1 **I. INTRODUCTION**

2

3 Q. PLEASE STATE YOUR NAME AND BUSINESS ADDRESS.

4 A. My name is Elizabeth Engelking. I am Manager of Resource Planning and
5 Bidding for Northern States Power Company, a Minnesota corporation
6 operating in North Dakota (“Xcel Energy” or the “Company”). My business
7 address is 414 Nicollet Mall (MP7), Minneapolis, Minnesota 55401-1993.

8

9 Q. PLEASE SUMMARIZE YOUR QUALIFICATIONS AND EXPERIENCE.

10 A. I received my MBA in finance and economics from the University of
11 Minnesota (Carlson School of Management) in 1986. From 1988-1998, I was
12 employed as a rate analyst with the Minnesota Public Utilities Commission
13 ("MPUC"), where I oversaw the implementation of Integrated Resource
14 Planning and advised the MPUC on utility resource planning, ratemaking, and
15 industry restructuring issues. Following my tenure at the MPUC, I joined
16 Great River Energy in 1998, first as a transmission analyst and then, in 2000,
17 as Manager of Resource Planning. In that capacity, I directed the
18 development, filing, and acceptance of two integrated resource plans with the
19 Commission. I have been employed at my current position with Xcel Energy
20 Services Inc. since August 2004. My resume is provided as
21 Exhibit ___(EME-1), Schedule 1.

22

23 Q. HAVE YOU PREVIOUSLY PROVIDED TESTIMONY IN THIS PROCEEDING?

24 A. No, I have not filed previous testimony in this proceeding

25

26 Q. WAS THE SCHEDULE PRESENTED WITH YOUR REBUTTAL TESTIMONY
27 PREPARED BY YOU OR UNDER YOUR SUPERVISION?

28 A. Yes, it was.

1

2 Q. ARE THERE OTHER WITNESSES YOU RELIED UPON IN DEVELOPING YOUR
3 REBUTTAL TESTIMONY?

4 A. Yes. I have relied upon and incorporated the results from the Rebuttal
5 Testimony of various other Company witnesses in this proceeding, to which I
6 refer in this Rebuttal Testimony.

7

8

II. SUMMARY AND ORGANIZATION

9

10 Q. WHAT IS THE PURPOSE OF YOUR REBUTTAL TESTIMONY?

11 A. The purpose of my Rebuttal Testimony is threefold. First, I will address
12 specific disallowances recommended by Mr. Charles King, presented on behalf
13 of the Advocacy Staff of the North Dakota Public Service Commission (the
14 “Commission”) for the Allen S. King Plant, the High Bridge Plant and certain
15 renewable facilities. Second, I will address Mr. King’s recommendation that
16 Xcel Energy file a North Dakota-specific resource plan and present our
17 proposal for better coordinating our planning with all of our jurisdictions.
18 Finally, I will provide support for Mr. Kent Larson’s Rebuttal Testimony
19 regarding the benefits of maintaining an integrated system.

20

21 Q. PLEASE PROVIDE A SUMMARY OF YOUR REBUTTAL TESTIMONY.

22 A. As discussed in the following sections of my Rebuttal Testimony, I have
23 reached the following conclusions:

24 • *Discussion of Key Investments.* Our investments in the Allen S. King Plant and
25 the High Bridge Plant are cost-effective responses to critical reliability and
26 environmental needs at these facilities.

- 1 • *Renewable Energy Development.* Our renewable energy projects, including the
2 Grand Meadow Wind Farm and associated wind transmission outlet, are
3 cost-effective investments and were acquired through competitive
4 processes. Additionally, our investments in Refuse-Derived Fuel (“RDF”)
5 facilities have been part of our system for quite some time and deliver cost-
6 effective energy to our customers.
- 7 • *Benefits of an Integrated System.* Customers throughout our system receive
8 significant benefits by being part of a 10,000 MW integrated system. My
9 Testimony further supports the information provided in the Rebuttal
10 Testimony of Mr. Larson.
- 11 • *Planning Proposal.* A proposed resource planning filing for North Dakota
12 would be an effective means of addressing current and future concerns
13 regarding our generation portfolio. I provide information to further
14 support the proposal outlined by Mr. Larson.

15
16 I therefore recommend that the Commission not adopt the disallowances
17 recommended by Mr. King and instead approve the resource planning process
18 proposed by Mr. Larson and further outlined in my Rebuttal Testimony.
19

20 **III. DISCUSSION OF KEY INVESTMENTS**

21
22 Q. WHAT ARE THE KEY INVESTMENTS THAT MR. KING RECOMMENDS BE
23 DISALLOWED IN THIS CASE?

24 A. As noted in Mr. Larson’s Rebuttal Testimony, Mr. King recommends
25 disallowance of several key investments, including:

- 26 • The costs of rehabilitating and extending the life of the Allen S. King
27 Plant.

- 1 • The costs of constructing a new, 515 MW natural gas-fired combined cycle
2 plant at High Bridge.
- 3 • 25 percent of the costs associated with the Grand Meadow Wind Farm
4 and new transmission facilities constructed to carry wind energy. In
5 addition, Mr. King recommends an adjustment to base rates to reflect a
6 similar 25 percent cost reduction for the contracted wind energy that
7 currently flows through the fuel clause.
- 8 • The costs associated with our refuse-derived fuel facilities.

9
10 The first two of these items are projects associated with our Metropolitan
11 Emissions Reduction Project (“MERP”).

12
13 Q. PLEASE DESCRIBE XCEL ENERGY’S MERP INITIATIVE.

14 A. In 2001, the Minnesota legislature passed the Emissions Reduction Statute,
15 Minn. Stat. § 216B.1692. This statute provides a mechanism to facilitate
16 emissions reductions by establishing a streamlined process for developing,
17 approving, and implementing appropriate projects. We initially proposed our
18 MERP project in May 2003, when Xcel Energy selected construction projects
19 at three of our older metropolitan coal-fired power plants for major
20 rehabilitation or repowering.

21
22 Q. PLEASE DESCRIBE THE THREE PROJECTS THAT WERE PART OF YOUR MERP
23 PROPOSAL.

24 A. The three projects are:

- 25 • *Allen S King*. To ensure long-term benefits to our customers, we proposed
26 state-of-the-art pollution control equipment and major rehabilitation/life
27 extension work. The resulting project makes this plant available to serve

1 our customers for at least an additional 25 years. In addition, the project
2 resulted in the recovery 60 MW of capacity and energy that had been lost
3 due to degradation and fuel switching, restoring the King plant to its full
4 original output of 564 MW. This additional capacity and energy is now
5 available to serve our customers at very little additional operating cost or
6 fuel. The rehabilitated King facility began operations in July of 2007.

- 7 • *High Bridge.* We proposed to replace this 272-MW, older coal plant with a
8 515-MW, natural gas combined-cycle facility located at the same site. This
9 conversion uses existing infrastructure that is critical to maintaining the
10 reliability of our system. The new facility at High Bridge began operation
11 in May 2008.
- 12 • *Riverside.* We proposed to replace existing unit 7 at this coal-fired plant
13 with two natural gas combustion turbines operating in a combined-cycle.
14 We will retire existing Unit 8. This portion of our MERP project will
15 provide approximately 439 MW of creditable capacity (a net increase in
16 URGE capacity of about 53 MW) while eliminating coal emissions from
17 this site. Implementation of this project will begin in September of 2008.
18 Thus, no costs related to this project are included in the test year in this
19 proceeding.

20
21 Q. WAS ANY PORTION OF THIS PROJECT MANDATED BY MINNESOTA LAW?

22 A. No. In fact, the MERP statute prohibits consideration of projects that are
23 mandated or a result of corrective action due to being out of compliance with
24 current standards. Xcel Energy proceeded with development of the three
25 above-described projects on a voluntary basis because we believed they would
26 provide significant benefits to our customers throughout our service
27 territories. I will elaborate on these benefits below.

1

2 Q. WHAT WAS XCEL ENERGY'S APPROACH TO SELECTING PROJECTS FOR
3 INCLUSION IN THE MERP PROPOSAL?

4 A. We chose an expansive approach that would achieve multiple goals,
5 benefitting our customers, our system, and other stakeholders. In addition to
6 meeting the environmental requirements to be considered under the
7 Emissions Reduction Statute, we selected projects that:

- 8 • Created energy-supply benefits by adding approximately 400 MW of
9 additional capacity to meet our customers' needs.
- 10 • Produced additional capacity and energy without significant new
11 transmission infrastructure.
- 12 • Maximized the use of existing plant sites and other infrastructure, keeping
13 generation located at critical interfaces on the system.
- 14 • Maintained needed fuel diversity.
- 15 • Met current and expected environmental requirements for generation
16 facilities.
- 17 • Hedged future risks to the Company and the region.
- 18 • Responded to community concerns.

19

20 We intentionally combined these three plants into one emissions reduction
21 project. This approach allowed us to effectively structure and coordinate our
22 operation of the plants during construction, best maintaining the reliability of
23 our system while these critical projects were being implemented.

24

25 Q. DID XCEL ENERGY CONSIDER AN ALTERNATIVE APPROACH TO THE MERP
26 PROPOSAL?

1 A. Yes. We proposed an alternative plan for consideration that was approximately
2 half the cost of our proposal, but achieved *less than* half the benefits. The
3 alternative would have kept all three plants on coal and would have required
4 major emissions upgrades at each of the three sites. The alternative plan
5 would not have resulted in any additional capacity at High Bridge and
6 Riverside. Based on cost-benefit analyses conducted by the Company, as well
7 as analyses undertaken by the Minnesota Pollution Control Agency
8 (“MPCA”), Xcel Energy did not recommend the alternative plan.

9
10 **A. King Plant**

11 Q. WHAT WAS THE KING PLANT’S CONDITION AT THE TIME THE MERP
12 PROPOSAL WAS MADE?

13 A. The King Plant was in need of significant upgrades in order to be able to
14 remain a reliable part of Xcel Energy’s generation fleet. The King Plant had
15 reached the end of its economic life and would have ceased operations in
16 2005. Because of its importance to the energy supply system, its age and its
17 high level of operation over many years, King needed attention at the time our
18 proposal was made. By 2001, the forced outage rate at King Plant had risen to
19 levels that caused us concern, and the plant was experiencing a number of
20 problems that are typical of a heavily used facility of its vintage.

21
22 This was the primary reason why we proposed the rehabilitation and life
23 extension work in addition to adding the air quality control systems to that
24 facility. It is also the primary reason why Xcel Energy proposed to implement
25 the King Plant upgrades first.

1 Q. IF THE KING PLANT COULD NOT BE REHABILITATED THROUGH THE MERP
2 PROJECT, WHAT WOULD XCEL ENERGY HAVE DONE TO REPLACE THE
3 CAPACITY AND ENERGY FROM THE KING PLANT?

4 A. Due to the stability needs of the electric grid in the area, we would have
5 needed to construct a new coal plant or a new natural gas combined-cycle
6 plant at or near the same system interface at which the King Plant is located --
7 retiring the plant without replacement of the generating capacity at or near the
8 existing location was simply not feasible.

9
10 Our evaluation determined that constructing new coal generation at this
11 location was infeasible for a variety of reasons, including space constraints,
12 permitting concerns, and cost. Constructing a combined cycle natural gas
13 facility at the King Plant site could have been feasible, but we concluded was
14 not the best use for this site, particularly when considering this project in
15 conjunction with the other MERP plants.

16
17 Instead, our proposal included the continuation of King as a coal-fired
18 generating plant, which enhanced fuel diversity for our system compared to
19 other alternatives for this site, and resulted in the reclamation of 60 MW of
20 capacity at comparatively very little incremental cost.

21
22 Q. AT THE TIME MERP WAS PROPOSED, WHAT WAS THE COST ESTIMATE FOR
23 REPLACING KING PLANT GENERATION WITH NEW GENERATION RESOURCES?

24 A. Our King Plant environmental upgrades and rehabilitation project as
25 completed cost around \$851/kW installed, including all transmission necessary
26 to deliver the energy to the integrated system. Assuming that new generation
27 could have been constructed at or near the King Plant site, we had estimated
28 new base load coal generation at roughly \$1,500/kW to \$1,800/kW. (Note

1 that these costs do not include the cost of new transmission that might be
2 needed because of a change to the basic plant configuration.) Our estimates
3 of the cost of natural gas combined-cycle construction were roughly in the
4 \$711/kW to \$827/kW installed range, not including any related transmission
5 costs.

6
7 Based on these facts, we concluded that the overall MERP project
8 rehabilitation of the King Plant was the best option for our customers.

9
10 Q. MR. KING SUGGESTS THAT THE COMPANY SHOULD HAVE DELAYED THE
11 REHABILITATION PROJECT AT THE KING PLANT. WAS DELAY A VIABLE
12 ALTERNATIVE ?

13 A. No. As I have discussed above, the King Plant was at the end of its useful life
14 and was experiencing problems that were typical of facilities of that vintage. It
15 would have been retired in 2005. Rehabilitation was needed in the timeframe
16 of our MERP project to ensure the plant's long-term availability to our fleet.

17
18 Q. CAN YOU PROVIDE SOME EXAMPLES OF THE DEGRADATION EXISTING AT THE
19 KING PLANT PRIOR TO ITS REHABILITATION?

20 A. Yes. In 2001, our Energy Supply division conducted condition assessments of
21 the both the boiler and the steam turbine. The pressure retaining components
22 of the boiler were failing on a regular basis, reducing the availability, reliability,
23 and capacity factor of the plant. Data showed that the frequency of the
24 failures was rising at an increasing rate. Babcock and Wilcox ("B&W"), our
25 consulting engineers, conducted an assessment of the boiler and found that
26 the boiler floor was in poor condition: physically distorted and metallurgically
27 weak. B&W also reported that the floor and the cyclone burners of the King
28 Boiler were the longest surviving original components of 1960's vintage

1 cyclone-fired, supercritical boilers. All similar boilers built by B&W had floors
2 and cyclones that had been replaced at least once, with some units having
3 replaced some or all of those components twice. Based on this information
4 and actual experience with plant performance, it was obvious that swift action
5 was needed for the King facility.

6
7 Q. HOW DID THE COMPANY RESPOND TO THIS SITUATION AT THE KING
8 FACILITY?

9 A. After careful consideration, the Company selected and conducted preliminary
10 design of the King rehabilitation project. As already discussed, this project
11 provided numerous benefits, including:

- 12 • We extended the life of the plant by 25 years or more, ensuring continued
13 low-cost, reliable energy for our customers.
- 14 • We improved the efficiency of the plant.
- 15 • We reclaimed 60 MW of capacity and energy that had been lost to
16 degradation, at virtually no increase in operating or fuel costs.
- 17 • We were able to do this at a cost that was roughly one-third of the cost of
18 constructing a new coal-fired facility, before consideration of transmission
19 costs.

20
21 **B. High Bridge**

22 Q. PLEASE DESCRIBE THE PURPOSE FOR THE HIGH BRIDGE RETROFIT PROJECT.

23 A. Similar to the King Plant, the High Bridge Plant was nearing the end of its
24 useful life. To maintain the viability of this facility, action was needed in the
25 immediate future. This retrofit project increased capacity and preserved
26 existing transmission and other infrastructure at a strategic location on the
27 system, while eliminating coal generation from an urban environment. It was

1 not prudent to abandon generation at this strategic location, but the long-term
2 use of coal at that sight was increasingly problematic. Switching to natural-
3 gas-fired generation was the best long-term solution for our customers.
4

5 Q. WERE ALTERNATIVES TO SWITCHING TO NATURAL GAS CONSIDERED FOR THE
6 HIGH BRIDGE PLANT?

7 A. Yes. We proposed an alternative plan that would have kept the plant on coal,
8 while providing for environmental upgrades to the plant. However, the
9 alternative project for High Bridge was not nearly as advantageous as the
10 conversion to natural gas. The conversion allowed us to nearly double the
11 capacity at this site, allowing us to defer investment in new, green-field
12 capacity and energy for several years. Expansion of generation capacity using
13 coal was not possible, due to the limited space available for plant expansion
14 and coal inventory at this relatively small, urban site.
15

16 Q. WOULD MAINTAINING THE HIGH BRIDGE PLANT AS A COAL PLANT AND
17 IMPLEMENTING THE COAL REHABILITATION ALTERNATIVE BEEN AN
18 EFFECTIVE ALTERNATIVE?

19 A. I believe it would have been very difficult to implement the coal rehabilitation
20 alternative at this site; at best, it would have significantly delayed
21 implementation of a project and our ability to secure the High Bridge Plant as
22 a continued, effective contributor to overall system reliability. The MPCA was
23 charged by statute to conduct an analysis of both our proposal and our
24 alternative, and assess their feasibility as well as determine whether they
25 constituted cost-effective solutions alternative that would be appropriate for
26 implementation. The MPCA conducted a thorough analysis of the High
27 Bridge coal alternative.

25
26
27

Initially, the MPCA rejected our coal alternative plan for High Bridge as not satisfying the EPA’s Best Available Control Technology (“BACT”) requirements. The MPCA concluded that the High Bridge Plant alternative was not adequate to satisfy BACT or the EPA’s New Source Performance Standards. In addition, the MPCA pointed out that extensive rehabilitation of the plant would have been necessary in addition to the installation of anti-pollution control equipment. In sum, the MPCA concluded that the cost and benefit of the proposed coal High Bridge Plant alternative was inadequate and that this alternative should be rejected.

The MPCA continued to study the High Bridge alternative. Its subsequent report concluded that the coal alternative was not a cost-effective way to proceed. While the MPCA modified its position on whether the coal alternative would satisfy the relevant EPA and MPCA pollution requirements, it concluded that keeping the plant on coal was not the most cost-effective approach.

In addition, other parties, including a variety of community and health organizations, submitted comments that the coal alternative at the High Bridge Plant should be rejected. Their recommendations were based on several concerns related to continued use of coal generation in a densely populated urban environment. Based on the record of that proceeding, we believe it would have been very difficult to successfully implement the coal alternative. At a minimum would almost certainly have entailed significant delay in addressing a critical reliability issue for our system

1 Finally, Mr. Rosvold provides additional information regarding the broader
2 environmental compliance issues we faced with our generation fleet and how
3 our MERP projects helped deal with these issues in a consistent and
4 foresighted manner.

5
6 In summary, unlike the King facility, the coal alternative at the High Bridge
7 Plant could not achieve the goals of: (i) maintenance of a high level of
8 reliability at this critical site in a timely manner; and (ii) expansion of needed
9 generation capacity for the benefit of all of our customers.

10
11 Q. IF XCEL ENERGY HAD PURSUED THE OPTION OF REHABILITATING HIGH
12 BRIDGE AS A COAL PLANT, WHAT COSTS WOULD HAVE BEEN INCURRED FOR
13 THE ADDITIONAL CAPACITY AND ENERGY NEEDED TO MEET CUSTOMER LOAD?

14 A. There would have been several additional costs in addition to the \$73 million
15 of environmental upgrades. First, we would have had to replace nearly 250
16 MW of capacity that was needed to serve our customers' growing
17 requirements but would not be provided through the MERP projects. If we
18 were to place this capacity elsewhere on our system, we would have incurred
19 not just the costs of the capacity, but also the costs of acquiring land,
20 developing infrastructure and building transmission -- all of which were
21 already present at the High Bridge site. This strategy would not have
22 permitted the Company to make optimal use of our existing land and
23 transmission infrastructure, both vital inputs into timely and successful
24 completion of generation projects.

25
26 Q. HOW DOES THE SIZE OF THE NEW HIGH BRIDGE PLANT COMPARE WITH THE
27 CAPACITY AND ENERGY OF A REHABILITATED HIGH BRIDGE COAL PLANT?

1 A. The original High Bridge coal plant was 243 MW. The High Bridge natural
2 gas conversion project resulted in 515 MW of capacity on our system, a net
3 increase of 272 MW. In contrast, the alternative project would have resulted
4 in a net decrease of capacity of about 4.4 MW (as a result of the operation of
5 some of the air quality equipment). In light of the increasing needs for
6 capacity expansion in our region, the expansion of capacity at this site
7 provides large reliability benefits for our entire system.

8

9 Q. WHAT WOULD HAVE BEEN THE COST OF REPLACING THE HIGH BRIDGE PLANT
10 AT A LATER DATE, HAD XCEL ENERGY NOT PURSUED PROJECTS THROUGH THE
11 MERP PROCESS?

12 A. The costs of installing new generating facilities have risen rapidly in the past
13 five years. At the time we proposed MERP, we estimated the installed cost of
14 new combined cycle generation to be between \$711/kW and \$827/kW. Our
15 current estimate for a new, combined-cycle generating facility is over
16 \$1100/kW, more than 33 percent higher. The savings from converting High
17 Bridge when we did is even greater than this difference, because we were able
18 to acquire low-cost turbines on the secondary market. Based on current
19 demand for turbines, it is unlikely that we could have replicated that
20 experience later.

21

22 Q. HAS THE ADDITION OF INCREASED CAPACITY AT THE HIGH BRIDGE PLANT
23 MITIGATED TRANSMISSION CONGESTION AND ULTIMATELY COSTS FOR ALL
24 CUSTOMERS?

25 A. Yes. High Bridge is located in the heart of a densely populated metropolitan
26 area. Most of our key baseload plants, including our nuclear and large coal
27 facilities, are located significant distances from our load centers. To facilitate
28 the siting of these large baseload facilities outside of metropolitan areas, the

1 Company must continue to maintain some resources within load centers to
2 ensure transmission stability and minimize overall transmission congestion.
3 Further, in the Midwest Independent Transmission Operator (“MISO”) Day 2
4 environment, which began operation in April 2005, energy providers are
5 directly assessed costs for the transmission congestion they impose on the
6 system by delivering energy from generators to load. The High Bridge Plant
7 location helps mitigate these costs for all ratepayers.
8

9 Q. PLEASE SUMMARIZE THE BENEFITS OF CONVERTING THE HIGH BRIDGE PLANT
10 TO A NATURAL GAS COMBINED CYCLE AT THE TIME OF THE MERP
11 CONVERSION.

12 A. There were several key benefits of having pursued and implemented the High
13 Bridge project when we did:

- 14 • We were able to expand capacity and energy to meet our growing customer
15 needs throughout our service territory.
- 16 • The operational flexibility provided by the new gas-fired units provides
17 improved system reliability, as our system must respond rapidly to hourly
18 changes in resource and load conditions.
- 19 • Retaining the High Bridge site allowed us to make best use of existing
20 infrastructure, providing cost savings for our customers.
- 21 • Similar benefits accrued to our customers through use of the existing
22 transmission infrastructure. We were also able to avoid potential
23 construction delays that frequently occur with new transmission additions.
- 24 • By acting quickly, the Company was able to gain access to low-cost
25 turbines on the secondary market.
- 26 • As discussed further in Mr. Richard Rosvold’s Rebuttal Testimony, we
27 were able to proactively address future environmental concerns.

1

2 **C. Summary of MERP Benefits**

3 Q. IN SUMMARY, CAN YOU EXPLAIN WHY XCEL ENERGY UNDERTOOK THE MERP
4 PROJECTS?

5 A. These projects achieve significant and lasting benefits for our customers
6 through extended lives of critical plants on our system, increased capacity, and
7 efficient use of existing infrastructure. In addition, as discussed in Mr.
8 Rosvold's Rebuttal Testimony, we believe that the MERP projects significantly
9 mitigated the risk of possible future environmental regulatory action. Given
10 that any rehabilitation and repowering project is a significant undertaking, it
11 made more sense to undertake an approach that hedged against potential
12 future requirements than to implement a significant project that did not
13 provide this hedge.

14

15 Q. WERE THERE OTHER BENEFITS OF PROCEEDING TO IMPLEMENT UPGRADES AT
16 THE KING AND HIGH BRIDGE PLANTS WHEN THE COMPANY DID?

17 A. Yes. The repower and rehabilitation projects also avoided the project
18 development risks associated with potential new generation sources. Siting
19 new generation and – perhaps more importantly – any required new
20 transmission facilities can take a significant amount of time and effort and is
21 potentially subject to significant proceedings, including litigation, before
22 construction can occur. Developing additional capacity at existing sites that
23 do not require such proceedings offered a hedge against the risk of delay.

24

25 Q. WAS DELAYING THE PROJECTS A FEASIBLE OUTCOME?

26 A. No. The option to take no action at the time was not feasible. Both the King
27 and the High Bridge plants were at or near the end of their useful lives. Major

1 rehabilitation of these plants (both of which would have been necessary in the
2 immediate future) would have triggered Federal New Source Performance
3 Standards environmental regulations that require the installation of
4 environmental control equipment. As a result, a 'do-nothing' approach would
5 have simply resulted in future modifications to the plants that would have
6 been comparable to the Company's alternative plan, but would have also
7 required additional costs associated with life extension activities.

8
9 Q. PLEASE SUMMARIZE YOUR CONCLUSIONS REGARDING THE COMPANY'S KEY
10 INVESTMENTS AT THE KING AND HIGH BRIDGE PLANTS.

11 A. Our investments at both King and High Bridge are proactive responses to
12 changes in economic and regulatory conditions. The investments did not, as
13 Mr. King suggests, simply involve the addition of environmental controls that
14 went beyond what was required by Federal law. To the contrary, the projects
15 resulted in expanded capacity and energy, extended unit lives and increased
16 reliability for our customers at a cost far below what it would have been to
17 construct new facilities. These investments will provide long-term benefits to
18 our customers throughout our service territory. For each facility, we believe
19 we made the correct choice of resource and set the Company on a timely path
20 to meet our customers' needs and expanding environmental requirements.

21 **IV. RENEWABLE ENERGY STANDARDS**

22
23 Q. ARE THERE OVERALL BENEFITS FROM XCEL ENERGY'S WIND ADDITIONS TO
24 ALL CUSTOMERS, REGARDLESS OF WHETHER THESE WERE IN RESPONSE TO
25 MINNESOTA MANDATES?

26 A. Yes. Although the wind has been installed on our system in response to
27 initiatives of the Minnesota legislature, it has proven to be a cost-effective

1 resource for all of our customers. In 2007, for example, the average cost of
2 wind on our system was \$32.16/MWh, while the average MISO market price
3 was roughly \$55.00/MWh. Without the wind in our portfolio, all of our
4 customers -- including those in North Dakota -- would have paid higher costs
5 for their energy. In addition, the wind energy has avoided emissions of SO₂
6 and NO_x allowing Xcel Energy to avoid purchase of allowances necessary to
7 emit those pollutants.

8

9 Q. WHAT WERE THE BENEFITS OF SITING THE WIND ENERGY FACILITIES WHERE
10 THEY ARE?

11 A. Generally speaking, Xcel Energy contracted for all of the wind through a
12 competitive process. The sites where our wind energy is currently located
13 were selected because the combination of wind speed (which helps determine
14 capacity factor), transmission, and other infrastructure producing the lowest
15 cost wind energy. In addition to capacity factors and transmission access, the
16 State of Minnesota adopted favorable incentives such as sales and property tax
17 exemptions in the early 1990s to encourage wind development. All of these
18 factors combined to produce low cost offers to supply wind energy and
19 provide significant benefits for our customers today.

20

21 Q. WHAT PARTICULAR BENEFITS DID CUSTOMERS RECEIVE THROUGH XCEL
22 ENERGY PURCHASING THE GRAND MEADOW WIND FARM?

23 A. The Grand Meadow Wind Farm is located in a particularly good area for wind
24 resources and relatively uncongested transmission. In addition, the project
25 was already well along in the development process, as it had access to wind
26 turbines and a favorable position in the Midwest Independent System
27 Operator's ("MISO's") interconnection queue. This last factor is critical to the
28 development process, as the interconnection queue currently contains over

1 20,000 MW of wind projects in our area, and it is estimated that it will take
2 many years to study and interconnect all currently proposed projects. The
3 ability to interconnect the project quickly allowed us to take advantage of the
4 Federal Production Tax Credit on wind energy, which is set to expire at the
5 end of 2008. This tax benefit alone is worth \$20.00 per MWh for the first ten
6 years, or more than 16 percent of the cost of the Grand Meadow project.

7

8 Q. TO THE EXTENT THEY EXIST, WOULD THE HIGHER CAPACITY FACTORS
9 AVAILABLE IN NORTH DAKOTA NECESSARILY TRANSLATE TO 25 PERCENT
10 LOWER WIND COSTS FOR XCEL ENERGY CUSTOMERS?

11 A. No. While North Dakota does have a favorable wind regime that can result in
12 higher capacity factors from wind turbines, the wind sites are remote from
13 load and there is very little transmission infrastructure currently available to
14 support the transmission of the wind to load. Thus any cost savings that may
15 be achieved from higher capacity factors would need to be balanced against
16 the costs of constructing major transmission lines.

17

18 Q. HAVE WIND PROJECT DEVELOPERS PROPOSED PROJECTS IN NORTH DAKOTA
19 IN RESPONSE TO OUR COMPETITIVE PROCESSES FOR WIND ACQUISITION?

20 A. Yes. While several North Dakota sites have been offered, they have not
21 proven to be the best resource when taking all key factors into account.
22 Clearly, the largest impediment to successful offers from North Dakota
23 projects has been the lack of transmission access. As discussed below, the
24 Company is working to address this issue for the future.

25

26 Q. MR. KING ALSO PROPOSES AN ADJUSTMENT TO BASE RATES TO REFLECT A 25
27 PERCENT REDUCTION IN THE COST OF OUR PURCHASED WIND, WHICH IS

1 CURRENTLY COLLECTED THROUGH THE FUEL ADJUSTMENT CLAUSE. IS THIS
2 ADJUSTMENT REASONABLE?

3 A. For the same reasons noted above, this type of adjustment would not be
4 reasonable. The adjustment assumes that the purchased wind facilities could
5 have been constructed elsewhere at a cost that was 25 percent below what was
6 agreed to under existing contracts entered into through a competitive bidding
7 process. Because infrastructure costs in other locations would have been
8 higher, we would not have been able to achieve those cost reductions even
9 under more favorable wind regimes.

10
11 Q. HOW MUCH WIND WILL XCEL ENERGY EVENTUALLY NEED TO PLACE ON ITS
12 SYSTEM?

13 A. To meet renewables requirements in all of its jurisdictions, Xcel Energy
14 estimates that we will have over 4,000 MW of wind on our system by 2020.

15
16 Q. WILL ALL OF THIS WIND BE LOCATED IN MINNESOTA?

17 A. No. Xcel Energy plans to develop wind facilities in wind-rich areas
18 throughout its service area, including North Dakota. As noted by Mr. Larson
19 in his Rebuttal Testimony, we have applied for approval to construct a new
20 345 kV transmission line extending from Fargo to the Twin Cities that will
21 allow us to export additional energy from North Dakota. We are currently
22 evaluating several North Dakota projects as part of our recent 500 MW wind
23 ownership solicitation. Xcel Energy recognizes the benefits of diversifying
24 wind resources over as large an area as possible and is affirmatively planning
25 and investing in our system to this end.

26
27 Q. PLEASE DESCRIBE THE BIOMASS FACILITIES THAT MR. KING RECOMMENDS
28 DISALLOWING.

1 A. Mr. King recommends that the Commission disallow the rate base items
2 related to our refuse-derived fuel facilities (“RDF”). These facilities include:
3 • Our Red Wing plant, a 20 MW plant which was constructed in 1949 as a
4 coal plant and converted to RDF in 1984;
5 • Our Wilmarth plant, a 20 MW plant which was constructed between 1941
6 and 1948 as a coal plant and converted to RDF in 1984; and
7 • Our French Island plant, a 25 MW plant that was constructed as a coal
8 plant between 1940 and 1948 and was converted to burn wood waste and
9 RDF in 1986.

10

11 The basis for this recommended disallowance is Mr. King’s claim that these
12 investments are responsive to the Minnesota mandates for renewable energy.

13

14 Q. WERE THESE FACILITIES CONSTRUCTED TO MEET MINNESOTA RENEWABLES
15 REQUIREMENTS?

16 A. No. These facilities have been a reliable part of our integrated system since
17 the 1940s, long before the Minnesota legislature passed any renewable
18 requirements. They were approved as a part of North Dakota electric rates in
19 our 1992 rate case and in prior cases. The facilities meet the definition of
20 “eligible energy technology” in Minnesota Statutes 216B.1691; therefore we
21 can count them toward meeting our renewables requirements, even though we
22 did not build them to meet those requirements. Xcel Energy also has several
23 owned and contracted hydro facilities that were developed pre-1970, but can
24 be counted toward our renewables requirements. Despite the fact that we can
25 count these facilities for the purpose of meeting our renewable requirements,
26 these projects were not, as Mr. King assumed, undertaken in response to any
27 new Minnesota renewable energy requirement.

25
26
27

Q. DOES THE ABILITY TO COUNT THESE FACILITIES TOWARD RENEWABLE REQUIREMENTS BENEFIT NORTH DAKOTA CUSTOMERS?

A. Yes. Our existing biomass and hydro facilities provide about three percent of our retail energy requirements. Since Xcel Energy can count these embedded facilities toward meeting our renewables requirements and because these already significantly depreciated costs are lower than the costs of new facilities, the amount of new renewables that we will need to install to meet our overall requirements, and our overall compliance costs are lower for all of our customers.

V. BENEFITS OF AN INTEGRATED SYSTEM

Q. MR. LARSON DISCUSSES THE BENEFITS OF AN INTEGRATED SYSTEM IN HIS REBUTTAL TESTIMONY. BASED ON YOUR EXPERIENCE IN SYSTEM PLANNING AND RESOURCE ACQUISITION, CAN YOU ELABORATE FURTHER ON THESE OVERALL BENEFITS?

A. Yes. As discussed above, my primary responsibilities with the Company are to determine the resources needed for the Company to continue to fulfill our customers' growing energy requirements and to secure those resources in the most cost-effective and environmentally responsible manner possible. The resource options that are available to a large integrated system such as ours are numerous and are due in large part to the overall size of the customer base we serve. As a 10,000 MW system, we can consider large resource additions of significant size to take full advantage of the economies of scale available through large facility generation.

1 For example, the addition of 515 MW at the new High Bridge facility
2 completed this spring could not have easily been absorbed into a smaller,
3 stand-alone system. The fuel efficiency of the combined cycle units now
4 available at the new High Bridge facility represents a 45 percent advantage
5 compared to the addition of a smaller, simple cycle turbine. Based on current
6 fuel prices, this translates into a cost savings of \$35/MWh or over \$70 million
7 per year in savings for all of our customers.

8
9 Similar advantages are made available due to the load diversity on our system.
10 Our overall system load factor is approximately 59.7 percent, meaning that our
11 customers use energy that is nearly 60 percent of the potential energy on our
12 system based on our peak load. While some large integrated systems
13 throughout the country may have similar system load factors, it is quite
14 difficult for smaller systems to achieve this level of efficiency. Thus, for a
15 smaller system, a larger percentage of load will be exposed to on-peak market
16 prices a larger percentage of the time than would be the case for larger
17 systems. Given that on-peak prices for energy in our region are currently
18 double to triple the level of off-peak prices, this is a significant benefit for
19 larger, integrated systems.

20
21 Finally, as discussed by Mr. Larson, the Company has built a highly diverse
22 fleet of generation and load management resources. Figure 1 in Mr. Larson's
23 Rebuttal Testimony provides a summary of the relative contributions from all
24 of our resources to meeting the needs of our customers. It is obvious from
25 this schedule that the Company has limited our customers' exposure to price
26 volatility from any single resource.

27

1 Q. PLEASE ELABORATE ON THE BENEFITS OF A LARGE INTEGRATED SYSTEM FROM
2 A RESOURCE ACQUISITION PERSPECTIVE.

3 A. When the Company wishes to acquire new generation resources, it can issue
4 RFPs for new resources exceeding 150 MWs in size. RFPs of this magnitude
5 are sufficient to draw the attention of large developers with resources available
6 to both bring large projects on-line in a timely manner and assume the
7 numerous risks present in power plant development. We can also weigh these
8 offers against large Company-owned projects that provide other advantages.
9 It would be difficult for a smaller stand-alone system to participate effectively
10 in this market.

11
12 This ability to construct larger facilities is still key to achieving economies in
13 the electric industry. For example, the cost of constructing a 600-MW, 2x1
14 combined cycle facility is at least 10 percent less expensive per kilowatt than
15 the smaller, 300 MW 1x1 combined cycle facility. These cost savings are
16 passed directly on to our customers in the form of lower rates.

17
18 There are also advantages to size in the mid-term and short-term power
19 acquisition markets that the Company must operate in to meet customers'
20 needs. The Company has developed extensive energy trading and risk
21 management expertise to better serve our customers in the mid-term markets
22 and the day-ahead and real-time markets facilitated by MISO. It would be less
23 cost-effective for a smaller entity to develop the expertise needed to
24 participate in these markets.

25
26 Q. PLEASE SUMMARIZE YOUR CONCLUSIONS REGARDING THE BENEFITS TO ALL
27 CUSTOMERS OF BEING PART OF A LARGE INTEGRATED SYSTEM.

1 A. There are significant advantages to being a part of a larger, integrated system
2 that result primarily from the existence of economies to scale in the electric
3 power industry. I have attempted to provide examples of these advantages.
4 While some advantages are more difficult to quantify, I believe that my
5 discussion demonstrates the overall advantages of participation in a large
6 integrated system compared to system planning and resource acquisition on a
7 stand-alone basis.

8

9

VI. RESOURCE PLAN

10

11 Q. HOW DOES XCEL ENERGY DEVELOP A RESOURCE PLAN?

12 A. Xcel Energy develops resource plans on the basis of an integrated system that
13 serves both the NSP-Minnesota and the NSP-Wisconsin operating companies
14 of Xcel Energy Inc. We examine the capacity and energy needs of our
15 customers as well as the regulatory and legal requirements in each of our
16 jurisdictions, and then design a plan that meets all requirements at the lowest
17 possible cost. We use a dynamic programming model (called "Strategist") that
18 allows us to look at various scenarios and ensure that our resource plan
19 provides customers with reliable, low-cost energy under a number of possible
20 outcomes.

21

22 Q. WHAT IS THE OVERALL BENEFIT OF THE PLANNING METHODOLOGY?

23 A. Planning on the basis of an integrated system allows us to take advantage of
24 economies of scale as well as the diversity of customer needs to provide lower
25 costs to all of our customers. For example, we are able to construct larger and
26 more economical facilities such as our nuclear plants and our 2400 MW
27 Sherco coal-fired generating facility. We are also able to maintain one of the
28 most diverse fuel mixes of any utility in the country, using coal, nuclear, hydro,

1 natural gas, wind, biomass, and oil to serve our customers' energy needs. In
2 addition, we are able to coordinate the requirements of our various
3 jurisdictions and develop a plan that meets all of those requirements at the
4 lowest possible cost.

5

6 Q. WOULD NORTH DAKOTA CUSTOMERS BENEFIT FROM A PLAN THAT PROVIDES
7 DIFFERENT RESOURCE REQUIREMENTS FOR DIFFERENT JURISDICTIONS?

8 A. No. If we were required to file a state-specific resource plan in North Dakota
9 or elsewhere, we would no longer be able to plan on an integrated basis.
10 Instead, we would need to propose specific resources to meet local needs and
11 policies that would not necessarily comply with the needs of other
12 jurisdictions. This approach could result in a number of conflicts for the
13 Company, and higher overall costs for all of our customers.

14

15 For example, if the Commission were to determine that our North Dakota
16 resource plan should not include wind energy in excess of its own state
17 objectives, we would need to include energy from other resources to make up
18 for the wind energy that would no longer be going to North Dakota
19 customers. This disaggregation would either involve construction of smaller,
20 more costly resources to meet North Dakota's exclusive needs or, more likely,
21 result in market purchases that would need to be paid for by North Dakota
22 customers. As noted above, the cost of our wind resources is currently far
23 below the market price, so such a decision would raise costs to North Dakota
24 consumers.

25

26 Similarly, our North Dakota load is simply not large enough to support the
27 construction of a large stand-alone generating facility such as a coal-fired plant.
28 Implementing such a requirement, were the Commission to impose it, would

1 require agreement from all other jurisdictions, as a share of the costs and
2 resource would need to be allocated across our entire service territory for such
3 a plant to approach feasibility. In short, if we were to construct facilities to
4 meet only North Dakota goals and requirements, our North Dakota
5 customers would lose the benefits of diversity of load and resources that help
6 keep costs low for all of our customers.

7

8 Q. WHAT CAN XCEL ENERGY DO TO OBTAIN MORE INPUT FROM NORTH DAKOTA
9 ON ITS RESOURCE PLAN?

10 A. Xcel Energy recognizes that the Commission desires more input into and
11 participation in our planning process, and we welcome that input. To ensure
12 we obtain the full benefit of an integrated system, we believe that input from
13 the Commission would be of the greatest value at the time we are developing
14 our resource plan.

15

16 To that end, we propose a collaborative planning process that would take
17 place approximately three months prior to our resource plan being completed.
18 Through this process we would meet with the state utility commissions and
19 staffs in all of our NSP jurisdictions to obtain specific information on their
20 goals and requirements for Xcel Energy's resource plan. In addition, we
21 would encourage and facilitate joint meetings of regulators from each
22 jurisdiction to discuss specific concerns and conflicts between various goals
23 and requirements. We would expect this process to be iterative; as Xcel
24 Energy uses the information from these meetings to help develop our plan, we
25 would share developments with our regulators for additional feedback.

26

27 While details of this process still need further development, we believe that
28 using this process will help us create a single, integrated, long-term resource

1 plan that brings benefits to all of our jurisdictions and addresses the specific
2 concerns of the Commission.

3

4 Q. CAN XCEL ENERGY MODIFY THE PLANNING PROCESS TO ADDRESS THE
5 COMMISSION'S CONCERNS ABOUT THE LOCATION OF GENERATING FACILITIES?

6 A. I believe so, yes. Since the 1990s, Xcel Energy has procured our resources
7 through competitive processes. These processes have focused on finding the
8 lowest-cost resources for our customers, regardless of location.

9

10 We understand that all of our jurisdictions are interested in the benefits that
11 come from the location of generating facilities in their respective states. While
12 we cannot commit to placing facilities in particular jurisdictions, we can
13 consider modifying our planning criteria to provide added emphasis to
14 location preferences when considering and selecting resources. In addition,
15 we can work specifically within our acquisition process to identify cost-
16 effective supply opportunities in all of our jurisdictions.

17

18 Again, this initiative requires further development. However, I offer it to
19 indicate there are useful approaches available that may address any concerns
20 the Commission has regarding our processes. The Company is opening to
21 exploring and refining such processes, as the Commission desires.

22

23 **VII. SUMMARY AND CONCLUSIONS**

24

25 Q. PLEASE SUMMARIZE YOUR CONCLUSIONS.

26 A. Our North Dakota customers enjoy the benefits of low-cost and reliable
27 energy as part of a large, integrated electric system. We develop our resource
28 plans to meet our customers' needs and the requirements of each of our

1 jurisdictions at the lowest possible cost and in an environmentally responsible
2 manner. While this approach may require one jurisdiction to supports costs
3 that result from other jurisdictional requirements, all of our customers benefit
4 from this approach, compared to separate planning and construction of each
5 system.

6
7 The investments in our King, High Bridge, wind and biomass facilities have
8 provided expanded capacity, extended lives and increased reliability on our
9 system that benefit all of our customers. The rehabilitation and repowering of
10 King and High Bridge resulted in the addition of over 300 MW of new
11 capacity and energy to serve our customers' growing needs at a cost that
12 would be much lower than development at a new site. Our wind facilities were
13 constructed in locations that avoided the cost of extensive transmission
14 infrastructure and today provide costs that are on average more than 40
15 percent below the current market. Our biomass facilities, long a part of the
16 Xcel Energy system, reduce the need for us to add new renewables to meet
17 regulatory requirements.

18
19 While the investments we have included in this case are reasonable and
20 prudent, we acknowledge that both Xcel Energy and our customers could
21 benefit from greater regulatory participation in our planning process. We
22 propose to establish a process that will allow us to obtain early input from our
23 regulators as we develop our plans, and receive continued feedback as our
24 plans progress. In addition, we propose to work to identify and acquire cost-
25 effective supply resources in each of our jurisdictions. These proposals will
26 allow us to ensure that the goals of each jurisdiction are heard, carefully
27 balanced, and addressed as we expand our system to meet future energy needs.

28

1 Q. DOES THIS CONCLUDE YOUR REBUTTAL TESTIMONY?

2 A. Yes, it does.
