With the recent tightening of emission levels for coal fired power plants. North Dakota would be proactive to approve more clean energy projects such as wind farms should reducing emissions result in a decrease in output. The more clean energy our state produces would further reduce our states carbon footprint.

In closing my siblings and I feel that the addition of wind turbines and the infrastructure that goes along with it would add value to our land.

If such a time should ever come where myself, my siblings or our heirs have to make that difficult decision to sell our land . It should be more attractive to a prospective buyer when the land starts paying a dividend at the date of sale.

Thank you for granting me the time today to express my views.
