**Large Industrial Group**

Direct Testimony of  
Kavita Maini

Before the  
North Dakota Public Service Commission

In the Matter of the Application of Otter Tail Power Company's Annual Filing for  
Renewable Resource Cost Recovery Factor

AND

In the Matter of the Application of Otter Tail Corporation for Authority to Increase Rates  
for Electric Service in North Dakota

Docket No. PU-08-862 AND PU-08-742 Combined

Exhibit \_\_

April 2, 2009

**I. INTRODUCTION**

*Q.* Please state your name and occupation.

*A.* My name is Kavita Maini. I am the principle and sole owner of KM Energy Consulting, LLC.

*Q.* Please state your business address.

*A.* My office is located at 961 North Lost Woods Road, Oconomowoc, WI 53066.

*Q.* Please summarize your educational background and experience

*A.* I graduated from Marquette University, Milwaukee, Wisconsin with a Masters in Business (1986) and a Masters in Applied Economics (1991). From 1991 to 1997, I worked for Wisconsin Power & Light as a Market Research Analyst and Senior Market Research Analyst. From 1997 to 1998, I worked as Senior Analyst at Regional Economic Research, Inc. in San Diego, California. From 1998 to 2002, I worked as a Senior Economist at Alliant Energy Integrated Services' Energy Consulting Division. Since 2002, I have been an independent consultant.

As an independent consultant, I have assisted industrial, commercial and institutional customers with issues related to rate design in various regulated states and provided electricity and natural gas RFP services to such customers in deregulated states. I have provided technical analysis related to energy policy issues on behalf of an energy user group called the Wisconsin Industrial Energy Group in various Wisconsin regulatory and federal regulatory proceedings. I have also conducted workshops on several energy related matters.

I represent the Wisconsin Industrial Energy Group as a Board Member at the Midwest Reliability Organization ("MRO") and also represent Midwest Industrial Customers ("MIC") at MISO. The MIC is a coalition of four end user associations including the Wisconsin Manufacturers' and Commerce, American Forestry & Paper Association, Wisconsin Paper Council and Wisconsin Industrial Energy Group.

*Q.* Who are you representing in this proceeding?

**PUBLIC-TRADE SECRET DATA OMITTED**

1 A. I am representing the North Dakota Large Industrial Group (“LIG”) which is  
2 further described in Larry Schedin’s testimony.

3  
4 Q. How are LIG members affected by this rate case proceeding?

5  
6 A. As can be noted, LIG members represent companies that are a significant source  
7 of employment and tax revenues in North Dakota. All these companies operate in a  
8 highly competitive environment and as such, are constantly driven to be efficient and  
9 drive down costs. These companies have a commitment to energy conservation and have  
10 implemented several energy efficiency initiatives in an effort to be cost competitive. The  
11 current economic downturn has already resulted in job losses and temporary shutdown  
12 for some of our members. Increases in electricity costs are a major concern for the  
13 companies I represent as it directly affects their competitiveness especially those  
14 companies where such costs are a major input.

15  
16 Q. Has any of your recent experience been with OTP proceedings closely related to  
17 this current case before the North Dakota Public Service Commission (“NDPSC” or  
18 “North Dakota PSC”)?

19  
20 A. Yes. I was an expert witness before the North Dakota PSC representing the ND  
21 OTP Large Industrial Group in OTP’s Cost of Fuel Adjustment Clause Tariff Case No.  
22 PU-05-131 in April 2007, and in OTP’s ND Time of Day Tariff Case No. TOD PU-07-  
23 03.

24  
25 I also recently assisted Larry Schedin who was an expert witness for the Minnesota  
26 Chamber of Commerce (“MN Chamber”) in OTP’s general rate case, MPUC Docket No.  
27 E-002/GR-07-1178 and who is an expert witness in this current rate proceeding as well.

28  
29 Q. Have you representing an industrial users group in these other North Dakota cases  
30 as well?

31  
32 A. Yes. All the members that I represented in these rate cases are also included in  
33 the current rate case proceeding with one exception: Imation. Imation is not participating  
34 because it shut down its plant in North Dakota and shifted additional manufacturing to  
35 Mexico. Imation participated in the PU-06-290 proceeding regarding time differentiated  
36 rates and provided comments emphasizing its need to stay competitive and the inability  
37 to pass energy cost increases in an intensely competitive environment.

38  
39 Q. Is your testimony focused on a particular class of service in this rate case  
40 proceeding?

41  
42 A. Yes. I focus principally on the Large General Service (“LGS”) class, but portions  
43 of my testimony pertaining to OTP’s Renewable Resource Rider (“RRR” or “Rider”) will  
44 benefit nearly all customer classes.

45

**PUBLIC-TRADE SECRET DATA OMITTED**

1 I will outline concerns and well as provide recommendations regarding OTP's current  
2 and proposed cost recovery approach related to the RRR, as well as OTP's proposed rate  
3 design changes to rates for the LGS class.

4  
5 *Q.* Does this testimony include all of the issues you are concerned with?

6  
7 *A.* Based on the information we have today, yes. The discovery response period,  
8 timing of when we got all of the initial filings in these proceedings and constrained  
9 timeframe in these cases has limited our ability to thoroughly prepare. LIG has a number  
10 of outstanding information requests or information requests that were received at the time  
11 of filing, which may refine or add concerns. If any supplement is necessary, LIG will  
12 make every effort to do so timely.

13  
14 **II. Renewable Resource Cost Recovery.**

15  
16 *Q.* What issue are you covering in this Section?

17  
18 In this section, I discuss the issues related to the renewable resource recovery rider.

19  
20 *A.* **Renewable Resource Recovery Rider ("RRR").**

21  
22 *Q.* What is the RRR?

23  
24 *A.* OTP obtained approval of a separate cost recovery mechanism, the RRR, to  
25 recover costs of owning wind generation in North Dakota.

26  
27 The North Dakota Public Service Commission ("NDPSC") granted OTP approval to  
28 recover costs associated with its 40.5 MW ownership of the Langdon Wind Energy  
29 Center ("Langdon") through the RRR on May 21, 2008, Case No. PU-06-466. In its  
30 Order, the NDPSC determined that:

- 31
- 32 1. Otter Tail's investment in the Langdon project was prudent;
  - 33
  - 34 2. The investment should be allocated to North Dakota based on its share of  
35 total energy consumed;
  - 36
  - 37 3. The RRR should be displayed separately on customers' bills;
  - 38
  - 39 4. Otter Tail must make an annual filing each year by September 1 to update  
40 the RRR for new projects and adjust for any over or under-recoveries of  
41 actual costs; and
  - 42
  - 43 5. A return on equity rate of 11.25 percent is to be used until the costs can be  
44 rolled into base rates.
  - 45

46 The RRR charge approved to be effective June 1, 2008 was \$0.00193/KWh.

**PUBLIC-TRADE SECRET DATA OMITTED**

1  
2 *Q.* Did OTP make its annual filing by September 1, 2008, as required under NDPSC  
3 decision in Case No. PU-06-466?  
4

5 *A.* Yes. OTP submitted its filing on August 29, 2008 and sought approval for  
6 revenue requirements associated with 48 MW ownership share in the Ashtabula Wind  
7 Energy Center (“Ashtabula”), which became operational in November 2008. In its filing,  
8 OTP also provided updated costs associated with the Langdon project since the original  
9 filing. Finally, OTP submitted a tracker balance for 2008 that represents a true-up of  
10 approved versus recovered costs.  
11

12 **B. Compliance – Renewable Energy Objective (“REO”)/Renewable Energy**  
13 **Standard (“RES”).**  
14

15 *Q.* Does North Dakota have a Renewable Portfolio Standard (“RPS”) or RES  
16 mandate?  
17

18 *A.* No. The North Dakota Legislature has established a state renewable and recycled  
19 energy objective that 10 percent of all retail electricity sold within the state by the year  
20 2015 be obtained from renewable energy and recycled energy sources. South Dakota has  
21 a similar objective.  
22

23 *Q.* Does OTP have to comply with an RES/RPS mandate in any state?  
24

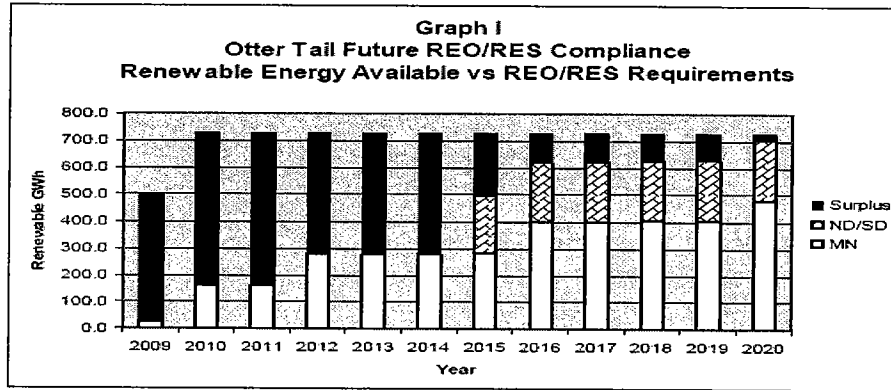

25 *A.* Yes. OTP has to meet the RPS mandate in Minnesota that requires that by 2025,  
26 25 percent of all retail electricity sold in Minnesota be generated from renewable  
27 resources. OTP’s REO/RES Compliance Report submitted to the Minnesota  
28 Commission on January 13, 2009 in Docket No. E-999CI-03-869 (“OTP Compliance  
29 Report”) **LIG Exhibit \_\_ (KM -1)** indicates the state’s step-wise increase requirements  
30 to meet the 25 percent requirement by 2025.  
31

32 *Q.* What is the status of OTP’s acquisition of renewable resources?  
33

34 *A.* According to 20 of the OTP Compliance Report:  
35

36 “With the current renewable resources in existence, under construction,  
37 and planned for the next couple of years, Otter Tail does not expect to add  
38 more resources for REO-RES compliance until about 2023, if even then.  
39 This forecast does not include counting the many small customer owned  
40 units currently being installed.”  
41

42 The OTP Compliance Report also includes the following chart which demonstrates that  
43 OTP will produce significantly more renewable energy than is required by current  
44 objectives for North Dakota. See OTP Compliance Report, p. 15. For example, by 2010,  
45 OTP expects to serve about 15 percent of its total retail load by renewable resources –  
46 primarily wind.

35

- Q.* What do you conclude from OTP’s efforts regarding renewable resources?
- A.* In particular, I conclude that OTP has acquired renewable resources well in advance of meeting the needs of North Dakota renewable objectives.
- Q.* Why is building wind generation projects well in advance of the need to fulfill renewable objectives a concern?
- A.* Acquiring these resources so far in advance of need is problematic because it results in unfairly burdening current customers with cost obligations and risks associated with requirements for future customers. In my opinion, OTP has not adequately proven that wind resources will be the least-cost resource to meet capacity or energy deficiency, nor that its addition will not be problematic for the system as wind resources in the region grow.
- C. Acquisition of Wind Generation as a Least-Cost Resource.**
- Q.* Does OTP claim that it has acquired the wind generation as least cost resource?
- A.* Yes. OTP’s Responses to LIG IR Nos. 7 and 78 suggest that OTP has installed wind because it is a least-cost resource and directs that the Minnesota 2005 IRP be reviewed. **See LIG Exhibit \_\_ (KM -2); LIG Exhibit \_\_ (KM -3).**
- Q.* After a review of the Minnesota 2005 IRP, OTP’s 2006 and 2008 supplemental filings and the Minnesota Public Utility Commission’s (“Minnesota PUC”) 2006 Orders, have you concluded that wind generation up to 160 MW has been chosen since it is a least cost resource?
- A.* No. I could not reach that conclusion for reasons discussed below.
- Q.* What is your understanding of the chronology of events that led to the approval of up to 160 MW of wind generation by the Minnesota PUC?

**PUBLIC-TRADE SECRET DATA OMITTED**

1 A. My understanding of the chronology of events that led up to 160 MW of approval  
2 of wind generation by Minnesota PUC is as follows:  
3

- 4 1. In OTP's 2005 IRP (**See LIG Exhibit \_\_ (KM -4)**), it is stated that 70.5  
5 MW of wind was manually implemented in the model (Section 9-4); It is  
6 not indicated whether the manual implementation was forced in spite of  
7 this generation not being least cost; OTP's 2005 IRP further states that an  
8 additional 20 MW of wind was selected in 2012 if total costs are 3  
9 cents/KWh flat costs over the life of the installation. OTP appears to use  
10 30 years as useful life as indicated under the Wind Sensitivity Section  
11 (Section 9-8).  
12
- 13 2. OTP's 2005 IRP also indicates minimum load problems at the level of  
14 wind included in the plan (Section 9-8) thereby implying that the solution  
15 was not least cost optimized.  
16
- 17 3. On August 9, 2006, the Minnesota PUC's Order indicates that up to 75  
18 MW of wind is approved.  
19
- 20 4. OTP's 2006 IRP supplement indicates that the availability of MISO  
21 wholesale market energy to back up wind generation is a key determinant  
22 in the amount of wind generation the planning model will select. OTP  
23 further states that if energy imports are capped and wind must be backed  
24 up by peaking capacity, the model will select less wind generation. OTP  
25 capped the amount of wind generation due to the back up generation issue.  
26
- 27 5. In November 2006, OTP's supplemental comments state "[a]dditional wind  
28 had to be forced into the model. IRP Manager determined that it was not  
29 economic to add simple cycle combustion turbines to firm up wind generation  
30 relative to the costs of other alternatives." (Otter Tail Power Company Reply  
31 Comments, Docket No. E017/RP-05-968 – November 29, 2006 **LIG Exhibit**  
32 **\_\_ (KM -5)**).  
33
- 34 6. OTP's November 2006 supplemental comments to the Minnesota PUC  
35 also indicate that at the Minnesota Department of Commerce's  
36 ("Minnesota DOC") request, it made some modeling adjustments that  
37 resulted in the model allowing more wind generation since more back up  
38 spot energy became available as a result of the adjustment. OTP's  
39 comments further appear to indicate that transmission improvements  
40 would be needed to allow for the back up energy from MISO market. OTP  
41 also indicated that it has not included the cost of such transmission  
42 improvements in the model (Otter Tail Power Company Reply Comments  
43 Docket No. E017/RP-05-968 – November 29, 2006).  
44
- 45 7. In the February 20, 2007 Amended Order by the Minnesota PUC, the  
46 Commission granted OTP's request to allow the utility to install up to 160  
47 MW of wind. OTP indicated that it would "like to pursue wind in excess of

**PUBLIC-TRADE SECRET DATA OMITTED**

1 75MW” and that the 75MW cap was posing as a financial impediment to  
2 securing financing. The Minnesota PUC acknowledged that OTP already has  
3 authority pursuant to the REO and community-based energy development  
4 (C-BED) statutory requirements, to exceed the 75 MW level mentioned in  
5 the Minnesota PUC’s Order. The Minnesota PUC granted approval to  
6 OTP for building up to 160 MW of wind.  
7

8 *Q.* What do you conclude from the chronology of these events which led up to 160  
9 MW of wind generation to be approved by Minnesota PUC?

10  
11 *A.* I conclude the following:

- 12  
13 1. Since the 75 MW were manually input in the model, it is possible that this  
14 amount was forced in the model due to REO compliance.  
15
- 16 2. OTP acknowledges there are issues related to dumping of surplus energy,  
17 as well as limitations regarding procuring backup generation from the  
18 MISO spot wholesale market without which additional wind generation is  
19 not cost effective. It is unclear how these issues and cost implications  
20 were addressed.  
21
- 22 3. It is not clear whether OTP accounted for the need of additional regulating  
23 reserve associated with wind generation or impact on Revenue Sufficiency  
24 Guarantee (“RSG”) costs. Since RSG costs are created whenever there are  
25 deviations related to load or generator output at MISO, it is likely that  
26 RSG costs will also increase.  
27
- 28 4. Additional wind up to 160 MW appears to be approved based on the  
29 premise that OTP was allowed to build in excess of 75 MW as per  
30 statutory provisions in place for REO/RES compliance and not least cost.  
31
- 32 5. It is not known what assumptions were used to forecast spot prices in the  
33 MISO market in the modeling adjustments identified in OTP’s November  
34 2006 supplemental comments. Since the spot market is being modeled to  
35 purchase back up energy, the results would likely be very sensitive to the  
36 spot market forecast. With the addition of this and other significant  
37 amounts of intermittent resources to the system, the spot market will likely  
38 have much more significant swings in the future.  
39
- 40 6. Cost assumptions used regarding wind in the 2005 plan indicate assumed  
41 flat levelized costs over a useful life of 30 years; as the discussion later in  
42 my testimony indicates, OTP’s proposed revenue requirements are neither  
43 using flat levelized costs nor a 30 year useful life.  
44

45 *Q.* Did you find any information from NDPSC that provides additional insight  
46 regarding the approval of wind generation of up to 160 MW?  
47

**PUBLIC-TRADE SECRET DATA OMITTED**

1 A. No.

2

3 Q. OTP has stated that wind generation reduces the Cost of Energy (“COE”). Has  
4 the COE decreased with the inclusion of wind generation?

5

6 A. As Larry Schedin’s testimony regarding COE indicates, there is no decrease in  
7 OTP’s average annual COE between 2007 and 2008.

8

9 Q. OTP presented a savings analysis using hourly OTP day ahead Locational  
10 Marginal Prices (“LMP”) and output from the Langdon project. Do you agree with these  
11 savings?

12

13 A. No. I do not agree with these savings since OTP does not use the appropriate  
14 \$/MWh cost to represent Langdon costs that are consistent with OTP’s proposed cost  
15 recovery approach. I discuss this later in this section in my testimony.

16

17 Q. So, what do you conclude overall?

18

19 A. I conclude that OTP is building wind generation primarily for REO/RES  
20 compliance.

21

22 Q. In your opinion, why has OTP acquired renewable resources so far in advance of  
23 meeting renewable resource need?

24

25 A. I believe that OTP acquired renewable resources so far in advance of need for the  
26 following reasons:

27

28 1. Cost recovery mechanisms separate from base rate cases in the form of the  
29 RRR allow for rapid cost recovery of capital investment without a general  
30 rate case.

31

32 2. To take advantage of the Federal Production Tax Credit (“FPTC” or  
33 “Production Tax Credit”).

34

35 3. To create surplus asset-based energy to sell to the open market.

36

37 4. As demonstrated in responses to LIG IR 4 and 5, OTP has non-regulated  
38 ownership and investments in businesses that support the wind industry  
39 and benefit from wind expansion. See LIG Exhibit \_\_ (KM - 6); See LIG  
40 Exhibit \_\_ (KM - 7).

41

42 **D. Current Cost Recovery Mechanism – RRR.**

43

44 Q. As a result of the NDPSC Order regarding the RRR on May 21, 2008, Case No.  
45 PU-06-466, the Commission required OTP to make an annual filing by September 1 to  
46 update the Rider for new projects, and to adjust for any over or under-recoveries of actual

**PUBLIC-TRADE SECRET DATA OMITTED**

1 costs. Did OTP make its annual filing by September 1, 2008, as required under NDPSC  
2 decision in Case No. PU-06-466?

3  
4 A. Yes. OTP submitted its filing on August 29, 2008 and sought approval for  
5 revenue requirements associated with 48 MW ownership share in the Ashtabula project,  
6 which became operational in November 2008. In its filing, OTP also provided updated  
7 costs associated with the Langdon Investment since the original filing. Finally, OTP  
8 submitted a tracker balance for 2008 that represents a true-up of actual versus recovered  
9 costs.

10  
11 Q. What are OTP's proposed revenue requirements for 2009 for the North Dakota  
12 jurisdiction?

13  
14 A. Table 1 shows the proposed revenue requirements summary for 2009 and  
15 resulting RRR charge in \$/KWh (in tracker summary of its August 29, 2008 filing)

16  
17 **Table 1**

18

| <b>SUMMARY</b>   |             |
|--|-------------|
| 2009 projected revenue requirements ( Ashtabula & Langdon) | \$7,522,598 |
| 12/31/08 tracker balance                                   | 1,818,580   |
| Carrying charge  | 99,062      |
| Total revenue requirements                                 | \$9,440,240 |
| 2009 projected sales in mWh                                | 1,851,179   |
| Proposed RR Rider Charge (\$/KWh)                          | \$0.00510   |

19  
20  
21 The 2009 projected revenue requirements of \$7.5 million consist of \$2.9 million and \$4.6  
22 million for OTP's 40.5 MW and 48 MW ownership in the Langdon and Ashtabula  
23 projects respectively.

24  
25 OTP's filing indicates the December 31, 2008 tracker balance of \$1.8 million and  
26 represents the amount of under recovery associated with the Langdon investment in 2008.  
27 The tracker account information provided by OTP compares costs and the amount  
28 recovered through North Dakota retail revenue, by month.

29  
30 The carrying charge of \$99,000 for the tracker balance is based on an assumed prime rate  
31 of 5 percent.

32  
33 The resulting RRR charge for customers after dividing the proposed total revenue  
34 requirement of \$9.4 million by 1.85 million MWh sales is \$0.0051/KWh. This represents  
35 a 164 percent increase over the previous RRR charge of \$0.00193/KWh. The proposed  
36 revenue requirement of \$9.44 million is 54 percent higher than the requested base rate  
37 case increase of \$6.08 million, and represents an overall 7.97 percent increase as  
38 compared to the base rate increase of 5.14 percent.

39  
40 Q. What is your overall concern about this increase?  
41

**PUBLIC-TRADE SECRET DATA OMITTED**

1 A. My overall concern is the rate shock implications of a potentially double-digit  
2 increase in rates (5.14 percent for base rates plus 7.97 percent for the RRR). Such an  
3 extraordinary increase is particularly problematic for the LIG members and others during  
4 the current and substantial economic crisis, especially given no recovery is anticipated  
5 anytime soon. The RRR hits high load profile users disproportionately harder, as it is  
6 proposed to be recovered through energy only.

7  
8 As highlighted in Larry Schedin's testimony, some LIG members have had extended  
9 shutdown periods since last fall and had a significant number of layoffs. Imposing such  
10 an increase during current economic conditions would further exacerbate an already  
11 adverse situation.

12  
13 E. **Key Concerns About OTP's Current and Proposed Cost Recovery**  
14 **Approach.**

15  
16 Q. What are your key concerns with OTP's current and proposed cost recovery  
17 approach?

18  
19 A. My key concerns are that OTP's current and proposed cost recovery approach:

- 20  
21 1. Exposes ratepayers to all the costs while failing to account for the  
22 considerable benefits obtained through increased asset-based wholesale  
23 margins and renewable energy attributes/credits (collectively "RECs")  
24 sale opportunities.  
25  
26 2. Unfairly subjects all the cost burdens associated with Otter Tail's  
27 RES/REO compliance to current ratepayers due to the front-end loading of  
28 costs.  
29  
30 3. While OTP's savings analysis using levelized costs indicates savings  
31 compared to procuring from MISO's wholesale spot market, OTP's  
32 proposed cost recovery approach does not use a levelized approach and  
33 highlights the fact that current ratepayers in fact are exposed to costs as  
34 opposed to savings.  
35  
36 4. Unfairly results in high load factor customers, such as customers in the  
37 LGS class, bearing a larger percent increase as compared to other  
38 ratepayer groups because of the energy only allocation.  
39

40 F. **Recommended Adjustments Regarding Cost Recovery Through The RRR.**

41  
42 Q. What are your recommendations regarding the cost recovery for renewable  
43 resources via the RRR?  
44

45 A. I recommend that the proposed revenue requirements be adjusted to reflect the  
46 following changes:

**PUBLIC-TRADE SECRET DATA OMITTED**

1

42  
43  
44  
45

1. ROE of 10.75 percent with adjustments as proposed in the partial settlement in the general rate case Docket.
2. Eliminate front-end loading of costs and levelize cost recovery.
3. If Recommendation No. 2 is not pursued, disallow OTP's proposed deferral of Production Tax Credit
4. Spread OTP's tracker balance, due to OTP's delay in recovery, over a period of 10 years.
5. Whether pursuing the levelized approach or OTP's proposed approach, change useful life to 30 years as identified in the Integrated Resource Plan.
6. Incorporate the benefits from selling or banking RECs, as well as incremental wholesale margins resulting from freeing up existing generation after adding wind, renewable energy certificates and any renewable energy sales made to third parties.
7. Change the method of recovery from ratepayers of an energy only charge to energy and demand charge.

I will discuss each of these recommendations with the exception of Recommendation No. 6, which will be discussed in Larry Schedin's Testimony.

**G. Recommended Adjustments.**

*Q.* What data did you use to ascertain the impacts of the recommended adjustments in this Section?

*A.* Except for the impacts described under levelized cost recovery, I used the spreadsheet provided in OTP's Response to LIG IR No. 11 to develop my own spreadsheet. **See LIG Exhibit \_\_ (KM - 8).** I went step wise and documented the impacts of each of the recommended adjustments. In my spreadsheet the results of each of the adjustments are provided, which were developed from the Tracker Summary tab of OTP's Response to LIG IR No. 11, Attachment No. 1. **See LIG TS Exhibit \_\_ (KM - 9).**

**1. *Return on Equity***

*Q.* Do the proposed revenue requirements for the RRR need to be updated?

*A.* Yes. The proposed revenue requirements for the Langdon and Ashtabula projects were based on a return on equity rate of 11.25 percent. As a result of the partial

**PUBLIC-TRADE SECRET DATA OMITTED**

1 settlement in this general rate case (Docket No. PU-08-742), the return on equity should  
2 be adjusted downward to 10.75 percent.

3  
4 *Q.* What impact does this have on the proposed revenue requirement for the Rider for  
5 2009?

6  
7 *A.* My spreadsheet referenced above provides the monthly summary results of the  
8 impact on revenue requirements. This decreases the projected 2009 revenue requirement  
9 by [Trade Secret Starts] [Trade Secret Ends] (non-tracker  
10 portion).

11  
12 **2. Levelized Cost Recovery**

13  
14 *Q.* What is OTP's current amortization method?

15  
16 *A.* Presently, OTP is front-end loading its cost recovery. OTP's chart below which  
17 was provided by OTP indicates the front-loading. See OTP Response to LIG IR No. 93,  
18 attached as **LIG Exhibit \_\_ (KM - 10)**. The chart was presented to demonstrate partial  
19 normalizing of the Production Tax Credit, an issue which is discussed later in my  
20 testimony. Notwithstanding, this chart demonstrates the heavily front-loaded nature of  
21 the cost recovery as proposed (in blue diamonds).  
22

**PTC Treatment**

23  
24  
25 *Q.* What are your concerns with this approach?  
26

**PUBLIC-TRADE SECRET DATA OMITTED**

1 A. Since OTP's acquisition of renewable resources through primarily wind  
2 generation is built far in advance of need, this approach results in *current* ratepayers  
3 unfairly and unnecessarily bearing higher costs  
4

5 Q. Is OTP's proposed method an accepted method by the Commission?  
6

7 A. Yes. OTP's current method is a traditionally accepted method of cost recovery.  
8 Like any other utility, OTP appreciates the rapid recovery of costs in earlier years.  
9 However, I am concerned that such an approach is over burdening current customers  
10 especially during these depressed economic times.  
11

12 Q. Is there an alternative method to OTP's current cost recovery approach?  
13

14 A. Yes. An alternative approach is to utilize the levelized method used in wind  
15 PPAs. This is the approach that I recommend to levelize the costs in a manner similar to  
16 the PPAs signed for wind generation. For example, OTP has a 19.5 MW 25-year PPA  
17 with FPL at the rate of [Trade Secret Begins] [Trade Secret Ends]. See  
18 OTP Response to LIG IR No. 27. See LIG Exhibit \_\_ (KM - 11). There is no front-end  
19 or back-end loading. Rather, this flat rate is levelized over the period of the PPA. Table  
20 2 (BELOW) shows an example of such cost recovery for the 40.5 MW Langdon project.  
21

22 OTP provided the levelized annual cost per MWh for this investment in response to LIG  
23 IR No. 131, attachment 1, which is attached hereto as LIG Exhibit \_\_ (KM - 12). As  
24 Table 2 below indicates, the product of the \$/MWh cost provided by OTP (LIG IR No.  
25 131) and wind output (LIG IR No. 12) results in annual revenue requirements of [Trade  
26 Secret Begins] [Trade Secret Ends] of which the North Dakota  
27 jurisdictional share is [Trade Secret Begins] [Trade Secret Ends]. See  
28 LIG Exhibit \_\_ (KM - 13). This would result in a [Trade Secret Begins]  
29 [Trade Secret Ends] RRR charge every year and would be a more reasonable charge  
30 especially given current economic conditions. A flat revenue requirement would also be a  
31 more equitable way of recovery from current and future ratepayers.  
32

33 **Table 2: Levelized Recovery Approach Results**

34 [Trade Secret Begins]  
35  
36  
37  
38  
39  
40  
41

42 [Trade Secret Ends]  
43

44 Q. What level of reduction would this resulting RRR charge be compared to the RRR  
45 charges in 2008?  
46

**PUBLIC-TRADE SECRET DATA OMITTED**

1 A. This would be a [Trade Secret Begins] [Trade Secret Ends]  
2 reduction over 2008 RRR charges of \$0.00193/KWh and a much more significant  
3 reduction compared to the proposed RRR for 2009.

4  
5 Q. Did OTP provide a savings analysis to demonstrate there are savings of owning  
6 wind generation compared to procuring spot purchases from MISO's wholesale market?

7  
8 A. Yes. OTP conducted an hourly analysis for 2008, using hourly Langdon output  
9 and multiplying this hourly output with the hourly differential between Langdon's  
10 levelized cost of [Trade Secret Begins] [Trade Secret Ends] and OTP's  
11 day ahead LMP. The result indicated a savings of roughly [Trade Secret Begins]  
12 [Trade Secret Ends]. See OTP Response to LIG IR No. 131.

13  
14 Q. Is OTP using the appropriate \$/MWh cost for Langdon as the basis of  
15 comparison? Why or why not?

16  
17 A. OTP is not using the appropriate \$/MWh cost for the basis of comparison since as  
18 pointed out earlier, OTP's approach is not levelized and results in higher costs in earlier  
19 years. See OTP Response to LIG IR No. 27, Attachment 1. The \$/MWh cost that is  
20 consistent with OTP's approach is [Trade Secret Begins] [Trade Secret  
21 Ends] in 2008, Using this \$/MWh cost results in a cost of roughly [Trade Secret Begins]  
22 [Trade Secret Ends] instead of any savings. The computation is attached as LIG  
23 Exhibit \_\_ (KM - \_\_). This result further reinforces the recommendation that the  
24 levelized cost approach should be used as it provides a benefit to current ratepayers as  
25 well.

26  
27 Q. Why else should the Commission consider recommending that OTP use the  
28 levelized recovery option that you just described?

29  
30 A. This approach will result in equitable recovery from current and future ratepayers.  
31 In addition, this approach will also help mitigate the rate shock impact during the current  
32 recession when businesses and ratepayers are really hurting.

33  
34 **3. OTP's proposal of deferring the Federal Production Tax Credit**  
35 **("FPTC" or "Production Tax Credit")**

36  
37 Q. Is OTP receiving the FPTC for the Langdon and Ashtabula plants?

38  
39 A. Yes. OTP is receiving the FPTC for both owned investments.

40  
41 Q. What is the FPTC?

42  
43 A. The FPTC is equal to the product of the actual wind output multiplied by  
44 \$21/MWh and is credited against income taxes for the first 10 years of a project. The  
45 FPTC is intended to reduce the cost of wind energy during the first 10 years of operations  
46 when wind ownership costs are the generally the highest.

**PUBLIC-TRADE SECRET DATA OMITTED**

1  
2 Q. How did OTP treat the federal production tax credit in its filing for approval of  
3 the Langdon investment in early 2008?  
4

5 A. It was proposed to be flowed directly through as credits are received.  
6

7 Q. What change is OTP proposing to make in the treatment of the production tax  
8 credit?  
9

10 A. OTP proposes to partially normalize the PTC by deferring increasing amounts of  
11 the credit over its assumed useful life of 25 years. OTP proposes to do this by increasing  
12 the deferred amount by 10 percent each year. In other words, starting in year 1, there  
13 would be no deferral, in year 2, there would be a 10 percent deferral, in year 3, a 20  
14 percent deferral and so on. The amount deferred is then normalized over the remaining  
15 life of the project – 24 years in year two, 23 years in year three and so on. OTP states  
16 that this will levelize the effects of the credit and smooth the resulting renewable factor  
17 over the life of each project.  
18

19 Q. Did OTP misapply its proposed approach in the treatment of the production tax  
20 credit to derive the proposed revenue requirements for Langdon and Ashtabula?  
21

22 A. Yes. OTP is deferring 10 percent and 20 percent in 2008 and 2009 for Langdon,  
23 which are years 1 and 2 of its commercial operation respectively. Instead, according to its  
24 proposed approach, it should have not deferred any amount in the first year (2008) and 10  
25 percent in the second year (2009). In addition, Ashtabula commenced commercial  
26 operation in December 2008. However, OTP started deferring 10 percent for Ashtabula  
27 in January 2009. Instead, OTP should not have deferred any FPTC amounts until  
28 December 2009, when it should have deferred the amount by 10 Percent. OTP Response  
29 to LIG IR No. 11, Attachment 1 shows the calculations provided by OTP that indicate  
30 misapplied deferral method. See LIG TS Exhibit \_\_ (KM - 9), Attachment 1, lines 31-  
31 36 Langdon TS Rows E-AH, lines 32-37 Ashtabula TS Rows V-AH.  
32

33 Q. What impact does correcting for this misapplication have on the proposed revenue  
34 requirements?  
35

36 A. The revenue requirements reduce by **[Trade Secret Starts]**  
37 **[Trade Secret Ends]** million for the Langdon and Ashtabula facilities and the 13/31/08  
38 tracker amount reduces by **[Trade Secret Starts]**  
39 **[Trade Secret Ends]** See LIG Exhibit \_\_ (KM - 14).  
40

41 Q. Even if OTP had correctly applied its proposed treatment of the FPTC, do you  
42 agree with proposed approach?  
43

44 A. No. I believe that the FPTC should be credited as OTP receives it and as OTP  
45 had initially proposed it in its filing for the Langdon project in early 2009.  
46

**PUBLIC-TRADE SECRET DATA OMITTED**

1 Q. Why do you disagree with OTP's proposed approach of the treatment of the  
2 FPTC?

3  
4 A. For two reasons – First, OTP is front-end loading the costs of its Langdon or  
5 Ashtabula projects as described earlier. OTP levelization of the FPTC, and not the  
6 overall investment, will result in an inconsistent treatment of costs.

7  
8 The FPTC was intended to provide an incentive to build wind resources by reducing the  
9 high cost of ownership during the first 10 years. OTP's proposed approach does not pass  
10 on that benefit to current ratepayers, but does pass through the high cost of the wind  
11 investment without any normalizing.

12  
13 Second, given the poor economic conditions and current recession, ratepayers, especially  
14 businesses such as members of the LIG simply cannot afford to take unnecessary electric  
15 rate increases during the current recession and further be at a competitive disadvantage.

16  
17 Therefore, if OTP continues to utilize its existing method and not levelize costs in a  
18 manner consistent with its PPA arrangements, then I recommend that OTP's proposed  
19 method of partially deferring the PTC be disallowed.

20  
21 Q. What are the resulting impacts on the revenue requirements for 0 percent deferral  
22 of the PTC?

23  
24 A. **LIG Exhibit \_\_ (KM - 14)** shows the resulting impacts on the revenue  
25 requirement for 0 percent deferral of the FPTC. As the exhibit indicates, the non-tracker  
26 balance is reduced to **[Trade Secret Starts]**

27 **[Trade Secret Ends]** the same amount as after adjusting for OTP's  
28 misapplication since PTC was 0 percent deferred in the first year of Langdon and  
29 Ashtabula commercial operations.

30  
31 Q. Will you consider OTP's approach of smoothing the FPTC reasonable under any  
32 circumstances?

33  
34 A. I will consider OTP's approach of smoothing the FPTC reasonable if OTP's  
35 method of cost recovery uses my recommended levelized approach.

36  
37 Q. What assumptions does OTP utilize for the useful life for the Langdon and  
38 Ashtabula projects for purposes of amortization?

39  
40 A. 25 years.

41  
42 Q. Do you recommend a change in this assumption?

43  
44 A. Yes. I recommend that the useful life be increased to 30 years. Since OTP's  
45 choice of wind generation was based on the analysis conducted in the Integrated  
46 Resource Plan and OTP assumed 30 years, I recommend that this adjustment be made for

**PUBLIC-TRADE SECRET DATA OMITTED**

1 whichever method is chosen for cost recovery (i.e., current front-end loading or  
2 levelized).

3  
4 *Q.* What impact does the change in useful life have on the proposed revenue  
5 requirements?

6  
7 *A.* This reduces the non-tracker revenue requirement to [Trade Secret Starts]  
8 . [Trade Secret Ends] See LIG Exhibit  
9 \_\_ (KM -14).

10  
11 *Q.* Are you recommending any other changes to the tracker balance?

12  
13 *A.* Yes. I am recommending that the tracker true up amount from the previous year  
14 be amortized over a period of 10 years. The assets (energy produced) that caused these  
15 deferred costs (true-up) are not just providing benefits to ratepayers in 2009. So, while  
16 OTP should be entitled to recovery, it should not be recovering true-up dollars entirely  
17 from 2009 ratepayers as such recovery would be punitive to that group. It is more  
18 reasonable to recover those costs evenly over a 10 year period. Using the approved rate  
19 of return of 8.62 percent over a 10 year period causes an annual net present value of  
20 \$224,415 per-year, plus carrying costs. This is a much more economic and reasonable  
21 annual true-up recovery, especially in the current economic downturn compared to \$1.8  
22 million plus carrying costs proposed by OTP for 2009.

23  
24 *Q.* Please summarize all the changes that you have recommended so far aside from  
25 your levelized cost recovery recommended option described earlier

26  
27 *A.* Table 3 below provides the summary of adjustments that I am recommending  
28 aside from the levelized cost recovery approach. Note that carrying costs are not  
29 included in demonstrating these adjustments. As can be noted, I am recommending that  
30 the proposed 2009 revenue requirements be adjusted downward by \$2.88 million.  
31 Assuming that \$/KWh charge is an appropriate method of recovering the revenue  
32 requirements, this reduces the charge from \$0.0051/KWh to \$0.0035/KWh.

33  
34 **Table 3: Cost Impacts of Recommended**

**[Trade Secret Ends]**

*Q.* Are you recommending any further adjustments?

*A.* Yes. While OTP is seeking 100 percent recovery for the costs of the Langdon and Ashtabula wind projects, there is no recognition of the incremental asset-based intersystem sales opportunity it creates for OTP’s existing generation fleet. In addition, as the cost of these wind assets have been and are recovered through the Rider, any energy sold from those assets to third parties should likewise be immediately credited to ratepayers through the Rider. Similarly, any RECs generated should also be immediately recovered through the Rider in the year that they are created. Some, though paid for by North Dakota Ratepayers will be used to satisfy Minnesota requirements. These benefits are described in Larry Schedin’s Testimony and need to be treated as savings before finalizing the adjustments to the revenue requirements.

*Q.* What method does OTP use to recover revenue requirements from ratepayers?

*A.* As discussed earlier, OTP charges a \$/KWh charge that is calculated by dividing the annual revenue requirement by the retail MWh sales.

*Q.* What are the resulting implications of using this method?

*A.* High load factor customers unfairly bear a disproportionate share of costs.

*Q.* Do you find this method reasonable? Why or why not?

*A.* No. I do not find this method reasonable because wind generation is neither built to satisfy base load energy use nor peak load requirement. It is an intermittent resource and is built to primarily fulfill a policy objective. As such, in my opinion, classifying wind as all energy related as is currently done is not a reasonable assumption. In fact, OTP has taken capacity credits based on MAPP accreditation rules for the Langdon project. See OTP Response to LIG IR No. 7, attached **LIG Exhibit \_\_ (KM - 2)**. OTP should therefore either use a 50/50 demand to energy split or, in the alternative, use its

**PUBLIC-TRADE SECRET DATA OMITTED**

1 equivalent peaker ("EP") method to classify wind, as it would any other owned  
2 generation.

3  
4 *Q.* Did you ask OTP to simulate the OTP proposed revenue requirement (i.e.,  
5 without any adjustments) using the EP method and calculating a resulting \$/KW and  
6 \$/KWh charge as an example of an alternative approach to use?

7  
8 *A.* Yes. OTP provided results of using the EP method and applying 28.11 percent  
9 demand and 71.89 percent energy split and the 2009 sales forecasts used in the rider  
10 filing. Table 4 shows the results (**corrected LIG-009, LIG-145 and LIG-151**). See LIG  
11 **Exhibit \_\_ (KM - 15), LIG Exhibit \_\_ (KM - 16) and LIG Exhibit \_\_ (KM - 17).**

12  
13 OTP also stated in response to LIG IR No. 9 that while it does not agree with this  
14 approach, should such an approach be approved, the demand factor should be 20%  
15 instead of 28.11% as MISO currently uses 20%. MISO is using the 20% as a default  
16 number and is currently in the process of developing an accreditation factor methodology  
17 that would be more location specific. For example, the Langdon plant has a higher  
18 capacity factor at 40% and it is most likely that once MISO's methodology is finalized,  
19 Langdon's accredited capacity will be double what it is today.

20  
21 Therefore, I recommend that the Commission consider a 50/50 energy to demand split or  
22 the energy to demand split from the existing EP method until MISO's method is  
23 finalized.

24  
25 **Table 4: RRR Charges Using after applying the EP Method**

Percent Demand/Energy split is based on amount used in Test Year CCSS and JCOSS in Case No. PU-08-062

1  
2 Q. Should the RRR charges remain as a separate line item in customer bills?

3  
4 A. Yes. As a separate line item, this increases transparency regarding the cost  
5 recovery regarding wind owned resources. In addition, LIG is recommending that  
6 incremental margins associated with existing displaced generation as a result of wind  
7 owned generation be flowed through as described in Larry Schedin's Testimony. These  
8 can be facilitated effectively through the existing Rider. Also, to the extent capacity costs  
9 are a part of RRR cost recovery, they cannot be recovered through the FCA.

**III. Rate Design.**

10  
11  
12  
13 Q. Please describe this section of your testimony.

14  
15 A. I will compare OTP's existing and proposed rate design structures for large  
16 customers, point out rate design concerns, and suggest modifications.

17  
18 Q. Will you be addressing issues related to CCOSS responsibility to the LGS class?

19  
20 A. No. The issues and proposed changes to the CCOSS are being addressed in  
21 Larry Schedin's Testimony. To the extent that any changes are approved for the CCOSS  
22 responsibility, they will need to be reflected in the revenue requirements to the LGS  
23 class. I will be addressing issues related to OTP's proposed rate design changes  
24 assuming OTP's proposed revenue requirements.

**PUBLIC-TRADE SECRET DATA OMITTED**

1     **A.     Existing Rates.**

2  
3     **Q.**     What are the existing OTP rate options commonly used by large customers?

4  
5     **A.**     For purposes of their CCOSS, OTP groups the large customer rate options in a  
6 single class called the Large General Service (“LGS”) rate class. However, specific  
7 major rates within the LGS class are the LGS, Large General Service Time of Day  
8 (“LGS-TOD”) and RTP rates. OTP is also proposing a new rate called the LGS Rider  
9 that lists guidelines in developing a customized interruptible rate.

10  
11    **Q.**     Describe the principal billing determinants of energy and demand included in the  
12 existing Large General Service Rate.

13  
14    **A.**     OTP’s basic LGS rate is a block rate with two demand blocks and three energy  
15 blocks Table 5 shows the energy and demand charges for the secondary class. The rate  
16 structure format for the primary and transmission voltage levels is identical, with lower  
17 charges related to higher voltage service. The energy charge for all consumption includes  
18 \$0.016473 per KWh in base fuel plus purchased energy costs. The rate includes COE and  
19 other charges. The energy and demand charge components are below.

20  
21                   **Table 5: Existing LGS Rate – Secondary Service Level**

22

| Demand Charge (\$/KW)                     | Secondary Service |
|---|-------------------|
| First 100 KW of Billing Demand            | \$8.33            |
| Excess KW of Billing Demand               | \$6.80            |
|   |                   |
| Energy Charge (\$/KWh)                    |                   |
| All over 360 KWh per KW of Billing Demand | \$0.02935         |
| First 700,000 KWh                         | \$0.03784         |
| Excess                                    | \$0.02979         |
|   |                   |
| Monthly Minimum                           | Demand Charge     |

23  
24  
25    **Q.**     Please describe the energy and demand charges related to the existing LGS-TOD  
26 rate.

27  
28    **A.**     This rate is available to any customer with billing demand of 80 KW or higher  
29 and consists of an on peak, shoulder peak and off-peak energy charges. Definition of on,  
30 shoulder peak and off peak hours varies by summer (June through September) and winter  
31 (October through May). The rate incurs a distribution facilities charge (\$/KW) that varies  
32 by demand level for secondary service level only. This could be considered an energy  
33 only rate since it has no demand charges reflective of generation capacity. Table 6 shows  
34 the energy and distribution facilities charges for the secondary class. As with the current  
35 LGS rate, the rate structure for the primary and transmission voltage levels is similar,  
36 with lower charges for subsequently higher voltage service levels. The rate incurs COE  
37 and other charges. The demand and energy components are below.

**PUBLIC-TRADE SECRET DATA OMITTED**

**Table 6 : Existing LGS TOD Rate – Secondary Service Level**

| Distribution Facilities Charges | Secondary Service |
|---------------------------------|-------------------|
| Less than 150 KW                | \$0.20            |
| 150KW to 299 KW                 | \$0.20            |
| 300 KW to 499 KW                | \$0.16            |
| Greater than 500 KW             | \$0.13            |
| Energy Charge (\$/KWh)          |                   |
| Winter                          |                   |
| Peak                            | \$0.0692          |
| Shoulder                        | \$0.0476          |
| Off Peak                        | \$0.0140          |
| Summer                          |                   |
| Peak                            | \$0.0106          |
| Shoulder                        | \$0.0369          |
| Off Peak                        | \$0.0129          |

Q. Did the existing LGS-TOD replace a prior one?

A. No. Although OTP has had a time differentiated in the Minnesota jurisdiction, it did not have one in North Dakota until the current LGS-TOD rate was introduced in 2007. In essence, OTP went from the extreme of having no TOD rate to the other extreme by introducing a complicated and flawed three-time period differentiated (on peak, shoulder peak, off peak) and two-season differentiated energy only rate.

Q. Are there any customers currently on the LGS-TOD rate?

A. No, none.

Q. In your opinion, why are there no customers on this rate?

A. The existing rate sends erroneous pricing signals as it has no demand charges to reflect capacity and other fixed costs that do not vary with energy use. Consequently, it is punitive to high load factor customers. In addition, the rate is complicated by the inclusion of shoulder peak, which includes weekend hours. I am not aware of any investor owned utility rate in the Midwest that does not consider all weekend hours as off peak. Typical time differentiated rates have on peak and off peak energy charges and summer and winter demand charges where demand charges are based a set definition of on peak billing demand only. OTP’s present LGS-TOD rate is not set from a practical perspective and does not consider customers’ ease of understanding and administration perspective.

My recommended changes discussed later in the testimony will result in a “user friendly” rate design that customers are accustomed to from their experience in other jurisdictions.

**OTP’S Proposed Changes to LGS Rate and LGS-TOD Rate.**

Q. What are OTP’s proposed changes to the demand and energy components of the LGS rate?

A. The LGS rate has been modified to include a single energy charge for summer months (June through September) and a single energy charge for winter months (October through May). Demand charges are also seasonally differentiated. There is a facilities charge that varies for customers less than 1 MW and 1 MW and greater. Table 7 shows the demand and energy related components of the rate at the secondary service level.

**Table 7 : OTP Proposed LGS Rate**

| Energy Charges (\$/KWh)   | Secondary Service |
|---------------------------|-------------------|
| Summer                    | \$0.05065         |
| Winter                    | \$0.05113         |
|                           |                   |
| Demand Charges (\$/KW)    |                   |
| Summer                    | \$7.13            |
| Winter                    | \$2.88            |
| Facilities Charge (\$/KW) |                   |
| Less than 1 MW            | \$0.30            |
| Eq or More than 1 MW      | \$0.15            |

13

Q. What is the impact of this proposed rate on LGS customers?

A. Witness Prazak’s testimony provides a chart showing the average monthly bill impacts to the LGS customers. See Witness Prazak Testimony, Figure 10, p. 35. Witness Prazak explains 95% of the customers will see a decrease and 5% of the customers with highest usage will see an increase. While the chart in the testimony indicates that 5% of the customers will receive a 7% increase, a revised chart was later provided by OTP that revised this increase to 5%. See OTP Response to LIG IR No. 56, attached as **LIG Exhibit \_\_ (KM - 18)**. Witness Prazak explains that the increase to customers with the highest usage is due to the removal of declining demand and declining load factor structures. The remaining customers will receive a 95% decrease with some customers receiving up to a 15% decrease. The customers receiving the highest increase are most likely manufacturers who are large employers and contribute significantly to the North Dakota economy.

27

Q. Does this result make sense?

28

A. No.

29

30

Q. What are OTP’s proposed changes to the LGS-TOD rate?

31

A. The LGS-TOD rate has been modified to include seasonally and time differentiated demand charges. The facilities charge is now exactly the same as OTP’s proposed LGS rate.

Please describe the time period defined as on, shoulder and off peak?

The below table is extracted from NERA Consulting's Marginal Cost of Electric Study Report provided in given in response to LIG IR 29, **LIG Exhibit \_\_ (KM - 19)**. This figure provides the time periods defined as on, shoulder and off peak. As is demonstrated, time period differentiations look very complicated. These time period differentiations are the same as OTP's existing rate that no customer is currently using.

**PUBLIC-TRADE SECRET DATA OMITTED**

**C. OTP's Proposed Methodology For Rate Design.**

**Q.** What methodology are OTP's proposed changes based on?

**A.** OTP used marginal cost analysis in order to allocate costs within classes after embedded costs were allocated by class.

**Q.** Who conducted the marginal cost analysis?

**PUBLIC-TRADE SECRET DATA OMITTED**

1 A. OTP retained the rate design expertise of Witness Parmesano from NERA, a  
2 national economics firm. Witness Prazak then made some further changes to meet OTP's  
3 design criteria

4  
5 Q. Has Witness Parmesano identified the same rate design objectives as Witness  
6 Prazak?

7  
8 A. Yes.

9  
10 Q. What is your understanding of how Witness Parmesano conducted the analysis to  
11 estimate marginal costs of providing electricity service?

12  
13 A. My understanding is that Witness Parmesano developed marginal costs for each  
14 cost component. For marginal costs of energy and generation capacity, she used a  
15 regional forecast. For transmission, she used the costs for wholesale transmission rates.  
16 For distribution sub stations and trunk feeders, she used OTP's recent and forecast  
17 growth-related expenditures and load growth. For local distribution facilities, she based  
18 estimates on the cost of typical equipment configurations for customers of various types  
19 and sizes. Lastly, marginal customer costs were based on the cost of typical meters and  
20 service drops and recent levels of customer related expenses.

21  
22 **D. Concerns With OTP/NERA Proposed Approach for Rate Design.**

23  
24 Q. Do you have any concerns with the OTP/NERA proposed approach for rate  
25 design?

26  
27 A. Yes. I have the following concerns with the proposed approach:

- 28  
29 1. By using regional forecasts for marginal energy and marginal capacity  
30 costs that are sensitive to the time period that they were generated, OTP  
31 unnecessarily creates an unstable foundation for setting rates.  
32  
33 2. Known factors known to OTP are ignored, such as its plans to construct  
34 Big Stone II to address base load resource deficiency and high  
35 transmission costs associated with CapX 2020 are not reflected in the  
36 demand charges of the LGS rate and LGS-TOD rate.  
37  
38 3. The proposed rates results in over recovery from high load factor  
39 customers with flatter load profiles.  
40  
41 4. The proposed rate unfairly recovers larger than average class increases  
42 from a small portion of the customers and provides decreases to remaining  
43 customers, with some customers receiving double digit decreases.  
44  
45 5. Proposed time of day rate remains complicated  
46

**PUBLIC-TRADE SECRET DATA OMITTED**

1           6.       Voltage level discounts for taking service at higher than secondary service  
2                    levels are inadequate

3  
4       I discuss each of these concerns below.

5  
6           1.       *Using Regional Forecasts creates an unstable foundation for setting*  
7                    *rates.*

8  
9       Q.       What is the weakness associated with the regional marginal energy and capacity  
10           forecasts?

11  
12       A.       Regional forecasts, by their very nature, are based on expectations and  
13           assumptions regarding various factors during the time period that they are generated. For  
14           example, the regional forecast would most likely look different if generated today as  
15           opposed to when this analysis was conducted last year. This is because market conditions  
16           driving the forecast including fuel costs have changed. An obvious illustration is the  
17           significant decline in natural gas prices since last year. Using forecasts that change and  
18           become outdated on a daily basis results in an unstable foundation to develop rates. A  
19           more stable foundation is needed.

20  
21           2.       *Demand charges are not reflective of known capital investment plans*

22  
23       Q.       Has OTP acknowledged that it is expecting high infrastructure investments for the  
24           period 2008 through 2012?

25  
26       A.       Yes. Witness Brause states that its anticipated capital investments for the 5 year  
27           period of 2008 through 2012 are \$880 million. See Witness Brause Testimony, p. 15.  
28           These costs include costs of OTP's share of Big Stone II, which is being constructed to  
29           meet OTP's growing baseload deficiency and CapX 2020 transmission projects. Id., p.  
30           16.

31  
32       These costs should be reflected in the form of higher demand charges in rates, which are  
33       a pricing signal for fixed infrastructure costs. Furthermore, since OTP is a winter peaking  
34       utility, the demand charges should be higher than they are proposed, in the LGS and  
35       LGS- TOD rate.

36  
37       Q.       Did OTP rely on the regional marginal capacity pricing forecast to announce its  
38           plans for Big Stone II?

39  
40       A.       No. OTP based its decision to build Big Stone II on its Integrated Resource Plan  
41           that indicated a baseload deficiency.

42  
43       Q.       Should OTP have waited to get a pricing signal from the regional market prior  
44           considering plans to build Big Stone II?

45

**PUBLIC-TRADE SECRET DATA OMITTED**

1 A. No, because if OTP waited for this pricing signal, it would have already been too  
2 late. Power plants, and in particular baseload plants, have a long lead time of  
3 construction. If OTP were to wait for this pricing signal, ratepayers would be exposed to  
4 high costs until the baseload deficiency is fulfilled.

5  
6 Q. So, does this mean that for capacity costs that ultimately get reflected in demand  
7 charges in rates, OTP does not need to rely on a regional marginal capacity forecast but  
8 its own investment plan?

9  
10 A. Yes. OTP operates in jurisdictions with no retail choice and has an obligation to  
11 serve. As such, OTP's plans to construct Big Stone II are based on an identified base  
12 load deficiency in its Integrated Resource Plan. Costs are approved by the Commission  
13 and are therefore, known costs specific to OTP. Consequently, OTP does not need a  
14 regional forecast to provide a pricing signal to customers. It must use its own known  
15 costs to provide the pricing signal.

16  
17 **3. *Over-recovery of costs from high load factor customers.***

18  
19 Q. Please explain how costs are over recovered from high load factor customers.

20  
21 A. Since OTP's proposed demand charges do not reflect OTP's known plans for  
22 capital investment, the pricing signal is distorted. This provides the erroneous signal that  
23 capacity is relatively inexpensive. The result is an under recovery in the demand charges  
24 in the proposed rates and consequently, over recovery in the energy charges to meet the  
25 proposed revenue requirements. This results in being punitive for the high load factor  
26 customers who have more efficient load profiles. High load factor customers also end up  
27 subsidizing low load factor customers.

28  
29 **Example 1**, below provides a simple illustration of how this subsidy occurs.

30  
31 Q. Are there any other reasons why you think that costs are over recovered from high  
32 load factor customers in the proposed LGS rate?

33  
34 A. Yes. Typically, high load factor customers have larger off peak use when OTP's  
35 variable costs of generating are lower. Using a seasonally differentiated average energy  
36 rate as proposed in the LGS rate, results in over recovery of costs. So, while the resulting  
37 unit cost is lower for a high load factor customer owing to the fact that the costs are  
38 spread over a larger amount of KWhs, the rate increase associated with the proposed LGS  
39 rate demonstrates the over recovery.

40  
41 Q. Please explain with an example.

42  
43 A. OTP's response in LIG IR 56 provides an illustrative example of the impact of the  
44 proposed changes to the LGS rate on customers with 50%, 75% and 100% load factor  
45 respectively. As the response indicates, the rate increase to a 50%, 75% and 100% load

**PUBLIC--TRADE SECRET DATA OMITTED**

1 factor customers is 4.5%, 1% and 5.5% respectively. OTP states that the customers with  
2 the highest load factors will continue to pay the lowest unit cost.

3

4 Paying the lowest cost is an obvious outcome since the costs are spread over a larger  
5 amount of energy consumptions for a 100% load factor customer as opposed to a 50% or  
6 75% load factor customer. A 100% load factor customer has higher off peak usage  
7 relative to other customers. The example provided by OTP illustrates that even though a  
8 customer with a 100% load factor has higher off peak usage, the rate increase is the  
9 largest. This is an unfair result.

10

*EXAMPLE 1*

*The following example demonstrates the subsidy that a high load factor customer provides a low load factor customer:*

Assume a class is made up of two customers with a combined demand of 1 MW and combined consumption of 500 MWh per month. Each customer has a demand of 500 kW. Assume a revenue requirement of \$20,000.

Customer A's monthly consumption = 170,000 kWh (47% load factor)

Customer B's monthly consumption = 330,000 kWh (90% load factor).

Assume variable energy-related cost is 2.0¢ per kWh, demand cost is \$10 per kW and total class revenue requirement is set at this total cost of \$20,000

$[(2.0¢ \times 500,000 \text{ kWh} = \$10,000) + (\$10 \times 1,000 \text{ kW} = \$10,000)] = \$20,000$

The total cost of serving customer A is \$8,400  $[(2.0¢ \times 170,000 \text{ kWh} = \$3,400) + (\$10 \times 500 \text{ kW} = \$5,000)]$ .

The total cost of serving customer B is \$11,600

$[(2.0¢ \times 330,000 \text{ kWh} = \$6,600) + (\$10 \times 500 \text{ kW} = \$5,000)]$ .

Now, let's assume that instead of setting energy and demand charges equal to the corresponding costs, energy charges are set at 3.0¢. Revenue from the energy charge would be \$15,000  $(3.0¢ \times 500,000)$  leaving \$5,000 to be recovered from the demand charge  $(\$20,000 \text{ revenue requirement less } \$15,000 \text{ of energy charge revenue})$ . Thus, the demand charge would be set at \$5.00 per kW  $(\$5,000 \div 1,000 \text{ kW})$ .

With these charges, customer A with the lower load factor would have a monthly bill of \$7,600  $[(3.0¢ \times 170,000 \text{ kWh} = \$5,100) + (\$5.00 \times 500 \text{ kW} = \$2,500)]$

Customer B with the higher load factor would pay \$12,400  $[(3.0¢ \times 330,000 = \$9,900) + (\$5.00 \times 500 \text{ kW} = \$2,500)]$ .

This example shows us that, because energy charges are set above energy costs, the high-load factor customer – customer B – is charged rates that cover not only its cost of service, but also an \$800 subsidy to customer A.

2  
3  
4  
5  
6  
7

4. *Unfair burden of recovering revenue requirements from a small set of customers typically manufacturing companies.*

Q. Is gradualism one of OTP's rate structure objectives?

**PUBLIC-TRADE SECRET DATA OMITTED**

1  
2 A. Yes. Witnesses Prazak and Parmesano both cite gradualism as one of the rate  
3 structure objectives?  
4

5 Q. Is the proposed rate design resulting in a fair and gradual change for all customers  
6 in the LGS rate class?  
7

8 A. No. The proposed rate results in 5% of the customers who are larger sized  
9 bearing higher rate increases than the proposed rate class increase of 1% and 95% of the  
10 customers getting a decrease. In fact, some customers get a 15% rate decrease.  
11

12 In response to LIG IR 56, OTP states:  
13

14 Attachment No. 1 in LIG-056 is an updated Duo-Decile chart for the large general  
15 service customers. In the original Decile chart, on page 35 of Mr. Prazak's  
16 testimony, the COE adjustment for one customer's estimated bill was incorrectly  
17 applied to all customers' present year bills based on usage for purposes of the  
18 Decile chart only. OTP has now correctly assigned this COE adjustment to the  
19 correct customer, which is the largest customer overall. The result of this  
20 reallocation is shown in the last Decile, which decreased from a positive 7% (as  
21 filed in testimony) to a positive 4% (corrected in IR ND LIG-056) change in  
22 monthly bill. This reallocation also changed all other deciles, reducing their  
23 decrease. For example in the original Decile chart the first Decile showed a  
24 monthly bill decrease of 20%. In the updated Decile chart the first Decile will  
25 have a monthly bill decrease of 15%.”  
26

27 **5. Concerns with OTP's proposed LGS-TOD rate.**  
28

29 Q. What are your concerns with the OTP's proposed LGS-TOD rate?  
30

31 A. No customers are currently using this rate. While the proposed LGS-TOD is an  
32 improvement over the existing rate since it now includes demand charges as a separate  
33 rate component, (1) as stated above, the on peak demand charges are understated –  
34 *Demand charges are not reflective of known capital investment plans*, and (2) the rate  
35 design remains complicated.  
36

37 Since OTP has never had a TOD rate prior to the existing problematic rate, that no  
38 customer currently uses, it would be preferable to introduce a simpler rate.  
39

40 **6. Voltage level discounts for taking service at higher than secondary service**  
41 **levels are inadequate.**  
42

43 What are your concerns about the voltage level discounts?  
44

45 Table \_ shows the voltage level discount from the secondary to the primary level for  
46 OTP's proposed LGS rate. As the table indicates, the discounts are less than 1%, a very  
low amount and could not possibly cover lines losses and the savings associated with

**PUBLIC-TRADE SECRET DATA OMITTED**

1 taking service at a higher voltage level. For example, Xcel Energy’s voltage discount at  
2 the primary level is at \$0.85/KW for demand and \$0.007/KWh for energy.

3  
4 Table 9 : OTP’s Proposed Rate – Voltage Level Discount from Secondary to Primary  
5 Level

|               | Secondary | Primary   | Voltage Discount |
|---------------|-----------|-----------|------------------|
| Energy \$/KWh |           |           |                  |
| Summer        | \$0.05065 | \$0.05045 | \$0.00020        |
| Winter        | \$0.05113 | \$0.05090 | \$0.00023        |
| Demand \$/KW  |           |           |                  |
| Summer        | \$7.13    | \$7.08    | \$0.05000        |
| Winter        | \$2.88    | \$2.86    | \$0.02000        |

6  
7  
8 **E. Proposed Modifications.**

9  
10 **1. *LGS Rate Modifications.***

11  
12 *Q.* Based on your concerns above, what guidelines are you proposing to modify  
13 OTP’s proposed LGS rate?

14  
15 *A.* I am recommending the following modifications OTP’s proposed LGS rate:

- 16  
17 1. The rate increase should be spread more evenly as opposed to a smaller  
18 percent of the customers bearing a more than class average rate increase  
19 and the remaining customers getting a rate increase.
- 20  
21 2. For reasons highlighted in Section D (above), the demand charges should  
22 be set higher and provide a pricing signal that indicates that capacity is not  
23 cheap. For example, one way to get part way is to set the winter demand  
24 charge equal to the summer demand charge. Table 10 shows the billing  
25 determinant for the LGS secondary service level as an illustration (billing  
26 determinants obtained from Witness Prazak’s Testimony. See Witness  
27 Prazak Testimony, Exhibit DGP1 Schedule 2 page 10. Once I modified  
28 the demand related costs, I readjusted the energy charges using the same  
29 Summer/Winter relationship as the OTP proposal.

30  
31 **Table 10: LGS Billing Determinants – Secondary Service**

**PUBLIC-TRADE SECRET DATA OMITTED**

| <b>LGS BILLING DETERMINANTS</b>    |                    |                          |                     |                     |                    |
|------------------------------------|--------------------|--------------------------|---------------------|---------------------|--------------------|
| <b>SECONDARY SERVICE</b>           |                    |                          |                     |                     |                    |
| <b>EXISTING RATES</b>              |                    |                          |                     |                     |                    |
|                                    | Units              | \$/Unit                  | Total Amount        |                     |                    |
| Energy over 360 per KW             | 113,192,890        | 0.02935                  | \$3,322,211         |                     |                    |

3. The energy rates should be set after deducting the amount established for demand under Recommendation No. 2 above. Winter and summer energy rates should follow the relationship prevalent in OTP’s **existing** marginal energy costs.
4. OTP should develop a high load factor credit to negate the over recovery of charges from high load factor customers as described in Section D3 above. For example, Xcel Energy’s approved rates in North Dakota have such a credit to counter the over recovery.
5. OTP needs to reassess the voltage discounts for higher voltage levels service levels in order to provide the proper price signal.

*Q.* What should be done about these modifications to OTP’s proposed rate design to the LGS rate?

*A.* The NDPSC should order OTP to use these guiding principles and move further with my idea of raising demand charges, using OTP’s known and existing marginal energy costs to develop the winter/summer energy rate and introducing a high load factor credit such that accurate pricing signals are provided regarding high capacity costs, voltage level differentials, winter/summer energy cost relationships and high load factor customers do not subsidize low load factor customers.

**2. LGS-TOD Rate Modifications.**

*Q.* Based on your concerns above, what modification to OTP’s proposed LGS-TOD rate should be made?

**PUBLIC-TRADE SECRET DATA OMITTED**

1 A. I am recommending the following guidelines to modify OTP's proposed LGS-  
2 TOD rate:

- 3
- 4 1. The rate design should be more conventional and easier to understand to facilitate  
5 acceptance and participation in the rate.
- 6
- 7 i. For example, OTP could set a single demand charge for the  
8 summer months and a single demand charge for the winter months.  
9 These charges should be higher for reasons cited earlier. Similar to  
10 Xcel's Commission-approved rates in North Dakota, OTP could  
11 set the same demand charges for the TOD rate as those set for the  
12 LGS rates.
- 13
- 14 ii. The energy rates should be set after deducting the amount  
15 established for demand under (i) above. OTP could include an on-  
16 peak and off-peak energy charge that is seasonally differentiated.  
17 OTP could use Xcel's definition for on- and off-peak in North  
18 Dakota. Also, similar to Xcel's methodology of utilizing an on-  
19 and off-peak ratio of its existing marginal energy costs to develop  
20 the on- and off-peak energy rate, OTP's existing marginal energy  
21 cost relationships should be used to develop the resulting on- and  
22 off-peak energy rates.
- 23
- 24 iii. Introduce a high load factor credit similar to the one approved by  
25 the Commission for Xcel.
- 26
- 27 iv. OTP needs to reassess the voltage discounts for higher voltage  
28 levels service levels in order to provide the proper price signal.
- 29

30 Q. What should be done about these guiding principles to modify OTP's proposed  
31 rate design to the LGS rate?

32

33 A. The Commission should order OTP to use these guiding principles and move  
34 further with my idea of raising demand charges, simplifying the rate and introducing a  
35 high load factor credit such that the rate is simpler, accurate pricing signals are provided  
36 regarding high capacity costs, voltage service differentials on and off peak energy rates  
37 are reflective of OTP's existing marginal costs and high load factor customers do not  
38 subsidize low load factor customers.

39

40 Q. Does this conclude your testimony?

41

42 A. Yes.

43
