The Basic Query provides the identification of the customer to whom the call will be delivered and includes area of service routing which allows routing of 800 calls by telephone companies to different interexchange carriers based on the Local Access Transport Area (LATA) in which the call originates. The Vertical Feature Query provides this same customer identification function in addition to vertical features which may include: 1) call validation (ensuring that call originates from subscribed service area); 2) POTS translation of 800 numbers (which is generally necessary for the routing of 800 calls); 3) alternate POTS translation (which allows subscribers to vary the routing of 800 calls based on factors such as time of day, place of origination of the call, etc.); and 4) multiple carrier routing based on factors similar to those in 3.
