WEST Business Process Vision, Integrated Inventory, and Work Effort

Management. I coordinated all Systems Architecture and Funding Forum activities and established the initial prioritization process.

Following that assignment, I served as Director of Integration Architecture and Transition for two years. That position involved managing resources and participating in the development of an architecture framework to define the relationship of strategies and processes through applications, data, programs, projects, and the IT development life cycle. I served as the IT representative to lead a team of consultants in the development of the strategic Business Integration Plan, outlining key business strategies, policies, market strategies, processes, systems, and operations; essentially, I worked to identify gaps and inconsistencies and then made recommendations for resolution to the Reengineering Executive Team.

Since January 1996, I have managed Qwest's response to OSS-related regulatory issues with respect to the 1996 Act, FCC orders, state commission decisions, and other legal and regulatory matters. Additionally, I led Qwest's effort to support OSS tests conducted by the Regional Oversight Committee (ROC) and the Arizona Corporation Commission. I am responsible for testifying before federal and state regulatory agencies in arbitration cases, rulemakings, and complaint proceedings concerning Qwest's conformance with state and federal telecommunications laws and regulations. In fact, I have testified in 14 state-level arbitration hearings on OSS access, performance measures, cost recovery, and CLEC motions. At the beginning of my tenure in this position, I evaluated the initial OSS impact and the feasibility of technical solutions to IT challenges posed

by the passage of the 1996 Act. Also, I have amassed experience in transacting business with CLECs, as well as experience with the Qwest Wholesale products and interconnection services CLECs sell and utilize. Examples of this experience include: leading multiple OSS negotiations with CLECs, which resulted in draft contractual agreements; impacting interconnection product definition through system and process analysis support for Resale, Unbundled Loops, Poles, Ducts, ROW, and Collocation; and, driving the initial strategy behind the implementation of OSS gateway access for interconnection.

My academic credentials include a Bachelor of Science degree in Business Administration (BSBA) from Creighton University. I have also completed all coursework toward a Master of Science degree in Telecommunications at the University of Colorado.

Q. MS. NOTARIANNI, PLEASE REVIEW YOUR WORK EXPERIENCE AND PRESENT RESPONSIBILITIES.

A. My 18-year telecommunications career began in 1984 when I was hired by U S WEST Communications, Inc. Throughout the course of my career, I have gained extensive experience by working in several U S WEST and Qwest organizations, including Information Technologies, Network, Mass Markets, and Advanced Technologies. Within each organization, I held management positions and often had major responsibility for managing persons involved in the development and/or implementation of Operations Support Systems ("OSS"). I

recently oversaw Qwest's 271 third-party OSS test. Currently I deliver departmental testimony on OSS-related matters and act as a liaison to other Qwest organizations that deal with IT solutions to regulatory issues. I also represent Qwest at state commission and FCC-sponsored workshops and other forums.

I am responsible for testifying before federal and state regulatory agencies in arbitration cases, rulemakings, and complaint proceedings concerning Qwest's conformance with state and federal telecommunications laws and regulations. In such capacity, I have testified in 14 state-level arbitration hearings on OSS access, performance measures, cost recovery, and CLEC motions. At the beginning of my tenure in this position, I evaluated the initial OSS impact and the feasibility of technical solutions to IT challenges posed by the passage of the 1996 Act. I also have extensive experience transacting business with CLECs, including issues relating to Qwest Wholesale products and interconnection services, which CLECs sell and utilize. Examples of this experience include: leading multiple OSS negotiations with CLECs, which resulted in draft contractual agreements; impacting interconnection product definition through system and process analysis support for Resale, Unbundled Loops, Poles, Ducts, ROW, and Collocation; and, driving the initial strategy behind the implementation of OSS gateway access for interconnection.

Q. MS. NOTARIANNI, PLEASE DESCRIBE YOUR EDUCATIONAL BACKGROUND.

A. My academic credentials include a Bachelor of Science degree in Business Administration (BSBA) from Creighton University. I have also completed all coursework toward a Master of Science degree in Telecommunications at the University of Colorado.

II. EXECUTIVE SUMMARY AND ORGANIZATION OF TESTIMONY

Q. PLEASE SUMMARIZE THIS TESTIMONY.

A. The Federal Communications Commission ("FCC") directed state commissions to complete two tasks within nine months of the *Triennial Review Order*'s August 21, 2003 effective date. *First*, state commissions must approve an incumbent LEC process for migrating batches of stand-alone unbundled loops from the ILEC's switch to CLECs' switches or explain why such a process is unnecessary. The new process should be capable of migrating larger quantities of CLEC UNE-P lines to stand-alone unbundled loops within acceptable timeframes and at an acceptable level of quality, and should enable CLECs to realize any cost savings and operational efficiencies that may result from pre-wiring and cutting over many loops at a time in the same central office location, instead of one or two at a time. *Second*, state commissions must determine whether the improvements in loop provisioning yielded by this new process would make it economic for CLECs to serve mass-market customers in various markets without access to unbundled ILEC switching. This testimony describes the new region-wide batch hot cut process ("BHCP") that Qwest developed in conjunction with the CLECs in its region, and

describes how that process eliminates any concern that Qwest's unbundled loop provisioning practices might "impair" CLECs from serving the mass market without unbundled ILEC switching.

Earlier in this docket, the parties "agree[d] that a single, uniform batch hot cut process for all states within the Qwest region provides the most efficient and effective operating environment for both Qwest and CLECs," and that it was "appropriate for the industry participants . . . to attempt to reach agreement on a batch hot cut process" to the extent possible.[1] Accordingly, all fourteen state commissions in Qwest's region agreed to participate in a consolidated forum to develop a region-wide batch hot cut process and to build the record for the states' individual *TRO* dockets. There is no doubt that the Forum was worthwhile. The new BHCP proposed here reflects the hard work of Qwest and the participating CLECs over the last two months and is the product of substantial give and take among the parties. Qwest and the CLECs were able to reach agreement on the broad outlines of a new BHCP and most of the operational details, and they were able to close the vast majority of the issues and questions that the CLECs had put on the table for resolution. A smaller number of operational issues went to impasse, along with (not surprisingly) the ultimate *TRO* question whether the process has improved sufficiently to permit the withdrawal of unbundled ILEC switching in certain markets in this state. (A copy of the issues matrix from the Forum showing resolved and impasse issues is attached as Exhibit DP-1. An additional document,

Exhibit DP-2 is a summary of only those issues which went to impasse during the Forum.

The BHCP proposed in this testimony will enable CLECs to order much larger quantities of standalone unbundled loops than they can today, at a lower TELRIC price,[2] and with predictable delivery intervals. CLECs (at their option) will be able to use the BCHP to convert both their existing base of UNE-P lines and batches of newly-acquired customers. The BHCP will be available as an additional option to the basic, coordinated, and project-managed hot cuts that Qwest offers today and that this Commission and the FCC reviewed in connection with Qwest's section 271 Application. CLECs desiring more coordination for the cutover of particular customers, or who wish to migrate loops with particular configurations preventing them from being batched for conversion on a consolidated and expedited basis, will continue to be able to use existing migration options.

The BHCP is premised on the fact that for the vast majority of hot cuts that CLECs request today and would require going forward, the conversion entails the simple reuse of facilities already being used (and thus known to be working), does not require the dispatch of a technician to the field, and requires only minimal coordination between the ILEC and the CLEC *as long as* the CLEC actually delivers working dial tone to the ILEC's frame before the conversion is to take place. The central office ("CO") tasks for these simpler migrations — the pre-

---

[1] See Joint Motion of Qwest, AT&T and MCI regarding adoption of a multistate Batch Hot Cut Forum. No CLEC in this state objected to this motion.

[2] In those states where Commissions have set the NRC for the basic installation well below the cost of providing it, the NRC price may not be lower.

wiring of the CLEC's connecting facility assignment ("CFA") to the ILEC's frame, and the actual "lift and lay" of the end user's loop from the frame termination of the ILEC's switch to the CLEC's CFA — can be performed on a consolidated basis. When a sufficient number of these conversions (at least 25) are performed at the same time in the same central office location, the ILEC (and hence the CLEC) can achieve significant time and cost savings by performing these tasks in efficient batches and moving through the central office in a logically-planned sequence.

At the same time, the CLECs at the multi-state forum forthrightly acknowledged that the widespread (in AT&T's word, "epidemic"[3]) failure of *CLECs* to have working dial tone ready on their CFA today requires Qwest to engage in redundant testing and back-and-forth communication with the CLECs that interrupts the process flow and adds additional steps and costs.[4] AT&T, Covad, McLeod, and MCI all agreed that in the context of these large-scale, expedited migrations, it is a "reasonable compromise"[5] to require CLECs to commit to providing working dial tone by the cut-over date, and to remove unready lines from the conversion process.[6] The BHCP proposed in this testimony reflects this

---

[3] 1/8/04 Tr. at 144:5 (John Finnegan, AT&T) (describing "alleged epidemic of no dial tone situations"); *id.* at 144:27-145-8 (Dennis Pappas, Qwest) (noting that today CLECs fail to provide working dial tone on the pre-wire date 50 percent of the time, and agreeing with AT&T's characterization of this as an "epidemic").

[4] *See, e.g.*, 1/8/04 Tr. at 146:9-22 (John Finnegan, AT&T) (acknowledging that Qwest must perform extra unnecessary work when "CLECs are systematically failing to have dial tone" ready, and describing this as "a waste of time"); 1/7/04 Tr. at 22:24-23:3 (Michael Zulevic, Covad) ("I understand the frustration with CLECs who procrastinate on doing their translations, and on cut date they are not ready, and that is something that should be dealt with . . . .").

[5] 1/7/04 Tr. at 36:23 (John Finnegan, AT&T).

[6] *See, e.g.*, 1/7/04 Tr. at 36:21-37:5 (John Finnegan, AT&T) ("I think that is a reasonable, compromise, where Qwest does the dial tone check, perhaps the ANI check, two days [in advance] or on DVA. If there's a problem, you notify us. It gives us two days to try and diagnose where the problem

consensus and achieves additional efficiencies by removing redundant testing steps and greatly streamlining the process on the day of cut.

Qwest's proposed region-wide BHCP does the following:

- It enables multiple CLECs at a time to convert significantly larger volumes of UNE-P lines to stand-alone unbundled loops simultaneously, and to do so quickly enough to meet the *Triennial Review Order*'s transition timetable.

- It provides CLECs with a fixed, seven business day provisioning interval for batches of 25 to 100 lines in a single central office, as compared to the SGAT's current individual-case-basis ("ICB") negotiated interval for LSRs containing 25 lines or more. This proposed seven-day interval is much shorter than any other RBOC has offered to date.

- As the testimony of Million demonstrates, in virtually every state, the per-line non-recurring costs of an eligible hot cut is significantly reduced from the basic hot cut rate.

- It takes advantage of the ability to streamline and consolidate conversions involving the reuse of in-service facilities, while preserving all existing (North Dakota Commission-approved) hot cut options for other kinds of conversions for CLECs that prefer a greater degree of coordination.

- It dedicates teams of central office technicians exclusively to performing these batch conversions outside normal business hours, thereby avoiding any interference with any other network provisioning activities.

- It minimizes customer disruption by scheduling lifts and lays during a time when business and residential customers are least likely to be receiving calls, and by giving CLECs the option of receiving *instantaneous* notification of both when the cutover of

---

exists and try and take corrective action. If on the day of the cut you find there is still no dial tone, then pull it from the batch, no exceptions."); *id.* at 173:14-174:2 (John Finnegan, AT&T) (endorsing Qwest proposal to perform early dial-tone check but eliminate same-day CFA changes); *id.* at 172:20-23 (Patty Lynott, McLeod) (same; "[T]his process works well . . . and we appreciate that Qwest is checking for dial tone ahead of time."); *id.* at 174:9:19 (Sherry Lichtenberg, MCI) (same; "We are very pleased Qwest has met us halfway on this, and we accept the proposal."); *id.* at 174:24-175:2 (Michael Zulevic, Covad) (same).

a batch is beginning and when the cutover of a given line is complete, signaling the CLEC to port the customer's number.

- It eliminates all need for up-front coordination between Qwest and the CLEC (except for the transition planning that the *Triennial Review Order* requires following a "no impairment" finding) by offering CLECs an electronic tool for scheduling their own cutover days.

- At the CLECs' request, it provides a web-based status tool that CLECs may use to review the results of their dial-tone checks and the progress of their cutovers, thus avoiding much of the need for e-mails and telephone calls.

- It gives CLECs early warning (at the time of prewiring) of potential problems with their facilities and gives them two to three days to fix any problems, thus greatly streamlining work on the day of cut.

- It gives CLECs an ample margin of error so that CLEC mistakes on a single line within the batch will not jeopardize an entire batch.

- As Hitachi Consulting has independently verified, it presents a process that works, and provides CLECs with the necessary assurances that Qwest will continue to provision unbundled analog loops using this new process at an acceptable level of quality.

- Finally, as Hitachi Consulting has also verified, it will be able to handle current and expected volumes of UNE-L orders and conversion of the embedded base of UNE-P lines over the course of the TRO's transition period, even assuming the worst case scenario that all existing UNE-P lines in affected areas would transition to UNE-L using the batch hot cut process.

These improvements make Qwest's already strong loop provisioning process even stronger, and eliminate any possible concern that Qwest's ability to provision stand-alone unbundled loops would prevent an efficient CLEC from being able to serve mass-market customers economically in the absence of unbundled ILEC switching.

The Commission should approve Qwest's proposed batch hot cut process, find that Qwest's process can manage anticipated volumes, and find that Qwest's batch hot cut process eliminates any arguable operational impairment with respect to analog loop provisioning.

Q. HOW IS THIS TESTIMONY ORGANIZED?

A. The testimony is broken into nine sections: Section I provides background on the witnesses. Section II provides an executive summary. Section III discusses the *TRO* requirements for a batch hot cut process. Section IV summarizes Qwest's existing hot cut process and current performance. Section V explains Qwest's current Operations Support Systems ("OSS") and the Change Management Process ("CMP") for implementing OSS changes. Section VI describes the region-wide Batch Hot Cut Forum ("BHCF"). Section VII details Qwest's proposed batch hot cut process and describes the efficiencies achieved by the process. Section VIII discusses each impasse issue remaining after the Forum and recommends solutions. Finally, Section IX addresses the question of impairment and loop provisioning issues outside the BHCP.

III. REQUIREMENTS OF THE *TRIENNIAL REVIEW ORDER*

Q. WHAT DID THE *TRIENNIAL REVIEW ORDER* SAY ABOUT INCUMBENT LECS' EXISTING LOOP MIGRATION PROCESSES GENERALLY?

A. In the *Triennial Review Order*, the FCC determined that "in the large majority of locations" (though not all),[7] incumbent LECs' existing processes for migrating in-service loops one at a time from their own switches to their competitors' could "serve as barriers to competitive entry in the absence of unbundled switching" for mass-market customers.[8] The FCC expressed concern that some ILECs' non-recurring charges were too high, and it questioned whether these current processes would be able "to handle the necessary volume of migrations" if mass-market switching is taken off the unbundling list.[9]

Q. DID THE FCC BELIEVE THAT THIS IMPAIRMENT COULD BE OVERCOME?

A. Yes. The FCC recognized that in many situations, it is possible to pre-wire and cut over several loops in a central office at the same time rather than converting each loop one-by-one, and that this consolidation may give rise to economic and operational efficiencies that can be passed through to the CLEC. The FCC held that a new batch hot cut process ("BHCP") may improve loop provisioning to such an extent as to overcome the *Triennial Review Order*'s finding of "impairment" with respect to mass-market switching: "We conclude that the loop access barriers contained in the record may be mitigated through the creation of a batch cut process

---

7 *TRO* ¶ 473.
8 *TRO* ¶ 460.
9 *TRO* ¶ 459.

by spreading loop migration costs over a large number of lines, decreasing per-line cut over costs."[10]

Q. WHAT DID THE *TRIENNIAL REVIEW ORDER* ASK STATE COMMISSIONS TO DO?

A. The *Triennial Review Order* directs state commissions to "approve, within nine months of the effective date of this Order, a batch cut migration process . . . that will address the costs and timeliness of the hot cut process," unless they determine that no such process is necessary in their markets.[11] The FCC specifically asks the states to decide four things with respect to a new batch hot cut process:

(1) A state commission shall first determine the appropriate volume of loops that should be included in the "batch."

(2) A state commission shall adopt specific processes to be employed when performing a batch cut, taking into account the incumbent LEC's particular network design and cut over practices.

(3) A state commission shall evaluate whether the incumbent LEC is capable of migrating multiple lines served using unbundled local circuit switching to switches operated by a carrier other than the incumbent LEC for any requesting telecommunications carrier in a timely manner, and may require that incumbent LECs comply with an average completion interval metric for provision of high volumes of loops.

(4) A state commission shall adopt rates for the batch cut activities it approves in accordance with the Commission's pricing rules for unbundled network elements. These rates shall reflect the

[10] *TRO* ¶ 487.
[11] *TRO* ¶ 488.

> efficiencies associated with batched migration of loops to a requesting telecommunications carrier's switch, either through a reduced per-line rate or through volume discounts as appropriate.[12]

Q. WHAT ELSE DOES THE FCC SAY WITH RESPECT TO LOOP PROVISIONING?

A. While the FCC expects the adoption of a BHCP to reduce the costs and improve the timeliness of provisioning stand-alone unbundled loops, it also recognized that "even after such processes are implemented, competitive carriers may face barriers associated with loop provisioning . . . which may continue to impair a requesting carrier's entry into the mass market."[13] If a state commission finds that the competitive triggers in a given market are not met and must go on to consider operational impairment, the *Triennial Review Order* directs the commission "to consider more granular evidence concerning the incumbent LEC's ability to transfer loops in a timely and reliable manner."[14] We discuss this requirement in greater detail in Section IX, below.

IV. QWEST'S CURRENT HOT CUT PROCESSES AND PERFORMANCE

Q. WHAT IS A HOT CUT?

---

12 47 C.F.R. § 51.319(d)(ii)(A)(1)-(4). *See also TRO* ¶ 489.
13 *TRO* ¶ 512.
14 *Id.*

A. When Qwest provisions a stand-alone analog unbundled loop to a CLEC, the loop's termination on Qwest's frame must be disconnected from the frame termination of Qwest's switch and rewired to a new terminating point on the frame that is connected to the CLEC's switch. This rewiring involves two steps that can be performed separately: the wiring of the CLEC's collocation, via the Interconnection Distribution Frame ("ICDF"), to a termination on the Qwest frame, and the replacement of the jumper connecting the customer's loop to Qwest's switch with one that connects to the new CLEC terminating point. When this transfer is performed on a loop that is currently in service, the transfer is known as a hot cut. To help the Commission understand what tasks are involved, we have produced a short video of some actual hot cuts. The video is available at **http://www.qwest.com/wholesale/training/tradeshow/batchhotcutarchive.html**. A CD is also attached for the Commission's convenience as Exhibit DP-3, and a transcript of the CD is attached as Exhibit DP-4.

Q. WHAT UNBUNDLED ANALOG LOOP PROVISIONING OPTIONS DOES QWEST OFFER TODAY?

A. As part of the Section 271 process, Qwest memorialized a number of different provisioning options in section 9.2.2.9 of its Commission approved Statement of Generally Available Terms ("SGAT"). Generally, these options include Basic Installation, Coordinated Installation, and Project Coordinated Installation. The process for each varies according to the degree of scheduling and other coordination

the CLEC desires, as well as by the number of loops involved in the installation. Basic Installation is the most streamlined process that Qwest offers today, and Project Coordinated Installation the most complex. Exhibit DP-5 generally depicts the installation options as they exist today. Importantly, the BHCP being proposed in this testimony would be added on as a new option for CLECs; all of these existing installation options would still be available going forward.

Q. WHAT IS THE QWEST CLEC COORDINATION CENTER ("QCCC")?

A. The QCCC manages the provisioning of unbundled analog loops. The QCCC was formed as part of Qwest's 271 process to improve Qwest's loop provisioning performance. The QCCC is involved in the provision of every unbundled analog loop today irrespective of the provisioning option involved.

Q. WHEN AND WHY WAS THE QCCC COORDINATION CENTER CREATED?

A. The QCCC was created in April 2001 specifically to improve Qwest's performance of *coordinated* unbundled loop installations. Prior to April 2001, Qwest was handling CLEC orders for the coordinated installation across multiple geographic centers. Prior to the QCCC's opening, Qwest had approximately 84,000 unbundled loops in service, but only approximately 88% of the loops requesting a basic installation options were being completed on time, while less than 40% of coordinated installations were performed on time (as that term is defined in PID

OP-13). This does not mean that these loops were not installed on the correct day, but only that Qwest did not contact the CLEC within the 30 minute window established for a coordinated installation. The QCCC was created to improve this performance, and by any objective measure it has succeeded. By September 30, 2003, for example, Qwest had provisioned and installed 564,028 unbundled stand-alone loops, and over 98% were provisioned on time, as discussed below.

Q. WAS THE FUNCTION OF THE QCCC EXPANDED?

A. Originally, the QCCC was staffed by approximately 90 employees and focused exclusively on coordinated installations. Due to the success of the QCCC and its dramatic impact on performance results, the QCCC's role was expanded about nine months later to include oversight of the provision of all unbundled loops.

Q. WHAT PERFORMANCE DATA SHOW THE SUCCESS OF THE QCCC?

A. From its inception, the QCCC has been focused on improving the provisioning performance captured in the following PID measurements:

1) OP-7 – Interval to perform the hot cut; and

2) OP-13 – Percent of coordinated installations completed on time.

Exhibit DP-6 compromises the regional PID results for 2001 for analog loops and shows the improvements in these PID measurements in the 3 months prior and subsequent to the QCCC's creation in April 2001. In summary:

	Jan 2001	Feb 2001	Mar 2001	April 2001 (QCCC Created)	May 2001	June 2001	July 2001
OP-3[15]	92.52%	94.11%	95.56%	95.24%	93.14%	96.52%	98.64%
OP-7	0:08	0:08	0:08	0:07	0:05	0:04	0:04
-9OP-13	71.06%	74.77%	82.19%	87.9%	93.89%	98.07%	99.03%

Q. WHAT STEPS DID THE QCCC TAKE TO IMPROVE THE QUALITY AND TIMELINESS OF LOOP PROVISIONING?

A. The QCCC achieved these improvements by focusing on three aspects of the job. The first was to issue detailed job descriptions in order to attract the most highly trained employees in order to limit ramp up time. Second, internal processes were refined with specific tasks and work steps to ensure a high level of performance on the loops requiring coordination. Third, the QCCC instituted a standing daily status meeting to review each order on an individual basis that was not provisioned on time or any other order related issue that affected or impacted the installation quality of the CLECs' service.

Q. PLEASE GIVE MORE DETAIL ABOUT THE QCCC'S ORIGINAL FUNCTIONS.

[15] The OP-3 data is from Zone 1, more densely populated areas.

A. The QCCC served as the Network Overall Control Office ("OCO") for the provisioning of unbundled loop orders. This included the coordination of installation activities with the CLEC and the Qwest departments such as the CO, Outside Field forces (if needed), the Central Office Resource Allocation Center ("CORAC"), Field Load and Resource Allocation Center ("LRAC"), and Design Services. The orders were loaded to a designated Service Representative Coordinator who was responsible for the end-to-end installation of unbundled loops that were provisioned using the coordinated installation option. Additionally, the Service Representative Coordinator in the QCCC was responsible for coordinating the actual order installation, at a CLEC-designated time, between the Qwest Central Office Technician ("COT") and the CLEC representative.[16] Eventually, the QCCC was also identified as the Maintenance Control Office ("MCO") with responsibilities for maintenance on all the embedded unbundled loops today and also the responsibility for any loops installed within the last 30 days via the 30 day warranty process. Exhibit DP-7 is a copy of the QCCC warranty process. Once again, by allowing this dedicated pool of resources to focus on the maintenance issues associated with an unbundled loop, certain efficiencies are realized and result in a greater customer i.e., CLEC experience.

[16] UBL provisioning options are found at URL: http://www.qwest.com/wholesale/pcat/unloop.html

Q. WHEN DID THE QCCC'S ROLE EXPAND TO INCLUDE BASIC UNBUNDLED LOOP INSTALLATIONS AS WELL AS COORDINATED ONES?

A. By early 2002, the QCCC had been processing all the coordinated unbundled loops across the region, and the loop performance measurements for these cuts had stabilized at around 97.5% of all commitments. Given this success, the QCCC's responsibilities were expanded in February 2002 to include basic loop installation. Staffing levels increased to a total of 102 employees. Basic installation performance in early 2002 was running an average of 90% commitments met. Once this work migrated to the QCCC, the performance improved to an average of 98% commitments met across the region. See Exhibit DP-8. In North Dakota the results are consistent with the region-wide performance. Exhibit DP-9 is the state specific results for analog loops. On a regional level, Qwest's performance has far exceeded the agreed upon benchmark of 90% commitments met in each month since mid-2001 when the QCCC first opened. This success is directly attributable to the dedicated employees in the QCCC and the daily review meetings and analysis on missed commitments and "I-Reports."

Q. WHAT STEPS ARE TAKEN BY THE QCCC TODAY TO ENSURE A HIGH PERFORMANCE LEVEL IS ACHIEVED FOR THE PROVISION OF UNBUNDLED ANALOG LOOPS?

A. The QCCC performs many quality checks throughout the day-to-day operations of the installation process to ensure sustained high performance. These checks include:

- QCCC supervisors perform four quality reviews of random orders per month per employee.
- QCCC management performs internal weekly audits for process compliance. These include audits on 48 hour no-dial tone ("NDT") checks and notification via Provider Test Access ("PTA"), which is an e-mail tool utilized for CLEC notification of NDT on the day pre-wiring is performed.
- Daily reviews and conference calls on every missed commitment and "I-Report" (repair report within 30 days of installation completion). This includes root cause investigation with the field, central office and QCCC and a feedback loop to all internal stakeholders.

If non-compliance as a result of human error is detected in any of these quality checks, the QCCC manages the performance of the responsible employee. This management includes re-training and/or development of a performance plan. The performance plan includes action steps that are based on the number of non-compliance reoccurrences. Continued non-compliance may result in termination of the employee. It is important to note that within the nearly three years the QCCC has existed, only one employee has been terminated for non-compliance. These process steps have led the QCCC to operate an extremely high level of quality as the performance data shows.

Q. PLEASE DESCRIBE THE DAILY REVIEW MEETINGS.

A. The QCCC implemented a high standard performance management process. This includes daily reviews of every missed commitment and I-Report. A readout conference call takes place where the root cause of the miss or I-Report is discussed and, if possible, resolved. This provides an immediate feedback loop for human error performance management and/or process gaps which are, in turn, addressed with either the employee body or the individual employee as a training opportunity.

Q. WHAT IMPACTS DO THESE MEETING HAVE ON PERFORMANCE OF QCCC PERSONNEL?

A. The QCCC philosophy of high performance management standards, disciplined approach to the work task and the focus on compliance to process has directly resulted in a sustainable high level of performance as demonstrated in Qwest's PID results across the region for all types of unbundled loops processed through this Center. As noted earlier in this testimony, Exhibit DP-8 is the December 31, 2003 Regional PID results for analog loops.

Q. WHAT IS THE CURRENT WORK LOAD AND STAFFING LEVEL OF THE QCCC?

A. The daily provisioning volumes completed in the QCCC average at 1000 orders per day. Due to additional efficiencies implemented in the QCCC, staffing levels have actually decreased from a peak staffing level of 102 in February 2002 to an average of 78 today. The primary driver of these efficiencies has been the internal

mechanization of repetitive tasks that the Service Representative Coordinator performs. Despite the decreased staffing, performance results have stayed consistently high.

Q. DOES THE QCCC HAVE ANY EXPERIENCE MANAGING LARGE HOT CUT PROJECTS?

A. Yes. The QCCC has successfully handled large projects by designating dedicated Service Representative Coordinators to the project and negotiating submittal volumes with the CLEC. Peak volumes are handled by moving skilled QCCC Service Representative Coordinators that may temporarily be assigned to another position.

Q. CAN YOU GIVE AN EXAMPLE OF A LARGE-SCALE PROJECT THAT QCCC HAS SUCCESSFULLY HANDLED?

A. Yes. During the past 24 months, Qwest has been working with one CLEC as it has continued to convert its embedded base of UNE-P customers over to its own switching platform. This conversion activity alone added an average of <REDACTED> conversions per day to the QCCC's typical daily volumes, and these extra volumes have been handled successfully. During 2002, this single CLEC submitted <REDACTED> conversion orders with approximately <REDACTED>. This conversion activity continued into 2003 as this CLEC

submitted another <REDACTED> conversion orders, with about <REDACTED>.

Q. HAS THE FCC DETERMINED WHAT LEVEL OF HOT CUT PROVISIONING PERFORMANCE GIVES CLECS A MEANINGFUL OPPORTUNITY TO COMPETE?

A. Yes. To have a section 271 application granted, a BOC must provision network elements at a level that gives CLECs a "meaningful opportunity to compete."[17] In the context of Bell Atlantic's section 271 application for New York, the FCC held that standard was met with respect to hot cuts at the following levels of performance:

> We consider Bell Atlantic's demonstrated on-time hot cut performance at rates at or above 90 percent, in combination with the evidence indicating that fewer than 5 percent of hot cuts resulted in service outages and that fewer than two percent of hot cut lines had reported installation troubles to establish compliance with the competitive checklist.[18]

Q. HOW DOES QWEST'S CURRENT HOT CUT PERFORMANCE COMPARE TO THE FCC'S BENCHMARK?

A. Qwest's unbundled analog loop provisioning consistently exceeds these benchmarks at both the region-wide and individual state levels. The regional results are very representative of the state specific performance levels. Exhibit DP-

9 contains the latest 12 months of loop performance data for North Dakota. Region-wide, Qwest is meeting in excess of 97% of commitments on time (far above the 90% threshold set by the FCC), migrating CLEC end users in an average of 3 minutes, and experiencing trouble on only approximately 0.7% of unbundled loops (far less than the 2% threshold set by the FCC and well below what Qwest end users are experiencing):

PID	Benchmark	September 2003	October 2003	November 2003
OP-3D	90%	97.23&	97.41%	97.23%
OP-5	Parity	97.91%	98.04%	Results one month in arrears
MR-8	Parity	.72%	.65%	.66%

Thus, Qwest's current unbundled analog loop provisioning and hot cut performance is far better than that which the FCC found gives CLECs a meaningful opportunity to compete in the marketplace.

Q. WHAT SHOULD THE COMMISSIONS CONCLUDE REGARDING THE QCCC'S PAST PERFORMANCE?

A. Based on the past performance and commitment by those staffing the QCCC, the ability to handle increased volumes should not be an impairment issue as Qwest seeks a finding of no impairment within certain MSAs. Since its inception in April

---

[17] Memorandum Opinion and Order, *In the Matter of Application by Bell Atlantic New York for Authorization Under Section 271 of the Communications Act to Provide In-Region, InterLATA Services in the State of New York*, CC Docket No. 99-295 ¶44 (Rel. Dec. 22, 1999).

[18] *Id.* at ¶ 309.

2001, the QCCC has continually demonstrated its ability to adapt to changes, take on additional unbundled loop volumes, and maintain a high level of performance, thereby giving CLECs a meaningful opportunity to compete. In addition, operational sessions such as the daily status meeting have allowed the QCCC to build into its process a daily monitoring function directed toward improving the CLEC's experience not only today but into the future. During the BHC Forum, the CLECs requested that the new process be monitored on a regular basis. The monitoring currently performed by the QCCC already provides that function. Since April of 2001, the QCCC has expanded it scope of responsibilities to accommodate basic installations along with a multitude of other loop types while the overall performance on each of these loop types and provisioning options has continued to improve. The efficiencies and experience of the QCCC staff, along with its long record of accomplishments, provide an excellent backdrop for reassuring the CLECs that orders utilizing the BHCP (both embedded and new) should expect the same level of professionalism and performance.

V. QWEST'S EXISTING OPERATIONS SUPPORT SYSTEMS ("OSS") AND THE CHANGE MANAGEMENT PROCESS ("CMP")

Q. PLEASE PROVIDE A BRIEF DESCRIPTION OF QWEST'S PRE-ORDER AND ORDERING SYSTEMS.

A. Qwest provides pre-ordering and ordering functionality through various electronic interfaces that enable CLECs to carry out real-time processing and allow CLECs to

integrate pre-ordering and ordering functions, including submitting Local Service Requests ("LSRs"). CLECs can perform the following pre-ordering functions though Qwest's interfaces: Address Validation; Customer Service Records; Service Availability; Reserve and Cancel Telephone Numbers; Facility Availability; Loop Qualification (for qualifying Qwest DSL for Resale and Unbundled Loop); Raw Loop Data; Connecting Facility Assignment; Meet Point Query; Schedule and Cancel Appointments; and Access to Directory Listings. The FCC has found in connection with each of Qwest's section 271 applications that Qwest's interfaces are available in a manner that affords an efficient competitor a meaningful opportunity to compete.[19] Each of Qwest's electronic interfaces is described below.

IMA-EDI: Qwest's IMA-EDI is a real-time, computer-to-computer, electronic interface that allows CLECs access to pre-ordering, ordering and provisioning OSS functions. It enables the electronic submission and processing of pre-ordering inquiries and Local Service Requests ("LSRs"). IMA EDI provides CLECs with uniform access to the same Qwest OSS across Qwest's 14 state region. IMA-EDI provides electronic access directly from CLEC systems to Qwest's interfaces, and thus enables CLECs to integrate their own OSS with the Qwest electronic interface (in addition to integrating IMA-EDI's pre-ordering functions with IMA-EDI's ordering functions).

A CLEC representative using the IMA-EDI interface interacts directly with CLEC-developed software and screens. A CLEC can connect to Qwest's OSS

[19] *See Qwest 271 9-State Order* at ¶ 44; *Qwest 3-State 271 Order* at ¶ 35; *Qwest Minnesota 271*

using IMA-EDI through a direct connection such as a dedicated T-1 line. CLECs develop their own IMA-EDI translation environments to interface with Qwest's IMA-EDI gateway. These environments may be either purchased commercially or developed by the CLEC. In either case, Qwest and the CLEC test the environments to ensure that they comply with Qwest's published IMA-EDI business rules. Generally, CLEC pre-ordering transactions submitted through the IMA-EDI interface rely on the same internal systems that process Qwest Retail transactions.

The same IMA-EDI gateway that is used by CLECs for pre-ordering functions can be used to perform ordering transactions. As with pre-ordering, CLECs submit LSRs directly with their own software through the IMA-EDI interface, which, in turn, relays the LSR to Qwest's OSS for processing. Service orders are created as a result of CLEC LSRs submitted through the IMA-EDI interface. These service orders are processed by the same SOP that processes Qwest Retail transactions.

IMA-GUI: Qwest's IMA-GUI is a real time, human-to-computer, electronic interface that allows CLECs to access Qwest's OSS to perform a variety of pre-ordering, ordering and provisioning functions. The IMA-GUI facilitates electronic submission and processing of pre-ordering inquiries and LSRs. A CLEC can connect to Qwest's OSS using the IMA-GUI in three ways: (1) through a dial-up modem; (2) through a dedicated connection such as a T-1 line; or (3) through the Internet with digital certificate access. In effect, then, the only tools' a CLEC needs

---

Order at ¶ 15; *Qwest Arizona 271 Order* at ¶ 13.

to access Qwest's OSS through the IMA-GUI is a personal computer and connectivity.

The IMA-GUI provides CLECs with uniform access to the same Qwest OSS across the 14-state region. Unlike IMA-EDI, the IMA-GUI allows a CLEC to obtain electronic access to various Qwest OSS pre-ordering, ordering and provisioning functionality without having to develop its own software. The use of the IMA-GUI therefore involves little to no development time and low start-up costs. The IMA-GUI is easy to use and, like IMA-EDI, provides integrated access to pre-ordering and ordering functionality. Generally CLEC pre-order transactions submitted through the IMA-GUI interface are processed by the same back-end systems that process Qwest Retail transactions.

The same IMA-GUI gateway that is used by CLECs for pre-ordering functions can be used to perform ordering transactions. CLECs can submit LSRs through Qwest's IMA GUI interface and interact directly with Qwest's OSS. Service orders are created as a result of CLEC LSRs submitted through the IMA-GUI interface. These service orders are processed by the same SOP that processes Qwest Retail transactions.

Q. WERE THESE SYSTEMS TESTED DURING THE 271 PROCEEDINGS?

A. Qwest's OSS interfaces were thoroughly tested during the various state 271 proceedings for functionality, volumes/scalability, and development/documentation across a complete set of product/activity types including, but not limited to, UNE-P,

UNE-Loop ("UNE-L") and UNE-P to UNE-L conversions. State commissions retained a number of independent parties (KPMG, MTG, CGE&Y, and HP) to assist in assessing the commercial readiness of Qwest's OSS. Thirteen state regulatory agencies in Qwest's local region worked together through a multi-agency organization known as the Regional Oversight Committee ("ROC")to endorse a test, and the Arizona Corporation Commission endorsed a similar, but separate, third-party test. These tests, the commissions that sponsored them, and the FCC all concluded that Qwest provides sufficient electronic functions and manual interfaces to allow CLECs access to all of the necessary pre-ordering and ordering OSS functions.[20]

Q. PLEASE DESCRIBE HOW CHANGES TO THESE SYSTEMS ARE MADE.

A. Since 1999, Qwest and CLECs have jointly participated in a forum for managing changes related to Qwest's products, processes, and systems that support the five categories of OSS functionality (pre-ordering, ordering, provisioning, maintenance and repair, and billing).[21] The Change Management Process ("CMP") is used to process and communicate to CLECs any changes to Qwest's OSS interfaces and to products and processes that are within the scope of CMP.[22] The CMP also provides

---

[20] *Id.*

[21] This Qwest-CLEC forum was previously known as the "Co-Provider Industry Change Management Process" or "CICMP" and is now known as the Change Management Process or "CMP." At the August 15, 2001, CMP meeting, CLECs voted to change the name of the CICMP to CMP. This declaration discusses the redesigned change management plan (the CMP), not the prior plan (CICMP).

[22] The CMP Redesign core team agreed to define the term 'OSS Interfaces' as "existing or new gateways (including application-to-application interfaces and Graphical User Interfaces), connectivity and system functions that support or affect the pre-order, order, provisioning, maintenance and repair, and

CLECs the opportunity to have input into Qwest-proposed changes and to propose their own. CLECs and Qwest meet collaboratively at least two days per month to consider such change requests ("CRs"), which may include CLEC Originated CRs, Qwest Originated CRs, Industry Guideline CRs, and Regulatory CRs.[23] Minutes from these meetings are posted on Qwest's CMP website[24] and distributed to participating CLECs regularly.[25]

The CLECs and Qwest jointly prioritize, as needed, CLEC Originated CRs, Industry Guideline CRs, and Qwest Originated CRs for OSS Interfaces and test environments. In addition, CLECs have the ability to prioritize certain Regulatory CRs, if Qwest determines that the changes can be implemented in more than one release and still meet the date required for implementation.[26]

Changes to Qwest OSS interfaces, products, or processes must be communicated to CLECs according to agreed-upon timeframes contained in the CMP. Qwest provides to CLECs, on a quarterly basis, its 12-month systems development view (known as the Qwest OSS Release Calendar), which shows, at a high level, the development plans for all OSS interfaces that Qwest offers to CLECs.[27] This information helps CLECs plan for upcoming OSS changes. Qwest

---

billing capabilities for local services (local exchange services) provided by CLECs to their end users." *See* CMP Document (n. 1 of every page).

[23] These categories of change requests are defined in the CMP Document, § 4.

[24] Qwest's CMP website can be found at http://www.qwest.com/wholesale/cmp. Minutes of CMP team meetings are available at http://www.qwest.com/wholesale/cmp/teammeetings.html.

[25] Prior to October 2001, these meetings were held one day a month. At the request of CLECs, Qwest began holding CMP meetings two full days a month, with one day devoted to systems issues and one day devoted to products and process issues.

[26] The prioritization process is set forth in the CMP Document, § 10.

[27] The OSS Release Calendar is available at http://www.qwest.com/wholesale/cmp/osscalendar.html.

regularly updates the 12-month view as more information becomes available or conditions change.

Q. HOW WAS THE CMP PROCESS DEVELOPED?

A. In June 2001, Qwest entered into a collaborative effort with the CLEC community to redesign its CMP, which applies in all fourteen states where Qwest is the incumbent local exchange carrier.[28] This effort was undertaken in part in response to issues that arose in the 271 workshops and in the third-party tests.

The core team that met to redesign the CMP was composed of representatives from several CLECs and Qwest.[29] Participation in the redesign process was open to all CLECs, and meetings were open to the CLEC community and interested parties. In addition, members of the Colorado Public Utilities Commission and (more recently) the Idaho Commission staff attended some of the sessions, as did representatives of CGE&Y (the third-party test consultant in Arizona) and KPMG Consulting (the third party test consultant in the 13 ROC states).

The redesign team met, roughly, four days a month between July 2001 and October 2002 in separate, dedicated sessions. The final Qwest CMP Document was issued on October 15, 2002.[30] Additionally, members of the Redesign team

---

[28] Information about the CMP redesign process can be found at http://www.qwest.com/wholesale/cmp/redesign.html.

[29] Generally, about six CLECs were active participants at each Redesign session.

[30] Since the CMP redesign process ended, changes were made to the CMP Document, effective January 6, 2003, May 30, 2003, and June 18, 2003. The current version of the CMP Document may be found at http://www.qwest.com/wholesale/cmp/whatiscmp.

presented the final CMP Document on November 22, 2002, in a meeting that was open to all CLECs. Participants agreed that the redesign effort was complete and that future changes would be made pursuant to Section 2.1 of the CMP Document.

Qwest has fully implemented the new processes that resulted from those negotiations. The FCC concluded that Qwest's change management plan satisfied each of the FCC's criteria for such activity: "(1) that information relating to the change management process is clearly organized and readily accessible to competing carriers; (2) that competing carriers [have] substantial input in the design and continued operation of the change management process; (3) that the change management plan defines a procedure for the timely resolution of change management disputes;" and (4) that "the BOC has demonstrated a pattern of compliance with [its change management plan]."[31]

VI. THE REGION-WIDE BATCH HOT CUT FORUM

Q. PLEASE DESCRIBE THE PURPOSE OF THE REGION-WIDE BATCH HOT CUT FORUM.

A. Qwest and the CLECs have always agreed that there can be only one batch hot cut process that applies in all fourteen states in Qwest's region. From Qwest's perspective, all hot cuts across all fourteen states are managed by a single center (the QCCC) and make use of the same set of ordering and provisioning systems. From a CLEC's perspective, it is much harder to comply with different ordering

[31] *Qwest 9-State 271 Order* at ¶¶ 132-136, 145-152, and Appendix K (¶42).

and provisioning procedures in different states, and business planning is difficult when provisioning intervals and the expectations for service delivery vary from state to state. While acknowledging that each state commission must ultimately approve the new batch hot cut process individually, Qwest and the CLECs have agreed from the start on the need to work out the outlines of the new process together and on a region-wide basis.

Accordingly, on October 31, 2003, AT&T, MCI, and Qwest filed a Joint Motion proposing a region-wide business-to-business forum to develop a batch hot cut process.[32] Qwest and the CLECs "agree[d] that a single, uniform batch hot cut process for all states within the Qwest region provides the most efficient and effective operating environment for both Qwest and CLECs." The parties further agreed that "it is essential for State Commissions" — and, in fact, "all of the states" — "to endorse this process." The point of the forum would be to attempt agreement on a process and to narrow the issues to be litigated in the individual state proceedings. The parties agreed that "[a]ll agreements reached by participants during the forum will be documented and will be binding," and that "[i]mpasse issues . . . remaining at the conclusion of the forum process will also be documented and will be litigated before the State Commissions."

No CLEC objected to this joint proposal in any of the fourteen states. All fourteen state commissions formally opted into the proposal, and representatives

---

[32] Joint Motion for Adoption of Batch Hot Cut Forum, Case No. PU-439-03-295

of the staffs of most of the state commissions attended at least some of the Forum sessions either in person or by telephone.

Q. WHEN DID THE BHC FORUM MEET?

A. The BHC Forum held full-day face-to-face sessions on December 1-3, 2003 and January 6-8, 2004. In addition, half-day conference calls were held on December 12, and December 19. Qwest, many large and small CLECs (including the CLECs with the largest current and potential future hot cut volumes), and a large number of representatives of commission staffs and state consumer advocates attended the various sessions either in person or by phone. (A list of the attendees of each session of the Forum is posted on the Forum web site at **http://www.qwest.com/wholesale/training/tradeshow/batchhotcutarchive.html** All sessions of the Forum were transcribed by a court reporter, and a comprehensive issues matrix was maintained that documented all the issues that the parties had raised, the positions of the parties, what issues were closed by consensus, and what issues went to impasse for resolution by the state commissions. A copy of the issues matrix is attached as Exhibit DP-1.

Q. HOW WAS THE FORMAL ISSUES LIST FOR THE BHC FORUM PUT TOGETHER?

A. Qwest submitted its original hot cut proposal in most states on November 12, 2003. AT&T, Covad, Eschelon, MCI, and McLeod all submitted written comments in

response and counterproposals one week later. Qwest put together a draft of a matrix identifying the issues that each of these CLECs had raised in their comments and attempting to summarize each CLEC's position. At the first session of the Forum, the CLECs reviewed and modified Qwest's summaries of the issues and their positions and added many further issues and subissues. Some of the smaller CLECs that had not filed written comments (such as USLink) added issues to the list, as did several of the commission staff representatives. The list was kept open throughout the sessions of the forum, and CLECs reformulated their issues and supplemented the list with additional issues and questions throughout.

The parties structured their discussion at the Forum session around this issues list and closed issues only by consensus of the participants, regardless of who raised them. Although Eschelon withdrew from the Forum just prior to the final face-to-face session, Qwest and the remaining CLECs continued to discuss and resolve the issues that Eschelon had put onto the list in the first three sessions.

Q. WAS THE BHC FORUM SUCCESSFUL?

A. Yes. Although the parties started out with numerous areas of disagreement, they were able to reach consensus on the workflow of a new BHCP and resolve a very large number of technical questions. The parties were able to close approximately 30 of the issues and subissues on the formal issues matrix. There was a significant amount of give and take between Qwest and the CLECs, particularly at the last face-to-face sessions. Qwest made very significant modifications to its original

BHCP proposal in response to the CLECs' concerns, and CLECs, as noted above, forthrightly accepted responsibility for improving their performance to allow streamlining of the process on the day of cut.

VII. THE PROPOSED BHCP

A. OVERVIEW

Q. PLEASE PROVIDE A HIGH LEVEL DESCRIPTION OF QWEST'S PROPOSED BHCP.

A. The proposed BHCP is a new, additional installation option that permits a single CLEC to order "batches" of 25 to 100 standalone unbundled analog loops, in the same Central Office, where loop facilities are being reused and no dispatch of a Qwest outside field technician is required. The standard provisioning interval for a batch hot cut is 7 business days. The existing appointment scheduler in Qwest's provisioning OSS will be enhanced to enable CLECs to electronically select their due date. Additionally, Qwest has agreed to build a web-based status tool to provide CLECs with regularly scheduled status reports concerning their BHC orders. The BHCP has been designed not only for the conversion of the embedded base of UNE-P customers, but also for the conversion and migration of newly acquired CLEC customers who have existing analog (voice) service (either Qwest retail or CLEC UNE-P or UNE-L) at present.

CLECs will submit LSRs as they do today with an additional field indicating that the LSR is part of a batch hot cut. By midnight on day 1 of the 7

business day interval, the CLECs will work the translations in their switches and have dial tone present on their designated CFA. The QCCC will produce a spreadsheet for the two Central Office Technician ("COT") team that provides it with a summary of pertinent order information and the locations of the relevant cross connects on Qwest's frames. This information will be sorted and prioritized in a way that minimizes the COTs' travel on and between the InterConnection Distribution Frame ("ICDF") and Main Distribution Frame ("MDF") or COSMIC™ frame during pre-wiring and cutover.

The COTs will pre-wire the CLEC's connection to the Qwest frame on days 2 and/or 3 and test the circuit. The testing will confirm that there are no problems on Qwest's side of the circuit, confirm whether the CLEC has dial tone ("DT") present at the CFA, and (if DT exists) verify that the CLEC's CFA is good. Testing at this stage gives both Qwest and the CLEC an early heads-up of any problems on their respective parts of the circuit with enough time left before the actual cut (two to three days) to fix the problem. If DT is not present on any of the CLEC's lines in the batch at this step, the CLEC would be notified via the new web-based Batch Status Tool ("BST").

On Due Date ("DD"), the Qwest COT will once again ANI both the CLEC DT and the DT of the CLECs UNE-P customer on the COSMIC frame. If a CLEC chooses to "Trap and Trace" this ANI test, the CLEC will have instantaneous notification that the cutover of that line is about to begin. Upon finding the correct ANI and after confirming that the line is not in use, the COT will perform the lift and lay on

each line. A final ANI test will be conducted at the final facility appearance in the CO. Again, if a CLEC exercises its option to "trap and trace" this ANI test, it will have instantaneous notification that the lift and lay of that line is complete and the porting of the customer's telephone number can begin. After the first lift and lay and every 25 thereafter, the COT will update the order status to reflect the order's completion, which will be reflected in the BST as well.

Q. DO YOU HAVE ANY OTHER MATERIALS THAT LAY OUT THE PROPOSED BHCP?

A. Yes. Exhibit DP-10 displays the proposed end-to-end process flow of a batch hot cut and associated work steps. The first two pages show the flow of a BHC and the major activities performed by the CLEC and the various Qwest organizations in a graphically swim lane format. The shaded boxes on the flow chart represent new activities that do not exist in the current Basic hot cut process. Pages 3 through 6 describe each work step or task in greater detail. This is the same flow chart and task list that the parties used in the BHC Forum.

Exhibit DP-11 is a day-by-day timeline of the 7 business day interval for the batch hot cut process that shows the work steps performed by Qwest and the CLEC during each of the seven days. This timeline was also used in the BHC Forum.

Q. WHAT OSS CHANGES IS QWEST PROPOSING AS PART OF THE BHCP?

A. As described in greater detail below, Qwest is proposing to enhance its existing pre-ordering and provisioning interfaces by providing CLECs with a scheduling functionality during the ordering process and status information during the provisioning process.[33] Qwest intends for these OSS enhancements to be available in the final quarter of 2004, barring unforeseen circumstances, such as conflicting regulatory rulings. Qwest intends for all proposed changes to follow the Qwest Wholesale Change Management Process ("CMP").

Q. HAS QWEST ESTIMATED HOW MUCH THESE OSS CHANGES WILL COST?

A. It is difficult for Qwest to give an accurate estimate of the system costs at this time. However, the changes Qwest proposes for the Batch Hot Cut process are large. As such, Qwest anticipates the costs will range from $900,000 to $2,800,000.

Q. HOW WILL QWEST IMPLEMENT THESE OSS CHANGES?

A. The OSS changes will follow the wholesale CMP. Qwest anticipates that these tools will become part of the BHCP ordered by the 14 state commissions within Qwest's local region. When the CLECs and Qwest redesigned the CMP, the participants understood that state commissions might mandate changes to Qwest's

[33] The systems changes proposed in this testimony are high level descriptions. As Qwest proceeds through the development life cycle for these changes, aspects of the proposed functionality may change.

OSS Interfaces, and they created a category in the CMP Document specifically for such changes:[34]

> A Regulatory Change is a change that "is mandated by regulatory or legal entities, such as the Federal Communications Commission (FCC), a state commission/authority, or state and federal courts. Regulatory changes are not voluntary but are requisite to comply with newly passed legislation, regulatory requirements, or court rulings. Either the CLEC or Qwest may initiate the change request."

The CMP document also provides that Regulatory CRs will be implemented, as a general rule, by mechanization unless all the parties agree otherwise.[35] Finally, if the implementation date for a Regulatory CR requires all or part of the change to be included in the upcoming IMA release, the process requires that the change not be subject to ranking and be automatically included in that release.[36]

Q. HAS QWEST INITIATED THE APPROPRIATE CHANGE REQUESTS IN CMP TO BEGIN THIS PROCESS?

A. Yes. Qwest is committed to implementing this process as quickly as practicable. As a result, Qwest has submitted two CRs (SCR012204-01RG and SCR012204-02RG) to CMP. Qwest will send a CMP notification when it posts these CRs to the CMP Web site. That notification will identify that CLEC comments identifying reasons why the objecting party does not agree that the CRs should be classified as a Regulatory Changes are due to the Qwest CMP Manager no later than eight business days prior to the February 19, 2004, monthly CMP meeting. If any CLEC

---

[34] CMP Document, § 4.
[35] CMP Document, § 5.1.2.

objects to the classification of the CRs as regulatory, that objection will be discussed at the February 19, 2004, monthly CMP meeting and Qwest and the CLECs will vote to determine where there is unanimous agreement that the CR's are Regulatory changes. If there are no objections, the CRs will move to the top of the list for the upcoming IMA major release. If there is not unanimous agreement, however, any member of the CMP community may utilize the CMP Dispute Resolution process to seek an order to implement the CRs as regulatory changes from any state commission.

Q. IF THE CHANGES ARE INCLUDED IN IMA RELEASE 16.0, WHEN WILL THEY BE IMPLEMENTED?

A. The current release production date for IMA release 16.0 is October 18, 2004.

B. LINES THAT ARE ELIGIBLE FOR BATCH CONVERSION

Q. PLEASE DESCRIBE THE TYPE OF ANALOG LOOP ORDERS THAT CAN BE INCLUDED IN THE BHCP.

A. As previously mentioned, only those conversion orders where facilities can be reused and where no field dispatch is required are eligible for the BHCP, because those are the only orders that can be provisioned on a consolidated basis. (These other types of loops may still be converted by means of Qwest's existing hot cut processes.). Based on the final Qwest BHC proposal, a CLEC can:

---

[36] CMP Document, § 10.2.1.

- Convert its own UNE-P or resale voice-only service to an analog or UNE-Loop.
- Migrate another CLEC's customer being served by UNE-P or resold Qwest voice service to an analog UNE-Loop.
- Migrate a Qwest retail voice-only customer to an analog UNE-Loop
- Migrate another CLEC's analog loop, providing the CLECs involved in the transaction coordinate the orders and re-use the existing facilities.

Q. PLEASE DESCRIBE THE TYPE OF ANALOG LOOPS THAT ARE NOT ELIGIBLE FOR THE BHCP?

A. Qwest has made clear in both policy and practice that it can provision any unbundled loop for CLECs using one of the existing provisioning processes. The question here is not whether Qwest can or will provision all forms of analog loops, but rather what kinds of analog loops can be converted on a consolidated basis and thus included in the BHCP. Any loop requiring a field dispatch necessarily requires extra, idiosyncratic steps that make it impossible to consolidate with other loop conversions and include in the BHCP. Generally, this affects two kinds of loops: IDLC and EX Cables. The exclusion of IDLC loops went to impasse at the Forum and will be discussed below. The parties uniformly agreed that EX cables can be excluded from the BHCP.

C. SIZE OF A BATCH

Q. WHAT IS THE MINIMUM AND MAXIMUM SIZE OF A BATCH ELIGIBLE FOR CONVERSION VIA THE BHCP?

A. Qwest has established minimum and maximum order volumes on a central office by central office basis. The original proposed minimum was a batch size of 25 lines per CLEC and a daily central office volume limit of 100 lines total (for all CLECs) per central office. As discussed in greater detail below, the 25 minimum is necessary to achieve efficiencies from consolidating tasks and spending costs across cutovers, and the 100 maximum reflects the work that dedicated two-central office technician team can perform in an eight hour shift.

At the BHC Forum, several CLECs argued that a hundred-line maximum per central office per day would not be sufficient for them to convert their embedded base of UNE-P customers within the timeframes set forth within the *TRO*. This assumption ended up to be incorrect. As the testimony of Ms. Terri Million demonstrates, it would only take approximately 82 business days to transition the office with the greatest number of UNE-P lines in Qwest's 14-state region using maximum daily batches of 100 lines, leaving ample time over the FCC's scheduled 21-month transition timetable to handle conversions of newly acquired customers or growth in the UNE-P embedded base between now and when the transition would begin.[37]

Q. WHAT HAPPENS TO THE BATCH IF A LINE MUST BE DROPPED BECAUSE IT TURNS OUT NOT TO BE ELIGIBLE FOR CONVERSION ON A CONSOLIDATED BASIS?

[37] A switch in Salem, OR has 8,172 UNE-P lines as of November 30, 2003.

A. Some CLECs at the Forum expressed concern that a single invalid line at order submittal could jeopardize the other lines in the batch and result in the entire batch being rejected. To satisfy this concern, Qwest will process a batch so long as it (a) started with 25 lines or more and (b) still contains 20 lines in it once unqualified lines are excluded. This change was sufficient to close the issue to the CLECs' satisfaction at the Forum.

D. SCHEDULING BATCH HOT CUTS

Q. WHAT TIME OF DAY WILL QWEST SCHEDULE BHCS?

A. Requests for conversions pursuant to the BHCP will be conducted Monday through Friday between the hours of 3:00 AM to 11:00 AM, excluding holidays. Due to concerns raised by several CLECs, Qwest has determined that it will use best efforts to complete the lift and lay activity during the first portion of the shift to mitigate service disruptions to the end user and give the CLEC ample opportunity to port the number in the early morning hours – usually before most businesses would open, and when most residential end-users are asleep. Later in the COT's shift, the COT would perform the advance pre-wiring for orders due 2 or 3 days hence.

Q. DOES QWEST HAVE EXAMPLES OF THIS PROCESS WORKING DURING THESE PROPOSED HOURS OF OPERATION?

A. We do. In a recent trial with one CLEC, Qwest processed two separate batches of orders in Idaho and Iowa. During this test, the pre-wires were performed on DVA while the lift and lay activity was conducted beginning at 3:00 AM on the Due Date. In Idaho, I observed a group of 26 orders with the lift and lay task beginning at 3:05 AM and concluding at 3:40 AM. None of these lines were in use at the time of cut. Representatives from Hitachi Consulting will be providing additional detail on each of these and other batches in addition to detailed time measurements on those orders.

Q. CAN THE CLECS REQUEST A SPECIFIC TIME OF DAY FOR A BATCH HOT CUT?

A. No. During the Forum, Qwest demonstrated that it can not efficiently prioritize central office work and organize COTs' movements through the central office if CLECs are able to demand that certain cutovers be performed at specific times. Such scheduling would interrupt the efficient task flow and reintroduce the need for the QCCC to communicate via telephone with CLECs regarding work start and stop times. Importantly, if a CLEC finds that it needs to schedule a hot cut for a particular customer at a specific time, the CLEC will still have the ability to do so by using the existing coordinated hot cut process. As explained above, Qwest provisions over more than 99% of such coordinated cuts on time today.

Q. CAN A CLEC PICK A PARTICULAR DAY FOR A BATCH HOT CUT?

A. Yes, with one caveat: The large-scale conversions of a CLEC's embedded base of UNE-P lines that would follow a state commission's "no impairment" finding would have to be scheduled within the contours of the negotiated 21-month transition plan required by the *Triennial Review Order*. In the event of a "no impairment" finding, the *Triennial Review Order* requires CLECs to work with Qwest to develop a plan for transitioning their embedded base of UNE-P lines in that market to alternative facilities or services.[38] This planning will establish an overall schedule for the migration of the embedded base that spreads these conversions out evenly over the 21 months provided by the FCC for this transition,[39] and designate specific dates for each affected CO to convert, with the understanding that UNE-P is no longer available after the final date for completion of the transition plan for a particular CO. This FCC-required transition planning for the embedded base occurs within the first two months after a state commission finding of "no impairment"[40] and is not part of the process flow for any individual migration order.

Q. HOW WILL THE CLECS SCHEDULE A BHC?

A. Qwest's original proposal required CLECs to coordinate with Qwest before the submission of individual conversion orders to discuss scheduling. While the CLECs at the first forum generally accepted the need (and the *TRO*'s legal

---

38 *TRO* ¶531; 47 C.F.R. § 51.319(d)(2)(iv).
39 *TRO* ¶532; 47 C.F.R. § 51.319(d)(2)(iv)(A).
40 *TRO* ¶531; 47 C.F.R. § 51.319(d)(2)(iv).

requirement) for up-front planning for the transition of the embedded base of UNE-P lines, several CLECs expressed concern with having an up-front coordination step for batched migrations of newly acquired customers and the time frames associated with such a meeting. These CLECs expressed a desire for some kind of electronic scheduling tool that would allow them to see when there was room for additional batches in a given central office and reserve those days without having to coordinate with Qwest.

In response to these comments, Qwest agreed to modify the appointment scheduler to enable CLEC to schedule their own batch hot cut days (within the context of the transition plan for the embedded base). The tool will allow a CLEC to search for a specific CO and a specific date. The tool will display the number of batch hot cuts that can be performed on that date at the selected CO. If there are slots available, the CLEC may then reserve a number of cuts in that CO for the designated day. If the CLEC enters 25 or more lines for conversion, the appointment scheduler functionality will return an appointment confirmation number. The CLEC will populate this number in the APPCON (appointment confirmation) field of each LSR for that day.

Adopting the Appointment Scheduler changes enables Qwest to eliminate the coordination step on individual orders for batch conversions of both the embedded base and newly acquired customers. The same tool will be used for the *TRO*'s mandatory transition planning for migration of the embedded base in the event of a finding of "no impairment": the conversion dates agreed to as a part of

CLECs' transition plans will be entered into the electronic tool, and capacity will be reserved accordingly.

Q. WILL CLECS BE ABLE TO USE THE APPOINTMENT SCHEDULER TO SCHEDULE BATCH HOT CUTS IN *ALL* QWEST CENTRAL OFFICES, INCLUDING UNSTAFFED ONES?

A. Yes.

Q. HOW WILL QWEST ACCOMMODATE A CLEC THAT IS GRADUALLY ACCUMULATING ORDERS IN ANTICIPATION OF MEETING THE BATCH MINIMUM?

A. If a CLEC submits fewer than 25 lines to the appointment scheduler, those lines will remain as pending until the CLEC enters a total of 25 lines. However, these pending lines may be "bumped" to the next available day if another CLEC submits LSRs in a batch that exceeds 75 lines for a particular CO.[41] In addition, CLECs will be able to "add" lines to an existing batch as long as the standard installation interval is met, and the batch size does not exceed 100 lines.

[41] For example, if CLEC ABC has 21 pending LSRs for Denver Main on January 29th, and CLEC XYZ submits 76 LSRs for the same CO and the same date, CLEC ABC's LSRs will be "bumped" to the next available date.

Q. WHAT OCCURS IF A CLEC HAS FEWER THAN 25 LINES RESERVED IN APPOINTMENT SCHEDULER WHEN THE INTERVAL FOR THAT DATE IS REACHED?

A. Pending reservations will be held until 7 PM MT seven business days prior to the cut date. If a CLEC has fewer than 25 lines in pending status at 7 PM MT seven business days prior to the cut, the appointment scheduler will automatically "bump" the lines to the next available business day.

Q. DID THE PROPOSED CHANGES TO THE APPOINTMENT SCHEDULER RESOLVE THE CLECS SCHEDULING CONCERNS?

A. Yes. Based on the proposed changes to the IMA EDI/GUI appointment scheduler the CLECs agreed that their concerns were completely resolved on this point.

E. ORDERING BATCH HOT CUTS

Q. WHAT CHANGES DOES QWEST PROPOSE TO ITS ORDERING FUNCTIONALITY?

A. Qwest proposes that during the ordering of a BHC, CLECs complete an accurate LSR via either EDI or IMA GUI in the same manner they do for a Basic Hot Cut request today. Qwest's proposal designates, however, that LSRs requesting BHCs must also contain the CHC field populated with a "B" for batch and include the confirmation number for the batch and frame due date returned from appointment scheduler.

Qwest also proposes additional IMA validations such as determining that the CLEC has appropriately populated LSR fields designating the order as a BHC. These validations will take the form of new edits and/or error messages. Business Process Level ("BPL") edits which will be developed are items to aid the CLEC in making a BHC request. The CHC field must be populated with the correct elements for the request to move forward into the batching of the service order for the CO. Some of the fields which will have the BPL edits established are the REQTYP – request type AB or BB, ACT-V (for conversion as specified) or Z (conversion with no directory listing changes), APTCON (this would be populated with the information from the appointment scheduler), TEST=N or blank (indicating there are no special testing requirements). DSPTH=N or blank (indicating no dispatch), CHC=B (indicating the request is for a BHC), NC-LX- - (this is the only network channel code allowed in the BHCP). Once an LSR passes these validations, a BHC USOC will be assigned to the Qwest service order. The BHC USOC drives the utilization of the new BHC process and the corresponding new lower NRC for each line associated in the BHC. All CLECs agreed that this process was acceptable.

F. PROVISIONING INTERVALS

Q. HAS QWEST PROPOSED A STANDARD INSTALLATION INTERVAL FOR THE BHCP?

A. Yes. Upon conclusion of the *TRO*-required transition planning CLECs will use the scheduling tool, find an available time slot and submit an LSR for individual orders on a CO basis. The CLEC must submit an LSR at least seven business days in advance of the time slot available in the scheduling tool. In past 271 proceedings, CLEC and State Commissions agreed to a seven business day interval where the CLEC submits order volumes between 17-24 lines for the same customer at the same address. These intervals are memorialized in the Service Interval Guide ("SIG"), which is Exhibit C to the state's approved SGAT, and which is attached here as Exhibit DP-12. In fact, if volumes exceed the 24 lines stated in the SIG, the stated interval is negotiated on an ICB. Unlike the current provisioning options, the Qwest proposed BHC seven business day interval allows the CLEC to give their end user a date certain due date without the need to negotiate when volumes are in excess of 24 lines. This interval is significantly shorter than those offered by any other ILEC for comparable UNE-P migration activity. This interval is discussed in greater detail below in connection with impasse issue S-2.

G. PRE-WIRING

Q. WHEN WILL QWEST PERFORM CENTRAL OFFICE PRE-WIRING?

A. Qwest had intended to move the pre-wire and DT/ANI steps to the Due Date for efficiency reasons; however, several CLECs at the forum asked that these steps remain on DVA (day 2 or 3 in a 7 business day interval) in order to allow time for both Qwest and the CLEC to respond to any issues that may be encountered with

their respective networks. Qwest agreed to modify its proposed BHCP to keep these work steps on days 2 or 3 with the understanding that Qwest will have discretion to perform pre-wiring and the DT/ANI tests on either day 2 or day 3 in order to gain the efficiencies from balancing the workload over multiple days.

Upon concluding these testing steps, Qwest will notify the CLEC via the web-based status tool of any No-Dial-Tone ("NDT") or reverse wiring or bad CFA situations. The NDT notification provides the CLECs with ample time prior to the Due Date to resolve issues. Qwest explained at the forum that moving pre-wiring and testing to days 2 and 3 of the proposed process instead of Due Date, as the CLECs had requested, would increase the costs associated with the COT by approximately $4.00. The CLECs requested the pre-wiring anyway.

Q. WHAT ARE THE CLEC'S RESPONSIBILITIES?

A. The CLECs committed at the forum to have switch translations completed by midnight of day 1, and agreed that such a commitment is reasonable.[42] If the CLEC receives a jeopardy via the web-based status tool, then the CLEC will have a minimum of 2 day and a maximum of 3 days to issue a subsequent order to change their CFA, perform their translation work or correct any other CLEC related issue that may be causing the problem. Per the PCAT the standard interval for CFA changes is 3 days, therefore the CLEC's subsequent LSR for CFA changes needs to

[42] *See, e.g.*, 1/17/04 Tr. at 173:1-13, 22-24 (John Finnegan, AT&T) (noting that AT&T's normal business procedure is to establish switch translations prior to submitting the LSR or mechanically within four hours of receipt of the FOC; hence it "would not be a problem" to have switch translations in place by midnight of day one.

be submitted no later than 7 PM on day 4 of the 7 day interval. For all CLEC changes, other than CFA changes, the CLECs do not need to notify Qwest of their corrective actions. Qwest will assume that corrective action will be taken by DD.

It remains the responsibility of the CLEC to ensure that its network (collocation facilities and tie cable pairs between that collocation and its terminations on the ICDF) are working and able to carry dial tone between these points. The verification by the CLECs can occur any time between when the collocation is first established up until the day the conversion orders are due; it is up to the CLEC to make this determination. The CLEC does not have to (and should not) wait until it receives a NDT notice from Qwest to resolve issues on its side of the network. The CLEC would do this by placing testing equipment at its switching location and the same type of equipment on the vertical side of the ICDF.

Upon conclusion of a successful pre-wire, the CLEC's dial tone should be appearing on a jumper that has been run, via the aforementioned frames, to the COSMIC™ or Main Distribution Frame ("MDF") and looped near its final termination point for the lift and lay activity on the order's due date.

Q. DID THE ABOVE PRE-WIRING AND TESTING PROPOSAL RESOLVE THE CLEC'S CONCERNS?

A. Yes. Qwest's willingness to pre-wire and test on day 2 or 3 resulted in the CLECs' willingness to close a number of issues at the forum. In turn, the CLECs' clear commitment to have their translations work completed by midnight of day 1 allows

for a better level of testing, fewer visits by the Qwest COT to retest for CLEC Dial Tone, fewer problems on the Due Date, and elimination of all of the manual inefficient processes parties go through to try and modify an order at the last minute on Due Date.

As noted above, this was one instance where the participants to the forum was able to agree to a process that mutually benefited both Qwest and the CLECs. AT&T called this a "reasonable compromise,"[43] and MCI, McLeod and Covad likewise endorsed this proposal.[44]

H. THE LIFT AND LAY

Q. WHAT ACTIVITIES OCCUR ON THE DUE DATE?

A. On due date, the Qwest COT will test the pre-wired loop, at the COSMIC™ or MDF, for dial tone to ensure that the CLEC has worked their translations and that the CLEC CFA information is correct and working. In addition, Qwest will conduct an ANI test on the Qwest cable and pair (where the existing UNE-P customer resides) to ensure that the correct pair and TN are reflected on the service order. Upon verifying both the CLEC and existing customers' DT, Qwest will monitor the line prior to performing the lift and lay and conduct the work only after finding the line in an idle state. If idle, the lift and lay will remove the end user

[43] 1/7/04 Tr. at 36:23 (John Finnegan, AT&T)

[44] 1/7/04 Tr. at 172:20-23 (Patty Lynott, McLeod) ("[T]his process works well ... and we appreciate that Qwest is checking for dial tone ahead of time."); *id.* at 174:9:19 (Sherry Lichtenberg, MCI) (same; "we

from the Qwest switching platform and connect them to the CLEC's switching platform. Qwest performs a final DT/ANI test at the protector frame once all of the office wiring is complete to verify that the lift and lay was performed correctly and DT is present at the last point before it leaves the CO.

Q. WHAT STEPS WILL QWEST TAKE IF THE LINE IS IN USE AT THE TIME THE LIFT AND LAY IS TO TAKE PLACE?

A. In order to remain efficient in wiring these in accordance with the facility location, the Qwest COT would monitor the line to ensure that the conversation was not of an urgent nature and upon making that determination, perform the lift and lay. Proceeding in this manner will allow Qwest to proceed on with the batch and allow the CLEC to get notification of batch completion without having to wait on a single customer. This possibility, however, is significantly reduced by the time frame for these cuts – 3:00 a.m. to 11:00 a.m. The cuts will occur at the beginning of the shift when most businesses are closed and people are asleep.

Q. ARE THERE STEPS THAT CAN BE TAKEN BY THE CLEC TO LET THAT END USER KNOW THAT WORK WILL BE TAKING PLACE ON THEIR LINE SOMETIME BETWEEN THE HOURS OF 3 AM AND 11 AM?

A. Yes. The CLEC can notify their end user to inform them of the pending order activity and that they may experience a momentary outage during the hours of

---

are very pleased Qwest has met us halfway on this, and we accept the proposal."); *id.* at 174:24-175:2

operation that Qwest is proposing to convert the embedded base UNE-P order utilizing the BHCP.

Q. WHAT OCCURS IF THE CLEC'S DIAL TONE IS NOT PRESENT ON DUE DATE?

A. As stated earlier in this testimony, if CLEC dial tone is not present at the time the DT/ANI verification step is performed on Due Date, then the CLEC will be notified and the LSR will be placed in jeopardy status and removed from the batch. It is important to note that if a single LSR contains multiple loops and a single loop does not have dial tone on the Due Date, then all loops in the LSR are placed in a jeopardy status. This is necessary, and the CLECs at the Forum did not object to this point. It is ironic to note that while the CLECs would not commit to any type of payment to Qwest for an order that was delayed on the original due date for any CLEC reason, they continue to favor the waiving of the NRC when Qwest does not execute on the order due date, and payment of automatic PAP penalties if Qwest's performance drops below a certain level.

Q. WHAT ARE THE CLEC'S RESPONSIBILITIES IF AN LSR CANNOT BE COMPLETED ON THE DUE DATE DUE TO NO DIAL TONE?

A. The CLEC will need to issue a subsequent change to that order and resubmit the LSR for a new Due Date. At the CLEC's option, the LSR can be added to another

---

(Michael Zulevic, Covad) (same).

batch for that office or a different installation option can be chosen. Additionally, the CLEC needs to verify if the LSR was related to any other LSRs. It is the CLECs responsibility to notify Qwest if there are any related LSRs that need to be cut back.

Q. PLEASE DESCRIBE THE CUT BACK AND ESCALATION PROCESSES.

A. The cut back and escalation processes are the same as those currently used by the CLECs today with any of the other provisioning options or products. Exhibit DP-13 is the cut back process. In essence, this process allows the CLEC to notify Qwest the day of the conversion and request that the CLEC end user be moved back to the Qwest switching platform due to some issue that the CLEC was not able to resolve and was concerned about their end user's ability to receive phone calls or retain DT. Upon receiving this call, the QCCC would notify the CO requesting that the COT move the CLEC end user back to the facilities that they resided on prior to the conversion order being worked. In order to ensure that the cut back can occur without the need to submit a new order, the CLEC must notify Qwest of the need to cut back within two hours of order completion through the Status Tool. If this request is submitted to Qwest after the translations work has been performed and the DT has been "removed", the CLEC would have to issue a service order requesting that the service be reconnected. One of the additional benefits of conducting the BHC work during the early morning hours is that it gives the CLEC ample opportunity to determine if issues exist long before Qwest's translations

removal would complete. The frame due time will continue to be 6:00 PM for all conversion orders. The parties agreed that this process was acceptable.

Q. CAN CLECS REQUEST THE ORDER IN WHICH THEIR LINES WILL BE PROVISIONED?

A. No. In order to realize the efficiencies gained by working at one location on a frame and then moving to the next location on that frame or a different frame, Qwest would need to stay the course and work orders by their associated frame location, not in the order the CLECs define.

I. NOTIFICATIONS TO THE CLEC

Q. HOW WILL THE CLECS KNOW WHEN TO PORT THE SERVICE?

A. The CLECs have two ways to know when the central office work has been completed. First, a CLEC can use existing functionality in its switches to "Trap and Trace" Qwest's ANI tests on the lines in the batch, thereby receiving instantaneous notification that the cutover of a line is about to begin and when the cutover is complete. Second, Qwest has agreed to implement a web-based status tool that will give the CLEC information on order status or status changes and indicate which orders or batches of orders have been completed.

Q. WHAT IS "TRAP AND TRACE" TECHNOLOGY?

A. Trap and Trace technology is a switch based feature. The most common application of this technology is the Last Call Identification feature, "*69". The CLEC can have its switch "Trap and Trace" a line that is a candidate for a conversion. By implementing "Trap and Trace", the CLEC will be able to detect the two ANI tests that the Qwest COT performs immediately before and immediately after the lift and lay. The initial ANI test would be an indication that the hot cut of that line is beginning, and the post-cutover test would signal that the lift and lay of that line had been completed. By monitoring its switch, the CLEC's OSS can effectively receive instantaneous notification when a cut-over is finished and electronically initiate the porting of the telephone number associated with that line, thereby keeping customer outage times to a minimum.

This notification solution was discussed late in the BHC Forum, and the CLECs agreed to continue researching it after the Forum's conclusion and to report back to Qwest prior to the filing of testimony. On January 21, 2004, AT&T representative John Finnegan reported by e-mail that AT&T was still considering trap and trace but "believe[s] it had some potential to work," although AT&T believes it should not be the only notification method available to CLECs.[45] Similarly, a McLeod representative reported by e-mail that McLeod "believes this could be a viable option," although, like AT&T, McLeod believes that additional options should be available as well.[46]

[45] E-mail from John F. Finnegan, AT&T, to Carolyn Hammack, Qwest (Jan. 21, 2004).

Q. ARE THE CLECS REQUIRED TO USE TRAP AND TRACE TO KNOW THE STATUS OF THEIR BHC ORDERS?

A. No. Qwest's original proposal involved notifying the CLECs by e-mail periodically throughout the course of the lift and lay process to let them know what conversions had been completed. A number of CLECs expressed concern with an e-mail-based notification process citing latency in their network and having to designate a single e-mail address that will receive such e-mails. Therefore, as previously mentioned, Qwest is developing a web-based status tool. This tool will provide BHC status to the CLEC throughout the entire BHCP, not just on the Due Date.

Q. PLEASE DESCRIBE THE WEB-BASED STATUS TOOL.

A. At the BHC Forum, the parties agreed that Qwest would create a secure, CLEC-specific, mechanically updated, web-based reporting tool, which Qwest calls the Batch Status Tool ("BST"). The BST will allow each CLEC to review the status of their Batch Hot Cut orders when the orders are processed through the Service Order Processor into the Work Force Administrator ("WFA"). Qwest expects typical orders to appear on the BST approximately 2 days following order submission, and several days before the Due Date. Information provided on the BST will include:

- Due Date
- Customer Identification (ZCID)
- State

---

[46] E-mail from Patty C. Lynott, McLeod to Carolyn Hammack, Qwest (Jan. 21, 2004).

- Common Language Location Identifier (CLLI)
- Complete with Related Order (CRO) field
- Circuit Facilities Assignment (CFA) Location
- Circuit Facilities Assignment (CFA) Number
- Job Identifier
- Circuit Layout Order (CLO) number
- Purchase Order Number (PON)
- Order Number
- Telephone Number (TN)
- Order status (Pending, Jeopardy (No Dial Tone, Customer Not Ready, Line in Use, Polarity Reversal), and Completed)
- Completion Date/Time
- Required Response Date/Time for Completed and Jeopardy orders
- QCCC e-mail address for CLEC messages pertaining to Completed and Jeopardy orders.

Q. HOW WILL THE INFORMATION IN THE BST BE FORMATTED?

A. Qwest proposes to provide the information listed above in a format that allows CLECs to sort the data and to download it into a Microsoft Excel file. An example of the BST's proposed output is attached in Exhibit LMVN-1. The CLECs found the BST's ability to permit CLECs to sort and manage the status information as

they deem necessary to be a key element that allowed several previously disputed issues to close.

Q. WILL CLECS STILL RECEIVE THE CURRENT IMA MESSAGES IN ADDITION TO THE INFORMATION ON THE BST?

A. Yes. CLECs will continue to receive the same IMA notifications (Firm Order Confirmations ("FOCs"), Service Order Completions ("SOCs"), etc.) for their BHC orders that they currently receive for their BHC orders today. However, IMA notifications are not sent until the order is completed within Qwest's service order processor. Qwest created the BST to give CLECs status information faster than they can receive it through IMA.

Q. PLEASE DESCRIBE HOW QWEST WILL UPDATE THE BST.

A. WFA is the same system Qwest CO technicians receive their work assignments from and enter their work completion records into immediately following the lift and lay of the first order in the Batch and then again upon completion of the last order in the Batch (at a minimum, the 25th line). Qwest intends to design an application that queries WFA for all Batch Hot Cut status changes every 15 minutes. Once the application queries WFA, the pending, jeopardy and recently completed orders information will immediately post to the BST.

Q. CAN THE BST BE USED BY STATE COMMISSIONS TO ENSURE THAT EMBEDDED BASE MIGRATIONS ARE OCCURRING ON SCHEDULE?

A. Yes. Qwest proposes that the BST may also be designed to provide Commissions with a means of tracking CLEC conversion progress. Qwest believes it is critical that the Commissions monitor this tool to ensure CLEC adherence to the transition plan.

Q. WILL QWEST BASE THE BST ON AN EXISTING OSS INTERFACE?

A. Qwest recognizes the importance of limiting the number of complicated OSS interfaces with the CLECs. As a result, Qwest intends to design the BST as a modification of the existing Customer Electronic Maintenance and Repair ("CEMR") system. Qwest chose CEMR because CLECs currently use the system, and it is efficiently adapted to the purpose of the BST. This will minimize the need for employee training to use the new system. For those CLECs not using CEMR, all that is required is a digital certificate for access.[47]

Q. DID THE BST RESOLVE ALL THE CLECS' CONCERNS REGARDING BHC STATUS NOTIFICATION?

A The CLECs were at odds with each other. MCI reported that it was pleased with the solution, that a web-based tool would provide CLECs with adequate notice, and that it was not too much work for CLECs to retrieve information from a web-based

[47] The Digital Certificates process is defined at the following URL: http//ecom.qwest.com/.

status tool. AT&T, by contrast, took one aspect of the BST to impasse. AT&T argued that a tool that provides automatic status update information at a web site still required the CLEC to perform too much work to retrieve that information; instead, AT&T wanted Qwest to "push" the information to them (via an e-mail, for example) when an order was in jeopardy status, even though the status tool provides the CLEC with 72 hours to rectify a NDT situation. This position ran counter to AT&T's original comments. Qwest's original plan was to send an e-mail, and AT&T (and many other CLECs) objected to e-mail notification and requested a web-based status tool instead. Once Qwest provided the status tool they had requested, AT&T reversed course and again demanded e-mail notification. This will be further discussed with the impasse issues.

J. SUMMARY OF EFFICIENCIES AND IMPROVEMENTS

Q. HOW IS THE BHCP MORE EFFICIENT THAN CURRENT HOT CUT PROCESSES?

A. Qwest has modified its Basic Hot Cut process to create as many efficiencies as possible. First, in the Basic Hot Cut process, the COTs spend time at the beginning of the day planning and categorizing the order of their work. The BHCP uses a computer generated spreadsheet that automatically identifies the most efficient order in which to perform the pre-wiring and lift and lay work at the ICDF and then the COSMIC™ or MDF. By loading the CO work onto a spreadsheet and prioritizing the cross connection work by frame location and terminations, the

COTs are able to efficiently use their time to conduct wiring in a sequential manner working across the frame – which simply means they take fewer steps, and less time. The spreadsheet will provide the COTs will all of the critical information they require to conduct their wiring activity quickly and efficiently. This provides two benefits -- less paper handling and better utilization of time due to limiting steps between frames until work is complete on those orders within the batch. In addition, by working orders in a batch manner, not a single LSR at a time, the COTs are able to work the entire 25-100 line batch and then clear the orders within the system in batches of 25 lines. The current process requires the COTs to complete each LSR individually within the systems.

Second, the BHCP reduces the number of contacts between the QCCC and the Qwest COTs, and between the QCCC and the CLEC. Moreover, while notification to the QCCC may include a phone call, the parties to the BHC Forum agreed that all communications for the BHCP will be done electronically (with most agreeing that notification via the web-based status tool would be adequate), and that phone calls would only occur on an exceptional basis. The proposed status tool also allows the COT to conduct their work more efficiently since they are required to only update the provisioning system, WFA-DI with an order status. COTs are not required to communicate with the QCCC during the course of the order or upon order completion. Once the COT updates WFA-DI, the status tool automatically performs the downstream communications with the CLEC. If the CLEC desires to obtain more prompt notification of order completion, CLECs can program their

switch to utilize "Trap and Trace" capability. Trap and Trace will automatically alert the CLEC when the line is provisioned and the final ANI Dial Tone check is performed. Whether the CLEC uses the Batch Status Tool or "Trap and Trace," the CLEC will have an automated process for communicating with Qwest about order status and completion.

Third, as explained earlier, there are many instances in the current process when the CLEC does not have dial tone on the line on Due Date, let alone on DVA. When this occurs, which is fairly frequent (about 20% of the time), both the QCCC, the COT and the CLEC must perform a number of manual steps to either establish dial tone on the CFA or keep rechecking to see if dial tone is on the line. This requires multiple phone calls, multiple tests by the COT, and last minute work which jeopardizes the Due Date and injects many inefficiencies into the process. The proposed BHCP eliminates this concern altogether. As described above, the CLECs have agreed to place dial tone on their CFA by midnight on Day 1 of the 7 day interval and Qwest will test whether that dial tone exists on Day 2-3 of the process when it performs pre-wire activities. If the CLEC has no dial tone on the line for whatever reason, the Batch Status Tool will make this point plain, and the CLEC will have time to rectify the problem. These newly developed steps in the process give the CLEC ample time – up to 3 days – to correct No Dial Tone, get translations in place or to correct CFA problems prior to the scheduled due date.

Q. PLEASE ELABORATE ON THE BENEFITS ASSOCIATED WITH CLECS' HAVING THEIR TRANSLATIONS DONE BY MIDNIGHT OF DAY 1.

A. The CLECs' voluntary commitment at the forum to perform their switch translations on day one enables Qwest to conduct the DT/ANI testing and run the pre-wire to the COSMIC Frame or MDF on day 2 or 3, and to never touch the order again until Due Date. If the CLEC Dial Tone is correctly provisioned, then the Qwest COT will only update information in WFA-DI once, and not multiple times as they do today as they check and re-check the CLEC's CFA for DT.

Q. ARE THERE ANY OTHER EFFICIENCIES BUILT INTO THE PROCESS?

A. Yes. The size of the batch and the associated dedicated two person teams yield additional efficiencies. Consolidation of work at a given Central Office on a given day will significantly reduce the amount of time it takes to travel between frames both during the pre-wiring phase and the lift and lay phase due to the "batching" of work. The transition plan will need to ensure that visits to Central Offices are conducted in a manner that allows these efficiencies to be realized while eliminating the opportunities for Central Offices to be revisited to complete a minimal set of BHC related tasks. Additionally, while network architecture in Central Offices can very, the one common thread is that the horizontal side (Qwest side) and vertical side (CLEC side) of the frame are physically separated. In most offices, they are on different sides of the frame, while in a few offices they may be on a different location on the same side of the frame. In either instance, however,

the ability to have one technician testing the CLEC dial tone on the vertical side of the frame while the other COT is waiting to connect the other end of the jumper wire to the horizontal side of the frame is the most effective manner in which to make these connections. During a recent batch of conversion orders, the ICDF termination blocks were in different isles back to back from each other. In that circumstance, if the COT were working alone, he/she would have had to perform DT/ANI on the vertical side of the ICDF, terminate the jumper wire and "poke" the wire through the frame to the other side of the ICDF, walk to the end of the frame and down the next isle in order to find the jumper and then connect it to the block on the horizontal side of the ICDF and perform another DT/ANI test. The travel time between these blocks clearly demonstrates why two technicians can work more efficiently.

K. EXPECTED PERFORMANCE

Q. HOW WOULD QWEST MONITOR THE NEW BHC PROCESS?

A. Qwest would continue to monitor the proposed process in the same manner that loop conversion activity is monitored today. There are currently PIDs in place that monitor loop installations and Qwest believes that certain aspects of these existing measurements should/will be applicable to the new process. In addition, personnel from the QCCC will continue to monitor order misses and conduct analysis to determine reason for miss and address through further training or modifications to the existing process.

Q. WHAT OTHER STEPS WILL QWEST TAKE TO ENSURE A QUALITY BHC?

A. Qwest will also take steps to ensure that the dedicated teams of COTs assigned to this effort will receive and acknowledge proper training on the new process prior to the first BHC being performed. This training will also be conducted within those organizations whose processes are impacted by the changes this joint team has made under the new process.

Q. HOW WILL QWEST FORMALLY MEASURE ITS BHC PERFORMANCE?

A. As part of the Section 271 process, Qwest, the CLEC community and the 14-state commissions created a process known as Long Term PID Administration ("LTPA"). The purpose of the LTPA is to create new performance measures or PIDs or to modify existing PIDs as the requirements of the business dictate. Qwest has agreed to expedite the creation of batch hot cut specific PIDs if such PIDs are deemed necessary by the LTPA. If the LTPA decides that creation of the BHCP does not require changes to existing PIDs or creation of new PIDs, there are many existing PIDs that track Qwest's performance in providing unbundled analog loops to CLECs. As such, analog loops provisioned using the BHCP would be included with the many other provisioning options and would be tracked in at least the following PIDS:

- OP-3: Provisioning Commitments Met on Due Date

- OP-5: New Installation Service Quality (troubles reported within 30-days of installation)

- All Maintenance and Repair measures including, but not limited to, the overall trouble rate (MR-8).

Thus, several key components of Qwest's performance will be tracked under the existing PIDs so that the Commission can monitor Qwest's overall performance in provisioning analog loops to CLECs.

Q. HAS QWEST REQUESTED ASSISTANCE IN REVIEWING THE BHC PROCESS?

A. Qwest requested assistance from Hitachi Consulting in an effort to differentiate between the current Hot Cut process and the newly proposed BHCP and then to make fact based assessments as to the efficiency, seamlessness and scalability of the new process. Hitachi delves into this in much greater detail in its report but I will provide a high level summary.

Q. PLEASE DESCRIBE HITACHI'S REVIEW OF THE PROCESS.

A. On three different occasions, Qwest has worked with a CLEC to conduct a test utilizing the initial proposed BHCP. The first test took place in Minneapolis, MN on December 17th and 18th, 2003 and entailed the conversion of two separate batches of order on consecutive days utilizing Qwest's original proposed BHCP. As such, pre-wire and lift and lay were both conducted on Due Date and communication was limited to electronic spreadsheets between the companies. The

second test was discussed earlier in my testimony and took into consideration some of the changes suggested by the CLECs in attendance during the BHC Forum – principally changing the time for pre-wire from Due Date to DVA.

Q. DID HITACHI OBSERVE THE CENTRAL OFFICE ACTIVITIES ASSOCIATED WITH THE EXISTING HOT CUT PROCESS?

A. Yes, on different occasions, Hitachi visited central offices in CO, WA, ID, IA and MN to monitor the tasks associated with each of the swim lanes on the process flow. The information witnessed during these observations served as the basis for the assessments Hitachi was performing to ensure that the newly proposed BHCP can meet the needs of the CLEC community not only in those markets where a finding of no impairment is entered, but also where CLECs desire to use the new process for its newly acquired customers.

Q. DID HITACHI LIMIT THEIR OBSERVATIONS TO THE CENTRAL OFFICE?

A. No. Hitachi also conducted observation in many of Qwest work centers including the QCCC, Design Services Center, Service Delivery, Loop Provisioning Center, ("LPC") and Central Office Resource Allocation Center ("CORAC") with the expectation of observing conversions both under the current Hot Cut process as well as the proposed BHCP.

Q. HAS HITACHI MADE AN ASSESSMENT ON QWEST'S ABILITY TO HANDLE THE BHC VOLUMES?

A. Yes. Based on the current volumes being processed through the QCCC, and Hitachi's observations in the field, Hitachi assessed Qwest's capabilities of being able to handle any anticipated increase in volumes of unbundled loops that may occur as a result of elimination of unbundled switching as a UNE. Hitachi's conclusion was that the proposed changes in the process and the systems would allow Qwest to handle the volumes as presented in the testimony of Ms. Million. Hitachi goes into greater detail on its assessment of Qwest's capabilities in its detailed report.

VIII. IMPASSE ISSUES

A. OVERVIEW

Q. DID THE PARTIES RESOLVE ALL THE ISSUES DURING THE BHC FORUM?

A. No. The parties did manage to resolve the large majority of the nearly 50 issues (many with multiple subparts) raised during the BHC Forum, the parties still went to impasse on 19 main issues. As stated above, during the BHC Forum, the key elements of the BHC process were agreed upon by all participants. The remaining impasse issues tended to be either peripheral issues, issues where the CLECs disagree among themselves, or issues relating to the ultimate legal determinations

of the nine-month docket, which nobody expected to be able to resolve. Basically the impasse issues fall into 9 categories:

1. Whether Qwest must offer CLECs a coordinated installation option that allows the CLEC to select the hour of the day for the cut;

2. Whether certain types of orders (IDLC and line splitting) may be excluded from the BHCP;

3. Whether Qwest's proposed systems changes for the BHCP are adequate and whether additional systems modifications should follow the Change Management Process (CMP) given that the CLEC community disagrees about the necessity of the proposed changes;

4. Whether Qwest must deploy "robotic frames" to manage the batch hot cut process;

5. The minimum and maximum size of a batch;

6. The standard installation interval for a batch;

7. The appropriate non-recurring charge for provisioning analog loops using the agreed upon BHCP;

8. Whether Qwest can meet anticipated volumes at an acceptable level of quality volumes; and

9. Whether Qwest must present test data verifying that its BHC proposal works.

The specification of the impasse issues was agreed to at the Forum, and those issues are identified on Exhibits DP-1 and DP-2. We refer to these issues using the numbers assigned to them at the Forum.

B. IMPASSE ISSUE P-3A (SCHEDULING BATCH HOT CUTS AT ANY TIME OF THE DAY)

Q. PLEASE DESCRIBE IMPASSE ISSUE P-3A.

A. Qwest's BHCP proposes to perform all batch hot cuts between the hours of 3:00 AM and 11:00 AM by a dedicated team of two technicians.[48] Qwest's objective is to create a group of employees whose responsibilities include provisioning analog loops using the BHCP. AT&T and Eschelon argued that they should be able to dictate the time of day when Qwest performs a batch hot cut, and that the BHCP should also allow for "coordination," which involves multiple telephone calls back and forth at the time of the cut over. The FCC defined its contemplated BHCP as "a seamless, low cost . . . process for switching mass market customers from one carrier to another."[49] The FCC required state commissions to factor in the "costs and timeliness" in approving a proposed BHCP.[50] Neither of these AT&T and Eschelon proposals are consistent with the efficient, low cost, timely process contemplated by the FCC and should therefore be rejected.

Q. AT&T AND ESCHELON ARGUED THAT THEY SHOULD BE ABLE TO SPECIFY A WINDOW OF TIME AT ANY HOUR OF THE DAY FOR QWEST TO PERFORM A BHC. WHY IS QWEST PROPOSING A 3 A.M. TO 11 A.M. CONVERSION WINDOW?

---

48 The 3 AM to 11AM window corresponds to the time zone of the CO associated with the BHC.
49 *TRO* at ¶487.
50 *TRO* at ¶488.

A. There are many reasons why Qwest proposes to use a dedicated team of COTs to perform batch hot cuts between 3:00 AM and 11:00 AM. All of Qwest's reasons are driven toward making the process as seamless as possible, as efficient as possible, and as inexpensive as possible. Moreover, Qwest will continue to provide a CLECs with a Coordinated Cut installation option, it will just not be as part of the BHCP.

Q. DESCRIBE HOW QWEST'S 3:00 AM TO 11:00 AM WINDOW HELPS TO CREATE A SEAMLESS PROCESS.

A. Throughout the BHC Forum, all parties uniformly agreed that the BHCP should attempt to create efficiencies while simultaneously limiting the amount of time an end user is out of service and without the ability to make or receive calls. The proposed 3 AM to 11AM conversion window addresses both of these concerns. When a hot cut is performed, the customer will be without service during the 20 or so seconds it takes to "lift" the line from the Qwest frame and "lay" it onto the CLEC appearance on the ICDF, and there is an additional lag in the customer's ability to receive calls from outside the customer's central office until the CLEC completes the number porting for the line. It is a simple fact that the early morning hours are the least active times for telephone calls. Thus, Qwest has proposed to perform these hot cuts at the time of day when the end-user customer is the least likely to be affected. Moreover, Qwest has committed to having the COTs perform the "lift and lay" work at the beginning of the 3 AM shift, which should all but

eliminate the chance of the end user noticing the momentary dial tone disruption. For both business and residential end users, the conversion activity will take place when a majority of these customers are asleep or are not open for business. This will also allow the CLEC to react to order closure notices and submit the subscription to have the number ported at a time when their customers are, generally, asleep.

Q. DESCRIBE HOW QWEST'S PROPOSED 3:00AM TO 11:00 AM WINDOW CREATES AN EFFICIENT, INEXPENSIVE PROCESS.

A. As set forth above, Qwest proposes to use a dedicated team of two COTs to perform the batch hot cuts, and for this team of COTs to perform the scheduled lift and lays at the beginning of the shift and then use the remainder of the shift to thereafter complete pre-wiring work for lines scheduled to be cut a few days hence. As explained in detail above when describing Qwest's BHCP, Qwest has created a process that automatically sequences the orders in the batch and the COT's pre-wiring and lift and lay work in order to obtain maximum efficiency and reduce costs. AT&T and Eschelon are requesting the ability to interrupt the sequencing of this work and require the COTs to leave their location at any given time to perform lifts and lays at whatever location the CLECs demand. If this proposal is adopted, the dedicated team will no longer be available to perform the work during a designated shift; the systems will not be able to order the lines to be cut; the systems will be overridden, forcing the cut to be managed by inefficient telephone

calls; and all of the efficiencies the parties worked so hard to create in the BHC Forum will disappear.

Q. DID ANY CLEC IN THE BHC FORUM RECOGNIZE THAT THE TELEPHONE CALLS INHERENT IN MANAGING A COORDINATED CUT ARE INEFFICIENT AND INCONSISTENT WITH A PROCESS USED TO CONVERT LARGE VOLUMES OF MASS MARKET CUSTOMERS?

A. Yes. Coincidentally, AT&T recognized that telephone communications between Qwest and the CLEC must be removed to the extent possible from the BHCP in order to create a process that will work for large volumes of mass market customers.[51]

Q. CAN A CLEC THAT WANTS TO USE A COORDINATED CUT PROCESS STILL HAVE THE ABILITY TO USE THAT PROCESS FOR SELECT CUSTOMERS.

A. Yes. The BHCP is one of many analog loop provisioning options that will be available to the CLECs. CLECs will be able to decide the customers they want to transition using the Batch, Basic, Coordinated, and Project methods. All of these options will remain available. During the BHC Forum, Eschelon emphasized that some of their customers provide alarm service, and as such they would want these

[51] 1/7/04 Tr. 72: 6 (John Finnegan - AT&T) "Right now, AT&T's Hot Cut volumes are very low, very small, and the current process relies on telephone calls. Given the low volumes, that's efficient notification process. If there were much higher volumes, that's probably not going to be a very efficient method..."

customers to be cut at a particular time of day with coordination. Eschelon will still be able to cutover such customers using coordination; it will just not be available as part of the BHCP with its lower prices because coordinated hot cuts cannot be consolidated in a manner that gives rise to the efficiencies that yield the lowest cost.

Q. PLEASE SUMMARIZE QWEST'S POSITION ON IMPASSE ISSUE P-3(A).

A. Qwest's proposed BHC process selects a specific window of time to complete BHCs in order to ensure that they can be performed by a dedicated team of people during a time of day when the customers are least likely to be affected. This proposal creates efficiencies, lowers the price and minimizes the impact to the end-user customer. The AT&T/Echelon proposal eliminates all of these efficiencies. Moreover, if a particular customer requires coordination, the coordinated cut process is still available as an option. The CLEC can decide which customers should use the BHCP and which should use one of the other provisioning options. The Commission should adopt Qwest's proposal and limit the BHCP to the 3:00 AM to 11:00 AM window.

C. IMPASSE ISSUE P-11 (ABILITY TO SPECIFY ORDER IN WHICH LINES CUTOVER)

Q. PLEASE DESCRIBE IMPASSE ISSUE P-11.

A. Impasse issue P-11 is related to P-3(A) in that it also involves a CLEC's insistence on the right to reorder the COT's work. At the BHC Forum, Eschelon sought the

ability to dictate the exact sequence in which each line within a batch would be provisioned. This request is unrealistic and makes it physically impossible to create any efficiencies by batching. For example, a COT may be able to complete several orders in one block on a frame and then move several blocks over to work on others to increase efficiency. A CLEC-ordered cut could require the COT to bounce back and forth from block to block to complete each cutover in the precise sequence the CLEC is demanding. This obviously inefficient scenario is completely inconsistent with the FCC's goal of "spreading the loop migration costs among a large number of lines, decreasing per-line cut over costs."[52] It also necessarily adds time to each length of cut. As discussed above, allowing Qwest to control the sequence of the provisioning process ensures that the batch is managed efficiently, as quickly as possible, and at the least possible cost. Eschelon's request should be rejected as wholly impractical.

D. IMPASSE ISSUES P-5, P-8 AND P-21(C) (INCLUSION OF IDLC AND OTHER CONVERSIONS REQUIRING AN INDIVIDUAL FIELD DISPATCH)

Q. PLEASE DESCRIBE RELATED IMPASSE ISSUES P-5 AND P-8.

A. Qwest has defined the BHCP to apply only to unbundled loops that will reuse existing facilities and not require the dispatch of a technician to the field. As a general rule, this will exclude the 9% of loops provisioned over IDLC from the BHCP. Despite this, on a region-wide basis this will allow approximately 91% of

[52] *TRO* ¶487.

existing UNE-P lines and 91% of Qwest retail lines to be provisioned to UNE-Loop using the BHCP. Qwest will, of course, still provision any unbundled loop requiring a field dispatch including loops using IDLC with existing provisioning options. Although AT&T agreed with Qwest that IDLC loops cannot practicably be "batched" for purposes of the BHCP, MCI, Eschelon and McLeod insisted at the Forum that such loops be included (Issue P-5). Eschelon then went one step further and argued that Qwest should include *all* loops requiring a field dispatch in the BHCP (Issue P-8). The Commission should reject both suggestions as irreconciable with the efficient, low cost, timely process contemplated by the FCC.

Q. SHOULD THE INSTALLATION OF A LOOP REQUIRING THE DISPATCH OF AN OUTSIDE TECHNICIAN BE INCLUDED IN A BHC?

A. No. The BHC is a new installation option that is primarily designed to reduce the cost of analog loop installations by taking advantage of the efficiencies gained by converting or migrating "batches" of existing lines – either UNE-P or other types of conversion orders – and reusing existing facilities to the extent possible. Conversion and installation efficiencies can be gained on two fronts: (1) reduction of coordination activities and (2) streamlining of the wiring at various frames in the Qwest central office. Provisioning loops that require the dispatch of a technician to the field is inconsistent with both efficiency categories. If an outside technician is required the necessary coordination increases and the central office can no longer group the wiring activity in the most efficient manner. Moreover, this will mean

that some loops will require a "truck roll" and others will not. By definition, loops provisioned with an outside field dispatch are provisioned on a line at a time basis, or individually. This is inconsistent with the FCC's definition of batch. Specifically:

> Generally . . . we expect [the BHCP] to result in efficiencies associated with performing tasks once for multiple lines that would otherwise have been performed on a line-by-line basis. For example, pursuant to the processes in place at least in some states, the incumbent LEC currently will pre-wire circuits on the central office frame, verify the presence of dial tone, and communicate with competitive LECs regarding problems encountered on a line-by-line basis. **Under a batch hot cut process, these activities might be undertaken simultaneously *for all lines affected by a given batch order*.**[53]

A field dispatch, by definition, cannot be performed for all loops in a given batch simultaneously. As such, they should not be included in the BHCP.

Q. WHAT OPTIONS DO THE CLECS HAVE IF THE INSTALLATION REQUIRES THE DISPATCH OF AN OUTSIDE TECHNICIAN?

A. If the dispatch of an outside technician is required, the CLEC can utilize one of the six existing installation options made available to them today. These options are described in the Wholesale Product Catalog ("PCAT") and the Commission approved SGAT §9.2.2.9.[54]

---

53 *TRO* at ¶489 (emphasis added).

54 Located at URL: http://www.qwest.com/wholesale/pcat/unloop.html

Q. IS THE EXCLUSION OF LOOPS PROVISIONED VIA IDLC TECHNOLOGY DIRECTLY TIED TO THE NEED TO DISPATCH AN OUTSIDE TECHNICIAN?

A. Most definitely. Issue P-5 concerns whether the BHCP should include lines provisioned using Integrated Digital Loop Carrier ("IDLC") facilities. In those instances where the UNE-P end user's facilities are currently provisioned over IDLC or in those cases where a retail or resale end user is asking to be converted to the CLEC switching platform and their service resides on IDLC, Qwest must dispatch a field technician to provision an unbundled loop to the customer. The dispatch is required to either obtain new facilities through a facility rearrangement, to copper or Universal DLC ("UDLC"), or to make rearrangements in the DLC through either hair-pinning, nailing the circuit up, or by building an Integrated Network Access ("INA") system. Each of these alternatives offer an interim process until a more permanent solution can be implemented – such adding a Universal shelf to the existing pair gain system. In those instances where no alternatives are available, Qwest has committed, in section 9.2.2.2.1 of the Commission approved SGAT to make "every feasible effort to unbundle the IDLC in order to provide the Unbundled Loop for CLEC."[55] Qwest delivers on this promise by implementing one of the solutions discussed above. Due to the additional complexities of converting these facilities to an unbundled loop, Qwest

[55] Qwest Wyoming SGAT Sixth Revision, July 8, 2002, pg 124.

has asked that the CLEC utilize one of the existing provisioning options and that the work be done during normal business hours.

Q. PLEASE EXPLAIN WHY THE DISPATCH OF AN OUTSIDE TECHNICIAN IS REQUIRED WHEN CONVERTING A UNE-P THAT CURRENTLY RESIDES ON IDLC?

A. In order to change facilities from IDLC to either copper or UDLC, Qwest would be required to dispatch a technician to conduct the rearrangement within the outside plant facilities and then test the newly assigned facility to ensure continuity. This work would entail the movement of one or more jumpers or cross connections at the Feeder/Distribution Interface ("FDI"). In those cases where an INA di-group is already in place or where the conversion is being hair-pinned or nailed-up, Qwest would still have to dispatch a technician to the field in order to perform the same type of continuity testing and jumper movement. In many instances, the work performed on the IDLC itself is conducted by a different technician that would be doing the installation work.

Q. DID THE FCC ANTICIPATE AND ACKNOWLEDGE THE COMPLEXITY AND DIFFICULTIES ASSOCIATED WITH PROVISIONING UNBUNDLED LOOPS OVER IDLC?

A. Yes. At numerous locations within its *UNE Remand Order,* the FCC recognized that unbundling IDLC is a difficult process. Throughout the 271 proceedings this

issue was discussed in great detail, and Qwest agreed to unbundle when IDLC was present; However, Qwest explained and the CLECs generally agreed that such unbundling is a very manually intensive process that requires loop by loop analysis and handling. Again, SGAT § 9.2.2.2.1 memorializes Qwest's commitment to provisioning UNE-Loops when IDLC is present.

Q. THERE APPEARS TO BE A DEGREE OF INCONSISTENCY IN THE CLEC'S ARGUMENT ON THIS POINT. PLEASE EXPLAIN.

A. It is interesting to note that while several CLECs appeared to recognize that provisioning which required an outside technician should not be included in a BHC, only AT&T agreed that IDLC loops should not be included in the batch. During the December 2, 2003 session of the BHC Forum, Mr. John Finnegan of AT&T stated, " I don't think the CLECs are suggesting that IDLC should be part of the batch. It's a question of identifying the IDLC to exclude it from the batch."[56]

Q. DOES QWEST CURRENTLY UNBUNDLE LOOPS THAT WERE SERVED BY IDLC?

A. Yes. Qwest has been successfully unbundling these types of loops and in accordance with the 271 rules will continue to do so even for those UNE-P conversions currently working over IDLC – they just will not be candidates for the BHCP. Exhibits DP-14 and DP-14.1 are the process flow and associated legend

[56] 12/02/03 Tr. at 409:6

that Qwest follows in order to provision UNE-Loops when IDLC is an issue. Exhibit DP-15 is an actual break down of the percentage of UNE-P lines currently working over IDLC today on a state by state basis. Qwest remains committed to provisioning loops, when IDLC is involved, however, these conversions are complex and should not be included as part of a "batch" process. Instead, CLECs should ask Qwest to unbundle loops over IDLC using one of the existing hot cut processes.

Q. THE CLECS PARTICIPATING IN THE FORUM STATED THAT OTHER ILECS HAD COMMITTED TO INCLUDE IDLC CONVERSIONS IN THEIR BHCP. CAN YOU COMMENT ON YOUR FINDING INTO THIS CLAIM?

A. Verizon does not include loops provisioned over IDLC in the BHCP. While Bell South and SBC have committed to convert UNE-P lines working over IDLC, their "batch" proposals for IDLC indicate that the provisioning will be done during normal business hours. Additionally, the IDLC lines will not be "batched" with non-IDLC loops. So in essence their "batch" IDLC processes are very similar to what Qwest has proposed to the CLECs. Namely, the CLECs must submit the orders to be worked during normal business hours and Qwest will use one of the existing processes to ensure that these UNE-P conversions are handled appropriately.

Q. DOES QWEST PROVIDE COMPETITIVE LECS WITH ACCESS TO INFORMATION ABOUT WHICH LOOPS ARE PROVISIONED USING IDLC?

A. Yes. Qwest has many tools available to the CLEC today which would allow them to ascertain this type of information. The ICONN database[57] provides the percentage of both IDLC and UDLC compared to total line counts on a Central Office by Central Office basis. The Raw Loop Data Tool ("RLDT") gives the CLEC a more granular view of each loop on a segment by segment basis. In fact, the CLECs can run a report on an entire wire center and determine the types of facilities serving each individual end user prior to marketing within the wire center. Exhibit DP-16 is a summary of the loop qualification tools that Qwest has made available to the CLECs today.

The Raw Loop Data Tool (RLDT), however, is the primary tool used by CLECs. Exhibit DP-17 shows the frequency with which CLECs use the RLDT. CLECs access the RLDT through IMA-EDI and the IMA-GUI, which provides CLECs with the necessary loop make-up information to allow them to determine if the loop they seek to convert from UNE-P to UNE-L is provisioned over IDLC. See Exhibit DP-17 for the number of times a CLEC accesses the RLDT. The RLDT provides CLECs with information about loop make-up characteristics, including: address, telephone number or circuit ID, CLLI code, terminal ID, load coils, bridged tap, wire gauge, *pair gain devices (such as IDLC)*, cable and pair make-up, MLT

[57] This information can be located at URL: http://www.qwest.com/cgi-bin/iconn/dlc.cgi

distance, and actual loop length by segment. The data supporting the RLDT is obtained via QServ, which accesses LQDB, the same data source that Qwest uses to qualify Qwest Retail DSL service.

For those CLECs that want to obtain loop information on a batch basis, Qwest provides access to an external website, where they can obtain bulk raw loop data by wire center. This website data, accessed outside of IMA, is referred to as the Wire Center Raw Loop Data Tool. This web-based tool provides the same fields of loop make-up information as that provided by the IMA-EDI and the IMA-GUI RLDT. Once again, the source of this data is the same as for the tool that Qwest uses to qualify its Retail DSL service.

Q. DURING THE BHC FORUM, ESCHELON NOTED THAT INFORMATION IN THE RLDT COULD BE MISSING OR INCORRECT AND QUESTIONED THE IMPACT ON THE BHCP. ECSHELON MADE THIS A SEPARATE IMPASSE ISSUE (21(C) TO EXHIBIT DP-2). PLEASE COMMENT ON THIS ISSUE.

A. The claim made by Eschelon was unsupported by any formal documentation and when asked to provide specific examples, none was provided. This issue was dealt with in great detail in the FCC's 271 decisions. Qwest also makes available a manual process that permits CLECs to obtain loop make-up information if the CLEC believes that the returned loop information may be unclear or incomplete. The FCC acknowledged this as a supplemental method for verifying that a loop can

support advanced loop technologies. [58] Qwest will perform a manual search of its back office records, systems and databases containing loop information to obtain the loop make-up information requested by the CLEC.[59] If loop make-up information is missing for a particular loop segment, Qwest will investigate its outside plant engineering records for the cable and pair from the central office to the SAI and from the SAI to the customer's serving terminal. Qwest has agreed to return the loop make-up information to the CLEC electronically within 48 hours. Qwest also then will update the applicable databases with this loop make-up information. The documentation describing this issue can be found at http://www.qwest.com/wholesale/downloads/lgrid_clecjobaid.pdf. Appendix D of this job aid is the Request for Manual Loop-Up and provides the CLEC with detailed steps to follow if they were to make an inquiry and find either no

---

[58] *See Qwest 9-State 271 Order* at ¶ 62 and ¶ 70 ("For these reasons, we cannot find that the RLDT's alleged unreliability denies competitors a meaningful opportunity to compete."); *see also* SGAT § 9.2.2.8.6. Specifically the SGAT language states:

> "[i]f the Loop make-up information for a particular facility is not contained in the Loop qualification tools, if the Loop qualification tools return unclear or incomplete information, or if CLEC identifies any inaccuracy in the information returned from the Loop qualification tools, and provides Qwest with the basis for CLEC's belief that the information is inaccurate, then CLEC may request, and Qwest will perform a manual search of the company's records, back office systems and databases where Loop information resides. Qwest will provide CLEC via email, the Loop information identified during the manual search within forty-eight (48) hours of Qwest's receipt of CLEC's request for manual search. The email will contain the following Loop make-up information: composition of the Loop material; location and type of pair gain devices, the existence of any terminals, such as remote terminals or digital Loop terminals, Bridged Tap, and load coils; Loop length, and wire gauge. In the case of Loops served by digital Loop carrier, the email will provide the availability of spare feeder and distribution facilities that could be used to provision service to the Customer, including any spare facilities not connected to the Switch and Loop make-up for such spare facilities. After completion of the investigation, Qwest will load the information into the LFACS database, which will populate this Loop information into the fields in the Loop qualification tools."

[59] Additional details are provided in Appendix D of Exhibit LN-OSS-26 (Loop Qualification and Raw Loop Data CLEC Job Aid).

information or unclear information. Since July 2003,Qwest has received only 67 CLECs for manual look-up and when comparing that to the total number of RLDT queries it breaks down to a percentage of facilities not available or clear .0009% of the time. *See* Confidential Exhibit DP-18. This does not appear to be an issue at all.

Q. DOES QWEST USE THESE SAME TOOLS FOR INFORMATION WHEN HANDLING ITS RETAIL CUSTOMERS?

A. Yes. Loop qualification information for both Qwest Retail and CLECs comes from the LODB, whose underlying source is the LFACS database. Therefore, CLECs are receiving the same loop qualification information that is available to, and used by, Qwest Retail.

Q. HOW SHOULD THE COMMISSIONS RULE ON ISSUES P-5, P-8 AND P-21(C)?

A. Based on the manual nature of performing work in the outside plant realm when an existing UNE-P end user is provisioned over IDLC facilities, and the fact that loop provisioned in this manner will require the dispatch of an outside plant field technician, the Commission should find that the BHCP is limited to reuse of facilities where there is no need for a field technician dispatch. Loops requiring a field technician dispatch should be provisioned using Qwest's existing loop

provisioning processes. The Commission should reject the CLEC requests as set forth in Issues P-5 and P-8.

E. IMPASSE ISSUE P-6(A) (LINE SPLIT LOOPS)

Q. PLEASE DESCRIBE IMPASSE ISSUE P-6(A).

A. This issue concerns whether or not Qwest should include "line splitting" arrangements in the BHCP. Line splitting is a situation where one CLEC provides voice service to a customer and another CLEC provides data service over the same loop. This is another situation that adds a level of complexity to the provisioning process, which is incompatible with the seamlessness and efficiencies contemplated by the FCC.

Q. SHOULD UNE-P LOOPS THAT ARE CURRENTLY IN A LINE SPLITTING ARRANGEMENT BE INCLUDED IN THE BHCP?

A. Much like the additional work involved with the IDLC loops, the inclusion of Line Splitting arrangements undermines the efficiencies of the BCHP. In this case, the conversion of Line Splitting includes additional coordination, and Central Office wiring for the migration of both the voice and the data services. This work causes added complexities that are inconsistent with the proposed BHCP. Qwest will provision these lines, again using the existing processes created for this exact purpose.

Q. DID THE FCC CONTEMPLATE THAT LINE SPLIT LOOPS WOULD BE INCLUDED WITHIN THE BHCP?

A. No. To the contrary, the FCC contemplated that the BHCP was to be created exclusively for the provision of voice service. A batch hot cut process is intended to be a tool "for switching *mass market* customers from one carrier to another."[60] The FCC specifically defined "mass market customers: as "*analogue voice customers* that purchase only a limited number of POTS lines."[61] Covad, the primary CLEC pushing for the inclusion of line-split loops in the BHCP, knows this full well: it is refusing to answer discovery concerning its data facilities precisely on the ground that only circuit-switched voice services are relevant to the mass-market switching inquiry, not the data services for which line splitting is used.[62] Covad is trying to have it both ways.

Q. IN ORDER TO AVOID ANY CONFUSION AROUND THE DIFFERENT TYPES OF "VOICE/DATA" PRODUCTS, BRIEFLY DESCRIBE LINE SHARING, LINE SPLITTING AND LOOP SPLITTING TYPE LOOPS.

A. **Line Sharing** – this product provides the CLEC with the opportunity to offer end users advanced data services over the existing copper loop that provides the end user's analog voice-grade service. This is done by using the high frequency portion of the loop (the frequency above the voice band) of the copper loop where Qwest is

---

60 *TRO* ¶487 (emphasis added).
61 *Id.* ¶ 497 (emphasis added).

the voice service provider to the end user. *Simply put, Qwest provides the voice and the CLEC provides the data.*

Line Splitting – this product provides the CLEC's with the opportunity to offer advanced data service simultaneously with an existing UNE-P by using the frequency range above the voice band on the copper loop. The advanced data service may be provided by a CLEC or DLEC or another data service provider chosen by the CLEC. Only one customer of record will be determined by Qwest in this CLEC/DLEC partnership. Line Splitting can only be requested on existing UNE-P POTS. The end-user must have dial tone originating from a Qwest switch in the CO and the CLEC or DLEC must provide the end-user with all equipment required to separate these distinct services. *In this scenario, the voice is provided from the Qwest switch (CLEC UNE-P) and the data is provided by the CLEC/DLEC.*

Loop Splitting – this product provides the CLEC or DLEC with the opportunity to offer advanced data service simultaneously with an existing Unbundled Local Loop by using the high frequency portion of the loop. The advanced data service may be provided by the CLEC or DLEC or another service provider chosen by the CLEC. As with line splitting, only one customer of record can be identified to Qwest and that is determined by the CLEC or DLEC. The customer of record is billed for the

---

[62] *See, elgl,*, Responses of Covad Communications to Staff's 2nd Set of Data Requests, *In the Mater of ILEC Unbundling Obligations as a Result of the Federal Triennial Review Order*, Dkt. No. T-00000A-03-0369, at 3 (citing *TRO* ¶ 497).

Loop Splitting arrangement. *In this scenario, the CLEC and DLEC are responsible for providing both the voice and data service.*

Q. ARE THERE ANY OTHER CONCERNS UNIQUE TO LINE SPLITTING THAT FACTORED INTO QWEST'S DECISION TO EXCLUDE THEM FROM THE BHCP?

A. Yes. The BHCP will convert UNE-P voice services, currently working on an analog unbundled loop. In a Line Splitting scenario, the UNE-P voice plus the CLEC's data service would both transverse the outside plant facilities in order to connect to the CLECs end user. The fundamental difference is that the loop type used in this architecture is not an analog voice grade loop but a non-loaded copper loop. In an analog unbundled loop environment, the CLEC has "control" of the data portion of the facility and may make arrangements with any DLEC to provide the data service. Accordingly, the CLEC would have to coordinate installation activities with the data provide and Qwest would have not record of the data service riding the analog loop. If for some reason, Qwest engineering or outside plant technicians were to rearrange outside plant facilities, the Qwest records would indicate that the technical requirements for the loop were analog or voice service and changes could be made to outside plant that may pose some risk to the data service. However, if the CLEC used the non-loaded loop, Qwest would know that the facility needed to support data services.

Q. HOW MANY LINE SPLITTING ARRANGEMENTS ARE IN SERVICE THROUGHOUT THE REGION?

A. There are currently only 748 line splitting arrangements across 6 of Qwest's 14 states.[63] Confidential Exhibit DP-22 is a break down of the line splitting circuits by state and Central Office location. To date Qwest is not aware of any Loop Splitting arrangements in its territory. Once again, Qwest understands its unbundling responsibilities and agrees to convert Line Splitting arrangements according to the CLEC's request. However, Qwest does not believe that this conversion meets the criteria for a BHC. The work should be conducted during normal business hours to allow any issues associated with the movement of the voice or data to be coordinated between the CLEC and DLEC and give each party time to resolve any issues in a timely manner. The BHC process was intended to apply to voice grade loops only, not loops that currently have some form of data services riding the high frequency portion of the loop.

Q. DOES QWEST CURRENTLY HAVE A PROCESS IN PLACE THAT WOULD ALLOW FOR THE MIGRATION OF THESE LINE SPLITTING ORDERS?

A. Exhibit DP-20 is an excerpt from the PCAT which describes Qwest's process to convert a UNE-P line with line splitting to Loop Splitting.[64] With the current

---

[63] The states included in the line splitting count are Arizona, Colorado, Minnesota, Nebraska, Oregon and Washington.

[64] Conversion activity is documented in the PCAT at URL: http://www.qwest.com/wholesale/clecs/migrateconvert.html

volumes, Qwest would have to convert less than two (2) line splitting loops per day across the region during normal business hours and complete the entire embedded base of line splitting loops well within the time frames set forth by the FCC. Even if volumes were to increase by 400% - 500% percent, as some CLECs have projected, Qwest would have to increase the volumes of orders processed on any day to less than 10 orders across the region or about 40 or 50 line splitting conversion per week which is well within QCCC's current capabilities. Moreover, an increase of this magnitude would only increase the line splitting base to less than ½ of one percent of the entire UNE-P base.

Q. YOUR PRIOR RESPONSE SUGGESTS THAT CLECS ONLY SEEK TO USE THE BHCP TO PROVISION EXISTING LINE SPLITTING ARRANGEMENTS, NOT NEW ARRANGEMENTS THAT COME INTO EXISTENCE AFTER DECEMBER 2, 2004. IS THIS CORRECT?

A. Yes. The CLECs have agreed that creation of a new line splitting arrangement is much too complex for the BHCP. Mike Zulivic, representing Covad Communications, commented on this issue during the forum and stated that given the increased number of cross-connects required in a new line splitting arrangement, it would be fair to exclude the new arrangements from the batch

process.[65] Thus, this issue is a relatively narrow one that will only impact line splitting arrangements that exist on or before December 2, 2004.

Q. IS THERE ADDED COMPLEXITY TO PROVISIONING A LINE SPLITTING ARRANGEMENT FROM A TRADITIONAL ANALOG LOOP.

A. Yes. There are several additional jumpers that need to be connected in order to transition a line splitting arrangement to a loop splitting arrangement. These additional jumpers again create added complexities. Moreover, given the small number of line-splitting arrangements in the Qwest region, it is highly unlikely that any batch could involve more than one such arrangement. As stated above, the FCC's contemplated BHCP is for "activities might be undertaken simultaneously *for all lines affected by a given batch order.*"[66] There will be no way to perform this work simultaneously for line splitting arrangements the added work will be for an individual loop which is inconsistent with the FCC's stated purpose of achieving efficiencies.

Q. PLEASE SUMMARIZE YOUR TESTIMONY ON ISSUE P-6, CONCERNING LINE SPLITTING ARRANGEMENTS.

A. The FCC's stated purpose for the BHCP was to transition voice grade service. The CLECs' desire to include line splitting arrangements in the BHCP is inconsistent

[65] 12/2/03 Tr. at 444:6 (exchange between Chuck Steese of Qwest and Mike Zulevic of Covad) Mr. STEESE: So really what we're talking about here is whatever the embedded base is at the time the line splitting goes away as being the total amount of lines that we are concerned about for batch hot cut;; is that fair? MR. ZULEVIC: I think that's fair.

with this objective, as such lines include digital service. Moreover, provisioning a line splitting arrangement requires additional jumper work in the central office thereby eliminating efficiencies. Finally, there are only a very small number of line splitting arrangements in the Qwest region. The CLECs will not be prejudiced by the exclusion of such lines from the BHCP. Instead, CLECs can use Qwest's existing processes for the provision of such lines.

F. IMPASSE ISSUE P-10(D)(4) (LSR REQUIREMENT)

Q. AT THE BHC FORUM, DID THE PARTIES DISCUSS THE SYSTEMS THAT WOULD IMPACT THE BHCP?

A. Yes. There were several issues discussed, with the principle emphasis being on the Batch Status Scheduling Tool discussed above. However, there were a few systems issues related issues that went to impasse. These systems concerned three different subjects: (1) whether CLECs should have to use the time tested LSR process for submitting batch hot cut orders; (2) whether Qwest must have a method, in addition to the Batch Status Tool to notify CLECs of trouble on a line, and when the batch is complete; and (3) whether the Change Management Process is the correct forum to request additional systems changes, especially when it is apparent that CLECs disagree about the need for such systems changes.

Q. PLEASE DESCRIBE IMPASSE ISSUE P-10(D)(4) FROM EXHIBIT.

---

[66] *TRO* at ¶489 (emphasis added).

A. Qwest's proposed BHCP requires CLECs to submit LSRs to complete a batch via an electronic interface. This is the exact method that CLECs have used for issuance of orders for analog loops for many years. Most of the CLECs that participated in the BHC Forum agreed with this approach. Eschelon, however, asked that CLECs be able to submit orders for batches using a spreadsheet. The Commission should reject Eschelon's request for an alternative ordering method.

Q. QWEST HAS PROPOSED USING THE CURRENT LSR PROCESS WITH MODIFICATIONS FOR BHC ORDERS. DO ALL THE CLECS USE THE CURRENT LSR PROCESS THROUGH ONE OF THE SYSTEMS?

A. Yes, it is the process for entering orders for basic UNE-Loop and coordinated hot cuts for all CLECs. As discussed previously, CLECs submit an LSR for a BHC order via either EDI or IMA GUI in the same manner they do for basic requests today.

Q. ARE LSR'S USED THROUGHOUT THE INDUSTRY?

A. Yes. LSR's are utilized throughout the telecom industry and are maintained under the Ordering and Billing Forum Guidelines.

Q. ONE GREAT EFFICIENCY OF THE LSR PROCESS IS THE POTENTIAL FOR FLOW-THROUGH. WILL BATCH HOT CUT LSRS BE ELIGIBLE FOR FLOW-THROUGH?

A. Yes. Batch Hot Cut orders are flow through eligible. The LSR's for such orders will flow through in accordance to the existing flow through standards as they do today, again increasing the efficiency of the process.[67] The flow though process will substantially expedite the process, lower the cost and create efficiencies.

Q. WHAT EFFICIENCIES RESULT FROM USING THE LSR PROCESS?

A. One of the goals of a batch hot cut process was to ensure efficiency and reduce costs. The reuse of the existing interfaces into IMA that CLECs already have in place for the current LSR Process results in significant benefits and efficiency. Utilizing existing systems and process will obviously minimize any development and additional training for the CLEC representatives who will deal with BHC orders. This cost efficiency is also combined with the minimal process changes necessary to process the order.

Q. WILL THERE BE ANY CHANGES TO THE CURRENT LSR ORDERING PROCESS FOR A CLEC SUBMITTING BHC ORDERS?

A. There will only be a few minor changes to the LSR ordering process for a batch hot cut. The following table illustrates the specific field and data that will be required on the LSR form to denote a BHC order:

---

[67] Exceptions to flow through are listed in the Ordering Overview PCAT at http://www.qwest.com/wholesale/clecs/ordering.html.

LSR FIELD	VALUE FOR BHC ORDER
CHC	B
APPCON	Confirmation Number from Scheduling Tool
DDD	Due Date from the Scheduling Tool
REQRTY	"AA" or "BB"
ACT	"V" or "Z"
DSPTCH	"N" or blank
NC	"LX--"

Q. PLEASE DESCRIBE HOW THE BHC SPECIFIC INFORMATION WILL BE ENTERED.

A. The CHC field utilizes a drop down menu to which Qwest will add the "B" option to indicate a BHC order. CLEC representatives entering information into the LSR form would have a choice of entering a Y, N or B from the drop down menu. For a BHC order, the representative would simply choose "B". Similarly, the CLEC representative entering a BHC order in the APPCON and DDD fields will insert the confirmation number and due date obtained earlier from the scheduler tool. Qwest is developing IMA edits that recognize BHC orders, and require that the appropriate information (as listed in the table above) be entered in the REQRTY, ACT,

DSPTCH and NC fields. This will ensure that the correct information will always be entered into those fields before submission.

Q. WOULD THESE CHANGES REQUIRE THE CLECS TO UNDERTAKE ADDITIONAL TRAINING?

A. These changes are so minor that training should not be necessary. Nonetheless, Qwest will offer standard training, which is provided no less than 21 days before the IMA release production date. Web-based training is available for the life of the IMA release.

Q. ESCHELON HAS REQUESTED (OR STATED THAT IT IS NECESSARY TO HAVE) A NEW INTERFACE JUST FOR BHC LSR'S.[68] IS THAT NECESSARY?

A. No. As I explained earlier, the current ordering systems, IMA GUI and IMA EDI, are both fully functional, have been rigorously tested, and are a proven method presently used by CLECs to submit LSR's today. A separate system for just BHC is duplicative and unnecessary. The systems in use today provide the CLECs with the appropriate tools to enter HBC orders with a minimal amount of distinction between an LSR for the BHC and an LSR submitted as an individual order.

[68] Batch Hot Cut Forum, December 19, 2003, Page 50, lines 13-53.

Q. HAVE ANY CLECS OTHER THAN ESCHELON COMMENTED ON ALTERNATE ORDER SUBMISSION METHODS, LIKE SPREADSHEETS?

A. No. To the contrary, several CLECs indicated they did not want to manually generate spreadsheets. The other CLEC participants in the BHC Forum were focused on use of the LSR process, use of existing interfaces, and achieving flow through.

Q. HOW SHOULD THE COMMISSION RULE ON THIS IMPASSE ISSUE?

A. The Commission should approve the use of the LSR process for submitting BHC orders. The LSR process is known and used by the CLECs today, efficient, and adaptable to BCH orders.

G. IMPASSE ISSUE P-23 (STATUS TOOL AND CLEC NOTIFICATION)

Q. PLEASE DESCRIBE IMPASSE ISSUES P-23.

A. In the BHC Forum, Qwest agreed to create a Status Tool that will inform the CLEC of situations when a line in the batch is deemed to be in trouble (i.e. No Dial Tone or bad CFA) and to notify the CLECs when the batch is complete. In addition, Qwest has encouraged CLECs to utilize the "trap and trace" technology inherent in their switch that can immediately notify the CLEC when each line in a batch has been provisioned. In addition to these methods, AT&T and McLeod have requested EDI or e-mail notification of both troubles and completion of the batch. In stark contrast, MCI believes the current Status Tool coupled with "trap and trace" is

adequate. The Commission should find that Qwest's proposed systems are adequate, and that any additional proposed systems changes should be taken to the Change Management Process (CMP) where the industry can evaluate the wisdom and need for additional system changes.

Q. WHAT WAS QWEST'S ORIGINAL PROPOSAL REGARDING COMMUNICATING BATCH HOT CUT STATUSES TO THE CLECS?

A. In the original BHC Forum which took place December 1-3, 2003, Qwest proposed that CLECs receive Batch Hot Cut status information via e-mail.

Q. WHAT WAS THE CLECS' RESPONSE TO THIS PROPOSAL?

A. Several CLECs proposed that an online tool be used instead of Qwest's suggestion that e-mail be used to communicate status on batch hot cuts.[69] The CLECs, including AT&T, argued that e-mail notification was subject to the vagaries of the Internet and therefore unreliable.

Q. WHAT WAS QWEST'S REVISED PROPOSAL BASED ON THE CLECS' RESPONSE?

[69] See December 1-3, 2003 Batch Hot Cut Forum Transcript. Page 37, Lines 15-17. Ms. Lichtenberg of MCI stated "We propose there be an on-line due date schedule and an on-line tracking system, as opposed to e-mails, et cetera." Page 239, lines 2-4. Ms. Sprague of McLeod USA stated "From a manual perspective, I'm not one for e-mail just because of all the problems we have with e-mail." Page 530, Line 4. Ms. Lichtenberg again stated "We're concerned about the e-mails." Page 534, Lines 1-7.

A. In response to the CLECs' suggestion, Qwest then proposed that a web-based GUI status tool be created which would report Batch Hot Cut statuses. The status tool would report jeopardy, pending, and completion information.[70]

Q. WHAT WAS THE CLECS' RESPONSE TO THIS REVISED PROPOSAL?

A. The CLECs' response was surprising. While MCI fully supported the web-based GUI status tool repeatedly in the January Forum[71], other CLECs contradicted MCI's position and their own statements from the December Forum, essentially stating that other communication tools would be preferred. For example, Covad indicated that some CLECs would prefer to have communication via the web-based status tool AND e-mail.

Q. WHAT TWO PIECES OF INFORMATION DOES THE WEB-BASED GUI STATUS TOOL GIVE THE CLECS?

A. The web-based GUI status tool gives the CLECs information about order jeopardy and order completion.

Q. HOW WILL QWEST HANDLE JEOPARDY REPORTING VIA THE WEB-BASED GUI STATUS TOOL?

A. As part of the Batch Hot Cut process, Qwest will perform the pre-wiring and dial tone test on day two or three of the Batch Hot Cut Timeline. If the dial tone test fails, the Central Office Technician updates WFA with the appropriate jeopardy status. The web-based GUI pulls the jeopardy status from WFA and indicates the line is in a jeopardy section on the GUI. WFA information will be queried every 15 minutes and once the data is populated in a intermediate database, it will be posted immediately to the status GUI. The GUI will also indicate that the CLECs have until close of business on day six to resolve the dial tone issue. Assuming a 7-day interval, the CLECs will then have 3 days to rectify the situation.

Q. HOW WILL THE CLECS ALERT QWEST THAT THE PROBLEM ON A JEOPARDIZED LINE HAS BEEN RESOLVED?

A. CLECs are not required to send an e-mail to the QCCC. The CLECs either simply resolve the problem or submit a supplemental order.

---

not, perhaps -- other than e-mail -- acceptable push solutions that might be easier to implement from a

Q. IN THE JANUARY FORUM AT&T ALLEGED THAT THE WEB-BASED GUI STATUS TOOL IS NOT SUFFICIENT FOR COMPLETION REPORTING. HOW WILL QWEST COMMUNICATE COMPLETED BATCH HOT CUT INFORMATION TO THE CLECS?

A. Qwest will communicate completed Batch Hot Cut information to the CLECs via the web-based GUI status tool. When a Central Office Technician (COT) successfully completes the "lift and lay" of the first line in a batch, he/she will indicate in WFA that the line has been cut. Qwest expects to have WFA completion information updated to the web-based GUI status tool every 15 minutes. Once the application queries WFA, the information will immediately post to the BST. The COT will then continue with the "lift and lay" for the remaining 24 lines in the batch. Once the 24 lines in the batch have been cut over successfully or jeopardied, the COT will indicate in WFA that the remaining lines have been completed.

In addition, the CLECs have the opportunity to receive immediate completion conformation via "trap and trace". A complete discussion of "trap and trace" is discussed above. AT&T and McLeod recognize the value of using "trap and trace," Qwest has already built redundancies into the process. Between the Status Tool and trap and trace, redundancies are created. A third method of notifying a CLEC about order completion is simply unnecessary. This is

---

programming perspective, might avoid some of the latency issues that e-mail has...".

highlighted by the fact that MCI did not believe anything more is necessary. Given the divergent views of the CLECs, this is an ideal issue to take to Change Management where the industry can obtain an idea of the inherent cost, CLEC demand for the changes, and whether the industry believes it is sufficiently important to prioritize with a new release.

Q. HOW SHOULD THE COMMISSION RULE ON THIS IMPASSE ISSUE?

A. Based upon the discussion above, The Commission should rule in favor of Qwest on Impasse Issue P-23. The majority of the CLECs embraced a GUI status tool for communicating BHC information rather than communication via e-mail. The GUI status tool will communicate jeopardy and completion status information in a timely manner which is more than sufficient for the CLECs to service their customers. CLECs will also be able to use a "trap and trace" solution for order completion. Another method of order notification is simply unnecessary.

H. IMPASSE ISSUE P-24 (NOTIFICATION OF COMPLETION)

Q. PLEASE DESCRIBE IMPASSE ISSUE P-23.

A. This question concerns the frequency with which Qwest will update the information in the Status Tool. Qwest stated that information will update no slower than every 15 minutes, and therefore will never be more than 29 minutes late. MCI asked that the tool update every 10 minutes, so the information will never be more than 19 minutes late. This dispute centers on technical feasibility and the reality of the

length of time it takes systems to update. Qwest will update the system as quickly as possible; however, there may be times when there is nothing that Qwest can do to speed the process along. The Commission should find that Qwest's update process is adequate.

Q. HOW OFTEN WILL THE WEB-BASED GUI STATUS TOOL BE UPDATED WITH BATCH HOT CUT INFORMATION?

A. Qwest will design an application that queries WFA for all Batch Hot Cut information every 15 minutes. Once the application queries WFA, the information will immediately post to the BST.

Q. HOW SHOULD THE COMMISSION RULE ON THIS IMPASSE ISSUE?

A. The Commission should rule that querying WFA every 15 minutes is sufficient for communicating BHC information to the CLECs.

I. IMPASSE ISSUES P-12 AND P-29 (INTEGRATION WITH CMP AND PENDING CR FOR MIGRATION BY TELEPHONE NUMBER

Q. PLEASE DESCRIBE IMPASSE ISSUES P-12 AND P-29 FROM EXHIBIT DP-2

A. Both of these issues concern systems changes proposed by MCI that Qwest does not believe are necessary to support the BHCP. MCI asks that the Commission order these changes as a "regulatory mandate" such that Qwest has no choice but to

implement them. Qwest on the other hand, believes that systems enhancements should go through the Change Management Process (CMP) where the CLEC community has an opportunity to decide the importance of the proposed systems changes. If the Commission orders inclusion of these enhancements, Qwest will have no choice but to implement, and the CLEC community runs the risk that other issues that they believe are more important may drop out of prioritization. The CMP exists for a reason. The Commission should let the process work as it was intended. The Commission should reject MCI Issue Nos. P-12 and P-29.

Q. MCI WANTS A NEW IMA RELEASE OUTSIDE OF CMP DEDICATED TO ONLY THE TRO.[72] [ISSUE P-29] IS THIS NECESSARY OR EFFICIENT?

A. No. The Change Management Process (CMP) was established for the specific purpose of managing system changes, in particular IMA releases. Qwest's Wholesale Change Management Document mandates that "[a] CLEC or Qwest seeking to change an existing OSS Interface, to establish a new OSS Interface, or to retire an existing OSS Interface must submit a Change Request (CR)."[73] Since a new IMA release with the changes required by the *TRO* would require changes to existing code and documentation in an existing OSS interface, CMP is the appropriate forum for addressing those changes and ensuring proper communication to all CLECs is followed. Taking a release of IMA outside the

---

72 Batch Hot Cut Forum, January 6, 2004, page 206, line 22 - page 208 line 9

73 Qwest Wholesale Change Management Process Document, which is publicly available at http://www.qwest.com/wholesale/cmp/whatiscmp.html, p. 24 (emphasis added).

CMP negates its use as the monitor and manager of the development that in essence, provides efficiency, consistency, communication and CLEC participation.

Q. HAS MCI PARTICIPATED IN THE CMP?

A. MCI is an active participant in the CMP. In fact, they fully participated in the redesign of the CMP,[74] and currently participates as one of the six (6) CLEC members of the CMP Oversight Committee. In other words, MCI seeks to rescind the very CMP language it agreed to in the past.

Q. IS CMP ABLE TO MANAGE A LARGE SCALE EFFORT SUCH AS THE BHC, ESPECIALLY GIVEN CUTS IN THE IMA RELEASE CAPACITY[75]?

A. Yes. CMP's ability to implement large regulatory CR's was specifically considered in the CMP Redesign effort.[76] The CLECs, including MCI, and Qwest contemplated how to manage a scenario in which a large number of regulatory CR's took up a full IMA release.[77] The language in the CMP document, which MCI accepted, was specifically drafted to account for this very situation. The CMP was designed for and is capable of handling this implementation.

---

[74] MCI (T.K.A. WorldCom) played a very significant role in the redesign of the CMP as a member of the Core Team. MCI representatives, usually three or four, were present at every CMP Redesign meeting. In the vast majority of those meetings, an MCI attorney was also present. See, CMP Redesign Core Team Attendance Record-Revised 10-21-02 available at http://www.qwest.com/wholesale/cmp/redesign.html .

[75] In November 2003, Qwest announced to the CLECs at the monthly CMP meeting, that due to the economic conditions present today, the number of releases for IMA would be changed from 3 to 2 for 2004 and that Qwest can only allocate 70,000 hours of IMA capacity in 2004.

[76] CMP Redesign Team Meeting Minutes, Thursday, January 24, 2002.

[77] Id.

Q. DOES THE CMP HAVE A PROCESS FOR DEALING WITH ORDERS FROM STATE COMMISSIONS OR THE FCC?

A. Yes. The CMP has a specific process for regulatory CR's, those mandated by regulatory or legal entities.[78]

Q. WHAT IS A REGULATORY CR?

A. Section 4.1 of the CMP Document defines a regulatory CR as follows:

> A Regulatory Change is mandated by regulatory or legal entities, such as the Federal Communications Commission (FCC), a state commission/authority, or state and federal courts. Regulatory changes are not voluntary but are requisite to comply with newly passed legislation, regulatory requirements, or court rulings. Either the CLEC or Qwest may originate the Change Request.

Q. IF THE COMMISSION ACCEPTS QWEST'S PROPOSAL ON THIS IMPASSE ISSUE, WOULD THE CR'S INVOLVED BECOME REGULATORY CR'S?

A. Qwest believes that change requests submitted to CMP to implement changes to systems as a result of the *TRO*, clearly fall within the CMP definition of regulatory changes listed above. A party submitting a Regulatory CR must also provide sufficient information to justify Regulatory CR treatment. Any CLEC or Qwest may object to the classification of a CR as regulatory and, if such an objection is raised, the CR will not be treated as a regulatory change unless the CLECs and

Qwest unanimously agree to such treatment.[79] In the present situation, the *TRO* issued by the FCC delegates authority to the Commission to approve and order the BHC process; thus, any objection to this being a regulatory CR would be hard to imagine.[80] Qwest must implement Regulatory CR's by the time specified in the regulatory requirement or, if no time is specified, as soon as practicable.[81] Most importantly, Regulatory CR's go "above the line" and are implemented ahead of any other non-regulatory CR's. This means the more regulatory CR's, the less money is available for alternative development that may be important, but is not required by Commission order.

Q. HOW SHOULD THE COMMISSION RULE ON IMPASSE ISSUE P-29?

A. Based upon the discussion above, The Commission should find that a new IMA release outside of CMP will be wasteful, inconsistent with CMP, and not necessary to implement the changes dictated by the *TRO*.

---

78 CMP Document, Sections 4.1, 5.1.1 and 5.1.2

79 CMP Document, Section 5.1.1.

80 CMP provides for dispute resolution of this issue to be taken to a state commission for resolution. CMP Document, Section 15.0

81 CMP Document, Section 10.2.1.

Q. AT THE BATCH HOT CUT FORUM, MCI REQUESTED A MODIFICATION TO IMA THAT WOULD ALLOW CLECS TO IDENTIFY AND CONVERT A CUSTOMER FROM UNE-P TO UNE-L BY CUSTOMER TELEPHONE NUMBER ("TN") AND SERVICE ADDRESS NUMBER ("SANO") ONLY.[82] IS THIS FUNCTIONALITY INCLUDED IN QWEST'S BATCH HOT CUT PROPOSAL?

A. No. MCI's change request is a system enhancement that is not essential to an efficient Batch Hot Cut process. Qwest's Batch Hot Cut proposal includes two significant changes to the pre-ordering and provisioning phases of Qwest's OSS interfaces. Qwest views these as critical to an efficient Batch Hot Cut process. The MCI change request is not. For example, in the last year, CLECs have submitted over 150,000 LSRs for conversion of lines to UNE-L without the requested change. In fact, MCI previously viewed this change as so insignificant that they did not include it in a similar earlier CR they submitted for another product.

Q. HAS MCI TAKEN THIS CHANGE TO THE CMP? HAS THIS CR BEEN PROCESSED?

A. MCI recently submitted a CR to CMP seeking the modification to IMA that would allow CLECs to identify and convert a customer from UNE-P to UNE-L by customer telephone number ("TN") and service address number ("SANO") only.

---

[82] Batch Hot Cut Forum, January 6, 2004, page 200, lines 19-20

CR (SCR1204003-1) was submitted to CMP by MCI on December 4, 2003. The CR has been accepted and will be included in prioritization for IMA release 16.0.

Q. WHAT IS "PRIORITIZATION"?

A. Prioritization is a ranking process for CR's and is defined in the CMP. Prioritization of major release CR's is determined when Qwest and all CLECs that elect to participate in the ranking assign a numeric value to a given CR. A value is assigned to each CR, with higher numbers representing a highest priority. For example, if there are 10 CR's to rank, Qwest and each CLEC assign a value of 1 to 10 (with 10 indicating the highest priority) to each CR. Qwest applies its resources for a release to the CR's in order of their ranking, until the resources are exhausted. The remaining CR's are then re-prioritized for the next release.

Q. MCI IS CONCERNED THAT THIS CR WILL NOT BE RANKED HIGH ENOUGH TO BE INCLUDED IN IMA RELEASE 16.0. SHOULD THIS CONCERN THE COMMISSION?

A. No. Pursuant to the CMP process, the CLEC community prioritizes those CR's it deems important. When a CR receives a prioritization that is not high enough for inclusion in the upcoming release, obviously the CLEC community deems the existing functionality to be sufficient. Rather than force the changes into the BHC, the Commission should allow the CLEC community to assess the importance of

MCI's CR, and give it an appropriate ranking and prioritization. Qwest has agreed as an accommodation that it will not oppose MCI's CR in the CMP.

Q. HAS QWEST MADE SIMILAR CHANGES TO ITS SYSTEMS IN THE PAST?

A. Yes. In June 2002, MCI submitted a CR (SCR061302-01) requesting that migrations to UNE-P be allowed with TN and SANO as the only required customer identifying fields. In July 2002, the CMP ranked this change for prioritization 19th out of a total 60 candidates for inclusion in IMA release 12.0. The changes were ranked high enough to be included in the development of IMA release 12.0 and successfully implemented. Additionally, Qwest has implemented two other CR's that are similar to this one. SCR101802-02 (Ability to submit Line sharing, Line Splitting and Loop Splitting LSR's with TN only(Omit address)) was implemented in IMA release 13.0 and provided similar functionality to the original CR. SCR022703-24 (Allow post migration transaction order types to be processed by TN and SANO) was opened by MCI after the original CR. It was implemented in IMA release 14.0 in order to increase the scope of the original CR to include subsequent maintenance order transactions to be processed by populating TN and SANO fields only.

Q. SHOULD THE COMMISSION ORDER THIS FUNCTIONALITY AS PART OF THE BATCH HOT CUT PROCESS?

A. No. CMP is the proper forum for implementing this change. As noted above, CMP has implemented a virtually identical change before and is perfectly suited to implement this one. The Commission should allow the CLEC community decide whether order by TN and SANO is of sufficient importance to place the item into the next release. The Commission should not usurp the CMP by mandating system enhancements. For these reasons, the Commission should reject Impasse Issue P-12.

J. IMPASSE ISSUE P-27 (ROBOTIC FRAMES)

Q. PLEASE DESCRIBE IMPASSE ISSUE P-27(C) FROM EXHIBIT DP-2.

A. It is well understood that a hot cut is an inherently manual process that requires a physical "lift" of a line from a Qwest frame and a "lay" of that facility onto a CLEC frame. The FCC has made this point plain: "a hot cut is a largely manual process requiring incumbent LEC technicians to manually disconnect the customer's loop . . . and physically reconnect it to the competitive LEC switch . . ."[83] Even AT&T recognized this point on the first page of its opening comments. Despite this MCI asks Qwest to deploy "robotic frames" throughout its central offices in an effort to decrease the manual steps involved in the process. The Commission should summarily reject this issue as the FCC specifically found that "the record in

[83] TRO at ¶465, n.1409.

[the *TRO*] proceeding does not support a determination that electronic loop provisioning is currently feasible."[84]

Q. WHAT IS A "ROBOTIC FRAME" AND DOES IT WORK?

A. The concept of robotic frames is one that has been argued by many of these same parties in cost proceedings in multiple states. For instance, in South Dakota [85] MCI's witness Mr. Sidney Morrison touted the capabilities of automatic distribution frames manufactured by Oki and ConX without personally reviewing the equipment's performance in a "real world" environment. The facts are, and continue to be, that while the concept is "really cool," as the FCC has recognized robotic frames simply do not work for a number of reasons. While intervening companies have produced documentation (sales literature and white papers) from equipment companies pushing their equipment, the International Engineering Consortium ("IEC"), an independent 3rd party with 60 years experience in the engineering and electronics field issued an article analyzing the concept and made the following observations:

> Section 4 – History of Copper Automation – "To date, despite strong interest in implementing automated distribution frames, there have been technology limitations that have hampered service providers from actually deploying these types of devices. While cross-connecting technologies have existed for some time, none have been able to meet all of the aforementioned automated distribution frame requirements in a cost-effective and scalable manner." The article continues in the same sections and states the following. "Perhaps the biggest "show stopper" for robotics , and all of the other copper

[84] TRO at ¶488, n. 1517.
[85] South Dakota cost proceeding – Docket No. TC01-098, July 28, 2003

automation technologies previously examined for frame applications, has been scalability. As COs vary dramatically in size, automated distribution frames must have the flexibility to grow in size, too. But, functionality cannot be sacrificed in the process. Traditional copper automation technologies typically become blocking at higher port counts or high port utilization. This dramatically limits their performance in medium to large COs." *See* Exhibit DP-418.

Q. SINCE FRAME SIZE AND SCALABILITY APPEARS TO BE ONE OF THE SHORTCOMINGS OF THE ROBOTIC FRAME TODAY, IS THERE AN ENVIRONMENT WHERE THESE FRAMES COULD BE DEPLOYED?

A. There is an application where it would make sense to deploy some type of automated distribution or robotic frame, but I am not aware of any CLEC that has deployed the application as part of their collocation arrangement. Apparently with deployment of "new" network technology, it would offer the CLEC cost savings in labor, increase service delivery and improve accuracy within their cross connection fields. The fact is, a majority of the CLEC today continue to wire from their switch or DLC equipment to an intermediate frame and then to the TIP cables that extend to the vertical side of the ICDF – just like a majority of the ILECs built their Central Office network in the past. If robotic frames are the wave of the future and these companies are riding the same wave, I find it rather odd that very few, if any, are deploying robotic frames in their brand new networks.

Q. HAS QWEST EXPERIMENTED WITH ROBOTIC FRAMES?

A. Qwest conducted laboratory tests on two different types of robotic frames and evaluated each based on a set of requirements. Upon initial testing of the equipment, it was determined that the ADF did not meet Qwest's basic requirements for network equipment. In short, Qwest was not able to provide bandwidths greater than one Megahertz ("MHz") nor was it able to accept power levels in excess of plus or minus 130 volts DC. To put this in perspective, DS1 facilities provide a bandwidth of 1.544 MHz and require power levels of up to (plus or minus) 230 volts DC. The device proposed behaved much like a fuse or circuit breaker in an electrical circuit. When the metallic cross-connect voltage limits are reached, the cross-connect breaks, causing the circuit to go out of service since the cross-connect is no longer in place. In the field test that Qwest has conducted with a different manufacturer's ADF, these "glitches" are an additional expense since not only would there be the cost of the equipment, but a truck roll would also be required in order to place manual cross-connects when this equipment fails.

Q. HAS QWEST ATTEMPTED TO DEPLOY A MECHANICAL CROSS-CONNECT DEVICE WITHIN ITS OUTSIDE PLANTS NETWORK AND IF SO, WHAT WERE THE RESULTS OF THE TEST?

A. Qwest has attempted to utilize a such a device with very disappointing results. Since the initial deployment of the device, Qwest has experienced bent pins due to the "intelligent routing software" because of heat issues and internal modem issues which limit Qwest's ability to communicate with the device remotely and result in

additional dispatches. Each of these field-tested problems may have resulted in a field dispatch so in addition to the cost of the device, Qwest would have incurred the additional cost associated with a truck roll. Eventually, the magnitude of these problems was so extensive that the manufacturer pulled the product off the shelf and discontinued it. Mr. Paul Zipps, a staff engineer in the Qwest Lab was central to the discussions on product selection and has provided me with the detail on this failed test.

Q. THE FCC'S TRO DEFERS THE ISSUE OF ELECTRONIC LOOP PROVISIONING ("ELP") IN PARAGRAPH 491. PLEASE EXPLAIN THIS TECHNOLOGY AND THE NETWORK IMPACTS ACROSS THE INDUSTRY.

A. In AT&T's August 7, 2002 presentation on ELP, it conveniently omitted the impacts on the "typical" ILEC network. This effort continued in early January 2004 as AT&T lobbyists/representatives met with representatives from the Colorado and Utah Legislatures once again pushing the concept of ELP. Exhibit DP-22 is a copy of the document they presented. I want to briefly note a few of the points they omitted during their August presentation. These are only a *few* of the points documented in Qwest Ex Parte Response to the ELP Proposal. *See* Exhibit DP-23.

1) Deploying ELP in a typical ILEC network would require the replacement of nearly 100% of the existing loop plant.

2) Deploying ELP would limit ILEC architecture options and stifle evolution of the network.

3) Deploying ELP would require Qwest to implement a VoATM architecture which currently does not exist in Qwest's network.

4) Deploying ELP would require Qwest to deploy a new ATM infrastructure in every Central Office since the current ATM switch technology does not have the capacity or capability to support ELP.

5) The A-INI interface required to make ELP a reality has not even been fully developed or implemented by industry vendors.

6) The FCC recognized that the cost to Qwest to make such a sweeping change in architecture would be in the billions of dollars.[86]

Exhibit DP-23 concludes with the following statement: "AT&T (by recommending ELP) is trying to solve a hot-cut problem that does not exist and has a hidden agenda to require ILEC's to replace their functioning infrastructure with a next generations network." The facts are that Qwest's current performance on hot cuts for both analog and digital loops does not warrant such a change. PID measurements for the past 12 month indicate that for each of these loop types, Qwest has been meeting installation commitments that gives the CLECs a meaningful opportunity to compete. Qwest fully expects that the newly-proposed BHCP will offer the same types of results with the efficiencies that we have built into the new process.

Q. PLEASE SUMMARIZE YOUR TESTIMONY ON ISSUE P-27(C).

A. MCI's proposal to utilize robotic frames is, at the present time, science fiction that does not work in the real world. The hot cut process has inherently manual steps as the FCC itself has recognized. Moreover, deploying such an architecture would cost Qwest billions of unnecessary dollars, given that Qwest has shown that it can consistently provision analog loops at an extraordinary level of quality using the current process and proposed BHCP. The Commission should reject MCI's request in issue P-27(c).

K. IMPASSE ISSUE S-2 (PROVISIONING INTERVAL)

Q. PLEASE DESCRIBE IMPASSE ISSUE S-2 FROM EXHIBIT DP-2.

A. This issue concerns the standard interval that should apply to the BHCP. Qwest proposes a 7 business day interval, which is substantially shorter than that suggested by any other ILEC. Qwest's interval harmonizes with the process agreed to by the participants to the BHC Forum, and also harmonizes with the intervals agreed to in the 271 process. The CLECs have suggested that Qwest should implement a 5 business day interval.

Q. DOES QWEST'S PROPOSED 7 BUSINESS DAY INTERVAL MESH WITH THE WORK THAT IS PERFORMED ON EACH DAY OF THE PROCESS.

A. It does. As described above, the parties have agreed in large part to the BHCP. During the BHC Forum, there was much give and take; however, one aspect of the

[86] TRO ¶491, n. 1524 - SBC's response to AT&T's ELP proposal estimates the cost to be approximately

process eliminated many issues that had previously been at impasse. Specifically, the CLECs agreed to place dial tone on their CFA on Day 1 so that Qwest could perform the pre-wire and verify that the CLEC had dial tone on DVA (Day 2 or 3). When a bad CFA is discovered, Qwest will identify the problem in its Status Tool on either on Day 2 or 3. This then provides the CLECs with time to dispatch a technician to the Central Office to rectify the CFA problem. As stated above, the *quid pro quo* to performing testing on DVA is that CLECs will not be able to rectify dial tone problems on Due Date. As states above, CFA changes on Due Date create a number of complexities and manual processes that make the process much less efficient and time consuming. Moreover, this process change was intended to create and incentive for the CLEC to have its work performed on time, which is not occurring in the real world today. The 7-day interval is intended to provide CLECs with time to rectify no dial tone, reversed wiring and bad CAF situations. Exhibit DP-11, presented earlier in my testimony, displays the critical dates, and the work that takes place on each of these days in a 7-day interval. While a previous proposal gave the CLEC 1 hour to respond to a NDT condition, the new 7 day interval will have the pre-wiring completed by day 2 or 3 with notification going back to the CLEC if NDT is found. Basically, the 7 day interval provides the CLEC with up to 3 days to cure the problem.[87] By notifying the CLEC and allowing this much time to resolve a translations or CFA issue, the COT should be

---

$100 billion dollars based on their Project Pronto estimates and spread across all ILECs.

[87] CLECs have committed to have translations work performed and dial tone on their CFA by midnight of day one in order for Qwest to conduct the DT/ANI testing.

able to successfully work the order on DD and complete the transaction with WFA-DI so that the CLEC can complete the porting activity.

Q. HOW DOES THIS INTERVAL COMPARE TO THE BHC INTERVALS PROPOSED BY OTHER ILECS?

A. In meetings Qwest has conducted with Verizon, SBC and BellSouth, we have confirmed that the interval Qwest is proposing is substantially shorter than the intervals set by the other ILECs.

Q. HOW DOES THIS 7 BUSINESS DAY INTERVAL COMPARE TO THOSE CURRENTLY STATED IN QWEST'S SERVICE INTERVAL GUIDE (SIG)?

A. For order volumes in excess of 25 lines, the stated interval in the SIG is negotiated on an Individual Case Basis ("ICB"). The intervals set forth in the SIG for analog loops were agreed to by the CLEC community as part of the 271 process. Under the proposed BHCP, a standard 7 day interval along with an electronic appointment scheduler allows the CLEC to provide their end user with a "real time" date certain Due Date. The CLECs are not required to have any up front negotiation meetings with Qwest, nor is there any ambiguity regarding the actual interval.

Q. DURING THE FORUM MCLEOD USA EXPRESSED CONCERNS AROUND THE PROPOSED INTERVAL FOR NEW CUSTOMERS. HOW DOES QWEST RESPOND TO THAT CONCERN?

A. As discussed at length during the Forum, new McLeod customers will have the ability to use the BHCP if the minimum batch size is met. If the line count for that end user is less than the minimum batch size, then at its discretion McLeod can group the request with other orders and submit a batch or McLeod can choose any of the remaining 6 provisioning options available to them today. If McLeod has a customer with the minimum batch size at the same end user location, they will have the similar interval that Qwest is offering with the BHC because orders with 25 lines or more carry a negotiated DD (ICB) and are usually out beyond the standard 6 day intervals offered for volumes between 9 and lines.

Moreover, customers who qualify for the BHCP should not be concerned about a 7 business day interval. As stated above, the BHCP is for reuse of existing facilities which, by definition, means the end-user customer is currently being served by someone. Thus, the BHCP is not available for customers who call and need to set up service because they are moving into a new residence. For this reason, the BHCP will not prevent a customer from obtaining service, but will simply dictate when an end user can either change providers or change the method by which their provider is providing the underlying service (UNE-P to UNE-Loop).

Q. DID QWEST POLL THE CLECS FOR THEIR RECOMMENDATIONS FOR A STANDARD INTERVAL?

A. Yes. AT&T requested the standard interval from the SIG for analog loops. As stated above, depending on the number of lines, this interval can be 5 business days,

6 business days, 7 business days, or ICB. MCI requested a 5 business day interval. McLeod requested a 5 business day interval in their comments, and a "4-5" business day interval in the BHC Forum.[88] Covad thought a 6 business day interval was appropriate. As previously stated, 17 to 24 loops carry a 7 business day interval and 25 lines or more are ICB. While the CLECs are required to negotiate the interval, it makes sense that at minimum the interval would be 7 days given, that 24 lines already carry a 7 day interval. This is especially the case when (1) the customer already has service and (2) it gives the CLECs time to perform their end of the work.

Q. WOULD IT BE POSSIBLE FOR THE SIZE OF AN ORDER WITHIN A BATCH TO DETERMINE THE STANDARD INTERVAL?

A. As stated above, at the BHC Forum AT&T stated that the interval for BHCs should follow the SIG agreed upon in the 271 process. To explain this point, I will clarify the question. A Batch can consist of multiple orders or LSRs. Each LSR will contain one or many lines. For illustrative purposes, I will assume a BHC that contains 5 LSRs, the first two with 1 line, the third with 5 lines, the fourth with 8 lines and the fifth with 20 lines. If the standard interval was determined by the LSR, what would the Due Date of this batch be? The first three LSRs would have a 5 business day Due Date, the fourth a 6 business day Due Date, and the last would have a 7 business day Due Date. When this occurs, it is well understood that the

[88] 1/8/04 Tr. at 163:27 & 164:14 (Patty Lynott - McLeod); 1/8/04 Tr. at 165:8 (Mike

longest standard interval applies to the entire group. Furthermore, regardless of its name, a "batch" is a project and the proposed 7 business day interval is shorter than the ICB interval set forth for projects in the SIG.

Q. HOW SHOULD THE COMMISSION FIND ON ISSUE S-2?

A. The Commissions should find that Qwest's proposed 7 business day interval provides the CLECs with a meaningful opportunity to compete, while providing the parties with sufficient time to organize workload including performing changes to CFAs, if necessary.

L. IMPASSE ISSUES V-2 AND V-3 (MINIMUM AND MAXIMUM SIZE OF A BATCH)

Q. HAVE THE CLECS TAKEN ISSUE WITH THE MINIMUM AND MAXIMUM SIZE OF THE BATCH? [ISSUES V-2 AND V-3]

A. Yes. Qwest has proposed that the minimum size of the batch be 25 analog loops and the maximum be 100 analog loops. Qwest makes this proposal for several reasons. First, the minimum number allows Qwest to achieve and pass along efficiencies to the CLECs in the form of reduced cost. Second, there is more than enough volume of UNE-P lines in service to take advantage of this process in converting its embedded base with the batch hot cut process. Third, 100 lines will allow Qwest to complete the process of converting the embedded base of UNE-P

Zulevic - Covad); Tr. 166:82 (John Finnegan - AT&T) and TR. 166:9 (Tim Gates - MCI).

lines during the FCC's 21 month transition period. Fourth, 100 lines is approximately the number of lines that a dedicated team of two can provision with a "lift and lay" in an eight hour shift. Despite this overwhelming evidence and rational, the CLECs request from a batch of "1" line (Issue V-3) to a batch of 200 lines (Issue V-2). The Commission should reject the CLEC's outlying proposals as unwarranted and unnecessary.

Q. WHY HAS QWEST SET A BATCH SIZE OF 100 LINES PER DAY PER CO? [ISSUE V-2]

A. Qwest's BHCP is based on the concept of two dedicated COTs working in tandem to perform the lift and lay activity during the first part of the shift and then focusing their attention on the pre-wiring activity for orders due some time in the future. Both Hitachi Consulting and Ms. Million have verified that it takes approximately 1.5 hours to perform the lift, lay and DT/ANI testing on the due date for each group of 25 lines. Thus, for a batch of 100, the COTs can complete 100 lines in 6.5 hours. I add an extra ½ hour for standard union breaks. This leaves 1½ hours for entering order information into WFA-DI, to cut-back lines as appropriate, and to rectify any identified problems with the conversion. If any time is left, the COTs can perform some pre-wiring activity for a future batch. Thus 100 lines is a full days work for a dedicated team of two. Moreover, Qwest interprets ¶¶487-489 of the *TRO* to mean that one of the only ways costs can be driven down is to migrate a large number of lines. For a team of two COTs, 100 is that large number.

Q. HAS QWEST INVESTIGATED USING MORE THAN ONE TEAM OF TECHNICIANS PER OFFICE?

A. Yes. Qwest did consider this possibility; however, due to space constraints in many of the offices I have toured over the past 7 years, we felt that multiple teams of COTs could get in each other's way on the smaller ICDF frames where the lift and lay are generally performed. I recommend that the Commission view the video demonstrating a hot cut (Exhibit DP-3) which depicts the large number of CLEC terminations that can be established in a very small space. For instance, in an eight foot Central Office environment, it is not unusual for 10 terminal blocks to be placed in single vertical frame each with 100 terminations per block. In other words, it is not unusual in a space only four feet wide for a single CLEC to have 4,000 DS-0 terminations. A single COT running cross connections to their peer on the horizontal side of the ICDF represents the most efficient manner in which to conduct these BHCs.

Q. IF THE COMMISSION IMPLEMENTS A 100 LINE LIMIT, CAN QWEST TRANSITION THE EMBEDDED BASE OF UNE-P LINES WITHIN THE FCC'S MANDATED 21-MONTH TIME FRAME?

A. Yes. As explained in detail in the testimony of Terri Million, the 100 line limit can easily accommodate the transition of every UNE-P line in the state. The

Commission should implement the 100 line limit as the maximum number of lines in a batch.

Q. WHY HAS QWEST RECOMMENDED A MINIMUM BATCH OF 25 LINES? [ISSUE V-3]

A. In an effort to satisfy the requirements for a new BHCP, efficiencies were realized by performing conversion in groups of multiple lines at a time. When converting single line, the COT performs the lift and lay and then has to complete the service order in WFA-DI. Another order is pulled, and the COT repeats the same work steps to complete the wiring on the frame and then complete the order in the system, WFA-DI. By being able to batch orders in groups of 25 lines according to their frame location, the COT is able to focus on the lift and lay activities for all 25 lines. Once these steps are completed, the COT can complete the entire batch in WFA-DI. Then the COT can move on to the next batch of orders and repeat the process. These efficiencies, along with the single spread sheet which prioritizes the sequence of the lines by terminal block location, allow the COTs to perform their work as efficiently as possible by minimizing steps between frames and reducing the number of times a single order is touched. Without such a minimum being set, the process and costs align with the current provisioning options.

What Qwest proposes is exactly the type of efficiencies contemplated by the FCC in the *TRO*:

> Generally . . . we expect [the BHCP] to result in efficiencies associated with performing tasks once for multiple lines that would

> otherwise have been performed on a line-by-line basis. **For example, pursuant to the processes in place at least in some states, the incumbent LEC currently will pre-wire circuits on the central office frame, verify the presence of dial tone, and communicate with competitive LECs regarding problems encountered on a line-by-line basis.** Under a batch hot cut process, these activities might be undertaken ***simultaneously*** for all lines affected by a given batch order.[89]

The batch with a minimum size of 25 lines creates the very efficiencies sought by the FCC.

Q. WHAT DID THE CLECS RECOMMEND AS THE MINIMUM BATCH SIZE?

A. The CLECs took the totally unrealistic position that there should be no minimum requirements, and that a batch should be 1 line or more. The CLECs' position is completely inconsistent with the *TRO* which contemplates performing work on multiple lines "simultaneously." If one were to accept the CLECs definition of a batch, the efficiencies once imagined in the BHCP would disappear, as Qwest would again be faced with provisioning using a serial process. A batch of cookies is more than one, and I the mind of almost anyone, constitutes many cookies! I make this comment only as an example to illustrate the ludicrous nature of the CLECs' position on the minimize size of the batch. Throughout the Forum when the issue of cost was discussed AT&T reminded Qwest that the intent of the *TRO* was to take advantage of the efficiencies gained by performing "batches" of like

[89] TRO at ¶489 (emphasis added).

orders.[90] However, this concept seemed to escape the CLECs during this discussion. As mentioned throughout this testimony, the efficiencies gained from the BHC process are due to grouping orders. If Qwest is required to reduce the minimum size to 1 or 2, then Qwest will be in the same position as it is today, and the BHCP would become a farce.

Q. WHY DID THE CLEC'S RECOMMEND SUCH A RIDICULOUS MINIMUM BATCH SIZE.

A. The CLECs recommended this size in an effort to obtain a 5-day provisioning interval. In the BHC Forum, AT&T consistently argued that the standard interval set forth in Qwest's existing Commission-approved SGAT should control. AT&T presumed this interval was 5 days. In reality, however, it varies by the number of lines. The interval is 5 days for 1-8 lines; 6 days for 9-16 lines; 7 days for 17-24 lines; and ICB for 25 lines or more. It is common knowledge that if two orders are combined together, the longer interval applies. In other words, if an LSR with 20 lines is combined with 5 LSRs each of which has one line, the longest interval, or 7 days applies. The CLECs asked for the ability to have batches of 1, so the CLECs could split each of their LSRs into mini-batches and always obtain a 5-day interval, and always obtain the lower price. The problem, as Terri Million explains in her testimony, however, is that the efficiencies have disappeared and the NRC would

[90] 1/7/04 Tr. at 38:3 (John Finnegan - AT&T) "One of the terms I remember for the FCC TRO was the notion that there maybe some economies of scale in doing many hot cuts at one time rather than doing them one at a time. The economies of scale, to me, represent efficiencies you gain from doing the same activities in larger numbers than doing them in smaller numbers."

then be too low. The CLECs cannot have it both ways. If loops are provisioned individually, the CLEC can use Qwest's existing provisioning options and get a faster interval and a higher cost. If loops are provisioned in a batch, the CLEC can get a slightly longer interval, and a lower cost.

Q. HAS QWEST INVESTIGATED REDUCING THE MINIMUM SIZE OF A BATCH?

A. Yes. Although Qwest maintained its position that a batch requires 25 lines, Qwest made three concessions during the Forum negotiations.

- The functionality of the appointment scheduler was enhanced to enable CLECs to "accumulate" lines to reach the 25 line limit. It is not necessary for the CLEC to submit all 25 lines at the same time.
- If for some reason lines fall out of the batch before the orders are processed by the QCCC, Qwest will continue to process the BHC if 20 lines remain in the batch.
- If on the DD, the CLEC is not ready or unforeseen problem arise and lines can not be completed, Qwest will provision the lines that it can, and place the problem orders into a jeopardy status.

Currently, for both Qwest retail and wholesale, 25 lines constitutes a project. In many ways a "batch" is very similar to a project. Finally, as Ms. Million explains in her testimony, 25 lines provides a large enough group to establish some economies of scale Therefore Qwest maintains its position that at order entry a batch should consist of at least 25 lines.

M. IMPASSE ISSUES SC-1 AND SC-5 (VOLUMES AND STAFFING)

Q. DESCRIBE RELATED ISSUES SC-1 AND SC-5 FROM EXHIBIT DP-2.

A. This issue concerns whether Qwest's proposed BHCP can manage the anticipated volumes of batch hot cuts. Several CLECs argues that Qwest has not put forward sufficient data to show it could meet the anticipated volumes. CLECs make this point without predicting in any way what the volumes would be. Qwest, on the other had, put forward a document in Ms. Million's testimony that explained in great detail the worst case scenario for the batch hot cut process. Qwest then explained that it would have no difficulty meeting the worst case scenario situation.

Q. WHAT IS THE COMMISSIONS OBLIGATION WITH RESPECT TO MAKING A FINDING THAT QWEST'S BHCP CAN MANAGE ANTICIPATED VOLUMES?

A. The FCC rules specifically require the Commission to make a determination about whether Qwest's proposed BHCP can manage the anticipated volumes:

> A state commission shall evaluate whether the incumbent LEC is capable of migrating multiple lines served using unbundled local circuit switching to switches operated by a carrier other than the incumbent LEC for any requesting telecommunications carrier in a timely manner, and may require that incumbent LECs comply with an average completion interval metric for provision of high volumes of loops.[91]

[91] 47 C.F.R. § 51.319(d)(ii)(A)(1)-(4). *See also TRO* ¶ 489.

Q. CAN QWEST HANDLE THE ANTICIPATED VOLUMES FROM BOTH THE EMBEDDED BASE AND NEW CONVERSIONS IF THE MAXIMUM BATCH SIZE IS 100?

A. Yes we could. Exhibit BB-** prepared by Qwest cost witness Ms. Terri Million presents a very conservative approach to the total volumes that Qwest would have to begin converting in those markets after a finding of no impairment is entered. As Ms. Million explains, this document assumes that every UNE-P line converts using the BHCP; that the growth of lines continues on the same path as if UNE-P were available; and that every CLEC decides to convert to UNE-L instead of an alternative approach. The likelihood that all of these assumptions will occur is highly unlikely. In fact, AT&T's witness John Finnegan proposed a more conservative approach for predicting anticipated volume.[92] Making all of these assumptions, and given the FCC's 21 month timeframe to transition the embedded base of UNE-P lines, Qwest expects there would be a maximum of 3600 batch hot cuts per day. As explained by Ms. Million and Ms. Lorraine Barrick, Qwest can easily meet such volume requirements.

[92] 12/3/04 Tr. 631:1 (John Finnegan - AT&T) "So in terms of the anticipated volumes, you've got to look at the embedded base you've got in place, and you've also got to make some assumptions about what the rate of new customer adds is going t be ... What AT&T has been thinking in terms of what kind of volumes you should expect is something akin to the long distance churn rate, that there should be an expectation that customers are going to move local service about as often as they move in their long distance service ... I have been searching for publicly available industry numbers on churn rate. I did see, I think it was a Bank of America estimate of 2.6% per month, that the LD churn rate is ... I've also seen some financial analysts' reports say that for CLECs, the local exchange churn rate is anywhere from 4.5 to 5.2% per month.

Q. HAS QWEST ESTIMATED THE STAFFING REQUIRED TO PROVISION THIS FORECASTED VOLUME?

A. We have. I asked the various Subject Matter Experts ("SME") to take the estimated level of conversion activity back into their organizations for staffing requirements. Each organization took into consideration the volumes, the process flow and the proposed mechanization that result from the *TRO* and other existing Change Management ("CMP") requests. The final variable to determine the required staffing levels was the UNE-P conversion schedule set forth by the FCC. The following is a break down of these requirements by work group.

STAFFING REQUIREMENTS		
ORGANIZATION	HEADCOUNT REQUIRED	
	October 2004	June 2005
QCCC Central Office Technicians	8	7 144 frame attendants

Q. DOES QWEST ANTICIPATE ANY PROBLEMS REACHING THESE STAFFING REQUIREMENTS?

A. No. The structure of the *TRO* enables Qwest to ramp up to handle the increase order volumes. Additionally, the transition plan provides Qwest with sufficient time to convert the services without a huge spike in the staffing and training requirements. Qwest believes that its proposal to perform the BHC conversions between 3 AM and 11 AM minimizes the staffing impacts and gives the CO operations the opportunity to manage the work within the capabilities of their CO forces.

Q. WHY DO THE INSTALLATION HOURS MINIMIZE THE STAFFING IMPACT?

A. The 3 AM to 11 AM hours of operation enable Qwest to have a staff of people dedicated to the BHCP. This will minimize the impact or interface with the existing daily load activities, and the increase in the daily load brought on by the finding of no impairment. This is particularly important in the Central Office due to the space constraints at the frame, and the number of people working in a very limited space in many instances . If batch hot cuts were provisioned during normal business hours, even if a dedicated team was assigned to BHC, they would still be competing for space to complete the wiring.

Q. DID THE FORUM REVISION TO THE BHC PROCESS IMPACT THE STAFFING REQUIREMENTS?

A. Yes. The changes provided/negotiated during the Forum created greater flexibility for Qwest and helped reduce the staffing requirements through additional mechanization within the process in Service Delivery, QCCC and the Central Office. The CLECs agreement to have Dial Tone ready by midnight of Day 1 provides Qwest with the flexibility to pre-wire and test the facility on Day 2 or 3. Therefore, this work can be performed during the BHC hours, time permitting, or it can be worked into the work load during normal business hours. Although this change increased the work required by the Central Office because it now requires two trips to the frame and testing on two separate occasions, what it did provide

was a scenario where there should be virtually no "surprises" on the Due Date. Additionally, this change significantly streamlined the QCCC activities. Due Date problems associated with No Dial Tone or CFAs generate a great deal of manual handling by the QCCC and the Central Office. The proposed change enables the CFA changes to occur in a systematic way over the course of a couple of days. The QCCC estimates that this change reduced the needed headcount by130.

Q. HOW WILL THE QCCC RAMP UP FOR THE INCREASE IN VOLUMES?

A. The QCCC will be able to manage the expected volume increase. The first phase of increased volumes, which will be a result of new Unbundled Loop orders due to UNEP no longer available in unimpaired offices, will begin January, 2005. Based on the expected BHC volumes and proposed BHC process, the QCCC will need to add approximately 8 resources. The process of hiring and training will begin in early October, 2004. The second phase of increased volumes will begin August, 2005 with the beginning of the conversion process for the embedded base of UNE-P to Unbundled Loop. With the proposed BHC process, the QCCC will add an additional 7 people. The process of hiring and training will begin in June, 2005. The QCCC does not anticipate any office space restrictions due to the increase in head count.

Q. WHAT REASSURANCE CAN QWEST PROVIDE TO THE COMMISSIONS THAT QCCC WILL SUCCESSFULLY MANAGE THE LOADS?

A. As previously mentioned, the QCCC's role has expanded on at least two separate occasions. In both instances the additional load was handled with minimal headcount increases and in each case the performance results improved. The quality control is a part of the daily activities of the QCCC and provides a strong foundation for ensuring timely BHC. During the BHC Forum, Don Gray of the Nebraska Commission explained that he had taken a tour of the QCCC and was quite impressed.[93] The QCCC has shown on multiple occasions that it can very quickly staff up for additional responsibility and continue to perform at a very high level of quality.

Q. IT APPEARS THAT THE HEADCOUNT REQUIREMENTS FOR THE SERVICE DELIVERY IS MUCH GREATER THAN THAT OF THE QCCC. WHAT IS THE REASON BEHIND THEIR NEEDS?

A. A. By its very nature, UNE-P Centrex lines will require manual assistance in order for Qwest to validate if there is any pending order activity against any of the Centrex numbers associated with the account. Each of these accounts will have to

---

[93] 1/7/04 Tr. 109:2 (Don Gray - Nebraska Commission) "I was fortunate that the week after our last forum I was able to go up to Omaha, and see the QCCC ... And that did a lot to help me feel comfortable that that side of the house was going to be able to respond ... One of the specific things they discussed there was the daily missed call meetings at 4 PM, in which every order that gets missed, for whatever reason, or any order that had a repair in the last 30 days, is analyzed. "What happened?" "Well, we don't know." So to me, as a commission staff, that's a comfort level there."

be reviewed and if a pending order does exist, the Service Delivery organization will have to resolve the issue before the order can be submitted back into the service order flow. During the BHC Forum, Mr. Gray of the Nebraska Commission staff explained that he had taken a tour of the QCCC and was favorably impressed.[94] The QCCC has shown on multiple occasions that it can very quickly staff up for additional responsibility and continue to perform at a very high level of quality.

Q. CAN THE CENTRAL OFFICE MANAGE BATCHES OF 100 LINES?

A. Yes. There is no question, but that COTs can manage a batch of 100 lines in an 8 hour shift. Ms. Million makes this point. Ms. Lorraine Barrick makes this point after performing actual commercial testing. Ms. Barrick explains that Qwest has routinely performed this number of cuts at various times in the past without incident. Ms. Barrick also explained that Qwest often provisions a large number of hot cuts and obtain virtually perfect performance – 100% commitments met and 100% of lines installed without an installation trouble.

[94] 1/8/04 Tr. 109:2 (Don Gray – Nebraska Commission) "I was fortunate that the week after our last forum, I was able to go up to Omaha, and see the QCCC ...And that did a lot to help me feel comfortable that that side of the house was going to be able to respond. . . . One of the specific things they discussed there was the daily missed call meetings at 4 p.m., in which every order that gets missed, for whatever reason, or any order that had a repair in the last 30 days, is analyzed. "What happened?" "Well, we don't know." So to me, as a commission staff, that's a comfort level there."

Q. AT&T ARGUES THAT THE COMMISSION SHOULD ALSO FACTOR IN ALL OF THE OTHER NON- BHC WORK ONGOING IN THE CENTRAL OFFICE. DO YOU AGREE?

A. No, I do not. The purpose of creating a dedicated team of COTs to perform batch hot cuts is to ensure that they do not have conflicting work assignments or responsibilities. Dedicating a team of people, and setting the hours for such operation between 3 AM and 11 AM should eliminate AT&T's concern altogether.

Q. HOW SHOULD THE COMMISSION RULE ON THIS ISSUE?

A. The Commissions should dismiss the CLECs concerns regarding the staffing level required to comply with the *TRO*. First, Qwest has made the commitment to comply with the *TRO* and the associated transitional timeline. Second, Qwest's record of performance over the last several years has shown that Qwest can and will continue to perform at a very high level of quality in provisioning analog loops. Third, Qwest has committed to include BHC performance in with other analog loop orders for performance tracking, which will provide an objective level of performance for all to evaluate. Based on these facts, Qwest has built in incentives to ensure that proper staffing is in place to comply with both the state and Federal rules. The Commission should affirmatively find with respect to issues SC-1 and SC-5 that Qwest's proposed BHCP will allow it to meet the anticipated demand of batch hot cuts at an acceptable level of quality.

N. IMPASSE ISSUE T-1 (PROCESS TESTING)

Q. DESCRIBE IMPASSE ISSUE T-1 FROM EXHIBIT

A. The CLECs uniformly stated that before the Commission can approve Qwest's proposed BHCP, that there must be evidence that the process works in a commercial setting. AT&T argued that Qwest must conduct a 271 like third-party test.[95] MCI asserted that Qwest should submit the BHCP to commercial orders from CLECs.[96] Various state staff members that attended the BHC Forum phrased it differently. They stated that Qwest must have demonstrable proof that its proposed BHCP will work. The Staff members believed that this evidence could be presented through analogous work activities showing that Qwest can ramp up for new volumes and perform well. In the BHC Forum, Qwest affirmatively stated that it did not believe a formal third party test was required, but that it would come forward with affirmative evidence.

Q. WHAT MUST THE STATE COMMISSION FIND WITH RESPECT TO THE BHCP AND HOW MUCH TIME DOES IT HAVE TO COMPLETE THE PROCESS?

---

[95] 12/3/p4 Tr. 705:6 (John Finnegan - AT&T) "[O]ur preference is that there be some sort of testing process that uses existing Qwest customers with potential monitoring by either the commissions or some independent third party to prove or disprove the notion that Qwest can keep up with the batch hot cut volumes.

[96] 12/3/04 Tr. 706:9 (Sherry Lichtenberg - MCI) "MCI does not think that a third-party test is required, but MCI does believe that ... the commercial operation with the ability to look at performance and with distinct performance metrics and remedies is the way to go ... our idea of testing is not a third party test ... It's commercial day-to-day activity."

A. The FCC found that state commissions must "approve and implement a batch cut migration process" within 9 months of the effective date of the *TRO*.[97] In other words, the Commission must have approved, and Qwest must have implemented a BHCP by July 2, 2004. Under this timeline, the 271'esque test suggested by AT&T is simply not a realistic alternative. That does not mean, however, that the Commission must take Qwest on faith.

Q. HAS QWEST PRESENTED EVIDENCE THAT ITS BHCP WORKS IN A COMMERCIAL SETTING?

A. Yes. Qwest has presented the results of a third party evaluation performed by Lorraine Barrick and Hitachi Consulting. Their review began in November 2003, and has consisted of many elements including:

- Gaining an understanding of the existing hot cut process;
- Studying Qwest's hot cut performance to date;
- Reviewing the proposed BHC process, as well as public CLEC comments and concerns regarding that process;
- Making recommendations for process improvements;
- Comparing the current hot cut process to the proposed BHC process;
- Developing a testing plan to be used to judge the quality and efficiency of the proposed BHC process; and,
- Testing the BHC process with four batches of approximately 25 lines each.

---

[97] *TRO* at ¶423.

After completing this work, Ms. Barrick concludes that Qwest's BHCP works, creates efficiencies for Qwest and the CLECs, and allows Qwest to continue to provision analog loops to CLECs at a very high level of quality. This is the exact type of commercial test that MCI suggested in the BHC Forum. This is the type of "demonstrable evidence" that the state staff members stated they wanted.

Q. DOES QWEST HAVE OTHER EVIDENCE THAT IT CAN PROVISION ANALOG LOOPS USING THE BHCP AT AN ACCEPTABLE LEVEL OF QUALITY?

A. Yes. As described above, ever since the QCCC opened in mid-2001 – over 2 and ½ years ago now – Qwest's audited and reconciled performance measures show that Qwest has been providing CLECs with access to unbundled loops at an extraordinary level of quality. This high level of performance occurs even when Qwest has provisioned well over 1500 analog loops on a given day. Qwest's current performance shows:

1. Over 97% of its installation commitments met (OP-3).
2. Over 97% of the analog loops installed do not experience any trouble within 30-days (OP-5).
3. Less than 1% of the analog loops in service experience any trouble (MR-8).
4. Over 95% of troubles on the loops are cleared within 24 hours (MR-3).
5. The average amount of time it takes Qwest to cure a trouble on an analog loop is less than 6-hours (MR-6).

This performance is nothing short of outstanding, and while it may not be enough standing alone, is indicative of the level of commitment shown by Qwest to provisioning and maintaining analog loops for CLECs in a commercial environment.

Q. PLEASE SUMMARIZE YOUR TESTIMONY ON IMPASSE ISSUE T-1.

A. Qwest has presented historical performance data as well as the review and test of the BHCP by an independent third party. The evidence shows Qwest's BHCP works, and works well. Thus, the Commission has substantial evidence that Qwest's proposed BHCP works, and will allow Qwest to continue to provision analog loops at an acceptable level of quality. The Commission should formally approve Qwest's proposed BHCP.

IX. LOOP PROVISIONING IMPAIRMENT ANALYSIS

Q. DOES THE PROPOSED BHCP MITIGATE ANY CONCERN THAT QWEST'S ABILITY TO PROVISION STANDALONE UNBUNDLED LOOPS WOULD SOMEHOW IMPAIR CLECS FROM SERVING THE MASS MARKET WITHOUT UNBUNDLED SWITCHING?

A. Yes. The FCC stated that the purpose of adopting a BHCP is "to reduce the economic and operational barriers posed by the present hot cut process."[98] The

[98] *Id.*

BHCP that Qwest has proposed meets all of the FCC's standards and will accomplish that task:

- *It reduces provisioning delays.* (*TRO* ¶ 488, 512) The BHCP gives CLECs a predictable seven-day provisioning interval for batches of 25-100 loops, whereas today they must negotiate intervals for projects of this size on an individual case basis. As noted above, the FCC and this Commission have already found in the section 271 process that a seven-day interval for batches just under this size range gives CLECs "a meaningful opportunity to compete." Being able to receive even larger batches of loops within the same time frame provides a significant competitive benefit to CLECs. With respect to individual customer cutovers, the BHCP gives CLECs the ability to receive *instantaneous* notification that cutovers are complete simply by using functionality already existing in their switches, thereby reducing customer outage times to the minimum possible.

- *It is seamless.* (*TRO* ¶ 487) Qwest already provisions stand-alone unbundled loops at an outstanding level of performance, and the BHCP only strengthens that process further. The BHCP streamlines and automates the flow of information within Qwest and the communication of information to CLECs. It rationalizes the central office technicians' work and their movement through the central office, and it avoids the need for them to interrupt their work after each cut to communicate with the QCCC.

- *It reduces costs.* (*TRO* ¶ 487, 512) As the testimony of Terri Million explains in more detail, the BHCP's process improvements significantly reduce the amount of QCCC and technician time required to perform an individual hot cut. The BHCP also realizes the efficiencies gained when performing at least 25 hot cuts in the same location at the same time and consolidating certain tasks for the entire batch. As Ms. Million explains, how these savings flow through to CLEC charges turns on how a state commission has permitted Qwest to recover its costs in the past and what it authorizes for the BHCP. But given that existing hot cut prices *already* permit an efficient CLEC economically to enter the markets where Qwest is seeking a "no impairment" finding (as demonstrated by the CPRO model presented in other Qwest testimony, which uses *current* coordinated cut rates in its calculations), there is no reason to think the prices set for the BHCP will create a problem — especially since all current hot cut options will remain available.

In addition, the BHCP reduces a CLEC's costs beyond the price it pays to Qwest. The BHCP gets rid of the CLEC's current need to negotiate a schedule and interval for each batch of 25 or more lines on an individual case basis, and eliminates *all* up-front coordination with Qwest save for the overall

transition planning required by the *Triennial Review Order* in the event of a "no impairment" finding. The BHCP also eliminates the need for repeated, expensive telephone calls between the CLEC and the QCCC and makes status information available electronically, allowing for further mechanization on the CLEC's side. The expected volume of conversions does require CLECs to be less sloppy about delivering dial tone to Qwest on time than they are today in order to take advantage of the streamlined process; however, the CLECs at the BHC Forum all agreed that it was reasonable to insist on such a commitment, which in any event does not change the amount of work the CLEC has to perform

- *It can handle the expected volumes of hot cuts if unbundled switching is no longer available.* (*TRO* ¶ 489) The incremental daily volume of hot cuts that Qwest would have to perform in the highly unlikely, worst of all worst-case scenarios — assuming a 100 percent conversion to unbundled loops in all markets where Qwest is seeking a "no impairment" finding, no slowing of growth, and all conversions of existing and new customers being run through the BHCP — is simply not that great when spread over the FCC's very long ramp-up and transition period, and the QCCC and central office staffing increases that would be required are readily achievable. Moreover, Qwest can perform this incremental activity with dedicated teams outside of usual business hours, meaning that dedicated teams would not be encumbered with normal central office work. Hitachi Consulting has reviewed Qwest's performance on existing project orders and agrees the proposed BHCP appears workable and scalable.

Q. ARE THERE ANY OTHER BARRIERS ASSOCIATED WITH LOOP PROVISIONING THAT WOULD IMPAIR CLECS' ENTRY INTO THE MASS MARKET EVEN AFTER ADOPTION OF THE BHCP?

A. No. The FCC asked state commissions "to consider more granular evidence concerning the incumbent LEC's ability to transfer loops in a timely and reliable manner" — in particular, "to determine whether incumbent LECs are providing nondiscriminatory access to unbundled loops."[99] This is exactly the same inquiry

[99] *TRO* ¶ 512.

that the state commissions and FCC have already undertaken in connection with Qwest's section 271 applications.[100] The *Triennial Review Order* acknowledges this parallel and specifically permits state commissions to rely on the section 271 records when considering the performance of a BOC: "For incumbent LECs that are BOCs subject to the requirements of section 271 of the Act, states may choose to rely on any performance data reports and penalty plans that might have been developed in the context of a past, pending, or planned application for long-distance authority."[101]

The FCC specifically found in connection with all fourteen of Qwest's section 271 applications that Qwest in fact provided "[n]ondiscriminatory access" to unbundled network elements as required by checklist item 2.[102] More specifically, in connection with checklist item 4, the FCC reviewed Qwest's third-party audited performance data (found "accurate and reliable" by Liberty Consulting) and concluded in all fourteen states that Qwest was meeting all of its legal obligations with respect to its provisioning of unbundled analog mass-market loops.[103] Finally, the FCC concluded that Qwest had an adequate performance plan in all fourteen states backing its performance measures up with stringent penalties

---

[100] Item 2 of the section 271 competitive checklist requires a BOC to provide "[n]ondiscriminatory access to network elements in accordance with the requirements of sections 251(c)(3) and 252(d)(1) of the Act." 47 U.S.C. § 271(c)(2)(B)(ii). Checklist item 4 addresses unbundled loops in particular. *Id.* § 271(c)(2)(B)(iv).

[101] *TRO* ¶ 512.

[102] *See Qwest 9-State 271 Order* ¶ 33; *Qwest 3-State 271 Order* ¶ 33; *Qwest Minnesota 271 Order* ¶ 12; *Qwest Arizona 271 Order* ¶ 12.

[103] *See Qwest 9-State 271 Order* ¶ 348; *Qwest 3-State 271 Order* ¶ 93; *Qwest Minnesota 271 Order* ¶ 53; *Qwest Arizona 271 Order* ¶ 26.

for missed performance.[104] The FCC's findings for North Dakota were in accord with what this Commission found in its own review of the state data.

Q. WHAT SPECIFIC LOOP PROVISIONING PERFORMANCE DATA DOES THE *TRIENNIAL REVIEW ORDER* ASK STATES TO REVIEW?

A. The FCC asked the states to look for "consistently reliable performance in three areas: (1) Timeliness: percentage of missed installation appointments and order completion interval; (2) Quality: outages and percent of provisioning troubles; and (3) Maintenance and Repair: customer trouble report rate, percentage of missed repair appointments, and percentage of repeat troubles."[105]

Q. WHAT DOES QWEST'S PERFORMANCE DATA SHOW WITH RESPECT TO PROVISIONING TIMELINESS?

A. Qwest's historic regional performance in provisioning unbundled analog loops is outstanding. The data shows that each month Qwest provisions in excess of 15,000 analog loops and consistently provisions in excess of 98% of its installation commitments. See OP-3 to Exhibit DP-8. This far exceeds the 90% of commitments that the CLECs agreed would provide them a meaningful opportunity to compete. Moreover, in 11 of the last 12 months, Qwest average installation

---

[104] *See Qwest 9-State 271 Order* ¶ 453; *Qwest 3-State 271 Order* ¶ 119; *Qwest Minnesota 271 Order* ¶ 69; *Qwest Arizona 271 Order* ¶ 51.

[105] *TRO* ¶ 512 n. 1574.

interval has been just over 5 days, well below the 6-day benchmark the CLECs agreed would provide them a meaningful opportunity to compete. Id. at OP-4.

Q. WHAT DOES QWEST'S PERFORMANCE DATA SHOW WITH RESPECT TO PROVISIONING QUALITY?

A. Qwest's existing performance measures also track the frequency with which a CLEC experience trouble on an analog loop within 30 days of provisioning. Qwest's regional performance data shows that CLECs routinely experience an installation trouble on less than 2% of newly installed analog loops. Id at OP-5 and OP-5*. This is better than the 95% standard set by the FCC, and substantially better than the retail parity standard agreed to by the CLECs in the Section 271 process.

Q. WHAT DOES QWEST'S PERFORMANCE DATA SHOW WITH RESPECT TO MAINTENANCE AND REPAIR?

A. Qwest's historical performance in maintaining unbundled analog loops is equally impressive. Qwest clears out of service troubles within 24 hours between 95% and 99% of the time. See Exhibit DP-8 at MR-3. Qwest always clears troubles within 48 hours is over 99% of the time. Id. at MR-4. CLECs experience repeat troubles less than 11% of the time, which is substantially better than retail parity. Finally, far fewer than 1% of analog loops experience troubles of any kind. In fact, Qwest tracks 12 aspects of its maintenance and repair performance each month, and for

each of these measures in each of the last 12 months, Qwest has provided service at or better than it provides to equivalent retail customers. The CLECs agreed they could compete at retail parity.

Q. WHAT CONCLUSION SHOULD THE COMMISSION DRAW WITH RESPECT TO THIS DATA?

A. The data demonstrate that Qwest is providing nondiscriminatory access to unbundled analog loops, and that it can transfer these loops in a timely and reliable manner. Qwest's performance in this regard has been consistently strong and reliable. Again, the FCC drew exactly the same conclusions from this performance data in the section 271 process. The CLECs have no operational barrier in obtaining unbundled analog loops from Qwest, and the Commission should so find.

Q. DOES THIS CONCLUDE YOUR TESTIMONY?

A. Yes.

FINAL BATCH HOT CUT PROCESS FORUM ISSUES MATRIX

PROCESS ISSUES - EFFICIENCY					
ISSUE #	**ISSUE DESCRIPTION**	**QWEST POSITION**	**CLEC POSITIONS**	**HISTORY**	**RESOLUTION/RATIONALE**
P-1 (see also P-10)	Method of Initiation of a Batch Hot Cut request	The Hot Cut process is initiated by the CLEC LSRs - See also, supplemental information in "History" column	a. CLECs should be able to initiate the batch via e-mail notification that would include Central Office, project date and time, number of customer accounts, and lines involved. Qwest would respond via e-mail with the project code and a confirmation of the date which would trigger the CLEC issuing its LSR. (AT&T p. 15) b. Clarify the timing for the pre-order negotiations with CLECs for submitting orders – how is the process kicked off? What is the interval for these negotiations? (MCI-Forum) In what release will the OSS modifications be included? (MCI – Forum)	1/6/2004 – Entering a "B" on the CHC Field on the LSR will identify the orders as being associated with a batch. Entering a "B" in that field will also drive CLECs to the scheduling tool where they will schedule a day for the batch to be cut. CLECs no longer a need to provide a Project ID number. This change will require OSS modifications – likely will be included in Release 16.0 (scheduled for Oct./Nov. 2004)	1/6/2004: CLOSED. Qwest will modify an existing field on the LSR (the CHC field) to indicate a batch that will include reservation number and date – information will be included on FOC. If order is rejected, reservation is not lost if the order is resubmitted within the standard interval, the same reservation number can be used. Subject to OSS change that will be prioritized in the 16.0 Release and to the extent that this OSS change impacts other items in the 16.0 release, it will be addressed in CMP. 1/6/2004 - MCI agrees to CLOSE pending development and testing of the software change to ensure it works. 1/6/2004 - AT&T and McLeod agree to CLOSE. 1/6/2004 - Sub Issue P-1b

**NOTE: Shaded items are closed issues.

					Wolters
P-5	Whether the Batch Hot Cut process should include loops provisioned over IDLC.	IDLC loops are handled using the standard hot cut process. Orders that are provided over IDLC are C-Jeop'd back to the CLEC if those orders are included in the Batch. To include these types of orders in a Batch eliminates the efficiencies the Batch process was designed to provide (due to requirement to roll a truck) Qwest will convert 10 UNE-Ps that are provisioned over IDLC loops per day per Remote Terminal within a Qwest Network Manager's area. Qwest will provide CLECs with an electronic spreadsheet of all CLEC customers, by central office, that are served via IDLC. Timing – for those markets where there is a finding of "no impairment," the spreadsheet will be provided to CLECs prior to the time when they must transition their lines.	IDLC should be included in the hot cut process. (AT&T – p. 16-19); (MCI – p. 4); (Eschelon – p. 15); (McLeod at 1) MCI would propose building a look-up table in Qwest OSS and reject those orders when they are submitted and providing information regarding IDLC and RT location. (MCI – Forum) AT&T proposal – AT&T is not proposing that IDLC be a part of the batch – what they are proposing is that when CLECs send over UNE-P's for conversion that Qwest identify whether the service is provided over IDLC, have those orders drop out of the Batch and automatically convert them under the standard hot cut process. If IDLC results in delay of customer migration to UNE-Loop, will Qwest continue to charge UNE-P rates until that customer can be migrated? (Gates – MCI – Forum)	IMPASSE - as to including IDLC loops in the batch - MCI (but MCI will consider Qwest's proposal to provide the IDLC information in advance of requirement to transition) 12/12/2003 – Remains at IMPASSE IMPASSE - as to action to be taken when loops submitted by the CLECs are provisioned over IDLC – should those orders automatically move to standard hot cut or should the order be c-jeop'd back to the CLEC by Qwest CLOSED– 12/10/2003: CLEC would be billed the UNE-P rate until the completion and acceptance of then UNE-Loop service conversion.	12/12/2003 - IMPASSE - as to including IDLC loops in the batch - MCI 12/12/2003 - IMPASSE - as to action to be taken when loop submitted by the CLECs are provisioned over IDLC – automatic move to standard hot cut or c-jeop of the order by Qwest CLOSED– 12/10/2003: as to the MCI question regarding what rates would apply pending migration of the CLEC to UNE-Loop.

Transcripts for all Batch Hot Cut Forums are located under the "Forum Transcripts and Exhibits" pulldown menu at:
http://www.qwest.com/wholesale/training/tradeshow/batchhotcutarchive.html

**NOTE: Shaded items are closed issues.

		Response to AT&T proposal – to handle in that manner, requires manual intervention and additional steps that impact efficiencies the Batch Hot Cut was designed to provide.			
P-6a	Whether the Batch Hot Cut process should include line split loops.	Line split loops are not included in the batch process, rather they are handled using the standard provisioning process.	Line splitting should be included in the hot cut process. (AT&T – p. 16-19); (MCI – p. 8-9); (Eschelon – p. 15); (Covad – p. 4);	12/3/2003 - OPEN – Qwest and Covad will meet to create a diagram depicting the various network connections required in a Line Splitting/Loop Splitting arrangement. – Diagrams completed – see BHC Forum Exhibit 4	12/12/2003 IMPASSE as to both P-6a and P-6b– for MCI, Cov Eschelon & AT&T
P-6b	Whether the Batch Hot Cut process should include UNE-P with ancillary DSL.	Requires changing the service from a non-design service to a design service – thereby eliminating some of the efficiencies the Batch process was designed to provide.	Covad agrees that this issue applies for the embedded base only and does not apply for new line splitting/loop splitting orders (Covad – Forum)		
P-7	How does the Batch Hot Cut process address situations where the end-user customer is served via exchange cable?	Batch Process will not include situations where customers are served via exchange cable because it cannot be unbundled – it is a truck side connection. CLECs can, however, use an EEL or they can collocate in the remote office. If CLECs are collocated in the remote, they can participate in the batch process	A batch appropriate process should be provided to address these situations (Eschelon MN- p. 11) Currently, Qwest rejects orders when the customer is served via exchange cable (Eschelon – Forum)	12/3/2003 OPEN - Qwest will provide a technical reference where exchange cable is defined/explained. CLECs will then review that information and provide position at next meeting of the Forum. 12/12/2003 Qwest will provide information at 12/19/2003 meeting of the Forum 12/17/2003 – Qwest Response: EX Cable - EX cable is cable that is identified due to its origination from a remote office switch. This cable	1/6/2004 - AT&T and MCI agree to CLOSE as to the issue of end user customers served via exchange cable not being included in the batch process.

Transcripts for all Batch Hot Cut Forums are located under the "Forum Transcripts and Exhibits" pulldown menu at:
http://www.qwest.com/wholesale/training/tradeshow/batchhotcutarchive.html

**NOTE: Shaded items are closed issues.

			Provide URL that contains a listing of the locations for all Qwest remotes sites (Clauson – Eschelon – Forum)	cannot be assigned from the Host office as there is no assignable connection between the host and remote switches. To access EX cables as Unbundled Loops a collocation must be established at the remote location. 12/19/2003 – Further Qwest Response – Qwest will post a diagram of this situation prior to the next Forum. 1/6/2004 – Qwest provided Exhibit 8 – which is a diagram of EX cable. Qwest will clarify in which remote collocation arrangements CLECs can use the batch hot cut process. 12/10/2003: The principle question coming from discussion at the Forum involved exchange cable and was: in a situation involving a host/remote switch relationship where an umbilical connects the host to a remote switching unit in the same Wire Center, can the Batch Hot Cut process be used? The answer depends on whether the premise that houses the remote switch is in a wire center where there is sufficient capacity such that	

Transcripts for all Batch Hot Cut Forums are located under the "Forum Transcripts and Exhibits" pulldown menu at:
http://www.qwest.com/wholesale/training/tradeshow/batchhotcutarchive.html

**NOTE: Shaded items are closed issues.

				no field technician dispatch is required. If a field dispatch is required, the Batch Hot Cut process may not be used; if not, it may be used so long as the prerequisites for a batch are satisfied for that wire center. It should be noted that in this instance, it is mandatory that the CLEC be collocated in the premises containing the remote switching unit. Qwest posts information on remote switches on the ICONN database www.qwest.com – Wholesale – Network Databases. It lists all of the host-remote relationships. Network Disclosures are also posted on the website and would include plans for future remote deployments. Information is also available in the Raw Loop Data Tool (RDLT). 12/10/2003 Information on Qwest remote switching sites can be found on the ICONN database – and can be searched by an entire state or by a specific CO within a state. If the 9th character of the CLLI is an "R" it is a remote or you can chose the "host/remote" correlation report at URL:

P-8	Whether the Batch Hot Cut process applies if an outside technician dispatch is required.	The Batch Hot Cut Process is limited to use of existing facilities that do not require an outside technician dispatch. It is Qwest's position that the efficiencies gained in the batch hot cut process would be lost if outside technician dispatch is required.	If the assumption that the batch process will be limited in every case to situations that do not require an outside technician dispatch, this is still an open issue for Eschelon	12/3/2003 OPEN – Eschelon will consider whether they will continue to pursue this position in light of discussion at 12/2/2003 meeting of the Forum. Eschelon will provide feedback at the next meeting of the Forum.	12/12/2003 – IMPASSE for Eschelon as to the issue of including in the batch those orders that require an outside technician dispatch.
P-9	How does the Batch Hot Cut process address CLEC-to-CLEC migrations? CLEC-to-ILEC? CLEC UNE-P to UNE-L (same CLEC) CLEC UNE-P to UNE-L (different LEC)	Qwest will utilize the same overall Batch Hot Cut process in each situation to the extent that conversion volumes are sufficient to qualify as a batch. Batch Hot Cut Process does not apply to situations in which a facilities-based provider has overbuilt Qwest facilities. This situation would be a New order and, therefore, not considered as a candidate for the Batch Hot Cut Process. For conversions from UNE-L to UNE-L (different CLECs) – Qwest would only move the	Qwest needs to explain how it will incorporate CLEC-to-CLEC migrations into a batch project. (AT&T – p. 19) Qwest must define "sufficient volumes" for CLEC-to-CLEC migrations. (MCI – p. 7) CLEC to CLEC migrations must also be included in the Batch Hot Cut process, in addition to Qwest Retail to UNE-L; Resale to UNE-L; Centrex/IFB to UNE-L. (McLeod – p. 1)		1/7/2004 - CLOSED - MCI – agrees to close this issue – Sherry Lichtenberg AT&T – agrees to close this issue – Rick Wolters McLeod – agrees to close this issue – Patty Lynott

		facility from one CLECs collocation to the other CLECs collocation and this would be included in the batch hot cut process. For CLEC to ILEC conversions (winback) –will not be included in the batch process.			
P-10 (See also P-1)	Order placement methods, flow-through and service order accuracy	CLECs submit their orders for a Batch Hot Cut using the existing LSR process, with the "BHC" plus CLEC ZCID project number, whether that is through the GUI or EDI interface. Qwest response to sub-issues in CLEC Position Column: **1.** CLECs can use either EDI or GUI to submit batch hot cut orders. **2.** CLECs will not be required to manually generate spreadsheets **3.** Batch Hot Cut Orders are flow-through eligible. Batch Hot Cut LSRs will flow-through in accordance with existing flow-through standards.	**1.** CLECs should be able to use either EDI or GUI to submit orders. **2.** CLECs should not be required to manually generate spreadsheets. **3.** Orders should flow through. (MCI-p. 5 & 9); (McLeod at 2) **4.** Efficient submission will likely require development of new ordering capabilities – sending individual LSRs for multiple orders should not be considered a "batch." . (Eschelon p. 12) Clarification by Eschelon - Eschelon would like Qwest to put in place an interface to the GUI and EDI for Batch Hot Cuts that would take the place of LSR-by-LSR entry. Or, in the alternative, give CLECs the capability of sending an electronic spreadsheet directly to the QCCC. (Eschelon –	MCI agrees to close as to the first 3 sub-issues (in CLEC Position column) McLeod agrees to close the first 3 sub-issues pending discussion of scalability issue. 12/3/2003 - On Sub-Issue 4 - Eschelon will take back and determine if it will continue to pursue asking for an alternative to submitting individual LSRs e.g., spreadsheet functionality. 12/12/2003 - Given discussion at last Forum, Qwest position is that taking a mechanized process and taking a step backward to a manual spreadsheet or to re-mechanize in another fashion is not something	12/12/2003 - MCI agrees to close as to the first 3 sub-issues (in CLEC Position column) 12/12/2003 - McLeod agrees to close the first 3 sub-issues pending discussion of scalability issue. 12/12/2003: IMPASSE as to ESCHELON issue (#4) – regarding alternative to submitting individual LSRs e.g., spreadsheet functionality.

**NOTE: Shaded items are closed issues.

				lines may be on multiple blocks on the frame, reduces the efficiencies of the process.	
P-12	Impact on Batch Hot Cut Process of migration by telephone number change request	The "migrate by TN" capability covered by CMP CRs SCR061302-01 and SCR022703-18 address only orders where the "to" product is UNE-P.	Batch Hot Cut process should allow CLECs to "migrate by telephone number." (MCI – p. 10) MCI views this as a critical requirement (MCI – Forum)	12/3/2003 - OPEN – pending Qwest take back on technical capability issues associated with making TN migration capability available for batch hot cuts. 12/10/2003 Qwest Response: There is no technical limitation precluding Qwest from modifying the edits in IMA to allow CLECs to enter TN and SANO for UNE-P to UNE-Loop conversions. Systems changes to accomplish this modification are required to go through Change Management. MCI submitted a CMP CR (SCR120403-01) requesting this change on December 4, 2003. There is, however, a technical limitation that would prevent migration by TN from UNE-Loop to UNE-Loop as in that instance, the TN does not reside in Qwest databases. 12/12/2003: Further Qwest response: This CR would be eligible	1/6/2004 – IMPASSE as to MCI issue of not providing CLECs with the capability, in the Batch Hot Cut process, to "migrate b telephone number and SANO

				for inclusion in IMA Release 16.0 which is tentatively scheduled for August 2004. To have it declared as a ***regulatory*** CR, requesting party must provide the docket number and verbiage from the regulatory order in that docket that mandates the activity. QWEST WILL TAKE BACK the questions of whether or not it considers this a regulatory mandate? If so, would Qwest oppose the change? Is it an option for the CR to be escalated in its implementation to a release sooner than IMA 16.0 via the CMP exception process? 1/6/2004 – As to MCI's question about whether Qwest will support or oppose the "migrate by TN" CR as a regulatory change – Qwest will embrace the spirit of a Commission order that may, at the end of the 9 month proceeding, direct such a change –it cannot support "migrate by TN" as a ***regulatory*** change because in order to be a ***regulatory*** change, the requirement must have a docket number **and** order associated with it. Qwest is not including the "migrate by TN" in its current Batch

				Qwest response: based on CLEC concerns, Qwest's counter-proposal is that, in a 7-day interval –order submittal on day 0 and FOC also on Day 0 if Order is received before 7:00 p.m. CLECs will have translations work complete by midnight on Day 1 the Record Issue Date (RID), Qwest will perform its pre-wire work on days 2-3, will test for dial tone, and will notify the CLECs, via the web-based status tool of any "no dial tone" situations. If the "no dial tone" situation is as a result of translations, then CLECs have until the end of Day 6 to remedy. If the "no dial tone" situation is as a result of a defective CFA, CLECs have until 7:00 p.m. on Day 4 to supplement their order with the new CFA to permit the order to remain in the batch. On Due Date, Qwest will perform a dial tone & ANI test and, if there is no dial tone at that time, the order will go into a customer not ready jeopardy status and will be removed from the batch. (Counting for interval purposes begins on Day 1.) SEE BHC Forum Exhibit 10 for timeline diagram.

**NOTE: Shaded items are closed issues.

				1/7/2004 – MCI - Subject to seeing the process in flow-chart form, MCI supports this new proposal as good process. 1/7/2004 – AT&T position is that this is an improvement from a dial tone check and CFA change perspective. AT&T needs to take back the issue of how the requirement to have translations established by midnight on Day 1 is something that can be accommodated by AT&T's processes. As to these modifications and their impact on the status tool, AT&T doesn't want to deal with different systems and interfaces – prefer to keep things on EDI from a statusing perspective. The web-based status tool requires CLECs to check 100% of the orders, e-mail, conceptually, requires CLECs to query orders only on an exception basis. 1/7/2004 – McLeod finds that the new proposal works well to resolve the Dial Tone and CFA issues.	

Transcripts for all Batch Hot Cut Forums are located under the "Forum Transcripts and Exhibits" pulldown menu at:
http://www.qwest.com/wholesale/training/tradeshow/batchhotcutarchive.html

**NOTE: Shaded items are closed issues.

				McLeod still wants to discuss the interval associated with the Batch. 1/7/2004 – AT&T will have the switch translations done within the timeframe provided for in the proposal. AT&T agrees there is sufficient time to remedy no dial tone situation and CFA issues. 1/7/2004 – MCI also finds the new proposal acceptable. 1/7/2004 – Covad finds the new proposal acceptable.	
P-18 (See also P-17, P-19 & P-28)	What is the appropriate time to pre-wire the CLEC CFA?	12/19/2003 – In response to CLEC feedback during the Forum, Qwest has agreed to move the pre-wire of the CLEC CFA to the Design, Verify and Assign date	Pre-wiring must have at least one (1) day lead time from the batch project due date. (AT&T – p. 8)		12/19/2003 – CLOSED Sherry Lichtenberg on behalf of MCI agrees to close. Karen Clauson on behalf of Eschelon agrees to close. Rick Wolters on behalf of AT&T agrees to close.
P-19 (See also P-17, 18, & P-28)	What is the appropriate timing for Qwest to perform a dial tone check?	Qwest proposes that technicians perform test for dial tone on the day of the cut and require CLECs to remedy any "no dial tone" situation within one hour.	Performing this test on the day of the cut leaves insufficient margin for error. One hour is often not sufficient time to resolve a lack of dial tone issue. (AT&T – p. 9) MCI requests dial tone check 2 days prior to cut. (MCI – pp. 10 & 12)	12/19/2003 – IMPASSE as to 48 hour dial tone check 1/7/2004 – Re-opened – CLECs want Dial Tone check done at due date minus 2 and that it would be a reasonable compromise, if that check is performed, to automatically pull the order from the batch if there is no dial tone on the date of the cut	1/7/2004 – Based on Qwest counter-proposal (See Issue P-17), AT&T agrees to CLOSE this issue. 1/7/2004 – Based on Qwest counter-proposal (See Issue P-17), MCI agrees to CLOSE this issue.

Transcripts for all Batch Hot Cut Forums are located under the "Forum Transcripts and Exhibits" pulldown menu at:
http://www.qwest.com/wholesale/training/tradeshow/batchhotcutarchive.html

**NOTE: Shaded items are closed issues.

			Eschelon wants the dial tone check 48 hours in advance, and believes the one hour window to remedy issues may be insufficient. (Eschelon – p. 17)	(no 2 hr. window for CLECs to remedy on day of cut) Qwest agreed to take back over the morning break 1/7/2004 – See Qwest counter-proposal at Issue P-17	1/7/2004 – Based on Qwest counter-proposal (See Issue P-17), McLeod agrees to CLOSE this issue. 1/7/2004 – Based on Qwest counter-proposal (See Issue P-17), Covad agrees to CLOSE this issue.
P-20	Requirement for Central Office Technician to call RCMAC to work the disconnect of the UNE-P line	The Central Office Technician does not call the RCMAC today. This is not customer service impacting. As long as the port has been set and the CLEC performs its LNP work, the customer will have the ability to receive calls even if the disconnect work at the RCMAC has not completed.	Proposed Batch Hot Cut process eliminates the central office technician's call to the RCMAC to work the disconnect – results in customer working on two switches for a period of time – and inability to receive calls. (Eschelon MN P. 12)	12/3/2003 OPEN 1/7/2004 – today the CO technician does not call RCMAC to execute the disconnect order. Eschelon's statement that the customer is served by two switches for a period of time is inaccurate. Qwest presets its triggers and when the CLEC executes its subscription to port will occur.	1/7/2004 – MCI agrees to CLOSE. 1/7/2004 – AT&T agrees to CLOSE. 1/7/2004 – McLeod agrees to CLOSE. 1/7/2004 – Covad agrees to CLOSE.
P-21a	If one line is removed from the batch, and that line is part of a multi-line customer, should all lines for that customer be removed from the batch?	Multi-line customers have related orders on a single LSR. If one of the lines has no dial tone and CLEC is unable to resolve the no dial tone issue, all related orders on the LSR for the multi-line customer will be pulled from the batch. CLECs will receive a jeopardy notification and must submit a supplemental LSR to work the	AT&T believes the entire customer should be removed from the batch. (AT&T – p. 10).	12/3/2003 OPEN 1/7/2004 – AT&T would be willing to close if Qwest is willing to document the process that is followed when one order falls out on an LSR and that it is the CLECs responsibility to work back when there are a series of related orders. Qwest accepts and will commit to documenting the process	1/7/2004 – AT&T agrees to CLOSE 21a.

		hour window applies. The below URL provides information on the CNR process. http://www.qwest.com/wholesale/clecs/provisioning.html	batch? (Clauson – Eschelon – Forum)	12/19/2003 – Qwest will take back providing a response the specifically address how a Customer Not Ready situation will be handled. 1/7/2004 – Qwest provided an explanation of the process for addressing a Customer Not Ready Situation. Based on explanation – AT&T, MCI, McLeod and Covad agree to CLOSE 21d	
P-22	Does the process have a step to prevent premature disconnection of a line in a "no dial tone" condition?	Yes – if there is a no dial tone condition, and the line is part of a multi-line customer, all lines on the LSR will be jeop'd and the cut will not occur. If the customer has multiple CSRs,, then it is the responsibility of the CLEC to make sure the LSRs associated with each other are related.	Is there a process that would automatically remove a multi-line customer from the batch in the event there is trouble found on a single line within that customer's multi-line group? (AT&T – p. 10) Provide the CLECs with the citation to PCAT or other documentation on what happens with a single LSR and also what happens when there are related lines on multiple LSRs and a single line for a multi-line customer experiences no dial tone (Lichtenberg – MCI and Finnegan-AT&T – Forum)	AT&T thinks may be able to close this issue if Qwest can provide the citation to the documentation that describes what happens when a single line on a single LSR is found to have no dial tone. Qwest will take back – providing the CLECs with the citation to PCAT or other documentation on what happens with a single LSR and also what happens when there are related lines on multiple LSRs and a single line for a multi-line customer experiences no dial tone Qwest will also take back – whether CLECs using an RPON to relate the orders results in the orders falling	1/7/2004 – AT&T agrees to CLOSE 1/7/2004 – MCI agrees to CLOSE

		would then need to be input into the SOP (Step 5), then designed (Step 9) before verification of the order by QCCC occurs (Step 10).	Verification/Qualification) to occur immediately after current step 3. There is no reason to proceed further if the order does not qualify for the BHC process (Gates – MCI – Forum)		
			SCALABILITY – VOLUMES		
SC-1 (See also SC-5)	Can Qwest's proposed process handle anticipated volumes?	The Batch Hot Cut process is scalable, which will allow Qwest to meet current and future demand. In considering volumes that may have to be handled by the Batch Hot Cut Process, Qwest has considered the embedded base as well as incremental growth similar to what AT&T has suggested. An additional assumption is that in the event there is a finding by state commissions of impairment,, or in markets where Qwest does not seek to challenge the presumption of impairment, then Qwest will continue to provide UNE-P. All of these assumptions will form the basis for the volumes that can be anticipated. Qwest will be prepared in the near future to put forward	Qwest needs to provide more evidence to establish this point. (AT&T – p. 12) Qwest needs to identify the number of batches that it can handle per Central Office, per state and per region. (Eschelon – p. 17) Qwest must clarify the maximum/minimum line volumes per day per CLEC for the Batch Hot Cut (McLeod – p. 1) The daily line count threshold that Qwest can manage for its retail unit must be provided, and parity established. (McLeod – p. 2) Are there limitations on the number of UNE-P to UNE-L lines that can be migrated for a single account? (MCI – Forum) Clarify the relationship of and	12/3/2003 OPEN - For SC-1 in total, Qwest will take-back – providing parties with the assumptions that form the basis for its proposed volume estimates. Qwest will also provide additional information on assumptions for staffing levels for the anticipated volumes. Qwest is not placing limits on the number of UNE-P lines that can be migrated for a single account.	1/7/2004 – IMPASSE as whether Qwest's propos process can handle anticipated volumes

(See SC-1 & SC-5)	Commissions can arrive at a maximum volume of hot cuts to be performed across the Qwest region	provide the basis on which Commissions can arrive at maximum volumes.	account for churn and winback activity. The Number should be broken out on a state-by-state basis. (AT&T – p. 13)	1/8/2004 – McLeod position is that the formula covers the embedded base, but does not account for new growth 1/8/2004 – MCI position is that the formula assumes that the movement will occur over a 21 month period – and does not account for the situation where a CLEC may want to move faster than the 21 month period. Further, it appears that the formula is completely dependent on the successful negotiation of a transition plan. There may also be certain central offices where the CLECs may want to move more quickly that may conflict with the 21 month time period as Qwest has proposed. 1/8/2004 – Covad cannot say that it agrees completely, but is encouraged that Qwest's numbers appear to show that Qwest has sufficient resources to handle the volumes. The assumptions appear reasonable. 1/8/2004 – Qwest can add to its assumptions the "net add" of the current UNE-Loop activity to reflect the growth. With that addition, McLeod would agree that the assumptions are appropriate.	CLOSE this Issue as it is covered in Issues SC-1 and SC-5.

**NOTE: Shaded items are closed issues.

				MCI would agree that the calculations are correct based on the assumptions. MCI does not believe that the conclusions Qwest is drawing from those numbers is necessarily correct.	
V-2	Per Central Office limit on Batch Hot Cuts	Qwest proposes a limit of 100 lines per Central office	What is the appropriate limit on a per central office basis – should there be a limit? (Eschelon – Forum)	12/3/2003 - OPEN 1/8/2004 – Qwest position is that the most efficient configuration is for 2 technicians performing 100 conversions during an 8-hour shift . 1/8/2004 – AT&T – accepting that premise – is there a reason why you have to limit it to two technicians? Qwest Response: two technicians is optimum given the concentration of wires on the frames where this work is being performed and is the most efficient way. Further, the 100 lines per CO permits Qwest to complete the migration well within the transition period. 1/8/2004 – If, in the transition meetings, MCI or other CLECs want a more rapid transition in certain central offices that met certain characteristics, would Qwest be willing to do more than 100 lines? 1/8/2004 - Qwest is not precluding that sort of discussion, however, the volumes appear to demonstrate that Qwest can	1/8/2004 - MCI would agree to CLOSE this issue based on an agreement th the parties are not foreclosed from mutually agreeing, during the transition planning process for the embedded base, to the possibility of doing more than 100 lines per CO on an exception basis. Further, planning can include new customers may also be included in the batch. 1/8/2004 – McLeod will go to **IMPASSE** at this time on the sizing limitation of the number of batch hot cut lines included in a batch central office. McLeod suggests we take a look at the resources available in a CO and proposes a 200 lines per CO limit.

**NOTE: Shaded items are closed issues.

			Clarify definition of batch/number of lines. (Eschelon – Forum) How many current orders would trigger the "batch" process as defined in the proposal. In other words, how often does a single CLEC submit orders for 25 mass market loops in a single wire center on a single day? Single week? What percentage of the offices in the state incur this type of volume? (Peter Healy TDS Metrocom – Forum) 12/19/2003 – MCI response – MCI position is that limit of 100 per CLEC per CO is the ***minimum*** limit.	12/10/2003 - Qwest does not currently track orders in this manner, and has no way of tracking this information since CLECs do not currently "batch" their orders for submission, except where they desire conversion on a project-managed basis. 12/12/2003 –Qwest has UNE-P arrangements in 91% of the central offices in its territory. In a large percentage of those offices there are 25 or more UNE-P arrangements. **Qwest will take back** question of what is that percentage. 12/19/2003 – generic example in a state with 130 offices, 75 have UNE-P in them; of that 75, less than 25% of them have fewer than 25 UNE-P arrangements, 6 offices have 1,000 or more. Qwest will provide more detail at the January forum. Steve Pitterle - from TDS Metrocom has additional questions before agreeing to close. 12/19/2003 –looking for response from Qwest regarding the percentage requested above.	price. 1/8/2004 – AT&T position is that 25 should not be the minimum batch size. AT&T proposes there be no minimum batch size 1/8/2004 – MCI position there should be no minimum batch size per CLEC or generally

**NOTE: Shaded items are closed issues.

				language. 1/7/2004 AT&T position is that it is still investigating the Trap and Trace proposal of Qwest and still questions whether a web-based status tool is sufficient to provide information to the CLECs on status or is an e-mail or other type of "push" technology appropriate. Parties will discuss this issue in the context of Issues P-23 & P-24 and so this Issue can be closed.	
S-2	Interval for the batch – from CLEC initiation of a request to due date for the batch	Intervals for the embedded base of UNE-P depends on the Batch Hot Cut process agreed to in the Forum and the transition plans ordered by the Commission. For new Batch Hot Cuts, the interval will be negotiated.	a. Batch Hot Cut intervals cannot be individually negotiated on a project-by-project basis. There must be a standard interval (e.g., 6 days). (AT&T – p. 14) a. CLECs should not be required to "negotiate" the provisioning date for a Batch Hot Cut in advance. Interval should be five (5) business days to minimize the amount of time a customer is held in a limbo state. (MCI – p. 5, 6 & 11) a. Assumption is that the current 5-day interval will be the interval for the new Batch Hot Cut process	**As to Sub-Issue S-2a** (as noted in CLEC position column): 12/3/2003 - OPEN - Qwest will take back – parameters for an interval and also whether or not there is a way to schedule without requiring negotiations 1/8/2004 – Qwest position is that the "meaningful opportunity to compete" standard as decided in the 271 proceedings should be the basis on which intervals are set. For Batch cuts for the embedded base, the volumes involved and the fact that CLECs already have the customer so there is not a customer acquisition issue, the 7-day interval is appropriate and meets the "meaningful opportunity to compete standard."	1/8/2004 – IMPASSE as to the issue S-2a - parameters for the interval - should the intervals for the batch hot cut process be the same as the intervals for the standard provisioning process? 1/8/2004 – CLOSED as to Issue S-2b – based on Qwest commitment to a scheduling tool. AT&T, MCI, McLeod, Covad agree to close. 1/8/2004 – S-2c – IMPASSE – as to the issue

**NOTE: Shaded items are closed issues.

			–p.11) What are the benefits of the new process? How are efficiencies quantified in Qwest's proposed process (AT&T & MCI - Forum)	proposal as it exists today along with a recommended price based on that study.	
R-2 (See also R-1)	What is the appropriate TELRIC-based price for the Batch Hot Cut process?	The NRC for the Batch Hot Cut process should reflect the forward-looking cost Qwest will actually incur to provide Batch Hot Cuts. The proposed process, as currently designed realizes efficiencies gained as a result of performing work in a batch manner.	Qwest needs to make significant reductions in its hot cut NRCs to make UNE-L a viable alternative for serving mass market (AT&T - p. 4) Qwest must specifically quantify all proposed NRCs involved in the Batch Hot Cut process. (McLeod – p. 1)	12/3/2003 OPEN – 1/8/2004 – see discussion in "History Column for Issue R-1 above.	1/8/2004 – See also Issue R-1 – IMPASSE – as to what is the appropriate TELRIC-based rate.
POST-CUT QUALITY					
Q-1 (See S-1)	Is there a process to "throw-back" a customer to its prior service	Qwest will send CLEC an electronic spreadsheet on the due date after the hot cuts have been completed. The spreadsheet will contain a deadline time when Qwest will begin running its completions out of the WFA/C system. If the CLECs identify issues with their lines, CLECs will contact the QCCC before the deadline set. Then the order would stop, it would be cut back to the Qwest switch, translations would not run and Qwest would send a jeopardy notice to the	There should be such a process. (AT&T - p. 20) (Eschelon – p. 14) (McLeod – p. 2) (MCI – p. 11) If there does happen to be a degradation of service associated with going from UNE-P to UNE-L, if there is no longer a UNE-P option, what then? (McLeod – Forum)	12/3/2003 OPEN 1/8/2004 – parties agree this issue is addressed in Issue S-1	1/8/2004 –CLOSED – MCI, AT&T, McLeod & Covad agree to close as this issue is addressed in Issue S-1

Transcripts for all Batch Hot Cut Forums are located under the "Forum Transcripts and Exhibits" pulldown menu at:
http://www.qwest.com/wholesale/training/tradeshow/batchhotcutarchive.html

**NOTE: Shaded items are closed issues.

		CLEC. CLEC would then supplement the order and follow the standard hot cut process.	Auto Completions from WFA – is it done in batches or by individual orders? (Clauson – Eschelon – Forum)	12/10/2003: Order automation checks for completions in WFA every 3 minutes and issues a request to the SOP to do completions. 12/12/2003 – CLOSED as to Eschelon's issue regarding WFA auto completions.	
Q-2 (See also S-3)	LNP activity	Qwest sets LNP triggers prior to the due date. CLEC subscription activity triggers the porting.	Qwest must submit the number-port activation order to NPAC within 10 minutes after the Batch Hot Cut is completed, with notice to the CLEC after successful completion of each step. (MCI – p. 12-13)	12/3/2003 OPEN – See also S-3 1/8/2004 – Qwest is not willing to perform LNP porting activity for the CLEC. Qwest is proposing CLECs use the web-based status tool and Trap & Trace capability to identify when hot cut activity is completed so that they can submit their own number port activation to the NPAC.	1/8/2004 – CLOSED. AT&T, MCI, Covad & McLeod agree to close.
PROCESS TESTING/PERFORMANCE MEASURES					
T-1	Should Qwest provide some demonstrable method to show that the Batch Hot Cut process works.	No. There is no such requirement in the TRO. The State Commissions shall establish and implement a batch hot cut process by July, 2004. Development of a test and incorporating a test as AT&T envisions takes an extensive amount of time that the timeframes provided by the FCC	Process must be thoroughly tested to guarantee operational readiness. (AT&T – p. 21) AT&T recommends that there be some sort of testing process that uses existing Qwest customers, subject to monitoring by the State Commissions. (AT&T) The test would have Qwest	12/3/2003 OPEN – OPEN - Qwest will take back – possibility of proposing some demonstrable vehicle/evidence to show that the process works. 12/19/2003 – Closed as to Rick Carter of the Oregon PUC question as to whether there a current work operation that could simulate a Batch Hot Cut that would	1/8/2004 – IMPASSE as to the issue of whether there is a requirement for Qwest to provide demonstrable proof that its proposed Batch Cut process works prior to state commission approval.

http://www.qwest.com/wholesale/training/tradeshow/batchhotcutarchive.html

**NOTE: Shaded items are closed issues.

			AT&T doesn't think the system or process will be the problem – the problem will be that you have a lot of human touch-points that create the opportunity for error. AT&T wants to see volumes of the level that could be expected with the process and some way to show that the process works under those volumes AT&T believes it is appropriate to test the actual process – once the process is developed – it should go through the test. As to the notion that there is something out there today that is a proxy – AT&T doesn't want to pursue that. Not suggesting that the testing has to be a part of any process proposal that the Commissions will approve – it can be done serially after the Commissions have issued their decisions. (AT&T 12/19/2003 Forum) Commercial testing must be an integral part of any approval process. (MCI – pp. 5 & 6) MCI does not believe a third party		

Transcripts for all Batch Hot Cut Forums are located under the "Forum Transcripts and Exhibits" pulldown menu at:
http://www.qwest.com/wholesale/training/tradeshow/batchhotcutarchive.html

**NOTE: Shaded items are closed issues.

			test is required. There must be metrics put in place and the commercial operation with the ability to look at performance and with distinct performance metrics and remedies is the way to go. It is commercial day-to-day activity that is monitored and that there are sanctions/penalties for non-performance. (MCI – Forum) MCI concerned that the ancillary processes that surround the batch hot cut process can handle the volumes that a batch process may bring about. Not something within the control of Qwest, however, will be an issue that may directly impact customers. So MCI believes must work through the process, the process must be measurable and then see what happens in the commercial world once the process is implemented. If there are problems that are impacting end-user customers, there must be a way to stop the process until the issues are addressed. (MCI – Forum) Process must be tested prior to implementation. (Eschelon – p.

http://www.qwest.com/wholesale/training/tradeshow/batchhotcutarchive.html

**NOTE: Shaded items are closed issues.

			16) Eschelon is interested in getting more information regarding AT&T's testing proposal using Qwest retail customers. (Eschelon – Forum) Qwest should be required to test any proposed Batch Hot Cut process before a Commission makes a finding on whether CLECs are impaired in switching mass-market customers. Qwest must also ensure that associated vendors (numbering administrator, E911 administrator, etc.) can handle any increased loads. (McLeod – p. 2)		
T-2	Performance measures for new Batch Hot Cut process	Long Term PID Administration is the appropriate forum to develop new performance measures associated with the Batch Hot Cut process. Further, there is not the same 9-month deadline associated with developing performance measures. 12/3/2003 - Qwest would be willing to discuss Process	Performance measures should be developed simultaneously with the process to permit Qwest's performance to be evaluated. (Eschelon – p. 15); MCI – p. 9. Need to have basic metrics and sanctions in place when the process is implemented. Eschelon cautions against delay in development of the metrics. (Eschelon – Forum)	12/3/2003 OPEN - Qwest will take back – providing PROCESS metrics that will be incorporated into the process (Per request of Don Gray) Qwest will take back – identifying those PIDS that apply to the activities associated with the proposed Batch Hot Cut process as well as those that do not apply. (MCI Request) 12/10/2003: Qwest would be willing to work with the Long Term PID	1/8/2004 – McLeod recommends the issue be CLOSED with the understanding that the issue was whether there are measures in place today that can be used, with further measures to be developed in the Long Term PID Administration once the process is finalized.

Transcripts for all Batch Hot Cut Forums are located under the "Forum Transcripts and Exhibits" pulldown menu at:
http://www.qwest.com/wholesale/training/tradeshow/batchhotcutarchive.html

**NOTE: Shaded items are closed issues.

		Measures – but these are different than Performance Measures. 12/19/2003 - Specifically as to the MCI request – the PIDs that impact analog loop provisioning and repair processes are publicly available. Which metrics will be impacted by the Batch Hot Cut process as well as those that need to be developed for the Batch Hot Cut Process is more appropriately addressed by those experts in the LTPA Qwest is not willing to provide the PIDs for discussion in this Forum – the appropriate place for discussion and development is the LTPA.	Metrics need to be incorporated into the various state PAPs. PIDs must be developed in parallel with the process development. (AT&T – Forum) Measure of things like how many order rejected for CFA or customer losing service on the day of the cut or how many cuts done per day. Need a description of the metrics or measurements relating to the accuracy and seamlessness of LNP transactions. (MCI – p. 10) MCI requests that Qwest provide the current PIDs that do apply to the Batch Hot Cut Process and any PIDs that you think do not apply to the Batch, but do apply to Basic or Coordinated or other installation methods. 12/19/2003 – Forum - AT&T believes that all existing PIDs, with the exception of OP-4 and OP-13, would apply to the Batch Hot Cut process.	Administration (LTPA) facilitator, state commission staff members and CLECs to facilitate expeditious completion of BHC PID development in LTPA once the Batch Hot Cut Process is complete. 12/19/2003 – OPEN –as to MCI issue regarding identifying those existing PIDs that apply to the Batch Hot Cut process. Based on discussion during the 12/19/2003 Forum, MCI will take back the Action Item to provide a response regarding its position on the appropriate forum for development of Performance Measures during January face-to-face Forum. 1/8/2004 – Qwest has committed to support having development of BHC metrics being made a high priority in the Long Term PID Administration. Further, for those PIDs that are not modified, then Batch Hot Cut activity will be included in those measures e.g., analog loop measures. Finally, process oversight exists today that evaluates any problems that may arise to determine the cause and takes steps necessary to rectify the problem to improve the process. In today's world, with no batch hot cut exclusions, which PIDs would cover batch hot cut activity? If you look at general analog loop provisioning PIDs at the very least, OP-4 and OP-13 would not apply to batch hot cut	AT&T agrees to CLOSE based on the above understanding. MCI agrees to CLOSE based on the above understanding. Covad agrees to CLOSE based on the above understanding.

PROCESS ISSUES - EFFICIENCY					
ISSUE #	**ISSUE DESCRIPTION**	**QWEST POSITION**	**CLEC POSITIONS**	**HISTORY**	**RESOLUTION/RATIONALE**
P-3 See also P-23 & P-24	Can CLECs request batch cuts at any time of day?	The Batch Hot Cut Proposal is designed for Basic Installation option only Those types of sensitive circuits that require that planning need to be run through the standard hot cut process. 12/10/2003: Qwest has committed to notify the CLEC on due-date via e-mail when the batch cut begins. Batches will be completed within a relatively short period of time; therefore a coordinated installation such as is contemplated by this question is not necessary. 1/6/2004 – The Batch Hot Cuts will be done during a 3:00 a.m. to 11:00 a.m. window. 1/6/2004 – MODIFICATION	CLECs should be able to request batch cuts on any day, at any time of day. (AT&T – p. 19); 1/6/2004 – AT&T continues to want the ability to identify a specific window of time during the day in which Batch Hot Cuts are performed and does not want to be limited to the 3-11 window currently provided by Qwest's process. 1/6/2004 - AT&T will take the Trap and Trace proposal back to its operational people and will get back to Qwest on whether or not it will close the issue of method of notice of commencement/completion of the batch/ status of batch. 1/6/2004 – McLeod will take the Trap and Trace proposal back to its operational people and will get	12/12/2003: Request from MCI: When MCI goes into the negotiation process, can it provide a notification e-mail address at that time? QWEST RESPONSE: prior to the time a CLEC submits a batch hot cut *for the first time*, the CLEC will provide a notification e-mail address to Qwest. That e-mail will then be used by Qwest to notify the CLEC that a batch hot cut has begun for all batch hot cuts for that CLEC. CLECs do not have to include the e-mail address on LSRs. How will Qwest make sure it uses the provided e-mail for batches and other e-mail addresses for other types of order activity. QWEST to respond in writing. 12/17/2003: Qwest written response: The CLEC will provide the email address for their BHC-ZCID project. The QCCC will build	1/6/2004 – IMPASSE as to AT&T regarding ability to identify a specific window of time during the day in which Batch Hot Cuts are performed. AT&T does not want to be limited to the 3-11 window currently provided in Qwest's process. 1/7/2004 – IMPASSE as to AT&T issue of whether or not the web-based status tool is the appropriate method of communication between Qwest and the CLECs on order status (See Related Issues P-23 & *?* 1/7/2004 IMPASSE as to McLeod on issue of whether or not the web-based status tool and the Trap and Trace capability is the appropriate method of communications between Qwest and the CLEC on order status.

**NOTE: Shaded items are closed issues.

		TO ORIGINAL PROPOSAL - Qwest will notify the CLECs when the batch has started via the new web-based status tool. The Trap and Trace option will also identify when the batch begins. 1/6/2004 - Qwest will submit a change request to Change Management as soon as it has fully defined the requirements for the status tool. There are clarification meetings that are held to accommodate CLEC input prior to submitting the CR.	back to Qwest on whether or not it will close the issue of notice of commencement/completion of the batch/status of batch. CLECs may need to plan certain batch hot cuts for customers with alarm circuits or CPE (Eschelon – p. 13)	a table unique to the Batch process with the BHC-ZCID and designated email. Therefore,, this email address will be dedicated only to these orders. 1/6/2004 – IMPASSE PENDING on e-mail notification issue as to AT&T and McLeod – both companies taking back issue of status tool and Trap and Trace as notification vehicles in lieu of e-mail or other "push" technology.	(See Related Issues P-23 & 24) IMPASSE as to Eschelon Request - regarding designating a time for customers with CPE or alarm circuits being something less than coordin. that could be accommodated by the Batch Hot Cut process. 1/6/2004 – MCI agrees issue regarding e-mail notification can be CLOSED.
P-5	Whether the Batch Hot Cut process should include loops provisioned over IDLC.	IDLC loops are handled using the standard hot cut process. Orders that are provided over IDLC are C-Jeop'd back to the CLEC if those orders are included in the Batch. To include these types of orders in a Batch eliminates the efficiencies the Batch process was designed to provide (due to requirement to roll a truck) Qwest will convert 10 UNE-Ps that are provisioned over IDLC	IDLC should be included in the hot cut process. (AT&T – p. 16-19); (MCI – p. 4); (Eschelon – p. 15); (McLeod at 1) MCI would propose building a look-up table in Qwest OSS and reject those orders when they are submitted and providing information regarding IDLC and RT location. (MCI – Forum) AT&T proposal – AT&T is not proposing that IDLC be a part of the batch – what they are proposing is that when CLECs	IMPASSE - as to including IDLC loops in the batch - MCI (but MCI will consider Qwest's proposal to provide the IDLC information in advance of requirement to transition) 12/12/2003 – Remains at IMPASSE IMPASSE - as to action to be taken when loops submitted by the CLECs are provisioned over IDLC – should those orders automatically move to standard hot cut or should the order be c-jeop'd back to the CLEC by Qwest	12/12/2003 - IMPASSE - as to including IDLC loops in the batch - MCI 12/12/2003 - IMPASSE - as to action to be taken when loops submitted by the CLECs are provisioned over IDLC – automatic move to standard hot cut or c-jeop of the order by Qwest CLOSED– 12/10/2003: as to the MCI question regarding what rates would apply pending

**NOTE: Shaded items are closed issues.

		loops per day per Remote Terminal within a Qwest Network Manager's area. Qwest will provide CLECs with an electronic spreadsheet of all CLEC customers, by central office, that are served via IDLC. Timing – for those markets where there is a finding of "no impairment," the spreadsheet will be provided to CLECs prior to the time when they must transition their lines. Response to AT&T proposal – to handle in that manner, requires manual intervention and additional steps that impact efficiencies the Batch Hot Cut was designed to provide.	send over UNE-P's for conversion that Qwest identify whether the service is provided over IDLC, have those orders drop out of the Batch and automatically convert them under the standard hot cut process. If IDLC results in delay of customer migration to UNE-Loop, will Qwest continue to charge UNE-P rates until that customer can be migrated? (Gates – MCI – Forum)	CLOSED– 12/10/2003: CLEC would be billed the UNE-P rate until the completion and acceptance of then UNE-Loop service conversion.	migration of the CLEC to UNE-Loop.
P-6a P-6b	Whether the Batch Hot Cut process should include line split loops. Whether the Batch Hot Cut process should include UNE-P with ancillary DSL.	Line split loops are not included in the batch process, rather they are handled using the standard provisioning process. Requires changing the service from a non-design service to a design service – thereby eliminating some of the efficiencies the Batch process was designed to provide.	Line splitting should be included in the hot cut process. (AT&T – p. 16-19); (MCI – p. 8-9); (Eschelon – p. 15); (Covad – p. 4); Covad agrees that this issue applies for the embedded base only and does not apply for new line splitting/loop splitting orders (Covad – Forum)	12/3/2003 - OPEN – Qwest and Covad will meet to create a diagram depicting the various network connections required in a Line Splitting/Loop Splitting arrangement. – Diagrams completed – see BHC Forum Exhibit 4	12/12/2003 IMPASSE as to both P-6a and P-6b– for MCI, Covad, Eschelon & AT&T

http://www.qwest.com/wholesale/training/tradeshow/batchhotcutarchive.html

**NOTE: Shaded items are closed issues.

P-8	Whether the Batch Hot Cut process applies if an outside technician dispatch is required.	The Batch Hot Cut Process is limited to use of existing facilities that do not require an outside technician dispatch. It is Qwest's position that the efficiencies gained in the batch hot cut process would be lost if outside technician dispatch is required.	If the assumption that the batch process will be limited in every case to situations that do not require an outside technician dispatch, this is still an open issue for Eschelon	12/3/2003 OPEN – Eschelon will consider whether they will continue to pursue this position in light of discussion at 12/2/2003 meeting of the Forum. Eschelon will provide feedback at the next meeting of the Forum.	12/12/2003 – IMPASSE for Eschelon as to the issue of including in the batch those orders that require an outside technician dispatch.
P-10 (See also P-1)	Order placement methods, flow-through and service order accuracy	CLECs submit their orders for a Batch Hot Cut using the existing LSR process, with the "BHC" plus CLEC ZCID project number, whether that is through the GUI or EDI interface. Qwest response to sub-issues in CLEC Position Column: 1. CLECs can use either EDI or GUI to submit batch hot cut orders. 2. CLECs will not be required to manually generate spreadsheets. 3. Batch Hot Cut Orders are flow-through eligible. Batch Hot Cut LSRs will flow-through in accordance with existing flow-through standards.	1. CLECs should be able to use either EDI or GUI to submit orders. 2. CLECs should not be required to manually generate spreadsheets. 3. Orders should flow through. (MCI-p. 5 & 9); (McLeod at 2) 4. Efficient submission will likely require development of new ordering capabilities – sending individual LSRs for multiple orders should not be considered a "batch." . (Eschelon p. 12) Clarification by Eschelon - Eschelon would like Qwest to put in place an interface to the GUI and EDI for Batch Hot Cuts that would take the place of LSR-by-LSR entry. Or, in the alternative, give CLECs the capability of sending an electronic spreadsheet directly to the QCCC. (Eschelon –	MCI agrees to close as to the first 3 sub-issues (in CLEC Position column) McLeod agrees to close the first 3 sub-issues pending discussion of scalability issue. 12/3/2003 - On Sub-Issue 4 - Eschelon will take back and determine if it will continue to pursue asking for an alternative to submitting individual LSRs e.g., spreadsheet functionality. 12/12/2003 - Given discussion at last Forum, Qwest position is that taking a mechanized process and taking a step backward to a manual spreadsheet or to re-mechanize in another fashion is not something	12/12/2003 - MCI agrees to close as to the first 3 sub-issues (in CLEC Position column) 12/12/2003 - McLeod agrees to close the first 3 sub-issues pending discussion of scalability issue. 12/12/2003: IMPASSE as to ESCHELON issue (#4) – regarding alternative to submitting individual LSRs e.g., spreadsheet functionality.

		4. The LSR process is appropriate for use with the Batch Hot Cut process. Because of quality and cost issues, Qwest will not pursue development of an interface.	Forum)	Qwest is willing to make a part of the Batch Hot Cut Process.	
P-11	Order in which lines are cut over	To achieve efficiencies, the process does not permit CLECs to determine the order in which lines are cut over.	CLECs should be able to specify the order in which lines are cut over e.g., customers with multiple CSRs (Eschelon – p. 13 MN p 9)	12/3/2003 - OPEN - Eschelon will take back to determine if they are going to continue to pursue this capability. 12/12/2003 - Eschelon continues to request this capability. Because CLECs must use the related PON process to submit such LSRs, Qwest should develop a spreadsheet for the batch so that related PONs are worked consecutively. Eschelon believes a PON format could be developed to indicate sequence for this purpose. 12/12/2003 - the efficiencies gained in the Batch Hot Cut Process include permitting the central office technician to perform work in the most efficient and effective way possible; specifying the order in which lines are cut over, when those lines may be on multiple blocks on	12/12/2003: IMPASSE as to Eschelon issue regarding CLEC ability to determine the order in which lines are cut over in the batch.

				the frame, reduces the efficiencies of the process.	
P-12	Impact on Batch Hot Cut Process of migration by telephone number change request	The "migrate by TN" capability covered by CMP CRs SCR061302-01 and SCR022703-18 address only orders where the "to" product is UNE-P.	Batch Hot Cut process should allow CLECs to "migrate by telephone number." (MCI – p. 10) MCI views this as a critical requirement (MCI – Forum)	12/3/2003 - OPEN – pending Qwest take back on technical capability issues associated with making TN migration capability available for batch hot cuts. 12/10/2003 Qwest Response: There is no technical limitation precluding Qwest from modifying the edits in IMA to allow CLECs to enter TN and SANO for UNE-P to UNE-Loop conversions. Systems changes to accomplish this modification are required to go through Change Management. MCI submitted a CMP CR (SCR120403-01) requesting this change on December 4, 2003. There is, however, a technical limitation that would prevent migration by TN from UNE-Loop to UNE-Loop as in that instance, the TN does not reside in Qwest databases. 12/12/2003: Further Qwest response: This CR would be eligible for inclusion in IMA Release 16.0 which is tentatively scheduled for	1/6/2004 – IMPASSE as to MCI issue of not providing CLECs with the capability, in the Batch Hot Cut process, to "migrate b··· telephone number and SAN(

				August 2004. To have it declared as a ***regulatory*** CR, requesting party must provide the docket number and verbiage from the regulatory order in that docket that mandates the activity. QWEST WILL TAKE BACK the questions of whether or not it considers this a regulatory mandate? If so, would Qwest oppose the change? Is it an option for the CR to be escalated in its implementation to a release sooner than IMA 16.0 via the CMP exception process? 1/6/2004 – As to MCI's question about whether Qwest will support or oppose the "migrate by TN" CR as a regulatory change – Qwest will embrace the spirit of a Commission order that may, at the end of the 9 month proceeding, direct such a change –it cannot support "migrate by TN" as a ***regulatory*** change because in order to be a ***regulatory*** change, the requirement must have a docket number **and** order associated with it. Qwest is not including the "migrate by TN" in its current Batch Hot Cut proposal because it is not a capability that is specific to batch hot cuts. However, Qwest will not

**NOTE: Shaded items are closed issues.

				oppose the MCI CR SCR061302-01 and SCR022703-18 (that deal with the TN SANO capability generally) in the CMP .	
21c	What happens when there is an error in the Qwest database, then how does Qwest handle the situation and what ability does the CLEC have to get the batch through?		What if CLEC has done the checks into the RLDT or other tools and yet their order becomes jeopardized because IDLC is present, but wasn't noted in the database? (Eschelon – Forum) 12/12/2003: MCI question - How does the Raw Loop Data Tool get updated?	12/10/2003: The jeopardized order would not be processed as a part of the batch. However, Qwest has modified its position to allow for the remainder of qualified lines in the batch to continue to be processed so long as at least 20 lines remain in the batch. While IDLC information is available in the RLDT, in some rare instances, the IDLC may not appear in the RLDT. If the information is missing, the CLEC has the capability of notifying Qwest of the missing information via the RLDT. 12/12/2003 - IMPASSE for Eschelon– as to handling of orders that are jeopardized as a result of inaccurate or incomplete information in the Qwest database.	12/12/2003 – Eschelon IMPASSE on 21c– as to handling of orders that are jeopardized as a result of inaccurate or incomplete information in the Qwest database. 12/12/2003 - CLOSED as to MCI question–The RLDT regularly dips into LFACs and gets updates. If a manual look up is requested by the CLECs, then LFACs, and consequently, RLDT, are updated with information discovered in the manual look-up. Qwest would update the systems automatically; the CLEC does not have to take further action to affect the updates.
P-23 (See also P-3 and P-24 and S-1)	Timing for notifying CLECs when a batch is completed Method of notice to CLECs	Qwest proposes to notify the CLECs when all lines in the batch have been completed and will do so via an electronic spreadsheet. In addition, Qwest currently sends FOCs and SOCs to CLECs electronically.	Notification upon completion of the entire should occur prior to completion of the entire batch (AT&T – p. 7) Completion of a cut should trigger an electronic SOC within 10	12/3/2003 OPEN – 1/7/2004 – MCI would like Qwest to take back the suggestion of having the Status Tool perform updates more frequently than 30 minutes.	1/7/2004 – IMPASSE as to timing and method of notice to CLEC of batch completion

http://www.qwest.com/wholesale/training/tradeshow/batchhotcutarchive.html

**NOTE: Shaded items are closed issues.

				has already explored enhancing EDI and found that the update intervals associated with updating status in EDI would likely be longer than those associated with Qwest's web-based status tool proposal. 1/7/2004 – McLeod will continue to evaluate the Trap and Trace option. McLeod position is that the web-based status tool is, in large part, a duplication of information that CLECs obtain today via EDI (with the exception of the jeopardy notices)	
P-27c	Level of mechanization – automated or robotic frames	According to the International Engineering Consortium (IEC) on URL: http://www.iec.org/online/tutorials/frames/topic04.html There is no viable solution for robotic distribution frames at this time.. "While simple in concept, this type of solution never quite matured into a viable technology for automating distribution frames. That is because pure mechanical, robotic solutions have reliability and maintenance issues due to their moving parts.	Automated or robotic frames should be evaluated (MCI – p. 3)	On the issue of automated or robotic frames – see information in Qwest Position column.	12/19/2003 – IMPASSE as to the issue of evaluating automated or robotic frames.

Transcripts for all Batch Hot Cut Forums are located under the "Forum Transcripts and Exhibits" pulldown menu at:
http://www.qwest.com/wholesale/training/tradeshow/batchhotcutarchive.html

**NOTE: Shaded items are closed issues.

		This limits their effectiveness in larger COs or in environments where significant churn is experienced." "Perhaps the biggest "show stopper" for robotics, and all of the other copper automation technologies previously examined for frame applications, has been scalability."			
P-29	Coordination of systems changes as a result of the Forum & State proceedings with CMP	For systems changes, the product of the Forum and the State Proceedings will go to CMP as Regulatory Change Requests. As such, the changes will be incorporated into releases above the line and will not be prioritized.	How will changes agreed to in the Forum be synched up with and incorporated into the CMP? (Lichtenberg – MCI – Forum)	12/10/2003 – OPEN 12/19/2003 - Qwest provided explanation that the CMP process for regulatory changes is for all CLECs and Qwest to vote to see if they agree that the systems changes are indeed a regulatory change. Qwest will agree to abide by the spirit and intent of the regulatory orders issued by state Commissions and the existing CMP processes as they pertain to the Batch Hot Cut process. MCI believes this issue needs to remain OPEN. 1/7/2004 – Qwest proposes that this issue be resolved by stating that changes agreed to in this forum **and** ordered by state commissions will be incorporated into the CMP process as regulatory changes. 1/8/2004 – McLeod concerned about	1/7/2004 – IMPASSE – as to MCI issue regarding the need for any system changes coming out of the batch hot cut proceedings in the states to be classified as regulatory changes. MCI does not agree, in this situation, that the CMP process is the appropriate forum to address systems changes associated with Batch Hot Cut given that the systems changes must be in place in order for the Batch Hot Cut process to exist.

**NOTE: Shaded items are closed issues.

				system enhancements for BHC being included in the CMP given the number of Change Requests that are currently pending – McLeod position is that the enhancements associated with BHC should be moved outside CMP as a separate release. 1/8/2004 – Covad recommends Qwest allocate additional resources to address systems issues associated with Triennial Review. 1/8/2004 – It is Qwest's position that the changes that result from the TRO will be handled through the normal CMP process..	
SCALABILITY – VOLUMES					
SC-1 (See also SC-5)	Can Qwest's proposed process handle anticipated volumes?	The Batch Hot Cut process is scalable, which will allow Qwest to meet current and future demand. In considering volumes that may have to be handled by the Batch Hot Cut Process, Qwest has considered the embedded base as well as incremental growth similar to what AT&T has suggested. An additional assumption is that in the event there is a finding by state commissions of impairment,, or	Qwest needs to provide more evidence to establish this point. (AT&T – p. 12) Qwest needs to identify the number of batches that it can handle per Central Office, per state and per region. (Eschelon – p. 17) Qwest must clarify the maximum/minimum line volumes per day per CLEC for the Batch Hot Cut (McLeod – p. 1)	12/3/2003 OPEN - For SC-1 in total, Qwest will take-back – providing parties with the assumptions that form the basis for its proposed volume estimates. Qwest will also provide additional information on assumptions for staffing levels for the anticipated volumes.	1/7/2004 – IMPASSE as to whether Qwest's proposed process can handle anticipated volumes

Transcripts for all Batch Hot Cut Forums are located under the "Forum Transcripts and Exhibits" pulldown menu at:
http://www.qwest.com/wholesale/training/tradeshow/batchhotcutarchive.html

**NOTE: Shaded items are closed issues.

		in markets where Qwest does not seek to challenge the presumption of impairment, then Qwest will continue to provide UNE-P. All of these assumptions will form the basis for the volumes that can be anticipated. Qwest will be prepared in the near future to put forward numbers based on those assumptions.	The daily line count threshold that Qwest can manage for its retail unit must be provided, and parity established. (McLeod – p. 2) Are there limitations on the number of UNE-P to UNE-L lines that can be migrated for a single account? (MCI – Forum) Clarify the relationship of and impact of batch process on non-batch orders and other services. (Eschelon MN p. 10) AT&T believes should assume worst case scenario for development of the process upper limit. AT&T thinks that adding an incremental growth number using analogous number e.g., customers will move their local service about as much as they move their long distance service approximately 2.6%. Churn for CLECs is approximately 4.6-5.2% Churn rate should also include winback rates for Qwest. AT&T concerned about Qwest's ability to handle volumes. Wants Qwest to share some of its analysis on why it believes it can keep up with the demand AT&T believes its	Qwest is not placing limits on the number of UNE-P lines that can be migrated for a single account.	

Transcripts for all Batch Hot Cut Forums are located under the "Forum Transcripts and Exhibits" pulldown menu at:
http://www.qwest.com/wholesale/training/tradeshow/batchhotcutarchive.html

**NOTE: Shaded items are closed issues.

			appropriate to look at embedded base of UNE-P and UNE-L customers, add some incremental growth number to account for the churn, include additional staff to handle IDLC, and then explain how the process will handle. (AT&T – Forum) Scalability is an issue for McLeod and very interested in how Qwest will gear up for the volume. (McLeod – Forum)		
SC-5 (See also SC-1)	Staffing levels	Resources will be added and/or shifted as the final Batch Hot Cut process requires. Qwest will use its standard recruiting, hiring and training practices to staff the work activities required. In those locations where Qwest has sufficient volumes, there will be dedicated personnel assigned to batch activities. For other locations, the staff will not be dedicated only to batch work, but during batch activity, will be focused on that work.	Describe the number of additional people Qwest must add to meet the increased hot cut demand. (AT&T p. 13) Plans for recruiting, hiring and training personnel (AT&T p. 14) Qwest must identify and dedicate Qwest personnel to the Batch Hot Cut process (Eschelon – p. 15) By dedicated, Eschelon means resources that will be working solely on batches.	12/3/2003 OPEN – See also SC-1	1/7/2004 – IMPASSE as to level of detail required regarding plans for staffing by Qwest to address batch hot cut activity
			VOLUMES		
V-2	Per Central Office limit on Batch Hot Cuts	Qwest proposes a limit of 100 lines per Central office	What is the appropriate limit on a per central office basis – should there be a limit? (Eschelon –	12/3/2003 - OPEN 1/8/2004 – Qwest position is that the most	1/8/2004 - MCI would agree to CLOSE this issue based on an agreement that

**NOTE: Shaded items are closed issues.

			Forum)	efficient configuration is for 2 technicians performing 100 conversions during an 8-hour shift . 1/8/2004 – AT&T – accepting that premise – is there a reason why you have to limit it to two technicians? Qwest Response: two technicians is optimum given the concentration of wires on the frames where this work is being performed and is the most efficient way. Further, the 100 lines per CO permits Qwest to complete the migration well within the transition period. 1/8/2004 – If, in the transition meetings, MCI or other CLECs want a more rapid transition in certain central offices that met certain characteristics, would Qwest be willing to do more than 100 lines? 1/8/2004 - Qwest is not precluding that sort of discussion, however, the volumes appear to demonstrate that Qwest can handle the transition in addition to day-to-day activity within the 100 line per CO limit.	the parties are not foreclosed from mutually agreeing, during the transition planning process for the embedded base, to the possibility of doing more than 100 lines per CO on an exception basis, Further, planning can include new customers may also be included in the batch. 1/8/2004 – McLeod will go to **IMPASSE** at this time on the sizing limitation of the number of batch hot cut lines included in a batch per central office. McLeod suggests we take a look at the resources available in a CO and proposes a 200 lines per CO limit. 1/8/2004- Covad agrees to CLOSE this issue based an agreement that the parties are not foreclosed from mutually agreeing, during the transition planning process for the embedded base, to the possibility of doing more than 100 lines

				McLeod will take back the question of what McLeod's proposed minimum/maximum numbers are for this purpose. Qwest will take back the request for additional support behind Qwest's 100 batch limit ***and*** the CLEC proposal to require less than a 25 minimum number as it pertains to unstaffed offices	
			SEAMLESSNESS		
S-2	Interval for the batch – from CLEC initiation of a request to due date for the batch	Intervals for the embedded base of UNE-P depends on the Batch Hot Cut process agreed to in the Forum and the transition plans ordered by the Commission. For new Batch Hot Cuts, the interval will be negotiated.	a. Batch Hot Cut intervals cannot be individually negotiated on a project-by-project basis. There must be a standard interval (e.g., 6 days). (AT&T – p. 14) a. CLECs should not be required to "negotiate" the provisioning date for a Batch Hot Cut in advance. Interval should be five (5) business days to minimize the amount of time a customer is held in a limbo state. (MCI – p. 5, 6 & 11) a. Assumption is that the current 5-day interval will be the interval for the new Batch Hot Cut process (McLeod – pp. 1 &2) a. Eschelon wants definition on what the interval is for the batch	**As to Sub-Issue S-2a** (as noted in CLEC position column): 12/3/2003 - OPEN - Qwest will take back – parameters for an interval and also whether or not there is a way to schedule without requiring negotiations 1/8/2004 – Qwest position is that the "meaningful opportunity to compete" standard as decided in the 271 proceedings should be the basis on which intervals are set. For Batch cuts for the embedded base, the volumes involved and the fact that CLECs already have the customer so there is not a customer acquisition issue, the 7-day interval is appropriate and meets the "meaningful opportunity to compete standard." 1/8/2004 – AT&T wants interval for the Batch process to be same as for the one-by-one hot cuts (5 business days). With	1/8/2004 – IMPASSE as to the issue S-2a - parameters for the interval - should the intervals for the batch hot cut process be the same as the intervals for the standard provisioning process? 1/8/2004 – CLOSED as to Issue S-2b – based on Qwest commitment to a scheduling tool. AT&T, MCI, McLeod, Covad agree to close. 1/8/2004 – S-2c – IMPASSE – as to the issue of a different batch interval for new customers vs. embedded base customers

			hot cut process. For new hot cuts, a standard interval critical. (Eschelon – Forum) b. AT&T wants to "get out of the negotiation business." For transition of the embedded base AT&T suggests scheduling it out every day for weeks at a time. If it is done that way, and Qwest has all the "CLEC balls in the air" and is scheduling the work accordingly, is there still a need for negotiation? (AT&T – Forum) b. Rather than make negotiation the rule, may be easier to have negotiation as the exception for both the embedded base and "new" customers. (AT&T – Forum) c. For CLEC new acquisition customers coming from Qwest to the CLEC, today on average for a residential customer McLeod can convert to McLeod service in 7-8 calendar days, primarily because of the 5 day Qwest interval for the UNE-Loop. Concern about whether the batch hot cut process is even a viable option for "new" customers. (McLeod – Forum)	no minimum batch size, this is consistent. Conditional upon cost. 1/8/2004 – McLeod position is that a 4-5 business day interval is appropriate. CLECs have committed to have their translations complete on Day 1 and McLeod would commit to have any defective CFAs supplemented by Day 3. Interval is conditional upon cost. 1/8/2004 – Covad is not prepared at this time to specify an interval – tentatively 6 days. Interval is conditional upon cost 1/8/2004 – MCI position is that 5 business day interval is appropriate. MCI would also agree to have any defective CFAs supplemented by Day 3. Interval is conditional upon cost **Sub-Issue S-2c** 12/12/2003 Qwest will take back issue of whether there could be a different interval for "new customers" vs. embedded base. 1/8/2004 – Qwest is not willing to have a different interval for "new customers" vs. embedded base.	1/8/2004 – S-2d – CLOSED 1/8/2004 – S-2e CLOSED

**NOTE: Shaded items are closed issues.

			d. MCI wants a timeline containing the intervals and what happens when. (MCI – Forum) e. MCI also wants Qwest to consider development of a scheduling tool. (MCI – Forum)		
			RATES/PRICE		
R -1 (See also R-2)	Rate structure for new batch process and timing for development of the structure	The final Batch Hot Cut process must be defined before Qwest can create an appropriate cost study. The proposed Batch Hot Cut Process does not include costs associated with Coordinated Installation.	Detailed rate information needs to be provided including the cost structure and cost studies used to develop the rate (AT&T – p. 3); (MCI – p. 3). Consideration of rates for coordinated installation. (Eschelon –p.11) What are the benefits of the new process? How are efficiencies quantified in Qwest's proposed process (AT&T & MCI - Forum)	12/3/2003 OPEN 1/8/2004 – Given the changes made to the process during the Forum – Qwest will need to incorporate the changes into its cost studies for the process as it now stands. Qwest plans on filing a cost study with its testimony based on Qwest's proposal as it exists today along with a recommended price based on that study.	1/8/2004 – See also R-2 – IMPASSE as to what is the appropriate rate structure
R-2 (See also R-1)	What is the appropriate TELRIC-based price for the Batch Hot Cut process?	The NRC for the Batch Hot Cut process should reflect the forward-looking cost Qwest will actually incur to provide Batch Hot Cuts. The proposed process, as currently designed realizes efficiencies gained as a result of performing work in a batch manner.	Qwest needs to make significant reductions in its hot cut NRCs to make UNE-L a viable alternative for serving mass market (AT&T - p. 4) Qwest must specifically quantify all proposed NRCs involved in the Batch Hot Cut process. (McLeod – p. 1)	12/3/2003 OPEN – 1/8/2004 – see discussion in "History Column for Issue R-1 above.	1/8/2004 – See also Issue R-1 – IMPASSE – as to what is the appropriate TELRIC-based rate.

POST-CUT QUALITY					
PROCESS TESTING/PERFORMANCE MEASURES					
T-1	Should Qwest provide some demonstrable method to show that the Batch Hot Cut process works.	No. There is no such requirement in the TRO. The State Commissions shall establish and implement a batch hot cut process by July, 2004. Development of a test and incorporating a test as AT&T envisions takes an extensive amount of time that the timeframes provided by the FCC do not provide.	Process must be thoroughly tested to guarantee operational readiness. (AT&T – p. 21) AT&T recommends that there be some sort of testing process that uses existing Qwest customers, subject to monitoring by the State Commissions. (AT&T) The test would have Qwest become a CLEC in its own territory establish a collocation, insert the required equipment, backhaul to a second CO, where it would have the backhaul connected to the second switch. Test would use Qwest's existing retail customers, and would test the 911 process, the LNP process etc. As the test was performed, there could be independent observations by the State Staffs to see how Qwest is performing. (AT&T – Forum) Subject to further discussion, expect that it would provide 100 cuts per day for a series of days. (AT&T – Forum)	12/3/2003 OPEN – OPEN - Qwest will take back – possibility of proposing some demonstrable vehicle/evidence to show that the process works. 12/19/2003 – Closed as to Rick Carter of the Oregon PUC question as to whether there a current work operation that could simulate a Batch Hot Cut that would illustrate Qwest's competency in this type of activity e.g., existing hot cut process bulk cuts to DLC etc. Qwest will take back – suggestions made by Don Gray from the Nebraska Commission and Rick Carter from the Oregon Commission regarding alternatives to testing e.g., PROCESS metrics 12/10/2003: Response to Don Gray (Nebraska Commission) suggestion regarding documentation of training and proficiency technicians and others involved in the batch hot cut process: Qwest is committed to training its affected workforce once the BHC process is finalized to ensure that technicians are	1/8/2004 – IMPASSE as to the issue of whether there is a requirement for Qwest to provide demonstrable proof that its proposed Batch Hot Cut process works prior state commission appro

http://www.qwest.com/wholesale/training/tradeshow/batchhotcutarchive.html

**NOTE: Shaded items are closed issues.

			Qwest would have to send orders to itself via the GUI. (AT&T – Forum) The test does not have to be set up and completed prior to implementation of the process. The State Commissions can approve and implement the process and then perform the test. (AT&T – Forum) AT&T doesn't think the system or process will be the problem – the problem will be that you have a lot of human touch-points that create the opportunity for error. AT&T wants to see volumes of the level that could be expected with the process and some way to show that the process works under those volumes AT&T believes it is appropriate to test the actual process – once the process is developed – it should go through the test. As to the notion that there is something out there today that is a proxy – AT&T doesn't want to pursue that. Not suggesting that the testing has to be a part of any process proposal that the Commissions will approve	proficient in the activities required by the process.

			– it can be done serially after the Commissions have issued their decisions. (AT&T 12/19/2003 Forum) Commercial testing must be an integral part of any approval process. (MCI – pp. 5 & 6) MCI does not believe a third party test is required. There must be metrics put in place and the commercial operation with the ability to look at performance and with distinct performance metrics and remedies is the way to go. It is commercial day-to-day activity that is monitored and that there are sanctions/penalties for non-performance. (MCI – Forum) MCI concerned that the ancillary processes that surround the batch hot cut process can handle the volumes that a batch process may bring about. Not something within the control of Qwest, however, will be an issue that may directly impact customers. So MCI believes must work through the process, the process must be measurable and then see what

**NOTE: Shaded items are closed issues.

			happens in the commercial world once the process is implemented. If there are problems that are impacting end-user customers, there must be a way to stop the process until the issues are addressed. (MCI – Forum) Process must be tested prior to implementation. (Eschelon – p. 16) Eschelon is interested in getting more information regarding AT&T's testing proposal using Qwest retail customers. (Eschelon – Forum) Qwest should be required to test any proposed Batch Hot Cut process before a Commission makes a finding on whether CLECs are impaired in switching mass-market customers. Qwest must also ensure that associated vendors (numbering administrator, E911 administrator, etc.) can handle any increased loads. (McLeod – p. 2)

**NOTE: Shaded items are closed issues.

The Hot Cut Process allows telecommunications customers to be converted from one provider to another. The actual hot cut is performed when a customer is not using the circuit and therefore, will not noticeably impact their service. To complete this conversion, it requires that the customer's line be physically switched from the original provider's circuit to the new provider's circuit. The conversion, performed by a technician within the central office, is referred to as a "Hot Cut."

Currently this process is performed one order at a time.

A proposed new process referred to as the Batch Hot Cut Process will allow the work steps for multiple orders to be handled concurrently by two technicians working in tandem.

The following video will demonstrate both the current hot cut process and the proposed Batch Hot Cut Process and will not only follow the various tasks performed while making a hot cut, but will also demonstrate that the batch hot cut process is faster and more efficient than current procedures.

The "Hot Cut" consists of four basic parts: Receiving the Service Order, circuit pre-wiring and testing, the actual Hot Cut and re-testing, and lastly the updating of software and records to reflect the transfer.

The proposed Batch Hot Cut Process will provide additional efficiency by allowing C-LECs to submit multiple loop service orders which Qwest will combine on a single spread sheet for internal use to assist the central office technicians to prioritize by the cross connection location on the InterConnection Distribution Frame and COSMIC or Main Distribution Frame, per C-LEC so that the technicians can perform multiple functionality in each working location more efficiently.

Phone calls traverse a Central Office a facility where subscribers' telephone lines are joined to switching equipment for the connection of local and long distance calls.

Within the Central Office are distribution frames, which are termination points for wiring on one side of the protector frame connecting thousands of wires from the outside world; on the other side are the wires coming from the Central Office switch itself. Both sides are connected with a "jumper" wire that completes the circuit which is the physical connection or path between

two given points through which an electric current may be established, and is required for a customer to receive telephone service.

To change switch service providers, one end of the jumper wire is moved from its current location to a new location, called a "hot cut."

The existing circuit from the central office to the end user will remain the same with a hot cut however the portion of the circuit within the central office connecting the switch to the outside world must be transferred from the Qwest Switch to the C-LEC Switch.

Using information provided to Qwest by the C-LEC, Qwest prepares a service order that includes detailed circuit information, including block location and the telephone number, from which the technicians are able to locate and prepare the circuit for the transfer.

To create the new C-LEC portion of the circuit, technicians begin at the C-LEC's Interconnect Distributing Frame or ICDF, the ICDF is the location in the central office where the C-LEC interconnects into the Qwest Network.

A jumper wire is connected from the connecting block on which the C-LEC's service is terminated to a connecting block that terminates to an existing tie cable that runs between the ICDF and the MDF.

The tie pair cables terminating connector block location on the COSMIC Frame is then wired to a jumper that will terminates on the end user's existing cable pair when the Hot Cut is performed.

When the hot cut is completed the dial tone will then be provided by the C-LEC.

Let's look at a simple overview of how the actual hot cut is performed today.

First the technicians check the CLEC's Connecting Facility Assignment located on their ICDF block and terminal location for dial tone.

If dial tone is not present this is noted and properly reported and wiring continues.

The wiring consists of first running a jumper wire from the block and terminal location on the ICDF is run to an open tie cable pair. In the current process the technician wires only a single circuit at this stage.

After completing work at the ICDF, the technician moves to the COSMIC Frame, where the network is connected to the end user and where the actual hot cut will be performed.

At the COSMIC Frame the technician attaches a jumper wire from the connecting block on which the tie cable from the ICDF is terminate

which runs to the appropriate plant cable termination block going to the outside world.

The jumper wire is then tied in a knot or kinked and left unconnected so that it may be easily identified at the time of the hot cut.

Continuity and Automatic Number Identification known as ANI testing of the Qwest customer line are now performed. Any problems detected are reported. Preparatory work is now complete.

Prior to the actual hot cut being performed, a second ANI test is conducted verifying the telephone number on the circuit and the line is monitored to ensure that the CLEC's end user is not currently utilizing the line. If the line is idle, COT will perform the hot cut or lift and lay process which removes the Qwest service to the customer as shown and replaces the jumper wire with the jumper ran during the pre-wire step as identified earlier in the process. In this step the technician is shown running a jumper from (ICDF) Interconnection Distribution Frame to the Cosmic or Main Distribution Frame or MDF.

The technician then moves to the facility protection Heat Coil blocks which acts like a fuse box, protecting the central office equipment from outside power surges.

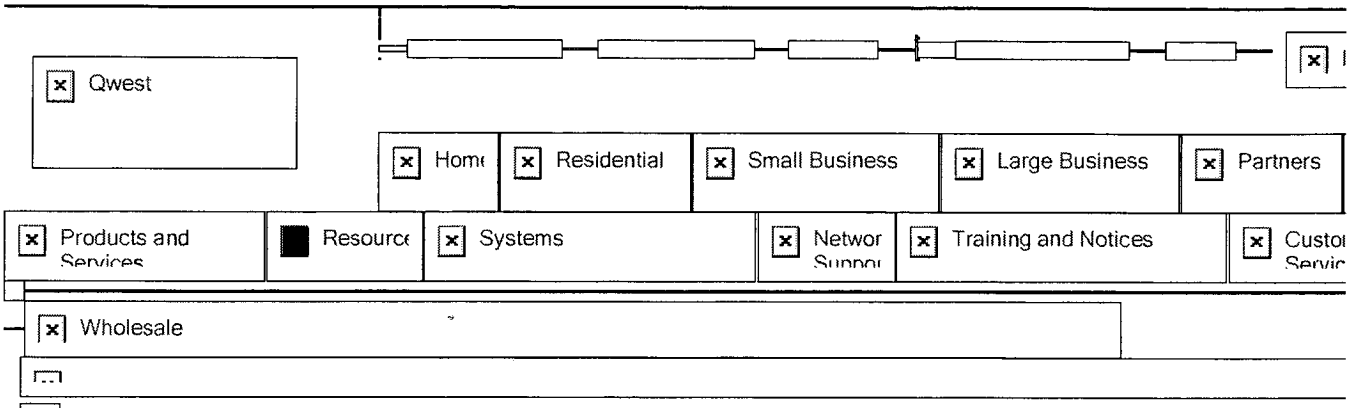
The Heat Coil block is where final dial tone and ANI testing of the C-LEC service occurs.

Any problems encountered at the protectors will be isolated to the central office wiring and corrected immediately or properly reported and the technician will complete on their WFADI terminal the customer circuit work requests.

After completing the physical work the technician will update Qwest records to indicate that actual connectivity of the circuit serving the end user is no longer served with Qwest dial tone. (End of Current Process)

Now that we have reviewed the Hot Cut Process, let's take a look at the proposed Batch Hot Cut Process which would allow two technicians to wire

multiple circuits for the entire end user batch at the ICDF rather than performing only one order at a time, significantly increasing efficiency.



Because current process only allows a technician to wire one circuit at a time, multiple trips must be made by the technicians between the ICDF and the COSMIC Frame. By using a batch hot cut process multiple trips will be eliminated creating a more efficient process.

After completing work at the ICDF, the technicians move to the COSMIC Frame, where the network is connected to the end user and where the actual batch hot cuts are performed.

At the COSMIC Frame the technician attaches a jumper wire from the connecting block on which the tie cable from the ICDF is terminated which runs to the appropriate plant cable termination block going to the outside world where the jumper wire is then tied in a knot or kinked and left unconnected so that it may be easily identified at the time of the batch hot cut. Again with the batch hot cut process this will be performed multiple times.

Continuity and ANI testing of the C-LEC facilities are performed at this time. Any problems detected are reported. At time of cut testing is repeated and the lift and lay operation is performed.

The proposed Batch Hot Cut Process will give end users a transparent and low cost transition between Qwest and C-LEC because of efficiencies gained when the pre-wiring is placed in groups reducing the time spent placing individual orders and performing unneeded steps before the batch migrations are started.

Unbundled Local Loop - General Information - V39.0

History Log

Product Description

Unbundled Local Loop is a facility or transmission path between the Distribution Frame or equivalent in the Qwest Central Office (CO) and the loop Demarcation Point at the end-user premises. The 'Demarcation Point' is defined as the point where Qwest ownership of facilities ceases and Competitive Local Exchange Carrier (CLEC), end-user, owner or landlord ownership of facilities begins. Unbundled Local Loop network element includes all features, functions, and capabilities of the transmission facilities including dark fiber and all attached electronics, with the exception of Digital Subscriber Line Access Multiplexer (DSLAM), owned by Qwest, between a Qwest CO and the loop Demarcation Point at the end-user premises. Unbundled Local Loop provides a transmission path that is a point-to point configuration. You gain access to an unbundled local loop at the Qwest CO through the establishment of a collocation arrangement. Information for collocation is available in Collocation - General Information. Individual state commissions and Interconnection Agreements determine the structure, pricing and guidelines for Unbundled Local Loop.

Unbundled Local Loop family of products consists of:

- 2-Wire or 4-Wire Analog (Voice Grade) Loop
- 2-Wire or 4-Wire Non-Loaded Loop
- Asymmetric Digital Subscriber Line (ADSL) Compatible Loop
- Digital Service Level 1 (DS1) Capable Loop
- Digital Service Level 3 (DS3) Capable Loop
- Integrated Services Digital Network (ISDN) Basic Rate Interface (BRI) Capable Loop
- Synchronous Optical Network (SONET) Channel Optical Carrier Level n (OCn) Capable Loop
- xDigital Subscriber Line-Integrated Services Digital Network

(xDSL-I) Capable Loop

The following provides general information about the Unbundled Local Loop family of products.

Product Diagram

This diagram is intended to generally represent an Unbundled Local Loop configuration. Variations may occur from location to location.

Availability
Unbundled Local Loop is available where facilities exist throughout Qwest's 14-state local service territory.

Terms and Conditions
Unbundled Local Loop product offerings are provided where existing facilities are available and in compliance with provisions of Commission Orders and State Requirements as stated in this web page. Additional information is located in the Tariffs, Regulations and Policies section of this web page.

Technical Publications

Technical characteristics, including Network Channel/Network Channel Interface (NC/NCI™) codes are described in Technical Publication, Interconnection - Unbundled Loop, 77384.

Collocation information, as it applies to the Unbundled Local Loop product family, is located in Technical Publication, Interconnection and Collocation for transport and Switched Unbundled Network Elements and Finished Services, 77386.

Pricing

Rate Structure

Recurring charges are billed on a month-to-month basis. Nonrecurring charges are billed at the time service is rendered. Term contracts are not available.

Interconnection Tie Pair (ITP) monthly charges are applicable for each unbundled local loop. The ITP rate item represents the cost of the connection between your Demarcation Point within the Qwest CC and the Qwest Demarcation Point within the same office. Additional information is available in your Interconnection Agreement.

When multiple Unbundled Local Loops are ordered from the same Network Interface Device (NID) to the same wire center at the same time, they will be assessed a first and additional nonrecurring charge. Information regarding your rates is available in Exhibit A or the specific rate sheet in your Interconnection Agreement.

A nonrecurring customer transfer charge will apply when converting an existing Private Line to Unbundled Local Loop pricing. If you request a dispatch when converting an existing Private Line to Unbundled Local Loop pricing, the nonrecurring installation rate for that specific Installation Options will be assessed. Contact your Qwest Sales Executive if an amendment to your Interconnection Agreement is necessary to support Private Line to Unbundled Local Loops pricing.

One-month minimum billing, contract termination liability and associated contract charges for the product from the loop converted will apply. These charges will be assessed to the end-user as described in the state specific Tariffs/Catalogs/Price Lists.

Miscellaneous charges assessed may include, but are not limited to, Due Date Changes; Design Changes; Conditioning; Time and Materials; Maintenance of Service, and Premises Work.

Information regarding Geographic Deaveraging is available in Geographic Deaveraging - General Information. For more information on Geographic Deaveraging, refer to Regulatory Commissions and Telecommunications Associations. To determine the impact of your specific transmission level for a specific state, refer to Statement of Generally Acceptable Terms and Conditions (SGAT), Exhibit A.

Rates

A nonrecurring charge applies to the installation of service(s) and in some states a disconnect service(s) charge will apply. Rates for Unbundled Local Loop are available in Exhibit A or the specific rate sheet in your Interconnection Agreement. If there are elements that are not in your Interconnection Agreement, contact your Qwest Sales Executive.

Tariffs, Regulations, and Policies

Qwest technicians do not provide service past the Demarcation Point at the end-user premises on an Unbundled Local Loop.

To convert your existing Private Line to Unbundled Local Loop pricing, the conversion must:

- Be like for like facilities, e.g., DS1 Private Line to Unbundled Local Loop DS1 Capable Loop

- Originate at your Collocation site in the serving CO
- Terminate at the end-user premises

The conversion of your Private Line to Unbundled Local Loop pricing does not require a redesign of the circuit. This conversion will not create a disruption of service to your end-user.

Unbundled Local Loops can be ordered in conjunction with a Multiplexer (MUX). Refer to Loop MUX Combination (LMC) for more information.

Unbundled Local Loop product offerings are provided where existing facilities are available. Exceptions may apply where Commission Orders or state requirements exist. Exceptions may occur with Qwest/U S WEST Merger Stipulations/Agreements in the states of Minnesota and Washington. These agreements are separate from Qwest efforts to regain long distance re-entry. For specifics on those exceptions, refer to Regulatory Commissions and Telecommunications Associations.

When you submit a request for an Unbundled Local Loop the standard assignment process may include both mechanized and manual processes. Requests that can be provisioned over copper facilities use the mechanized assignment process. When facilities cannot be assigned via this process, the default is the Manual Steps Required for Copper Facility Assignment Process. Requests that are provisioned over fiber use the Fiber Facility Assignment Process for DS1 and Above. For additional information on the Facility Assignment Process. If cable capacity is available, Qwest will complete any necessary incremental facility work to provide complete facilities to the end-user premises. This work includes but is not limited to; placement of a drop, addition of a NID at the end-user demarcation point, addition of cards to an existing Subscriber Loop Carrier Systems at the CO and Remote Terminal, addition of CO Tie Pairs, and addition of Field Cross Jumpers. This process will not include the splicing of Unbundled Dark Fiber. Additional information for Unbundled Dark Fiber can be found in Unbundled Dark Fiber (UDF).

If no facilities are available to meet the parameters required for your requested service, Qwest will look for an existing engineering job order that could fill your service request in the future. If an engineering job order is identified, Qwest will provide the Ready For Service (RFS) date. You will have the opportunity to wait for the service to be delivered or cancel your service request..

If the service request involves a 2-Wire or 4-Wire Analog (Voice Grade) Unbundled Local Loop, and the loop is considered primary service the normal assignment process described above will be followed in its entirety. If no facilities are available, and there is No Planned Engineering Job, an engineering job order will be initiated to

ensure delivery of the primary service to the end-user. Qwest will construct facilities for the 2-Wire or 4-Wire Analog (Voice Grade) loop that are in alignment with its Eligible Telecommunications Carrier (ETC) obligations to provide basic local exchange service in the retail markets. For more information on Qwest's ETC obligations refer to Regulatory Commissions and Telecommunications Associations.

Qwest will construct facilities to satisfy the primary 2-Wire or 4-Wire Analog (Voice Grade) lines for the Unbundled Local Loop, in the same manner as Qwest constructs these facilities for its own end-users.

If you submit a service request for a 2-Wire or 4-Wire Analog (Voice Grade) Unbundled Local Loop, and the loop is considered secondary service the normal assignment process described above will be followed in its entirety. If facilities can not be located and there is No Planned Engineering Job, your service request will be held for 30 business days. Availability of facilities is on a first come, first served basis. If spare facilities become available, a Firm Order Confirmation (FOC) is generated and sent to you in response to your original service request. If at the conclusion of the 30 business day hold facilities are still unavailable, your service request will be rejected. Exceptions may occur, as mentioned above. This information is also described in the Provisioning and Installation Overview. If it is determined that facilities are unavailable, contact your Qwest Service Manager for other options. Information for CLEC requested Unbundled Network Elements (UNE) Construction is available in CLEC Requested Unbundled Network Elements (UNE) Construction (CRUNEC).

When you submit an Unbundled Local Loop request for xDSL Services (i.e., 2-Wire or 4-Wire Non-Loaded Loop, ADSL Compatible Loop, ISDN BRI Capable Loop, xDSL-I Capable Loop), for or a DS1 Capable Loop or DS3 Capable Loop, the normal assignment process will be followed in its entirety. If facilities can no be located and there is No Planned Engineering Job, your service request will be held for 30 business days. Availability of facilities is on a first come, first serve basis. If spare facilities become available, a FOC is generated and sent to you in response to your original service request . If at the conclusion of the 30 business day hold facilities are still unavailable, your service request will be rejected. Exceptions may occur, as mentioned above. This information is also described in the Provisioning and Installation Overview. If it is determined that facilities are unavailable, contact your Qwest Service Manager for other options. Information for CLEC requested UNE Construction is available in CLEC Requested UNE Construction (CRUNEC).

Qwest Outside Plant (OSP) and Interoffice (IOF) engineering jobs may be viewed in the ICONN database. For specific details and instructions see the Tariffs, Regulations, and Policies Section of the

Provisioning and Installation Overview.

Upgrades of Interoffice Facilities may allow copper interoffice facilities to be redesignated as available for loop facilities. When copper interoffice facilities become available, these copper loop facilities will be available as spare for you to use as unbundled local loops to your end-user. This spare copper will be indicated as spare facilities in the Raw Loop Data (RLD) Tool.

Qwest normal hours of operations are 8:00 AM to 5:00 PM, Monday through Friday, excluding Qwest Holidays. Installations requested outside of the normal operating hours are considered to be Out of Hours Installations. All Out of Hours installations require a coordinated installation option as defined in the Ordering section. Contact your Qwest Service Manager for information regarding this process. Out of Hours rates are assessed for this service. These rates appear in Exhibit A or the specific rate sheet in your Interconnection Agreement.

All Unbundled Local Loop intervals, including Extension Technology and Loop Conditioning, are located in the Service Interval Guide (SIG). Additional information regarding Extension Technology is described in ISDN BRI Capable Loop and xDSL-I Capable Loop. Information regarding Loop Conditioning is located in the Ordering section of this web page.

Quick Loop provides a reduced provisioning interval for Unbundled Local Loops. Additional information regarding Quick Loop is described in 2-wire or 4-wire Analog (Voice Grade) Loop and 2-Wire or 4-Wire Non-Loaded Loop.

Information for Local Number Portability (LNP) when associated with Unbundled Local Loops can be found in LNP.

The provisioning intervals for converting from Private Line to Unbundled Local Loop pricing are located in the SIG. The intervals will be consistent with the type of loop you are converting to, e.g., Private Line DS1 to Unbundled Local Loop DS1 Capable Loop Pricing, your provisioning interval would be for DS1 Capable Loop.

Optional Features
Detailed information regarding optional features for each Unbundled Local Loop product is available by selecting the product hyperlink located in the Product Description section of this web page.

Features/Benefits

Features	Benefits

Market Presence	• Allows you to provide Local Exchange service to your end-users
Low Cost	• Allows you to lease facilities from Qwest at wholesale rates

Applications

See Features/Benefits

Implementation

Product Prerequisites
If you are a new CLEC and are ready to do business with Qwest, view the Getting Started as a Facility-Based CLEC. If you are an existing CLEC wishing to amend your Interconnection Agreement or New Customer Questionnaire, additional information is located in the Interconnection Agreement.

Pre Ordering

General pre-ordering activities are described in Pre-Ordering Overview.

Border town characteristics, including a NPA/NXX matrix are described in the Pre-Ordering Overview.

Border town cities are physically located and tariffed in one state witl service provided from a central office located in a different state. The recurring and non-recurring rates for each border town are based on the tariffs of the state where the service is physically located. Taxes are also based on the end user's physical location, not the serving Central Office.

For UBL accounts, the SBN/MAN number, Summary BAN, Geographic Deaveraging Rate Zone, and Exchange Code (Eastern) will be assigned using the END USER State data. The STN (Eastern) and Circuit ID will be assigned using the serving central office State data.

Exceptions occur where a tariff specifically addresses a city by name or by NPA/NXX. In these exception cases, the tariff is the final source of authority for determination of recurring and non-recurring charges as well as late payment charges.

The Interconnect Mediated Access (IMA) Users Guide specifically details the information applicable to pre-ordering functions.

Loop qualification queries should be used prior to submitting a service request. Use of the queries can greatly reduce service request rejects by ensuring the types of facilities requests are available prior to placing a service request. The query will enable you to verify the type of facility and physical characteristics of the facility. Bases on the physical characteristics you can determine if the facility needs to be conditioned, i.e. the removal of load coils or bridge taps, which will assist you in identifying the appropriate service request intervals, as described in the SIG.

Some of these queries are available in IMA and others are web based. The qualification queries provide you with access to physical characteristics of the Qwest Facility from Qwest databases. This is the same underlying data that Qwest utilizes for its retail product offerings.

- The queries are for informational purposes only and do not restrict or imply that your service will or will not work on a given facility. This determination is your responsibility.
- As mentioned, the physical characteristics provided are based on Qwest's plant facility database. If you encounter any inaccuracies in the information, please contact your Qwest Service Manager.

IMA qualification queries are:

- Loop Qualification Query
- Raw Loop Data (RDL) Queries
- Plan Old Telephone Service (POTS) Conversion to Unbundled Loop Query (submenu under Check Facility Availability)
- ISDN Facility Availability Query (submenu under Check Facility Availability)

Wed based qualification queries are:

- Wire Center RLD
- Fiber Data Reports

For web based queries, contact your Qwest Service Manager to request an ID, which will be required to obtain the Digital Certificate required for access to the Wire Center RLD and the Fiber Data Reports. You will need to provide the names and telephone of each staff member that will be accessing the query. After your Qwest Service Manager has notified you that the necessary access permissions have been established, and provided you with your ID, you may then initiate the Digital Certification process.

Information about the IMA based loop qualification queries are available in the IMA User's Guide or the Pre-Ordering Overview. The IMA Loop Qualification and Raw Loop Data-CLEC Job Aid is a web-based training course designed to provide valuable information and instructions on how to use and interpret IMA-based loop qualification queries and the raw loop data queries.

The Fiber Loop Qualification Report Users Guide provides you with instructions on how to use this query.

The Loop Qualification Query can be accessed via IMA to pre-qualify for Qwest DSL, Unbundled Local Loop and ADSL. If the end-user's telephone number is a Port-Within telephone number also known as a Location Ported telephone number, you must use the address to perform an ADSL qualification. Information regarding the Loop Qualification query is described in the IMA User's Guide.

When an end-user is served from a Remote Serving Unit (RSU), an "EX" prefix will appear in the end-users cable pair (e.g., F1 ca EXA7). Unbundled Local Loops are available when you are collocated in the same RSU that your end-user is served by. If you are not collocated in the same RSU as an end-user, contact your Qwest Sales Executives for assistance with products that may be available to serve your end-user.

Ordering

General ordering activities are described in the Ordering Overview.

Unbundled Local Loop service requests are submitted using the following LSOG forms:

- Local Service Request (LSR)
- End User (EU)
- Loop Service (LS)
- Loop Service with Number Port (LSNP)
- Directory Listings (DL)

Filed entry requirements are located in the LSOG.

Service requests should be placed using IMA-Graphical User Interface (GUI) or faxed to (888) 796-9089. The IMA User's Guide specifically details information applicable for the ordering functions.

Upon completion of construction or augmentation of your Collocation, Qwest provides you with an Alternate Point of Termination (APOT) form. The APOT form will provide you with the specific Collocation terminations at the ICDF frame or the frame

where the service terminates. This is your Connecting Facilities Arrangement (CFA) information, which you will need when submitting an service request.

Service intervals are available in the SIG. Additional state specific information is available in Exhibit C for the relevant state.

A Design Layout Record (DLR) request is described in the IMA EDI Network Disclosure Document or the IMA User's Guide.

Service requests for multiple Unbundled Local Loops can be submitted on one service request to disconnect, move or change, if the Circuit Identifications terminate at the same end-user address. The requested ACT type must be the same for each loop on the service request. Information is available in the IMA User's Guide and LSOG

If you relate Purchase Order Numbers (PON) and associate them to a Project Identification Code, in the PROJECT field on the LSR, or if the LQTY field on the LSR has 25 or more loops, the service request will be handled as a project by the center responsible for handling your account. The installation guidelines for projects are negotiated on an Individual Case Basis (ICB) based on the request.

Unbundled Local Loop and Unbundled Local Loop with LNP requires a facility between the serving wire center and the end-user. Market Expansion Line (MEL) also known as Remote Call Forwarding (RCF) does not have a facility associated with it, therefore, MEL conversion to an Unbundled Local Loop or Unbundled Local Loop with LNP is unavailable.

Re-use of facilities is a Qwest priority. Facilities are re-used when an existing end-user is migrated to a CLEC, either from Qwest or another CLEC, as long as the request involves like services (e.g., Fixed Rate Residential (1FR)/Fixed Rate Business (1FB) analog to an analog loop (LX--)) and both providers are located in the same Serving Wire Center. This is accomplished through the service request process. The table below identifies the re-use specific LSR requirements. Detailed information is described in the LSOG.

Service Request Field	**Must Be Populated With**
AGAUTH	Y
DATED	CCYYMMDD
REQTYP	AB
ACT	V or Z
	Standard interval applies as identified in the

DDD	SIG
CFA	Enter CFA information

Private Line to Unbundled Local Loop pricing conversion

The table below identifies the existing Private Line to Unbundled Local Loop pricing conversion LSR specific requirements:

Service Request Field	**Must Be Populated With**
REQTYP	AB FOR Loop only or BB for Loop with LNP
ACT	V
LNA	D
Manual Indicator	Y
ECCKT	Circuit Identification of the Private Line
APOT	Enter APOT information
Remarks	Include in the remarks: • Private Line to Unbundled Local Loop pricing conversion • CFA information • No CO work (ie. PRIVATE LINE TO UNBUNDLED LOOP PRICING CONVERSION ON 64/HGGS/159524/MS. NO CO WORK INVOLVED PSU07/22-NL/00025/BNTFUTMA/BNTFUTMAHG7

Unbundled Local Loop service requests are identified by using Common Language Circuit Identification (CLCI™). The CLCI is in Serial Number format and is provided to you on your FOC. Once the Circuit Identification is assigned, all subsequent requests must carry the Circuit Identification in the ECCKT field of the LSR.

The existing Private Line CLCI will be changed to an Unbundled Local Loop CLCI and is provided to you on your FOC. Once the CLCI is assigned, all subsequent design changes will require the Unbundled Loop CLCI, and should be compliant with the design requirements identified in Technical Publication, Interconnection - Unbundled Loop, 77384. Private Line to Unbundled Loop Pricing Conversion CLEC Job Aid is a document designed to provide

guidance in performing service request entries for the Private Line to Unbundled Loop Price Conversion.

Following is a description of the Qwest Circuit Identification Number format:

- Characters 1 and 2 are the state code (Refer to Circuit ID by State Table below.)
- Characters 3 through 6 are the Service Code indicating what product is being ordered (Refer to the Service Code Table below.)
- Characters 7 through 12 are numeric
- Characters 13 and 14 represent; PN equates to Western, MS equates to Central, and NW equates to Eastern

29.LXFU.123456..MS is an example of a Circuit Identification Number in Serial Format.

Circuit ID by State Table

Central MS		Eastern NW		Western PN	
State	State Code	State	State Code	State	State Code
Arizona	19	Iowa	1	Oregon	5
Colorado	29	Minnesota	3	Washington	4
Idaho	39	Nebraska	7		
Montana	49	North Dakota	5		
New Mexico	59	South Dakota	9		
Utah	69				
Wyoming	79				

SERVICE CODE TABLE

Analog type loops, Voice Grade, Non-Loaded ADSL Compatible Loops	LXFU
DS1 Capable Loop	HCFU
DS3 Capable Loop	HFFU
ISDN BRI Capable Loop	UBXU

OC3 Capable Loop	OBFU
OC12 Capable Loop	ODFU
OC48 Capable Loop	OFFU
OC192 Capable Loop	OGFU
xDSL-I Capable Loop	AGFU

*UBXU service code replaces UBCU, UBCU is a grandfathered code for ISDN BRI Capable Loop.

Qwest hours of operation are identified in the Tariffs, Regulations, and Policy Policies section.

Six installation options are available for Unbundled Local Loop. The following is information regarding each of the provisioning installation options:

Installation Option	**Description**	**Ordering Requirements**
Basic Installation	Available for new or existing Unbundled Local Loops. For an existing end-user, the basic installation option is the 'lift and lay' procedure. In this scenario the Qwest Technician 'lifts' the loop from its current termination and 'lays' it on a new termination connecting to the CLEC. For new end-user service, the basic installation option involves Qwest Technicians to complete the circuit wiring and conduct the performance tests to ensure the circuit meets the required parameter. Test results are not provided to the CLEC.	Basic is assumed unless Coordinated Hot Cut (CHC) and Appointment Time (APPTIME) fields are populated.
Basic Installation with Performance Testing *	Available for new or existing Unbundled Local Loops. For an existing end-user, the 'lift' and 'lay' process is performed. In addition performance testing is done to ensure the circuit meets the required parameters limits.	LSR entries include a 'N' or blank in the 'CHC' field and the 'TEST' field contains a 'A' for performance testing.

	Test results are provided to your designated contact verbally during close-out activities of the order on the due date.For new end-user service, this option requires a dispatch to the end-user premises. The Qwest Technician will complete the circuit wiring and conduct performance tests to ensure the circuit meets the required parameter limits. The test results are provided to your designated contact verballyduring close-out activities of the order on the due date.	
Basic Installation with Cooperative Testing *	Available for a new or existing Unbundled Local Loops. For an existing end-user, the 'lift' and 'lay' process described above is performed. Your designated contact is contacted on the due date to perform loop back acceptance test, accept the loop and exchange demarcation information. Test results are provided verbally during close-out activities of the order on the due date. For new end-user service, this option requires a dispatch to the end-users premises. The Qwest Technician will complete the circuit wiring and conduct the performance tests to ensure the circuit meets the required parameter limits. Your designated contact is contacted on the due date to perform loop back acceptance test, accept the loop and exchange demarcation information. The test results are provided verbally during close-out activities of the order on the due date. If Qwest fails to perform	LSR entries include a 'N' or blank in the 'CHC' field and the 'TEST' field contains a 'I' for cooperative testing.

	cooperative testing due to Qwest's fault, Qwest will waive the nonrecurring charge for the installation option. If you still desire cooperative testing, you and Qwest will attempt to set a new appointment time on the same day and, if unable to do so, Qwest will issue a jeopardy notice and a FOC with a new Due Date.	
Coordinated Installation with Cooperative Testing *,**	Available for a new or existing Unbundled Local Loops. The service request submitted must designate a specific 'Appointment Time' for the cooperative testing to occur. For an existing end-user, the 'lift' and 'lay' process is performed, on the due date, at the designated 'Appointment Time', the Qwest Technician will contact your designated contact to ensure that you are ready for the installation, at which time the work is initiated and the required performance test conducted. Additional tests requested by you are also performed at this time. The test results are provided verbally during close-out activities of the order on the due date. If you are not ready within thirty (30) minutes of the scheduled appointment time, you must re-schedule the installation by submitting a supplemental service request for a new Due Date and appointment time. If Qwest is not ready within thirty (30) minutes of the scheduled appointment time, Qwest will waive the nonrecurring charge for the installation option, you and Qwest will attempt to set a	LSR entries include a 'Y' in the 'CHC' field, 'APPTIME' and Desired Frame Due Time (DFDT) fields populated with the same time in military format and 'TEST' field contains a 'B' for cooperative testing.

	new appointment for the same day. If Qwest fails to perform cooperative testing due to Qwest's fault, Qwest will waive the nonrecurring charge for the installation option. If you still desire cooperative testing, you and Qwest will attempt to set a new appointment time on the same day and, if unable to do so, Qwest will issue a jeopardy notice and a FOC with a new Due Date. For new end-user service, this option requires a dispatch to the end-user premises. On the due date, at the designated 'Appointment Time' the Qwest Technician will contact your designated contact to ensure that you are ready for the installation, at which time the installation work is initiated and the required performance test conducted. Additional tests requested are also performed at this time. The test results are provided verbally during close-out activities of the order on the due date. When this option is selected with 25 or more DS0 Unbundled Local Loops, or one or more DS1 Capable Loops or DS3 Capable Loops, the parameters for the Project Coordinated Installation can apply. Additional information is located in the Project Coordinated Installation option below.	
Coordinated Installation without Cooperative Testing **	Available for a new or existing Unbundled Local Loops. The service request submitted must designate a specific 'Appointment Time' to coordinate the conversion activity.	LSR entries include a 'Y' in the 'CHC' field, 'APPTIME' and 'DFDT' fields populated with the same time in

		For an existing end-user, the 'lift' and 'lay' process is performed, on the due date, at the designated 'Appointment Time'; the Qwest Technician will notify you that the conversion activity is beginning. Your designated contact will be notified by the technician once the 'lift' and 'lay process is completed. Performance test results not provided. If you are not ready within thirty (30) minutes of the scheduled appointment time, then you must reschedule the installation by submitting a supplemental service request . If Qwest is not ready within thirty (30) minutes of the scheduled appointment time, Qwest will waive the nonrecurring charge for the installation option. You and Qwest will attempt to set a new appointment time on the same day and, if unable to do so, Qwest will issue a jeopardy notice and a FOC with a new Due Date. For new end-user service, a dispatch may be required to tie-down the new circuit at the end-user premises. You may elect to specify that no dispatch is requested. This will signal the Qwest Technician that they will not need to stay on the premises to perform the Coordinated Installation once the circuit is in place. On the due date, at the designated 'Appointment Time', after the circuit is in place, the Qwest Technician will contact you to ensure that you are ready for the installation. The work will	military format and 'TEST' field contains a 'N' for no cooperative testing required.

	be initiated and the required performance tests conducted. Performance test results are not provided, your designated contact is notified when the installation is complete. When this option is selected with 25 or more DS0 Unbundled Local Loops, or one or more DS1 Capable Loops or DS3 Capable Loops, the parameters for the Project Coordinated Installation can apply. Additional information is located in the Project Coordinated Installation option below.	
Project Coordinated Installation **	Available for a new or existing Unbundled Local Loops. The Project Coordinated Installation permits you to obtain a coordinated installation for Unbundled Local Loops with or without LNP, when you order DS1, DS3 or 25 or more DS0 Unbundled Local Loops. The Project Coordinated Installation Option is available with the Coordinated Installation with Cooperative Testing or the Coordinated Installation without Testing. The service request submitted must designate a specific 'Appointment Time' to coordinate the conversion activity. All requests are processed on a first come, first served basis and are subject to Qwest's ability to meet a reasonable demand. Qwest will schedule the appropriate number of employees based on the scale and scope of the project based on the information you provided.	LSR entries: 'Y' in the 'CHC' field, 'APPTIME' and 'DFDT' fields populated with the same time in military format and 'Y' in the Manual Indicator (IND) field. Remarks section of the LSR must indicate 'Project Coordinated Installation'

	If you requested Project Coordinated Installation with LNP and the LNP Managed Cut conversion is not successful; you and Qwest will jointly isolate and fix the problem in a timeframe agreeable with you and your end-user. If the problem cannot be resolved within an acceptable timeframe, you may request the restoral of Qwest service for the ported customer. Qwest will ensure that any LNP order activity requested in conjunction with a Unbundled Local Loop Project Coordinated Installation will be implemented in a manner that avoids interrupting service to the end-user, ensuring that the end-user's Qwest loop will not be disconnected prior to confirmation from you that the loop has been successfully installed.	

For additional information on installation options please refer to the SGAT.

* Upon order close-out of either new or existing services to an end-user, the Qwest Implementor/Coordinator will first provide verbally and then email the test results to your permanent email address withir two business days. The email notification will only take place if you have provided the permanent e-mail address to your Qwest Service Manager. This option is available with the following provisioning installation options:

- Basic Installation with Performance Testing
- Basic Installation with Cooperative Testing
- Coordinated Installation with Cooperative Testing

** You will be required to attempt an appointment reservation to reserve an appointment, which will populate the APT CON field. Thi requirement applies when the appointment is made via IMA. APT CON must have a value for these products when CHC = Y. Information for Schedule Appointment is described in the IMA User's Guide.

White Page Directory Listings are available for Unbundled Local

Loops and Unbundled Local Loops with Local Number Portability.

Unbundled Local Loops with ACT types of N and V require:

- Listed Telephone Number (LTN) on the DL form to match the Circuit Reference (CKR) entry on the LS form.
- ACT types of C and T require the LTN on the DL form match the CKR entry on the Customer Service Records (CSR).

Unbundled Local Loops with LNP for the ACT type of V requires:

- LTN on the DL form match the CKR entry on the LSNP form.
- ACT type Z does not require a DL form to convert all existing listings.

When Facility Based Directory Listing (FBDL) listings exist in the listing database for an Unbundled Local Loop end-user, the listing should be retained as FBDL, with no DL Form associated with the Unbundled Local Loop request. However, if the FBDL is disconnected and no longer resides on the listing database, the end-user listing can be established on the Unbundled Local Loop account, and will then be available on the CSR. Information is available in the White Pages Directory Listings. Additional information is located in Directory Listings.

Accessing the Directory Listing Inquiry System (DLIS) will enable you to review directory listing information prior to and subsequent to submitting directory listing orders to Qwest for processing.

The Loop Service with Number Portability (LSNP) form is also used if the request involves LNP. Additional information regarding LNP can be found in LNP.

UNE-P to Unbundled Local Loop Conversion

If you want to convert your UNE-P end-users to Unbundled Local Loop in a bulk conversion (REQTYP equal "AB" or "BB" depending upon porting request) the following steps are required:

- Perform pre-order activities for each individual end-user account.
    - Check facility availability by validating the Connecting Facility Assignment (CFA) per the detailed information available in Chapter 1 of the IMA User Guide. Potential reject problems such as busy CFA, validation of end-user address for data mismatch, and facility qualification requirements are identified and explained in the IMA documentation.
    - If you encounter CFA discrepancies, open an escalation

ticket. For information regarding escalations and relevant contact numbers, refer to the Expedites & Escalations Overview.
    - You may create a project tracking number that will be placed on the LSR for the bulk conversion. The same project number will be applied to all LSRs that you wish to track as a project.
    - Contact your Service Manager to define the parameters for the bulk conversion. You should provide the following:
        - Number of lines per Local Serving Office (LSO)
        - Number of LSOs involved in the bulk conversion
        - Number of lines you want to convert each day/night
    - Negotiate with Qwest regarding when you want to convert the lines. Conversions that occur outside of normal business hours can only be supported if resources are available. Normal business hours for conversions (cuts) are based upon product type (e.g., Unbundled Local Loop normal business hours are 8 AM to 5 PM). The type of installation, basic or coordinated, determines the specific cut time.
    - Perform normal ordering procedures for a LSR. If you provided a project number, it will be included on the LSRs.
        - Refer to the following for information regarding ordering:
        - IMA's User's Guide
        - Pre-Ordering Overview
        - Ordering Overview
        - Provisioning and Installation Overview
    - Service interval guidelines are found in the Service Interval Guide (SIG). They are listed by product.
- Participate in pre-due-date readiness activities as appropriate. The following activities will be performed prior to the due date (s) for bulk conversion(s):
    - Lift and lay tests will be performed by the QCCC.
    - Pre-wiring at the central office
    - Loop qualification via standard testing practices
    - Dial tone will be checked at the co-location, however, ANI for the TN cannot be performed. You will need to make certain that the correct translation path is selected to the co-location point prior to conversion.
- Participate in due date conversion activities as appropriate. The following activities will be performed on the due date of the bulk conversion:
    - Pre-cut call to validate that you are prepared for the lift and lay function
    - If you provide a continuous bridge number, status will be provided at the start and completion of each line cut. We will not be on the bridge number continuously (24 hours)

but will be available when needed during the line cut activities. We will also contact the entity identified in the Implementation Contact (IMPCON) field of the LSR.
    - We will perform qualifying tests for each line and request that you check it and provide acceptance or feedback to us. We will continue to work with you until you accept the circuit. Once you accept the circuit as complete, you cannot roll back to UNE-P.
- If you encounter any difficulties immediately after the conversion, contact the escalation group and open a ticket. For information regarding escalation, refer to the Expedites & Escalations Overview

Qwest Port out with UBL Main Number and TER's

After you have obtained the new business and received POA from the end-user, you will need to verify TN(s) are eligible to Port out with TER's then submit LSR's to Qwest using the standard order process for LSNP with the following additions.

The table below identifies the Qwest Port out with UBL Main Number and TER's, reuse facilities LSR specific requirements:

Service Request Field	Must Be Populated With
REQTYP	BB
ACT	V or Z
LNA	V
Ported Number	Must equal the main number of the TER's
Manual Indicator	Y
Remarks	Include in the remarks: • "TN associated to TER's, line items on LSNP page matching TER associction" Example: TER1 - Line 1(typically the main number), TER 2 - Line 16, TER 3 - Line 17, etc.

Valid LSR ACT types are:

- C = Change
- D = Disconnect
- N = New Installation
- M = Inside move
- T = Outside Move
- V = Conversion as specified
- Z = Conversion as specified with no directory listing change is only applicable with Unbundled Local Loop with LNP

Valid REQTYP is AB unless the request involves LNP; then the REQTYP is BB.

Some of the more common information required on Unbundled Local Loop LSR request includes the following information:

- Valid Network Channel (NC) and Network Channel Interface (NCI) codes
- CFA
- Installation Option
- Desired Due Date
- Secondary Location Information
- Contact Information

Some services may require Qwest to condition facilities i.e., Load Coils and Bridged Tap removal, in order to provision the type of service you requested.

You can use the ADSL Loop Qualification Query or the RLD query to determine if conditioning is necessary to provide the service you intend to offer. Qwest will always attempt to assign facilities that do not require conditioning. However, there may be some situations where the only way to fulfill your request requires Qwest to condition the loop. No additional charge is assesed for this conditioning, however Qwest will not condition a loop without you requesting the conditioning. If you request conditioning and the conditioning degrades the voice services on the loop to the point where it is unacceptable to end-users, charges will be assessed to recondition the loop. Qwest will provide removal of load coils and excessive bridged taps on digital capable Unbundled Loops at no charge. Qwest will not require a contract amendment to change the rate for removal of load coils and excessive bridged taps of Unbundled Loops. Qwest reserves the right to revert to the contractual rate for this type of conditioning upon appropriate notice. If any regulatory body issues a ruling related to this change, or upon other applicable event, this change may be subject to the conditions described under Change in Law Provisions of the SGAT (Section 2.2) or the applicable interconnection agreement.)

To simplify the process, you have the option to request conditioning by entering a "Y" in the SCA field of the LSR. If this field carries the "Y", all Load Coils and excessive Bridged Tap will be removed, with the exceptions of stub cable. The pre-approval option provides the following benefit:

- If conditioning is required, the service request will flow through the provisioning process.
- If the pre-approval is not included on your service request and conditioning is required, Qwest will reject your LSR and you will need to submit a new service request.

Following are examples for ordering loop conditioning on a non-loaded loop e.g., 2 Wire or 4 Wire Non-Loaded Loop, ADSL Compatible Loop, ISDN BRI Capable Loop or xDSL-I Capable Loop:

- When your LSR is submitted with a "Y" in the SCA field, Qwest's first attempt will be to assign a facility free of Load Coils and Bridged Tap. If the only available facilities have Load Coils and Bridged Tap, Qwest will dispatch a technician to ensure that the circuit will meet the parameters specified in the service request. If loop conditioning is required, the standard 15 business day loop conditioning interval will apply.
- When your LSR is submitted with a "N" in the SCA field or if the SCA field is blank, you have not authorized the removal of Load Coils or Bridged Tap. Qwest will attempt to assign a facility free of Load Coils and excessive Bridged Tap.
    - If facilities are unavailable free of Load Coils and/or excessive Bridged Tap your service request will be rejected. Qwest will advise you that loop conditioning of the facility is required. You will need to resubmit an LSR with a 'Y' in the SCA field.
    - If such a facility can be found, it will be assigned and the request will be processed. In this situation, the facility assigned can have Bridged Tap on it that does not exceed the limits identified by the NC/NCI code specified in your LSR.
- If Load Coils and/or excessive Bridged Tap are not identified by Qwest as being present on the facility assigned, Qwest should be able to identify Load Coils and/or excessive Bridged Tap during Test and Turn-up. If the test doesn't indicate the presence of Load Coils and /or excessive Bridged Tap, and the loop is subsequently turned over with Load Coils and/or excessive Bridged Tap on it, Qwest will remove the Load Coils and/or excessive Bridged Tap within five business days of order completion. This process will not require you to submit a supplemental service request in the below scenarios:
    - You originally entered a "Y" in the SCA field of the LSR, Qwest will remove any Load Coils and/or excessive Bridged Tap.
    - You originally entered a "N" in the SCA field of the LSR or left the SCA field blank, Qwest will only remove the Load Coils and/or excessive Bridged Tap that impedes the service or is not indicated in the Qwest records. Bridged Tap that doesn't interfere with the services specified in the NC/NCI code combination will not be removed.

For additional information on jeopardy notifications refer to the Provisioning and Installation Overview.

The pre-approval inclusion will not have any negative impacts on

your order. Qwest will still attempt to locate facilities that do not require loop conditioning.

Qwest will remove Load Coils and/or excessive Bridged Tap for 2-Wire and 4-Wire Non-Loaded Loops, ADSL Compatible Loops, ISDN BRI Capable Loops and xDSL-I Capable Loops. The interval required to perform loop conditioning is 15 business days. The standard intervals and critical dates are available in the SIG.

The due date interval for Unbundled Local Loops depends on the type of loop that is being installed. If the requested installation interval specified is less than the standard interval, your request will be processed with the intervals found in the SIG. If you requested an installation interval that is greater than or equal to the standard interval, the requested installation interval will be assigned. The standard intervals and critical dates are available in the SIG.

Product specific Unbundled Local Loop ordering information is available by clicking on the appropriate product hyperlink located in the Product Description section.

Provisioning and Installation

NC/NCI codes for provisioning are available in the the Technical Publication, Interconnection - Unbundled Loop, 77384.

General provisioning and installation activities are described in the Provisioning and Installation Overview.

FOC intervals are found in the SIG.

If no facilities are available to meet the parameters required for your requested service, Qwest will look for an existing engineering job order that could fill your service request in the future. If an engineering job order is identified, Qwest will provide the Ready For Service (RFS) date. You will have the opportunity to wait for the service to be delivered or cancel your service request.

A jeopardy on a service order request results if a condition exists that threatens timely completion of the request. Jeopardy notifications are described in the Provisioning and Installation Overview.

For order status information for Unbundled Local Loops above DS0 signal levels, refer to the Design Service Order Status (DSOS). This tool requires a digital certificate. For additional information about DSOS, access the Qwest Design Service Order Status Job Aid.

Specific Performance Testing is conducted to ensure that a circuit

meets the required parameters and objectives of the requested loop type. Performance tests are conducted based on the Unbundled Local Loop product being converted or installed. Product information is available on each product by selecting the product hyperlinks included in the Product Description section. Performance information is located in the Technical, Interconnection - Unbundled Loop, 77384.

For Unbundled Local Loop , the migration activities will not exceed forty five (45) minutes. For more information on migrations and conversion, see the Migrations and Conversions Procedural PCAT.

Qwest is responsible for notifying you of any activity associated with your account. This includes transfers of your end-users to other Local Exchange Carriers and order completion on requests you have submitted. Loss and Completion Reports are generated based on loss and gain account activity. Information regarding completion notification, including Loss and Completion Reports, is described in the Provisioning and Installation Overview.

Spectrum Management is the administration of outside loop plant to assure spectral compatibility for services and technologies that use pairs in the same cable. In general, spectrum compatibility refers to the ability of loop technology to operate and reside in the same or adjacent binder groups without causing an unacceptable degradation of service from the end-user's perspective.

Spectrum Management process applies to digital loops, (e.g., xDSL Loops).

- 2-Wire or 4-Wire Non-Loaded Loop
- ADSL Compatible Loop
- DS1 Capable Loop
- ISDN BRI Capable Loop
- xDSL-I Capable Loop

The NC/NCI codes submitted on your LSR describe the type of technology, fitting within a Power Spectral Density (PSD) mask. These codes will provide Qwest with the technical parameters at which the newly deployed or changed technology will operate. Detailed information is available on each product by selecting the product hyperlinks included in the Product Description section. The NC/NCI codes are specified in the Technical Publication, Interconnection - Unbundled Loop, 77384.

- Qwest will treat NC/NCI code information provided by you as proprietary information. This proprietary information will be used for Spectrum Management administration purposes only. The PSD mask on all loops, within a binder group, will be disclosed only if trouble or interference occurs on the end-

user's xDSL-I loop.

- If trouble or interference, found by either you or Qwest, is degrading the performance of other advanced services or traditional voice band services, the carrier experiencing the interference will notify the causing carrier. When notified of the problem, the causing carrier, given reasonable opportunity to correct the problem, shall promptly take action to bring its facilities/technology into compliance with industry standards.
- If a carrier's end-user experiences interference problems, Qwest will provide binder group information to you within 48 hours, after receiving a trouble resolution request. In the trouble isolation process, you will need to test the pairs in the binder group and identify the spectrum class causing the problem. Once isolated, Qwest will then provide you with names of the carriers and the spectrum classes in the affected binder group.
- If you are unable to isolate trouble to a specific pair within the binder group, Qwest, upon receipt of a trouble resolution request, will perform a main frame pair by pair analysis and provide results within five business days. Contact your Qwest Service Manager regarding your request.
- Qwest will not have the authority to unilaterally resolve any dispute over spectral interference among carriers.
- Qwest shall not disconnect carrier services to resolve a spectral interference dispute, except when voluntarily undertaken by the interfering carrier or Qwest is ordered to do so by a state commission or other authorized dispute resolution body.
- The Federal Communications Commission (FCC) has designated that within the Qwest network there are "known disturbers," such as T1 Transport, and Qwest will spectrum manage "disturber" technology as required by FCC rules.

Maintenance and Repair

General maintenance and repair activities are described in the Maintenance and Repair Overview.

You retain the right to request reconciliation of trouble reports in order to minimize repeat reports. You can initiate the reconciliation process through your Qwest Service Manager.

Trouble isolation and testing is a joint process. You are responsible for testing and providing trouble isolation results prior to submitting a trouble report to Qwest. As part of this trouble isolation, testing from the far end of the loop (NID) is your responsibility (this includes assurance that the end-user Customer Provided Equipment (CPE) and inside wiring is free of trouble). If you elect not to perform trouble isolation testing, Qwest will offer you the option of performing CO based testing on your behalf. If you request the testing, Qwest will perform the optional testing for you and include the test results in the

trouble report. The test results will be provided to you either verbally or electronically. You will be billed for the optional testing.

If you do not provide test results when attempting to submit a trouble report and elect not to have Qwest perform the optional testing on your behalf, Qwest will not have enough information to open a valid ticket and therefore will not open a ticket. You will need to obtain testing information prior to Qwest accepting and issuing a valid trouble report.

The following examples of trouble reporting and charge assessment could result:

- You have performed trouble testing and provided the test results to Qwest. Qwest will assess the test results that you provided and dispatch a technician to conduct the repair work. If the trouble is found to be in the Qwest network, Qwest will repair and close the ticket with you, no charges will apply for the work activity. If the trouble was found to be in your network, Qwest will notify you and, if authorized by you, dispatch and repair. A Maintenance of Service charge will be assessed.
- You have not performed trouble testing on the end-user's circuit. Qwest will offer you the option of having Qwest conduct the testing on your behalf at a charge. If you choose to have Qwest conduct the testing, Qwest will conduct the test anc assess the results. Qwest will contact you with results stating that the trouble is in your network or in the Qwest network. If the trouble is found to be in your network and you authorize a dispatch, a charge will apply for both the optional testing and for any Maintenance of Service charges resulting from Qwest trouble resolution activity. However, if the circuit is on Pair Gain you should advise Qwest that the circuit is on Pain Gain and Qwest will not assess optional testing charges. If the trouble is found to be in the Qwest network, Qwest will dispatch a technician to conduct the repair work and close the ticket with you. No Maintenance of Service charges will apply for repair of the trouble on Qwest's side of the network, however a charge will be assessed for the optional testing.
- You have not performed trouble testing on the end-user's circuit. Qwest will offer to test the circuit for you. If you decline this option, Qwest will not have enough testing information to warrant the issuance of a valid repair ticket. You will need to perform trouble testing on your end-user's circuit and call Qwest with the testing information.

When reporting a trouble report, you will need to provide test results, analysis of the testing and trouble isolation performed. The information must reasonably demonstrate that the trouble is not in your network.

At a minimum the information contained in a trouble report must define:

- Information reflecting the results of testing and isolation
- Test results
- Analysis of your fact-finding (Is the trouble isolated to the Qwest network?).
- If the circuit is on Pair Gain

Examples of acceptable test results:

- You report: "Line is testing hard short tip-ring."
- Circuit is on Pair Gain.
- You report: "End-user has no dial tone, tested at CLEC and Qwest Point of Interface (POI), have 15v of foreign battery on Qwest side."
- You report: "Open out, no voltage, tip to ground = 0."

Examples of unacceptable test results:

- You report: "No dial tone."
- You report: "Not Working."

Charges could also apply if, at your request, Qwest performs the optional additional testing which results in a dispatch of a Qwest technician and isolates the trouble within your network. In this instance the applicable charge will be assessed.

Your representative, who authorized Qwest to perform the optional testing, will be documented and upon billing inquiry, the representative's name and telephone number will be provided to you by Qwest.

Billing

Customer Records and Information Systems (CRIS) billing is described in Billing Information - Customer Records and Information Systems (CRIS).

Qwest is responsible for notifying you of any activity associated with your account. This includes transfers of your end-users to other Local Exchange Carriers and order completion on service requests you have submitted. Loss and Completion Reports are generated based on loss and gain account activity. Information regarding completion notification, including Loss and Completion Reports, is described in the Provisioning and Installation Overview.

Training

Qwest 101 "Doing Business With Qwest"

- This introductory, instructor led, training course is designed to teach the CLEC and Reseller how to do business with Qwest. It will provide a general overview of products and services, Qwest billing and support systems, processes submitting service requests, reports, and web resource access information. Click here to learn more about this course and to register.

Unbundled Loop

- This instructor-led process and systems training course is designed to introduce and teach the Unbundled Loop (UBL) products, instructing CLEC's on how to request service for Unbundled Loops. This course will provide and overview of the current UBL products, and address the Pre-Order, Order, Post-Order, Provisioning, Billing and CMER Maintenance and Repair. Click here to learn more about this course and to register.

Unbundled Network Element - Switching

- This is a self-directed, web-based training course that provides you with an overview of the Unbundled Network Element - Switching product and its features. Click here to learn more about this course and register.

Unbundled Loop Elements (ULE)

- This is a self-directed, web-based training course that provides you with an overview of the Unbundled Loop Elements (ULE) product and its features. Click here to learn more about this course and register.

Unbundled Dedicated Interoffice Transport (UDIT)

- This is a self-directed, web-based training course that provides you with an overview of the Unbundled Dedicated Interoffice Transport (UDIT) product and its features. Click here to learn more about this course and for registration information.

IMA Classic

- This introductory instructor-led training course provides the participant with an overview of Qwest's Interconnection Mediated Access (IMA) Graphical User Interface (GUI) to order wholesale products. This class provides a comprehensive look at IMA via software demonstrations used to familiarize

you with the IMA GUI system. Click here to learn more about this course and register.

IMA "Hands On"

- This introductory instructor-led training course teaches you how to use Qwest's IMA Graphical User Interface (GUI) to order wholesale products. You will experience interactive software demonstrations and participate in hands-on practice sessions to familiarize your self with the IMA GUI system. Please click here to learn more about this course and to register

Introduction to Service Requests & Billing for CLEC's

- This mutimedia self-directed process and systems training course is designed to provide you with information to identify the required Access Service Request (ASR) and Local Service Request (LSR) forms, and how to complete the forms to request various services from Qwest. The training is based upon case study scenarios and provided three modes of learning:
  - Tutorial
  - Practice
  - On Line Support

Click here to learn more about this course and to register.

Facility-Based CLECs and Reseller/Unbundled Network CLECs Directory Listing User Document

- The Qwest Facility-Based Competitive Local Exchange Carriers (CLECs) and Reseller/Unbundled Network CLECs Directory Listings User Document describes Qwest processes and business rules for working with you to establish and maintain directory listing information throughout Qwest's 14-state local service territory. You provide end-user directory listing information to Qwest to ensure that the end-user listings in Qwest's listing database are current and accurate. This makes your listings available to Qwest's Directory Assistance (DA) and for publication in published directories based on contractual agreements. Maintaining a comprehensive listing database, regardless of each end-user's Local Service Provider, ensures that end-users have access to complete DA Information and the option to appear in a published White Page Directory. Please click here to learn more about this course and to register

Interconnect Mediated Access (IMA) Directory Listing Training

- This course introduces the participant to the IMA functionality as well as the processes that need to be followed to establish,

change and/or delete directory listing information. The participant will review the resources available to assist with Directory Listing questions and processes. A significant amount of time will be spent reviewing Qwest listing business rules and how to complete an Ordering and Billing Forum (OBF) Directory Form via IMA. Please click here to learn more about this course and to register.

Private Line to Unbundled Loop Pricing Conversion - CLEC Job Aid

- The purpose of this job aid is to provide guidance in performing LSR Order Form entries for the Private Line to Unbundled Loop Price Conversion. Click here to learn more about this course and to register.

View additional Qwest courses by clicking on Course Catalog.

QCCC Warranty Process

Definition

The customer of record will have 30 calendar days to call the implementor in the four Designed Services Centers when they experience problems with their circuit. The QCCC warranty process will expand from 48 hours to 30 calendar days and will include all products and installation options.

Goals

Our goal is to reduce the future number of 'I' reports that each center receives monthly and to also improve the service that we provide the customer of record.

An 'I' report is recorded when a new service is turned up and the customer of record reports a trouble ticket on the service within 30 calendar days.

In the QCCC the warranty work will be routed to the appropriate maintenance group.

Hours of Operation

Hours of operation in the four Designed Services Center and the QCCC will be Monday through Friday from 8am to 5pm

The QCC will be open 24 X 7 beginning June 10th.

Each Provisioning Department will have a 30-calendar days warranty on all installs.

Each DSC Provisioning CCT/ SR will provide to the customer of record their name and direct call back number The QCCC will provide the Warranty number, which will be answered in the new maintenance group. Staffed 24X 7

Information to be Given

Information to be given to Customer of Record on Completion

The following information will need to be given to the customer of record upon completion of the order:

Step	Action
1	Circuit I.D.
2	Type of service installed
3	Date of install
4	Location of DMARC
5	DMARC extension (if applicable)
6	Name and number of Center C/I to call if trouble happens when they install their equipment or if any other trouble happens within the next 30-calendar days.
7	DSC personnel will have to give hours of operation for provisioning C/I availability

Handling The Call

The following steps must be followed when the customer of record calls in with a trouble report

Step	Action
1	When **QCCC maintenance C/I** receives a call back on a recent install. The tester will verify with the customer of record the problem that they are reporting.
2	A trouble ticket must be created, AT, (Assist Test) in the RPTCAT field. See Report Categories Job Aid at: http://emedia.uswc.uswest.com/ned/Network_Services/designsrv/jobaids/01026/.CE_0-3443957/
3	Technician shall determine the nature of the call. If Dmarc info is requested by the customer of record, pass the information to them and close the ticket with INFO If a trouble ticket is already open on this circuit give the ticket number to the customer of record, access the ticket and give the most current status information.
4	If the customer of record is reporting that service is either down or they can't get service up then the following actions will be taken by **QCCC maintenance C/I** : Access the circuit reported Perform tests that ensure that the service is still ok. If tests indicate that a network problem exist and can be resolved without a dispatch, then **QCCC maintenance C/I** needs to resolve the issue. The **C/I** will need to retest the service and close the AT ticket with the appropriate analysis and disposition codes. A CR ticket will then need to be created. See Analysis Code/Trouble Code Cross Reference Job Aid at: http://emedia.uswc.uswest.com/ned/Network_Services/designsrv/jobaids/01019/.CE_0-3443913/
5	If a network problem exist and a dispatch is needed to resolve the problem then a **QCCC maintenance C/I** will need to close the AT ticket, and create new ticket with CR (Customer Report) in the RPTCAT field. Detailed notes of what transpired during the AT ticket are required. **The QCCC C/I would follow through on entire transaction.**
6	**QCCC maintenance C/I** will provide all test results performed. They will also note where the dispatch is needed to resolve network issue
7	If the **QCCC maintenance C/I** has a TOK on the circuit and the customer of record is requesting a dispatch to retest to the DMARC, the **QCCC maintenance C/I** will inform the customer of record that billing charges may apply. Again the AT ticket must be closed and CR ticket opened.
8	(**This refers to future group only**) On service that was turned up for billing, C02 Process from Customer Not Ready Process, and no cooperative testing has been performed. The **maintenance C/I** will follow the process and do conformance testing. Per the process on starting of billing an AT ticket is to be opened and tracked.
9	Disconnects in error should be handled in the following manner: **QCCC maintenance C/I** received call from customer of record **QCCC maintenance C/I** will call the SNR and request an order to reinstall service. Expedite process outlines criteria to determine if reconnect would qualify as expedite.

Proposed

PROPOSED BATCH HOT CUT PROVISIONING FLOW

Proposed

PROPOSED BATCH HOT CUT PROVISIONING FLOW

Proposed Batch Hot Cut Process Task List

Note: Transition Planning is expected to take place between Qwest and the CLECs prior to implementation of the Batch Hot Cut Process. Following a Commission ruling of non-impairment in those markets where Qwest brings a case and succeeds, Qwest along with the CLECs will establish a schedule to transition the embedded base in accordance with the TRO requirements and agreements from the State Commissions. The transition schedule will establish a central office time line to convert the embedded base within 21 month transition schedule put forth by the FCC in the TRO.

Proposed Batch Hot Cut Process Task List

1. Batch Hot Cut requires automation efficiencies through IMA. CLEC performs pre-order loop functions, such as check for IDLC, Line Splitting, address validation. CLEC uses the electronic scheduling tool to designate the DD of the cut. Scheduling tool is accessed via IMA.
2. CLEC submits LSR to Qwest for an analog Unbundled Loop. The only acceptable activity codes for BHC are "V"(conversion as specified with relationship to listing activities) and "Z" (conversion as specified, no directory listing changes). In the "CHC" field on the LSR a "B" identifies a request for BHC. Additionally, the appointment confirmation number (from the scheduling tool) must be included on the LSR.

2a. CLEC provides accurate end user service address information to Qwest via LSR.

3. Qwest electronically receives LSR from CLEC.
4. If LSR does not flow through, Qwest manually validates LSR for completeness and accuracy.
5. If LSR is flow through the Qwest service orders are electronically created by the Qwest SOP. A separate service order will be created for each line on the LSR. If a disconnect order is required, then all lines will be combined on one disconnect order. If LSR does not flow through, the SDC issues the service order into the SOP upon completion of Step 4. If the LSR is not accurate and complete the SDC issues a reject or jeopardy notice to the CLEC via IMA.
6. Qwest issues the FOC via IMA to the CLEC.
7. CLEC receives FOC.

7a. CLEC does translations on day 1 (see Exhibit 10 for Batch Hot Cut Timeline).

8. If necessary, the LPC must clear the RMA and manually assist with the facility assignments.
9. Circuit design is created based on the service request. A Word Document is generated and is electronically sent to the QCCC, central office (CO) and LNO. This document contains information necessary to wire the circuit.

Proposed Batch Hot Cut Process Task List

10. QCCC verifies the order for completeness and accuracy.
10a. QCCC will create and email the Batch Hot Cut spreadsheet to the CORAC. The Status Website is updated with the orders.
10b. QCCC performs hand-offs to the CORAC for due date activities.
10c. CORAC receives work DD hand-offs and the spreadsheet via email. CORAC electronically sends spreadsheet to the Central Office. CORAC loads appropriate LNO personnel.
11. On DVA, COT performs pre-wiring and cross office continuity and DT test.
11a. The Status Website is updated with the NDT status.
11b. CLEC investigates the NDT status. If the NDT is due to a CFA issue, CLEC supplements the LSR with new CFA information (Go to Step 2).
11c. CLEC resolves NDT by performing translations activity or applicable activity. CLEC does need to notify Qwest of resolution action taken.
12. On DD, the COT performs DT/ANI at the CFA. If DT, Go to Step 16. If NDT, the COT will notify the QCCC.
12a. CLEC has the option to trap the ANI test to get immediate notification that the 'lift and lay' is beginning.
13. Status Website is updated with the NDT notification to the CLEC to advise of NDT.
13a. The Order is put in a jeopardy status and follows the standard jeopardy process and is removed from the Batch.

Proposed Batch Hot Cut Process Task List

14. Service Delivery follows standard jeopardy process and issues a jeopardy notice back to CLEC.
15. CLEC receives and reviews jeopardy notice, go to Step 2 to reissue the LSR with new DD.
16. COT performs 'lift and lay', DT/ANI and completes WFA-DI.

16a. At the CLEC's option, CLEC can trap the ANI test to get immediate notification that the 'lift and lay' is complete and the CLEC can port the number.

17. QCCC receives notification from the COT that Batch has begun. Status Website is updated. Upon COT completion of the Batch, Status Website is updated with a 2 hour time frame stated for the CLEC to accept the order.

17a. CLEC reviews the order for completeness.

17b. A non-response from the CLEC is an acceptance of the order. After the 2 hour time frame has elasped, QCCC completes the order in WFA-C.

17c. CLEC detects an issue on the order and emails the QCCC with the information.

17d. At CLEC's request, QCCC starts the cutback process.

18. COT does FOMS disconnect work.

18a. LNP and switched translation work is performed.

19. The service order is completed in the SOP and distributed to other downstream systems such as billing, E911.
20. CLEC receives the order completion status via IMA, and Loss/Completions report data via the avenue provided in the information from the CLEC questionnaire.

Batch Hot Cut Timeline (7 Business Day Due Date) Exhibit 10

	Day 0 Monday	**Day 1** Tuesday	**Day 2 - 3** Wednesday	**Day 4** Thursday	**Day 5 -6** Friday / Monday	**Day 7** Tuesday

EXHIBIT C
SERVICE INTERVAL TABLES

1.0 Unbundled Loops, Line Sharing and Line Splitting Service Interval Table:

(a) Established Service Intervals 2/4 Wire Analog (Voice Grade):

a)	1-8 lines	Five (5) business days
b)	9-16 lines	Six (6) business days
c)	17-24 lines	Seven (7) business days
d)	25 or more	ICB

(b) Established Service Intervals for 2/4 Wire Non-Loaded Loops, and ADSL Compatible Loops that do not require conditioning:

a)	1-8 lines	Five (5) business days
b)	9-16 lines	Six (6) business days
c)	17-24 lines	Seven (7) business days
d)	25 or more	ICB

(c) Established Service Intervals for xDSL-I/ BRI ISDN Capable Loops that do not require conditioning:

a)	1-8 lines	Five (5) business days
b)	9-16 lines	Six (6) business days
c)	17-24 lines	Seven (7) business days
d)	25 or more	ICB

(d) Established Service Intervals for existing DS-1 Capable Loops, DS1 Capable Feeder Loop:

a)	1 – 24 lines	Nine (9) business days
b)	25 or More	ICB

(e) Established Service Intervals for existing DS3 Capable Loops:

a)	1-3 lines	Seven (7) business days
b)	4 or more	ICB

(f) Established Service Intervals for Line Sharing and Line Splitting that do not require conditioning:

a)	1-24 lines	Three (3) business days
d)	25 or More	Three (3) business days

(g) Conditioned Loops for 2/4 Wire Non-Loaded Loops, ADSL Compatible, Basic Rate ISDN Capable, xDSL-I Capable Loops, Line Sharing and Line Splitting:

a)	1-8 lines	Fifteen (15) business days
b)	9 or more	ICB

(h) Established Repair Intervals for Basic 2-wire Analog Loops, Line Sharing, Line Splitting, and Shared Distribution Loop:

Twenty-four (24) hours OSS
Forty-eight (48) hours AS

(i) Established Repair Intervals for 4-wire Analog Loops, 2/4 Wire Non-Loaded Loops, Basic Rate ISDN Capable Loops, and ADSL Compatible Loops, xDSL-I Capable Loops, DS1 Capable Loops, DS3 Capable Loops, and Ocn Capable Loops:

Four (4) hours

(j) Quick Loop

a)	1 to 24 Lines	Three (3) business days
b)	25 or more Lines	ICB

Quick Loop with Number Portability

a)	1 to 8 Lines	Three (3) business days
b)	9 to 24 Lines	Four (4) business days
c)	25 or more Lines	ICB

(k) OCn Loop

1 or more Lines	ICB

(l) Shared Distribution Loop

1 or more Lines	Five (5) business days

(M) Established Service Intervals for 2/4 wire Distribution and Non-loaded Distribution Loop

1 or more Lines	Two (2) business days or Appointment Scheduler

2.0 Unbundled Dedicated Interoffice Transport (UDIT) Service Interval Table:

Product	Services Ordered	Installation Commitments	Repair Commitments
UDIT, EUDIT, UCCRE			
DS0	1 to 8	Zone 1: Five (5) business days Zone 2: Six (6) business days	Four (4) hrs. Zone 1 Four (4) hrs. Zone 2
	9 to 16	Zone 1: Six (6) business days Zone 2: Seven (7) business days	Four (4) hrs. Zone 1 Four (4) hrs. Zone 2
	17 to 24	Zone 1: Seven (7) business days Zone 2: Eight (8) business days	Four (4) hrs. Zone 1 Four (4) hrs. Zone 2
	25 or more	ICB	ICB
DS1	1 to 8	Zone 1: Five (5) business days Zone 2: Eight (8) business days	Four (4) hrs Zone 1 Four (4) hrs Zone 2
	9 to 16	Zone 1: Six (6) business days Zone 2: Nine (9) business days	Four (4) hrs Zone 1 Four (4) hrs Zone 2
	17 to 24	Zone 1: Seven (7) business days Zone 2: Ten (10) business days	Four (4) hrs Zone1 Four (4) hrs Zone 2
	25 or more	ICB	Four (4) hrs
DS3	1 to 3 Circuits	Zone 1: Seven (7) business days Zone 2: Nine (9) business days	Four (4) hrs Zone 1 Four (4) hrs Zone 2
	4 or more Circuits	ICB	Four (4) hrs
OC3 and Higher	1 or more Circuits	ICB	Four (4) hrs

3.0 Unbundled Local Switching Service Interval Table:

Product	Services Ordered	Installation Commitments	Repair Commitments
Unbundled Switching			
Unbundled Switching – Line Side Analog With Line Class Code (LCC) already supported in requested switch.	1 to 8	Zone 1: Five (5) business days Zone 2: Six (6) business days	Twenty-four (24) hrs. Zone 1 Twenty-four (24) hrs. Zone 2
	9 to 16	Zone 1: Six (6) business days Zone 2: Seven (7) business days	Twenty-four (24) hrs. Zone 1 Twenty-four (24) hrs. Zone 2
	17 to 24	Zone 1: Seven (7) business days Zone 2: Eight (8) business days	Twenty-four (24) hrs. Zone 1 Twenty-four (24) hrs. Zone 2
	25 or more	ICB	Twenty-four (24) hrs.
Unbundled Switching – Line Side Analog – Existing – Vertical Feature(s) (Features change without inward line activity and not impacting the design of the circuit.)	1 to 19	Two (2) business days	Twenty-four (24) hrs. OOS Forty-eight (48) hrs. AS
	20 to 39	Four (4) business days	Twenty-four (24) hrs. OOS Forty-eight (48) hrs. AS
	40 or more	ICB	Twenty-four (24) hrs. OOS Forty-eight (48) hrs. AS
Unbundled Switching – New Line Class Code (LCC) ordered through customized routing		ICB	Twenty-four (24) hrs.
Unbundled Switching – BRI-ISDN Line-side Port. With a Q WEST standard configuration and Line Class Code (LCC) already supported in the requested switch	1 to 4 Lines	Zone 1: Seven (7) business days Zone 2: ICB	Twenty-four (24) hrs. Zone 1 Twenty-four (24) hrs. Zone 2
	5 or more	ICB	Twenty-four (24) hrs.

Unbundled Switching – BRI-ISDN Line-side Port. With non-standard configuration and Line Class Code (LCC) already supported in the requested switch	1 to 4 Lines	Zone 1: Seventeen (17) business days (includes 10 days for complex translations.) Zone 2: ICB	Twenty-four (24) hrs. Zone 1 Twenty-four (24) hrs. Zone 2
	5 or more	ICB	Twenty-four (24) hrs.
Unbundled Switching – DS1 Trunk Port	1 to 8 Ports	Zone 1: Five (5) business days Zone 2: Six (6) business days	Twenty-four (24) hrs. Zone 1 Twenty-four (24) hrs. Zone 2
	9 to 16 Ports	Zone 1: Six (6) business days Zone 2: Seven (7) business days	Twenty-four (24) hrs. Zone 1 Twenty-four (24) hrs. Zone 2
	17 to 24 Ports	Zone 1: Seven (7) business days Zone 2: Eight (8) business days	Twenty-four (24) hrs. Zone 1 Twenty-four (24) hrs. Zone 2
	25 or more Ports	ICB	Twenty-four (24) hrs.
Unbundled Switching – Message Trunk Groups • Translation questionnaire required • Routing to trunks is ordered separately as Customized Routing • DS1 trunk port & UDIT in place.	Zone 1: 1 to 24	Seven (7) business days	Twenty-four (24) hrs.
	25 to 48	Eight (8) business days	Twenty-four (24) hrs.
	49 to 72	Ten (10) business days	Twenty-four (24) hrs.
	73 to 96	Twelve (12) business days	Twenty-four (24) hrs.
	97 to 120	Fourteen (14) business days	Twenty-four (24) hrs.
	121 to 144	Fifteen (15) business days	Twenty-four (24) hrs.
	145 to 168	Sixteen (16) business days	Twenty-four (24) hrs.
	169 to 240	Eighteen (18) business days	Twenty-four (24) hrs.
	241 or more	ICB	Twenty-four (24) hrs.
	Zone 2: 1 to 24	Eighteen (18) business days	Twenty-four (24) hrs.

	25 to 72	Nineteen (19) business days	Twenty-four (24) hrs.
	73 to 120	Twenty (20) business days	Twenty-four (24) hrs.
	121 or more	ICB	Twenty-four (24) hrs.
Unbundled Switching – Two Way and DID Equivalent Group (add/change/increase) DS1 trunk port in place	1 to 8 Trunks	Zone 1: Five (5) business days Zone 2: Six (6) business days	Twenty-four (24) hrs. Zone 1 Twenty-four (24) hrs. Zone 2
	9 to 16 Trunks	Zone 1: Six (6) business days Zone 2: Seven (7) business days	Twenty-four (24) hrs. Zone 1 Twenty-four (24) hrs Zone 2
	17 to 24 Trunks	Zone 1: Seven (7) business days Zone 2: Eight (8) business days	Twenty-four (24) hrs. Zone 1 Twenty-four (24) hrs. Zone 2
	25 or more Trunks	ICB	Twenty-four (24) hrs.
Unbundled Switching – PRI-ISDN Capable Trunk-Side DS1 Trunk port in place	1 to 8	Zone 1: Five (5) business days Zone 2: Six (6) business days	4 hrs. Zone 1 4 hrs. Zone 2
	9 to 16	Zone 1: Six (6) business days Zone 2: Seven (7) business days	4 hrs. Zone 1 4 hrs. Zone 2
	17 to 24	Zone 1: Seven (7) business days Zone 2: Eight (8) business days	Four (4) hrs. Zone 1 Four (4) hrs. Zone 2
	25 or more	ICB	Four (4) hrs.

Unbundled Packet Switching	• Design changes – 8 Business days • Non-design changes – 5 Business days • Service changes – 5 Business days	New service request – 10 Business days	Twenty-four (24) hrs

4.0 Unbundled Dark Fiber Interval Table:

Installation Guidelines apply where facilities/network capacity is in place, on Qwest-owned, in region facilities. Where non-Qwest locations are involved, intervals are handled on an Individual Case Basis – (ICB).

Product	Activity/ Features	Services Ordered	FOC Guidelines	Installation Guidelines	Repair Guidelines
Dark Fiber					
Initial Records Inquiry (IRI) (simple & complex)			N/A	Ten (10) business days	N/A
Field Verification And Quote Preparation (FVQP)			N/A	Twenty (20) business days	N/A
Provisioning (non-FVQP requests)			N/A	Twenty (20) business days	

5.0 Unbundled Network Elements Platform (UNE-P) Service Interval Table:

For UNE-P POTS, Saturday due dates are available under the following circumstances:

The Saturday Desired Due Date (DDD) must be at least the standard interval.

For dispatched orders, a Saturday appointment must be available and reserved in Appointment Scheduler.

For UNE-P POTS non-dispatched orders, Saturday is counted as part of the standard installation interval, even if a Saturday due date is not desired. For example: when the standard interval is 2 (two) business days, an LSR submitted on a Friday morning may have a due date as early as the following Monday.

Product	Services Ordered	Installation Commitments	Repair Commitments
UNE-P POTS New Installs, Address Changes, or Change Requests adding new lines. **Facility Check indicates "AVAILABLE (SDT)" and DISPATCH "NO"**		Three (3) business days	Twenty-four (24) hrs OOS Forty-eight (48) hrs AS
Addition, removal, or change of CO Features, PIC/LPIC change, number changes without inward line activity, or hunting changes without inward line activity		Three (3) Business Days	Twenty-four (24) hrs OOS Forty-eight (48) hrs AS
UNE-P POTS Suspend/Restore	Customers with service placed on "vacation"	Next Business Day (includes Saturday)	Twenty-four (24) hrs OOS 48 hrs AS
Deny/Restore	Treatment for Non-payment issues	Same Business Day if request received before noon MT, otherwise next business day (includes Saturday)	Twenty-four (24) hrs OOS Forty-eight (48) hrs AS
UNE-P POTS New Installs, Address Changes, Changes with inward line activity **Facility Check indicates "AVAILABLE DISP. REQ" and DISPATCH "YES"**		Next available due date as indicated by Appointment Scheduler **Note:** Appointment Scheduler minimum default interval is 3 (Three) Business Days.	Twenty-four (24) hrs OOS Forty-eight (48) hrs AS

Enhanced Extended Loop Conversions (EEL-C) – Private Line (PLTS) - Conversion as is		ICB	Twenty-four (24) hrs OOS Forty-eight (48) hrs AS

* Installation Guidelines apply where facilities/network capacity is in place. Where facilities/network capacity are not in place, intervals are handled on an Individual Case Basis (ICB).

EXHIBIT C
SERVICE INTERVAL TABLES

1.0 Unbundled Loops, Line Sharing and Line Splitting Service Interval Table:

(a) Established Service Intervals 2/4 Wire Analog (Voice Grade):

a)	1-8 lines	Five (5) business days
b)	9-16 lines	Six (6) business days
c)	17-24 lines	Seven (7) business days
d)	25 or more	ICB

(b) Established Service Intervals for 2/4 Wire Non-Loaded Loops, and ADSL Compatible Loops that do not require conditioning:

a)	1-8 lines	Five (5) business days
b)	9-16 lines	Six (6) business days
c)	17-24 lines	Seven (7) business days
d)	25 or more	ICB

(c) Established Service Intervals for xDSL-I/ BRI ISDN Capable Loops that do not require conditioning:

a)	1-8 lines	Five (5) business days
b)	9-16 lines	Six (6) business days
c)	17-24 lines	Seven (7) business days
d)	25 or more	ICB

(d) Established Service Intervals for existing DS-1 Capable Loops, DS1 Capable Feeder Loop:

a)	1 – 24 lines	Nine (9) business days
b)	25 or More	ICB

(e) Established Service Intervals for existing DS3 Capable Loops:

a)	1-3 lines	Seven (7) business days
b)	4 or more	ICB

(f) Established Service Intervals for Line Sharing and Line Splitting that do not require conditioning:

a)	1-24 lines	Three (3) business days
d)	25 or More	Three (3) business days

(g) Conditioned Loops for 2/4 Wire Non-Loaded Loops, ADSL Compatible, Basic Rate ISDN Capable, xDSL-I Capable Loops, Line Sharing and Line Splitting:

a)	1-8 lines	Fifteen (15) business days
b)	9 or more	ICB

(h) Established Repair Intervals for Basic 2-wire Analog Loops, Line Sharing, Line Splitting, and Shared Distribution Loop:

Twenty-four (24) hours OSS
Forty-eight (48) hours AS

(i) Established Repair Intervals for 4-wire Analog Loops, 2/4 Wire Non-Loaded Loops, Basic Rate ISDN Capable Loops, and ADSL Compatible Loops, xDSL-I Capable Loops, DS1 Capable Loops, DS3 Capable Loops, and Ocn Capable Loops:

Four (4) hours

(j) Quick Loop

a)	1 to 24 Lines	Three (3) business days
b)	25 or more Lines	ICB

Quick Loop with Number Portability

a)	1 to 8 Lines	Three (3) business days
b)	9 to 24 Lines	Four (4) business days
c)	25 or more Lines	ICB

(k) OCn Loop

1 or more Lines	ICB

(l) Shared Distribution Loop

1 or more Lines	Five (5) business days

(M) Established Service Intervals for 2/4 wire Distribution and Non-loaded Distribution Loop

1 or more Lines	Two (2) business days or Appointment Scheduler

2.0 Unbundled Dedicated Interoffice Transport (UDIT) Service Interval Table:

Product	Services Ordered	Installation Commitments	Repair Commitments
UDIT, EUDIT, UCCRE

	17 to 24	Zone 1: Seven (7) business days Zone 2: Ten (10) business days	Four (4) hrs Zone1 Four (4) hrs Zone 2
	25 or more	ICB	Four (4) hrs
DS3	1 to 3 Circuits	Zone 1: Seven (7) business days Zone 2: Nine (9) business days	Four (4) hrs Zone 1 Four (4) hrs Zone 2
	4 or more Circuits	ICB	Four (4) hrs
OC3 and Higher	1 or more Circuits	ICB	Four (4) hrs

3.0 Unbundled Local Switching Service Interval Table:

Product	Services Ordered	Installation Commitments	Repair Commitments
Unbundled Switching			
Unbundled Switching – Line Side Analog With Line Class Code (LCC) already supported in requested switch.	1 to 8	Zone 1: Five (5) business days Zone 2: Six (6) business days	Twenty-four (24) hrs. Zone 1 Twenty-four (24) hrs. Zone 2
	9 to 16	Zone 1: Six (6) business days Zone 2: Seven (7) business days	Twenty-four (24) hrs. Zone 1 Twenty-four (24) hrs. Zone 2
	17 to 24	Zone 1: Seven (7) business days Zone 2: Eight (8) business days	Twenty-four (24) hrs. Zone 1 Twenty-four (24) hrs. Zone 2
	25 or more	ICB	Twenty-four (24) hrs.
Unbundled Switching – Line Side Analog – Existing – Vertical Feature(s) (Features change without inward line activity and not impacting the design of the circuit.)	1 to 19	Two (2) business days	Twenty-four (24) hrs. OOS Forty-eight (48) hrs. AS
	20 to 39	Four (4) business days	Twenty-four (24) hrs. OOS Forty-eight (48) hrs. AS
	40 or more	ICB	Twenty-four (24) hrs. OOS Forty-eight (48) hrs. AS
Unbundled Switching – New Line Class Code (LCC) ordered through customized routing		ICB	Twenty-four (24) hrs.
Unbundled Switching – BRI-ISDN Line-side Port. With a Q WEST standard configuration and Line Class Code (LCC) already supported in the requested switch	1 to 4 Lines	Zone 1: Seven (7) business days Zone 2: ICB	Twenty-four (24) hrs. Zone 1 Twenty-four (24) hrs. Zone 2
	5 or more	ICB	Twenty-four (24) hrs.

Unbundled Switching – BRI-ISDN Line-side Port. With non-standard configuration and Line Class Code (LCC) already supported in the requested switch	1 to 4 Lines	Zone 1: Seventeen (17) business days (includes 10 days for complex translations.) Zone 2: ICB	Twenty-four (24) hrs. Zone 1 Twenty-four (24) hrs. Zone 2
	5 or more	ICB	Twenty-four (24) hrs.
Unbundled Switching – DS1 Trunk Port	1 to 8 Ports	Zone 1: Five (5) business days Zone 2: Six (6) business days	Twenty-four (24) hrs. Zone 1 Twenty-four (24) hrs. Zone 2
	9 to 16 Ports	Zone 1: Six (6) business days Zone 2: Seven (7) business days	Twenty-four (24) hrs. Zone 1 Twenty-four (24) hrs. Zone 2
	17 to 24 Ports	Zone 1: Seven (7) business days Zone 2: Eight (8) business days	Twenty-four (24) hrs. Zone 1 Twenty-four (24) hrs. Zone 2
	25 or more Ports	ICB	Twenty-four (24) hrs.
Unbundled Switching – Message Trunk Groups • Translation questionnaire required • Routing to trunks is ordered separately as Customized Routing • DS1 trunk port & UDIT in place.	Zone 1: 1 to 24	Seven (7) business days	Twenty-four (24) hrs.
	25 to 48	Eight (8) business days	Twenty-four (24) hrs.
	49 to 72	Ten (10) business days	Twenty-four (24) hrs.
	73 to 96	Twelve (12) business days	Twenty-four (24) hrs.
	97 to 120	Fourteen (14) business days	Twenty-four (24) hrs.
	121 to 144	Fifteen (15) business days	Twenty-four (24) hrs.
	145 to 168	Sixteen (16) business days	Twenty-four (24) hrs.
	169 to 240	Eighteen (18) business days	Twenty-four (24) hrs.
	241 or more	ICB	Twenty-four (24) hrs.
	Zone 2: 1 to 24	Eighteen (18) business days	Twenty-four (24) hrs.

	25 to 72	Nineteen (19) business days	Twenty-four (24) hrs.
	73 to 120	Twenty (20) business days	Twenty-four (24) hrs.
	121 or more	ICB	Twenty-four (24) hrs.
Unbundled Switching – Two Way and DID Equivalent Group (add/change/increase) DS1 trunk port in place	1 to 8 Trunks	Zone 1: Five (5) business days Zone 2: Six (6) business days	Twenty-four (24) hrs. Zone 1 Twenty-four (24) hrs. Zone 2
	9 to 16 Trunks	Zone 1: Six (6) business days Zone 2: Seven (7) business days	Twenty-four (24) hrs. Zone 1 Twenty-four (24) hrs Zone 2
	17 to 24 Trunks	Zone 1: Seven (7) business days Zone 2: Eight (8) business days	Twenty-four (24) hrs. Zone 1 Twenty-four (24) hrs. Zone 2
	25 or more Trunks	ICB	Twenty-four (24) hrs.
Unbundled Switching – PRI-ISDN Capable Trunk-Side DS1 Trunk port in place	1 to 8	Zone 1: Five (5) business days Zone 2: Six (6) business days	4 hrs. Zone 1 4 hrs. Zone 2
	9 to 16	Zone 1: Six (6) business days Zone 2: Seven (7) business days	4 hrs. Zone 1 4 hrs. Zone 2
	17 to 24	Zone 1: Seven (7) business days Zone 2: Eight (8) business days	Four (4) hrs. Zone 1 Four (4) hrs. Zone 2
	25 or more	ICB	Four (4) hrs.

Unbundled Packet Switching	• Design changes – 8 Business days • Non-design changes – 5 Business days • Service changes – 5 Business days	New service request – 10 Business days	Twenty-four (24) hrs

4.0 Unbundled Dark Fiber Interval Table:

Installation Guidelines apply where facilities/network capacity is in place, on Qwest-owned, in region facilities. Where non-Qwest locations are involved, intervals are handled on an Individual Case Basis – (ICB).

Product	Activity/ Features	Services Ordered	FOC Guidelines	Installation Guidelines	Repair Guidelines
Dark Fiber					
Initial Records Inquiry (IRI) (simple & complex)			N/A	Ten (10) business days	N/A
Field Verification And Quote Preparation (FVQP)			N/A	Twenty (20) business days	N/A
Provisioning (non-FVQP requests)			N/A	Twenty (20) business days	

5.0 Unbundled Network Elements Platform (UNE-P) Service Interval Table:

For UNE-P POTS, Saturday due dates are available under the following circumstances:

The Saturday Desired Due Date (DDD) must be at least the standard interval.

For dispatched orders, a Saturday appointment must be available and reserved in Appointment Scheduler.

For UNE-P POTS non-dispatched orders, Saturday is counted as part of the standard installation interval, even if a Saturday due date is not desired. For example: when the standard interval is 2 (two) business days, an LSR submitted on a Friday morning may have a due date as early as the following Monday.

Product	Services Ordered	Installation Commitments	Repair Commitments
UNE-P POTS New Installs, Address Changes, or Change Requests adding new lines. **Facility Check indicates "AVAILABLE (SDT)" and DISPATCH "NO"**		Three (3) business days	Twenty-four (24) hrs OOS Forty-eight (48) hrs AS
Addition, removal, or change of CO Features, PIC/LPIC change, number changes without inward line activity, or hunting changes without inward line activity		Three (3) Business Days	Twenty-four (24) hrs OOS Forty-eight (48) hrs AS
UNE-P POTS Suspend/Restore	Customers with service placed on "vacation"	Next Business Day (includes Saturday)	Twenty-four (24) hrs OOS 48 hrs AS
Deny/Restore	Treatment for Non-payment issues	Same Business Day if request received before noon MT, otherwise next business day (includes Saturday)	Twenty-four (24) hrs OOS Forty-eight (48) hrs AS
UNE-P POTS New Installs, Address Changes, Changes with inward line activity **Facility Check indicates "AVAILABLE DISP. REQ" and DISPATCH "YES"**		Next available due date as indicated by Appointment Scheduler **Note:** Appointment Scheduler minimum default interval is 3 (Three) Business Days.	Twenty-four (24) hrs OOS Forty-eight (48) hrs AS

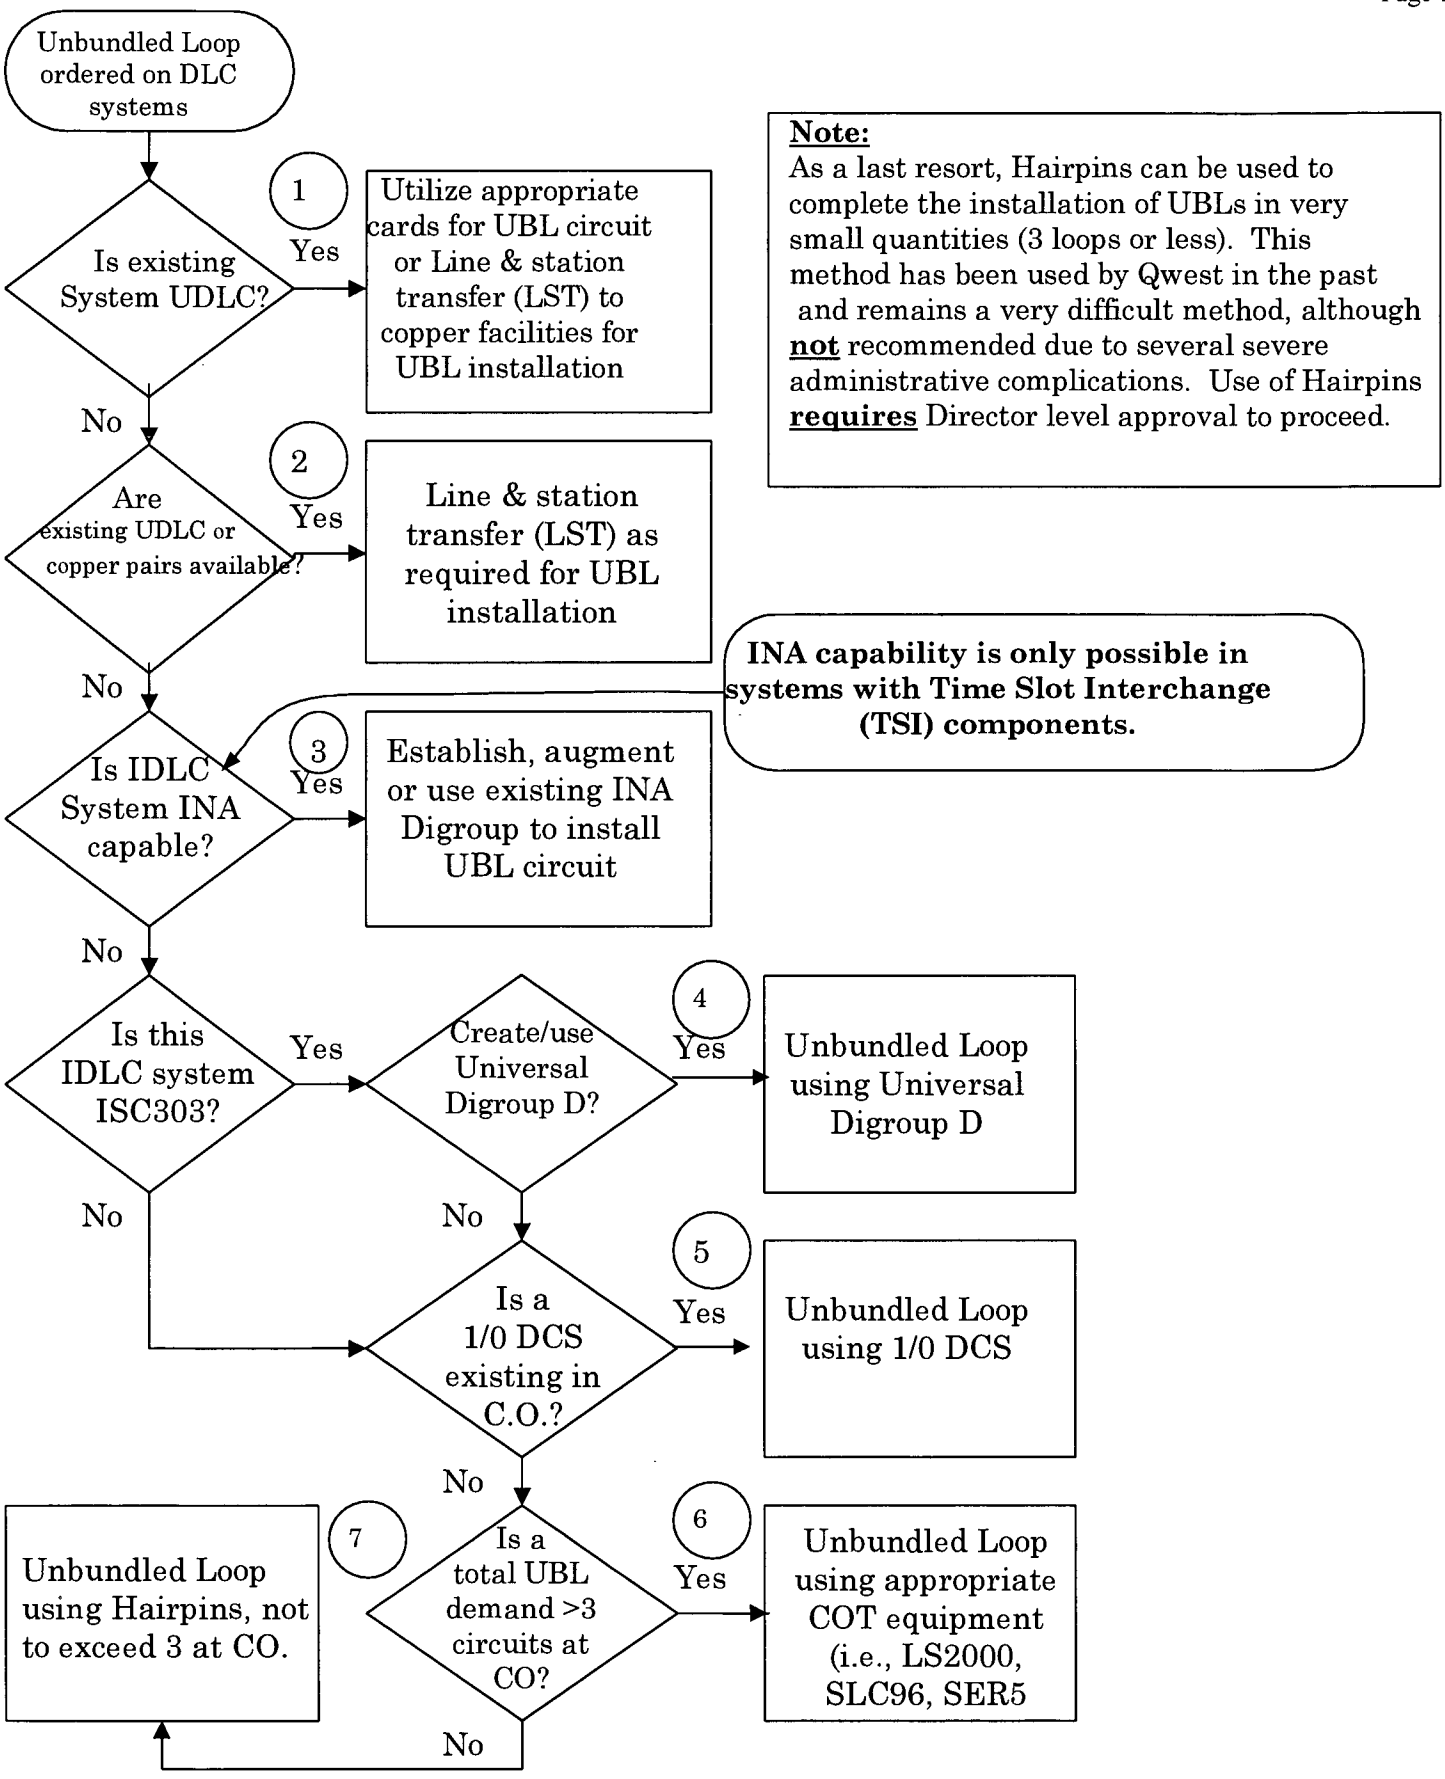
* Installation Guidelines apply where facilities/network capacity is in place. Where facilities/network capacity are not in place, intervals are handled on an Individual Case Basis (ICB).

DUE DATE CUTBACK FLOW



Cutback Process Task List

1. CLEC reviews the Statue Website and the Trap and Trace signal to note completion. CLEC performs any additional testing to determine the loop acceptance. If accepted NO response is required. If CLEC is NOT accepting the order, CLEC action is required.
2. CLEC detects an issue on the order. CLEC requests cutback of service to the original provider by sending an email to Qwest. CLEC can call Qwest CSIE group to open an escalation ticket. These actions must take place prior to the 2-hour acceptance timeframe has elapsed. CLEC supplements original LSR for appropriate action.
3. The CLEC may opt to have the cutback escalated via the CSIE group.
4. Qwest CSIE receives call to open an escalation ticket to stop the completion of a service order or LSR LSR currently contained in the BHC. CSIE forwards the ticket to the QCCC to cutback the end user to the original provider.
5. QCCC will perform CO hand-off and page the CO to notify that the order needs to be cutback.

5a. QCCC follows the standard Jeopardy process. The Status Website is updated.

6. COT performs cutback of service to original provider equipment and updates WFA-DI.
7. The Status Website is updated.
8. CLEC is statused that the cutback is complete and order is now in Jeopardy status.

Unbundled Loop ordered on DLC systems
Is existing System UDLC?
1
Yes
Utilize appropriate cards for UBL circuit or Line & station transfer (LST) to copper facilities for UBL installation
No
Are existing UDLC or copper pairs available?
2
Yes
Line & station transfer (LST) as required for UBL installation
No
Is IDLC System INA capable?
3
Yes
Establish, augment or use existing INA Digroup to install UBL circuit
INA capability is only possible in systems with Time Slot Interchange (TSI) components.
No
Is this IDLC system ISC303?
Yes
Create/use Universal Digroup D?
4
Yes
Unbundled Loop using Universal Digroup D
No
No
Is a 1/0 DCS existing in C.O.?
5
Yes
Unbundled Loop using 1/0 DCS
No
Is a total UBL demand >3 circuits at CO?
6
Yes
Unbundled Loop using appropriate COT equipment (i.e., LS2000, SLC96, SER5
7
Unbundled Loop using Hairpins, not to exceed 3 at CO.
No
Note:
As a last resort, Hairpins can be used to complete the installation of UBLs in very small quantities (3 loops or less). This method has been used by Qwest in the past and remains a very difficult method, although not recommended due to several severe administrative complications. Use of Hairpins requires Director level approval to proceed.
Note:
Manufacture Discontinued (MD) COT equipment should be obtained from Reuse stock

Legend for IDLC Flow

Solution provisioning intervals:

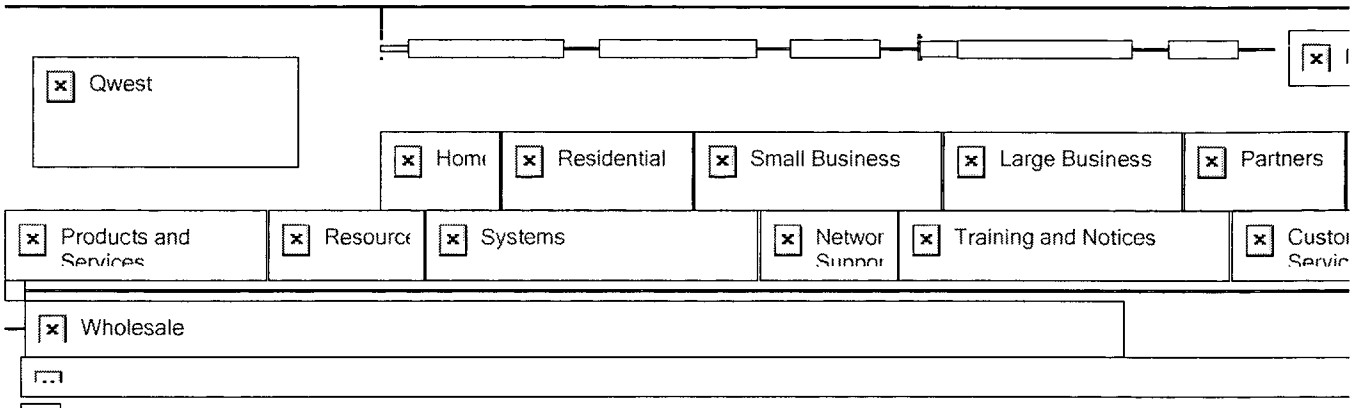
1) UBL circuit cards – 5 days
LST – 5 days
2) LST – 5 days

3) INA Digroup (D4 Channel Bank, dedicated DS1) – 5 days if span capacity

4) Order COT – 90 days – 120 days

5) 1/0 DCS (Adtran BR110) - 90 days – 120 days

6) LS 2000, SLC 96, Series 5 - 90 days – 120 days



7) Hairpin – 15 days after approval

Loop Qualification and Raw Loop Data - CLEC Job Aid

Job Aid Description/Purpose

This job aid is designed to provide the CLEC guidance in the appropriate use of IMA Loop Qualification Tools, the IMA Raw Loop Data Tool, and the Wire Center Raw Loop Data Tool for Loop Qualifications. This job aid may also be used as a guide for the qualification of DSL. The tools described in this job aid support the pre-order functions for 2/4 wire non-loaded loops, Asymmetrical Digital Subscriber Loop (ADSL) compatible loops, Integrated Switched Digital Network (ISDN) Basic Rate Interface (BRI) capable loops, xDSL-I capable loops, Line Sharing, Line Splitting, Loop Splitting, and Shared Distribution Loops.

Note: This job aid does not contain information for HICAP Service requests or Design Service requests (see the IMA User's Guide).

Objectives

While using this job aid you should be able to:

- Describe the terms of Facility Availability, Loop Qualification and Raw Loop Data
- Describe the likes and differences of Loop Qualifications and Raw Loop Data queries
- Navigate the IMA Loop Qualification tools, and Raw Loop Data tools
- Obtain Raw Loop Data from the Wire Center and IMA Raw Loop Data Tools

Prerequisites

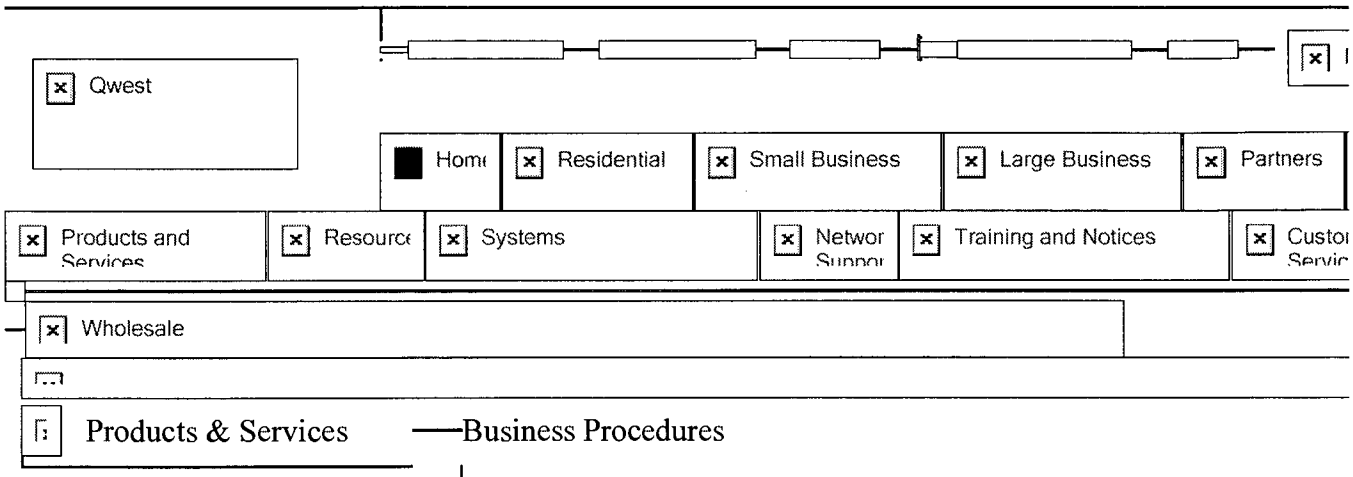
- Qwest 101 "Doing Business with Qwest"
- Basic Telephony course and/or equivalent industry experience
- Working knowledge of Qwest IMA EDI/GUI ordering system
- A CLEC end-user must have telecommunication engineering knowledge to interpret the significance of raw loop data

Audience
The target audience for this job aid is primarily CLECs and External Customers.

How to Obtain
It is not necessary to register to obtain and use this job aid. The training course catalog is available to External Customers and CLECs on the Qwest Wholesale Markets Customer Training Web site.

To obtain this job aid, scroll through the Course Catalog until you find the listing "Loop Qualification and Raw Loop Data-CLEC Job Aid". Click the link "Click Here to Download".

For product specific information view the Wholesale Markets Web site.



If you have any questions regarding the use ot this job aid, please call your Service Manager. If you have questions on the content please contact Michelle Thacker of Wholesale Markets at 303-382-5725, or email your comments using to the following email address, mthacke@qwest.com.

Migrations and Conversions Overview - V13.0

History Log

Description

This overview provides you with a summary of end-user migrations and conversions. Migrations and conversions are terms used interchangeably by Qwest when an end-user moves from one Local Service Provider (LSP) to another. The term LSP describes the company that provides local services to the end-user. You or Qwest may be an end-user's LSP in a migration/conversion scenario.

One or more of the following conditions exists/occurs in a migration:

- The end-user's telephone number is being ported. Refer to Local Number Portability (LNP) for additional information regarding porting.
- The current service delivery method is Qwest Retail, Resale, Unbundled Network Elements (UNEs), Unbundled Network Elements Platform (UNE-P) or Unbundled Network Elements Combination (UNE-C).
- The end-user is converting to a different/new LSP

In today's competitive environment, end-users may choose to migrate from:

- Qwest to a Competitive Local Exchange Carrier (CLEC)
- CLEC to CLEC
- CLEC to Qwest

Within each of these scenarios, responsibility for delivering, servicing and billing the end-user's local service(s) changes from the current Old LSP (OLSP) to the New LSP (NLSP).

Even though Qwest uses the terms migration and conversion

☐Migrations and Conversions

☐Negotiations Process

interchangeably to describe a move between LSPs, you must specify a Local Service Request (LSR) Activity (ACT) Type that references conversion activity to request migration/conversion. The exception is Unbundled to Bundled, this type of migration requires a LSR ACT Type of "N".

Full or Partial Migration

When a LSR is submitted for migration with an ACT Type of "V" or "Z", it should also include an indicator (Migration Indicator (MI)) specifying whether the migration activity is for "Full Migration" or "Partial Migration". Full Migration occurs when all services/lines contained on the Customer Service Record (CSR) and billed to the OLSP under a primary telephone number or account telephone number are migrating to the NLSP and no services/lines remain on the OLSP account under that account telephone number.

Partial Migration occurs when a portion of the end-user's services/lines billed to the OLSP under a single account telephone number are being migrated and one or more services/lines remain with the OLSP under that account telephone number.

Migration Process Flows

The following process flows illustrate some potential migration scenarios by service delivery method. Qwest is the Network Service Provider (NSP) and Directory Service Provider (DSP) in each of these scenarios.

Bundled to Bundled

This group of scenarios includes:

- Qwest Retail to Resale or UNE-C
- Resale to Resale
- Resale to UNE-P
- UNE-P to Resale
- UNE-C-to-UNE-C

In bundled to bundled migrations, the end-user's services/lines move from the OLSP to a NLSP. The NSP remains unchanged throughout the migration, the reuse of the loop facility is involved and the end-user retains their telephone number (if applicable).

The NLSP and OLSP provide service to the end-user by leasing bundled services from a NSP. The NSP is also the DSP.

Responsibilities:

NLSP

- Negotiate service request with end-user (including Directory Listing)
- Obtain CSR and local service configuration from OLSP
- Perform necessary pre-order functions with NSP (e.g., address validation)
- Submit LSR to NSP/DSP

OLSP

- Provide CSR and local service configuration to NLSP

NSP

- Support requests from NLSP for pre-order functions
- Receive/process LSR and issue service orders
- Send Firm Order Confirmation (FOC) to NLSP
- Send Completion Report to NLSP
- Send Loss Report and Completion Report to OLSP
- Send completed service order information to DSP

DSP

- Publish Directory Listing

Bundled to Unbundled

This group of scenarios includes:

- Qwest Retail, Resale, or UNE-P to Unbundled Local Loop (with or without LNP)

Description
Involves reusing the loop facility and retaining the end-user's telephone number via LNP, if applicable. The OLSP services the end-user via bundled services. The NLSP will service the end-user via its own switch and an Unbundled Local Loop. Requires a hot cut where the loop must be disconnected from the OLSP's bundled service and re-connected to the NLSP's facility.

Responsibilities

NLSP

- Negotiate service request with end-user (including Directory Listing)
- Obtain CSR and local service configuration from OLSP
- Perform necessary pre-order functions with NSP (e.g., address validation)
- Submit LSR to NSP/DSP

OLSP

- Provide CSR and local service configuration to NLSP

NSP

- Support requests from NLSP for pre-order functions
- Receive/process LSR and issue service orders
- Send FOC to NLSP
- Send Completion Report to NLSP
- Send Loss Report and Completion Report to OLSP
- Send completed service order information to DSP

DSP

- Publish Directory Listing

Unbundled to Bundled

This group of scenarios includes:

- Unbundled Local Loop to Resale or UNE-P (with or without LNP)
- Unbundled Local Loop to Qwest Retail (with LNP)

Description
Involves reusing the loop facilities and the end-user retains their telephone number via LNP if applicable. The OLSP services the end-user via its own switch and leases an unbundled loop facility from an NSP. The NLSP will service the end-user via bundled services (Qwest Retail, Resale or UNE-P) leased from a NSP.

Responsibilities

NLSP

- Negotiate service request with end-user (including Directory Listing)
- Obtain CSR and local service configuration from OLSP (when appropriate)
- Perform necessary pre-order functions with NSP (e.g., address validation)
- Submit LSR to NSP

OLSP

- Provide CSR and local service configuration to NLSP

NSP

- Support requests from NLSP for pre-order functions
- Receive/process LSR and issue service orders
- Send LNP (LSR) to Old NSP (ONSP) if appliable
- Send FOC to NLSP
- Send Completion Report to NLSP
- Send Loss Report and Completion Report to OLSP
- Send completed service order informaton to DSP

ONSP

- Send LNP FOC to NSP

DSP

- Publish Directory Listing

Unbundled to Unbundled

This type of migration includes Unbundled Local Loop to Unbundled Local Loop.

Description
Unbundled Local Loop to Unbundled Local Loop migration refers to the change of responsibility or coordination of loop reuse for unbundled local loops from the OLSP to a NLSP.

Responsibilities:

NLSP

- Negotiate service request with end-user (including Directory Listing, if appropiate)
- Obtain CSR and local service configuration from OLSP
- Perform necessary pre-order functions with NSP (e.g., address validation)
- Submit LSR to NSP/DSP

OLSP

- Provide CSR and local service configuration to NLSP

NSP

- Support requests from NLSP for pre-order functions
- Receive/process LSR and issue service orders
- Send FOC to NLSP
- Send Completion Report to NLSP
- Send Loss Report and Completion Report to OLSP
- Send completed service order information to DSP

DSP

- Publish Directory Listing

Definitions associated with migrations

Bundled Services

Bundled local services include Qwest Retail services, Resale services, and UNE-C services. The migration of Bundled Services may, in some circumstances, include Local Number Portability (LNP).

DSP

The DSP is responsible for the implementation of the LSP's requirement to provide directory assistance/directory listing(s) for the end-user.

LSP

Provides local service(s) to the end-user.

NSP

Provides the dial tone, switched features and/or loop(s). In some cases the following more specific designations may be used:

- NSP-Switch - Carries the dial tone and switched

features
- NSP-Loop - Provides the local loop to the end-user premises or other mutually agreed upon point

Unbundled Services

Unbundled Services include Unbundled Local Loops and Unbundled Switching.

UNE-C

UNE-C offerings are combinations of UNEs. The UNE-C family of products consists of:

- Enhanced Extended Loop - EEL
- Loop/MUX Combination - LMC
- UNE-P

Availability

Migrations/Conversions can occur throughout Qwest's 14-state local service territory.

Terms and Conditions

Credit Status

Qwest allows end-users to migrate their service from one LSP to another, regardless of their credit status with the current LSP. This policy means that Qwest does not prevent an end-user with an unpaid bill or credit problem with one provider (including Qwest) from migrating their service to another provider. The old provider is responsible for collecting any balance due them.

Loop Reclamation

When possible, Qwest will reclaim an Unbundled Local Loop associated with migration activity:

- Migration to Qwest Retail, Resale, or UNE-P:
  - Q· Qwest will reclaim the Unbundled Local Loop associated with a telephone number being Ported-In to Qwest, for like services. Qwest will send the LSR, EU and NP forms for straight number portability and will use the following REQ TYP entries depending upon whether Qwest is reclaiming an Unbundled Local Loop.
    - REQ TYP "CB" = Qwest is not relaiming an Unbundled Local Loop

        - REQ TYP "BB" = Qwest is reclaiming an Unbundled Local Loop
    - Qwest will advise the OLSP in the LSR remarks field whether or not the Unbundled Local Loop(s) is being reclaimed. If the Unbundled Local Loop(s) is being reclaimed, Qwest will also include the Exchange Company Circuit ID (ECCKT) in the LSR remarks field or in the "ECCKT" field on the NP form preceding the associated "PORTED NBR" field.
    - Loss reports and Completion reports will identify the loop disconnect date for billing termination.
- Qwest will not reclaim an Unbundled Local Loop associated with a telephone number being Ported-In to Qwest, if the end-user is changing address and Qwest is not aware of the loop at the old address or if the loop circuit ID cannot be identified. Qwest will identify this situation by entering the following remark on the LSR, "End-user moving to new loc, not reclaiming loop".

Loop Reuse

Loop reuse occurs when the end-user changes to a NLSP and all of the following apply:

- The loop is moving from the OLSP's collocation facility to the NLSP's collocation facility within the same serving wire center
- The end-user termination remains the same.
- The UNE-Loop ordered on the migration by the NSLP is a "like service" as described below:

  A "like services" condition exists when the following elements of the requested loop are identical to the existing loop:
    - Network Channel (NC) Code
    - First two positions of the Network Channel Interface (NCI) code
    - Secondary NCI code (if applicable)
- The OLSP and NLSP will be notified of the loop activity on Loss reports and Completion reports.

Implementation

Pre-Ordering

Pre-Ordering refers to the set of activities performed by you prior to placing a service request with Qwest. Performing Pre-Ordering activities allows you to validate details prior to submitting service requests and avoid unnecessary errors and/or delays of your request.

General pre-ordering activities are described in the Pre-Ordering Overview.

Requirements for pre-ordering are described in LSOG Pre-Order.

Ordering

Migration/conversion activity service requests are submitted using th following LSOG forms:

- LSR
- End User (EU) (except for Resale Private Line Transport (PLT - Non-Switched)
- Product specific forms

The LSOG forms submitted by the NLSP for migration activity should reflect the end state of the service and include all details required for provisioning. Field entry requirements are described in the LSOG.

The account telephone number and Street Address Number (SANO) information may be all that is required to match migration or conversion activity to a CSR. Refer to the Ordering Overview. to determine if this abbreviated ordering option is available in the version of Interconnect Mediated Access (IMA) Electronic Data Interchange (EDI) used to submit your request.

The end-user must have provided you with a Letter of Authorization (LOA) requesting that you serve as their LSP.

Service requests should be placed using IMA EDI, IMA Graphical User Interface (GUI) or faxed to (888) 796-9089.

General ordering activities are identified in the Ordering Overview.

Migration ACT Types

The following ACT Types and Manual Indicator values should be used when submitting a LSR for migration activity:

Migration Activity	ACT Type "V" Conversion As Specified	ACT Type "W" Conversion As Is	ACT Type "Z" Conversion As Specified/No Directory Listing Changes	ACT Type "N" New Installation	Manu Indic Value
Bundled to Bundled	X	X	X		N

Bundled to Unbundled	X		X		N
Unbundled to Bundled				X	Y
Unbundled to Unbundled	X				Y

Related Purchase Order Number (RPON) Relating Multiple Migration Service Requests

When multiple migration service requests (not constituting a project) must be worked together, the requests must be related upon submission. The related requests must contain Related Purchase Order Number (RPON) and/or page sequencing information (PG_of_). If the related requests involve multiple requisition types (REQTYP's), they may need to be submitted in a specific sequence o with a manual handling indicator. For example, an account with 5 POTS lines is migrating. One of the lines will be migrating as Resale POTS (REQTYP – EB). The other 4 lines will be migrating as LNP (REQTYP – CB). The LNP request should be submitted first, followed by the Resale POTS request. This sequencing allows for appropriate service order and account creation associated with your requests. Neither should require a manual handling indicator unless specifically stated in the LNP or Resale PCAT.

Very few requests involving multiple requisition types require specific sequencing. If sequencing or a manual handling indicator is required, this information is documented in the product specific PCAT.

Courtesy Disconnects

A Courtesy Disconnect is a request by a CLEC to disconnect an account that does not belong to them, as part of a migration scenario. Typically, the CLEC has already provisioned new service for the end-user and is now requesting a disconnect for the end-user's old service with another provider.

The account may be Retail, Resale, or UNE-P. The LSP for the service to be disconnected may be another CLEC or Qwest. Qwest will accept Courtesy Disconnects for the following telephone number based products:

- Plain Old Telephone Service (POTS)
- Centrex
- Integrated Services Digital Network (ISDN)

Qwest will also accept Courtesy Disconnects on a T1 (Digital Signal

level 1 (DS1)) for Digital Switched Services (DSS), Primary Rate Service (PRS), Uniform Access Solution (UAS) Service, and integrated T1 products when a Related Purchase Order Number (RPON) is submitted to disconnect all associated trunks and Direct Inward Dialing (DID) station numbers. However, these are the only private line products for which Qwest will accept a Courtesy Disconnect.

To request a Courtesy Disconnect, specific areas of the LSR form must be completed as follows:

- ACT must be D or C.
- If ACT is C, the assumption is that a Courtesy Disconnect is being requested for one or more lines on the account, but not all. Therefore, one or more lines on the account must appear on the Resale Services (RS) form or CRS form with Line Activity (LNA) = "D".
- Agency Authorization (AGAUTH) must be "Y"
- MANUAL IND must be "Y"
- REMARKS must include the words "Courtesy Disconnect."

Courtesy Disconnect LSRs that do not meet these criteria will be rejected.

Loop Reclamation

Migration to NLSP with Number Portability (Retail, Resale or UNE-P):

- Qwest will send the LSR, EU and NP forms for straight numbe portability and will use the following REQ TYP entries depending upon whether Qwest is reclaiming an Unbundled Local Loop.
  - REQ TYP "CB" = Qwest is not reclaiming an Unbundlec Local Loop
  - REQ TYP "BB" = Qwest is reclaiming an Unbundled Local Loop
- Qwest will advise the OSLP in the LSR remarks field whether or not the Unbundled Local Loop(s) is being reclaimed. If the Unbundled Local Loop(s) is being reclaimed, Qwest will also include the Exchange Company Circuit ID (ECCKT) in the LSR remarks field or in the "ECCKT" field on the NP form preceding the associated "PORTED NBR" field.
- A disconnect service order(s) will be issued for the Unbundled Local Loop(s) and billing will cease on the Due Date.
- No action is required by the OLSP**.

**If Unbundled Local Loops exist and are associated with the telephone number being Ported-In to Qwest (as the NSP) and the LSF form sent to the OLSP does not indicate that Qwest is reclaiming the

loops, it will be the responsibility of the OLSP to perform one of the following actions:

- Submit a LSR to Qwest for each end-user address where one or more Unbundled Local Loops are to be disconnected. Qwest will issue Disconnect Order(s) for the Unbundled Local Loop (s) and billing will stop on the Due Date.

or

- Send a FOC (in response to the LSR submitted by Qwest, above) to Qwest that provides the Unbundled Local Loop Circuit ID associated with each telephone number being Ported-In. Qwest will issue Disconnect Order(s) for the Unbundled Local Loop(s) and billing will stop on the Due Date.

Migration to Qwest without Number Portability (Resale or UNE-P)

- The NLSP has requested reuse of facilities from an existing Unbundled Local Loop.
- Qwest will issue a disconnect order for the Unbundled Local Loop(s) and billing will cease on the Due Date.
- No action is required by the OLSP.

Use of Universal Service Order Codes (USOCs) and Field Identifiers (FIDs) are described in the USOCs and FIDs Overview. Use of the USOC/FID Finder will assist you in identifying USOC and FID requirements.

Service interval guidelines are found in the Service Interval Guide (SIG).

Migration and Move

Migration and move (change of address) activity may be requested on the same LSR under the following conditions:

- The product at the new address must be Resale POTS, Resale Centrex 21, Resale Basic Rate Interface (BRI) ISDN, UNE-P POTS, UNE-P Centrex 21 or UNE-P BRI ISDN.
- The ACT field must equal "V".
- The LNA field must equal "V" or "N".
- The End User Moving Indicator (EUMI) field on the EU form must equal "Y".
- The end user's new address must be entered in the location address fields on the EU form.
- Applies to full migrations only
- End-user must keep the same telephone number(s)
- The new address must be served by the same wire center as the

old address. (For Migrate and Move process involving number portability, refer to the Port Within PCAT
- A Directory Listing (DL) form must be submitted.

When you submit migration and move requests, you may also perform the following activities:

- Feature changes on existing lines
- Add new lines
- Change products within each local service product type (e.g., Resale POTS to UNE-P POTS). The LSR Requisition Type (REQTYP) should represent the product at the new address.

Transfer of Responsibility

Transfer of Responsibility refers to the transfer of a Collocation site or the transfer of occupancy of either aerial or underground facilities to an assuming CLEC from a vacating CLEC. For additional information regarding Transfer of Responsibility refer to the Collocation - General Information Product Catalog (PCAT). For additional information regarding Transfer of Responsibility of occupancy of either aerial or underground facilities refer to the Access to Poles, Ducts and Rights of Way PCAT.

A Design Layout Record (DLR) provides you with a description of the facilities and services ordered. It is provided at your request and is intended to assist in designing the overall service. You can choose to view and/or retrieve the DLR information on-line through IMA or have it delivered electronically. A DLR request is described in the IMA EDI Network Disclosure Document or the IMA User's Guide.

For information regarding consolidation, deconsolidation, or rearrangement of CSR data with migration activity, refer to the Ordering Overview.

Data Migrations

When the voice and data portions of a loop have been split, it is possible to migrate only the data portion from Data Local Exchange Carrier (DLEC) to DLEC. It is also possible to migrate between products that offer splitting of voice and data services (e.g., requesting migration activity from Line Sharing to Line Splitting). For more information regarding various Line Splitting and Loop Splitting scenarios, click on one of the following:

- Line Splitting Scenarios
- Loop Splitting Scenarios

Provisioning

Firm Order Confirmation (FOC) intervals are available in the Service Interval Guide (SIG).

General provisioning and installation activities are described in the Provisioning and Installation Overview.

If no facilities are available, the LSR will be rejected for a No Facilities reason. Reject notification information is described in the Ordering Overview.

A jeopardy occurs on a service request, if a condition exists that threatens timely completion. Jeopardy notification information is described in the Provisioning and Installation Overview.

Loss reports and Completion reports are generated based on loss and gain account activity. Loss and Completion Reports are described in Billing Information - Additional Outputs - SMDR, Completion Report, Loss Report.

Billing

Customer Records and Information System (CRIS) billing is described in Billing Information Customer Records and Information System (CRIS).

Training

Qwest 101 "Doing Business With Qwest"

- This introductory instructor-led training course is designed to teach the CLEC and Reseller how to do business with Qwest. It will provide a general overview of products and services, Qwest billing and support systems, processes for submitting service requests, reports, and web resource access information. Click here to learn more about this course and to register.

View additional Qwest courses by clicking on Course Catalog.

Contacts

Qwest Contact information is located in Qwest Wholesale Customer Contacts.

Frequently Asked Questions (FAQs)

Q. In a CLEC to CLEC migration scenario, who is responsible for providing the CSR?

A. The OLSP is responsible for providing the CSR to the NLSP.

Q. Who communicates with the OLSP regarding LOA in a CLEC to CLEC migration?

A. The NLSP needs to communicate with the OLSP regarding LOA in a CLEC to CLEC migration.

Q. Is the Migration and Conversion Overview PCAT the only source for migration information?

A. The Migration and Conversion Overview PCAT contains general migration information. Because the different migration scenarios are numerous and vary by product, the individual product PCATs should be consulted for specific information.

4. The History of Copper Automation

To date, despite strong interest in implementing automated distribution frames, there have been technology limitations that have hampered service providers from actually deploying these types of devices. While cross-connecting technologies have existed for some time, none have been able to meet all of the aforementioned automated distribution frame requirements in a cost-effective and scalable manner.

Historically, service providers first looked at electromechanical solutions that leverage metallic relays as a means of automating distribution frames. This type of solution is known to be extremely reliable for cross-connecting, having been used for many years in conventional telecommunications equipment, such as voice switches. However, it is difficult to build large non-blocking switches with conventional relays, as they would require an enormous amount of space and cost due to the size of individual relays and the amount that would be required to create automated distribution frames of significant size. A CO serving tens of thousands of subscribers, for example, would require millions of relays to establish any-to-any connectivity. As this would take up a significant amount of equipment space and require a vast amount of capital expenditure, this type of solution never got put into practice in an automated distribution frame application.

Service providers then turned their attention toward robotic solutions. In this type of solution, robotic technology is used to physically remove and insert pins when making a cross-connect. While simple in concept, this type of solution never quite matured into a viable technology for automating distribution frames. That is because pure mechanical, robotic solutions have reliability and maintenance issues due to their moving parts. This limits their effectiveness in larger COs or in environments where significant churn is experienced.

Perhaps the biggest "show stopper" for robotics, and all of the other copper automation technologies previously examined for frame applications, has been scalability. As COs vary dramatically in size, automated distribution frames must have the flexibility to grow in size, too. But, functionality cannot be sacrificed in the process. Traditional copper automation technologies typically become blocking at higher port counts or high port utilization. This dramatically limits their performance in medium to large COs. Those that can provide any-to-any connectivity in large deployments typically require tremendous amounts of hardware to do so. Rather than experiencing a linear growth rate, whereby the ratio of frame

ports to subscribers remains constant regardless of the size of deployment, these solutions have a tendency to grow exponentially. This means that for any-to-any non-blocking connectivity to be maintained, the ratio of frame ports to subscribers must grow at a geometric rate. Such growth requires enormous capital expenditures and dramatically increases the complexity of a network infrastructure.

Figure 3. An automated distribution frame solution that can grow linearly to keep pace with subscriber growth rates is more cost-effective and easier to deploy than one that grows exponentially.

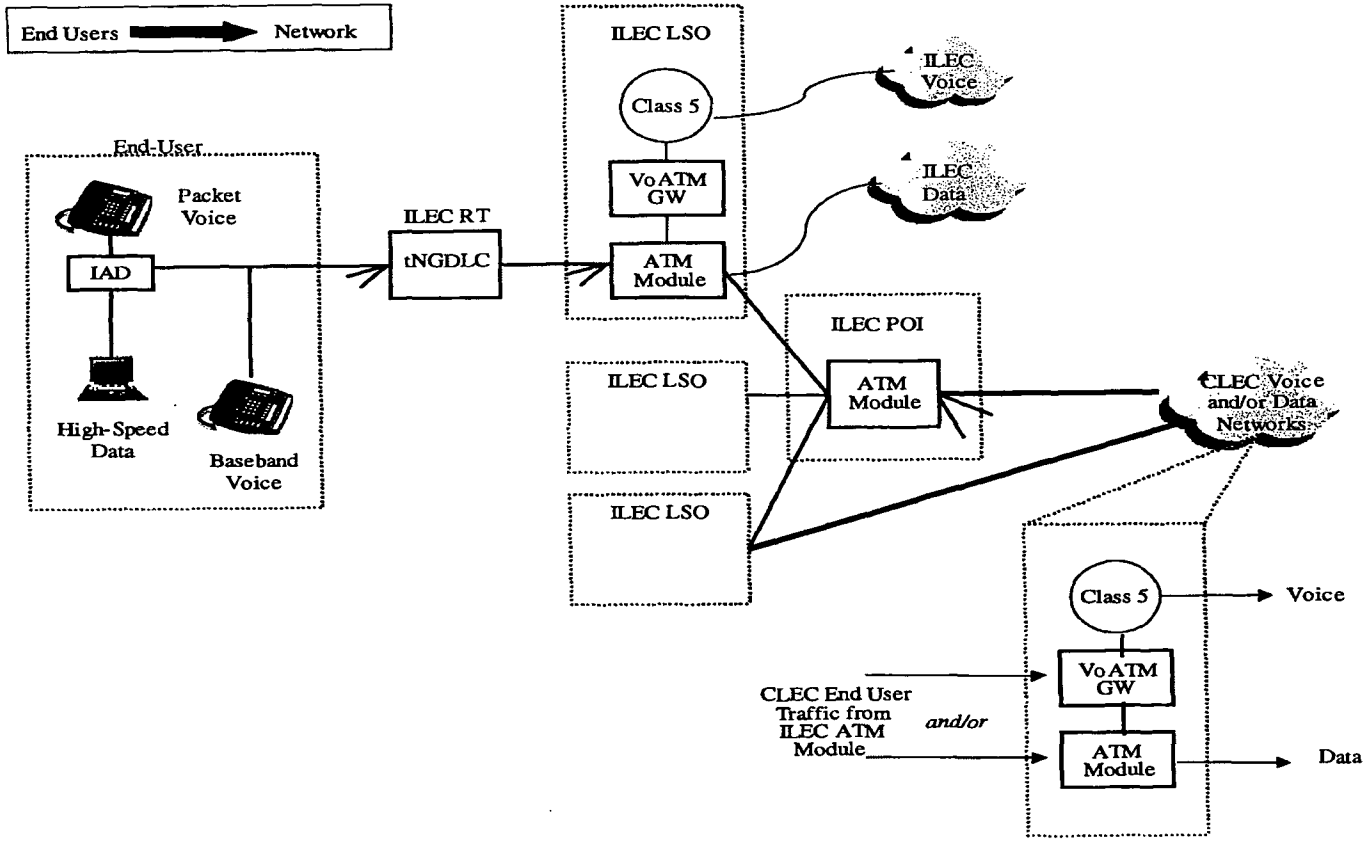
FYI - let's talk about this.
Mark S.

THE GENERAL ASSEMBLY HEREBY FINDS, DETERMINES, AND DECLARES THAT:

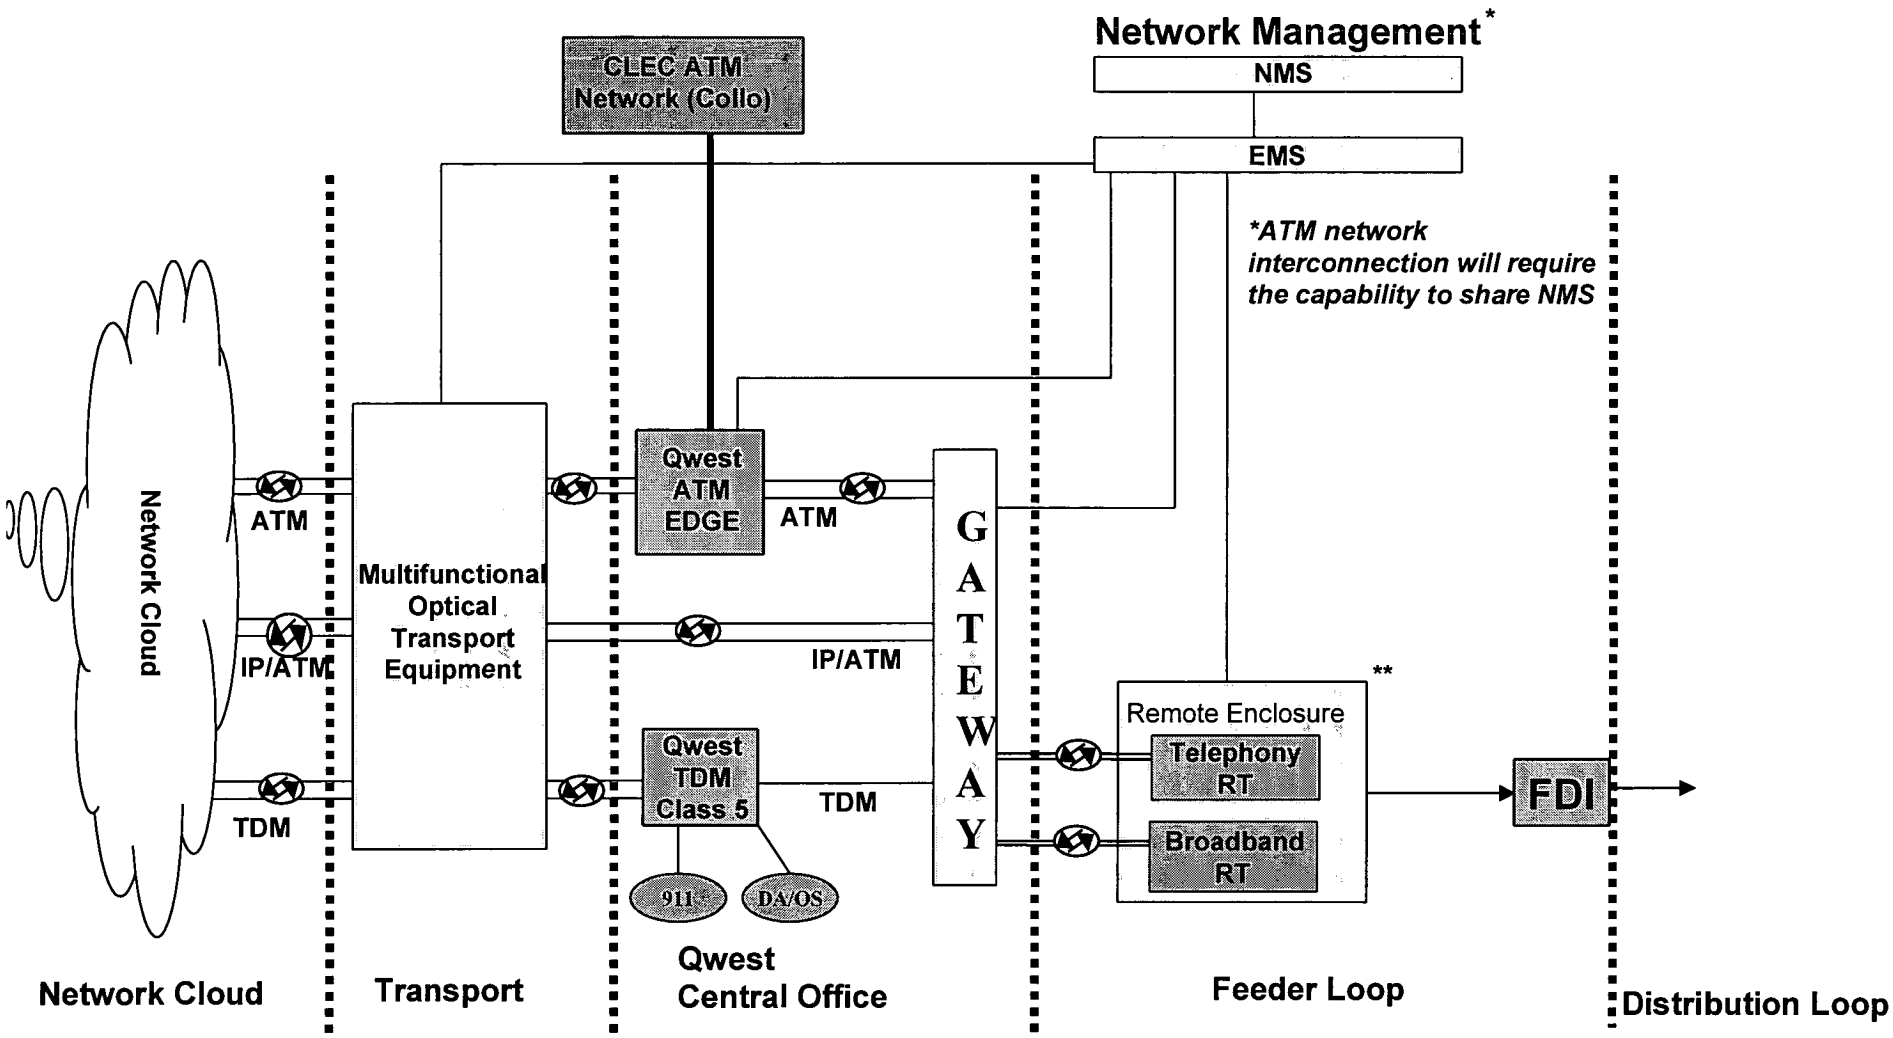
a) IT IS THE POLICY OF THE STATE OF COLORADO TO PROMOTE A COMPETITIVE TELECOMMUNICATIONS MARKETPLACE WHILE PROTECTING AND MAINTAINING A WIDE AVAILABILITY OF HIGH-QUALITY TELECOMMUNICATIONS SERVICES;
b) INCREASED COMPETITION IN THIS MARKET PLACE WILL BENEFIT CONSUMERS AND BUSINESSES IN COLORADO;
c) RETAIL TELECOMMUNICATIONS CONSUMERS IN THIS STATE SHOULD HAVE THE CHOICE BETWEEN AND AMONG PROVIDERS OF LOCAL EXCHANGE TELECOMMUNICATIONS SERVICES AND WHETHER A CONSUMER CAN CHANGE PROVIDERS OF BASIC LOCAL TELECOMMUNICATIONS SERVICE EASILY AND AT COMPARABLE COST IS A SIGNIFICANT FACTOR IN THAT CHOICE;
d) CONSUMERS SHOULD HAVE THE SAME EASE, TIMELINESS, AND COST OF SWITCHING A LOCAL EXCHANGE TELECOMMUNICATIONS SERVICE THAT OCCURS WHEN THOSE CUSTOMERS DECIDE TO CHANGE THEIR PROVIDER OF LONG DISTANCE TELECOMMUNICATIONS SERVICES.

CHOICE OF LOCAL EXCHANGE PROVIDER



1. CUSTOMERS SHALL BE ABLE TO CHANGE PROVIDERS OF BASIC LOCAL EXCHANGE TELECOMMUNICATIONS SERVICE FROM THEIR INCUMBENT LOCAL EXCHANGE CARRIER TO A COMPETITIVE LOCAL EXCHANGE TELECOMMUNICATIONS PROVIDER WITH THE SAME EASE, TIMELINESS AND COST AS WHEN CUSTOMERS CHANGE PROVIDERS OF LONG DISTANCE SERVICES.

2. AS TO ITS PRICING AND PROVISION OF WHOLESALE LOCAL EXCHANGE SERVICE, NO LOCAL EXCHANGE PROVIDER SHALL MAKE OR GRANT ANY PREFERENCE OR ADVANTAGE TO ANY OTHER PROVIDER OF TELECOMMUNICATIONS SERVICE OVER THAT PROVIDER'S COMPETITORS OR CREATE ANY ADVANTAGE ON ITS OWN BEHALF IN ITS PRICING OR PROVISION OF SUCH WHOLESALE SERVICE THAT IT DOES NOT OFFER TO OTHER PROVIDERS.



3. THE COMMISSION SHALL PROMULGATE RULES TO IMPLEMENT THIS SECTION. IN THE IMPLEMENTATION OF THIS ACT, THE COMMISSION SHALL IDENTIFY ALL TECHNICALLY FEASIBLE METHODS FOR CUSTOMERS TO CHANGE PROVIDERS OF BASIC LOCAL EXCHANGE TELECOMMUNICATIONS SERVICE AND PROMULGATE RULES FOR THOSE METHODS. IN ADDITION, AS NEW METHODS BECOME TECHNICALLY FEASIBLE, THE COMMISSION SHALL UPDATE THE RULES TO ADD THOSE NEW METHODS. THE COMMISSION'S GOAL SHALL BE TO INCLUDE RULES TO FACILITATE FULLY ELECTRONIC METHODS FOR FACILITIES BASED COMPETITION.

Electronic Loop Provisioning

GENERAL ELP NETWORK ARCHITECTURE

The Full NGDLC Architecture

***NGDLC deployment would require physical separation of shelf and fiber transport for appropriate affiliate separation.*

NOTE: Gateway is a functional description only for equipment that includes multi-protocol conversion

Summary of AT&T's Proposed ELP Architecture

- **AT&T's Proposed ELP Architecture Does Not:**
  - Identify the demand for a near 100% loop plant replacement
  - Consider requirements necessary to facilitate multi-provider interconnection
  - Account for Common Channel Signaling vendor interoperability
  - Address the provisioning of 911/E911 and PSAP services
  - Address the provisioning of DA/OS services
  - Address a method of Quality of Service (QoS) verification

Summary of AT&T's Proposed ELP Architecture (continued)

- AT&T's Proposed ELP Architecture also:
  - Limits LEC architecture
  - Stifles evolution
  - Requires replacement of functioning infrastructure
  - Proposes that ELP is analogous to the FGD (Equal Access) implementation, which minimizes the ELP technology change out

ELP Technical Limitations

- **Electronic Loop Provisioning (ELP)**
  - **ELP requires Voice over Asynchronous Transfer Mode (VoATM) packet architecture that does not currently exist in Qwest's network**
    - In order to provide ELP functionality and increase capacity, Qwest would have to extensively augment its existing network
      - Qwest's existing ATM switch technology does not have the capacity or capability to support ELP
      - Qwest would be required to deploy a new ATM infrastructure in every central office

ELP Technical Limitations (continued)

- **Electronic Loop Provisioning (ELP) (continued)**
  - **ELP requires an ATM packet protocol that is fundamentally different from Qwest's circuit based Time Division Multiplexing (TDM) network**
    - Qwest's existing voice DLC platform is circuit based TDM, while ELP is packet based
    - Qwest would be required to replace all existing circuit based TDM DLC equipment with an optical based ATM infrastructure that is ELP capable

ELP Technical Limitations (continued)

□ ATM to ATM Interconnection

- **An ELP architecture would require an ATM Inter-Networking Interface (A-INI) protocol; this type of protocol does not exist in Qwest's network today**
  - A-INI is an ATM protocol that allows multiple ATM networks to interconnect
  - The existing Qwest User to Network Interface (UNI) does not provide for ELP functionality
- **A-INI is required to provide a firewall between networks**
  - Qwest's UNI interface does not provide the necessary firewall to interconnect multiple interconnecting ATM networks

ELP Technical Limitations (continued)

- **ATM to ATM interconnection (continued)**
  - **A-INI has not been fully developed or implemented by industry vendors**
    - Vendors of telecom equipment would be required to develop and implement A-INI
  - **ELP requires A-INI VoATM interconnection for the exchange of local traffic**
    - Minutes-of-use billing has only been developed for TDM networks
    - ELP would require vendors to develop the ability to bill ATM interconnection minutes of use

ELP Technical Limitations (continued)

□ Gateway Architecture

- **Telecom vendors would be required to develop gateways for multi-provider access**
  - Qwest's existing circuit based TDM technology allows interconnection for multiple carriers
  - Qwest has not deployed multi-protocol gateways that support ELP

ELP Technical Limitations (continued)

- **Element Management Systems (EMS) and Network Management Systems (NMS)**
  - **EMS and NMS have not been fully tested or deployed for multi-carrier access and interoperable environments**
    - Partitionable EMS would enable CLEC access to features, functions and capabilities
      - Vendors of telecom equipment and software would have to develop a proven partitionable EMS
    - Non-partitioned EMS systems adversely impact all users
      - Over provisioning of ATM network capacity will reduce interconnected carriers capability to provide service
      - Interconnecting carriers' alarm reporting could potentially flood a multi-provider ATM network

ELP Technical Limitations (continued)

- Element Management Systems (EMS) and Network Management Systems (NMS) (continued)
  - ELP would require VoATM Quality of Service (QoS) standards
  - QoS standards have been established for the circuit based TDM network, but not for VoATM

ELP Technical Limitations (continued)

- **Common Channel Signaling**
  - **ELP requires Bearer Independent Call Control (BICC) Protocol to establish virtual voice paths through the ATM network**
    - BICC Protocol has not been proven to be vendor interoperable in Qwest's network
    - Lab testing would have to prove vendor interoperability
    - Lab testing of vendor interoperability has not been completed

ELP Technical Limitations (continued)

- **911/E911 and Public Safety Answering Point (PSAP)**
  - **Qwest associated emergency services network is circuit based TDM, not packet based**
    - Currently PSAPs have not deployed packet based 911/E911 networks
- **Directory Assistance/Operator Service (DA/OS)**
  - **DA/OS networks are circuit based TDM, not packet based**
    - If ELP supports DA/OS, all DA/OS networks would need to be packet capable
      - Currently, OS/DA providers have not deployed packet based DA/OS networks

Impact Summary

- AT&T is searching the ILEC ATM network for additional network features beyond the FCC's requirements, expecting to create services based on network features that ILEC's have not deployed or do not use

Impact Summary (continued)

- **The FCC has ruled that Unbundled Packet Switching (UPS) is the only ATM packet switching UNE that passes the Act's necessary and impair test where:**
  1. **Qwest has deployed digital loop carrier systems, including but not limited to, integrated digital loop carrier (IDLC) or universal digital loop carrier systems or has deployed any other system in which fiber optic facilities replace copper facilities in the distribution section,**
  2. **There are no spare copper loops available capable of supporting the xDSL services the requesting carrier seeks to offer,**
  3. **Qwest has placed a DSLAM for its own use in a remote Qwest premises, but has not permitted CLEC to collocate its own DSLAM at the same remote Qwest premises,**
  4. **Qwest has deployed packet switching capability for its own use.**

Impact Summary (continued)

- ELP would require Qwest to provide unfettered access to UPS even where the FCC's four conditions have not been met
- AT&T's proposal for ELP and unconditional access to Qwest's network would permit AT&T to reassign its financial risk to Qwest
- AT&T's proposal creates an opportunity for CLECs to directly access NGDLC through virtual connections, which provides slamming opportunities that would impact customer choice

Impact Summary (continued)

- In order for Qwest to provide ELP, as proposed by AT&T, Qwest would be required to make significant changes to its existing network; this type of sweeping technology change would require billions of new capital investment

- AT&T's arguments about GR-303 are largely irrelevant to the cost of deploying ELP
  - Only about 18% of Qwest's Central Offices are currently equipped with GR-303 capability
  - Only about 2% of Qwest's access lines are served by GR-303 DLC

Impact Summary (continued)

- ELP would require Qwest to place new A-INI capable ATM switches in every central office in its region
  - Currently, Qwest has 146 ATMs deployed in 12% of its central offices
  - Qwest's existing ATM technology does not have the capacity to support a robust ELP functionality
- Qwest's currently deployed ATM interfaces do not support ELP
  - All existing ATM interfaces would require A-INI, rather than the UNI interface that Qwest currently has in place
  - Additional hardware would be required to upgrade Qwest's existing ATM network to be A-INI capable

Impact Summary (continued)

- The FGD transition did not demand the degree of global infrastructure replacement, and was based on exiting, prevalent capabilities
  - The FGD (Equal Access), MFJ driven transition, adjusted the in-place architecture; it was essentially software based
  - It did not demand technology replacement
  - In fact, it was not nearly as equipment focused as the ELP thought
  - Some new signaling enhancements were needed for exiting switches for FGD (Equal Access), not global infrastructure replacement

FGD (Equal Access) vs ELP
High Level Comparison

☐ FGD

- **Existing Switching architecture left in place**
  - OSS change was required
- **Billing System architecture left in place**
  - Enhancements required
- **Software development lengthened process completion (biggest obstacle)**

☐ ELP

- **All new ATM infrastructure in every central office**
- **Replace all existing circuit based TDM DLC equipment**
- **With an optical based ATM infrastructure**
- **That is ELP capable**
- **An ELP architecture would require an A-INI protocol; this type of protocol does not exist in Qwest's network today**

Conclusion

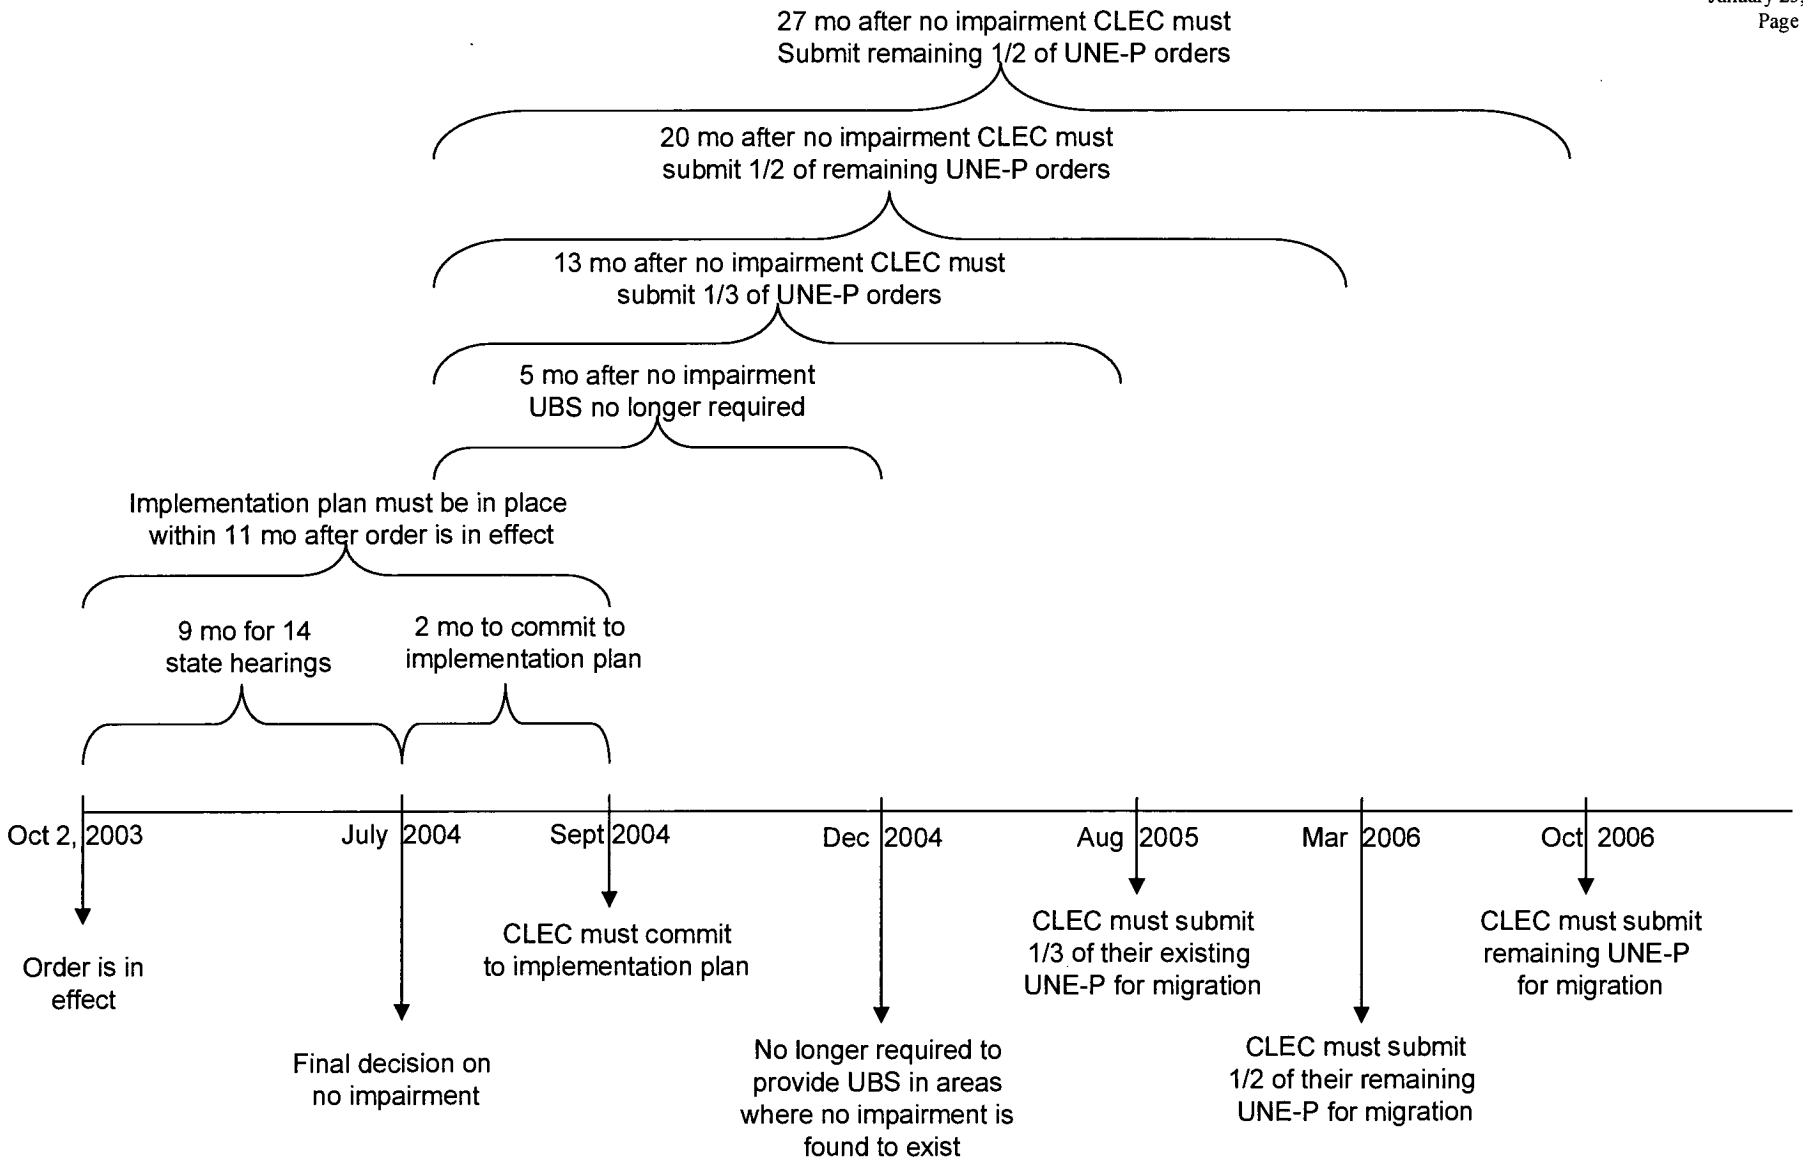
- **AT&T (by recommending ELP) is trying to solve a hot-cut problem that does not exist and has a hidden agenda to require ILEC's to replace their functioning infrastructure with a next generation network**
  - **Qwest's current hot-cut performance is meeting or exceeding current performance standards**
    - In particular, in each month since July of 2001, Qwest has performed at least 98% of its analog loop hot-cuts on time and at least 96% of its digital loop hot-cuts on time

Conclusion (continued)

☐ Qwest's current hot-cut performance (continued)

- Furthermore, as demonstrated in the *UNE Fact Report*, hot-cuts are now routinely completed on-time without significant disruptions more than 98% of the time. [1]
- Because they cannot credibly dispute the overwhelming evidence of the ready availability of switching from sources other than ILECs, AT&T falls back to the argument that "hot cuts" pose operational impediments sufficient to satisfy the impair standard. But AT&T ignores the evidence that hot cut performance has improved considerably in the more than two years since the *UNE Remand Order* to a level foreclosing any argument that hot cuts pose an operational or other barrier to competition through use of UNE loops.

1 UNE Fact Report at II - 16 to II - 17, App. H.



Final Thoughts

- It seems hard to imagine that the FCC or any state commission could take the ELP proposal seriously when one of their charters is to keep dial tone costs to customers as reasonable as possible. If it is as cost-effective as AT&T promotes, any army of CLECs would be rushing in to place NGDLCs at the FDI and cut the ILEC out of a major segment of the business, leveraging off unbundled subloops
- If this thrust were successful, an architecture du joir is mandated to the service provider
- Is this something that AT&T is offering on their own ATM network?

LORRAINE BARRICK

ON BEHALF OF
QWEST CORPORATION

JANUARY 23, 2004

TABLE OF CONTENTS

INTRODUCTION 1
PURPOSE OF TESTIMONY 1
DESCRIPTION OF WORK 1
BATCH HOT CUT PROCESS CONCLUSIONS 3

INTRODUCTION

Q. PLEASE STATE YOUR NAME AND ADDRESS.

A. My name is Lorraine Barrick. My address is 1144 Federal Avenue East, Seattle, WA 98102.

Q. WHAT IS YOUR CURRENT BUSINESS OCCUPATION?

A. I am the Sole Proprietor of Lorraine Barrick LLC and a certified public accountant. I provide clients with business and financial consulting services.

Q. WHAT IS YOUR BACKGROUND?

A. My work experience includes nearly 18 years of auditing and consulting work, 15 years of which were at the public accounting and consulting firm of Arthur Andersen, LLP. When I left Arthur Andersen in May of 2000, I was a partner in the Consulting Division of the Seattle office. I have extensive experience assisting companies in the telecommunications industry. See Exhibit 1 of my attached Report for a copy of my resume.

PURPOSE OF TESTIMONY

Q. WHAT IS THE PURPOSE OF YOUR TESTIMONY?

A. I was retained by Qwest Corporation (Qwest) through Hitachi Consulting to review and test its processes and procedures pertaining to the Batch Hot Cut (BHC) process. I was assisted in my work by a team of telecommunications and process consultants from Hitachi Consulting.

DESCRIPTION OF WORK

Q. WHAT WAS THE SCOPE OF YOUR ENGAGEMENT WITH QWEST COMMUNICATIONS?

A. We were engaged in a consulting capacity to review the proposed BHC process, observe commercial tests of the process, and make recommendations for process improvement. The scope of our BHC engagement with Qwest included the following:

- Gaining an understanding of the existing hot cut process;
- Studying Qwest's hot cut performance to date;
- Reviewing the proposed BHC process, as well as public CLEC comments and concerns regarding that process;
- Comparing the current hot cut process to the proposed BHC process;
- Developing a testing plan to be used to judge the quality and efficiency of the proposed BHC process;
- Making recommendations for process improvements; and,
- Observing commercial tests of the BHC process.

The "Scope of Work" section in my attached Report contains a description of the Qwest facilities that we observed during the engagement. In addition, Exhibit 4 of my attached Report contains a list of the people we met with or interviewed over the course of our engagement with Qwest.

Q. WERE PROCESS IMPROVEMENT RECOMMENDATIONS MADE BY HITACHI CONSULTING?

A. Yes, we made several process improvement recommendations over the course of our engagement. All of the material process improvement recommendations made by Hitachi Consulting have been addressed to my satisfaction. Section 6 of

my Report sets forth examples of those recommendations. In addition, Exhibit 5 of the Report contains a detailed diagram of the proposed BHC process.

BATCH HOT CUT PROCESS CONCLUSIONS

Q. HAS QWEST DEMONSTRATED THE ABILITY TO PROCESS LARGE COMMERCIAL VOLUMES OF HOT CUTS?

A. Qwest has demonstrated, based on historical data for the existing hot cut process, that it can handle large volumes of UNE-P to UNE-Loop conversion requests. Qwest has demonstrated on many occasions the ability to process more than 1,000 hot cut requests in a day. Qwest has also demonstrated the capability to consistently perform between 25 and 100 hot cuts per day per central office and to exceed these amounts when required, with new installation trouble rates (troubles within 30-days of installation) of less than 1%. See Section 8 of the attached Report for a detailed analysis of the historical hot cut volumes performed by Qwest.

Q. IS THE BHC PROCESS MORE EFFICIENT THAN THE EXISTING HOT CUT PROCESS?

A. The BHC process was created to make the hot cut process described above more scalable and efficient for larger volumes of hot cuts. The process groups multiple service orders for hot cuts into "batches". A CLEC will be required to submit a minimum of 25 lines and a maximum of 100 lines to create a batch. Significant efficiencies over the existing hot cut process are created through front-end edit checks, process automation, and streamlining of manual processes. We have measured the benefit of several of these differences. The results indicate that the

process is substantially more efficient than the current process and the differences we measured save many hours per day at the projected volumes. See Section 11 of the attached Report for the detailed results from our process efficiency comparisons.

Q. DISCUSS THE RESULTS FROM THE COMMERCIAL TESTS OF THE BHC PROCESS

A. We have tested this BHC process with live data, and the process works. Our testing to date has included four batches of approximately 25 telephone numbers per batch. In all cases, Qwest met 100% of its installation commitments, and no troubles were Reported for the Preliminary Live Trial within the first 30 days. As stated, Qwest met 100% of its installation commitments, which exceeds the FCC's 90% on-time hot cut performance standard set forth in its Bell Atlantic Section 271 decision. In fact, Qwest has demonstrated an ability to consistently meet and exceed this benchmark. See Section 11 for a detailed explanation of test results from the preliminary live trial and the second round live trial of the BHC process.

Q. WILL THE BATCH HOT CUT PROCESS SUPPORT THE ANTICIPATED VOLUMES?

A. In my opinion, the BHC process as proposed represents significant improvements in efficiency with acceptable levels of quality when compared to the existing hot cut process. Nothing has come to my attention to suggest that this process will not scale to the forecasted volumes.

Q. WHAT IS YOUR SUPPORT FOR THESE FINDINGS?

A. My support for these findings is based upon analysis of the volumes of hot cuts Qwest has successfully handled in the past using the existing hot cut process, the significant efficiencies gained through the BHC process (and measurement of some of the time savings associated with them), my understanding the volumes of hot cuts that will be required during the 21 month migration period, and the results of the live trials we conducted, all of which are documented in the attached Report.

Q. DO YOU HAVE ANYTHING TO ADD?

A. All of the details supporting my conclusions are detailed in the attached Report.

1. Executive Summary

I am a certified public accountant. I have been engaged in business and financial consulting since 1988. I have extensive experience in assisting companies in the telecommunications industry.

I was retained by Qwest Corporation (Qwest) through Hitachi Consulting to review and test its processes and procedures pertaining to the Batch Hot Cut (BHC) processes defined below. I was assisted in my work by a team of telecommunications and process consultants from Hitachi Consulting. This report summarizes the work performed by me, or under my supervision, and my opinions resulting from this work.

Our work included the following:

- Gaining an understanding of the existing hot cut process;
- Studying Qwest's hot cut performance to date;
- Reviewing the proposed BHC process, as well as public CLEC comments and concerns regarding that process;
- Making recommendations for process improvements;
- Comparing the current hot cut process to the proposed BHC process;
- Developing a testing plan to be used to judge the quality and efficiency of the proposed BHC process; and,
- Testing the BHC process.

Qwest has demonstrated, based on historical data for the existing hot cut process, that it can handle large volumes of UNE-P to UNE-Loop conversion requests. Qwest has demonstrated, on many occasions, the ability to process more than 1,000 hot cut requests in a day. Qwest has also demonstrated the capability to consistently perform between 25 and

100 hot cuts per day per central office (CO) and to exceed these amounts when required, with 30-day trouble rates of less than 1%.

Qwest has serviced the above volumes using the existing hot cut process. Currently, Qwest processes hot cuts individually on a first in, first out basis. The proposed BHC process will implement significant improvements that will enable increased efficiencies, seamless service and enhanced scalability as compared to the existing hot cut process.

The BHC process was created to make the hot cut process described above more scalable and efficient for larger volumes of hot cuts. The process groups multiple service orders for hot cuts into "batches." A CLEC will be required to submit a minimum of 25 lines and a maximum of 100 lines to create a batch. Significant efficiencies over the hot cut process are created through front-end edit checks, process automation and streamlining of manual processes. We have measured the benefit of several of these differences. The results indicate that the process is substantially faster than the current process and the differences we measured save many hours per day at the projected volumes.

We also tested Qwest's proposed BHC process with live trials using CLEC customers. Our testing to date has included four batches of approximately 25 telephone numbers per batch. In all cases, Qwest met 100% of its installation commitments, and no troubles were reported for the preliminary live trial within the first 30 days. (The second two batches were cut within a week of issuance of this report and, therefore, 30-day trouble report data is not available for the second two batches.) As stated, Qwest met 100% of its installation commitments, which exceeds the FCC's 90% on-time hot cut performance standard set forth in its Bell Atlantic Section 271 decision. In fact, Qwest has demonstrated an ability to consistently meet and exceed this benchmark.

Extrapolation of the Due Date activities of the COs for each of the live trials indicates that a team of two technicians should be able to complete them in the course of an eight-hour shift. Any remaining time in the shift, plus other shifts, could be used to conduct pre-wire activity for other batches.

To scale to the Qwest forecasted volumes, additional resources will be required. Each of the key departments have plans to scale as required. We have discussed these plans with department management and nothing has come to our attention to suggest that they are unreasonable.

In my opinion, based on the above, the BHC process as proposed represents significant improvements in efficiency with acceptable levels of quality when compared to the existing hot cut process. Nothing has come to my attention to suggest that this process will not scale to the forecasted volumes.

2. Introduction

I am a certified public accountant. I have been engaged in business and financial consulting since 1988. Prior to that, I was an auditor for three years. My work experience includes nearly 15 years at the public accounting and consulting firm of Arthur Andersen, LLP. When I left Arthur Andersen in May of 2000, I was a partner in the Consulting Division of the Seattle office. I have extensive experience in assisting companies in the telecommunications industry. My resume is attached as Exhibit 1.

I was retained by Qwest through Hitachi Consulting to review and test its processes and procedures pertaining to the BHC processes defined below. I was assisted in my work by a team of telecommunications and process consultants from Hitachi Consulting. This report

summarizes the work performed by me, or under my supervision, and my opinions resulting from this work.

This report assumes the reader's familiarity with the hot cut process and related subject matter. A glossary of terms and acronyms used in this report is provided in Exhibit 2.

During the course of our test work, we obtained information from electronic databases and other Qwest systems that was captured in the course of Qwest operations. The scope of this engagement was not to conduct an audit of any of this information under the Generally Accepted Auditing Standards of the American Institute of Certified Public Accountants. We relied on this information as discussed below.

Certain information and assumptions were provided to us by Qwest. Any such information upon which we relied is documented in the relevant report section.

I reserve the right to change my opinion due to any new information that becomes available to me.

This report was prepared for the above-referenced matter and should not be used or referred to for any other purpose.

3. Background

The Federal Communications Commission (FCC), in its September 26, 2003, Triennial Review Order (TRO), required any Incumbent Local Exchange Carrier (ILEC) seeking to rebut the FCC's national presumption that Competitive Local Exchange Carriers (CLECs) are impaired without access to unbundled switching in mass markets to establish a "batch hot cut

process" for CLECs. Pursuant to that Order, Qwest petitioned many of the state commissions within its 14-state region to open such a docket.

The FCC found that a "seamless, low-cost batch hot cut process for migrating mass market customers from one carrier to another is necessary, at a minimum, for carriers to compete effectively in the mass market."[1]

In conjunction with Qwest's petition to rebut the presumption of impairment, Qwest engaged Hitachi Consulting to review and test its BHC process, to provide recommendations for process improvement, and to determine whether, in my opinion, Qwest will be able to perform the required number of hot cuts per CO per day necessary to both serve future demand and migrate CLECs' embedded base of Unbundled Network Element Platform (UNE-P) clients to Unbundled Network Element Loop (UNE-Loop), at an acceptable quality level.

4. The Scope of Work

Our work included the following:

- Gaining an understanding of the existing hot cut process;
- Studying Qwest's hot cut performance to date;
- Reviewing the proposed BHC process, as well as public CLEC comments and concerns regarding that process;
- Making recommendations for process improvements;
- Comparing the current hot cut process to the proposed BHC process;
- Developing a testing plan to be used to judge the quality and efficiency of the proposed BHC process; and,
- Testing the BHC process.

[1] TRO paragraph 487.

During the course of our work, we visited 10 COs, the Qwest CLEC Coordination Center (QCCC), two Loop Provisioning Centers (LPCs), Design Services and two of the three Service Delivery Centers. We observed both the existing hot cut process and the proposed BHC process. We discussed the process and resource requirements with personnel at various locations. The sites we visited are included in Exhibit 3. The people we interviewed are identified in Exhibit 4.

5. Overview of the Current Hot Cut Process

Currently, Qwest processes hot cuts individually on a first in, first out basis. The hot cut process consists of three basic activities: (a) order creation and acceptance, (b) planning and pre-wire (Designed, Verified and Assigned Date or DVA) and (c) cut over (Due Date). These activities are performed discretely for each requested hot cut. Local Service Requests (LSRs) are issued by the CLEC to initiate the hot cut for a particular line. Qwest's Service Delivery Centers convert these LSRs into service orders to be provisioned in the network. The LSRs are submitted in two ways; through the Interconnect Mediated Access (IMA) system (submitted through GUI or EDI), or through facsimile. The majority of LSRs are received in IMA and are processed through the automated systems in the Service Delivery Centers.

The service orders are processed and reviewed by two additional departments' automated systems to ensure the line can be cut over as requested by the CLEC. The LPC verifies the loop to the customer premises and Design Services checks the quality of the loop and designs the circuit. These steps are typically completed within one day of the LSR submittal.

Once a service order is created and accepted, Qwest prepares for the hot cut in the days prior to the Due Date. The QCCC is responsible for scheduling, provisioning and assembling work orders to execute the hot cuts for the inside plant on Due Date. The Central Office

Technician (COT) "pre-wires" the hot cut by installing cross-connects and jumpers between the Interconnect Distribution Frame (ICDF) and the Main Distribution Frame (MDF) inside the CO. This wiring will remain in place, but unused, until the hot cut Due Date. These steps occur between days two and three of the process.

On Due Date, the COT performs the hot cut to transfer service from Qwest's switch to the CLEC's switching equipment. The COT first performs a dial tone and Automatic Number Identification (ANI) test on the loop terminating on the CLEC switch and the Qwest switch. If all tests are successful, the COT performs the "lift and lay" to transfer service to the CLEC switch facility. The COT subsequently performs the same dial tone and ANI tests at the protector frame to ensure the hot cut was successful. Once cut over activity is complete on the CO floor, the COT notifies the QCCC that the cut is completed and closes the work order in Qwest's work management system. The QCCC contacts the CLEC with notification of the completed cut. The CLEC is required to reject the hot cut within two hours of completion of the hot cut. If no cuts are rejected, the COT removes the hot cut jumpers from the MDF to the Qwest switch.

6. Overview of the Batch Hot Cut Process

As Planned

Qwest's BHC design process has been an iterative one. On December 1, 2003, Qwest proposed a BHC process to the CLECs. This process was revised and refined based on the following:

- Qwest's internal study of the proposed process;
- CLEC input: two multi-day forums were held by Qwest to elicit CLEC comments on the proposed process; and,
- Hitachi Consulting input.

The BHC was created to make the hot cut process described above more scalable and efficient for larger volumes of hot cuts. The process is based on grouping multiple service orders for hot cuts into "batches." A CLEC will be required to submit a minimum of 25 lines and a maximum of 100 lines to create a batch. (These batches will be assembled by the QCCC after LSR submission and acceptance.) The COTs will pre-wire lines and perform dial-tone and ANI tests three or four days before Due Date, using a 7-day standard interval. If there is no dial-tone or the incorrect ANI is detected, the CLEC will have until Due Date to correct any CLEC-side issues. On Due Date, COTs will work to cut up to 100 lines between 3:00 am and 11:00 am local time. The CLEC can monitor the status of the project through an online order status tool, or trap and trace capability. The CLEC is required to reject the hot cut within two hours after the BHC is complete. If no cuts are rejected, the COT will remove the hot cut jumpers from the MDF to the Qwest switch. The BHC process is documented in Exhibit 5. As with the hot cut process, the CLEC will have the opportunity to accept or reject any of the hot cuts.

Hitachi Consulting made several process improvement recommendations over the course of our engagement. All of the material process improvement recommendations made by Hitachi Consulting have been addressed to our satisfaction. One example of the recommendations that have been incorporated in the proposed BHC process is requiring CLECs to submit BHC LSRs via the IMA system with the option to fax the order in the event of system outages.

Key Process Differences

In order to gain efficiencies and allow for greater volume, the BHC process will differ from the hot cut process in various ways. The most significant differences are discussed below and are identified in Exhibit 5.

Order Creation and Acceptance

- Significant interactive edits will be built into the IMA system to identify the LSRs tagged for the BHC process and to ensure the reduction of input errors, which then require additional manual handling by both Qwest and the CLEC.
- Qwest will require that all LSRs submitted for the BHC process must be sent through IMA (GUI or EDI) and faxes will only be allowed when the above systems are unavailable. BHC LSRs will not have the option to be marked for "Manual Handling" by the CLEC thereby, enabling them to flow-through to the Service Order Processor (SOP) electronically.

Planning and Pre-wire (DVA)

- An automated sort engine filters out the BHC service orders and assembles batches based on CLEC and CO.
- Multiple work documents, sorted by the location of the jumpers on each frame, are automatically created for the COTs. The documents are organized to maximize efficient wiring procedures in the CO.
- Creation of an automated sort engine to input the wiring information into the spreadsheets used by the COTs.

Cut Over

- An online order status notification tool will be created. The CLEC will have the ability to monitor the tool for updates as its own processes dictate.
- The CLEC will not be given time to correct an incorrect dial tone or ANI test problem on Due Date. If there is an issue with CLEC dial tone or ANI on Due Date, the line will be assigned a Jeopardy status using the online order status tool and the line will be removed from the batch.
- QCCC updates in WFA-C as well as CO updates in FOMS/TIRKS are no longer manual processes. These processes have been automated.

- CLECs will also have the option to enable trap and trace functionality in their switches. When Qwest initiates the ANI test, the CLEC will be notified via trap and trace of the test, signifying the BHC has begun.

As Tested

Some of the planned process improvements will require significant time and resources from Qwest to develop. Therefore, they could not be completed in time for our testing. Principal process improvements not available at the time of our testing include:

- Interactive edits added to the IMA;
- Creation of an online order status notification tool;
- Use of trap and trace capabilities inherent in the CLEC's switch; and,
- Automated updates to various Qwest's systems.

A complete list of the components of the process, not yet available as of the date of our testing, is included in Exhibit 6.

The process improvements not available for testing will serve to expedite the process and create additional efficiencies. Therefore, actual performance should be better than that experienced in our testing.

7. Assumptions Regarding Batch Hot Cut Process

According to Qwest management, the following services are eligible for the BHC process:

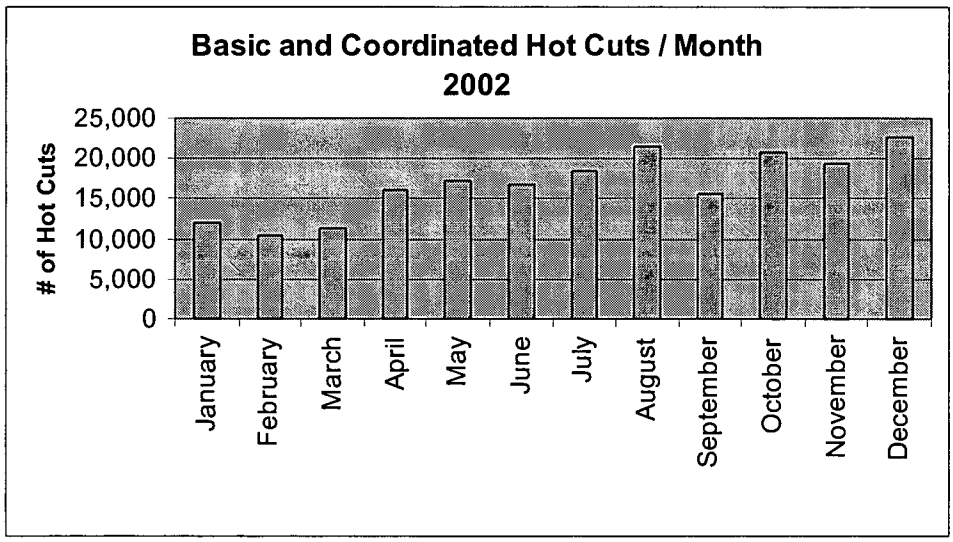
- UNE-P to UNE-Loop;
- Retail to UNE-Loop;
- UNE-Loop to UNE-Loop (CLEC to CLEC);
- UNE-P to UNE-Loop (CLEC to CLEC);

- Resale to UNE-Loop; and,
- Centrex to UNE-Loop.

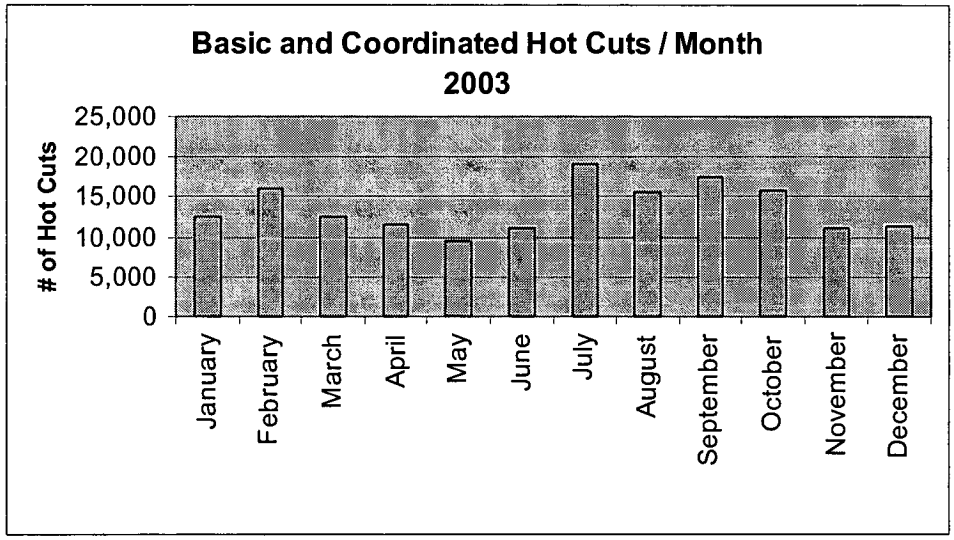
The following services are excluded, although the traditional hot cut process will be available for these services:

- IDLC;
- Line Splitting;
- Line Sharing;
- Lines with Conditioning;
- Remote Serving Offices (EX cables);
- Extended Electronic Loops;
- Requests with Coordination; and,
- CLEC to ILEC.

We have also been informed that the maximum number of BHCs per day, in any given CO, will be 100 lines (plus all regular hot cuts).



In addition, we received information from Qwest concerning embedded base, growth and historical and future volumes. This information is discussed in the section of this report titled "Qwest Historical Hot Cut Volumes and Volume Forecast." We have relied on these assumptions and structured our testing accordingly.



8. Qwest Historical Hot Cut Volumes and Volume Forecast

Daily volumes of Basic and Coordinated 'Reuse' (i.e., reusing the loop facility) hot cuts performed by Qwest COs for each CLEC during 2002 and 2003 were collected from Qwest's Service Order Processing systems.

This data indicates that Qwest performed approximately 202,000 and 163,000 hot cuts during 2002 and 2003, respectively. Illustration 1 represents the total number of hot cuts performed each month by Qwest. Exhibit 7 provides total monthly volume of hot cuts performed by state.

Illustration 1 – Total Number of Hot Cuts Performed per Month

Source: Qwest's Service Order Processing Systems

Total Daily Volume

The following observations are made regarding total daily volumes of Basic and Coordinated 'Reuse' hot cuts performed by Qwest for all CLECs, across all COs.

2002

- Qwest performed between 700 and 900 hot cuts on 85 different business days.
- Qwest performed between 901 and 1,100 hot cuts on 56 different business days.
- Qwest performed between 1,101 and 1,300 hot cuts on 20 different business days.
- Qwest performed more than 1,300 hot cuts on five different business days.
- The maximum number of hot cuts performed by Qwest in a single day was 1,631.

2003

- Qwest performed between 700 and 900 hot cuts on 59 different business days.
- Qwest performed between 901 and 1,100 hot cuts on 23 different business days.
- Qwest performed between 1,101 and 1,300 hot cuts on three different business days.
- The maximum number of hot cuts performed by Qwest in a single day was 1,216.

Illustration 2 – Total Daily Volume of Hot Cuts

Daily Hot Cut Volumes	2002	2003
700-900	85	59
901-1100	56	23
1101-1300	20	3
>1300	5	0
Maximum Single Day Volume	**1,631**	**1,216**

Source: Qwest's Service Order Processing Systems

Daily Volume by Central Office

Daily volumes of Basic and Coordinated 'Reuse' hot cuts performed by Qwest were disaggregated to analyze hot cut volume at each CO. The following observations were made.

2002

In 2002, 73 COs across 11 different states demonstrated the ability to perform 50 or more hot cuts in a day. Exhibit 8 provides a list of COs that demonstrated the aforementioned capability and the number of times they achieved hot cut volume of 50 or more in a day. The following are examples of COs that performed high volumes of hot cuts on a consistent basis. Exhibit 9 provides daily volume of hot cuts performed by these and other COs.

- CDFLIACO (Iowa) performed between 22 and 122 hot cuts per day over 17 days (a total of 723 hot cuts) in April and between 20 and 134 hot cuts per day over 14 days (a total of 1,045 hot cuts) in August.
- CLTNIACO (Iowa) performed between 33 and 119 hot cuts per day over six days (a total of 477 hot cuts) in April and between 37 and 94 hot cuts per day over six days (a total of 373 hot cuts) in April and May.
- DESMIANW (Iowa) performed between 21 and 81 hot cuts per day over 14 days (a total of 744 hot cuts) in January and between 16 and 65 hot cuts per day over nine days (a total of 387 hot cuts) in January and February.

- DUBQIATC (Iowa) performed between 19 and 83 hot cuts per day over nine days (a total of 428 hot cuts) in April and May and between 20 and 86 hot cuts per day over 59 days (a total of 2,978 hot cuts) in September, October and November.
- WTRLIADT (Iowa) performed between 19 and 89 hot cuts per day over 18 days (a total of 881 hot cuts) in September and October between 30 and 122 hot cuts per day over 39 days (a total of 2,779 hot cuts) in October and November.
- FARGNDBC (North Dakota) performed between 20 and 71 hot cuts per day over 13 days (a total of 458 hot cuts) in January and between 27 and 75 hot cuts per day over 14 days (a total of 633 hot cuts) in August and September.
- SXFLSDCO (South Dakota) performed between 29 and 124 hot cuts per day over 21 days (a total of 1,209 hot cuts) in August and between 30 and 80 hot cuts per day over 16 days (a total of 930 hot cuts) in December.

The five largest daily volumes of hot cuts performed by individual COs were 205, 257, 291, 335 and 347, respectively. Further research indicates that there were 12 trouble reports experienced within 30 calendar days following installations of the aforementioned 1,435 hot cuts. This represents a trouble rate of 0.84%. Paragraph 309 of FCC's decision In the Matter of Application by Bell Atlantic New York for Authorization Under Section 271 of the Communications Act to Provide In-Region InterLATA Service in the State of New York, -CC Docket #99-295 (Rel. Dec. 22, 1999), sets the performance benchmark at five percent or lower for such new installation service outages. The aforementioned trouble rate of 0.84% met the benchmark set forth mentioned in the section of the report titled "Testing Benchmarks."

2003

In 2003, 66 COs across 11 different states demonstrated the ability to perform 50 or more hot cuts in a day. Exhibit 8 provides a list of COs that demonstrated the aforementioned capability and the number of times they achieved hot cut volumes of 50 or more in a day.

The following are examples of COs that performed high volumes of hot cuts on a consistent basis. Exhibit 9 provides daily volume of hot cuts performed by these and other COs.

- FTCLCOMA (Colorado) performed between 33 and 63 hot cuts per day over seven days (a total of 309 hot cuts) in August and between 28 and 56 hot cuts per day over 14 days (a total of 569 hot cuts) in September.
- ANKNIACO (Iowa) performed between 27 and 86 hot cuts per day over 25 days (a total of 1,456 hot cuts) in August and September.
- DUBQIATC (Iowa) performed between 20 and 65 hot cuts per day over 24 days (a total of 1,129 hot cuts) in July and August and between 25 and 65 hot cuts per day over 17 days (a total of 816 hot cuts) in August.
- MRTWIASO (Iowa) performed between 20 and 46 hot cuts per day over 13 days (a total of 404 hot cuts) in September and between 28 and 88 hot cuts per day over 27 days (a total of 1,421 hot cuts) in September and October.
- WFRGNDBC (North Dakota) performed between 34 and 60 hot cuts per day over 21 days (a total of 948 hot cuts) in October and November and between 23 and 72 hot cuts per day over eight days (a total of 398 hot cuts) in December.

The four largest daily volumes of hot cuts performed by individual COs were 100, 111, 123 and 135, respectively. Further research indicates that there were four trouble reports experienced within 30 calendar days following the aforementioned installations (a total of 469 hot cuts). This represents a trouble rate of 0.85%. The aforementioned trouble rate of 0.85% met the benchmark set forth mentioned in the section of the report titled "Testing Benchmarks."

Illustration 3 is a tabular representation of consistent, high-volume monthly hot cuts performed at aforementioned COs.

Source: Qwest's Service Order Processing Systems

Multi-CLEC Hot Cut Volume

Although high-volume days are often triggered by a large volume of requests from one CLEC, Qwest has handled significant hot cut volumes for multiple CLECs on the same day. For example, the following observations were made after analyzing the five largest daily volumes of hot cuts performed by Qwest:

2002

- On November 27, 2002 Qwest performed 1,631 hot cuts for 18 CLECs.
- On July 31, 2002 Qwest performed 1,503 hot cuts for 16 CLECs.
- On June 28, 2002 Qwest performed 1,435 hot cuts for 15 CLECs.
- On August 30, 2002 Qwest performed 1,389 hot cuts for 19 CLECs.
- On December 16, 2002 Qwest performed 1,331 hot cuts for 18 CLECs.

2003

- On July 31, 2003 Qwest performed 1,216 hot cuts for 18 CLECs.
- On September 17, 2003 Qwest performed 1,198 hot cuts for 20 CLECs.
- On February 10, 2003 Qwest performed 1,172 hot cuts for 19 CLECs.
- On September 15, 2003 Qwest performed 1,050 hot cuts for 24 CLECs.
- On September 11, 2003 Qwest performed 1,049 hot cuts for 24 CLECs.

Volume Forecast of UNE-Loop

Qwest has estimated the embedded base of UNE-P lines as of December 31, 2004, at 1,275,000 lines. Qwest assumes that 64% of the total embedded lines are in the proposed unimpaired market areas, resulting in an estimate of 816,000 UNE-P lines in unimpaired market areas as of December 31, 2004. Between January 1, 2005, and July 31, 2005, the number of UNE-P lines in the proposed unimpaired market areas is further reduced by

assuming churn of three percent per month, resulting in approximately 659,000 lines that will require conversion.[2]

Qwest's migration analysis includes:

- The estimated embedded base requiring conversion;
- New UNE-Loops resulting from a freeze on UNE-P in unimpaired markets;
- Churn on the embedded base requiring conversions; and,
- Churn on the UNE-Loop.

This analysis forecasts a daily volume of conversions of that reaches a peak approximately 3,600 in August 2005. Qwest assumes all UNE-P lines in unimpaired areas will convert to UNE-Loop. Hence, the forecast made by Qwest of the daily conversion volumes appears to be conservative.

To conduct a migration analysis at the CO level, Qwest chose the CO with the largest embedded base of UNE-P in Minnesota (6,595 lines). Using 60% growth, Qwest estimates the embedded base will be 10,552 lines. Qwest has estimated that to convert the embedded base of UNE-P in this largest CO in the state of Minnesota while handling the new UNE-Loop volume created by the absence of the UNE-P option, the CO would have to perform 64 hot cuts per business day over the next 21 months. This is significantly less than the 100 BHCs Qwest has committed to undertake per CO per day. It is also significantly less than Qwest has successfully performed in the past using the current hot cut process.[3]

This analysis indicates that all of the individual COs can be converted within the 21 months provided in the FCC Triennial Review Order.

[2] Source: According to the written testimony of Robert Brigham dated January 23, 2004.
[3] Source: According to the written testimony of Robert Brigham dated January 23, 2004, filed in the state of Minnesota.

Summary of Historical and Forecast Volume Analysis

Qwest has demonstrated, based on historical data for the existing hot cut process, that it can handle large volumes of UNE-P to UNE-Loop conversion requests. Qwest has further demonstrated on many occasions the ability to process more than 1,000 hot cut requests per day. Qwest has also demonstrated the capability to consistently perform between 25 and 100 hot cuts per day per CO and to exceed these amounts when required with 30-day trouble rates of less than 1%.

Qwest has serviced the above volumes using the existing hot cut process. The proposed BHC process will implement significant improvements that will enable increased efficiencies and scalability over the existing process.

Qwest has provided forecasts of the volume of hot cuts required in the largest COs over the 21 month migration period. This forecast, including growth of the embedded base and including new UNE-Loop replacing new UNE-P, would be 64 cuts per business day in the largest CO in Minnesota. This is significantly less than the 100 BHCs Qwest has committed to, and is no more than Qwest performs today using the current hot cut process.

9. Testing Procedures Performed

Our testing of Qwest's BHC process consisted of three parts:

- A preliminary live trial of the BHC process;
- A second round live trial of the BHC process; and,
- A comparison of the current hot cut process to the BHC process.

Preliminary Live Trial of the BHC Process

We tested Qwest's proposed BHC process with a live trial using CLEC customers. This was accomplished through an agreement with a CLEC to perform commercial trials of the BHC process. The purpose of the initial trial was to ensure that the process worked and to develop process improvement recommendations based on the results.

The BHC preliminary live trial consisted of two production batches of 25 hot cuts each in one Cod (CO #1)[4]. This trial was conducted on two consecutive days in December 2003. The submission of LSRs occurred on December 10th and 11th and the hot cuts took place on the December 17th and 18th. The LSRs were submitted on two consecutive days as two separate batches containing 25 lines each. The composition of these batches is included in Exhibits 12 and 13a. Results of the preliminary live trial are discussed in the section of this report titled "Testing Results."

Second Round Live Trial of the BHC Process

After the CLEC forum in January 2004, the CLEC permitted us to perform additional live testing. Two additional batches of 25 cuts were submitted on the same day to two separate COs.[5] The composition of these batches is included in Exhibits 12 and 13b. LSRs were submitted on January 12, 2004, DVA was on January 15, 2004 and Due Date was on January 19, 2004.

During the period between the preliminary live trial and the second round live trial, changes were made to the BHC process. Significant examples of these changes include:

- In December 2003, the process did not offer the ability for Qwest to notify CLECs of issues before Due Date because the pre-wire was done on Due Date. Thus, in the December 2003 trial, the CLEC had only one hour on Due Date to resolve issues

[4] The locations of these COs are disclosed in the highly confidential Exhibit 14.
[5] IBID.

before the order was removed from the BHC. In January 2004, pre-wire occurred on DVA and the "lift and lay" occurred on Due Date. The COTs checked CLEC dial tone and ANI on DVA which would have allowed the CLEC to fix issues before Due Date if there were any.

- In January 2004, if the CLEC dial tone or ANI test was not accurate on Due Date, the order would have been pulled from the BHC.[6] This process step did not occur in the December trial.
- In January 2004, the line continuity testing was removed from the automated sort engine at the QCCC. The removal of the test allowed for faster throughput at the QCCC.

The results of the second round live trial are included within the section titled "Testing Results" of this report.

Comparison of Hot Cut Process to the BHC Process

In addition, we compared key process steps between the hot cut process and the BHC process. This approach required the identification and comparison of the most significant differences between the two processes. Thus, observations were required of time components to measure efficiencies.

Between January 13 and 15, 2003, we observed the existing hot cut process at three Colorado COs on three consecutive days. These observations created a baseline for the time required to complete the CO steps for the hot cut process. This benchmark was used to compare the current hot cut process with the BHC process. In both processes (hot cut and BHC), the pre-wire and Due Date steps occur on separate days.[7]

[6] In this case, there were no issues.

[7] Due to the fact that both pre-wire and Due Dates steps were observed on the same day at the CO, the service orders that were observed for the steps were different.

We captured the same time metrics that were captured during the BHC trials. These metrics were compared against the BHC trial results. The comparisons were used to evaluate efficiencies created by the new process. Results of these comparisons are included in the section of the report titled "Testing Results."

The most significant process changes we were able to monitor were:

- Implementation of the online order status tool as a replacement for the current QCCC communication process[8]; and,
- Updates to the CO workflow.

Test Documentation

We developed test documentation templates to capture process and system timing. During each phase of testing, we obtained system logs and data extracts from the Qwest systems used to execute the BHC transactions. In addition, our consultants were on-site at various Qwest facilities to capture the time required to perform specific work activities. Summaries of these test logs are shown in Exhibits 10 and 11.

10. Testing Benchmarks

The FCC's decision In the Matter of Application by Bell Atlantic New York for Authorization Under Section 271 of the Communications Act to Provide In-Region InterLATA Service in the State of New York, -CC Docket #99-295 (Rel. Dec. 22, 1999), sets forth a series of performance benchmarks with which to evaluate an ILEC's ability to unbundle network elements. Paragraph 309 of FCC's New York 271 decision broadly categorizes the benchmarks and the minimum expected performance as:

- On-time hot cut performance rate at or above 90%;

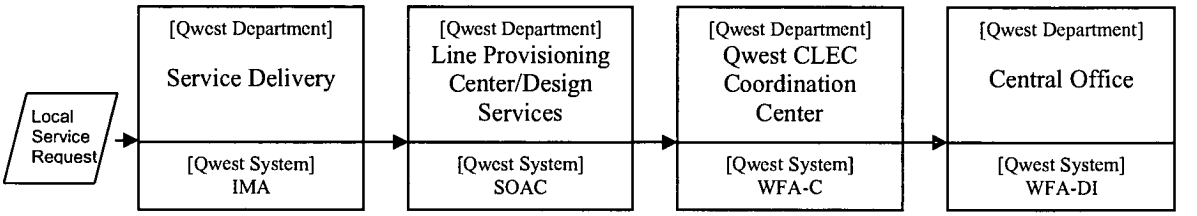
[8] This step was not involved in January because CLEC dial tone was available for all lines.

- Hot cuts resulting in service outages within the first 30 days at rates at or below 5%; and,
- Trouble rate at or below 2% per month for the total installed base.

It is our understanding that Qwest has developed the following PIDs to measure and report the aforementioned benchmarks:

- Installation Commitments Met (OP-3): evaluates the extent to which Qwest installs services for customers by the scheduled due date;
- New Service Installation Quality (OP-5): evaluates the quality of ordering and service within the first 30 days of installation; and,
- Trouble Report (MR-8): evaluates the trouble rate per month as a percentage of the total installed base of the service or element.

11. Testing Results



Preliminary Live Trial of the BHC Process

The preliminary live trial of the BHC process was conducted in CO #1. The BHC process began on Wednesday, December 10, 2003, with the submission of 17 LSRs that contained 25 lines for the BHC. The LSRs submitted on that day represented 24 migrations from UNE-P to UNE-Loop and one migration from Qwest Resale to UNE-Loop. The following day, Thursday, December 11, 2003, an additional 18 LSRs were submitted that also contained a batch of 25 hot cuts. The 18 LSRs submitted on that day represented 25 migrations from UNE-P to UNE-Loop. Our consultants were on-site at Qwest facilities to observe the orders processed through the various Qwest departments and systems.[9] The following diagram

[9] Consultants observed the orders process through Service Delivery and the QCCC. Consultants were not on site at the LPC or Design Services.

represents a high-level depiction of the physical flow for the BHC orders through Qwest departments and systems. Detailed process flows are in Exhibit 5.

Illustration 4: High Level Physical Flow of BHC Orders

Service Delivery Observations

The Qwest Service Delivery Centers' primary responsibility is to process the LSRs received by Qwest. The Service Delivery Centers will typically process all LSRs in the same day that the request for service is received by Qwest. The LSRs for the preliminary live trial of the BHC process were received by the IMA application. The IMA application provides a graphical user interface (GUI) for the CLECs to enter BHC LSRs. The IMA application provides functionality for the Qwest Service Delivery Center to validate the accuracy of LSRs. For example, a basic address check is run to check certain types of address errors before the LSR is submitted.

We observed the BHC LSRs processed by Service Delivery on Wednesday, December 10, 2003. Each Telephone Number (TN) that qualified for automatic flow-through had a Firm Order Commitment (FOC) issued within one minute. On that day, the average LSR processing time through the Service Delivery Center was approximately three minutes.

We observed that one LSR fell out for manual handling because there were other orders on the account in pending status. Based on the functionality of the IMA application, all LSRs that are received with pending orders on the account will be automatically routed for manual handling in Service Delivery. This LSR represented a migration from Resale to UNE-Loop.

Based on discussions with Qwest personnel, resale LSRs will frequently have other orders pending on the account and will require manual handling.[10]

We also observed the BHC LSRs processed by Service Delivery on Thursday, December 11, 2003. Each TN that qualified for automatic flow-through had a FOC issued within one minute. On that day, the average LSR processing time through the Service Delivery Center was approximately two minutes. We observed that one LSR fell out for manual handling due to a central number (CNUM) error database exception. This exception was created by a database issue which resulted in an error on the service order. When this error occurs, the addresses and numbers are revalidated and updated if required to correct the database. The entire batch of 18 LSRs was processed through Service Delivery within 38 minutes of receipt by Qwest.

For the preliminary live trial, Service Delivery assigned a dedicated Service Delivery Coordinator (SDC) to monitor the LSRs as they passed through the system. These LSRs were not pulled in chronological order from the queue due to a request from the CLEC to understand the nature of the fallout for manual handling.

Line Provisioning Center and Design Services

The Line Provisioning Center (LPC) is responsible for managing the process of evaluating the loop characteristics to determine compatibility with the requested service. UNE-Loops are automatically evaluated for compatibility through the Loop Facility Assignment and Control System (LFACS) application. In the event any service orders have fallen out for RMA (Request for Manual Assistance) in the provisioning systems, the LPC will resolve or facilitate the resolution of the RMA to meet the service order Due Date.

[10] Service Delivery manually processed the Resale LSR within 53 minutes. We observed that the entire batch of 17 LSRs was processed through Service Delivery within 53 minutes of receipt by Qwest.

The Design Services organization is responsible for creating the circuit design. The circuit design for UNE-Loops is automatically created in the TIRKS application.

We observed both the LPC and Design Services operations to become familiar with the components of the BHC process. In addition, we contacted representatives from these departments on an as needed basis to clarify results from the BHC Trial.

QCCC Observations

The QCCC is responsible for validating the accuracy of the BHC service orders, assigning the service orders to the appropriate Qwest CO facility, managing the BHC process and providing communication with CLECs regarding order status. Qwest has proposed the development of an online order status application that will provide online communication with CLECs regarding the status of requested BHCs. The online order status tool was not available during our preliminary live trial of the BHC process.

The QCCC receives BHC service orders in the WFA-C application. The BHC orders received in WFA-C are processed daily. Thus, the BHC preliminary live trial LSRs that were received on Wednesday, December 10, 2003, by Service Delivery were processed at the QCCC on Thursday, December 11, 2003.

We observed the BHC service orders processed by the QCCC on Thursday, December 11, 2003. All the orders went through the automated flow-through process; however, we observed two service orders that required manual follow up by the QCCC. The orders required follow up for the following reasons: one for a Universal Digital Channel Unit (UDC) issue that required a dispatch out and the second for a facilities error that was resolved manually by the LPC before the QCCC could reach the LPC for follow up.[11] The elapsed time for all BHC service orders processed on December 11, 2003, was 51 minutes.

[11] Both of these issues were resolved prior to the Due Date.

We also observed the BHC service orders processed by the QCCC on Friday, December 12, 2003. All of the service orders went through the automated flow-through process, however, we observed five service orders that required manual follow up by the QCCC. The orders that required manual handling consisted of one order that had a line short in the loop and required a dispatch out from the CO to resolve. The other four service orders that required manual handling were resolved by LPC Consultants. One of the service orders was resolved before the QCCC could reach the LPC for follow up. Refer to Exhibit 10 for results of preliminary live trial. The elapsed time for all BHC service orders processed on December 12, 2003, was 38 minutes.

CO Observations

The Qwest CO facilities are responsible for operating and maintaining the core telephony assets (e.g. main distribution frame, interconnection distribution frame, etc.) that are involved in the BHC process. Under the BHC process, the CO receives a spreadsheet from the QCCC that contains a list of the work orders included in the BHC.

We observed the BHC procedures performed at CO #1 on Wednesday, December 17, 2003, and Thursday, December 18, 2003. The BHCs performed on these two days represented the LSRs received on Wednesday, December 10 and Thursday, December 11, 2003, respectively. We observed 25 BHCs performed on December 17 and 23 BHCs performed on December 18, 2003. Two orders with Due Dates on December 18, 2003, had their Due Dates delayed and were later cancelled by the CLEC for the following reasons: In the first case, the CLEC input an incorrect Service Provider Identification Code (SPID) on the LSR. The SPID on the order was for a different CLEC and if cut over, the number would have incorrectly ported to another CLEC. The second cancellation was due to an issue with an off-premises extension.

During these two days we observed the following procedures performed in the Qwest CO:

- Review of the spreadsheet with orders and wiring information;
- Dial tone test;
- Installation of interconnection distribution frame jumpers;
- Installation of main distribution frame jumpers;
- Qwest and CLEC ANI checks;
- Physical lift and lay of the copper pair;
- Protector Distribution Frame (PDF) dial tone check; and,
- Updates to WFA-DI.

During our observations of the BHC trial, we recorded the following average elapsed time to complete each CO procedure:

Illustration 5: Average Elapsed Time for Each DVA Procedures

CO Procedure	Average Time Per TN (December 17, 2003)	Average Time Per TN (December 18, 2003)
Review spreadsheet	16 seconds (Note 1)	16 seconds (Note 1)
Dial Tone Test	22 seconds	24 seconds
Installation of IC distribution frame jumpers	2 minutes 46 seconds	3 minute 2 seconds
Installation of main distribution jumpers	1 minute 17 seconds	1 minute 53 seconds
Total Average Time for DVA Procedures	**4 minutes 41 seconds**	**5 minutes 35 seconds**

Note 1: These figures represent the average times recorded in the second round live trial.

Illustration 6: Average Elapsed Time for Each Due Date Procedures

CO Procedure	Average Time Per TN (December 17, 2003)	Average Time Per TN (December 18, 2003)
Review spreadsheet	N/A (Note 2)	N/A (Note 2)
Qwest and CLEC ANI tests & Lift and Lay	1 minute 17 seconds	1 minute 36 seconds
PDF dial tone checks	17 seconds	29 seconds
Update WFA	43 seconds (Note 1)	43 seconds (Note 1)
Total Average Time for CO Procedures	**2 minutes 17 seconds**	**2 minutes 48 seconds**

Note 1: These figures represent the average times recorded in the second round live trial.

Note 2: Review of the spreadsheet was only performed once because the steps for DVA and Due Date were performed on the same day.

The preliminary live trial piloted the proposed BHC process that was discussed during the CLEC Forum on December 3-5, 2003. In this trial the pre-wire and hot cut tasks were both performed on the Due Date. During the second round live trial on January 12 thru 19, 2004, Qwest modified the process based on feedback received from the CLEC forum. The revised BHC process dated January 9, 2004, performs the pre-wire activities on DVA and hot cut procedures on Due Date. Therefore, for comparison with additional trials, we have separated the elapsed work time for the pre-wire and hot cut procedures in the following table:

Illustration 7: Elapsed Time for Preliminary Live Trial

Date	Volume of TNs Included in Batch	Elapsed Work Time for Pre-Wire Procedures	Elapsed Work Time for Due Date Procedures	Time Required for CO BHC Procedures	Total Elapsed Time for CO BHC Procedures; Question and Answer with COT
December 17, 2003	25	1 hour 57 minutes	57 minutes	2 hours 54 minutes	6 hours 37 minutes (Note 1)
December 18, 2003	23	2 hours 20 minutes	1 hour 9 minutes	3 hours 29 minutes	4 hours 25 minutes

Note 1: Time includes rework associated with a process error that occurred in the CO BHC procedures on Due Date.

Summary of Preliminary Live Trial

During both days of the preliminary live trial, Qwest met 100% of its commitments on time.

There were no trouble reports for these TNs during the 30 days following the BHC.

Second Round Live Trial of the BHC Process

The second round live trial of the BHC process was conducted in CO #2 and CO #3. The BHC process began on Monday, January 12, 2004, with the submission of 26 LSRs that contained 52 BHCs. The LSRs submitted on that day represented 26 migrations from UNE-P to UNE-Loop submitted in nine LSRs and 26 Centrex migrations submitted in 17 LSRs. In addition to monitoring the process through system-captured times, our consultants were on-site at the CO facilities to observe the orders processed.

Service Delivery Observations

The BHC LSRs were processed by Service Delivery on Monday, January 12, 2004. Each TN that qualified for automatic flow-through in Service Delivery had a FOC issued within one minute. The only LSRs that fell out for manual handling were the Centrex orders, which were anticipated. LSRs received with Centrex orders may fall out to manual handling in Service Delivery due to the fact that there may be a pending order on the account.

The average manual processing time for Centrex LSRs through Service Delivery was 46 minutes. Orders that fell out for manual handling and were handled by the SDC also had a FOC issued within one minute of the completion. The average LSR processing time for both manual handling and automatic flow-through in the Service Delivery Center was 39 minutes. Based on discussion with Qwest personnel, Centrex comprises approximately 20% of the total embedded base of UNE-P.

QCCC Observations

The BHC service orders were processed in the QCCC on Monday, January 12, 2004. All the orders went through the automated flow-through process and none required manual follow up by the QCCC. Two orders that had been rejected were processed on January 13th.

CO Observations

We observed the BHC procedures performed at CO #2 and CO #3 for both the DVA Date, Thursday, January 15, 2004, and Due Date, Monday, January 19, 2004. The BHCs performed on these two days represented the LSRs received on Monday, January 12, 2004. We observed 26 BHCs performed in each location.

On the DVA Date, Thursday, January 15, 2004, we observed the following procedures performed in both COs:

- Review of the spreadsheet with orders and wiring information.
- ANI and dial tone test.
- Installation of interconnection distribution frame jumpers.
- Installation of main distribution frame jumpers.

On the Due Date, Monday, January 19, 2004, we observed the following procedures performed in both COs:

- Review of the spreadsheet with orders and wiring information.
- Qwest and CLEC dial tone and ANI tests.
- Physical lift and lay of the copper pair.
- Updates to WFA-DI.

During our observations of the second round live trial we recorded the following average elapsed time to complete each CO procedure:

Illustration 8: Average Elapsed Time Per DVA Procedure

CO Procedure	Average Time Per TN (CO #3)	Average Time Per TN (CO #2)
Review spreadsheet	16 seconds	16 seconds
Dial Tone Test	(Performed along with MDF jumpers)	44 seconds
Installation of ICDF jumpers	1 minute 44 seconds	1 minute 39 seconds
Installation of main distribution jumpers	1 minute 9 seconds	1 minute 48 seconds
Total Average Time for DVA Procedures	**3 minutes 9 seconds**	**4 minutes 27 seconds**

Illustration 9: Average Time Per Due Date Procedure

CO Procedure	Average Time Per TN (CO #3)	Average Time Per TN (CO #2)
Review spreadsheet	16 seconds	16 seconds
Qwest and CLEC ANI tests & Lift and Lay	1 minute 21 seconds	1 minute 30 seconds
PDF dial tone checks	Note 1	Note 1
Update WFA	28 seconds	58 seconds
Total Average Time for Due Date Procedures	**2 minutes 5 seconds**	**2 minute 44 seconds**

Note 1: Neither CO had a separate PDF from the MDF so the PDF checks could not be performed.

We compiled the following elapsed work times in the CO for the second round live trial of the BHC process. The following elapsed times include the total work time to perform the pre-wire (DVA) and Due Date (Due Date) procedures.

Illustration 10: Elapsed Times for the Second Round Live Trial

Date/ Location	Volume of TNs Included in Batch	Elapsed Work Time for Pre-Wire Procedures	Elapsed Work Time for Due Date Procedures	Total Elapsed Work Time for CO BHC Procedures	Total Elapsed Time for CO BHC Procedures; Question and Answer with COT
January 19, 2004 (CO #3)	26	1 hour 22 minutes	54 minutes	2 hours 16 minutes	2 hours 48 minutes
January 19, 2004 (CO #2)	26	1 hour 56 minutes	1 hour 11 minutes	3 hours 7 minutes	3 hours 14 minutes

The second round live trial piloted components of the revised BHC process that was discussed during the CLEC Forum on January 6 thru 8, 2004. The pre-wire activities were performed on DVA and hot cut procedures on Due Date.

Summary of Second Round Live Trial

During the second round live trial, Qwest met 100% of its commitments on time. In addition, there were no trouble reports for these TNs as of the writing of this report following the BHC, although the 30 days were not up.

The findings for the second round live trial represented an improvement preliminary live trial.

Differences in times for the COs can be attributed to several factors including:

- The physical size and layout of the COs and the installed equipment. For example, larger COs require more travel time (walking) between larger frames. Moreover, in CO #1 and CO #2, the vertical and horizontal side of the ICDF were facing opposite directions. In CO #3, they were both facing the same direction and therefore easier to wire.
- Unique COTs at each site.

Comparison of Hot Cut Process to the BHC Process

In comparing the BHC process to the hot cut process, we focused on two areas, as previously mentioned in this report, in the section titled "Testing Procedures Performed". These are:

- BHC communication between Qwest and CLECs
- Updates to the CO workflow

BHC Communication between Qwest and CLECs

As part of the BHC process, three changes are being made which will have a major effect on the communication process between Qwest and the CLEC.

- TNs are grouped by CO by CLEC and not by LSR. This results in having a larger number of TNs per batch.
- Only basic Reuse orders are allowed, thereby, information shared between the parties is less extensive than the amount of data communicated through coordinated and new orders.
- Orders that have NDT or an incorrect ANI on Due Date are immediately removed from the BHC. No resolution process is required.

Each of these changes would reduce the amount of coordination required between the CLEC and the QCCC. However in addition, Qwest is developing an online order status tool to communicate order status directly from the CO to the CLEC. The QCCC, in this process, will monitor the communications tool from the Qwest side and resolve any issues that arise. All current standard communications between the CO and the CLEC through the QCCC will be eliminated. All correspondence regarding NDT and incorrect ANI on Due Date will also be eliminated.

For comparison to the use of the online order status tool, observations of Plain Old Telephone Service (POTS) Provisioners at the QCCC were performed over the week of November 17, 2003, and January 15, 2004. During both visits, observations included monitoring the Provisioners, listening to their phone calls and understanding the nature and duration of the calls. The observations demonstrated that the Provisioner is currently involved in multiple types of orders including basic Reuse, coordinated Reuse and new orders. Each call series is based on an individual LSR (multiple TNs can exist per order). However, the average number of TNs associated with each LSR, based on the average number of TNs per LSR from January 2002 to December 2003, is 1.80. Servicing orders

individually results in Provisioner workload that averages 30 TNs per Provisioner per day. This is, in part, due to the many telephone calls that the Provisioners perform using the existing hot cut process.

To better understand the impact on the BHC process, actual workflow steps that would be removed by the online tool were recorded during the January 15, 2003 visit. The results of these observations are shown below.

Illustration 11: CLEC Notification Time Measurement

QCCC Service Representative Phone Call	Average Time Per Call
Call from COT to QCCC about cuts being completed	30 seconds
Call to CLEC from QCCC about cuts being completed	56 seconds
Call from CLEC to QCCC about acceptance of cuts	30 seconds
Completing the paper OSSCN form	60 seconds
Total impact per order	**2 minutes 56 seconds**

For each call type above, there were seven orders used to calculate the averages shown. While not a representative sample, our observations yielded very similar call times across all orders, and the largest variation in any of the calls was 20 seconds.

Calls conveying NDT and incorrect ANI were also observed as shown below:

Illustration 12: CLEC Communication Time Measurement

QCCC Provisioner Phone Call	Average Time Per Call
Call from CO to QCCC notifying them of problem	2 minutes
Call from QCCC to CLEC notifying them of problem	2 minutes
Call from CLEC to QCCC telling them problem was fixed	10 seconds
Call from QCCC to CO telling them problem was fixed	10 seconds
Total time per order	**4 minutes 20 seconds**

The average times above are representative of two observed instances. Each instance had a variance in each call of a few seconds. No data is available to demonstrate the frequency of NDT and incorrect ANIs. Qwest believes that approximately 20% of all orders have at least one line failing the DT/ANI test.

Consequently, assuming the projected volume of 3,600 lines per day, an average of 1.80 lines per LSR, the BHC process changes and the online communication tool would save approximately 5,867 minutes per day (two minutes 56 seconds per order x 3,600 TNs/1.80 TNs per call series). The time savings on the estimated 20% of orders that have NDT or incorrect ANI is 1,733 minutes (20% of 3,600 TNs/1.80 TNs per call series x 4 minutes 20 seconds). The combined amount of time saved per day is 7,600 minutes, or approximately 127 staff-hours per day over the current process.

The process efficiencies estimated above for the BHC process do not account for all of the potential savings. Our analysis included efficiencies gained from automating the QCCC communication time for orders that complete without issue and for NDT and ANI issues encountered on Due Date. To the extent that there are other types of issues that require communication, there may be additional communication efficiencies resulting from the BHC process.

CO Workflow

We compared the CO workflow between the current hot cut process and the BHC process during visits to COs throughout our study. We measured the time required under the existing process on January 13, 2004, in the Dry Creek CO in Denver, January 14, 2004, at the CO in Arvada and January 15, 2004, at the Colorado Springs Main CO. During each of these visits, we observed COTs performing the steps of the hot cut process and recorded times associated with the process. The observations consisted of three DVA orders and 35 Due Date orders.

During the DVA steps for the current hot cut process, the COT performs the pre-wire for one order at a time. The COT would wire the ICDF jumper, then immediately move to the MDF to install that jumper for each line needing to be wired on that day. For the BHC process, the COT(s) wire all of the ICDF jumpers before moving to the MDF frame. Time savings associated with the travel time from the ICDF to the MDF is variable based on the unique CO layout. The average was 90 seconds for the COs we visited.

The impact to the CO, using the assumption that there are 100 lines per CO per day, of saving 90 seconds per line time difference aggregates to 37.5 (90 * 25/ 60) minutes per CO or a maximum of 150 (90*100/60) minutes saved per day per CO per batch. The COT travel time is the primary efficiency of the BHC process when compared with the existing hot cut process.

Overall Trial Testing Considerations

The trials were conducted with a high level of scrutiny from Qwest, Hitachi Consulting and the participating CLEC. The high level of scrutiny and the number of people standing around the frames is likely to have affected COT productivity in some circumstances, increasing the overall activity times. For example, the COTs may have been hindered in some cases due to maneuvering around so many observers and answering questions while performing the cuts. We excluded some of the discussion time from the testing results but were unable to remove all disruption completely.

We have tested the largest volumes available to us during the course of our work. While this does not represent a test of the maximum volume per CO or for the whole organization, results to date suggest a high degree of success, particularly in the second round live trial and suggest that, assuming the BHC process is used, the COs can easily perform Due Date activities for the forecasted volumes. I also note that, based on the aforementioned volume

forecast, the largest CO in Minnesota would only have to perform 64 BHCs per business day during the 21 month conversion period.

12. Staffing the BHC Process

The BHC process will require incremental headcount in Service Delivery, QCCC and CO organizations. During our review of the BHC process, we met with representatives from each of these organizations to discuss Qwest's plans for staffing the BHC process. Based on our discussions and review of preliminary staffing plans, we see no reason to anticipate obstacles in finding the resources required to perform the BHC process.

Service Delivery Staffing

We spoke with Russ Urevig, Senior Process Analyst, about the ability of Qwest's Service Delivery Center to scale its resources based on the forecasted volumes when the BHC process is implemented. Mr. Urevig forecasted growth of the department based on the volume estimates developed by Robert Brigham, Staff Director of Public Policy. Mr. Urevig's calculations were based on three areas of need:

- Manual Handling;
- CFA Changes; and,
- Call Handling.

Based on Mr. Urevig's estimates, the Service Delivery Centers have existing facility capacity, including computers, for two-thirds of the forecasted volume of headcount growth that would be required. The other one-third can easily be outsourced to the third party contractor currently working with Qwest.

QCCC Staffing

We discussed the ability of the QCCC to scale from current volumes to the forecasted daily volumes documented in the section of this report titled "Qwest Historical Hot Cut Volumes and Volume Forecast" with Mary Pat Cheshier, Director of the QCCC. Ms. Cheshier noted that under the proposed BHC process, nearly all of the QCCC functions have been automated. For the existing process a substantial portion of the QCCC Service Representatives' time is spent communicating order status to the CLECs. This process will be automated with the implementation of the online order status tool. The QCCC will be required only to monitor the tool for CLEC updates related to CLEC jeopardy issues and update the CO as needed. Therefore, additional human resource requirements for the BHC process will be minimal.

The QCCC will be more significantly impacted by the growth in new UNE-Loop, as it is anticipated that much of this will not be done in batch. This will require significant additional headcount, which Ms. Cheshier anticipates she will begin hiring in October 2004. The QCCC has space in its existing facility to house this headcount. No problem is anticipated in hiring the additional headcount. Ms. Cheshier notes that when she opened the QCCC two and one half years ago, she hired and trained approximately 90 people. Most of these people were internal transfers already familiar to varying degrees with Qwest's processes and systems.

CO Staffing

We discussed the ability of the Qwest COs to scale from current volumes to the forecasted daily figures documented in the section of this report titled "Qwest Historical Hot Cut Volumes and Volume Forecast," with Jim Barganski, Manager, Program and Project Management. Mr. Barganski indicated that Qwest intends to staff the BHC process with dedicated COTs. Mr. Barganski also mentioned that the BHC process does not require any special skills and that every COT within Qwest is qualified to perform a BHC. Nonetheless, Mr. Barganski and

Qwest have committed to training its COTs on the new process, once it is approved by each affected state commission.

Qwest has estimated that approximately 100 additional COTs will be required to perform the BHC process. Mr. Barganski indicated that the staffing for new COTs is typically accomplished through a combination of internal transfers, hiring of new employees and contract supplemental staffing. Qwest has performed special projects in past that have required incremental headcount. During those projects Qwest did not experience difficulty staffing additional COTs.

We also met with Gale Todd, Director of Occupational Staffing, at Qwest. Gale mentioned that Qwest currently employs approximately 2,000 COTs. In addition, she mentioned that Qwest does not experience difficulty recruiting and hiring for the COT position.

13. Conclusion

Qwest has demonstrated the ability to process large volumes of hot cuts using its existing process:

- Qwest has performed more than 1,000 hot cuts on 28 days in the last two years. The maximum number of hot cuts per day during this period was 1,631;
- Qwest has demonstrated the ability to perform more than 50 hot cuts per day in 73 COs during 2002 and 66 COs in 11 states during 2003. Qwest has repeatedly performed in excess of 100 hot cuts in a CO in a day, with trouble rates of less than 1%; and,
- Qwest has demonstrated the ability to consistently cut large volumes of lines in a CO on a series of consecutive days.

Based on Qwest's volume forecasts, Qwest would be required to cut over a maximum of approximately 3,600 lines per day during the 21 month migration period. The largest CO in Minnesota, for example, would have to perform 64 BHCs each business day during the 21 month period.

Qwest has designed a new BHC process. This process introduces significant efficiencies over the hot cut process through front-end edit checks, process automation and streamlining of manual processes. We have measured the benefit of several of these differences. The results indicate that the process is substantially faster than the current process and the differences we measured save many hours per day at the projected volumes.

We have tested this process with live data and the process works.[12] Our testing to date has included four batches of approximately 25 TNs per batch. In all cases, all commitments were met and no troubles were reported for the first round of testing within the first 30 days.[13] Qwest met 100% of its commitments and, based upon the benchmarks set by the FCC of an on-time hot cut performance at 90%, Qwest demonstrated an ability to meet and exceed this benchmark.

Extrapolation of the Due Date activities of the COs for each of the live trials indicates that a team of two COTs should be able to complete them in the course of an eight-hour shift. Any remainding time in the shift, plus other shifts, could be used to conduct pre-wire activity for other batches.

The process improvements not available for testing will only serve to expedite the process and create additional efficiencies. Therefore, actual performance should be better than that experienced in our testing.

[12] We note however, that some portions of the process, such as the online order status tool, are not yet available to test.
[13] The second round was cut only four days prior to issuance of this report. At this date, we cannot comment on trouble status.

To scale to the Qwest forecasted volumes, additional resources will be required. Each of the key departments have plans to scale as required. We have discussed these plans with department management and nothing has come to our attention to suggest that they are unreasonable.

In my opinion, based on the above, the BHC process as proposed represents significant improvements in efficiency with similar levels of quality compared to the existing hot cut process. Nothing has come to my attention to suggest that this process will not scale to the forecasted volumes.

Respectfully Submitted,

Lorraine Barrick

Bachelor of Science degree with distinction in accounting, with minor in computer science, Colorado State University

I have been in consulting for 18 years, the last 15 of which I have focused on business, financial and economic consulting. I have extensive experience in both domestic and international disputes. My work has included quantitative analysis, auditing (including process testing and compliance), asset tracing, fraud investigations, post-acquisition disputes, lost profits analysis, and business valuations.

I began my career as an auditor. My audit clients included public and private companies, as well as non-profit organizations, both in the U.S. and abroad. This work included developing statistically valid samples for testing, as well as reviews of business processes, procedures and internal controls, and development of recommendations, thereon, for management.

After resigning as a partner from Arthur Andersen in May of 2000, I was employed in the management of a public technology company. As Vice President of Operations for the technology development division, I was responsible for the initial development of all processes and procedures for our customer service teams (including electronic ordering systems, service response times, and quality assurance procedures and metrics), client relationship management, and finance. In October of 2001, I established my own consulting practice.

My consulting work includes forensic accounting and financial investigation, complex transaction and process mapping, modeling, business and intangible asset valuation, economic analysis, and financial advisory services. I have worked with clients in many industries, including telecommunications and technology, airline, banking and finance, real estate, retail, manufacturing, engineering, professional services and utilities.

I have worked with telecommunications clients in wireline, wireless, paging and equipment manufacturing businesses, in the U.S. and abroad. My work has included class action work, claims administration, business and intangible valuation and process improvement analysis.

I have experience in working in litigation, arbitration, utility and other regulatory tribunal settings, and have worked with private companies and individuals, as well as regulatory authorities such as the Federal Bureau of Investigation, the Securities and Futures Commission, Commercial Crime Bureau, and Department of Justice in Hong Kong.

Exhibit 2: Glossary of Terms Used

January 23, 2004

Exhibit 2: Glossary of Terms Used

Acronym	Word	Definition
ANI	Automatic Number Identification	ANI provides for the transmission through the network of the telephone number associated with a pair of wires.
BOSS	Billing and Order Support System	BOSS is the system that manages the Customer Service Record (CSR). CSRs contain account status, billing, listing and services and equipment information. This system serves Qwest's central and eastern regions.
BPL	Business Process Layer	The business process layer provides system edits for the IMA (order entry) system. Today, the BPL contains a series of edits to increase automated flow-through. An additional series of edits will be proposed to make the BPL more efficient and effective in the future.
CO	Central Office	A building or space where transmission facilities or circuits are connected or switched.
CORAC	Central Office Resource Allocation Center	The CORAC's primary function is to assign or "load" orders to the COTs.
	Centrex/Centrex 21	Centrex is a business telephone service offered by a local telephone company from a local CO. Centrex is basically normal single line telphone service with added features like intercom, call forwarding, call transfer, etc. It has more features than those typically offered for residential service.
ZCID	CLEC Identification	The ZCID identifies the CLEC via a three character, alpha-numeric entry.
CJEOP	CLEC Jeopardy Code	An alphanumeric code assigned to a service order used to indicate the type of trouble the order is experiencing and the responsible party for resolution.
CFA	Connecting Facility Assignment	Identifies the dedicated transport facility on which the service will ride; the cable name (DS0, DS1); cable and pair the loop will use to connect the ICDF/SPOT frame that is collocated with Qwest; slot number; and, A to Z CLLI codes.
CARS	Customer Account Retrieval System	CARS is the system that manages the Customer Service Record (CSR). CSRs contain account status, billing, listing and services and equipment information. This system serves Qwest's western

Exhibit 2: Glossary of Terms Used

Acronym	Word	Definition
		region.
CNUM	Customer Number Database	Telcordia's Media Vantage/Media Core corporate number database system responsible for the selection and administration of numbers associated with a customer's service. CNUM provides a single corporate database for the selection, assignment and administration of TNs and their associated data. TNs and their attributes will be extracted from SWITCH and loaded into CNUM.
CSR	Customer Service Record	From BOSS/CARS (the Qwest CSR systems).The CSR is the record of all services that a customer currently has, it includes administrative information such as service addresses, billing USOCs and features.
DS	Design Services	Qwest organization responsible for designing the circuit.
DVA	Designed, Verified and Assigned Date	The date on which implementation groups are to report that all documents and materials have been received and are complete.
DD	Due Date	The specific date on which the requested service is to be available to the CLEC or the CLEC's end-user.
FOC	Firm Order Confirmation	The notice Qwest provides to the CLEC to confirm that the CLEC LSR has been received and has been successfully processed. The FOC confirms the schedule of dates committed to by Qwest for the provisioning of the service requested.
FOMS	Frame Operations Management System	FOMS is a Telcordia product. The major functions of this system are to inventory and assign line equipment and provide information about frame wiring. FOMS supports flow-through service provisioning and is part of this mechanized process. The OE-LOIS data is provided by FOMS.
IMA	Interconnect Mediated Access	IMA is a Qwest system that allows CLECs to request Resale and Interconnect Products from Qwest. IMA provides several types of functionality to CLECs and Service Centers. IMA has a GUI for entry of LSRs, as well as an EDI interface. It allows the CLECs to perform pre-order, order and post-order functions.

Exhibit 2: Glossary of Terms Used

Acronym	Word	Definition
LNP	Local Number Portability	Local Number Portability (LNP) allows consumers to change service providers while retaining their phone numbers. NeuStar provides LNP services to the telecommunications industry. North American Portability Management, LLC and Canadian LNP Consortium currently contract with NeuStar to provide this service.
LSR	Local Service Request	The industry standard forms and supporting documentation used for ordering local services.
LFACS	Loop Facility Assignment and Control System	The system performing automated loop assignment.
LPC	Loop Provisioning Center	Qwest has six of these to look at the requested service change, to determine whether the existing loop is adequate or whether a change to the physical loop is required.
MDF	Main Distribution Frame	Used to connect Qwest cable pairs and line and trunk equipment terminals on a Qwest switching system.
PID	Performance Indicator Definition	Performance Indicator Definitions were developed during Qwest's 271 approval process that provides Qwest's performance indicators for various systems and functions (e.g. pre-order/order, provisioning, billing, etc.) for both retail and wholesale customers.
POTS	Plain Old Telephone Service	The basic service supplying standard, single line telephones, telephone lines and access to the public switched network. Does not include added features such as call waiting and call forwarding. All POTS lines work on loop start signalling.
PON	Purchase Order Number	Field on LSR.
QCCC	Qwest CLEC Coordination Center	Dedicated to the support of CLECs in procuring Qwest services.
RID	Record Order Issue Date; Record Issue Date	The date the design is completed and TIRKS is updated.
RMA	Request for Manual Assistance	Generated when orders fall out of LFACS and SWITCH/FOMS.
SDC	Service Delivery Coordinator	Team member in the Service Delivery Organization tasked with handling the manual portions of the creation of the service order and FOC, when needed.
SOAC	Service Order Analysis and Control System	The OSS used to coordinate order management and provisioning processes.

Exhibit 2: Glossary of Terms Used

Acronym	Word	Definition
SOP	Service Order Processor	There are three service order processors (one for each region). They are called RSOLAR, SOLAR, and SOPAD. SOLAR (Service Order Logistics and Reference), SOPAD (Service Order Processor and Distribution) , and RSOLAR (Regional SOLAR). Within each region, the corresponding SOP for that region directs/processes service orders for all product types. SOPAD is the SOP in the central region. SOLAR is the SOP in QWEST's eastern region; RSOLAR is the SOP in the western region.
SUP	Supplemented	Term used to describe the action of or the actual supplement to LSR. The "Supp" would be generated by the orignator of the LSR being "supplemented."
SWITCH	SWITCH	The SWITCH System is a network management system providing configuration management for the new digital access domain, while also retaining full-function support for older analog facilities and equipment. The SWITCH System administers and automatically assigns: • Switches and associated central office equipment. • Digital loop electronics, including network elements with either static or dynamic time slot interchange interfaces to the switch. The SWITCH System supports flow-through service activation for POTS, ISDN, Centrex and hunting and special services. In addition, it provides inventory management and telephone number administration capabilities and supports the provisioning process.
	Switch	A (telephone) switch is a device (network element) that establishes a connection (circuit route) between two-end users. The connection between the end-users is referred to as a "circuit switched connection" and consumes the same resources whether or not data (conversation) is being transmitted and is the dedicated path between the end-users. A switch can also connect to other switches.
TAG	Telephone and Address GUI	TAG is the link to ALOC (Address Location) and CNUM. ALOC and CNUM are replacing PREMIS.
TRO	Triennial Review Order	Put out by the FCC.

Exhibit 2: Glossary of Terms Used

Acronym	Word	Definition
TIRKS	Trunk Integrated Record Keeping System	The TIRKS System is an integrated, computerized system supporting the total network provisioning process for special services circuits, message trunks and carrier circuits. It also provides inventory management for both facilities and equipment.
UDC	Universal Digital Channel Unit	The UDC terminates two pair STP cable to form a hierarchic connection that requires no jack or plug.
UNE	Unbundled Network Elements	Physical and functional elements of the network (e.g., NID, local loop, and switch ports.)
WFA	Work Force Administration	"Family" of Telcordia system that include WFA/Control, WFA/Dispatch Inside, WFA/Dispatch Outside. The Work Force Administration (WFA) System product line manages and automates most of the work assignments required to install and repair Client Company facilities, trunks, special service circuits, and business/residential lines.
WFA/C	Work Force Administration/Control	The work assignment and control administration part of the WFA product line used by the QCCC.
WFA/DI	Work Force Administration/Dispatch In	The force administration part that manages central office craft personnel used by the COTs.
WFA/DO	Work Force Administration/Dispatch Out	The force administration component that manages outside technicians used by the Outside Plant technician.
WFA/C OSSLOG	Work Log	Screen within WFA/C. The display-only Work Log (OSSLOG) screen shows a detailed account of activities on an order or trouble report. OSSLOG also displays log entries for remote trouble reports. Remote trouble reports are entered in remote service assurance systems and associated with Unbundled Network Element (UNE) circuit IDs. This screen shows activities in date/time sequence with the most recent activity at the top. Entries are made to the Work Log via the Work Activity Screen (OSSEA) and automatically by the system for certain predefined functions, such as receipt of the WORD document and completion of an event.
WORD	Work Order Record Detail/Document	A "document" created by TIRKS and accessible via WFA that contains the details of a circuit from end-to- end.

Exhibit 6: Process Improvements Not Available At Our Time of Testing

January 23, 2004

Exhibit 6: Process Improvements Not Available at Our Time of Testing

Process Area	Proposed Process Initiatives Not Tested or Observed	As Tested	Impact
Order Creation and Acceptance	Systems edits in the Business Process Layer will manage the workload across COs. These edits will ensure the CLEC has used the "Appointment Scheduler" when submitting the LSR. The "Appointment Scheduler" verifies that each CO is not overloaded on a particular day.	These edits were not in place during the preliminary live trial. The preliminary live trial was prearranged with a CLEC and Qwest. COs were selected specifically for the live testing. Scheduling conflicts were not a risk.	This did not impact the test results.
Order Creation and Acceptance	Enhanced edits in the Qwest systems will reduce errors that cause LSRs to fall out of the automated process to manual handling. For example, for the BHC, the Dispatch field will have to be blank or "no" for the LSR to be able to be submitted for the BHC process.	These edits were not added at the time of the trials.	The edits that will be integrated are not related to the reasons that the LSRs during the trials fell out of the automated process. Therefore, this did not impact the test results.
Planning and Prewire	The Automated Sort Engine will supply the "wiring location" on the work order the COTs use to perform the BHC.	The "wiring location" was looked up manually for each TN by a member of the process team.	The time to perform this activity manually was not included in the calculated elapsed time because this step will be eliminated. Therefore, this did not impact the test results.
Planning and Prewire	The Automated Sort Engine will automatically create 3 views of the work to be performed in a BHC. These views will enable the COTs to perform the work steps in a more efficient sequence.	The 3 views were created manually by a member of the process team.	The time to perform this activity manually was not included in the calculated elapsed time. Therefore, this did not impact the test results.

Exhibit 6: Process Improvements Not Available at Our Time of Testing

Process Area	Proposed Process Initiatives Not Tested or Observed	As Tested	Impact
Planning and Prewire; Cut over	An online status tool will provide the CLEC with visibility to their orders (start/completion of batch, Jep Status, etc.). The tool will sweep WFA for changes in order status. The website will be updated automatically. The CLECs will have the responsibility of monitoring the website for the status of their orders on Due Dates that they have orders.	The online status tool was not available during the preliminary live trial. Qwest communicated to the CLECs using a work around solution to monitor changes in WFA status. E-mails were automatically generated and sent to the CLEC to communicate status.	This BHC process improvement will significantly reduce the manual time in the QCCC because the phone calls to the CLEC to alert of the hot cut will be removed.
Cut Over	The CLECs will use the Trap/Trace functionality on their switch to identify when Qwest is performing ANI tests. On Due Date, Qwest will perform this test at the beginning of the BHC process. The CLEC will then have visibility that the BHC has started. The CLEC will also know the BHC is completed when it sees that the ANI tests have stopped.	The COT "completed" one TN in WFA – DI after the first line in the batch was cut. Qwest automatically generated an e-mail to the CLEC based on this status change. The e-mail stated the batch had started. After the last hot cut of the batch was completed, the COT "completed" a second TN in WFA – DI. Again, Qwest automatically generated an e-mail notifying the CLEC that the batch was complete.	The time for this activity was included in the elapsed time. A change to the Trap/Trace method will reduce the time required to perform the BHC because the COT will not have to stop working and update WFA – DI. Additionally, the CLECs would benefit from this proposal because they would have real-time visibility into the progress of the cut. The CLECs would be able to begin porting customer numbers more rapidly.

• Products – 24 UNE-P to UNE-Loop and 1 Resale to UNE-LOOP	• Products – 25 UNE-P to UNE-Loop

Reference	Details
Note 1	**Pending Order Activity:** An LSR fell out of the automated flow-through process due to order activity on the account. Order activity on an account causes the LSR to be routed to the "Submitted" queue of the IMA system where an SDC will pick up the LSR for manual handling. The pending order is reviewed to ensure that it is not associated with the same lines.
Note 2	**QCCC Auto-flow through:** QCCC noticed that Qwest was using a Universal Digital Channel Unit (UDC) which allows multiple customers on one line. Refer to Glossary for a definition of UDC. The problem with this arrangement is that it can not be shared between a CLEC and an ILEC. This resulted in a dispatch out and the issue was resolved before Due Date. Additionally, there was a facilities exception whereby a new facilities assignment was made by the system. This issue was caught and resolved by the LRAC.
Note 3	**Time required to complete process steps:** The time represented here reflects the elapsed time to complete all work steps in the CO. The time to close out the first order in WFA is included in the "lift and lay" measurement. Times for the review of the spreadsheet at the commencement of the work in the CO (7 minutes) and the updating of WFA (18 minutes) at the completion of the BHC were taken from the second round live trial as they were not recorded in the preliminary trial and can be viewed in detail in the section of the report titled "Test Results".
Note 4	**CNUM Exception:** This issue was caused by a CNUM database error. Please refer to our glossary for a definition of CNUM database. Currently, TNs and their attributes are extracted from SWITCH and loaded into CNUM. Because of this conversion there are some database issues which resulted in a CNUM error on our service orders. The addresses and numbers are re-validated and updated when a CNUM error occurs. These errors can typically be corrected automatically. If not, then a group that oversees the CNUM database works to correct the error.
Note 5	**QCCC Auto Flow Through:** Facilities Exceptions: There were four exceptions. Three exceptions were caught by the QCCC who in turn notified the LPC to resolve the issues. The fourth exception was resolved by the LRAC before the QCCC could notify the LPC. Line Short: One line experienced a line short. A line short is an electrical fault that renders the line inoperable (another type of fault is an open circuit). A dispatch out was triggered by the QCCC which generated a trouble ticket. The issue was resolved by the due date.

Exhibit 10: Testing Summary: Preliminary Live Trial

Note 6	**CO Elapsed Times:** The following factors contributed to the elapsed time: • A significant delay of approximately two hours caused by the incorrect sorting of the spreadsheet used on due date for trial 1. This had no impact on customer service as the issue was identified before performing the "lift and lay". The total impact on elapsed time was approximately 2 hours. The potential human error has been eliminated from the process by making the sort an automated process. • The presence of many observers may have caused disruption to the test process in some cases. • COTS were not properly trained on all the changes in tasks and procedures resulting from BHC, requiring COTs to repeatedly seek instructions from their supervisors. • Routine breaks taken by the COTs are included in the elapsed time.

Overall Observations	*CO #3*	*CO #2*
• Service Delivery ▪ 17 LSR's (Centrex) fell out for manual handling ▪ Average resolution time was **46 min** ▪ Range of resolution time was **8 min to 2 hrs 1 min** • Automatic Flow-Through: - Service Delivery: 26/52 (Centrex were the exceptions) - LPC: 52/52 - Design Services: 52/52 - QCCC: 52/52 • Commitments Met: 52/52 • Products ▪ 26 UNE – P to UNE – Loop ▪ 26 Centrex	• Central Office: (Note 1) - Time required to complete DVA process steps: **1 hr 22 min** - Elapsed time (DVA): **1 hr 31 min** - Time required to complete Due Date process steps: **54 min** - Elapsed time (Due Date): **1 hr 17 min** • Commitments Met: 26/26 • Products – 26 UNE-P to UNE-Loop • CLEC Notification (Note 3): - BHC Start: **5:17 AM** - BHC Stop: **7:15 AM**	• Central Office: (Note 1) - Time required to complete DVA process steps: **1 hr 56 min** - Elapsed time (DVA): **2 hr 3 min** - Time required to complete Due Date process steps: **1 hr 11 min** - Elapsed time (Due Date): **1 hr 11 min** • Commitments Met: 26/26 • Products – 26 Centrex • CLEC Notification: - BHC Start: **3:41 AM** - BHC Stop: **4:15 AM**

Exhibit 11: Testing Summary: Second Round Live Testing

Reference	Details
Note 1	**PDF DT Checks were not performed:** The PDF could not be tested at CO #3 because they have a "COSMIC 2" frame. At CO #2 the PDF could not be tested due to having a conventional frame. These two types of frames have the PDF integrated with the MDF and, thus, there is no access to singular PDF test.
Note 2	**Notification of Start of migrations delayed:** The CORAC had not loaded the orders into WFA-C the night before, so the COTs could not input the information into the system and, thus, updated the OSSLOGs only. Because the tickets had not been loaded, the CLEC was not notified about the start of the test. The issue was addressed at 4:55am and the tickets were loaded into WFA-C. The COTs were able to then begin updating WFA-C at 5:00am and finished updating all information at 5:17am.
Note 3	**CLEC Notification:** The WFA – DI steps had not been loaded into the Central Office, which meant that the COT's had to wait until the problem was resolved before they could update the orders. This resulted in a delay in the CLEC notification of the BHC start. Since the system looks for changes in 30 minute time period and because all the updates were made in less than 30 minutes, the ending e-mail was not sent out at the correct time. The ending e-mail time shown is when the actual e-mail was sent manually after this problem was realized in the QCCC.
	Time Intervals: Due to time constraints, we were unable to test a seven day interval. We tested a five day interval which allowed us to do the separate DVA and Due Date steps.

Re: Case No. PU-439-03-295
Local Competition Investigation

Responses to Preliminary Discovery Requests

Dear Executive Secretary:

Thank you for contacting me on this issue.

On January 15, 2004, Integra Telecom of North Dakota, Inc. submitted a Public Version and a Non-Public Version of Responses to the Staff's Data Requests. In its cover letter, Integra intended to apply Trade Secret protection for certain information submitted in a separate marked envelope. If Integra's application for Trade Secret protection of the information enclosed in the sealed envelope was not sufficient as an application for such protection, Integra Telecom of North Dakota, Inc. respectfully withdraws the Trade Secret filing and requests that the Commission immediately return or destroy such information.

Integra will submit another application for Trade Secret protection.

Please advise if the Commission requires a more formal application.

Sincerely,

Karen J. Johnsen
Corporate Regulatory Attorney

Public Service Commission Local Competition Investigation	Case No. PU-439-03-295

QWEST RESPONSE TO SECOND LETTER REQUEST OF INDEPENDENT LOCAL EXCHANGE COMPANIES

By letter dated January 19, 2004, the Rural Telephone Group ("RTCG") requested the Public Service Commission to limit discovery requests from MCI and Qwest so only rural ILECs providing "Qualified Services," consistent with the Commission's Order of January 14, 2004 regarding discovery served by the Commission, would be required to respond to MCI and Qwest's discovery requests.

Qwest objects to the RTCG request to the extent a rural ILEC is affiliated with a CLEC that provides "Qualified Services" in a Qwest exchange. The RTCG members, which are parties to this proceeding and subject to discovery, should be required to answer Qwest's discovery requests to the extent they are providing Qualified Services by themselves or through affiliate CLECs. The definitions in Qwest's discovery specifically state that information is requested not only for the responding party but also its affiliates.

Alternatively, if the Commission grants Qwest's pending motion for the Commission to issue Information Requests to nonparty CLECs, then Qwest does not object to the RTCG request that only ILECs providing Qualified Services respond to the Qwest discovery.

Dated this 22 day of January, 2004.

Respectfully submitted,

Daniel S. Kuntz (ID #03490)

Case No. PU-439-03-295

ORDER
January 16, 2004

On January 15, 2004, the "Parties" (Qwest, MCI, and Covad) filed a Joint Motion for Extension of Batch Hot Cut Direct Testimony Filing Date ("Joint Motion"), jointly requesting an extension of the filing date for the Batch Hot Cut Process direct testimony from Tuesday, January 20, 2004, to Friday, January 23, 2004. The Parties represent that after consultation no other participants in the Batch Hot Cut Forum have expressed any objections to the requested extension and modification, and further represent that these changes will not create any delays in the resolution of this docket. The Parties request this extension only to delay the filing of opening testimony until January 23, 2004, to allow for more time for review of recently available materials and for adequate preparation of opening testimony.

Being aware of no objections, considering the limited nature and timing of the request, and accepting the representations made, there appear to be no reasons not to grant the motion.

Accordingly, the Public Service Commission orders that the Joint Motion is GRANTED. The filing date for the Batch Hot Cut Process direct testimony is extended to Friday, January 23, 2004.

Case No. PU-439-03-295

AN APPLICATION REQUESTING TRADE SECRET PROTECTION

AT&T Communications of the Midwest, Inc. ("AT&T"), pursuant to Chapter 69-02-09 of the North Dakota Administrative Code, requests the North Dakota Public Service Commission issue a protective order limiting the disclosure of trade secret information included in AT&T's responses to the Commission's Discovery Requests in this proceeding.

Copies of the discovery responses containing the trade secret information have been appropriately marked and sealed.

1. General description of the nature of the information sought to be protected.

1. AT&T's confidential response to discovery request A-1 and the attachment to discovery responses A-1, A-4 and A-6 entitled AT&T ND Confidential Switches, which provide switch data for AT&T's switches serving North Dakota customers.

2. AT&T's confidential response to discovery request B-7 regarding whether or not the local switching capacity of AT&T's switches can be expanded through modular software and hardware additions.

3. The attachment to discovery responses A-2 and A-3 entitled AT&T ND Highly Confidential ADL Customer Lines.

2. Explanation of why the information derives independent economic value, actual or potential, from not being generally known to other persons.

The information for which AT&T seeks trade secret protection is confidential and proprietary information regarding AT&T's services, customers and facilities. Competitors that have access to this information could use it to disadvantage AT&T, its customers, and competition in North Dakota.

3. Explanation of why the information is not readily ascertainable by proper means by other persons.

This information is not available to persons outside the company and is generally known only to employees who have a need to know or who are involved in the collection of the information. AT&T security guidelines and procedures protect the information from disclosure to unauthorized persons inside or outside of the company.

4. General description of the persons or entities that would obtain economic value from disclosure or use of the information.

Competitors of AT&T that provide similar services would obtain economic value from disclosure or use of the information.

5. Specific description of known competitors and competitors' goods and services that are pertinent to the information.

Competitors of AT&T in North Dakota include Qwest, MCI WorldCom, McLeod Telemanagement, Inc., Sprint Corporation, Integra Telecom of North Dakota, Inc., Midcontinent Communications, and other providers of telecommunications services in North Dakota.

6. Description of the efforts used to maintain the secrecy of the information.

See No. 3 above.

Respectfully submitted this 15th day of January, 2004.

Responses to Preliminary Discovery Requests

Dear Executive Secretary:

Please find enclosed for filing an original and seven copies of the Public Version of the Responses to Preliminary Discovery Requests for Integra Telecom of North Dakota, Inc.

In addition, Integra Telecom of North Dakota, Inc. is claiming Trade Secret Protection for some of the responses under NDAC Ch. 69-02-09, as set forth in the Response. In general, Integra claims that all requests related to revenue, customer services, customer location, service type and level identification, customer churn, switch and other investment costs is trade secret. We have detailed the specific Requests in our Responses.

Integra receives great economic benefit from this information in that it defines our company's development and growth. If known by any of our competitors, including Qwest, this information could be used for their own development, sales and marketing purposes and to the detriment of Integra.

This information is not publicly known. Integra is a privately-held company. This information is held strictly confidential by Integra and is not shared with third parties. This information is only shared as required by law or under strict confidentiality agreements solely for purposes of specific transactions. In addition, Integra does not give some of this information in the form or in the totality to any one party, as appearing in these responses.

Please find enclosed for filing one copy of the Non-Public Version of the

PUBLIC SERVICE COMMISSION LOCAL COMPETITION INVESTIGATION
CASE NO. PU-439-03-295

We are in receipt of the Commission's Order in this matter ordering that the rural ILECs are not required to respond to the Preliminary Discovery Requests unless they are providing Qualified Services.

Our inquiry of these rural ILECs indicates they are not providing Qualified Services as defined in the Commission's Order of January 14, 2004. Obviously, if we learn of information that causes us to believe that Qualifying Services are being offered, we will supplement the responses as required by the Rules of Civil Procedure.

We are in the process of reviewing a Proprietary Agreement that was distributed by Qwest yesterday. In the meantime, we wish to preserve objections for trade secret information disclosure in the event we should later need to supplement this response.

CASE NO. PU-439-03-295

Enclosed for filing in the above matter are responses to the Preliminary Discovery Requests on behalf of Polar Telcom, Inc., and Daktel Communications, L.L.C., two CLECs with Qualifying Services in Qwest service areas. We have also included our Affidavit of Service by Mail.

Please note that we erroneously included Dakota Central Telecom I as the entity in this matter and we hereby move the Commission to substitute Daktel Communications, L.L.C., for Dakota Central Telecom I in this matter since Daktel is the real party in interest.

We are reviewing the Qwest proposal for handling confidential information and will supplement our responses as soon as this issue is resolved.

APPLICATION FOR TRADE SECRET PROTECTION

Pursuant to 69-02-09-01, North Dakota Administrative Code, Midcontinent Communications ("Midcontinent") hereby makes application for trade secret protection for its responses to Requests C.1 and C.2 of Questions to both CLECS and ILEC - Switching and Response 6 to Requests for Information Regarding the Development of an Efficient Loop Migration Process of Midcontinent Communications Response to Preliminary Discovery Requests QWEST ROC State TRO Proceedings October 31, 2003. In support of this application, Midcontinent states as follows:

1. The information sought to be protected is information contained in Midcontinent Communications Response to Preliminary Discovery Requests QWEST ROC State TRO Proceedings October 31, 2003.

2. The information sought to be protected derives independent economic value from not being generally known to other persons because it is proprietary information concerning Midcontinent's customers and costs of providing services to Midcontinent's customers.

3. The information sought to be protected is not readily ascertainable by proper means by other persons because it is not public or published data. The information is confidential proprietary information of Midcontinent.

4. Entities that would obtain economic value from disclosure of the information sought to be protected include the CLECS and ILECS who are parties to this proceeding.

5. The confidentiality of the information sought to be protected is maintained by limiting access to the data to employees of Midcontinent who have need for the information in their duties.

NORTH DAKOTA
PUBLIC SERVICE
COMMISSION
EXECUTIVE SECRETARY

STATE OF NORTH DAKOTA
PUBLIC SERVICE COMMISSION

Public Service Commission)
Local Competition Investigation) **Case No. PU-439-03-295**

MCI APPLICATION FOR TRADE SECRET PROTECTION

MCI WorldCom Communications Inc. and MCImetro Access Transmission Services LLC (collectively "MCI") by and through its undersigned counsel applies to the Public Service Commission ("PSC") for an Order granting trade secret protection to certain highly confidential information which is responsive to PSC preliminary discovery requests nos. C1. (average total monthly revenues per line), B6 (relating to numbers of residential lines), B9 (relating to churn rates for residential customers), B10 (regarding residential acquisition costs), B11 and B12 (regarding churn rates), B13 (regarding residential customers that subscribe to each rate plan), and B14(regarding per-minute usage plans) and set forth on the spreadsheet which is included in the attached envelope marked" **TRADE SECRET- PRIVATE".**

This motion for protective order is made in accordance with the provisions of N.D.C.C. 47-25.1-01 et seq., N.D.C.C. 44-04-18.4, Rule 507, N.D. R. Evid. and, N.D.A.C. Ch. 69-02-09, Trade Secret Procedures.

1. General Description of Information for which Protection is Sought.

The information for which MCI seeks protection responds to PSC discovery requests in the captioned proceeding. As described above, it discloses the number of residential lines which MCI has in North Dakota, its monthly revenues for those lines, the

costs to acquire those lines and customers, subscribers to each rate plan, its usage plans and churn rates for MCI's North Dakota residential customers.

2. Independent Economic Value.

Information for which trade secret protection is sought has independent economic value to MCI's competitors in North Dakota and elsewhere because it discloses the level of penetration which MCI has had into the North Dakota market, valuable information about the terms and conditions of plans which it offers to attract and retain North Dakota residential customers, the costs it has incurred in order to attract customers in North Dakota, and the success it has achieved in retaining customers once they have switched to MCI residential service. These are primary factors which are considered by telecommunications companies when they consider entering, remaining, or exiting a market and can be used to accurately estimate the current and future profitability of MCI's operations in North Dakota and by extension, the best methods by which to compete with MCI for North Dakota residential customers. This information can be used as part of the process of determining and evaluating MCI's business plans and strategies and the revenue and expense associated with different lines of businesses. The information has independent economic value in a competitive market place and MCI would suffer irreparable and unfair economic or competitive damage if the information is available to competitors or the general public and for their use. Unprotected access to the information would give MCI's competitors an advantage in the event MCI's competitors sought to provide equivalent services to similar customers because it would allow competitors to adjust their rate plan pricing in certain locations in the market. This would be a competitive advantage that would not exist, but for public access or disclosure.

Therefore, the number, type and location of customers by rate plans as well as their churn rates are highly confidential, trade secret, proprietary, commercial and financial information for MCI.

3. Lack of Public Access.

Information of the nature set forth on the spreadsheet which is in the envelope marked "Trade Secret- Private" is not public and is highly guarded by MCI from disclosure to any person who is not an authorized employee of the company or working directly on its behalf. The information is not disclosed by MCI in public filings and is not readily ascertainable by proper means. The information is available within the company only in secure databases which are accessible only to a limited number of authorized employees. Those employees are not given access to the information without first having undertaken an express obligation to maintain its confidentiality and to restrict its use for MCI purposes exclusively.

4. Persons To Whom The Information Has Independent Economic Value.

Because it is not now known or accessible outside MCI, the information would be of independent economic value to Qwest, CLECs which are now providing service in North Dakota (irrespective of their status as interveners in this proceeding), non-CLEC providers of telecommunications services in North Dakota and any person who is considering entering the North Dakota residential telecommunications service market. Such information allows MCI to make decisions regarding efficient deployment of its network in a competitive environment. MCI's competitors would obtain substantial economic value if such information was available to them.

5. Specific Description Of Competitors and Competitive Services.

Known competitors to which the information would have independent economic value include each party/intervenor to this captioned proceeding and every other company which is currently providing residential telecommunications services in North Dakota or considering the provision of such services in North Dakota, irrespective of their intervention in this proceeding. Protection of this information plays a vital role in MCI's continued growth and in its ability to compete.

6. Efforts Used To Maintain Secrecy of this Information.

MCI maintains internal security and barriers to prevent access to this information by unauthorized persons, including MCI employees who have not received clearance to access it. In proceedings such as these, MCI has disclosed the information only when compelled to do so by legal process, under a protection order, and, additionally, only to persons who have executed a non-disclosure agreement on terms acceptable to MCI.

PUBLIC SERVICE COMMISSION

Public Service Commission Local Competition Investigation	))	Case No. PU-439-03-295

AN APPLICATION REQUESTING TRADE SECRET PROTECTION

Qwest Corporation ("Qwest") requests the North Dakota Public Service Commission, pursuant to Chapter 69-02-09 of the North Dakota Administrative Code, to issue a protective order limiting the disclosure of trade secret information provided by Qwest in response to Discovery Requests served by the North Dakota Public Service Commission in this investigative proceeding.

The trade secret information has been appropriately marked and is submitted in a sealed envelope with this filing.

1. General Description of the Nature of the Information Sought to be Protected.

The information sought to be protected is:

A. Confidential Attachment A to Qwest's response to Switching Request A-14 (Qwest 14) provides summary information about Qwest's residential and business customers, and the revenues gained by serving those customers.

B. Confidential Attachment A to Qwest's response to Switching Request A-15 (Qwest 15) describes costs of switches purchased by Qwest from 1999 to the present and initial line counts for those switches.

C. Confidential Attachment A to Qwest's response to Switching Request A-17 (Qwest 17) describes each Qwest switch in North Dakota and its capabilities.

D. Confidential Attachment A to Qwest's response to Loop Migration Request A-14 (Qwest 31) describes the number of Qwest technicians trained and capable of transferring a line from an ILEC switch to the CLEC facility as a part of the hot cut process.

E. Confidential Attachment A to Qwest's response to Loop Migration Request A-18 (Qwest 35) describes the staffing arrangements for North Dakota wire centers, and the dispatching central office locations from which roving technicians would be sent.

2. An Explanation of Why the Information Derives Independent Economic Value, Actual or Potential, From Not Being Generally Known to Other Persons.

Confidential Attachment A to Qwest's response to Switching Request A-14 (Qwest 14) provides summary information about Qwest's residential and business customers including revenues gained by serving those customers. This information is confidential and proprietary to Qwest and is not publicly disclosed. In a competitive telecommunications marketplace, this type of information is highly sensitive and its public disclosure would place Qwest at a competitive disadvantage. If disclosed, publicly, the information would disadvantage Qwest as the information reflects specifics regarding Qwest's revenue information it is not required to disclose in public reports, and information about customers and customer revenues that is confidential to both Qwest and its customers.

Confidential Attachment A to Qwest's response to Switching Request A-15 (Qwest 15) describes the costs of switches purchased by Qwest from 1999 to the present and initial line counts for those switches. This information is confidential and proprietary to Qwest and is not publicly disclosed. In a competitive telecommunications marketplace, this type of information is highly sensitive and its public disclosure would place Qwest at a competitive disadvantage. If disclosed publicly, this information would disadvantage Qwest as the information is an important part of Qwest's cost and network structure and provides information about the location and services available to its North Dakota customers.

Confidential Attachment A to Qwest's response to Switching Request A-17 (Qwest 17) describes Qwest's switches in North Dakota and their capabilities. This information is confidential and proprietary to Qwest and is not publicly disclosed. In a competitive telecommunications marketplace, this type of information is highly sensitive and its public disclosure would place Qwest at a competitive disadvantage. If disclosed publicly, this information would disadvantage Qwest as the information is an important part of Qwest's cost and network structure, and provides information about the location and services available to its North Dakota customers.

Confidential Attachment A to Qwest's response to Loop Migration Request A-14 (Qwest 31) provides information regarding Qwest's technicians and their training. This information is confidential and proprietary to Qwest and is not publicly disclosed. In a competitive telecommunications marketplace, this type of information is highly sensitive and its public disclosure would place Qwest at a competitive disadvantage. If disclosed publicly, this information would disadvantage Qwest as it provides a view into Qwest's management, staffing, and cost structures.

Confidential Attachment A to Qwest's response to Loop Migration Request A-18 (Qwest 35) describes the staffing arrangements for North Dakota wire centers and dispatching central office locations. This information is confidential and proprietary to Qwest and is not publicly disclosed. In a competitive telecommunications marketplace, this type of information is highly sensitive and its public disclosure would place Qwest at a competitive disadvantage. If disclosed publicly, this information would disadvantage Qwest as it provides a view into Qwest's management, staffing and costs structures.

3. An Explanation of Why the Information is Not Readily Available by Proper Means to Other Parties.

The information at issue is proprietary to Qwest and is available only to those employees and representatives of Qwest who have a need to know the information to perform their duties and responsibilities. Qwest does not disclose this information outside the company except pursuant to the terms of strict agreements or orders to maintain the confidentiality of the information.

4. The General Description of the Persons or Entities that Would Obtain Economic Value from Disclosure or Use of the Information.

Competitors or potential competitors of Qwest would obtain economic value from disclosure or use of the information.

5. Specific Description of Known Competitors or Competitor's Goods and Services that are Pertinent to the Information.

Competitors and potential competitors of Qwest in North Dakota include AT&T, McLeod Telemanagement, Inc., MCI WorldCom, Consolidated Communications Network, Sprint Corporation, IdeaOne Telecom Group and any other provider of telecommunications services in North Dakota or any of the other states in which Qwest operates.

6. Description of the Efforts Used to Maintain the Secrecy of the Information.

See No. 3 above.

Dated this 15th day of January, 2004.

Respectfully submitted,

By: _____

Public Service Commission **Local Competition Investigation**	**Case No. PU-439-03-295**

MOTION TO ISSUE INFORMATION REQUEST

Qwest Corporation ("Qwest") pursuant to the workshop held in this proceeding on November 24, 2003, moves the Commission to issue the Information and Document Requests submitted as Attachment 1 hereto to all Competitive Local Exchange Carriers ("CLECs") certified or registered to provide local exchange telecommunications service in North Dakota and which have not intervened as parties in this proceeding. The Information and Document Requests are necessary to obtain needed information from these nonparty CLECs so the Commission may properly consider and determine the issues in this proceeding. The Information and Document Requests are drafted to impose only a minimal burden on those nonparty CLECs that do not own, control, maintain or lease switching capacity for the provision of CLEC telecommunications services in North Dakota.

Dated this 15th day of January, 2004.

INFORMATION AND DOCUMENT REQUESTS TO NORTH DAKOTA CLECS FOR TRIENNIAL REVIEW PROCEEDINGS

The North Dakota Public Service Commission requests that you respond under oath to the following information and document requests within thirty (30) days hereof and requests that the requested documents be filed at the offices of the North Dakota Public Service Commission, thirty (30) days after this request. Your answers and responses must include all information available to you, and also available to your agents, attorneys, or others who have information available to you upon your inquiry to them.

INSTRUCTIONS

Please answer each request separately and in the order that it is asked. Following each answer, please identify the person or persons responsible for the answer and indicate what person or witness provided responsive information or documents.

In response to requests seeking the production of documents, please produce copies all responsive documents as they are kept in the usual course of business and organize and label them to correspond to the categories in this request. If the requested documents are kept in an electronic format, you should produce the requested document in such format. If any part of a document is responsive to any request, the whole document is to be produced. If there has been any alteration,

modification or addition to a document (whether in paper form or electronic), including any marginal notes, handwritten notes, underlining, date stamps, received stamps, attachments, distribution lists, drafts, revisions or redlines, each such alteration, modification or addition is to be considered as a separate document and it must be produced.

Please produce the requested information at the most granular level you possess. If a request seeks information at a level more granular than you possess, state that you do not possess information at that level and produce the information requested at the most granular level that you possess. The North Dakota Public Service Commission is not asking for the creation of new data, but is seeking all available data for the specific categories and sub-categories described. If you are unable to respond fully and completely to a document request, explain the reasons why you are unable to do so.

The requests are directed to all documents and information in your possession, custody or control. A document is deemed to be in your possession, custody or control if you have possession of the document, have the right to secure such document or communication from another person having possession thereof, or the document or communication is reasonably available to you including those documents or communications in the custody or control of your company's present employees, attorneys, agents, or other persons acting on your behalf and your affiliates. In response to requests for production of documents, you shall produce the documents, including all appendices, exhibits, schedules, and attachments, that are most relevant to the request.

If you are unable to produce a document or information based on a claim that the document is not in your possession, custody or control, state the whereabouts of such document or information when it was last in your possession, custody or control, and provide a detailed description of the reason the document is no longer in your possession, custody or control, and the manner in which it was removed from your possession, custody or control.

These information requests are continuing in nature, and should there be a change in circumstances within the next nine (9) months which would modify or change an answer you have supplied, then in such case, you should change or modify such answer and submit such changed answer as a supplement to the original answer. Further, should a subsequent version(s) of a document be created or exist after the date of this information request, such version(s) must be produced. Where prior versions or drafts of documents exist, please produce all such documents in your possession, custody or control.

If you claim a privilege, or otherwise decline to produce or provide any document or information responsive to one or more information requests, then in addition to, and not in lieu of, any procedure that you must follow under law to preserve your objection(s) and/or privilege(s), the person asserting the privilege shall:

a. identify in the objection to the request for information, or sub-part thereof, detailed reasons for your claim of privilege or other basis for protecting the document or information from disclosure; and the nature of the privilege that is being claimed; and

b. provide the following information in the objection, unless divulgence of such information would cause disclosure of the allegedly privileged information:

(i) for documents: (1) the type of document; (2) subject matter of the document; (3) the date of the document; (4) the number of pages in the document; (5) the location or custodian of the document; (6) such other information as is sufficient to identify the document for a subpoena *duces tecum*, including, where available, the names(s), address(es) and telephone number of the author(s) of the document and all recipient(s), and, where not apparent, the relationship of the author and addressee to each other;

(ii) for oral communications: (1) the name(s), address(es) and phone number(s) of the person making the communication and the name(s), address(es) and phone number(s) of the persons present while the communication was made; (2) the relationship of the person(s) present to the person(s) making the communication; (3) the date and place of each communication; (4) the general subject matter of the communication.

Confidential documents should be filed with a trade secret application in this proceeding to prevent disclosure under North Dakota open records laws.

DEFINITIONS

1. The terms "and" and "or" as used herein shall be construed as both conjunctive and disjunctive.

2. The term "any" shall be construed to include "all," and "all" shall be construed to include "any."

3. The acronym "CLEC" refers to competitive local exchange carriers.

4. The acronym "CLLI" refers to common language location identifier, a multi-character code generally composed of numerals and letters that provides a unique identifier for circuit switches used by incumbent local exchange carriers ("ILECs") and CLECs.

5. The term "customer location" refers to a building or set of connected, contiguous, or adjacent buildings in a common area, used by residential, commercial, and/or governmental customers that share a primary street address or group of street addresses. It includes multi-unit residential, commercial, and/or governmental premises.

6. The term "digital" refers to electrical or optical signals representing sound or data which are transmitted in a binary, discontinuous, non-linear format.

7. The term "DLC" refers to Digital Loop Carrier and includes UDLC, IDLC, and NGLDC.

8. The term "DS-0" refers to a loop or circuit operating at Digital Signal Level Zero, and capable of transmitting information at 64 kilobits per second.

9. The term "DS-0/voice grade" includes all loops or circuits normally used for the provision of a service to transmit human voice alone. In particular, it includes analog circuits and digital circuits capable of transmitting at levels greater than 2400 baud, up to and including 64 kilobits per second.

10. The term "DS-1" refers to Digital Signal Level 1, which has a transport speed of 1.544Mbps, and can be either unchannelized or channelized into 24 voice grade channels.

11. The term "hot cut" refers to an individual coordinated simultaneous transfer of a DS-0/voice grade loop with live customers' service transferred.

12. The term "LATA" means "Local Access and Transport Area" as that term is defined in the *Modification of Final Judgment, United States v. Western Elec.*

Co., 552F. Supp. 131 (D.D.C. 1982), *aff'd sub nom., Maryland v. United States,* 460 U.S. 1001 (1983).

13. The past tense includes the present tense and vice-versa.

14. The singular form of a word shall be interpreted to include the plural, and the plural form of a word shall be interpreted to include the singular whenever appropriate.

15. The term "wire center" is synonymous with the term "central office," and refers to the single physical building that houses one or more Class 5/end office switch(es) and in which end user customer's loops are cross connected to the Class 5/end office switch(es).

INFORMATION AND DOCUMENT REQUESTS

1. Do you own, control, or maintain a switch, or lease dial tone or trunking functionality/capacity in a switch from a party other than Qwest, used by you to provide local exchange telecommunications services as a competitive local exchange carrier ("CLEC") to customers in North Dakota? If your answer is "yes," please answer the remaining Information and Document Requests. If your answer is "no," simply return these Information and Document Requests with your answer; you do not need to answer the remaining Requests.

2. Please identify all switches owned or controlled by you that are being used to provide service to customers in North Dakota served by facilities at or above the DS-1 level. For each switch that you identify, please identify the type (e.g., 5ESS and 4ESS) and describe the "footprint" of the switch, meaning the geographic area that the switch is capable of reaching. Separately, please provide the same information for customers served by DS-0 loop facilities.

3. For each switch that you identify in response to Request No. 2, please provide the capacity of the switch, with "capacity" defined as: (1) the number of lines installed; (2) the number of lines currently in use; (3) the number of trunks installed; and (4) the number of trunks currently in use. In addition, for each switch that you identify, please provide the generic (feature package) loaded in the switch.

4. Please state whether the information in the LERG is current and accurate for the switches that you own, operate, control, or maintain, or from which you lease dial tone or trunking functionality/capacity, to serve customers in North Dakota. If any of the information is not accurate, please identify the inaccurate information and provide corrected information, including any additions, deletions or changes. As part of your review of the information in the LERG, please state whether the CLLI code is accurate for each switch that you own, operate, control, or maintain, or from which you lease dial tone or trunking functionality/capacity. In addition, please state whether the LERG definition of the function of each switch (i.e., tandem, end office, etc.) is accurate.

5. Please report (in Excel spreadsheet format) the number of DS0 level business lines in North Dakota served by unbundled loops for which you provide switching dial tone functionality. In responding to this request, please separate loop facilities by the categories set forth in the following table:

Sample Response Form							
State	Wire Center	Residential			Business		
		# DS0-1 lines served via your facilities	# DS0 lines served via Qwest leased facilities	# DS0 lines served via facilities leased from third party	# DS0 lines served via your facilities	# DS0 lines served via Qwest leased facilities	# DS0 lines served via facilities leased from third party

6. For each LATA and wire center in which you provide local telecommunications services in North Dakota, please identify the number of in-service lines that are:

i. UNE-P Business;

ii. UNE-P Residence;

iii. UNE-L Business;

iv. UNE-L Residence;

v. Business lines provided using the your own loop facilities and another party's dial tone (switching);

vi. Business lines provided using your own loop facilities and own dial tone;

vii. Business lines using a third party's loop facilities and your own dial tone;

viii. Residential lines provided using your own loop facilities and another party's dial tone;

ix. Residential lines provided using your own loop facilities and own dial tone;

x. Residential lines using a third party's loop facilities and your own dial tone;

xi. For any residential and business lines served in any manner not listed above, in what manner are those lines served?

7. For each Qwest wire center in North Dakota in which you provide retail switched local exchange service, please report the number of switched DS-0 level lines in service per customer location that you serve. Please provide this information in the following format:

WIRE CENTER

	Customer Location	
Quantity of DSO Lines	Residence	Business
1		
2		
3		
4		
5		
6		
7		
8		
9		
10		
11		
12		
13		
14		
15		
16		
17		
18		
19		
20		

For example, if you currently serve 100 single line residential customers and 200 2 line business customers in the wire center, show "100" in the residential column on the Quantity line of "1", and "200" in the business column on the Quantity line of "2."

8. Please provide the average total revenue per line that you received from your residential customers within North Dakota in 2001 and 2002. The average revenue per

line should include revenues associated with the basic retail price charged to residential customers, vertical features, universal service payments, interstate access charges, intrastate access charges, subscriber line charges, toll, long distance, local number portability, and line revenues derived from any other sources. Please provide both the total average revenue per line and a breakdown of the amount of revenue for each category of revenue that comprises the total. Please produce all documents that reflect, refer or relate to the information provided in your response to this request.

9. Please provide the average total revenue per line that you received from your business customers within North Dakota in 2001 and 2002. The average revenue per line should include revenues associated with the basic retail price charged to business customers, vertical features, universal service payments, interstate access charges, intrastate access charges, subscriber line charges, toll, long distance, local number portability, and line revenues derived from any other sources. Please provide both the total average revenue per line and a breakdown of the amount of revenue for each category of revenue that comprises the total. If revenues differ depending on the type of business customer (small vs. large), please provide the total revenues and the breakdown of revenues by type of business customer. Please provide the information by POTS, DS0, DS1, DS3, OC-3, OC-12, OC-48, and any other relevant categories. Please produce all documents that reflect, refer or relate to the information provided in your response to this request.

10. Please explain how you define your business customer segments and provide any documents that reflect this definition or the criteria you use to segment or classify

business customers into distinct customer groups. Please produce all documents that reflect, refer or relate to the information provided in your response to this request.

11. Please provide the average total cost per line that you incurred in 2001 and 2002 for lines used to serve residential customers within North Dakota. These costs should include costs associated with switching; loops; collocation; transport; hot cuts; operational support systems ("OSS"); signaling; customer acquisitions; backhauling traffic to your switches; maintenance, operations, and other administrative activities; and capital costs. If available, please provide a breakdown of this information for the following categories: (1) service provided by UNE-P, (2) service provided by UNE-L, and (3) service provided using your own facilities. In addition, please provide any available breakdowns of each cost component that is part of the average total cost per line, identifying the type and amount of each cost. Please produce all documents that reflect, refer or relate to the information provided in your response to this request.

12. Please provide the average total cost per line that you incurred in 2001 and 2002 for lines used to serve business customers within North Dakota. These costs should include costs associated with switching; loops; collocation; transport; hot cuts; OSS; signaling; customer acquisitions; backhauling traffic to your switches; maintenance, operations, and other administrative activities; and capital costs. In addition to a total average cost, please provide separate averages for service provided through UNE-P, UNE-L, and with your own facilities. Please provide a breakdown of each cost component that is part of the average total cost per line, identifying the type and amount of each cost. If costs differ depending on the type of business customer (small vs.

large), please provide the total cost and the breakdown of costs by type of business customer. Please produce all documents that reflect, refer or relate to the information provided in your response to this request.

13. Please identify the monthly churn rate you experienced for local exchange customers in each month in which it has provided local exchange service in the North Dakota market. In answering this request, you should calculate the churn rate based upon the number of lines lost each year divided by the average number of lines in service that year. In calculating churn, do not include customers who move but stay with the company. Please produce all documents that refer or relate to the information you provide in response to this request.

14. In connection with your churn rates in North Dakota for the most recent 24 months that are available for local exchange customers, of the total customers that have left you, please identify the percentage that have left within one month of signing up for service, within two months of signing up for service, within three months of signing up for service, and within six months of signing up for service. Please produce all documents that refer or relate to the information you provide in response to this request.

15. Please identify each rate plan that you offer to local exchange customers in North Dakota. In addition, please identify the percentage of your total local exchange customers in North Dakota that subscribe to each plan that you identify. Please produce all documents that reflect, refer or relate to the information you provide in response to this request.

16. For rate plans identified in Response No. 15 that include a per minute of use component, please provide the average long-distance per minute usage in North Dakota of your local exchange customers who subscribe to such plans for the most recent 24 months available. Please produce all documents that reflect, refer, or relate to the information you provide in response to this request.

Re: Local Competition Investigation -- Case No. PU-439-03-295

Dear Mr. Mielke:

Enclosed for filing are the original and seven copies of a Joint Motion for Extension of the filing date for Batch Hot Cut direct testimony. By this motion, Qwest and the other moving companies request an extension of the filing date for the Hot Batch Cut process direct testimony from Tuesday, January 20, 2004 to Friday, January 23, 2004.

Also enclosed are the original and seven copies of the Notice of Filing of the Batch Hot Cut Forum Final Issues Matrix submitted by Qwest.

Please contact me if you have any questions regarding these filings.

Sincerely,

Daniel S. Kuntz

NOTICE OF FILING BATCH HOT CUT FORUM FINAL ISSUES MATRIX

In the Joint Motion for Adoption of a Batch Hot Cut Forum filed with this Commission on October 31, 2003, Qwest assumed the administrative role of documenting, at the conclusion of the Batch Hot Cut Forum (Forum) held by the parties, those issues the parties were able to close as well as those issues that remain at impasse concerning Qwest's proposed Batch Hot Cut proposal. Sessions of the Forum were held December 1-3, 2003, December 12, 2003, December 19, 2003 and January 6-8, 2004. Attached for the Commission's information is a copy of the Final Batch Hot Cut Issues Matrix which reflects the issues discussed during the Forum and notes whether those issues were closed or remain at impasse. The impasse issues will form the basis on which the parties will file their testimony concerning the Batch Hot Cut process.

Respectfully submitted this 15th day of January, 2004.

ATTORNEYS FOR QWEST CORPORATION

STATE OF NORTH DAKOTA
PUBLIC SERVICE COMMISSION

Public Service Commission Local Competition Investigation	Case No. PU-439-03-295

JOINT MOTION FOR EXTENSION OF BATCH HOT CUT DIRECT TESTIMONY FILING DATE

Qwest Corporation ("Qwest"), WorldCom, Inc., on behalf of its regulated subsidiaries ("MCI"), and DIECA Communications, Inc., D/B/A Covad Communications Company ("Covad"), (the "Parties) jointly request an extension of the filing date for the Batch Hot Cut Process direct testimony from Tuesday, January 20, 2004 to Friday, January 23, 2004.

The Parties request this extension to delay opening testimony until January 23, 2004, in order to allow the Parties an additional three calendar days to prepare opening testimony, and to ensure that the Parties have had sufficient time to review all the materials on the Forum website (http://www.qwest.com/wholesale/training/tradeshow/batchhotcutarchive.html). For example, as stated in the joint motion to initiate the Batch Hot Cut Forum ("Forum") the last face-to-face meetings were held from January 6-8, 2004. Complete transcripts for those meetings have not yet been completed and likely will not be posted on the Forum website before January 15, 2004. Because the last meetings were three days, it is expected that there will be about 500-600 pages of transcripts for the last face-to-face meeting based upon the number of pages in the first three day face-to-face meeting held in December 2003. Forum participants expect to cite to those transcripts in the opening round of testimony.

The Parties have consulted with the other participants in the Forum including AT&T, McLeod, Eschelon, and US Link by an e-mail sent to all persons on the Forum e-mail list and

can represent to this Commission that no Forum participant has expressed any objections to the requested extension and modification and that these changes will not create any delays in the resolution of this docket.

In the interest of making this filing on an expedited basis, the undersigned is authorized to state that MCI and Covad concur in this request and is further authorized to sign and file this pleading on behalf of MCI and Covad.

Respectfully submitted this 15th day of January, 2004.

FINAL BATCH HOT CUT PROCESS FORUM ISSUES MATRIX

PROCESS ISSUES - EFFICIENCY					
ISSUE #	**ISSUE DESCRIPTION**	**QWEST POSITION**	**CLEC POSITIONS**	**HISTORY**	**RESOLUTION/RATIONALE**
P-1 (see also P-10)	Method of Initiation of a Batch Hot Cut request	The Hot Cut process is initiated by the CLEC LSRs - See also, supplemental information in "History" column	a. CLECs should be able to initiate the batch via e-mail notification that would include Central Office, project date and time, number of customer accounts, and lines involved. Qwest would respond via e-mail with the project code and a confirmation of the date which would trigger the CLEC issuing its LSR. (AT&T p. 15) b. Clarify the timing for the pre-order negotiations with CLECs for submitting orders – how is the process kicked off? What is the interval for these negotiations? (MCI-Forum) In what release will the OSS modifications be included? (MCI – Forum)	1/6/2004 – Entering a "B" on the CHC Field on the LSR will identify the orders as being associated with a batch. Entering a "B" in that field will also drive CLECs to the scheduling tool where they will schedule a day for the batch to be cut. CLECs no longer a need to provide a Project ID number. This change will require OSS modifications – likely will be included in Release 16.0 (scheduled for Oct./Nov 2004)	1/6/2004: CLOSED. Qwest will modify an existing field on the LSR (the CHC field) to indicate a batch that will include reservation number and date – information will be included on FOC. If order is rejected, reservation is not lost if the order is resubmitted within the standard interval, the same reservation number can be used. Subject to OSS change that will be prioritized in the 16.0 Release and to the extent that this OSS change impacts other items in the 16.0 release, it will be addressed in CMP. 1/6/2004 - MCI agrees to CLOSE pending development and testing of the software change to ensure it works. 1/6/2004 - AT&T and McLeod agree to CLOSE. 1/6/2004 - Sub Issue P-1b CLOSED also as to the issue of pre-order negotiations. MCI

**NOTE: Shaded items are closed issues.

					agrees to close subject to development and testing of the software change and successful negotiation of a transition plan.
P-2	Project Identifier for a Batch Hot Cut	The Project number is required in the LSR and consists of the letters "BHC" and the CLEC's ZCID	Clarification on how the Project number is obtained and if it is required on the LSR. (MCI – p. 12)	1/6/2004 – Based on changes discussed in P-1 above, CLECs will no longer have to provide a Project Number.	1/6/2004 – CLOSED - MCI agrees to close
P-3 See also P-23 & P-24	Can CLECs request batch cuts at any time of day?	The Batch Hot Cut Proposal is designed for Basic Installation option only Those types of sensitive circuits that require that planning need to be run through the standard hot cut process. 12/10/2003: Qwest has committed to notify the CLEC on due-date via e-mail when the batch cut begins. Batches will be completed within a relatively short period of time; therefore a coordinated installation such as is contemplated by this question is not necessary. 1/6/2004 – The Batch Hot Cuts will be done during a 3:00 a.m. to 11:00 a.m. window.	CLECs should be able to request batch cuts on any day, at any time of day. (AT&T – p. 19); 1/6/2004 – AT&T continues to want the ability to identify a specific window of time during the day in which Batch Hot Cuts are performed and does not want to be limited to the 3-11 window currently provided by Qwest's process. 1/6/2004 - AT&T will take the Trap and Trace proposal back to its operational people and will get back to Qwest on whether or not it will close the issue of method of notice of commencement/completion of the batch/ status of batch. 1/6/2004 – McLeod will take the	12/12/2003: Request from MCI: When MCI goes into the negotiation process, can it provide a notification e-mail address at that time? QWEST RESPONSE: prior to the time a CLEC submits a batch hot cut *for the first time*, the CLEC will provide a notification e-mail address to Qwest. That e-mail will then be used by Qwest to notify the CLEC that a batch hot cut has begun for all batch hot cuts for that CLEC. CLECs do not have to include the e-mail address on LSRs. How will Qwest make sure it uses the provided e-mail for batches and other e-mail addresses for other types of order activity. QWEST to respond in writing. 12/17/2003: Qwest written response: The CLEC will provide	1/6/2004 – IMPASSE as to AT&T regarding ability to identify a specific window of time during the day in which Batch Hot Cuts are performed. AT&T does not want to be limited to the 3-11 window currently provided in Qwest's process. 1/7/2004 – IMPASSE as to AT&T issue of whether or not the web-based status tool is the appropriate method of communication between Qwest and the CLECs on order status (See Related Issues P-23 & 24) 1/7/2004 IMPASSE as to McLeod on issue of whether or not the web-based status tool and the Trap and Trace capability is the appropriate method of

Transcripts for all Batch Hot Cut Forums are located under the "Forum Transcripts and Exhibits" pulldown menu at:
http://www.qwest.com/wholesale/training/tradeshow/batchhotcutarchive.html

**NOTE: Shaded items are closed issues.

		1/6/2004 – MODIFICATION TO ORIGINAL PROPOSAL - Qwest will notify the CLECs when the batch has started via the new web-based status tool. The Trap and Trace option will also identify when the batch begins. 1/6/2004 - Qwest will submit a change request to Change Management as soon as it has fully defined the requirements for the status tool. There are clarification meetings that are held to accommodate CLEC input prior to submitting the CR.	Trap and Trace proposal back to its operational people and will get back to Qwest on whether or not it will close the issue of notice of commencement/completion of the batch/status of batch. CLECs may need to plan certain batch hot cuts for customers with alarm circuits or CPE (Eschelon – p. 13)	the email address for their BHC-ZCID project. The QCCC will build a table unique to the Batch process with the BHC-ZCID and designated email. Therefore,, this email address will be dedicated only to these orders. 1/6/2004 – IMPASSE PENDING on e-mail notification issue as to AT&T and McLeod – both companies taking back issue of status tool and Trap and Trace as notification vehicles in lieu of e-mail or other "push" technology.	communications between Qwest and the CLEC on order status. (See Related Issues P-23 & 24) IMPASSE as to Eschelon Request - regarding designating a time for customers with CPE or alarm circuits being something less than coordination that could be accommodated by the Batch Hot Cut process. 1/6/2004 – MCI agrees issue regarding e-mail notification can be CLOSED.
P-4	Can the CLECs request a "Batch Hot Cut" with coordination?	The Batch Hot Cut process is for basic installations only. If a CLEC wants to order a coordinated installation, it should use the standard coordinated hot cut process.	The Batch Hot Cut process should include options for both a coordinated hot cut and a frame due time option. (MCI – p. 5).	CLOSED - All existing installation options, in addition to Batch Hot Cut, are available to CLECs Closed as to MCI – Sherry Lichtenberg Closed for AT&T - Rick Wolters	CLOSED - All existing installation options, in addition to Batch Hot Cut, are available to CLECs Closed as to MCI – Sherry Lichtenberg Closed for AT&T - Rick Wolters
P-5	Whether the Batch Hot Cut process should include loops provisioned over IDLC.	IDLC loops are handled using the standard hot cut process. Orders that are provided over	IDLC should be included in the hot cut process. (AT&T – p. 16-19); (MCI – p. 4); (Eschelon – p. 15); (McLeod at 1)	IMPASSE - as to including IDLC loops in the batch - MCI (but MCI will consider Qwest's proposal to provide the IDLC information in advance of requirement to transition)	12/12/2003 - IMPASSE - as to including IDLC loops in the batch - MCI

Transcripts for all Batch Hot Cut Forums are located under the "Forum Transcripts and Exhibits" pulldown menu at:
http://www.qwest.com/wholesale/training/tradeshow/batchhotcutarchive.html

**NOTE: Shaded items are closed issues.

		IDLC are C-Jeop'd back to the CLEC if those orders are included in the Batch. To include these types of orders in a Batch eliminates the efficiencies the Batch process was designed to provide (due to requirement to roll a truck) Qwest will convert 10 UNE-Ps that are provisioned over IDLC loops per day per Remote Terminal within a Qwest Network Manager's area. Qwest will provide CLECs with an electronic spreadsheet of all CLEC customers, by central office, that are served via IDLC. Timing – for those markets where there is a finding of "no impairment," the spreadsheet will be provided to CLECs prior to the time when they must transition their lines. Response to AT&T proposal – to handle in that manner, requires manual intervention and additional steps that impact efficiencies the Batch Hot Cut was designed to provide.	MCI would propose building a look-up table in Qwest OSS and reject those orders when they are submitted and providing information regarding IDLC and RT location. (MCI – Forum) AT&T proposal – AT&T is not proposing that IDLC be a part of the batch – what they are proposing is that when CLECs send over UNE-P's for conversion that Qwest identify whether the service is provided over IDLC, have those orders drop out of the Batch and automatically convert them under the standard hot cut process. If IDLC results in delay of customer migration to UNE-Loop, will Qwest continue to charge UNE-P rates until that customer can be migrated? (Gates – MCI – Forum)	12/12/2003 – Remains at IMPASSE IMPASSE - as to action to be taken when loops submitted by the CLECs are provisioned over IDLC – should those orders automatically move to standard hot cut or should the order be c-jeop'd back to the CLEC by Qwest CLOSED– 12/10/2003: CLEC would be billed the UNE-P rate until the completion and acceptance of then UNE-Loop service conversion.	12/12/2003 - IMPASSE - as to action to be taken when loops submitted by the CLECs are provisioned over IDLC – automatic move to standard hot cut or c-jeop of the order by Qwest CLOSED– 12/10/2003: as to the MCI question regarding what rates would apply pending migration of the CLEC to UNE-Loop.
P-6a	Whether the Batch Hot Cut process	Line split loops are not included in the batch process, rather they	Line splitting should be included in the hot cut process. (AT&T – p.	12/3/2003 - OPEN – Qwest and Covad will meet to create a diagram	12/12/2003 IMPASSE as to both P-6a and P-6b– for MCI, Covad,

Transcripts for all Batch Hot Cut Forums are located under the "Forum Transcripts and Exhibits" pulldown menu at:
http://www.qwest.com/wholesale/training/tradeshow/batchhotcutarchive.html

**NOTE: Shaded items are closed issues.

	should include line split loops.	are handled using the standard provisioning process.	16-19); (MCI – p. 8-9); (Eschelon – p. 15); (Covad – p. 4);	depicting the various network connections required in a Line Splitting/Loop Splitting arrangement. – Diagrams completed – see BHC Forum Exhibit 4	Eschelon & AT&T
P-6b	Whether the Batch Hot Cut process should include UNE-P with ancillary DSL.	Requires changing the service from a non-design service to a design service – thereby eliminating some of the efficiencies the Batch process was designed to provide.	Covad agrees that this issue applies for the embedded base only and does not apply for new line splitting/loop splitting orders (Covad – Forum)		
P-7	How does the Batch Hot Cut process address situations where the end-user customer is served via exchange cable?	Batch Process will not include situations where customers are served via exchange cable because it cannot be unbundled – it is a truck side connection. CLECs can, however, use an EEL or they can collocate in the remote office. If CLECs are collocated in the remote, they can participate in the batch process	A batch appropriate process should be provided to address these situations (Eschelon MN- p. 11) Currently, Qwest rejects orders when the customer is served via exchange cable (Eschelon – Forum)	12/3/2003 OPEN - Qwest will provide a technical reference where exchange cable is defined/explained. CLECs will then review that information and provide position at next meeting of the Forum. 12/12/2003 Qwest will provide information at 12/19/2003 meeting of the Forum 12/17/2003 – Qwest Response: EX Cable - EX cable is cable that is identified due to its origination from a remote office switch. This cable cannot be assigned from the Host office as there is no assignable connection between the host and remote switches. To access EX cables as Unbundled Loops a collocation must be established at the remote location. 12/19/2003 – Further Qwest Response – Qwest will post a	1/6/2004 - AT&T and MCI agree to CLOSE as to the issue of end user customers served via exchange cable not being included in the batch process.

Transcripts for all Batch Hot Cut Forums are located under the "Forum Transcripts and Exhibits" pulldown menu at:
http://www.qwest.com/wholesale/training/tradeshow/batchhotcutarchive.html

**NOTE: Shaded items are closed issues.

				diagram of this situation prior to the next Forum.	
			Provide URL that contains a listing of the locations for all Qwest remotes sites (Clauson – Eschelon – Forum)	1/6/2004 – Qwest provided Exhibit 8 – which is a diagram of EX cable. Qwest will clarify in which remote collocation arrangements CLECs can use the batch hot cut process. 12/10/2003: The principle question coming from discussion at the Forum involved exchange cable and was: in a situation involving a host/remote switch relationship where an umbilical connects the host to a remote switching unit in the same Wire Center, can the Batch Hot Cut process be used? The answer depends on whether the premise that houses the remote switch is in a wire center where there is sufficient capacity such that no field technician dispatch is required. If a field dispatch is required, the Batch Hot Cut process may not be used; if not, it may be used so long as the prerequisites for a batch are satisfied for that wire center. It should be noted that in this instance, it is mandatory that the CLEC be collocated in the premises containing the remote switching unit.	

Transcripts for all Batch Hot Cut Forums are located under the "Forum Transcripts and Exhibits" pulldown menu at:
http://www.qwest.com/wholesale/training/tradeshow/batchhotcutarchive.html

**NOTE: Shaded items are closed issues.

				Qwest posts information on remote switches on the ICONN database www.qwest.com – Wholesale – Network Databases. It lists all of the host-remote relationships. Network Disclosures are also posted on the website and would include plans for future remote deployments. Information is also available in the Raw Loop Data Tool (RDLT). 12/10/2003 Information on Qwest remote switching sites can be found on the ICONN database – and can be searched by an entire state or by a specific CO within a state. If the 9th character of the CLLI is an "R" it is a remote or you can chose the "host/remote" correlation report at URL: http:www.qwest.com/cgi-bin/iconn/iconn_centraloffice.pl?function=3	
P-8	Whether the Batch Hot Cut process applies if an outside technician dispatch is required.	The Batch Hot Cut Process is limited to use of existing facilities that do not require an outside technician dispatch. It is Qwest's position that the efficiencies gained in the batch hot cut process would be lost if outside technician dispatch is required.	If the assumption that the batch process will be limited in every case to situations that do not require an outside technician dispatch, this is still an open issue for Eschelon	12/3/2003 OPEN – Eschelon will consider whether they will continue to pursue this position in light of discussion at 12/2/2003 meeting of the Forum. Eschelon will provide feedback at the next meeting of the Forum.	12/12/2003 – IMPASSE for Eschelon as to the issue of including in the batch those orders that require an outside technician dispatch.

Transcripts for all Batch Hot Cut Forums are located under the "Forum Transcripts and Exhibits" pulldown menu at:
http://www.qwest.com/wholesale/training/tradeshow/batchhotcutarchive.html

**NOTE: Shaded items are closed issues.

P-9	How does the Batch Hot Cut process address CLEC-to-CLEC migrations? CLEC-to-ILEC? CLEC UNE-P to UNE-L (same CLEC) CLEC UNE-P to UNE-L (different LEC)	Qwest will utilize the same overall Batch Hot Cut process in each situation to the extent that conversion volumes are sufficient to qualify as a batch. Batch Hot Cut Process does not apply to situations in which a facilities-based provider has overbuilt Qwest facilities. This situation would be a New order and, therefore, not considered as a candidate for the Batch Hot Cut Process. For conversions from UNE-L to UNE-L (different CLECs) – Qwest would only move the facility from one CLECs collocation to the other CLECs collocation and this would be included in the batch hot cut process. For CLEC to ILEC conversions (winback) –will not be included in the batch process.	Qwest needs to explain how it will incorporate CLEC-to-CLEC migrations into a batch project. (AT&T – p. 19) Qwest must define "sufficient volumes" for CLEC-to-CLEC migrations. (MCI – p. 7) CLEC to CLEC migrations must also be included in the Batch Hot Cut process, in addition to Qwest Retail to UNE-L; Resale to UNE-L; Centrex/1FB to UNE-L. (McLeod – p. 1)		1/7/2004 - CLOSED - MCI – agrees to close this issue – Sherry Lichtenberg AT&T – agrees to close this issue – Rick Wolters McLeod – agrees to close this issue – Patty Lynott
P-10 (See also P-1)	Order placement methods, flow-through and service order accuracy	CLECs submit their orders for a Batch Hot Cut using the existing LSR process, with the "BHC" plus CLEC ZCID project number, whether that is through the GUI or EDI interface.	**1**, CLECs should be able to use either EDI or GUI to submit orders. **2**, CLECs should not be required to manually generate spreadsheets. **3**, Orders should flow through. (MCI-p. 5 & 9); (McLeod at 2)	MCI agrees to close as to the first 3 sub-issues (in CLEC Position column) McLeod agrees to close the first 3 sub-issues pending discussion of scalability issue.	12/12/2003 - MCI agrees to close as to the first 3 sub-issues (in CLEC Position column) 12/12/2003 - McLeod agrees to close the first 3 sub-issues pending discussion of scalability

Transcripts for all Batch Hot Cut Forums are located under the "Forum Transcripts and Exhibits" pulldown menu at:
http://www.qwest.com/wholesale/training/tradeshow/batchhotcutarchive.html

**NOTE: Shaded items are closed issues.

		Qwest response to sub-issues in CLEC Position Column: 1. CLECs can use either EDI or GUI to submit batch hot cut orders. 2. CLECs will not be required to manually generate spreadsheets 3. Batch Hot Cut Orders are flow-through eligible. Batch Hot Cut LSRs will flow-through in accordance with existing flow-through standards. 4. The LSR process is appropriate for use with the Batch Hot Cut process. Because of quality and cost issues, Qwest will not pursue development of an interface.	4. Efficient submission will likely require development of new ordering capabilities – sending individual LSRs for multiple orders should not be considered a "batch." . (Eschelon p. 12) Clarification by Eschelon - Eschelon would like Qwest to put in place an interface to the GUI and EDI for Batch Hot Cuts that would take the place of LSR-by-LSR entry. Or, in the alternative, give CLECs the capability of sending an electronic spreadsheet directly to the QCCC. (Eschelon – Forum)	12/3/2003 - On Sub-Issue 4 - Eschelon will take back and determine if it will continue to pursue asking for an alternative to submitting individual LSRs e.g., spreadsheet functionality. 12/12/2003 - Given discussion at last Forum, Qwest position is that taking a mechanized process and taking a step backward to a manual spreadsheet or to re-mechanize in another fashion is not something Qwest is willing to make a part of the Batch Hot Cut Process.	issue. 12/12/2003: IMPASSE as to ESCHELON issue (#4) – regarding alternative to submitting individual LSRs e.g., spreadsheet functionality.
P-11	Order in which lines are cut over	To achieve efficiencies, the process does not permit CLECs to determine the order in which lines are cut over.	CLECs should be able to specify the order in which lines are cut over e.g., customers with multiple CSRs (Eschelon – p. 13 MN p 9)	12/3/2003 - OPEN - Eschelon will take back to determine if they are going to continue to pursue this capability. 12/12/2003 - Eschelon continues to request this capability. Because CLECs must use the related PON process to submit such LSRs, Qwest	12/12/2003: IMPASSE as to Eschelon issue regarding CLEC ability to determine the order in which lines are cut over in the batch.

				should develop a spreadsheet for the batch so that related PONs are worked consecutively. Eschelon believes a PON format could be developed to indicate sequence for this purpose. 12/12/2003 - the efficiencies gained in the Batch Hot Cut Process include permitting the central office technician to perform work in the most efficient and effective way possible; specifying the order in which lines are cut over, when those lines may be on multiple blocks on the frame, reduces the efficiencies of the process.	
P-12	Impact on Batch Hot Cut Process of migration by telephone number change request	The "migrate by TN" capability covered by CMP CRs SCR061302-01 and SCR022703-18 address only orders where the "to" product is UNE-P.	Batch Hot Cut process should allow CLECs to "migrate by telephone number." (MCI – p. 10) MCI views this as a critical requirement (MCI – Forum)	12/3/2003 - OPEN – pending Qwest take back on technical capability issues associated with making TN migration capability available for batch hot cuts. 12/10/2003 Qwest Response: There is no technical limitation precluding Qwest from modifying the edits in IMA to allow CLECs to enter TN and SANO for UNE-P to UNE-Loop conversions. Systems changes to accomplish this modification are required to go through Change Management. MCI submitted a CMP CR (SCR120403-01)	1/6/2004 – IMPASSE as to MCI issue of not providing CLECs with the capability, in the Batch Hot Cut process, to "migrate by telephone number and SANO"

				requesting this change on December 4, 2003. There is, however, a technical limitation that would prevent migration by TN from UNE-Loop to UNE-Loop as in that instance, the TN does not reside in Qwest databases. 12/12/2003: Further Qwest response: This CR would be eligible for inclusion in IMA Release 16.0 which is tentatively scheduled for August 2004. To have it declared as a ***regulatory*** CR, requesting party must provide the docket number and verbiage from the regulatory order in that docket that mandates the activity. QWEST WILL TAKE BACK the questions of whether or not it considers this a regulatory mandate? If so, would Qwest oppose the change? Is it an option for the CR to be escalated in its implementation to a release sooner than IMA 16.0 via the CMP exception process? 1/6/2004 – As to MCI's question about whether Qwest will support or oppose the "migrate by TN" CR as a regulatory change – Qwest will

**NOTE: Shaded items are closed issues.

				embrace the spirit of a Commission order that may, at the end of the 9 month proceeding, direct such a change –it cannot support "migrate by TN" as a ***regulatory*** change because in order to be a ***regulatory*** change, the requirement must have a docket number **and** order associated with it. Qwest is not including the "migrate by TN" in its current Batch Hot Cut proposal because it is not a capability that is specific to batch hot cuts. However, Qwest will not oppose the MCI CR SCR061302-01 and SCR022703-18 (that deal with the TN SANO capability generally) in the CMP .	
P-13a See also P-1, P-2 and P-3	Does Qwest take orders for a Batch Hot Cut on a first come first served basis?	Batch Hot Cut orders will be processed by due date as assigned by Qwest OSS. 1/6/2004 – Due date scheduler will facilitate taking orders on a first come-first served basis.	Qwest must process batch orders on a first in-first out basis and must send both electronic and on-line notification to CLEC within one day of reject or if busy CFAs are found. (MCI p. 12)	12/3/2003 OPEN – Qwest will take back questions around what is involved in the negotiations process and what happens if the CLEC fails to place their orders – do they lose their slot? Will Qwest assess some sort of penalty?	1/6/2004 – MCI, AT&T, Covad & AT&T agree to close 13a.
P-13b	If Qwest will miss a due date, will jeopardy notice issue?	Yes. A jeopardy notice will be sent to CLEC on the day of the cut. If there is a Qwest jeopardy in a batch that takes the batch below 25, the entire batch will not be jeopardized.	Priority levels may be designated so that CLECs are aware of which services are in jeopardy due to the processing of a Batch Hot Cut. (Eschelon – p. 15)	12/3/2003 - OPEN	1/6/2004 – MCI, AT&T, Covad and McLeod agree to CLOSE 13 b.
P-14	How will the spreadsheet in Qwest's proposal be	The systems within QCCC will electronically produce a spreadsheet for internal Qwest	AT&T supports the use of an electronically prepared spreadsheet developed by Qwest's OSS based	12/3/2003 OPEN	1/6/2004 – AT&T, McLeod, Covad and MCI agree to CLOSE this issue.

**NOTE: Shaded items are closed issues.

				1/7/2004 – **afternoon session** – Qwest response: based on CLEC concerns, Qwest's counter-proposal is that, in a 7-day interval –order submittal on day 0 and FOC also on Day 0 if Order is received before 7:00 p.m. CLECs will have translations work complete by midnight on Day 1 the Record Issue Date (RID), Qwest will perform its pre-wire work on days 2-3, will test for dial tone, and will notify the CLECs, via the web-based status tool of any "no dial tone" situations. If the "no dial tone" situation is as a result of translations, then CLECs have until the end of Day 6 to remedy. If the "no dial tone" situation is as a result of a defective CFA, CLECs have until 7:00 p.m. on Day 4 to supplement their order with the new CFA to permit the order to remain in the batch. On Due Date, Qwest will perform a dial tone & ANI test and, if there is no dial tone at that time, the order will go into a customer not ready jeopardy status and will be removed from the batch. (Counting for interval purposes begins on Day 1.) SEE BHC Forum Exhibit 10 for timeline diagram.

**NOTE: Shaded items are closed issues.

				1/7/2004 – MCI - Subject to seeing the process in flow-chart form, MCI supports this new proposal as good process. 1/7/2004 – AT&T position is that this is an improvement from a dial tone check and CFA change perspective. AT&T needs to take back the issue of how the requirement to have translations established by midnight on Day 1 is something that can be accommodated by AT&T's processes. As to these modifications and their impact on the status tool, AT&T doesn't want to deal with different systems and interfaces – prefer to keep things on EDI from a statusing perspective. The web-based status tool requires CLECs to check 100% of the orders, e-mail, conceptually, requires CLECs to query orders only on an exception basis. 1/7/2004 – McLeod finds that the new proposal works well to resolve the Dial Tone and CFA issues. McLeod still wants to discuss the interval associated with the Batch.

http://www.qwest.com/wholesale/training/tradeshow/batchhotcutarchive.html

**NOTE: Shaded items are closed issues.

				1/7/2004 – AT&T will have the switch translations done within the timeframe provided for in the proposal. AT&T agrees there is sufficient time to remedy no dial tone situation and CFA issues. 1/7/2004 – MCI also finds the new proposal acceptable. 1/7/2004 – Covad finds the new proposal acceptable.	
P-18 (See also P-17, P-19 & P-28)	What is the appropriate time to pre-wire the CLEC CFA?	12/19/2003 – In response to CLEC feedback during the Forum, Qwest has agreed to move the pre-wire of the CLEC CFA to the Design, Verify and Assign date	Pre-wiring must have at least one (1) day lead time from the batch project due date. (AT&T – p. 8)		12/19/2003 – CLOSED Sherry Lichtenberg on behalf of MCI agrees to close. Karen Clauson on behalf of Eschelon agrees to close. Rick Wolters on behalf of AT&T agrees to close.
P-19 (See also P-17, 18, & P-28)	What is the appropriate timing for Qwest to perform a dial tone check?	Qwest proposes that technicians perform test for dial tone on the day of the cut and require CLECs to remedy any "no dial tone" situation within one hour.	Performing this test on the day of the cut leaves insufficient margin for error. One hour is often not sufficient time to resolve a lack of dial tone issue. (AT&T – p. 9) MCI requests dial tone check 2 days prior to cut. (MCI – pp. 10 & 12) Eschelon wants the dial tone check 48 hours in advance, and believes the one hour window to remedy issues may be insufficient.	12/19/2003 – IMPASSE as to 48 hour dial tone check 1/7/2004 – Re-opened – CLECs want Dial Tone check done at due date minus 2 and that it would be a reasonable compromise, if that check is performed, to automatically pull the order from the batch if there is no dial tone on the date of the cut (no 2 hr. window for CLECs to remedy on day of cut) Qwest agreed to take back over the morning break	1/7/2004 – Based on Qwest counter-proposal (See Issue P-17), AT&T agrees to CLOSE this issue. 1/7/2004 – Based on Qwest counter-proposal (See Issue P-17), MCI agrees to CLOSE this issue. 1/7/2004 – Based on Qwest counter-proposal (See Issue P-17), McLeod agrees to CLOSE this issue.

				Based on explanation – AT&T, MCI, McLeod and Covad agree to CLOSE 21d	
P-22	Does the process have a step to prevent premature disconnection of a line in a "no dial tone" condition?	Yes – if there is a no dial tone condition, and the line is part of a multi-line customer, all lines on the LSR will be jeop'd and the cut will not occur. If the customer has multiple CSRs,, then it is the responsibility of the CLEC to make sure the LSRs associated with each other are related.	Is there a process that would automatically remove a multi-line customer from the batch in the event there is trouble found on a single line within that customer's multi-line group? (AT&T – p. 10) Provide the CLECs with the citation to PCAT or other documentation on what happens with a single LSR and also what happens when there are related lines on multiple LSRs and a single line for a multi-line customer experiences no dial tone (Lichtenberg – MCI and Finnegan-AT&T – Forum)	AT&T thinks may be able to close this issue if Qwest can provide the citation to the documentation that describes what happens when a single line on a single LSR is found to have no dial tone. Qwest will take back – providing the CLECs with the citation to PCAT or other documentation on what happens with a single LSR and also what happens when there are related lines on multiple LSRs and a single line for a multi-line customer experiences no dial tone Qwest will also take back – whether CLECs using an RPON to relate the orders results in the orders falling out for manual handling.. 12/10/2003: The material is not contained in the PCAT. LSRs and RPON relationships are discussed generally in the IMA User's Guide Once the BHC process is finalized Qwest will ensure that the underlying documentation contains a reference to this material along with the detailed documentation on the BHC process itself.	1/7/2004 – AT&T agrees to CLOSE 1/7/2004 – MCI agrees to CLOSE

		held to accommodate CLEC input prior to submitting the CR.			
P-24 (See also P-3 & P-23)	How will CLECs know which orders in the batch were completed?	Qwest proposes to notify the CLECs when all lines in the batch have been completed and will do so via an electronic spreadsheet. In addition, Qwest currently sends FOCs and SOCs to CLECs electronically. Further, Qwest changes the status within EDI within one (1) hour of completion of the service order activities to identify that LSR requests are completed. 1/6/2004 - Qwest will also notify the CLECs when the batch has started via the status tool. The Trap and Trace option will also identify when the batch begins. 1/6/2004 - Qwest will submit a change request to Change Management as soon as it has fully defined the requirements for the status tool. There are clarification meetings that are held to accommodate CLEC input prior to submitting the CR	The CLEC needs accurate information regarding the exact lines that were cut over. (AT&T – p. 11)	1/6/2004 – Today, this would be IMPASSE for AT&T as to existing proposal that has CLECs pulling information from Qwest as opposed to the information being pushed to the CLEC by Qwest. The issues are (1) notification via the website when there is a no dial tone issue discovered by Qwest and (2) notification via the website of the initiation and completion of the batch. 1/7/2004 – MCI supports the web-based system proposal, particularly if it can use it in conjunction with Trap and Trace. MCI looks forward to working with Qwest on the requirements document associated with the proposed status tool as part of the clarification meetings provided for in CMP. MCI believes the status tool needs to be developed as an "API" so that information can be shared back and forth. 1/7/2004 – AT&T does not want to commit at this time to a "pull" solution as Qwest currently proposes and preclude some sort of "push" technology such as some sort	1/7/2004 – IMPASSE as to the issue of whether a web-based status tool is sufficient to provide information to the CLECs on status or is an e-mail or other type of "push" technology appropriate.

**NOTE: Shaded items are closed issues.

			Migration of directory listings "as is" should be allowed. (MCI - Forum) MCI also recommends examining any existing processes to see if additional procedures are required to address what happens in the event Qwest receives a trap and trace request from a PSAP in between the time the order has been cut and when the 911 unlock is processed	processed to the PSAP at 6:00 p.m. on the day of the cut. It is the same process used today. 12/10/2003: 911 unlock is sent in a batch format to the PSAP for all orders completed as of 6pm on the day of completion. This is the same process as used today.	in the underlying Task List, MCI believes this issue can be CLOSED. MCI agrees to consider the issue of migration of directory listings "as is" CLOSED. – Sherry Lichtenberg
P-26 (See also S-1)	Is there an escalation process for Batch Hot Cuts?	Qwest's current escalation process will be used for the Batch Hot Cut process Any issues prior to the day of the cut go through the ISC (Escalation Center). On the day of the cut, Qwest will provide CLEC a spreadsheet on completion of the batch and will provide a timeframe prior to closing out the orders where the CLECs can call the ISC and work through issues associated with orders in the batch. This process will be documented in CLEC-facing documentation as a part of the Batch Hot Cut Process.	An escalation process should be developed for the Batch Hot Cut. including addressing multiple escalation tickets and priority for resolution (Eschelon – p. 14) Eschelon wants to ensure that escalation process will address multiple escalation tickets and that escalation centers are trained in the components and implications of a batch process. (Eschelon – Forum)	12/3/2003 OPEN - Once the batch hot cut process is finalized, training, methods and procedures and documentation concerning the batch hot cut process, how orders will be associated in the batch, etc. will be provided to the centers within Qwest that are involved in the cut process. CLEC documentation concerning the process will also be created and CLEC training made available Qwest will take back the issue of whether CLEC employees can be trained along with Qwest employees 12/19/2003 – Qwest evaluated this request and did not see the benefit of having CLECs participate in Qwest employee training. In this process,	1/7/2004 – MCI agrees to CLOSE 1/7/2004 – AT&T agrees to CLOSE 1/7/2004 - Covad agrees to CLOSE 1/7/2004 – McLeod agrees to close.

**NOTE: Shaded items are closed issues.

(See also P-17, 18 & 19)	acceptance of multiple loops – specifically, sufficiency of one-hour window to resolve trouble and to accept orders	CLECs are notified if there is trouble on a line within the Batch. The one-hour notification begins at the time that notice is provided. CLECs can also do work up-front to minimize the likelihood of trouble at the time of the cut.	address troubleshooting on multiple loops within the current one hour window provided? (Eschelon MN – p. 12) 12/19/2003 – Eschelon believes this is related to P-19 and, since Qwest has not yet closed on P-19, Eschelon disagrees that the 1-hour window is appropriate to resolve. (Eschelon – 12/19/2003 Forum) AT&T and MCI believe e-mail notification is inappropriate given that the CLEC only has a 1-hour window to resolve. MCI believes that this issue may be mitigated if there is some sort of on-line statusing tool made available to the CLECs. (AT&T & MCI – Forum)	CLEC is notified via email of trouble on the line(s), when the email is sent to the CLEC, the hour timeframe starts for the orders contained on the e-mail notification. The CLEC then has 1 hour to resolve the trouble(s) and provide information back to the QCCC. If no response, the QCCC follows the standard jeopardy process and the CLEC will need to supplement the LSR(s) with a new due date. 12/19/2003 – OPEN on 1-hour window– pending CLEC discussions to explore what an appropriate period may be. Also OPEN as to issue of method of notification. 1/7/2004 – Qwest counter-proposal as discussed in Issue P-17 eliminates the opportunity to cure on Due Date. AT&T, MCI, McLeod and Covad all agree that the opportunity to cure on due date can be eliminated.	Qwest counter-proposal as discussed at Issue P-17. 1/7/2004 - AT&T agrees to CLOSE. 1/7/2004 – MCI agrees to CLOSE 1/7/2004 – McLeod agrees to CLOSE 1/7/2004 – Covad agrees to CLOSE
P-29	Coordination of systems changes as a result of the Forum & State proceedings with CMP	For systems changes, the product of the Forum and the State Proceedings will go to CMP as Regulatory Change Requests. As such, the changes will be incorporated into releases above the line and will not be prioritized.	How will changes agreed to in the Forum be synched up with and incorporated into the CMP? (Lichtenberg – MCI – Forum)	12/10/2003 – OPEN 12/19/2003 - Qwest provided explanation that the CMP process for regulatory changes is for all CLECs and Qwest to vote to see if they agree that the systems changes are indeed a regulatory change. Qwest will agree to abide by the spirit and intent of the regulatory	1/7/2004 – IMPASSE – as to MCI issue regarding the need for any system changes coming out of the batch hot cut proceedings in the states to be classified as regulatory changes. MCI does not agree, in this situation, that the CMP process is the appropriate forum to address

		are flow-through. Step 3 is the receipt of the LSR. The LSR would then need to be input into the SOP (Step 5), then designed (Step 9) before verification of the order by QCCC occurs (Step 10).	recommends that Qwest move step 10 (Order Verification/Qualification) to occur immediately after current step 3. There is no reason to proceed further if the order does not qualify for the BHC process (Gates – MCI – Forum)	agrees to close this issue.	
			SCALABILITY – VOLUMES		
SC-1 (See also SC-5)	Can Qwest's proposed process handle anticipated volumes?	The Batch Hot Cut process is scalable, which will allow Qwest to meet current and future demand. In considering volumes that may have to be handled by the Batch Hot Cut Process, Qwest has considered the embedded base as well as incremental growth similar to what AT&T has suggested. An additional assumption is that in the event there is a finding by state commissions of impairment,, or in markets where Qwest does not seek to challenge the presumption of impairment, then Qwest will continue to provide UNE-P. All of these assumptions will form the basis for the volumes that can be anticipated. Qwest will be prepared in the near future to put forward	Qwest needs to provide more evidence to establish this point. (AT&T – p. 12) Qwest needs to identify the number of batches that it can handle per Central Office, per state and per region. (Eschelon – p. 17) Qwest must clarify the maximum/minimum line volumes per day per CLEC for the Batch Hot Cut (McLeod – p. 1) The daily line count threshold that Qwest can manage for its retail unit must be provided, and parity established. (McLeod – p. 2) Are there limitations on the number of UNE-P to UNE-L lines that can be migrated for a single account? (MCI – Forum) Clarify the relationship of and	12/3/2003 OPEN - For SC-1 in total, Qwest will take-back – providing parties with the assumptions that form the basis for its proposed volume estimates. Qwest will also provide additional information on assumptions for staffing levels for the anticipated volumes. Qwest is not placing limits on the number of UNE-P lines that can be migrated for a single account.	1/7/2004 – IMPASSE as to whether Qwest's proposed process can handle anticipated volumes

**NOTE: Shaded items are closed issues.

		numbers based on those assumptions.	impact of batch process on non-batch orders and other services. (Eschelon MN p. 10) AT&T believes should assume worst case scenario for development of the process upper limit. AT&T thinks that adding an incremental growth number using analogous number e.g., customers will move their local service about as much as they move their long distance service approximately 2.6%. Churn for CLECs is approximately 4.6-5.2% Churn rate should also include winback rates for Qwest. AT&T concerned about Qwest's ability to handle volumes. Wants Qwest to share some of its analysis on why it believes it can keep up with the demand AT&T believes its appropriate to look at embedded base of UNE-P and UNE-L customers, add some incremental growth number to account for the churn, include additional staff to handle IDLC, and then explain how the process will handle. (AT&T – Forum) Scalability is an issue for McLeod and very interested in how Qwest will gear up for the volume.

			(McLeod – Forum)		
SC-2	What is the impact of performing Batch Hot Cuts for multiple CLECs in same CO.	In a given CO, Qwest will perform batch cuts for up to 100 lines. The 100 lines can be associated with one or more CLECs. This number is over and above the normal workload. 1/7/2004 Qwest will work with multiple CLECs in the same central office if the sum of the CLECs batches does not exceed 100 lines. Today, Qwest has no formal limitations that it places on the number of basic or coordinated hot cuts. Generally, Qwest and the CLECs pre-plan to ensure a smooth transition. Batch Hot Cuts are an additional option over and above standard hot cut volume	a. Will Qwest work with Multiple CLECs in the same central office on the same day if the sum of the CLEC's batches does not exceed 100 lines? (AT&T p. 12) b. Is there a limit on the number of CLECs that can migrate 100 lines in a central office in a day? (AT&T p. 13) How will Qwest deal with multiple CLECs in a single CO? What is the maximum number of Batch Hot Cuts it can do in a single day per CO? (MCI – p. 7, 8) c. How will prioritization be determined so that multiple carriers can submit a Batch Hot Cut while not freezing out non-batched cuts or freezing out particular COs? (Eschelon – p. 14) d. If restrictions are placed on CLECs ability to complete Batch Hot Cuts in any wire center at any time, how will comparable restriction apply to Qwest retail? (Eschelon – p. 14) e. McLeod would like clarification around what the "normal	12/3/2003 OPEN	1/7/2004 - Sub-issues a, b, and c (as identified in the CLEC position column) are CLOSED for AT&T, MCI, Covad & McLeod Sub-issue d - AT&T agrees to close; MCI agrees to close; Covad agrees to close; McLeod agrees to close. Sub-issue e – McLeod agrees to close this sub-issue, but believes it is still open as to the issue of scalability (See SC1 & SC-5) Covad agrees to CLOSE AT&T agrees to CLOSE MCI agrees to CLOSE

		Restrictions, if any, will be applied in a non-discriminatory manner.	workload" is as well as an understanding of exactly how the new batch hot cut process and the normal workload will be resourced. (McLeod – Forum)		
SC-3	Same CLEC, multiple Collocations in the same CO	So long as conversions are for the same CLEC, CLECs with multiple collocations in the same CO can use the Batch Hot Cut process for such conversions	Will Qwest allow CLECs that had two different collocation arrangements in the same CO to include facilities in each of the arrangements on the same project? (AT&T p. 13) For the same CLEC with multiple RSID/ZCID how will Qwest handle?	12/3/2003 OPEN - Qwest will take back – the question of whether the process will accommodate the same CLEC/operating entity with multiple RSIDs or ZCIDs and multiple ICAs combining their orders into a batch. 12/10/2003: If a CLEC is operating under multiple ZCIDs, that means that they are operating under multiple ICAs and, therefore, their orders must be handled as separate batches. 12/12/2003 – If a CLEC is operating under a single interconnection agreement but has multiple RCIDs or ZCIDs, their orders must be handled as separate batches. CLOSED – AT&T agrees to close. MCI agrees to close.	12/12/2003 - CLOSED – AT&T agrees to close. MCI agrees to close.
SC-4	Staffed vs. Un-staffed COs	The Batch Hot Cut process will be available in any central office, whether staffed or un-staffed.	Are batch projects limited to central offices with full-time staff? (AT&T p. 13)	CLOSED – AT&T agrees to close this issue. – Rick Wolters	CLOSED – AT&T agrees to close this issue. – Rick Wolters
SC-5 (See also SC-1)	Staffing levels	Resources will be added and/or shifted as the final Batch Hot Cut process requires. Qwest will	Describe the number of additional people Qwest must add to meet the increased hot cut demand. (AT&T	12/3/2003 OPEN – See also SC-1	1/7/2004 – IMPASSE as to level of detail required regarding plans for staffing

Transcripts for all Batch Hot Cut Forums are located under the "Forum Transcripts and Exhibits" pulldown menu at:
http://www.qwest.com/wholesale/training/tradeshow/batchhotcutarchive.html

**NOTE: Shaded items are closed issues.

		use its standard recruiting, hiring and training practices to staff the work activities required. In those locations where Qwest has sufficient volumes, there will be dedicated personnel assigned to batch activities. For other locations, the staff will not be dedicated only to batch work, but during batch activity, will be focused on that work.	p. 13) Plans for recruiting, hiring and training personnel (AT&T p. 14) Qwest must identify and dedicate Qwest personnel to the Batch Hot Cut process (Eschelon – p. 15) By dedicated, Eschelon means resources that will be working solely on batches.		by Qwest to address batch hot cut activity
SC-6	Order accuracy		Qwest should develop a mechanism to create accurate service orders from the batch, and batch hot cut orders should flow-through. (Eschelon – p. 13)	12/3/2003 OPEN 1/8/2004 - Qwest position is that order accuracy is more appropriately dealt with in Long Term PID Administration. 1/8/2004 - AT&T and Covad agree to close this issue and will take up their concerns regarding performance metrics in other sections of the Disputed Issues matrix.	1/7/2004 – MCI agrees to CLOSE this issue. 1/7/2004 –AT&T is willing to close as to SC-6. 1/7/2004 – Covad agrees to close 1/7/2004 – McLeod agrees to close
			VOLUMES		
V-1 (See SC-1 & SC-5)	The basis on which Commissions can arrive at a maximum volume of hot cuts to be performed across the Qwest region	Qwest proposed formulas provide the basis on which Commissions can arrive at maximum volumes.	Qwest's proposed formulas do not account for churn and winback activity. The Number should be broken out on a state-by-state basis. (AT&T – p. 13)	12/3/2003 - OPEN - See SC-1 1/8/2004 – McLeod position is that the formula covers the embedded base, but does not account for new growth 1/8/2004 – MCI position is that the formula assumes that the movement will occur over a 21 month period – and does	1/8/2004 – Parties agree to CLOSE this Issue as it is covered in Issues SC-1 and SC-5.

Transcripts for all Batch Hot Cut Forums are located under the "Forum Transcripts and Exhibits" pulldown menu at:
http://www.qwest.com/wholesale/training/tradeshow/batchhotcutarchive.html

**NOTE: Shaded items are closed issues.

				not account for the situation where a CLEC may want to move faster than the 21 month period. Further, it appears that the formula is completely dependent on the successful negotiation of a transition plan. There may also be certain central offices where the CLECs may want to move more quickly that may conflict with the 21 month time period as Qwest has proposed. 1/8/2004 – Covad cannot say that it agrees completely, but is encouraged that Qwest's numbers appear to show that Qwest has sufficient resources to handle the volumes. The assumptions appear reasonable. 1/8/2004 – Qwest can add to its assumptions the "net add" of the current UNE-Loop activity to reflect the growth. With that addition, McLeod would agree that the assumptions are appropriate. MCI would agree that the calculations are correct based on the assumptions. MCI does not believe that the conclusions Qwest is drawing from those numbers is necessarily correct.	
V-2	Per Central Office limit on Batch Hot Cuts	Qwest proposes a limit of 100 lines per Central office	What is the appropriate limit on a per central office basis – should there be a limit? (Eschelon – Forum)	12/3/2003 - OPEN 1/8/2004 – Qwest position is that the most efficient configuration is for 2 technicians performing 100 conversions during an 8-	1/8/2004 - MCI would agree to CLOSE this issue based on an agreement that the parties are not foreclosed from mutually

http://www.qwest.com/wholesale/training/tradeshow/batchhotcutarchive.html

**NOTE: Shaded items are closed issues.

				AT&T's request and agrees that it will now provide CLECs with an email notification on the initiation of the batch. 12/19/2003 – From AT&T's perspective, believe that with response above and discussion during 12/19/2003 Forum AT&T **believes there is agreement in principle.** Parties understand that, similar to the process followed during the 271 workshops, agreements reached during the Forum will ultimately be documented in SGAT and, once it has gone through the CMP, in PCAT language. 1/7/2004 AT&T position is that it is still investigating the Trap and Trace proposal of Qwest and still questions whether a web-based status tool is sufficient to provide information to the CLECs on status or is an e-mail or other type of "push" technology appropriate. Parties will discuss this issue in the context of Issues P-23 & P-24 and so this Issue can be closed.	
S-2	Interval for the batch – from CLEC initiation of a request to due date for the batch	Intervals for the embedded base of UNE-P depends on the Batch Hot Cut process agreed to in the Forum and the transition plans ordered by the Commission. For new Batch Hot Cuts, the interval	a. Batch Hot Cut intervals cannot be individually negotiated on a project-by-project basis. There must be a standard interval (e.g., 6 days). (AT&T – p. 14)	**As to Sub-Issue S-2a** (as noted in CLEC position column): 12/3/2003 - OPEN - Qwest will take back – parameters for an interval and also whether or not there is a way to schedule without requiring negotiations	1/8/2004 – IMPASSE as to the issue S-2a - parameters for the interval - should the intervals for the batch hot cut process be the same as the intervals for the

Transcripts for all Batch Hot Cut Forums are located under the "Forum Transcripts and Exhibits" pulldown menu at:
http://www.qwest.com/wholesale/training/tradeshow/batchhotcutarchive.html

**NOTE: Shaded items are closed issues.

		will be negotiated.	a. CLECs should not be required to "negotiate" the provisioning date for a Batch Hot Cut in advance. Interval should be five (5) business days to minimize the amount of time a customer is held in a limbo state. (MCI – p. 5, 6 & 11) a. Assumption is that the current 5-day interval will be the interval for the new Batch Hot Cut process (McLeod – pp. 1 &2) a. Eschelon wants definition on what the interval is for the batch hot cut process. For new hot cuts, a standard interval critical. (Eschelon – Forum) b. AT&T wants to "get out of the negotiation business." For transition of the embedded base AT&T suggests scheduling it out every day for weeks at a time. If it is done that way, and Qwest has all the "CLEC balls in the air" and is scheduling the work accordingly, is there still a need for negotiation? (AT&T – Forum) b. Rather than make negotiation the rule, may be easier to have negotiation as the exception for	1/8/2004 – Qwest position is that the "meaningful opportunity to compete" standard as decided in the 271 proceedings should be the basis on which intervals are set. For Batch cuts for the embedded base, the volumes involved and the fact that CLECs already have the customer so there is not a customer acquisition issue, the 7-day interval is appropriate and meets the "meaningful opportunity to compete standard." 1/8/2004 – AT&T wants interval for the Batch process to be same as for the one-by-one hot cuts (5 business days). With no minimum batch size, this is consistent. Conditional upon cost. 1/8/2004 – McLeod position is that a 4-5 business day interval is appropriate. CLECs have committed to have their translations complete on Day 1 and McLeod would commit to have any defective CFAs supplemented by Day 3. Interval is conditional upon cost. 1/8/2004 – Covad is not prepared at this time to specify an interval – tentatively 6 days. Interval is conditional upon cost 1/8/2004 – MCI position is that 5 business day interval is appropriate. MCI would also agree to have any defective	standard provisioning process? 1/8/2004 – CLOSED as to Issue S-2b – based on Qwest commitment to a scheduling tool. AT&T, MCI, McLeod, Covad agree to close. 1/8/2004 – S-2c – IMPASSE – as to the issue of a different batch interval for new customers vs. embedded base customers 1/8/2004 – S-2d – CLOSED 1/8/2004 – S-2e CLOSED

Transcripts for all Batch Hot Cut Forums are located under the "Forum Transcripts and Exhibits" pulldown menu at:
http://www.qwest.com/wholesale/training/tradeshow/batchhotcutarchive.html

**NOTE: Shaded items are closed issues.

			both the embedded base and "new" customers. (AT&T – Forum) c. For CLEC new acquisition customers coming from Qwest to the CLEC, today on average for a residential customer McLeod can convert to McLeod service in 7-8 calendar days, primarily because of the 5 day Qwest interval for the UNE-Loop. Concern about whether the batch hot cut process is even a viable option for "new" customers. (McLeod – Forum) d. MCI wants a timeline containing the intervals and what happens when. (MCI – Forum) e. MCI also wants Qwest to consider development of a scheduling tool. (MCI – Forum)	CFAs supplemented by Day 3. Interval is conditional upon cost **Sub-Issue S-2c** 12/12/2003 Qwest will take back issue of whether there could be a different interval for "new customers" vs. embedded base. 1/8/2004 – Qwest is not willing to have a different interval for "new customers" vs. embedded base.	
S-3 (See also Q-2)	Responsibility for issuing LNP Order		Qwest should issue the LNP order when the cut is complete and provide immediate notification to the CLEC when it occurs. (MCI – p. 13)	12/3/2003 OPEN 1/8/2004 – See related issue Q-2. Qwest is not willing to perform LNP porting activity for the CLEC. Qwest is proposing CLECs use the web-based status tool and Trap & Trace capability to identify when hot cut activity is completed so that they can submit their own number port activation to the NPAC.	1/8/2004 – CLOSED – AT&T, MCI, Covad & McLeod agree to close.
RATES/PRICE					

Transcripts for all Batch Hot Cut Forums are located under the "Forum Transcripts and Exhibits" pulldown menu at:
http://www.qwest.com/wholesale/training/tradeshow/batchhotcutarchive.html

**NOTE: Shaded items are closed issues.

R -1 (See also R-2)	Rate structure for new batch process and timing for development of the structure	The final Batch Hot Cut process must be defined before Qwest can create an appropriate cost study. The proposed Batch Hot Cut Process does not include costs associated with Coordinated Installation.	Detailed rate information needs to be provided including the cost structure and cost studies used to develop the rate (AT&T – p. 3); (MCI – p. 3). Consideration of rates for coordinated installation. (Eschelon –p.11) What are the benefits of the new process? How are efficiencies quantified in Qwest's proposed process (AT&T & MCI - Forum)	12/3/2003 OPEN 1/8/2004 – Given the changes made to the process during the Forum – Qwest will need to incorporate the changes into its cost studies for the process as it now stands. Qwest plans on filing a cost study with its testimony based on Qwest's proposal as it exists today along with a recommended price based on that study.	1/8/2004 – See also R-2 – IMPASSE as to what is the appropriate rate structure
R-2 (See also R-1)	What is the appropriate TELRIC-based price for the Batch Hot Cut process?	The NRC for the Batch Hot Cut process should reflect the forward-looking cost Qwest will actually incur to provide Batch Hot Cuts. The proposed process, as currently designed realizes efficiencies gained as a result of performing work in a batch manner.	Qwest needs to make significant reductions in its hot cut NRCs to make UNE-L a viable alternative for serving mass market (AT&T - p. 4) Qwest must specifically quantify all proposed NRCs involved in the Batch Hot Cut process. (McLeod – p. 1)	12/3/2003 OPEN – 1/8/2004 – see discussion in "History Column for Issue R-1 above.	1/8/2004 – See also Issue R-1 – IMPASSE – as to what is the appropriate TELRIC-based rate.
POST-CUT QUALITY					
Q-1 (See S-1)	Is there a process to "throw-back" a customer to its prior service	Qwest will send CLEC an electronic spreadsheet on the due date after the hot cuts have been completed. The spreadsheet will contain a deadline time when Qwest will begin running its completions out of the WFA/C system. If the CLECs identify issues with their lines, CLECs	There should be such a process. (AT&T - p. 20) (Eschelon – p. 14) (McLeod – p. 2) (MCI – p. 11)	12/3/2003 OPEN 1/8/2004 – parties agree this issue is addressed in Issue S-1	1/8/2004 –CLOSED – MCI, AT&T, McLeod & Covad agree to close as this issue is addressed in Issue S-1

Transcripts for all Batch Hot Cut Forums are located under the "Forum Transcripts and Exhibits" pulldown menu at:
http://www.qwest.com/wholesale/training/tradeshow/batchhotcutarchive.html

**NOTE: Shaded items are closed issues.

		will contact the QCCC before the deadline set. Then the order would stop, it would be cut back to the Qwest switch, translations would not run and Qwest would send a jeopardy notice to the CLEC. CLEC would then supplement the order and follow the standard hot cut process.	If there does happen to be a degradation of service associated with going from UNE-P to UNE-L, if there is no longer a UNE-P option, what then? (McLeod – Forum) Auto Completions from WFA – is it done in batches or by individual orders? (Clauson – Eschelon – Forum)	12/10/2003: Order automation checks for completions in WFA every 3 minutes and issues a request to the SOP to do completions. 12/12/2003 – CLOSED as to Eschelon's issue regarding WFA auto completions.	
Q-2 (See also S-3)	LNP activity	Qwest sets LNP triggers prior to the due date. CLEC subscription activity triggers the porting.	Qwest must submit the number-port activation order to NPAC within 10 minutes after the Batch Hot Cut is completed, with notice to the CLEC after successful completion of each step. (MCI – p. 12-13)	12/3/2003 OPEN – See also S-3 1/8/2004 – Qwest is not willing to perform LNP porting activity for the CLEC. Qwest is proposing CLECs use the web-based status tool and Trap & Trace capability to identify when hot cut activity is completed so that they can submit their own number port activation to the NPAC.	1/8/2004 – CLOSED. AT&T, MCI, Covad & McLeod agree to close.
PROCESS TESTING/PERFORMANCE MEASURES					
T-1	Should Qwest provide some demonstrable method to show that the Batch Hot Cut process works.	No. There is no such requirement in the TRO. The State Commissions shall establish and implement a batch hot cut process by July, 2004. Development of a test and	Process must be thoroughly tested to guarantee operational readiness. (AT&T – p. 21) AT&T recommends that there be some sort of testing process that uses existing Qwest customers,	12/3/2003 OPEN – OPEN - Qwest will take back – possibility of proposing some demonstrable vehicle/evidence to show that the process works.	1/8/2004 – IMPASSE as to the issue of whether there is a requirement for Qwest to provide demonstrable proof that its proposed Batch Hot Cut process works prior to state commission approval.

Transcripts for all Batch Hot Cut Forums are located under the "Forum Transcripts and Exhibits" pulldown menu at:
http://www.qwest.com/wholesale/training/tradeshow/batchhotcutarchive.html

**NOTE: Shaded items are closed issues.

		incorporating a test as AT&T envisions takes an extensive amount of time that the timeframes provided by the FCC do not provide.	subject to monitoring by the State Commissions. (AT&T) The test would have Qwest become a CLEC in its own territory establish a collocation, insert the required equipment, backhaul to a second CO, where it would have the backhaul connected to the second switch. Test would use Qwest's existing retail customers, and would test the 911 process, the LNP process etc. As the test was performed, there could be independent observations by the State Staffs to see how Qwest is performing. (AT&T – Forum) Subject to further discussion, expect that it would provide 100 cuts per day for a series of days. (AT&T – Forum) Qwest would have to send orders to itself via the GUI. (AT&T – Forum) The test does not have to be set up and completed prior to implementation of the process. The State Commissions can approve and implement the process and then perform the test. (AT&T	12/19/2003 – Closed as to Rick Carter of the Oregon PUC question as to whether there a current work operation that could simulate a Batch Hot Cut that would illustrate Qwest's competency in this type of activity e.g., existing hot cut process bulk cuts to DLC etc. Qwest will take back – suggestions made by Don Gray from the Nebraska Commission and Rick Carter from the Oregon Commission regarding alternatives to testing e.g., PROCESS metrics 12/10/2003: Response to Don Gray (Nebraska Commission) suggestion regarding documentation of training and proficiency technicians and others involved in the batch hot cut process: Qwest is committed to training its affected workforce once the BHC process is finalized to ensure that technicians are proficient in the activities required by the process.	

Transcripts for all Batch Hot Cut Forums are located under the "Forum Transcripts and Exhibits" pulldown menu at:
http://www.qwest.com/wholesale/training/tradeshow/batchhotcutarchive.html

**NOTE: Shaded items are closed issues.

			– Forum) AT&T doesn't think the system or process will be the problem – the problem will be that you have a lot of human touch-points that create the opportunity for error. AT&T wants to see volumes of the level that could be expected with the process and some way to show that the process works under those volumes AT&T believes it is appropriate to test the actual process – once the process is developed – it should go through the test. As to the notion that there is something out there today that is a proxy – AT&T doesn't want to pursue that. Not suggesting that the testing has to be a part of any process proposal that the Commissions will approve – it can be done serially after the Commissions have issued their decisions. (AT&T 12/19/2003 Forum) Commercial testing must be an integral part of any approval process. (MCI – pp. 5 & 6) MCI does not believe a third party		

Transcripts for all Batch Hot Cut Forums are located under the "Forum Transcripts and Exhibits" pulldown menu at:
http://www.qwest.com/wholesale/training/tradeshow/batchhotcutarchive.html

**NOTE: Shaded items are closed issues.

			test is required. There must be metrics put in place and the commercial operation with the ability to look at performance and with distinct performance metrics and remedies is the way to go. It is commercial day-to-day activity that is monitored and that there are sanctions/penalties for non-performance. (MCI – Forum) MCI concerned that the ancillary processes that surround the batch hot cut process can handle the volumes that a batch process may bring about. Not something within the control of Qwest, however, will be an issue that may directly impact customers. So MCI believes must work through the process, the process must be measurable and then see what happens in the commercial world once the process is implemented. If there are problems that are impacting end-user customers, there must be a way to stop the process until the issues are addressed. (MCI – Forum) Process must be tested prior to implementation. (Eschelon – p. 16)

http://www.qwest.com/wholesale/training/tradeshow/batchhotcutarchive.html

**NOTE: Shaded items are closed issues.

			Eschelon is interested in getting more information regarding AT&T's testing proposal using Qwest retail customers. (Eschelon – Forum) Qwest should be required to test any proposed Batch Hot Cut process before a Commission makes a finding on whether CLECs are impaired in switching mass-market customers. Qwest must also ensure that associated vendors (numbering administrator, E911 administrator, etc.) can handle any increased loads. (McLeod – p. 2)		
T-2	Performance measures for new Batch Hot Cut process	Long Term PID Administration is the appropriate forum to develop new performance measures associated with the Batch Hot Cut process. Further, there is not the same 9-month deadline associated with developing performance measures. 12/3/2003 - Qwest would be willing to discuss Process Measures – but these are different than Performance Measures. 12/19/2003 - Specifically as to	Performance measures should be developed simultaneously with the process to permit Qwest's performance to be evaluated. (Eschelon – p. 15); MCI – p. 9. Need to have basic metrics and sanctions in place when the process is implemented. Eschelon cautions against delay in development of the metrics. (Eschelon – Forum) Metrics need to be incorporated into the various state PAPs. PIDs must be developed in parallel with the process development. (MCI Request) 12/10/2003: Qwest would be willing to work with the Long Term PID Administration (LTPA) facilitator, state commission staff members and CLECs to facilitate expeditious completion of BHC PID development in LTPA once the	1/8/2004 – McLeod recommends the issue be CLOSED with the understanding that the issue was whether there are measures in place today that can be used, with further measures to be developed in the Long Term PID Administration once the process is finalized. AT&T agrees to CLOSE based on the above understanding.

Transcripts for all Batch Hot Cut Forums are located under the "Forum Transcripts and Exhibits" pulldown menu at:
http://www.qwest.com/wholesale/training/tradeshow/batchhotcutarchive.html

**NOTE: Shaded items are closed issues.

		the MCI request – the PIDs that impact analog loop provisioning and repair processes are publicly available. Which metrics will be impacted by the Batch Hot Cut process as well as those that need to be developed for the Batch Hot Cut Process is more appropriately addressed by those experts in the LTPA Qwest is not willing to provide the PIDs for discussion in this Forum – the appropriate place for discussion and development is the LTPA.	– Forum) Measure of things like how many order rejected for CFA or customer losing service on the day of the cut or how many cuts done per day. Need a description of the metrics or measurements relating to the accuracy and seamlessness of LNP transactions. (MCI – p. 10) MCI requests that Qwest provide the current PIDs that do apply to the Batch Hot Cut Process and any PIDs that you think do not apply to the Batch, but do apply to Basic or Coordinated or other installation methods. 12/19/2003 – Forum - AT&T believes that all existing PIDs, with the exception of OP-4 and OP-13, would apply to the Batch Hot Cut process.	Batch Hot Cut Process is complete. 12/19/2003 – OPEN –as to MCI issue regarding identifying those existing PIDs that apply to the Batch Hot Cut process. Based on discussion during the 12/19/2003 Forum, MCI will take back the Action Item to provide a response regarding its position on the appropriate forum for development of Performance Measures during January face-to-face Forum. 1/8/2004 – Qwest has committed to support having development of BHC metrics being made a high priority in the Long Term PID Administration. Further, for those PIDs that are not modified, then Batch Hot Cut activity will be included in those measures e.g., analog loop measures. Finally, process oversight exists today that evaluates any problems that may arise to determine the cause and takes steps necessary to rectify the problem to improve the process. In today's world, with no batch hot cut exclusions, which PIDs would cover batch hot cut activity? If you look at general analog loop provisioning PIDs at the very least, OP-4 and OP-13 would not apply to batch hot cut activity. If you look at what the FCC focuses on it is commitments met and new installation service quality. Those PIDs would capture batch hot cut activity.	MCI agrees to CLOSE based on the above understanding. Covad agrees to CLOSE based on the above understanding.

My Commission Expires JUNE 11, 2004

STATE OF NORTH DAKOTA

PUBLIC SERVICE COMMISSION

Public Service Commission
Local Competition
Investigation

Case No. PU-439-03-295

AFFIDAVIT OF SERVICE BY ORDINARY AND ELECTRONIC MAIL

STATE OF NORTH DAKOTA
COUNTY OF BURLEIGH

Sharon Helbling deposes and says that:

she is over the age of 18 years and not a party to this action and, on the **15th day of January, 2004**, she deposited in the United States Mail, Bismarck, North Dakota, envelopes by first class mail, fully prepaid, securely sealed, each containing a photocopy of:

Order

The envelopes were addressed as follows:

See Attached List

Each address shown is the respective addressee's last reasonably ascertainable post office address.

Sharon Helbling

Subscribed and sworn to before me
this **15th day of January, 2004**.

PUBLIC SERVICE COMMISSION

Public Service Commission
Local Competition
Investigation

Case No. PU-439-03-295

ORDER

January 14, 2004

On December 3, 2003, the Commission sent Preliminary Discovery Requests to the intervenors in this proceeding requiring responses within 30 days. On December 31, 2003, the Commission extended the response time to January 15, 2004.

On December 24, 2003, the intervening rural ILECs filed a letter requesting that the discovery requests posed to rural ILECs be withdrawn. The rural ILECs state that the questions posed have no application to these rural ILECs since they do not operate in Qwest territory.

On January 7, 2004, Qwest filed a response objecting to the letter request filed by the rural ILECs. Qwest states that although these ILECs may not provide telephone services in local exchanges served by Qwest, some of the ILECs are affiliated with CLECs that provide telephone services in Qwest exchanges. Qwest states that ILEC facilities may be used by these or other CLECs to provide competitive telecommunications services in Qwest exchanges. In addition, Qwest states that some of the ILECs may be providing telecommunications services other than local exchange telephone services within local exchanges served by Qwest.

In the Triennial Review Order (TRO), the FCC found "that in order to gain access to UNEs, carriers must provide qualifying services using the UNE to which they seek access."[1] We agree that the Preliminary Discovery Requests do not apply to rural ILECs that provide no "qualifying services" within the local exchanges served by Qwest. "Qualifying service" is defined in 47 C.F.R. § 51.5 as follows:

> Qualifying service. A qualifying service is a telecommunications service that competes with a telecommunications service that has been traditionally the exclusive or primary domain of incumbent LECs, including, but not limited to, local exchange service, such as plain old telephone

[1] *In the Matter of Review of Section 251 unbundling Obligations of Incumbent Local Exchange Carriers*, CC Docket No. 01-338, *In the Matter of the Implementation of the Local Competition Provisions of the Telecommunications Act of 1996*, CC Docket No. 96-98, *In the matter of Deployment of Wireline Services Offering Advanced Telecommunications Capability*, CC Docket No. 98-147, Report and Order on Remand and Further Notice of Proposed Rulemaking, ¶ 135 (rel. Aug. 21, 2003).

Order
by Public Service Commission

service, and access services, such as digital subscriber line services and high-capacity circuits.

At the Commission's TRO Workshop on November 12, 2003, the parties discussed developing and submitting, jointly or individually, an abbreviated discovery request for CLECs that have not intervened in this proceeding. The Commission has not received any abbreviated discovery request proposals for Commission distribution to non-intervening CLECs.

Order

The Commission orders:

1. To the extent any rural ILEC provides any qualifying service within any of Qwest's exchanges, that rural ILEC is required to answer the Preliminary Discovery Requests to the extent applicable to that rural ILEC.

2. Any rural ILEC not providing any "qualifying service" within any Qwest exchange is not required to answer the Preliminary Discovery Requests.

Public Service Commission Local Competition Investigation	Case No. PU-439-03-295

QWEST RESPONSE TO LETTER REQUEST OF INDEPENDENT LOCAL EXCHANGE COMPANIES

By letter dated December 23, 2003, an unidentified group of Independent Local Exchange Companies ("ILECs") asked that recent discovery requests posed by the North Dakota Public Service Commission in this proceeding to "rural" ILECs be withdrawn. The letter states that the ILECs maintain the rural exemption provided under the Telecommunications Act of 1996 (47 U.S.C. § 251(f)(1) and that the questions posed by the Commission's discovery "have no application to these ILECs since they do not operate in Qwest territory."

Qwest Corporation objects to the ILECs request that the discovery posed to them be withdrawn. While these ILECs may not provide telephone services in local exchanges served by Qwest, some of the ILECs are affiliated with CLECs that provide telephone services in Qwest exchanges. ILEC facilities may be used by these or other CLECs to provide competitive telecommunications services in Qwest exchanges. In addition, some of the ILECs may be providing telecommunications services other than local exchange telephone services within local exchanges served by Qwest. Therefore, Qwest believes the questions posed by the Commission are relevant to these ILECs.

Response to Letter Request of
Independent Local Exchange Companies
by Qwest Corporation by Dan Kuntz, Attorney

01/07/2004 CC: Comm Legal PUD (3) ALJ

Accordingly, to the extent applicable, the discovery requests should be answered by the ILECs.

The ILECs' request for withdrawal of the discovery questions should be denied and the ILECs directed to file respond to the questions in accordance with the Commission's procedural order.

Dated this 7th day of January, 2004.

Respectfully submitted,

Daniel S. Kuntz (ID #03490)

PUBLIC SERVICE COMMISSION LOCAL COMPETITION INVESTIGATION
CASE NO. PU-439-03-295

We wish to file this request for recognition of rural exemption on behalf of the rural ILECs who petitioned to intervene in this matter. We request the recent questions posed to rural ILECs be withdrawn. We respect and appreciate the role of the North Dakota Public Service Commission (Commission) in facilitating the implementation of the Triennial Review Order.[1]

We respectfully request that the Commission consider the position of these companies. These companies intervened in this matter to monitor the activities in this matter. The focus of this proceeding is a granular analysis of the ability of competitors to compete in Qwest service territories in the state of North Dakota. (See ordering paragraph 527 at page 337.* Text enclosed.) The questions posed have no application to these ILECs since they do not operate in Qwest territory.

None of the rural carriers have received any requests for unbundled network elements in the state of North Dakota. All of these companies retain the rural exemptions outlined in the 1996 Telecommunications Act (47 U.S.C. § 251(f)(1). Given these circumstances, it

[1] In the Matter of Review of the Section 251 Unbundling Obligations of Incumbent Local Exchange Carriers, CC Docket No. 01-338, In the Matter of the Implementation of the Local Competition Provisions of the Telecommunications Act of 1996, CC Docket 96-98, In the Matter of Deployment of Wireline Services Offering Advanced Telecommunications Capability, CC Docket No. 98-147, Report and Order on Remand and Further Notice of Proposed Rulemaking (rel. Aug. 21, 2003).

is an exercise with no outcome and a moot point to undertake any granular factual review relative to provision of unbundled network elements in rural areas. It is an undue burden for these companies to gather and submit this information at this time since the submission of the information has no relationship or relevance to the granular review (90-day or 9-month review) by the Commission.

There may be a proper time and a proper place for a granular analysis of a rural company's ability to provide unbundled network elements to a requesting carrier. (One such method suggested in paragraph 418 of the TRO at page 260 is a review conducted after a petition is filed.* Text enclosed.) This can be performed in conjunction with the analysis of the particular rural carrier's rural exemption under § 251(f)(1). Due to the diversity of these rural carriers and their unique circumstances in any particular situation, that analysis can best be conducted on an a case-by-case basis. This analysis should be deferred until the appropriate time to do so.

With all due respect to the efforts of the Regional Oversight Committee that developed a list of questions that could be used by state commissions, the rural ILECs submit that a list of questions developed for use in Colorado, Minnesota, or Arizona have no application or relevancy to North Dakota's rural setting. As such, the rural ILECs request the Commission withdraw these questions or recognize that the questions are not applicable to rural ILECs.

Thank you for your consideration of this request.

Don Negaard

jt

Enclosure

ragraph shall be completed within six months of the filing of a petition or other pleading submitted in accordance with the prescribed state procedures.[1611]

(f) State Commission Failure to Act

527. For the mass market, state commissions will conduct their initial reviews, applying the triggers and factors discussed above,[1612] within nine months of the effective date of this Order. The incumbent LEC must continue providing unbundled circuit switching in all locations until a state commission completes its proceedings. To the extent that a state commission fails to complete the granular inquiry,[1613] any aggrieved party may file a petition with this Commission demonstrating a state's failure to act pursuant to the procedures we outline today.[1614] Moreover, should a state commission fail to approve a batch cut migration process or provide a detailed explanation why such a process is not necessary within nine months of this Order's effective date, any aggrieved party will be permitted to initiate a proceeding with this Commission.[1615] The incumbent LEC must continue providing unbundled local circuit switching, subject to the four-line carve-out described above,[1616] while such a petition is pending with this Commission.

7. Transition of the Embedded Customer Base

528. We recognize the need to establish a transition plan to migrate the embedded unbundled local circuit switching customer base to an alternative service arrangement when unbundled local circuit switching is no longer made available. We find that we have the authority to establish such a plan because whether competing carriers can deploy facilities in a timely fashion is a key consideration in determining whether there is impairment. In instances when existing network elements may potentially be eliminated pending a fact-intensive investigation, we find that section 251(d)(2) gives us authority to promulgate reasonable transition rules to protect the public interest by preserving the status quo pending the outcome of the investigation and by giving competitive carriers a realistic opportunity to deploy their own

---

[1611] *See supra* note 1291.

[1612] This includes the state commissions' approval of a batch cut migration process or, in the alternative, the provision of a detailed explanation why such a process is not necessary within nine months of this Order's effective date.

[1613] By "complete," we mean that a state commission, upon receiving sufficient evidence, has an affirmative obligation to review the relevant evidence associated with any market submitted by an interested party, and to apply the trigger and any other analysis specified in this Part to such evidence.

[1614] As discussed above, if a state fails to act, we set forth procedures for the Commission to step into the role of the state. *See supra* Part V.E.2. (discussing the role of the states).

[1615] *See id.*

[1616] *See supra* para. 525.

418. After completion of their initial reviews, we expect state commissions to conduct further granular reviews, pursuant to the procedures the state commissions adopt, to identify additional routes that satisfy the triggers. Such proceedings shall be completed within six months of the filing of a petition or other pleading submitted in accordance with the prescribed state commission procedures.[1291]

D. Local Circuit Switching

1. Summary

419. Pursuant to the approach set forth in the *Triennial Review NPRM*,[1292] the Commission adopts in this Order a more granular analysis for access to unbundled incumbent LEC local circuit switching. Specifically, based on the evidence in the record, we make the following determinations:

- *Local Circuit Switches Serving DS1 Capacity and Higher Enterprise Customers*. Based on evidence of competing carriers' widespread switch deployment to provide DS1 and above capacity service, we find on a national level that requesting carriers are not impaired without access to unbundled local circuit switching when serving DS1 enterprise customers. The states may rebut this finding by petitioning this Commission based on a granular review of specifically enumerated operational and economic criteria regarding facilities-based entry in specific markets.

- *Local Circuit Switches Serving Mass Market Customers.* We find on a national level that requesting carriers are impaired without access to unbundled local circuit switching when serving mass market customers. This finding is subject to a more granular review by the states pursuant to specifically enumerated triggers and other operational and economic criteria regarding facilities-based entry in specific geographic markets.[1293]

[1291] Subsequent to the initial review, states have the flexibility to adopt reasonable and timely procedures for the periodic collection and evaluation of evidence indicating the satisfaction of the transport triggers on additional routes to remove unbundling obligations. For example, a state may decide to include self-reporting information regarding alternative transport deployment in an annual or semi-annual report, either as an independent obligation or as part of the competitive carriers' periodic filing obligations. Alternatively, a state may decide to accept evidence of alternative deployment through petitions filed during prescribed filing windows or through rulemaking proceedings. Regardless of the procedures adopted, however, states that conduct further reviews must complete their evaluation of the evidence and reach a determination within six months of the filing of a petition or other pleading filed pursuant to the state procedures.

[1292] *Triennial Review NPRM*, 16 FCC Rcd at 22806, para. 55.

[1293] *USTA*, 290 F.3d at 422. By establishing an overarching national framework while at the same time developing precisely the type of granularity test called for by the D.C. Circuit in *USTA*, our switching approach allows for the Commission to take advantage of, and build on, the wealth of knowledge and expertise within a national regime for local telephone competition consistent with the federal-state partnership envisioned by the Congress in the Act.

PUBLIC SERVICE COMMISSION LOCAL COMPETITION INVESTIGATION
CASE NO. PU-439-03-295

We wish to file this request for recognition of rural exemption on behalf of the rural ILECs who petitioned to intervene in this matter. We request the recent questions posed to rural ILECs be withdrawn. We respect and appreciate the role of the North Dakota Public Service Commission (Commission) in facilitating the implementation of the Triennial Review Order.[1]

We respectfully request that the Commission consider the position of these companies. These companies intervened in this matter to monitor the activities in this matter. The focus of this proceeding is a granular analysis of the ability of competitors to compete in Qwest service territories in the state of North Dakota. (See ordering paragraph 527 at page 337.* Text enclosed.) The questions posed have no application to these ILECs since they do not operate in Qwest territory.

None of the rural carriers have received any requests for unbundled network elements in the state of North Dakota. All of these companies retain the rural exemptions outlined in the 1996 Telecommunications Act (47 U.S.C. § 251(f)(1). Given these circumstances, it

[1] In the Matter of Review of the Section 251 Unbundling Obligations of Incumbent Local Exchange Carriers, CC Docket No. 01-338, In the Matter of the Implementation of the Local Competition Provisions of the Telecommunications Act of 1996, CC Docket 96-98, In the Matter of Deployment of Wireline Services Offering Advanced Telecommunications Capability, CC Docket No. 98-147, Report and Order on Remand and Further Notice of Proposed Rulemaking (rel. Aug. 21, 2003).

97 PU-439-03-295 Pages: 4

Request for recognition of rural exemption
by Rural Telephone Company Group by Don Negaard,

12/24/2003 CC: Comm Legal PUD (2) Al

is an exercise with no outcome and a moot point to undertake any granular factual review relative to provision of unbundled network elements in rural areas. It is an undue burden for these companies to gather and submit this information at this time since the submission of the information has no relationship or relevance to the granular review (90-day or 9-month review) by the Commission.

There may be a proper time and a proper place for a granular analysis of a rural company's ability to provide unbundled network elements to a requesting carrier. (One such method suggested in paragraph 418 of the TRO at page 260 is a review conducted after a petition is filed.* Text enclosed.) This can be performed in conjunction with the analysis of the particular rural carrier's rural exemption under § 251(f)(1). Due to the diversity of these rural carriers and their unique circumstances in any particular situation, that analysis can best be conducted on an a case-by-case basis. This analysis should be deferred until the appropriate time to do so.

With all due respect to the efforts of the Regional Oversight Committee that developed a list of questions that could be used by state commissions, the rural ILECs submit that a list of questions developed for use in Colorado, Minnesota, or Arizona have no application or relevancy to North Dakota's rural setting. As such, the rural ILECs request the Commission withdraw these questions or recognize that the questions are not applicable to rural ILECs.

Thank you for your consideration of this request.

Don Negaard

jt

Enclosure

paragraph shall be completed within six months of the filing of a petition or other pleading submitted in accordance with the prescribed state procedures.[1611]

(f) State Commission Failure to Act

527. For the mass market, state commissions will conduct their initial reviews, applying the triggers and factors discussed above,[1612] within nine months of the effective date of this Order. The incumbent LEC must continue providing unbundled circuit switching in all locations until a state commission completes its proceedings. To the extent that a state commission fails to complete the granular inquiry,[1613] any aggrieved party may file a petition with this Commission demonstrating a state's failure to act pursuant to the procedures we outline today.[1614] Moreover, should a state commission fail to approve a batch cut migration process or provide a detailed explanation why such a process is not necessary within nine months of this Order's effective date, any aggrieved party will be permitted to initiate a proceeding with this Commission.[1615] The incumbent LEC must continue providing unbundled local circuit switching, subject to the four-line carve-out described above,[1616] while such a petition is pending with this Commission.

7. Transition of the Embedded Customer Base

528. We recognize the need to establish a transition plan to migrate the embedded unbundled local circuit switching customer base to an alternative service arrangement when unbundled local circuit switching is no longer made available. We find that we have the authority to establish such a plan because whether competing carriers can deploy facilities in a timely fashion is a key consideration in determining whether there is impairment. In instances when existing network elements may potentially be eliminated pending a fact-intensive investigation, we find that section 251(d)(2) gives us authority to promulgate reasonable transition rules to protect the public interest by preserving the status quo pending the outcome of the investigation and by giving competitive carriers a realistic opportunity to deploy their own

---

[1611] *See supra* note 1291.

[1612] This includes the state commissions' approval of a batch cut migration process or, in the alternative, the provision of a detailed explanation why such a process is not necessary within nine months of this Order's effective date.

[1613] By "complete," we mean that a state commission, upon receiving sufficient evidence, has an affirmative obligation to review the relevant evidence associated with any market submitted by an interested party, and to apply the trigger and any other analysis specified in this Part to such evidence.

[1614] As discussed above, if a state fails to act, we set forth procedures for the Commission to step into the role of the state. *See supra* Part V.E.2. (discussing the role of the states).

[1615] *See id.*

[1616] *See supra* para. 525.

418. After completion of their initial reviews, we expect state commissions to conduct further granular reviews, pursuant to the procedures the state commissions adopt, to identify additional routes that satisfy the triggers. Such proceedings shall be completed within six months of the filing of a petition or other pleading submitted in accordance with the prescribed state commission procedures.[1291]

D. Local Circuit Switching

1. Summary

419. Pursuant to the approach set forth in the *Triennial Review NPRM*,[1292] the Commission adopts in this Order a more granular analysis for access to unbundled incumbent LEC local circuit switching. Specifically, based on the evidence in the record, we make the following determinations:

- *Local Circuit Switches Serving DS1 Capacity and Higher Enterprise Customers*. Based on evidence of competing carriers' widespread switch deployment to provide DS1 and above capacity service, we find on a national level that requesting carriers are not impaired without access to unbundled local circuit switching when serving DS1 enterprise customers. The states may rebut this finding by petitioning this Commission based on a granular review of specifically enumerated operational and economic criteria regarding facilities-based entry in specific markets.

- *Local Circuit Switches Serving Mass Market Customers*. We find on a national level that requesting carriers are impaired without access to unbundled local circuit switching when serving mass market customers. This finding is subject to a more granular review by the states pursuant to specifically enumerated triggers and other operational and economic criteria regarding facilities-based entry in specific geographic markets.[1293]

[1291] Subsequent to the initial review, states have the flexibility to adopt reasonable and timely procedures for the periodic collection and evaluation of evidence indicating the satisfaction of the transport triggers on additional routes to remove unbundling obligations. For example, a state may decide to include self-reporting information regarding alternative transport deployment in an annual or semi-annual report, either as an independent obligation or as part of the competitive carriers' periodic filing obligations. Alternatively, a state may decide to accept evidence of alternative deployment through petitions filed during prescribed filing windows or through rulemaking proceedings. Regardless of the procedures adopted, however, states that conduct further reviews must complete their evaluation of the evidence and reach a determination within six months of the filing of a petition or other pleading filed pursuant to the state procedures.

[1292] *Triennial Review NPRM*, 16 FCC Rcd at 22806, para. 55.

[1293] *USTA*, 290 F.3d at 422. By establishing an overarching national framework while at the same time developing precisely the type of granularity test called for by the D.C. Circuit in *USTA*, our switching approach allows for the Commission to take advantage of, and build on, the wealth of knowledge and expertise within a national regime for local telephone competition consistent with the federal-state partnership envisioned by the Congress in the Act.

Subject: Attached Procedural Order

Colleen Park
North Dakota Newspaper Association

Colleen:

Please have the attached Procedural Order published as a legal publication in the next issue of the ten North Dakota daily newspapers and run it as a "News Item Only" article as well.

Please send the bill to the Public Service Commission, along with a tear sheet for billing purposes.

If you have any questions, let me know.

Thank you.

Investigation

Case No. PU-439-03-295

PROCEDURAL ORDER

December 3, 2003

On August 21, 2003, the Federal Communications Commission (FCC) released its Triennial Review Order (TRO) and adopted new rules concerning incumbent local exchange carrier (ILEC) obligations to unbundle certain elements of their networks and make those unbundled network elements (UNEs) available to competitive local exchange carriers (CLECs). The FCC made nationwide findings of impairment or non-impairment for switching and certain high capacity loops and dedicated transport network elements, but has given the opportunity for state commissions to engage in additional fact finding and make alternative impairment findings based on a more granular impairment analysis of the markets in each respective state. The rules became effective on October 2, 2003.

For a significant group of issues, the FCC requires state commissions to complete their analyses and reviews within nine months from the effective date of the *TRO*. These issues concern high capacity loops, dedicated transport, batch hot cut process, DS0 crossover point, and mass market switching.

On November 7, 2003, the Commission issued a Notice of Multi-State Batch Hot Cut Forum and Procedural Order. By the Notice, the Commission endorsed a multi-state forum with participation by ILECs, CLECs, as well as state commission personnel and other interested parties that will attempt to reach agreement on a batch hot cut process for use by all states within the Qwest Corporation region. The Procedural Order adopted in that Notice is included in this Procedural Order.

The Commission originally set October 24, 2003 as an intervention deadline in this case, and several petitions to intervene have been received. However, in an effort to facilitate the sharing of sufficient information among all potentially interested parties, so that each potentially interested party can make an informed decision about the impact of the case and the appropriate level of participation, the Commission held a workshop on November 24, 2003. At the workshop, Qwest indicated that it would be seeking a non-impairment finding for switching network elements.

The Commission now adopts the following schedule and procedural requirements:

ACTIVITY	DUE DATE
Commission Notice to all CLECs within respective states regarding batch hot cut forum	November 7, 2003

92 PU-439-03-295 Pages: 2
Procedural Order
by Public Service Commission
12/03/2003 CC: Comm Legal PUD (3) ALJ

Qwest submits its batch hot cut proposal which will include a detailed description of the process, including, but not limited to, capacity, Pre-order, Ordering and Provisioning, the proposed cost for the batch hot cut activities, and the intervals.	November 12, 2003
CLECs submit comments/counter proposals to Qwest's batch hot cut proposal	November 18, 2003
Initial Batch Hot Cut Forum – Denver, Colorado	December 1-3, 2003
Preliminary Discovery Questions regarding switching network element impairment/non-impairment distributed by the Public Service Commission	December 3, 2003
Weekly conference calls on batch hot cut proposal, if useful. Face-to-face meetings as necessary (in Seattle, Washington & Phoenix, Arizona)	December 4, 2003 - January 15, 2004
Deadline for requests to intervention	December 22, 2003
Simultaneous filing to the Commission of direct testimony on impasse issues regarding the batch hot cut process and filing of a Stipulation among parties on areas of agreement/consensus items.	January 20, 2004
Simultaneous filing to the Commission of rebuttal testimony regarding the batch hot cut process	February 17, 2004
Simultaneous filing to the Commission of direct testimony regarding switching network element impairment/non-impairment	March 8, 2004
Simultaneous filing to the Commission of rebuttal testimony regarding switching network element impairment/non-impairment	April 19, 2004

Mr. William W. Binek
Hearing Administrator
Public Service Commission - Dept. 408
600 East Boulevard Avenue
Bismarck, ND 58505

Dear Mr. Binek:

Thank you for your November 25, 2003, request of the designation of an administrative law judge from the Office of Administrative Hearings to conduct a hearing in the matter of Qwest Corporation (PU-439-03-295). I hereby designate myself as administrative law judge to conduct the hearing in regard to this matter. Because the administrative law judge will not be making recommended findings of fact and conclusions of law, or issuing a recommended order, the person or persons who will actually be making the final administrative decision in regard to this matter (i.e., agency head, deputy, board, commission) must actually be in attendance at the hearing.

Please send all additional relevant documents in regard to this matter (correspondence, and other pleadings and documents) to the designated administrative law judge in care of the Office of Administrative Hearings, 1707 North 9th Street, Bismarck, North Dakota 58501-1882. I understand the hearing has been scheduled for May 10 - 14, 2004 and May 24 - 28, 2004 in the Commission's Hearing Room, 12th Floor, State Capitol, 600 East Boulevard, Bismarck, North Dakota.

Sincerely,

Allen C. Hoberg
Director

Re: Case No. PU-439-03-295
Public Service Commission
Local Competition
Investigation

Dear Mr. Hoberg:

Enclosed is a request for an administrative law judge in the above case. The Commission has scheduled hearings for May 10 – 14, 2004 and May 24 – 28, 2004, in the Commission's Hearing Room, 12th Floor, State Capitol, Bismarck. The administrative law judge will serve as a procedural law judge, a court reporter may be present, and the hearing will be tape recorded. A copy of the case is enclosed.

Please provide the Commission with a copy of any filings issued by your office in this matter.

If you have any questions, please contact me. Thank you.

Sincerely,

William W. Binek
Hearing Administrator

REQUEST FOR ADMINISTRATIVE LAW JUDGE--APPEAL, APPLICATION, OR PETITION

NORTH DAKOTA OFFICE OF ADMINISTRATIVE HEARINGS

SFN 17819 (Rev. 03-2001)

Name of Agency, Board, or Commission
Public Service Commission

The above named agency, board, or commission requests designation of an administrative law judge from the Office of Administrative Hearings for the Public Service Commission Local Competition Investigation; Case No. PU-439-03-295

(e.g., application of [name], appeal of [name], petition of [name]). Authority for the administrative action is found in Title 49 (North Dakota Century Code and/or North Dakota Administrative Code).

Please attach related documents and correspondence.

The administrative action is more fully described as follows:
Formal Hearings will be held May 10 - 14, 2004 & May 24 - 28, 2004, (time to be determined) in the Commission Hearing Room, 12th Floor, State Capitol, Bismarck, ND.

It requests designation of an administrative law judge (please check one):

- ☐ **To conduct the hearing and issue recommended findings of fact, conclusions of law, and order.**
- ☑ **To serve as a procedural administrative law judge only (no recommended decision). The agency head will be present at the hearing as required by NDCC 54-57-04(6).**
- ☐ **To conduct the hearing, issue findings of fact, conclusions of law, and a final order.**

PLEASE MAKE A REQUEST FOR AN ADMINISTRATIVE LAW JUDGE AT LEAST ONE MONTH BEFORE THE HEARING.

Please list parties, including the agency if it is a Party, and Representation [attorney (or other)] if known, or Agency Contact: (Attach separate list if necessary.)

AGENCY Public Service Commission	Address 600 E. Blvd. Ave., Dept. 408, Bismarck, ND 58505	Telephone Number 328-2400
Representation William W. Binek	Address Same as Above	Telephone Number 328-4088
PARTY See Attached	Address	Telephone Number
Representation	Address	Telephone Number
PARTY	Address	Telephone Number
Representation	Address	Telephone Number

Additional Comments
The hearings will be tape recorded and a court reporter present.

(For agencies required to use OAH, notice of hearing will be issued by the administrative law judge, unless a procedural administrative law judge is requested. Other requesting agencies and agencies requesting a procedural administrative law judge should first contact OAH about scheduling a hearing. If notice has already been issued, attach a copy of the notice.)

Typed or Printed Name and Title of Requesting Person William W. Binek, Hearing Administrator	Date November 25, 2003
Signature of Requesting Person X	Telephone Number 328-4088

Case No. PU-439-03-295

ORDER GRANTING INTERVENTION

November 20, 2003

On October 24, 2003, Pringle & Herigstad, P.C. filed a Petition to Intervene in this proceeding on behalf of the Rural Telephone Company Group (RTCG). On November 13, 2003 Pringle & Herigstad, P.C. filed an amendment to its Petition. The RTCG is comprised of BEK Communications Cooperative, Consolidated Communications Networks, Inc., Consolidated Telcom, Dakota Central Telecommunications Cooperative, Dakota Central Telcom I, Inc., Dickey Rural Telephone Cooperative, Dickey Rural Communications, Inc., Dickey Rural Access, Inc., Griggs County Telephone Co, Inter-Community Telephone Company, L.L.C., Midstate Telephone Company, Midstate Communications Inc., Moore and Liberty Telephone Company, North Dakota Telephone Company, Northwest Communications Cooperative, Polar Communications Mutual Aid Corporation, Polar Telecommunications, Inc., Polar Telcom, Inc., Red River Rural Telephone Association, Red River Telecom, Inc., Reservation Telephone Cooperative, SRT Communications, Inc., Turtle Mountain Communications, Inc., United Telephone Mutual Aid Corporation, and West River Telecommunications Cooperative. The companies of the RTCG are licensed local exchange carriers or competitive local exchange carriers in North Dakota.

The petition stated that the RTCG has substantial financial and legal interests in the issues regarding the availability or unavailability of certain unbundled network elements. The Commission finds the RTCG does have an interest in these matters and its participation will not unduly broaden the issues or delay the proceedings.

Order

The Commission orders:

1. The petition of the Rural Telephone Company Group, to intervene in this proceeding is granted.

2. Admission as an intervenor shall not be construed as recognition by the Commission that an intervenor might be aggrieved by an order of the Commission in this case.

MCI'S RESPONSE TO QWEST'S PROPOSAL FOR REGION-WIDE BATCH LOOP CONVERSION PROCESS

WorldCom, Inc., on behalf of its regulated subsidiaries, ("MCI") submits this response to Qwest Corporation's ("Qwest") proposal for a region-wide batch hot cut ("BHC") process. These are preliminary comments based upon MCI's review of Qwest's proposal in less than a week. Qwest's proposal is being circulated within MCI to its relevant business units and its information technology personnel for review and comment. Accordingly, MCI requests and reserves the right to provide additional and more complete comments as the 14-state collaborative forum progresses.

INTRODUCTION

Qwest has made a number of legal arguments concerning what it believes it is obligated to provide for a batch hot cut process. MCI does not intend to address those legal arguments in depth in this preliminary filing. Rather, MCI will state from a business perspective what it needs for a batch hot cut process.

Although Qwest states that its current process to convert lines from one competitive local exchange carrier's ("CLEC") circuit switch to another in a "batch process", is adequate, it nevertheless has proposed modifications which, in MCI's opinion, are not sufficiently defined

and create risks that the end user customers may have a greater likelihood of losing service for longer periods of time. In other words, Qwest's proposed changes tend to reduce the quality of services proposed, for example, by eliminating certain testing, by eliminating the sending of test results, by contacting CLECs by e-mail to notify of the completion of a hot cut, and by doing pre-wiring on the day of the cut instead of in advance of the cut. This elimination of services associated with conversion of lines poses greater risks to end users that their lines will be out of service longer, that the cut will not take place when scheduled, or that other service failures will increase.

Nevertheless, MCI remains hopeful that procedures and practices eventually emanating from the Qwest's BHC process will help to facilitate the orderly and seamless migration of a portion of its current, or embedded, UNE-P-based mass market customers to services provided over unbundled loop ("UNE-L") facilities purchased from Qwest and switching facilities owned and/or controlled by MCI itself in areas where it is economically viable to do so. It is MCI's expectation that any processes designed to facilitate such a migration will be efficient, economical and, most importantly, non-customer impacting. MCI does not believe, however, that the mere *identification* – as distinguished from the designing, testing, implementing and on-going performance in a commercial environment – of a BHC process is sufficient to address questions of actual impairment.

MCI encourages Qwest, the Commission and its Staff, and all other Parties involved in this collaborative forum to recognize that the establishment or modification of a BHC process must be considered along with all other affected systems, procedures and practices in order to verify that each such system, procedure and practice will effectively perform its designed

functions simultaneously under commercial loads. Also, a BHC process must address other areas of impairment relating to other types of hot cuts - such as CLEC-to-CLEC migrations, CLEC-to-ILEC migrations which will occur after the embedded base of a given has been transitioned to UNE-L in a given geographic market or the migration of customers who have CLEC data services from UNE-P line splitting to UNE-L line splitting.

MCI also encourages Qwest, the Commission and its Staff, and all other Parties involved in this collaborative forum to remain focused on the long-term objectives involved with the establishment of an efficient BHC process and to consider not only the short-term, manual modifications, but the longer term possibilities including, for example, the wider implementation of GR303 capable Integrated Digital Loop Carrier ("IDLC") systems which would allow for the unbundling of IDLC based loops without migration to "other facilities," which often times contributes to additional manual processing, delays and errors. The use of automated or robotic frames should also be contemplated as a longer-term solution, particularly in unmanned central offices ("COs") similar to those in which such technologies have already been tested, proven and are currently operational.

Finally, consideration must be given to a competitively neutral cost recovery mechanism for all costs. Qwest has failed to provide any total element long run incremental cost ("TELRIC") studies or proposed any new rates for its proposed BHC process. This is critical since the pricing must reflect Qwest's efficiencies gained from the BHC process. For instance, the BHC process will significantly reduce coordination costs and such reductions should be reflected in the economic costs.

SUMMARY OF MCI'S BHC PROCESS CRITERIA

The Federal Communications Commission's ("FCC") BHC process must be implemented by Qwest for purposes of provisioning unbundled loops. [see FCC rule §51.319(d)(2)(ii)]. Any BHC process implemented by MCI, including the internal systems/processes needed to complement the Qwest process, will be directly affected by Qwest's BHC process ultimately adopted by the Commission. It is not possible to identify all relevant CLEC operational issues in a vacuum, because the systems of both Qwest and the CLECs must be considered together. That is, systems and processes must be in place in the functional areas of pre-ordering, ordering, provisioning, and maintenance and repair in order to identify all operational issues.

There are, however, certain criteria that MCI believes must be captured by Qwest's BHC process to be consistent with the FCC's *Triennial Review Order* ("TRO"). Those include at least the following:

a. The process must be largely mechanized if it is to comply with the FCC's requirements of seamlessness, scalability and low cost. MCI believes that the mechanized process currently available for UNE-P migrations stands as a workable benchmark against which any seamless, scalable and low cost BHC process should be measured.

b. The process must be largely free of exclusions, i.e., a CLEC must be allowed to use the process to move any loop from another carrier's circuit switch to its own circuit switch. This should include any line splitting scenarios, any equipment types such as IDLC and should not be restricted by class or size of an end user customer.

The BHC process should not only accommodate these loops from a physical provisioning standpoint, but should also include them in any performance metrics as well. The FCC places no

restrictions on the BHC process relative to different types of loops and MCI believes such restrictions would dramatically reduce the benefit and effectiveness of the BHC process as envisioned by the FCC.

c. The process should maximize the ability for both Qwest and CLECs to rely upon existing electronic bonded systems, such as electronic data interchange ("EDI"). While opportunities exist for enhancements in this area, such as the passing of status information relative to BHC pre-wiring, wiring, LNP in real-time, and system-to-system interface, graphical user interfaces ("GUI") interfaces should be used only as a last resort but nevertheless be available to obtain information. CLECs should be allowed to submit orders which identify a given hot cut batch, using EDI or other established ordering mechanisms that generally flow through their existing systems for individual or multiple lines. Qwest should not be allowed to require some type of manual ordering scenario or require the CLEC to provide spreadsheets, or "cut sheets" even if such sheets are required for ordering loops today. Indeed, there should never be a need to call Qwest provisioning centers or to exchange faxes or other time consuming and error prone exchanges of information.

d. The BHC process should provide both a coordinated hot cut ("CHC") and frame due time ("FDT") option. Both options should include a due date scheduling function that can be accessed electronically by CLECs.

e. Performance measures, remedies and commercial testing must be an integral part of any approval process. Again, the existing UNE-P migration process and related performance criteria should be used as a starting point for these exercises. Provisioning intervals should be

established in advance. A CLEC should not be required to "negotiate" the provisioning date for each BHC in advance.

The appropriate average completion intervals for BHC processes should be similar, if not identical, to the existing UNE-P migration process and the applicable completion intervals that exist therewith. Consistent with MCI's primary concern relative to the applicable customer experience, it is absolutely imperative that the customer be completely oblivious to whether he/she is being served via UNE-P or UNE-L, or when that change in provisioning technology might have taken place. Part of that transparency is the ability to serve customers on a relatively short timeframe, consistent with the timeframe available using UNE-P today. Completion intervals for the BHC process that exceed existing UNE-P migration intervals will not provide adequate transparency for the customer and will negatively impact a CLEC's ability to effectively compete.

f. After having established proper metrics, the Commission should establish a testing schedule for at least the long-term process to ensure that all systems work as advertised under testing and commercial conditions.

g. After Qwest has successfully completed BHC process testing, a TELRIC-compliant rate that reflects the efficiencies resulting from the "batch" processes must be established. MCI would expect a rate structure that would reflect costs for the initial hot cut and additional hot cuts. The pricing might also vary by 2-wire and 4-wire circuits. There is currently no detail in Qwest's filing that would help MCI understand the pricing structure or underlying costs.

SPECIFIC COMMENTS

Qwest's filing begins by suggesting that the TRO's comments about problems with the incumbent local exchange carriers' current hot cut processes does not apply to Qwest, because its Arizona 271 application was reviewed, presumably by the FCC, with the TRO findings in mind. Nothing supports this assertion in the TRO. The TRO speaks to mass markets hot cuts at high volumes so that customers may be transitioned from UNE-P to UNE-L. Nowhere does the TRO state that Qwest has a process that meets its new criteria of a seamless, scalable, low-cost process. The FCC has had Qwest's current process under 271 review for some time, and if the FCC considered Qwest's process to be adequate, it likely would have said so and provided guidance to other ILECs and CLECs.

Qwest states that its process applies when a CLEC has "requisite number of lines" and defines that as 25 lines. MCI may want a lower number based on unique customer requirements or other circumstances. CLECs should be allowed to determine a minimum or maximum amount of orders to send per batch, per CO. This change allows CLECs the opportunity to continuously examine their UNE-P customer base and/or targeted sales volume by CO location and make informed decisions about which COs to convert with a BHC and which would be best served by individual orders.

In addition, Qwest must define "sufficient volumes" for CLEC-to-CLEC migrations and must provide another seamless process to move these customers. If MCI has to transition its customer base, it appears that Qwest is stating that MCI cannot use the BHC if MCI does not have enough lines/customers/orders for a Qwest-defined batch. This needs to be clarified.

MCI's initial transition of UNE-P customers will be UNE-L with LNP 100% of the time. Qwest must clarify how many orders it is able perform per CO, per CLEC in a single day for both CHC and FDT hot cuts. In its proposal (Exhibit 7), it sets a cap at 100 "orders" per day, per CO. While Qwest states that it will do batches of at least 25 "lines", its proposal does not address multiple CLECs and the largest number of BHCs it can do in a single day per CO. Qwest discusses completing orders with line splitting during "normal business hours" but doesn't define those hours or indicate whether batch cuts will be completed at times other than normal business hours. These timing issues are critical since Qwest's process envisions "phoning the CLEC" to resolve issues. Qwest's proposal includes only POTS lines; however, as noted above MCI also requires that IDLC lines and line splitting/line sharing loops be included. It is MCI's understanding that other incumbent local exchange carriers will include IDLC in their BHC processes. Finally, Qwest uses "lines" and "orders" in addressing sizing and BHC limitations. The correct nomenclature needs to be clarified.

The BHC (CHC and FDT) process and relevant systems and related processes must apply to multiple scenarios including, but not limited to, CLEC UNE-P to UNE-L (same CLEC), CLEC UNE-P to ILEC-retail, CLEC UNE-P to CLEC UNE-L (different CLEC), CLEC UNE-L to CLEC UNE-L (different CLEC), just to name a few. All of the functional areas are implicated in one or more ways—and more importantly, in different ways—by the various possible serving scenarios. By way of example, beyond the processes associated with the physical cutover of Qwest's loop to the CLEC's collocation are numerous critical database issues, including Line Information Database ("LIDB"), Customer Name ("CNAM"), 9-1-1 Automatic Location Identification ("ALI), and directory listings and NPAC-Number Portability Administration

Center impacts. Each of these databases contains customer-impacting data, and there is a critical need to develop coordinated, seamless, and scalable processes and systems addressing all of the possible serving scenarios to avoid putting at risk a variety of customer features and functionalities

When MCI transitions its customers from UNE-P to UNE-L in a specific CO, MCI will likely transition all lines in a given CO. MCI will also require migrating a line splitting line from "one carrier's circuit switch to another" when MCI moves an in-place line splitting customer. The fact that CLECs continue to have an interest in the provision of DSL-based services—including, for example, via line-splitting—adds yet another level of difficulty to the complexities already noted. Loop splitting thus remains a critical area that must be reviewed and tested prior to any finding that the BHC process has been adequately addressed.

Qwest must provide a detailed summary of its "new business rules" associated with the process and a time frame for implementation. The final business rules cannot be developed, however, until the process is fully defined, in place and tested. Qwest must also provide information on the current OSS used for this process and whether the orders "flow through" and whether and under what circumstances orders will fall out to manual processing. The process must be applicable for both EDI and GUI. Qwest's BHC Provisioning Flow (Exhibit 6) is not nearly detailed enough. Finally, the BHC process must be implemented and tested to prove it is effective and working as defined. Testing must also ensure that the BHC process works as defined under commercial loads. There must be new metrics for the new process.

MCI does not want to have meetings to negotiate due dates. Spreadsheets or cut sheets sent to the CLEC by Qwest are inadequate and cause delay. Qwest must develop an automated

due date scheduler or some other method of time selection that will allow CLECs to know when the process can start and be completed. Negotiations and contacts with project managers must not be required and only serve to increase the time required for the transitions. Qwest should develop an electronically bonded and on-line system for communicating with CLECs similar to the Verizon Wholesale Provisioning Tracking System ("WPTS") system.[1] This will eliminate work steps and miscommunications and enhance efficiencies. MCI does not believe that a good process requires that problems will be communicated by phone calls. This takes time and is a manual process prone to errors. An on-line, real-time electronic system should be used.

Delaying a dial tone check and the final jeopardy until the day of the cut is dangerous for consumers. MCI also disagrees with Qwest's proposal that CLECs be informed of cut completion via an e-mail. This is a wholly manual process that will lead to additional problems. The completion of the cutover should trigger an electronic service order completion ("SOC") notice within 10 minutes of the cut in order to prevent undue delay for the LNP process calls for an extended period of time that consequently delays when customers will be able to receive calls.

The Qwest BHC process takes a step backwards from the "migrate by telephone number ("TN") procedures that MCI previously requested and were recently implemented by Qwest as a result of MCI's change request submitted through Qwest's change management process. CLECs should not have to send service addresses or customer code for any of these orders. Moreover, Directory listings must be "migrated as is". Qwest must specify all ordering requirements. Qwest must also provide the highest number of number portability transactions (ILEC to CLEC,

---

[1] By referencing the Verizon system does not mean that MCI considers that system in its presently identified status to be ideal or acceptable to MCI; however, it is one form of an electronically bonded and on-line system for communicating with CLECs.

CLEC to ILEC, and CLEC to CLEC) done on one day over the past year. Additionally, Qwest must provide a description of any metrics or measurements relating to the accuracy and seamlessness of LNP transactions, both pertaining to conduct of NeuStar and also relating to conduct of carriers in general. Additionally, Qwest's proposal eliminates the dial tone check two days prior to the cut date ("DD-2") and moves the dial tone check to the day of cut. This will not give the CLEC time to fix any problems and will cause customer dissatisfaction.

Some general observations are appropriate. Qwest never really discusses number porting and how quickly after the BHC is completed, the TN is released. Qwest does not address whether it will notify a CLEC only after the entire batch is completed or after a certain number of orders within the batch are completed in order to allow the CLEC to continue updating its systems. In Exhibit 6, Qwest refers standard "Record Retention Process", but does not describe that process or what it entails. In Exhibit 7, under "CLEC Impacting" in the 1st bullet there is a reference order entry and prioritization of BHC by Qwest. What is Qwest prioritizing? Under "Qwest Requirements" in the 2nd bullet, MCI does not need a spreadsheet from Qwest after the FOC, the FOC should be sufficient. Finally, Qwest has not proposed a "throwback"' timeframe, during which period such as three hours, after a cut has taken place, the CLEC can request the customer be returned to UNE-P to address any subsequent problems that might arise and maintain a customers telephone service.

RECOMMENDATIONS AND CONCLUSIONS

1. Allow CLECs to determine a minimum or maximum amount of orders to send per batch per CO. This change allows CLECs the opportunity to continuously examine UNE-P

customer base and/or targeted sales volume by CO location and make informed decisions about which CO's to convert with a BHC and which would be best served by individual orders.

2. Allow CLECs to designate orders as part of a batch via a unique identifier on individual LSR. CLECs should control which orders will be subject to BHC process and will minimize changes to CLECs' order processing stream for order creation, work flow management, error resolution and reporting.

3. The data on LSR should be similar to what is required for UNE-P Migration-TN, minimal address fields, CFA, etc. This will minimize changes to LSR data population and reduces chance for rejects because requiring less information means less editing by Qwest.

4. LSRs will specify a due date five (5) business days in the future. This interval minimizes the amount of time a customer is held in a "limbo" state of no changes.

5. Qwest must process batch orders when received (first in first out). Qwest must send both electronic and on-line notification to CLEC within 1 day of reject or if Busy carrier facility assignments ("CFAs") are found. CLECs can expect a specific cutover window and better manage the customer's experience. This also allows CLECs time to correct any CFA issues.

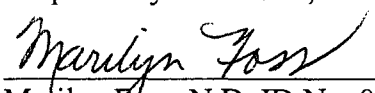
6. Qwest must refrain from any order activity against a customer's account while the batch order is pending, except to cancel an individual batch order, or if a disconnect of dial tone or migrate away order has a more current date than the conversion order (after which changes could be made). Qwest should send electronic and on-line notification to CLEC if this should, nevertheless, occur. This still leaves the customer in a "no change" situation. However, selecting a due date and shortening the due date interval positions CLECs to better manage their

customers' expectations of when a change can be made to their account. Allowing disconnect or migration away orders to override conversion orders will minimize delays the customer could experience trying to migrate to other carriers after converting to UNE-L.

7. Qwest must send both electronic and on-line notification to CLECs 2 days prior to cut date if there is no dial tone. "No Dial Tone" issues must be identified prior to the BHC in order to allow CLECs time to correct prior to the cut date.

8. Qwest must send both electronic and on-line notifications as soon as BHC has taken place. Ultimately notification should be real-time, but in any case no longer than 10 minutes after cut completion. This also allows CLECs to develop better back-office processes for those customers with time-sensitive needs, such a small business customers.

9. Qwest must submit the number-port activation order to NPAC w/in 10 minutes after the BHC was completed on the due date. This offers potentially the quickest turnaround for NPAC notification. Qwest would trigger its NPAC Release order within a specified interval, such as 5 minutes, after cut completion, then initiate the winning CLEC's Port-In order to NPAC within a specified interval, such as 5 minutes. CLECs would also need notification after successful completion of each step.



10. Qwest must send EDI provisioning and completion notifications to close out LSR. This is consistent with UNE-P workflow process. This would a CLECs to continue to acquiring customers using UNE-P and convert after acquisition. This would also give CLECs the option to continue acquiring customers and allow for churn.

11. Qwest must ensure the following are included in the batch hot cut process: 1.) CLEC-to-CLEC UNE-L migrations, 2.) Lines provisioned with DSL, and 3.) Lines provisioned

by IDLC. This will remove the cumbersome "pre-qualification" selection for batch candidates and minimize fallout.

AT&T'S COMMENTS AND COUNTER PROPOSALS ON QWEST'S REGION-WIDE BATCH LOOP CONVERSION PROCESS

AT&T Communications of the Midwest, Inc. ("AT&T") submits the following comments and counter proposals to Qwest's batch hot cut proposal.

I. INTRODUCTION

Fundamentally, every time a hot cut is performed, an incumbent local exchange carrier ("ILEC") technician must physically disconnect the customer's loop from the current carrier's switch and reconnect it to the new provider's network. Those same manual, loop-by-loop activities must be performed whether they are done for one customer or for a batch of customers. Qwest's proposal does nothing to change those fundamental facts. Instead, Qwest's proposal reinforces why the FCC found the hot cut process was a source of operational impairment and why the Federal Communications Commission ("FCC"): concluded that ILECs must offer competitive local exchange carriers ("CLECs") access to mass market switching.

That is not to say that AT&T is uninterested in having Qwest improve its current hot cut process. Any proposal that seeks to improve the efficiency, capacity, quality and cost of the current individual hot cut process is a welcome step in the right direction. However, based on AT&T's review, Qwest's proposal is but a very small step in what may prove to be a long journey to get agreement on a batch hot cut process that the

Commissions and the CLECs can support and meets the FCC's requirements. AT&T believes Qwest's proposal falls far short of curing the operational and economic impairments that exist with the current hot cut process.

AT&T finds Qwest's proposal to be either short on essential details or outright deficient in a number of critical areas such as cost, quality of service to the end user, scalability and functionality. As an initial matter, there are certain key principles that must be followed during the batch hot cut collaborative. The first key principle is that any process changes must consider the impact on Qwest, the CLEC(s)[1] and the CLEC's customer. For example, a process change that reduces Qwest's cost by $1.00 but increases a CLEC's cost by $2.00 is a change that should not be made. Qwest should not be the only party considered in the batch hot cut process design. A second key principle is that any process changes must consider the effect on all of the critical hot cut characteristics. For example, a change that reduces a cost but also increases the frequency of customer outages should not be made. Changes should not be viewed in isolation but should be viewed as part of the overall process. Unfortunately, many of Qwest's proposed changes fail to consider all of the affected parties or suboptimize one element at the expense of another. The following describes AT&T's primary concerns with each of these key areas. As AT&T better understands Qwest's proposal, it reserves the right to raise other concerns.

[1] Multiple CLECs will be involved for the migration of an unbundled loop from one CLEC's switch to another.

II. AT&T's CONCERNS

A. Cost of a Hot Cut

On page 3 of its proposal Qwest admits that it has not yet completed its detailed cost studies; however, they state "it appears that in **virtually every instance** these efficiencies will reduce Qwest's cost of performing a batch hot cut." Emphasis added. Qwest goes on to state on page 15 that "the batch conversion process that Qwest proposes above will yield significant additional efficiencies and in **most** states the CLEC community can expect to experience a significantly reduced rate." Emphasis added. The Commissions and the CLECs cannot rely on vague statements such as these to get a sense of whether Qwest's batch hot cut rates will even begin to address the economic impairment concerns expressed by the FCC in the Triennial Review Order ("TRO"). Before the Commission considers this proposal Qwest should be required to specifically state what its batch hot cut cost structure will be and provide the cost studies it conducted to support its proposed rates.

With respect to its current loop hot cut non-recurring costs, Qwest congratulates itself on page 15 of its proposal by stating, "As an initial matter, Qwest notes it is starting from a better position than many other incumbent LECs in this regard. The FCC found in the *Triennial Review Order* that currently hot cuts are '*often* priced at rates that prohibit facilities based competition for the mass market,' citing ILEC non-recurring charges exceeding $100 and as high as $185. But Qwest's hot cut charges across its region are not nearly this high. In virtually every state Qwest's current non-recurring charges for a basic hot cut range between $29.10 and $65.00." Footnotes omitted. What Qwest has failed to point out is that its coordinated installation with Cooperative Testing loop

installation option is as high as $171.87 per loop for the first installation. That rate would place Qwest at the upper end of the range discussed by the FCC. Even assuming a Qwest hot cut rate of $60[2] there remains much room for improvement to remedy the economic impairment experienced by the CLECs when trying to serve the mass market with unbundled loops. In contrast to the much less than $1.00 non-recurring charge the CLECs pay Qwest to migrate a customer to UNE-P, Qwest needs to make significant reductions in its hot cut non-recurring rates to make UNE-L a viable alternative for serving the mass market from a non-recurring charge perspective.[3]

B. Quality of Service

Using the current hot cut process, which requires a physical disconnection of the customer's line from its existing local service provider's switch and reconnecting it to the new service provider's switch, a service outage is unavoidable. When each of the steps of the process is done correctly this service outage can be measured in seconds. However, because of the manual nature of the process and all of the human touch points involved, there is a tremendous opportunity for human error and a resulting service outage. When performing an individual hot cut from retail to UNE-L these outages are a concern for the CLEC because it is the customer's first experience with the CLEC and the CLEC does not want it to be a negative experience. However, when this does happen, at least the CLEC can explain to its new customer that something went awry during the migration process. On UNE-P (or resale) to UNE-L conversions, where the

[2] The approved rate for a coordinated installation without cooperative testing is $59.81 in ten of the Qwest states.

[3] Of course there are other economic impairment issues that the CLECs will face when trying to serve the mass market with UNE-L such as the collocation and backhaul costs. These comments are only related to the economic impairment issues associated with the hot cut non-recurring charges.

batch hot cut process will most likely be used 100% of the time (see functionality section below), these service outages become even more of a concern for the CLEC. In these cases the customer already has his/her service with the CLEC and may have been doing business with that CLEC for an extended period of time. When a hot cut is performed on these customer's lines and an outage occurs, the customer can only think that the CLEC has a maintenance issue. Because the customer impacted by the outage did not request to have his/her service modified, any outage is viewed as poor performance on the part of the CLEC, even though it most likely would have been caused by Qwest. As far as this customer is concerned Qwest is not even in the picture. Therefore, it is of critical importance that hot cut migrations of existing CLEC UNE-P customers be as seamless and go as flawlessly as possible. It should also be noted that Qwest is not above taking advantage of quality problems experienced by CLEC customers that it may have created. Qwest has recently been running radio and television advertisements where it describes how a competitor "dropped the ball" with a customer and how Qwest saved the day.

Qwest's current batch hot cut proposal leaves much to be desired in the area of service assurance and quality. Fundamentally, Qwest's proposal sacrifices service assurance and quality for a reduction of a few process steps. There are many pitfalls Qwest's proposed process that put the CLEC's customers in jeopardy of an extended service outage. Some of the service quality concerns that AT&T has with Qwest's proposal include the following:

1. Batch Hot Cuts Limited to Basic Installation Only

One of the requirements of Qwest's proposed batch hot cut process is "basic installation only on batch conversions."[4] Qwest further underscores the unavailability of coordinated conversions when it states, "Coordinated and/or basic installation is still offered for business as usual activities – for example – requests not identified as part of the conversion or a part of a project managed hot cut."[5] Qwest's proposal to limit batch hot cuts to basic installation only significantly and negatively impacts the CLEC customer in two areas. The first area is that performance testing is not done with basic installation for existing customers. Qwest's SGAT states:

> 9.2.2.9.1.1 For an existing End User, the Basic Installation option is a "lift and lay" procedure. The Central Office Technician (COT) "lifts" the Loop from its current termination and "lays" it on a new termination connecting to CLEC. *There is no associated circuit testing performed.*[6]

Qwest identified the following testing activities as part of performance testing:

2-Wire and 4-Wire Analog Loops

- No Opens, Grounds, Shorts, or Foreign Volts
- Insertion Loss = 0 to -8.5 dB at 1004 Hz
- Automatic Number Identification (ANI) when dial-tone is present[7]

While Qwest does propose to check for dial tone and ANI, its proposal does not include the other types of performance testing. Qwest's proposal of only basic installation for batch hot cuts is nothing more than reducing the amount and level of testing that it typically does for hot cuts. Qwest's proposal to reduce testing will potentially result in negative impacts on CLEC customers.

---

[4] Qwest BHCP – Exhibit 7, p. 1.
[5] *Id.*
[6] Colorado SGAT, March 4, 2003 (emphasis added).
[7] Colorado SGAT, March 4, 2003, § 9.2.2.9.6.

The second major problem with the basic installation only option is that it extends the period of time a customer cannot receive incoming calls. With a coordinated installation option, Qwest contacts the CLEC after the "lift and lay" procedure is completed. Once the CLEC is notified, the CLEC can complete the number portability activities. In contrast, with Qwest's new proposal, the CLEC will be notified only when every line in the batch has been completed.

Page 12 of Qwest's proposal states; "Upon completion of the orders identified on the batch spreadsheet, Qwest will notify the CLEC via email that it has completed the conversion. It remains the responsibility of the CLEC to ensure that each line is triggered for number porting upon completion of the order." This is totally unacceptable from a quality of customer service standpoint. From the moment that Qwest migrates the customer's line on the MDF to the time that the CLEC issues the trigger to port the customer's number, the customer cannot receive phone calls. Considering that Qwest has indicated that a batch project can be as many as 100 lines and Qwest has its technicians performing all of the work (e.g. pre-wiring, dial tone checks, telephone number verifications, and actual "lift and lay" cutover) to migrate these lines on the day of the cut it could literally take hours between the time the first lines are cut over to the CLEC and the CLEC is informed via email of the completion of the cutover. Leaving a customer without the ability to receive calls for this length of time is totally unacceptable. Qwest must revisit its position regarding the timing of the CLEC notification to make this proposal acceptable in this area.

Qwest's proposal of basic installation only clearly sacrifices the CLEC's customer's experience for some yet unquantified benefit.

2. Pre-wiring of the circuit

For individual hot cut orders, Qwest currently performs the Main Distribution frame ("MDF") pre-wiring of the CLEC's Connecting Facility Assignment ("CFA") to the loop two days prior to the cutover. This lead time gives the Qwest frame technician ample time to ensure all of the wiring work has been performed correctly, and is connected to the proper CFA assignment for CLEC's collocated equipment and to the proper cable and pair assignment for the customer's line. However, when this pre-wiring is performed on the day of the cutover, as proposed by Qwest's batch process, there is no margin for error on the part of the Qwest or the CLEC. Considering Qwest's frame technicians work on activities other than batch hot cuts, including individual hot cut orders, new line installs for both retail and wholesale customers, disconnect orders and trouble shooting of maintenance and repair trouble tickets, many times these technicians may be stressed to the limit to complete all of their work for that day. This is especially true in cases where the batch job approaches the Qwest proposed 100 line limit. AT&T feels that to help ensure continuity of customer service, this pre-wiring function must continue to have at least a one day lead time from the batch project due date. Qwest's proposal to eliminate the pre-wiring step sacrifices service quality and the customer's experience solely for Qwest's own efficiency.

3. Qwest's proposed spreadsheet

Qwest is short on details regarding how this spreadsheet is to be prepared and how it is going to be used. AT&T supports the use of an electronically prepared spreadsheet developed by Qwest's OSS's based on the information supplied on the

batch project LSRs. However, if it is Qwest's intention to develop these spreadsheets manually, this adds yet another human touch point to a process that is already very manual. Human errors on this spreadsheet will create confusion and possibly delay the project. They can also result in hot cuts being missed or service outages. Qwest must be required to provide additional details on how this spreadsheet is to be created, how it will be distributed to the stakeholders, what each stakeholder will use the spreadsheet for, how the spreadsheet will be synchronized with the CLEC's LSRs and Qwest's service orders and how errors found on the spreadsheet will be corrected. In addition, creation of a spreadsheet appears on Qwest's proposed process as a new step. It is likely that the spreadsheet creation step is going to put upward pressure on Qwest's already uneconomic hot cut costs.

4. Dial tone checks

Qwest's current hot cut process requires the central office frame technician to check for dial tone and verify the line for the proper telephone number two days prior to the scheduled cutover date. Whereas, Qwest's batch hot cut proposal has its technicians performing these verifications on the day of the cutover just prior to performing the conversion. If a problem is discovered with the CLEC dial tone, Qwest's proposal gives the CLEC one hour to remedy the problem. If the problem cannot be resolved, the affected line is removed from the project.

As was the case for the pre-wiring (item #2 above), AT&T is concerned that performing this quality check on the day of the cut leaves no margin for error for either Qwest or the CLEC. In cases where the no dial tone problem must be resolved by the CLEC, often times one hour is not going to be sufficient, especially in

instances where the CLEC must dispatch a technician to its collocated equipment. When the CLEC cannot quickly resolve these problems, the customer's line must be removed from the batch project. When this happens for multi-line customers, the CLEC must be assured that all lines for that customer are also removed from the project to insure continuity of features such as hunting arrangements. Considering the Qwest frame technicians will be working from either the individual internal service orders that are created for each line that is included in the project or from the proposed spreadsheet, it is not clear how the frame technician will be able to relate the orders to make the determination that the line with no dial tone is associated with a multi-line customer. It is also unclear how the technician will be able to determine the other lines that need to be removed from the project even though they are not experiencing the same no dial tone issues. Additionally, Qwest's proposal is silent on what occurs if the technician discovers a no dial tone condition or an incorrect telephone number on the customer's cable and pair on the line side of the frame.[8] This would be a problem that Qwest would need to correct. AT&T can only assume that these lines will also be removed from the project. If so, the same issue involving multi-line customers is of a concern. AT&T believes that without further details on how the dial tone checks will be performed and how the CLECs can be assured that the right lines are being removed from the project the proposal as written is too risky.

In addition, a Qwest decision to remove one or more lines from the project must be accompanied by a step to assure that Qwest does not disconnect the customer's service under the assumption that the cut would have been completed. In very short

[8] These problems can occur as a result of inaccurate cable and pair inventory records.

order, Qwest technicians must be able to communicate to Qwest's back office systems that an order has been removed from a project and to ensure that no associated disconnect orders are inadvertently completed.

5. CLEC notification

In addition to the previously mentioned problems with the timeliness of the notification, AT&T has a concern with regard to the quality of Qwest's notification process. Qwest's statement indicates that this notification will be based "upon completion of the orders identified on the batch spreadsheet" yet; as discussed in item 4 above, some line may have to be removed from the project even in cases where they did not have a no dial tone problem. Qwest has not indicated how the CLEC will know exactly which of the orders identified on the spreadsheet were cut over and which were not. Unless the CLEC has absolutely accurate information regarding the exact identification of the lines that were cut, the CLEC may port numbers that it should not be porting, thereby adversely impacting customer service.

C. Scalability

As an initial matter, Qwest claims that it provisions "1,000 hot cuts per day on average."[9] The most recent results that Qwest published for the OP-7 Coordinated "hot cut" interval – Unbundled loops – Analog measurement belie that claim. In September of 2003, Qwest completed 9,488 hot cuts in the entire 14-state region. Assuming a twenty day work month, Qwest averaged about 475 hot cuts a day in September of 2003 – nearly half of Qwest's claimed rate. Over the last year, Qwest's OP-7 results show that Qwest averaged about 400 analog loop hot cuts a day in its entire 14-state region. This

[9] Qwest Proposal, p. 7.

represents an average of 28 per workday per state. Qwest's current average daily volume of hot cuts in a state would barely make what Qwest identifies as a minimum batch for its proposed batch hot cut process. Either Qwest's claim of 1,000 hot cuts per day is erroneous, or Qwest is excluding significant volumes of hot cuts from the OP-7 results. Qwest needs to explain the incongruity between its claim of 1,000 hot cuts per day and its OP-7 results for analog loops.

The only specifics that can be found in Qwest's proposal regarding the scalability of the process is that an individual CLEC must have at least 25 and no more than 100 lines in a given CO to qualify for a batch project.[10] Qwest also, on page 14 of its proposal, makes the premature assumption of a finding of non-impairment and therefore lays out the timetable with vague and inaccurate formulas for determining how many hot cuts will be required to convert the embedded base of UNE-P customers. AT&T believes that the Commission should not take Qwest's assumption of a non-impairment finding seriously. Notwithstanding Qwest indulging itself with a little wishful thinking, Qwest needs to provide specific information in the following areas with respect to its ability to handle significantly larger numbers of hot cuts.

1. Limitations imposed on the process

Other than the stated limit of one project consisting of no more than 100 lines per day per CLEC, what other limits does Qwest impose on its process? Some examples of questions that Qwest needs to address are:

- Will Qwest work with multiple CLECs in the same central office on the same day if the sum of the CLECs' batch projects does not exceed 100 lines (e.g. four different CLECs where each CLEC had a bulk project of 25 lines)?

[10] One can assume that CLEC's who have more than 100 lines may break them up into individual batches of less than 100, however, that is not specified in the Qwest proposal.

- Does Qwest impose any limits on the number of CLECs that can migrate 100 lines in a central office in a day?
- Will Qwest allow a CLEC that had two different collocation arrangements in the same CO to include facilities in each of the arrangements on the same project?[11]
- Are there any limitations on the number of simultaneous batch projects Qwest is capable of working within a given geographic area?
- Are these projects limited to central offices that Qwest has staffed on a full time basis or can a project be performed in any central office?

2. Potential Hot Cut Volumes

Qwest's formulas for estimating the potential hot cut volumes it will be faced with in a mass market environment do not provide any specifics with respect to the number of actual hot cuts Qwest estimates it will have to perform during the 27 month transition period. Instead Qwest states, "To calculate the expected monthly volumes in each state, the state commissions should apply the following formulas based on the volumes of UNE-P lines and UNE-L lines in each individual state." Rather than ask the state commissions to estimate the hot cut volumes based on a formula that is neither clear nor accurate (e.g., the formula does not account for the significant hot cut activity that will be required by customer churn and Qwest win-backs), Qwest should come forward on a state by state basis with its estimate of how many hot cuts will be required each month. Qwest must also provide the details on how it came up with this estimate.

3. Additional Qwest Personnel

Assuming that Qwest's work centers, field technicians and central office frame technicians are currently working at optimal capacity, Qwest needs to disclose how many additional people it will need to add to its staff to meet the hot cut demand

[11] CLECs will sometimes have multiple collocation arrangements in the same central office as a result of an acquisition of another CLEC.

estimated in item #2 above. Qwest also needs to specify how it arrived at this estimate and how it plans on recruiting, hiring and training these people to ensure that they are qualified to perform the work that will be required of them without impacting customer service. Additionally, Qwest needs to reveal how the hiring of these additional people will impact the CLEC's hot cut costs.

D. Functionality of the proposed process

The Qwest proposal is extremely short on many of the details needed to determine whether its proposed batch hot cut process will be functional. Additionally, in other areas where Qwest did provide specific information it is clear that there is much room for improvement to make the process of value. Following are some of the specific areas of concern for AT&T with respect to the functionality of the process.

1. Project Intervals

Qwest must clearly state what its interval is between the time the CLEC initiates a request for a batch hot cut project and the due date for the project. In a robust market with many CLECs requesting batch projects these intervals cannot be individually negotiated on a project-by-project basis. Qwest must publish its standard interval for these jobs and be measured on its performance in meeting these intervals. This is particularly critical if a CLEC wants to use this process for a migration from Qwest retail to UNE-L, a migration that Qwest states is supported by its bulk process. Unless the CLEC can give its prospective customer a date certain of when the migration will occur this process can never be used for the migration of retail customers to a CLEC.[12]

[12] It is critical to note that even with standard intervals, unless the interval is reasonable (e.g. 6 business days or less), this process will be virtually useless for migrating retail customers to UNE-L.

Additionally, the introduction of a standard interval for requesting a batch hot cut project will eliminate the time/resource consuming step of conducting the initial batch hot cut project coordination meeting required by the Qwest proposal. With a standard interval a CLEC can initiate a project via a simplified email notification to Qwest of its intent to engage in a batch project. This email would supply Qwest with the details it will need, such as the central office location, the desired project date and time and the number of customer accounts and lines involved with the project. Qwest can respond to this email with the project code and a confirmation of the date which would trigger the CLEC to issue its LSRs. While Qwest's proposal is not entirely clear, it appears that unique Qwest-supplied project codes would be required on the individual LSRs that a CLEC submits as part of the batch. Qwest needs to clarify whether unique project codes are required on an LSR; and, if so, how those project codes are obtained.

2. The process must be voluntary

Qwest's proposal indicates on page 11 that at the initiation of a project request "a CLEC will perform pre-order functions including an initial batch coordination meeting with Qwest." The initiation of a batch project must be at the option of the CLEC and cannot be dictated by Qwest. There are many factors that would prevent a CLEC from wanting to perform a batch hot cut job in a specific central office, even in cases where the CLEC may have the requisite quantity of lines to qualify for a batch project. These factors include, but are not limited to, not having a collocation arrangement in the central office, not having sufficient spare capacity on the collocated equipment that the CLEC has in the central office and a temporary

congestion problem that the CLEC may be experiencing on its network. There should be no mistake that the batch hot cut process that the parties will be creating is voluntary on the part of the CLEC. A CLEC may conclude that Qwest has not reduced the economic or operational impairments of hot cuts sufficiently to justify converting a UNE-P customer to UNE-L. The true measure of the worth of Qwest's batch hot cut process will be seen when CLECs voluntarily choose to exercise that process.

3. Limits on loop types

Qwest's proposal limits the loop types that qualify for a batch project to analog POTS loops and further underscores the operational impairment involved with hot cuts. On page 9 of its proposal Qwest states, "A batch conversion process is possible for these analog DS0 loops, which constitute the vast majority of Qwest's outside plant. But it is not feasible to gain these efficiencies when the underlying facility uses integrated digital loop carrier systems ('IDLC')." AT&T agrees that when the Qwest network is viewed as a whole, the analog DS0 loops do constitute the majority of the loops. However, the batch job is not performed on a network-wide basis; it is performed at a central office level.

When viewed at a central office level, the IDLC restriction becomes a bit more problematic. Qwest has many large central offices with over 30,000 lines that have 30% or more IDLC lines. This is particularly true in states such as Arizona, Washington and Colorado that have experienced a high degree of growth over the past 10 years. In these states, as well as in some of the other states, there are many central offices that would have a large proportion of the loops that terminate in the

office precluded from the batch hot cut process under the current Qwest proposal. In fact there are a number of offices that have more than 50% of their lines on IDLC facilities.[13]

To make this process functional in a mass market environment, Qwest needs to revisit its removal of IDLC lines from the process. In addition, Qwest needs to disclose to the commission and the CLECs what its capacity is for migrating these lines in the high density offices to non-IDLC facilities as required for a hot cut. In wire centers with a high number of hot cuts, Qwest may be limited in the amount of spare copper/UDLC facilities it can use to overcome the IDLC problem. Qwest needs to explain how it will ensure the necessary inventory of spare non-IDLC facilities.

In addition to the restriction of IDLC loops, Qwest's proposal restricts the migration of line splitting loops. Qwest's rational for this is two-fold. First, Qwest states, "The FCC expressly defined its batch-cut requirements in terms of developing a process to migrate loops "from one carrier's local circuit switch to another carrier's *local circuit switch.*" The FCC's definition of a 'batch cut process' thus does not include conversions including loop-splitting arrangements that also connect an unbundled loop to a third carrier's *packet* switch." Footnote omitted; emphasis added. Qwest goes on to state, "conversions from UNE-P directly to loop-splitting arrangements cannot be consolidated into a batch because each loop must be individually checked to ensure it is capable of carrying DSL signals and, if not,

[13] Per Qwest's ICONN database. See www.qwest.com/iconn.

conditioned."[14] It seems that on both of these points Qwest seems to have misstated the facts.

To the first point, when cutting over a loop to a CLEC using a line splitting arrangement, the voice frequency portion of the loop does not go to the CLEC's packet switch. After the loop is connected to the CLEC's splitter, the voice frequency is connected to the CLEC's circuit switch. Therefore, the line is being connected "from one carrier's local circuit switch to another carrier's local circuit switch" just as the FCC had envisioned. Secondly, it is highly unlikely that a customer who is receiving standalone POTS service via UNE-P is going to need to be migrated to a DSL capable loop as described by Qwest. However, it is very likely that a customer who is currently on a line splitting arrangement today where the voice service is provided via UNE-P will need to be converted to line splitting when the CLEC is using Qwest's loop and connecting the voice frequency to a CLEC's switch. In these cases there is no need to determine whether the loop requires conditioning for the DSL service because the customer is already receiving DSL service on a loop that is already meeting the requirements for a DSL service. Qwest's rational for restricting line splitting loops from the batch process is without merit. AT&T believes that Qwest should remove this restriction from its proposed process.

4. CLEC-to-CLEC migrations

Qwest's proposal indicates that its batch process will support CLEC-to-CLEC of migrations. However, Qwest is silent on how it plans to include these migrations into the ordering flow for a batch hot cut. Given the current lack of industry procedures

[14] See Qwest's proposal on pages 9 and 10.

on CLEC-to-CLEC migrations, AT&T believes that Qwest needs to provide specific details on how it plans to incorporate these types of migrations into a batch project.

5. Project cutover times

Qwest's proposal on page 13 states; "The CLEC must make resources readily available to clear all loops identified on the batch spreadsheet in a timely manner between the hours of 3:00PM CST and 11:00PM CST." For any of us who have sat around waiting for the telephone installer or repair person who is supposed to show up between the hours of 8 AM and 5 PM, we know how inefficient a use of time this is for the person kept waiting. In addition to providing the CLEC more timely notice on the status of the project as described in the "Quality of Service" section of this document, Qwest needs to be more specific as to what time the project is going to start and what time it anticipates it will end to allow the CLEC to properly plan the workload for its staff members. Additionally, there are going to be times when, because of the nature of the customers being cutover, a CLEC may not wish to have the migrations performed between the hours of 3:00PM and 11:00 PM. In these cases the Batch process should be flexible enough to allow the CLEC to request a batch hot cut project at any time of the day and on any day of the week.

6. Pending orders

The Qwest process has the CLEC issuing LSRs for the lines involved in the project. However, as stated in #1 above, without knowing what the interval is for these LSRs,they may be waiting a considerable amount of time in Qwest's systems as pending orders before the due date of the batch project. Considering that these orders will most likely be exclusively for existing CLEC customers, it is not clear what

happens to that order should the CLEC needs to issue an interim order to make a change on the existing customer's account (e.g. a feature change to a UNE-P customer). Additionally, Qwest needs to clarify what the process is for ensuring that the customer's line does not get migrated as part of the batch process in cases where the customer churned over to another carrier in the time between when the batch order was issued and the due date of the batch project.

7. Service outages

Qwest needs to make clear what the process is for the CLEC to quickly resolve service outages discovered after the CLEC receives the project completion notification. Specifically, will there be a process in place for a "throw-back" of the affected customer's line to its original state to quickly restore the customer's service, or will the CLEC have to go through the normal trouble reporting process? AT&T believes that Qwest needs to have a process in place that will allow Qwest and the CLEC to work cooperatively to restore the customer's service in an expedited time frame.

8. Testing the process

Qwest's proposal is also silent on how it proposes to test its batch hot cut proposal to make sure it is operational. Because the industry has absolutely no experience with operating in a mass market environment using a manual hot cut process, any process being proposed must be thoroughly tested to guarantee its operational readiness. Because of the incentive that Qwest has to make such a test appear that its proposed process is flawless, AT&T believes that this testing should be closely monitored by the Commissions and an independent third-party tester. Additionally, AT&T believes

that this test should not impact any CLEC customer's service and, therefore, should be conducted by having Qwest using its proposed process to migrate a significant number of its own retail customers from a direct connection of the customer's line from the existing Qwest switch over to another Qwest switch connected via collocated equipment located in the original central office. Testing should include independent third-party monitoring of the conversion activities and monthly monitoring of performance results for the converted customers.

III. CONCLUSION

AT&T is encouraged by the fact that Qwest has taken the initial step to propose a batch hot cut process. However, as indicated by these comments, AT&T has many serious concerns about the cost, customer impact, scalability and functionality of the process that was outlined by Qwest in its batch hot cut proposal. Additionally, AT&T is also concerned about the necessary details that were *not* addressed by Qwest.

AT&T looks forward to working collaboratively with Qwest and the other industry participants to work through the Qwest proposal to resolve these initial issues identified by AT&T and issues that are raised by other participants. This collaborative should also determine what other improvements need to be made to improve upon the Qwest proposal and make the batch hot cut process one that is beneficial to Qwest, the CLECs and, most importantly, to the end-user consumer.

Respectfully submitted on November 18, 2003.
