RATE CODE: A62 (FIRM), A63 (CONTROLLABLE) 22nd Revised Sheet No. 65

DAY-TYPE
Separate energy charges are defined for each of eight day-types. Company will normally designate the applicable day-type for each day by 4:00 p.m. of the preceding day. If Company has not designated the applicable day by 4:00 p.m., the day-type will be the same as the last designated day-type, unless Company later designates a lower cost day-type.

CONTRACT
Customers must contract for this service through an Electric Service Agreement with Company. Contract period will normally be for one year.

FUEL CLAUSE
Bills are subject to the adjustments provided for in the Fuel Clause Rider.

RESOURCE ADJUSTMENT
Bills are subject to the adjustments provided for in the Conservation Improvement Program Adjustment Rider, the State Energy Policy Rate Rider, the Renewable Development Fund Rider, the Transmission Cost Recovery Rider, the Renewable Energy Standard Rider and the Mercury Cost Recovery Rider.

ENVIRONMENTAL IMPROVEMENT RIDER
Bills are subject to the adjustments provided for in the Environmental Improvement Rider.

SURCHARGE
In certain communities, bills are subject to surcharges provided for in a Surcharge Rider.

LOW INCOME ENERGY DISCOUNT RIDER
Bills are subject to the adjustment provided for in the Low Income Energy Discount Rider.

LATE PAYMENT CHARGE
Any unpaid balance over $10.00 is subject to a 1.5% late payment charge or $1.00, whichever is greater, after the date due. The charge may be assessed as provided for in the General Rules and Regulations, Section 3.5.

PEAK PERIOD HOURS DEFINITION
Peak period hours are the nine hours between 9:00 a.m. and 6:00 p.m. for day-types 1, 2, 3, 4, 5, and 6. No peak period hours are applicable for day-types 7 and 8.

STABILITY FACTOR ADJUSTMENT

Day-type energy charges will be adjusted by a stability factor to compensate for departures from the normal distribution of day-types. The average day-type energy charge, weighted with system loads, will be determined for actual and normal day-types. Stability factors of no more than five percent will be implemented following an annualized differential that exceeds two percent, and discontinued after the differential for the preceding 12 months is less than one percent. Customers will be notified of the effective date and amount of any stability factor adjustment before that adjustment is implemented, changed or discontinued. No stability factor adjustment will apply to customers receiving this service for fewer months than used to determine the adjustment.

POWER FACTOR

The power factor for the month shall be determined by permanently installed metering equipment. Company may require customer to install Company-approved equipment to maintain a power factor of not less than 90%.

REAL TIME PRICING SERVICE (Continued) Section No. 5
RATE CODE: A62 (FIRM), A63 (CONTROLLABLE) 9th Revised Sheet No. 66

DETERMINATION OF DEMAND

Contract Demand in kW is designated by customer and is fixed for no less than 12 months. Customers are allowed a maximum of one opportunity to revise to their contract demand level in any continuous 12-month period. In no month shall the demand to be billed be considered as less than the actual or expected average kW load during peak period hours of the billing month. In all months, the Contract Demand designated by customer shall be used to determine the kWh sales applied to the Limited Energy Surcharge and the Energy Charge Credit.

Distribution Demand in kW shall be the greatest 15 minute load that occurred during the past 12 months, including the current billing month, rounded to the nearest whole kW. Additional demand that may result from customer's use of contracted standby or supplemental capacity is not included in the determination of distribution demand.

CONTROLLABLE SERVICE OPTION

The controllable service option is available to customers that agree to control a minimum load of 500 kW to a predetermined level whenever required by Company. The applicable monthly controllable demand credit is applied customer's monthly controllable demand. The applicable limited energy charge per kWh replaces the charge for firm service.

Controllable Demand Credit per Month per kW			Limited Energy Surcharge per kWh	
	Jun-Sep	Other Months		
Level A: < 65% PF	$5.36	$1.04	$0.1353	R
Level B: ≥ 65% and < 85% PF	$6.16	$1.84	$0.0962	R
Level C: ≥ 85% PF	$6.67	$2.34	$0.0772	R

Controllable Demand in kW is the difference between Contract Demand for the billing month and Predetermined Demand Level.

Predetermined Demand Level shall be specified and agreed to by the customer and Company, and may not exceed the Contract Demand. Customer's demand must not exceed the predetermined demand level (PDL) during a control period.

Performance Factor (PF) is defined in percentage terms as the average of the July and August calendar month maximum Controllable Demand occurring from 1:00 p.m. to 7:00 p.m. on weekdays, divided by the maximum annual Controllable Demand. Customer's representative load characteristics will be used to determine customer's performance factor. Company reserves the right to determine customer's eligibility for performance factor levels and may transfer customers between levels following verification of a customer's performance.

REAL TIME PRICING SERVICE (Continued) Section No. 5
RATE CODE: A62 (FIRM), A63 (CONTROLLABLE) 6th Revised Sheet No. 67

Controllable Service Terms and Conditions

1. Company will endeavor to give customer one hour notice of commencement of control period.

2. An additional charge of $8.00 per kW for failure to control will apply during each Company specified control period to the amount that customer's maximum power factor adjusted on peak demand exceeds their predetermined demand level.

3. The duration and frequency of control periods shall be at the discretion of Company. Control periods will normally occur when Company expects a reasonable possibility of system load levels surpassing the level for which NSP has sufficient accredited capacity under the Midwest Reliability Organization (MRO) or any successor organization, including reserve requirements, or when in Company's opinion, the reliability of the system is endangered. Customers will be separated into two groups by Company with control periods applicable to one or both groups. Customer groups are determined by geographical location and equivalent total controllable load. Control periods will apply to both customer groups at times of the highest forecast system load levels. Control periods at other high load times may apply to only one of the customer groups. Customer groups will be defined as subject to control periods on either even or odd numbered days.

4. Maximum duration of all control periods specified by Company will be 80 hours per year.

5. Customer may revise predetermined demand level subject to approval by Company.

6. Company shall not be liable for any loss or damage caused by or resulting from any interruption of service.

7. Any customer with generating equipment that is operated in parallel with Company must comply with all requirements associated with parallel operations as specified in the General Rules and Regulations of the Company.

8. Any load served by customer generation during Company requested control periods must normally be served by Company.

STANDBY SERVICE
Standby service is available under this schedule subject to the provisions contained in the Standby Service Rider.

TERMS AND CONDITIONS OF SERVICE
1. Alternating current service is provided at the following nominal voltages:
   a. Secondary Voltage: Single or three phase from 208 volts up to but not including 2,400 volts,
   b. Primary Voltage: Three phase from 2,400 volts up to but not including 69,000 volts,
   c. Transmission Transformed Voltage: Three phase from 2,400 volts up to but not including 69,000 volts, where service is provided at the Company's disconnecting means of a distribution substation transformer, or
   d. Transmission Voltage: Three phase at 69,000 volts or higher.

   Service voltage available in any given case is dependent upon voltage and capacity of Company lines in vicinity of customer's premises.

2. Transmission Transformed Service is available only to customers served by an exclusively dedicated distribution feeder. Customer will be responsible for the cost of all facilities necessary to interconnect at the Company's disconnecting means of a distribution substation transformer.

3. Transmission Service is available at transmission voltage, subject to the terms and conditions contained in the Company's General Rules and Regulations, Section 5.1(B).

4. Company will provide, install, and maintain equipment necessary to communicate real-time prices to customers. Customer will provide for a dedicated telephone line service approved by Company.

5. Customer will pay a cancellation charge for contract cancellation prior to the end of a contract period. The cancellation charge is $1,000.00, plus the difference between customer's bills recalculated using customer's previous rate schedule and this rate schedule if such difference is greater than zero.

LOW INCOME ENERGY DISCOUNT RIDER
Bills are subject to the adjustment provided for in the Low Income Energy Discount Rider.

The following are terms and conditions for service under this tariff.

LATE PAYMENT CHARGE
Any unpaid balance over $10.00 is subject to a 1.5% late payment charge of $1.00, whichever is greater, after the date due. The charge may be assessed as provided for in the General Rules and Regulations, Section 3.5.

DEFINITION OF PEAK PERIODS
The on peak period is defined as those hours between 9:00 a.m. and 9:00 p.m. The on peak period occurs Monday through Friday, except the following holidays: New Year's Day, Good Friday, Memorial Day, Independence Day, Labor Day, Thanksgiving Day, and Christmas Day. When a designated holiday occurs on Saturday, the preceding Friday will be designated a holiday. When the designated holiday occurs on a Sunday, the following Monday will be designated a holiday. The off peak period is defined as all other hours. Definition of on peak and off peak period is subject to change with change in Company's system operating characteristics.

DETERMINATION OF TRACTION STATION ON PEAK PERIOD NON-COINCIDENT DEMAND
The individual Traction Station Actual On Peak Period Non-Coincident Demand in kW shall be the greatest 15-minute load during the on peak periods during the month for which the bill is rendered for each and every Traction Station along the Light Rail Line. The individual Traction Station Adjusted On Peak Period Non-Coincident Demand in kW for any one Traction Station for billing purposes shall be determined by dividing the Actual On Peak Period Non-Coincident Demand by the power factor expressed in percent but not more than 90%, multiplying the quotient so obtained by 90%, and rounding to the nearest whole kW. The total Traction Station Adjusted On Peak Period Non-Coincident Demand in kW for billing purposes shall be the sum of the individual Adjusted On Peak Period Non-Coincident Demands from each and every Traction Station.

DETERMINATION OF TRACTION STATION OFF PEAK PERIOD NON-COINCIDENT DEMAND
The individual Traction Station Actual Off Peak Period Non-Coincident Demand in kW shall be the greatest 15-minute load during the off peak periods during the month for which the bill is rendered for each and every Traction Station along the Light Rail Line. The individual Traction Station Adjusted Off Peak Period Non-Coincident Demand in kW for any one Traction Station for billing purposes shall be determined by dividing the Actual Off Peak Period Non-Coincident Demand by the power factor expressed in percent but not more than 90%, multiplying the quotient so obtained by 90%, and rounding to the nearest whole kW. The total Traction Station Adjusted Off Peak Period Non-Coincident Demand in kW for billing purposes shall be the sum of the individual Adjusted Off Peak Period Non-Coincident Demands from each and every Traction Station.

MINNESOTA ELECTRIC RATE BOOK - MPUC NO. 2

LIGHT RAIL LINE TARIFF (Continued) Section No. 5
RATE CODE A29 6th Revised Sheet No. 73

DETERMINATION OF RAIL LINE ON PEAK PERIOD COINCIDENT DEMAND

The Rail Line Actual On Peak Period Coincident Demand in kW shall be the greatest simultaneous 15-minute load during the on peak periods during the month for which the bill is rendered for all of the Traction Stations along the Light Rail Line. The Rail Line Adjusted On Peak Period Coincident Demand in kW for billing purposes shall be determined by dividing the Actual On Peak Period Coincident Demand by the power factor expressed in percent but not more that 90%, multiplying the quotient so obtained by 90%, and rounding to the nearest whole kW.

STREET LIGHTING SYSTEM SERVICE Section No. 5
RATE CODE A30 26th Revised Sheet No. 74

AVAILABILITY

Available for year-round illumination of public streets, parkways, and highways by High Pressure Sodium (HPS), Metal Halide or Light Emitting Diode (LED) luminaires supported on poles, where the facilities for this service are furnished by Company. Underground Service under this schedule is limited to areas having a Company owned underground electric distribution system. Standard Service includes a monthly payment for the lighting system cost. Pre-Pay Option requires customer payment for the lighting system cost before establishing service.

DETERMINATION OF CUSTOMER BILLS

Customer bills shall reflect energy charges (if applicable) based on customer's kWh usage, plus a customer charge (if applicable), plus demand charges (if applicable) based on customer's kW billing demand as defined below. Bills may be subject to a minimum charge based on the monthly customer charge and / or certain monthly or annual demand charges. Bills also include applicable riders, adjustments, surcharges, voltage discounts, and energy credits. Details regarding the specific charges applicable to this service are listed below.

RATE

	Monthly Rate Per Luminaire				
	Standard Service			Pre-Pay	
Designation of Lamp (Lumens)	Overhead	Underground	Decorative	Option	
70W High Pressure Sodium	$9.63	$19.54	--	$5.97	R
100W High Pressure Sodium	$10.17	$20.07	$31.67	$6.66

RATE CODE A30 11th Revised Sheet No. 74.1

PRE-PAY OPTION SURCHARGE
A monthly surcharge per luminaire of 0.2% applies to the amount the purchase price exceeds $1,200.

In addition, customer bills under this rate are subject to the following adjustments and/or charges.

FUEL CLAUSE
Bills are subject to the adjustments provided for in the Fuel Clause Rider.

RESOURCE ADJUSTMENT
Bills are subject to the adjustments provided for in the Conservation Improvement Program Adjustment Rider, the State Energy Policy Rate Rider, the Renewable Development Fund Rider, the Transmission Cost Recovery Rider, the Renewable Energy Standard Rider and the Mercury Cost Recovery Rider.

ENVIRONMENTAL IMPROVEMENT RIDER
Bills are subject to the adjustments provided for in the Environmental Improvement Rider.

SURCHARGE
In certain communities, bills are subject to surcharges provided for in a Surcharge Rider.

LATE PAYMENT CHARGE
Any unpaid balance over $10.00 is subject to a 1.5% late payment charge or $1.00, whichever is greater, after the date due. The charge may be assessed as provided for in the General Rules and Regulations, Section 3.5.

OTHER PROVISIONS
This schedule is also subject to provisions contained in Rules for Application of Street Lighting Rates.

Customer bills shall reflect energy charges (if applicable) based on customer's kWh usage, plus a customer charge (if applicable), plus demand charges (if applicable) based on customer's kW billing demand as defined below. Bills may be subject to a minimum charge based on the monthly customer charge and / or certain monthly or annual demand charges. Bills also include applicable riders, adjustments, surcharges, voltage discounts, and energy credits. Details regarding the specific charges applicable to this service are listed below.

RATE

Designation of Lamp	Monthly Rate per Luminaire	
100W High Pressure Sodium	$5.70	R
150W High Pressure Sodium	$6.39	R
250W High Pressure Sodium	$8.95	R

In addition, customer bills under this rate are subject to the following adjustments and/or charges. D

FUEL CLAUSE
Bills are subject to the adjustments provided for in the Fuel Clause Rider.

RESOURCE ADJUSTMENT
Bills are subject to the adjustments provided for in the Conservation Improvement Program Adjustment Rider, the State Energy Policy Rate Rider, the Renewable Development Fund Rider, the Transmission Cost Recovery Rider, the Renewable Energy Standard Rider and the Mercury Cost Recovery Rider.

ENVIRONMENTAL IMPROVEMENT RIDER
Bills are subject to the adjustments provided for in the Environmental Improvement Rider.

SURCHARGE
In certain communities, bills are subject to surcharges provided for in a Surcharge Rider.

The following are terms and conditions for service under this tariff.

LATE PAYMENT CHARGE
Any unpaid balance over $10.00 is subject to a 1.5% late payment charge or $1.00, whichever is greater, after the date due. The charge may be assessed as provided for in the General Rules and Regulations, Section 3.5.

RULES FOR APPLICATION OF STREET LIGHTING RATES

Section No. 5
7th Revised Sheet No. 82

1. SERVICE INCLUDED IN RATE

a. *Street Lighting System Service*

Overhead, Underground, and Decorative
Company shall own, operate, and maintain the overhead and underground street lighting systems using Company's standard street lighting equipment.

Company Property
All poles, other material and equipment that may be used by Company in carrying out street lighting service shall be and remain the property of Company. Company shall have the right to install poles and other materials for street lighting service on or along public streets and alleys of customer and to remove the same upon expiration of term.

Terms and Conditions:

Standard Service
Except for customers choosing the pre-pay option for street lighting system service, the term of service will be a minimum of five (5) years. After the minimum five year service term, service shall continue thereafter for one (1) year terms, unless either party provides written notice at least ninety (90) days prior to the expiration of a term that customer intends to terminate the service. Existing lights that have been in service for more than five years at the time this Tariff provision is approved by the Commission will continue on 1-year terms until either party terminates the service based on the provisions listed above. Company shall furnish all electric energy necessary to operate the street lighting system, shall make all lamp and glassware renewals, clean the glassware, light and extinguish all lamps, make all ballast and starter renewals, and furnish all the materials and labor necessary for these services. Company shall also repair all damaged equipment.

Pre-Pay Option
Customer shall pay the Company upfront the costs associated with the entire ornamental street lighting system including underground cables, posts, lamps, ballasts, starters, photocells, and glassware. The Company retains ownership of the street lighting system. The street lighting system shall be Company approved and include a lamp type and wattage combination that corresponds to an existing Pre-Pay Option rate. Company shall furnish all electric energy necessary to operate the street lighting system, shall make all lamp and glassware renewals, clean the glassware, light and extinguish all lamps, make all ballast and starter renewals, and furnish all the materials and labor necessary for these services. Company shall also repair all damaged equipment for 25 years from the installation date. After 25 years, Company will repair damaged equipment when the damage is not associated with the age of the street lighting system. These repairs are routine in nature such as lamp, photo control, starter, and fuses.

(Continued on Sheet No. 5-83)

Northern States Power Company, a Minnesota corporation
Minneapolis, Minnesota 55401
MINNESOTA ELECTRIC RATE BOOK - MPUC NO. 2

RULES FOR APPLICATION OF Section No. 5
STREET LIGHTING RATES (Continued) 6th Revised Sheet No. 83

1. SERVICE INCLUDED IN RATE (Continued)

Prepay Option (Continued)
If in the Company's opinion, the condition of the street lighting system is such that replacement or significant renovation of the system is necessary (for example, due to underground faults, pole deterioration, ballast outage), the customer shall have two options:

(1) the customer must either transfer to the Street Lighting Energy Service – Metered rate, or
(2) reimburse Company for the installed cost of a replacement system.

Attachments
The Customer may not make any attachments, including but not limited to, banners, flags, signs, or holiday lighting, to the poles without the express written permission of Company. Approval of any such attachments will be at the sole discretion of the Company. In the event that any such attachments are made without written Company authorization, customer shall remove such attachments upon notice from Company. Any damage to Company property or other Company equipment caused by an unauthorized attachment by customer shall, after notice of damage to the customer be repaired by Company at the customer's expense. However, notice to customer prior to repair will not be required in case of an emergency or any other reason that requires immediate repair. In addition, if a street light outage is caused by an unauthorized attachment to Company property, service outage credits will not apply as described in paragraph 3 below.

b. *Street Lighting Energy Service*
The customer owns and maintains entire ornamental street lighting system including underground cables, posts, lamps, ballasts, photocells, and glassware. Ballasts shall provide a power factor of at least 90% and photocells shall conform to specified daily operating schedule. Company furnishes energy only at central distribution points designated by Company.

c. *City of St. Paul*
City owns and maintains lamp units, lamps, photocells, and glassware. Company owns and maintains distribution system, including hangers and furnishes energy at the lamp unit. Ballasts shall provide a power factor of at least 90% and photocells shall conform to specified daily operating schedule.

2. DAILY OPERATING SCHEDULE
The daily operating schedule of lamps shall be from approximately one-half hour after sunset until one-half hour before sunrise.

STREET LIGHTING RATES (Continued) 6th Revised Sheet No. 84

3. OUTAGES

If illumination from any non-metered lamp is interrupted and the illumination is not resumed within 2 business days from the time the Company receives notice, 1/30th of the applicable monthly metered energy and fuel cost charges for the affected lamp(s) for each night of service outage shall be credited to the customer.

The Company shall apply such credits to all affected customers one time annually in the month of December of each year, together with an itemized list of the street lamps and/or poles associated with the credits.

Interruption of Company Performance:
In the event of the total or partial interruption of service where the Company is prevented from providing service, a customer shall not be charged under this tariff for the duration of time service cannot be provided. The Company will proceed with all reasonable diligence to put itself and its works in condition to resume and continue the supply of electric energy and the performance of the service. The Company shall not be responsible for any loss or damage resulting from the interruption or disturbance of service for any cause other than gross negligence of the Company. The Company shall not be liable for any loss of profits or other consequential damages resulting from the use of service or any interruption or disturbance of service.

4. SPECIAL SERVICES

a. *Street Lighting System Service*

Temporary Disconnection of Service (Street lighting facilities remain in place.)
When requested by the customer, Company will temporarily disconnect service to individual street lighting units provided the customer pays a monthly facilities charge equal to the regular monthly rate less the product of the average monthly kWh for the lighting unit and the energy charge from the Street Lighting Energy Service - Metered rate schedule. The customer must pay a charge of $25.00 to disconnect or reconnect each lighting unit.

Termination of Street Lighting Facilities
When requested by the customer, except for Pre-Pay Option lighting service, Company will remove all or a portion of a street lighting system and cease billing. The customer must pay termination costs for the removal and undepreciated value of facilities, less any salvage value, if the number of lights requested to be removed in any 12 month period exceeds 5% of the municipality's street lighting system.

4. SPECIAL SERVICES (Continued)

b. *Street Lighting Energy Service*

Daily Operating Schedule Option

Reduced hours of operation from the standard daily operating schedule is available under the applicable commercial and industrial rate, subject to the following provisions:

(1) customer must install a meter socket at the service point, and
(2) customer shall provide all maintenance to lighting units and identify the lighting units with Company approved markings.

Disconnection of Service

During the period between customer disconnection and reconnection of street lighting units, Company will cease billing provided the disconnection is made on the line side of the lighting unit ballast. Customer disconnection not on the line side will require the customer to pay a charge to compensate for the lighting unit ballast core loss. When requested by the customer, Company will disconnect or reconnect street lighting units provided the customer pays a charge of $25.00 for the disconnection or reconnection of each lighting unit. The customer must identify all disconnected street lighting units with Company approved markings.

SMALL MUNICIPAL PUMPING SERVICE (Continued) Section No. 5
RATE CODE A40 7th Revised Sheet No. 86

The following are terms and conditions for service under this tariff.

LATE PAYMENT CHARGE
Any unpaid balance over $10.00 is subject to a 1.5% late payment charge or $1.00, whichever is greater, after the date due. The charge may be assessed as provided for in the General Rules and Regulations, Section 3.5.

INSTALLATION OF DEMAND METERS
The Company shall install a demand meter for a customer when:
1. Customer's connected load is estimated to be 20 kW or greater, or
2. Customer is served single phase and has a service entrance capacity greater than 200 amperes, or
3. Customer is served three phase at 120/208 or 120/240 volts and has a service entrance capacity greater than 200 amperes, or
4. Customer is served three phase at 240/480 or 277/480 volts and has a service entrance capacity greater than 100 amperes, or

Customer's average monthly kWh use for four consecutive months exceeds 3,500 kWh.

If a demand meter is installed in accordance with the above, the customer may remain on the Small Municipal Pumping Service schedule as long as customer’s maximum demand is less than 25 kW. When the customer achieves an actual maximum demand of 25 kW or greater, the customer will be placed on the Municipal Pumping Service schedule in the next billing month. Customers with a billing demand of less than 25 kW for 12 consecutive months will be given the option of returning to the Small Municipal Pumping Service schedule.

SURCHARGE
In certain communities, bills are subject to surcharges provided for in a Surcharge Rider.

LOW INCOME ENERGY DISCOUNT RIDER
Bills are subject to the adjustment provided for in the Low Income Energy Discount Rider.

The following are terms and conditions for service under this tariff.

LATE PAYMENT CHARGE
Any unpaid balance over $10.00 is subject to a 1.5% late payment charge or $1.00, whichever is greater, after the date due. The charge may be assessed as provided for in the General Rules and Regulations, Section 3.5.

DETERMINATION OF DEMAND
The adjusted demand in kW for billing purposes shall be determined by dividing the maximum actual demand in kW by the power factor expressed in percent but not more than a 90% power factor and multiplying the quotient so obtained by 90% and rounding to the nearest whole kW. In no month shall the demand to be billed be considered as less than the current month's adjusted demand in kW nor greater than the value in kW determined by dividing the kWh sales for the billing month by 75 hours per month.

MAXIMUM DEMAND
The maximum actual demand in kW shall be the greatest 15 minute load during the month for which bill is rendered.

POWER FACTOR
For three phase customers with services above 200 amperes, or above 480 volts, the power factor for the month shall be determined by permanently installed metering equipment. For all single phase customers and three phase customers with services 200 amperes or less, a power factor of 90% will be assumed.

MINIMUM DEMAND TO BE BILLED
The monthly minimum billing demand shall not be less than provided above.

TERMS AND CONDITIONS OF SERVICE
Alternating current service is provided at the following nominal voltages:

1. Secondary Voltage: Single or three phase from 208 volts up to but not including 2,400 volts, or
2. Primary Voltage: Three phase from 2,400 volts up to but not including 69,000 volts.

FIRE AND CIVIL DEFENSE SIREN SERVICE Section No. 5
RATE CODE A42 14th Revised Sheet No. 89

AVAILABILITY
Available for power service for the operation of municipal fire and civil defense warning sirens having a rated capacity not in excess of 25 horsepower.

DETERMINATION OF CUSTOMER BILLS
Customer bills shall reflect energy charges (if applicable) based on customer's kWh usage, plus a customer charge (if applicable), plus demand charges (if applicable) based on customer's kW billing demand as defined below. Bills may be subject to a minimum charge based on the monthly customer charge and / or certain monthly or annual demand charges. Bills also include applicable riders, adjustments, surcharges, voltage discounts, and energy credits. Details regarding the specific charges applicable to this service are listed below.

RATE
Per Month per Horsepower of Connected Capacity $0.76 R

In addition, customer bills under this rate are subject to the following adjustments and/or charges.

MONTHLY MINIMUM CHARGE
Net per Month $3.66 R

The following are terms and conditions for service under this tariff.

LATE PAYMENT CHARGE
Any unpaid balance over $10.00 is subject to a 1.5% late payment charge or $1.00, whichever is greater, after the date due. The charge may be assessed as provided for in the General Rules and Regulations, Section 3.5.

CONNECTION
Under the above rate, the Company will make no extension for service other than a normal service span. Where conditions are such that a long service connection or extra transformer capacity, or both, are necessary, the customer shall either pay the entire cost of such extra equipment or pay a monthly facilities charge based on such costs.

The circuit serving the siren must be in conduit from the entrance to the motor with an enclosed entrance switch box, which may be sealed and operated from an external appliance.

OPTIONAL
In case the customer already has a service connection of sufficient capacity to permit operation of the siren without unduly disturbing conditions on the Company's nearby circuits, the siren may be connected at the option of the customer on the load side of the customer's existing meter and the commercial rate applied to the total load.

Northern States Power Company, a Minnesota corporation
Minneapolis, Minnesota 55401
MINNESOTA ELECTRIC RATE BOOK - MPUC NO. 2

FUEL CLAUSE RIDER Section No. 5
29th Revised Sheet No. 91

FUEL CLAUSE CHARGE
There shall be added to or deducted from the monthly bill a Fuel Cost Charge calculated by multiplying the applicable monthly billing kilowatt hours (kWh) by the billed Fuel Adjustment Factor (FAF) per kWh. The billed FAF is calculated by prorating each calendar month FAF by the number of customer billing days in each calendar month, and rounding to the nearest $0.00001 per kWh.

EXEMPTION
For customers participating in Company's Renewable*Connect and Renewable*Connect Government pilot programs, or the Windsource® Program under the Voluntary Renewable and High-Efficiency Energy Purchase Rider, the applicable billing kWh subject to the FAF shall be reduced by the elected Voluntary Renewable Adjustment energy blocks. In the event that a customer's metered energy use is lower than the subscribed energy blocks, the applicable billing kWh for the FAF for that month is zero. L

For customer premises recognized by the Company as not being subject to any of the costs of satisfying the solar energy standard under Minn. Stat. § 216B.1691, subd. 2f ("SES Costs"), the SES Costs reflected in the Fuel Clause Charge assessed to the accounts associated with these premises may be credited to these accounts, and the dollar amount of these credits shall be added back into the Current Period Cost of Energy applicable to the time period when the credit is issued. N N N N N

FUEL ADJUSTMENT FACTOR (FAF)
A separate FAF will be determined for each service category defined by customer class and time-of-day (TOD) period within the Commercial and Industrial – Demand class. The FAF for each service category is the sum of the Current Period Cost of Energy multiplied by the applicable FAF Ratio, and the applicable Energy Cost True-up Factor. The FAF Ratio is the Class Cost Ratio multiplied by the corresponding TOD Ratio:

Service Category	Class Cost Ratio	TOD Ratio	FAF Ratio
Residential	1.0177	1.0000	1.0177
C&I Non-Demand	1.0305	1.0000	1.0305
C&I Demand	0.9930	1.0054	0.9984
C&I Demand TOD On-Peak	0.9930	1.2574	1.2486
C&I Demand TOD Off-Peak	0.9930	0.8224	0.8166
Outdoor Lighting	0.7976	1.0000	0.7976

BASE COST OF ENERGY
The System Base Cost of Energy is $0.02680 per kWh. The FAF for each service category includes a Base Cost of Energy, which is the System Base Cost of Energy multiplied by the applicable FAF Ratio.

Service Category	Base Cost of Energy
Residential	$0.02727
C&I Non-Demand	$0.02762
C&I Demand Non-TOD	$0.02676
C&I Demand TOD On-Peak	$0.03346
C&I Demand TOD Off-Peak	$0.02188
Outdoor Lighting	$0.02138

FUEL CLAUSE RIDER (Continued)

Section No. 5
16th Revised Sheet No. 91.1

CURRENT PERIOD COST OF ENERGY

The Current Period Cost of Energy per kWh is defined as the qualifying costs, forecasted to be incurred during the calendar month, divided by the kWh sales forecasted for the same month. Qualifying kWh sales are all kWh sales excluding intersystem, Renewable*Connect, Renewable*Connect Government and Windsource® Program kWh sales. Qualifying costs are the sum of the following:

1. The cost of fuels consumed in the Company's generating stations as recorded in Federal Energy Regulatory Commission (FERC) Accounts 151 and 518.

2. The cost of energy purchases as recorded in FERC Account 555, exclusive of capacity or demand charges, irrespective of the designation assigned to such transaction, when such energy is purchased on an economic dispatch basis.

3. All Midwest ISO (MISO) costs and revenues authorized by the Commission to flow through this Fuel Clause Rider and excluding MISO costs and revenues that are recoverable in base rates, as prescribed in applicable Commission Orders.

4. All fuel and purchased energy expenses incurred by the Company over the duration of any Commission-approved contract, as provided for by Minnesota Statutes, Section 216B.1645, except any such expenses recovered in base rates or other riders.

5. The energy cost of purchases from a qualifying facility, as that term is defined in 18 C.F.R. Part 292 and Minn. Rule 7835.0100, Subp. 19, as amended, and the net cost of energy (and capacity if purchased on an energy output basis) purchases from any qualifying facility using wind energy conversion systems for the generation of electric energy, whether or not those purchases occur on an economic dispatch basis. Capacity costs associated with such purchased power contracts, which are in excess of 100 kW and commenced after the date of the Commission's final order in Docket No. E002/GR-05-1428, shall be excluded from Fuel Cost Charge recovery.

6. Less the fuel-related costs recovered through intersystem sales.

7. Less purchased power costs for the Renewable*Connect and Renewable*Connect Government pilot programs and for the Windsource® Program as recorded in FERC account 555.

8. Less neutrality charge cost recovery for the Renewable*Connect and Renewable*Connect Government pilot programs.

FUEL CLAUSE RIDER (Continued)

Section No. 5
10th Revised Sheet No. 91.2

ENERGY COST TRUE-UP FACTORS

An Energy Cost True-up Factor per kWh is calculated for each Class and TOD category by dividing the Energy Cost True-up Amount by the qualifying kWh sales forecasted for the calendar month. The Energy Cost True-up Amount is the cumulative balance of the unrecovered and over-recovered actual energy costs and MISO Day 2 expenses from prior months and the retail share of intersystem margins pursuant to the Margin-Sharing program approved by the Commission. The asset based margins are defined as sales revenues less the sum of fuel and energy costs (including costs associated with MISO Day 2 markets that are booked to FERC Account 555) and any additional transmission costs incurred that are required to make such sales. The retail share of intersystem margins is the following:

Asset Based Margins: One hundred percent (100%) of the Minnesota State jurisdiction share of margins from intersystem sales of ancillary services and intersystem sales of excess generation. These margins shall be the actual amounts of such margins recorded and are subject to any MISO resettlements.

CONSERVATION IMPROVEMENT PROGRAM Section No. 5
ADJUSTMENT RIDER 19th Revised Sheet No. 92

APPLICABILITY
Applicable to bills for electric service provided under the Company's retail rate schedules. Exemptions are as follows:

"Large Customer Facility" customers that have been exempted from the Company's Conservation Improvement Program charges pursuant to Minn. Stat. 216B.241 subd. 1a (b) shall receive a monthly exemption from conservation improvement program charges pursuant to Minn. Stat. 216B.16, subd. 6b Energy Conservation Improvement. Such monthly exemption will be effective beginning January 1 of the year following the grant of exemption. Upon exemption from conservation program charges, the "Large Customer Facility" customers can no longer participate in the Company's Energy Conservation Improvement Program.

RIDER
There shall be included on each non-exempt customer's monthly bill a Conservation Improvement Program (CIP) Adjustment, which shall be calculated by multiplying the monthly applicable billing kilowatt hours (kWh) by the CIP Adjustment Factor.

DETERMINATION OF CONSERVATION IMPROVEMENT PROGRAM ADJUSTMENT FACTOR
The CIP Adjustment Factor shall be calculated for each customer class by dividing the Recoverable Conservation Improvement Program Expense by the Projected Retail Sales for a designated recovery period. The factor may be adjusted annually with approval of the Minnesota Public Utilities Commission. The CIP Adjustment Factor for all rate schedules is:

All Classes	$0.001813 per kWh	R

Recoverable Conservation Improvement Program Expense shall be the CIP expense not recovered through base rates as determined from the CIP Tracker account balance for a designated period. All costs appropriately charged to the CIP Tracker Account shall be eligible for recovery through this Rider. All revenues received from the CIP Adjustment Factor shall be credited to the CIP Tracker Account.

Projected Retail Sales shall be the estimated kilowatt-hour sales to all non-exempt customers for the designated recovery period.

CONSERVATION IMPROVEMENT PROGRAM Section No. 5
ADJUSTMENT RIDER 18th Revised Sheet No. 92

APPLICABILITY
Applicable to bills for electric service provided under the Company's retail rate schedules. Exemptions are as follows:

"Large Customer Facility" customers that have been exempted from the Company's Conservation Improvement Program charges pursuant to Minn. Stat. 216B.241 subd. 1a (b) shall receive a monthly exemption from conservation improvement program charges pursuant to Minn. Stat. 216B.16, subd. 6b Energy Conservation Improvement. Such monthly exemption will be effective beginning January 1 of the year following the grant of exemption. Upon exemption from conservation program charges, the "Large Customer Facility" customers can no longer participate in the Company's Energy Conservation Improvement Program.

RIDER
There shall be included on each non-exempt customer's monthly bill a Conservation Improvement Program (CIP) Adjustment, which shall be calculated by multiplying the monthly applicable billing kilowatt hours (kWh) by the CIP Adjustment Factor.

DETERMINATION OF CONSERVATION IMPROVEMENT PROGRAM ADJUSTMENT FACTOR
The CIP Adjustment Factor shall be calculated for each customer class by dividing the Recoverable Conservation Improvement Program Expense by the Projected Retail Sales for a designated recovery period. The factor may be adjusted annually with approval of the Minnesota Public Utilities Commission. The CIP Adjustment Factor for all rate schedules is:

All Classes	$0.001875 per kWh	R

Recoverable Conservation Improvement Program Expense shall be the CIP expense not recovered through base rates as determined from the CIP Tracker account balance for a designated period. All costs appropriately charged to the CIP Tracker Account shall be eligible for recovery through this Rider. All revenues received from the CIP Adjustment Factor shall be credited to the CIP Tracker Account.

Projected Retail Sales shall be the estimated kilowatt-hour sales to all non-exempt customers for the designated recovery period.

Northern States Power Company, a Minnesota corporation
Minneapolis, Minnesota 55401
MINNESOTA ELECTRIC RATE BOOK - MPUC NO. 2

CONSERVATION IMPROVEMENT PROGRAM Section No. 5
ADJUSTMENT RIDER (Continued) 7th Revised Sheet No. 92.1

DETERMINATION OF CONSERVATION COST RECOVERY CHARGE (CCRC)
The CCRC is the amount included in base rates dedicated to the recovery of CIP costs as approved by the Minnesota Public Utilities Commission (or successor agency) in the Company's last general rate case. The CCRC is approved and applied on a per kWh basis by dividing the test-year CIP expenses by the test-year sales volumes (net of CIP-exempt volumes). All revenues received from the CCRC shall be credited to the CIP Tracker Account. The CCRC for all rate schedules is:

All Classes	$0.003133 per kWh

DETERMINATION OF CCRC EXEMPTION ADJUSTMENT FACTOR
For "Large Customer Facilities", as defined in Minn. Stat. 216B.241 subd. 1, granted exemption by the Commissioner of the Minnesota Department of Commerce, Division of Energy Resources, pursuant to Minn. Stat. 216B.241, the CIP Adjustment Factor shall not apply and monthly bills will include a CCRC Exemption Adjustment credit determined by multiplying total billing kWh by the applicable CCRC Exemption Adjustment Factor. Customers' accounts granted exemption by a decision of the Commissioner after the beginning of a calendar year shall be credited for any CIP collections billed after January 1st of the year following the Commissioner's decision. The CCRC Exemption Adjustment Factor for all rate classes is:

All Classes	$0.003133 per kWh

PROVISION OF FORECAST DATA
To assist commercial and industrial customers in budgeting and managing their energy costs, the Company will annually make available on April 1st a 24-month forecast of the CIP Adjustment Factor applicable to demand billed C&I customers under this Rider. The forecast period begins January 1st of the following year.

EXEMPTION
For customer premises recognized by the Company as not being subject to any of the costs of satisfying the solar energy standard under Minn. Stat. § 216B.1691, subd. 2f ("SES Costs"), the SES Costs reflected in the CIP Adjustment assessed to the accounts associated with these premises may be credited to these accounts, and the dollar amount of these credits shall be added as part of the Recoverable Conservation Improvement Program Expense applicable to the time period when the credit is issued. SURCHARGE RIDER

Section No. 5
8th Revised Sheet No. 93

A surcharge will be included in the monthly customer bills in Minnesota communities in an amount equal to any franchise gross earnings or other fee, permit or usage fee, excise, city sales or other charge or tax now or hereafter imposed upon Company by a community, whether by ordinance, franchise or otherwise, applicable to electric service supplied by Company to a customer.

The Company remits 100% of these fees collected from ratepayers to the local government unit.*

The Company will notify the Minnesota Public Utilities Commission of any new, renewed, expired, or changed fee, authorized by Minn. Stat. § 216B.36 to raise revenue, at least 60 days prior to its implementation. If the Company receives less than 60 days' notice of a repealed or reduced fee from a city, the Company will notify the Minnesota Public Utilities Commission within 10 business days of receiving notice. Notification to the Minnesota Public Utilities Commission will include a copy of the relevant franchise fee ordinance, or other operative document authorizing imposition of, or change in, the fee.

Affected customers will be notified on the first bill on which a new or modified fee is listed via the standard bill message below:

> *[The municipality] imposes a [X% of gross revenues/$X per meter/$X per kWh/$X per therm] fee on Xcel Energy collectable through a fee on Xcel Energy [electric/gas] accounts effective [effective date]. The line item appears on your bill as "City Fees." Xcel Energy remits 100% of this fee to [the municipality].*

*The amount collected for Baker is applied to the community's street lighting bill.

[1] South St. Paul: The franchise fee excludes rate schedules for highway lighting, municipal street lighting, municipal water pumping, municipal traffic signals, municipal fire sirens, and municipal sewage disposal service.

[2] St. Cloud: The franchise fee for residential heating customers will be 1.5% during the months of November – April.

[3] St. Paul: The monthly franchise fee will be as stated on the following sheets. The residential service franchise fee will be as stated except during the months of November - April when there will be no fee. The fee shall not exceed $620,000 during any calendar year from any large commercial and industrial customer qualifying for service on the Competitive Market Rider. The schedule on the following sheets show the meter, energy, and demand factor for each year of the St. Paul franchise and for each of the customer classifications.

LOW INCOME ENERGY DISCOUNT RIDER Section No. 5
9th Revised Sheet No. 95

DISCOUNT PROGRAM D
Eligible Senior and / or Disabled customers receive a $15 discount in each monthly billing period. Customers must be certified annually by an authorized agency as receiving assistance from the Low Income Home Energy Assistance Program. N N N

PowerOn PROGRAM
Eligible Seniors and / or Disabled, and Customers Under 62 Years of Age with no Disability.
A customer using more than 3% of their annual household income for electric use may be eligible for the Company's PowerOn affordability program. Customers must be certified annually by an authorized agency as receiving assistance from the Low Income Home Energy Assistance Program. The Company will offer customers with the lowest income, and a history of electric consumption that exceeds the residential average of 750 kWh per month, an affordable monthly bill. For a customer to be eligible for a supplemental reduction in their electric bill, the customer must agree to affordable monthly payments. N N

Medical Affordability PROGRAM N
Available to customers with certified medical circumstances and an income level up to 50 percent of the state median income guidelines. Availability will be extended to medically certified customers with income up to 60 percent of the state median income guidelines if funds are available. Availability is on a first-come/first-served basis until the budget is exhausted.

- Affordability Credit: Participating customers will receive an affordability credit limiting their bill to 3% of household income.
- Arrearage Credit: Participating customers will receive an arrearage credit. Receipt of the arrearage forgiveness credit will require a customer copayment that does not exceed 3% of the customer's annual income. The arrearage credit is designed to eliminate customer arrears over a period of 12 to 24 months.
- Customer Payment Requirements: Participating customers that miss two consecutive monthly payments will be removed from the program and subject to regular collection practices, including service disconnection. N

TERMS AND CONDITIONS OF SERVICE

1. The company will review current billing information, approved LIHEAP benefits and household income to make payment arrangements with the customer. A mutually agreed to payment plan will be offered to the customer and a payment schedule provided.

2. Customer must maintain an active account registered under customer's name with the Company to be eligible for this discount Rider.

3. Customers receiving assistance from LIHEAP with electric service through one meter for domestic and non-domestic purposes jointly may be eligible for this Discount Rider subject to Company's verification and approval. The Company shall determine the kWh use that is for domestic purposes. This Discount Rider only applies to kWh use for domestic purposes.

LOW INCOME ENERGY DISCOUNT RIDER Section No. 5
(Continued) 12th Revised Sheet No. 96

TERMS AND CONDITIONS OF SERVICE (Continued)

4. Qualified customers are only eligible to receive an energy discount under this Rider at one residential location at any one time and the discount only applies to a qualified customer's permanent primary residence. This Rider will not be available when, in the opinion of the Company, the customer's accommodation or occupancy is of temporary nature.

5. The discount shall be prospective and may not be applicable to past due bills or non-electric services.

6. An annual application and eligibility declaration is required for each request for service under this Rider. Without declaration of continuing eligibility, the discount ends in the September calendar month of each year.

7. It is the customer's responsibility to notify the Company if there is a change of address or eligibility status.

8. Discounts will be credited to the eligible customer bills one billing month after Company's receipt of notification of LIHEAP certification. The applicable discount under this Rider will be retroactive to the October billing month during that same LIHEAP fiscal year.

9. Refusal or failure of a customer or agencies to provide documentation of eligibility acceptable to the Company may result in removal from this Rider.

10. Customers may be rebilled for periods of ineligibility under the applicable rate schedule.

11. This Rider shall meet the conditions of Minnesota Statutes, Chapter 216B.16, Subd. 14 on low income discount rates.

PROGRAM SURCHARGE

Rider program costs shall be recovered in the following per month amounts, with the total surcharge as a separate line item on customer billing statements:

Service Category	Base	PowerOn	Medical Affordability	Total	
Residential	$0.58	$0.21	$0.19	$0.98	R
C&I Non-Demand	$0.78	$0.26	$0.23	$1.27	R
C&I Demand	$2.34	$0.66	$0.60	$3.60	R

Xcel Energy customers who receive LIHEAP assistance in the current LIHEAP year (October 1–September 30) and Lighting class service customers are exempt from paying the program surcharge.

RESIDENTIAL CONTROLLED AIR CONDITIONING AND WATER HEATING RIDER

Section No. 5
8th Revised Sheet No. 97

AVAILABILITY

Available to Residential Service customers with:

1. Company controlled central air conditioning, or
2. Company controlled heat pumps receiving Energy Controlled Service (Non-Demand Metered) with optional non-interruptible service during June through September.

Company controlled electric water heating is also available to residential customers with a controlled central air conditioner or heat pump, except electric water heaters served with the Energy Controlled Service (Non-Demand Metered) rate schedule. Availability is limited to customers located in areas which are within the operating range of radio control transmitters.

In addition, customer bills under this rate are subject to the following adjustments and/or charges.

RIDER

Residential Central Air Conditioning. A 15% discount will apply to the energy and fuel cost charges up to a maximum of 4,000 kWh per month during the billing months of June through September.

Residential Electric Water Heating. A 2% discount will apply to the energy and fuel cost charges up to a maximum of 4,000 kWh per month during each billing month provided total energy use is not less than 300 kWh.

TERMS AND CONDITIONS OF SERVICE

1. The duration and frequency of interruptions will be determined by Company. Customer's air conditioning equipment will normally be cycled on a schedule designed to achieve a 50% reduction in the homes air conditioning requirements during load management period. Air conditioning interruptions will normally occur on high demand days during summer months. Water heating interruptions will normally occur on high demand days during summer and winter months. Interruption will normally be based on meeting peak demands and system economic dispatch requirements of Company. However, interruption may also occur at times when, in the Company's opinion, the reliability of the system may be at risk. Air conditioning and water heating interruptions will not normally occur during the observation day of the following holidays: New Year's Day, Good Friday, Memorial Day, Independence Day, Labor Day, Thanksgiving Day, and Christmas Day. The interruptions as described above, will be made so as to benefit native load and may occur up to a maximum of 300 hours per calendar year.

2. Company shall not be liable for any loss or damage caused by or resulting from any interruption of service.

3. To be eligible for this service, customer must agree to Company load control for a minimum term of one year.

TERMS AND CONDITIONS OF SERVICE (Continued)

4. The storage capacity of the water heater shall be 40 gallons or more in order to be eligible for this service.

5. The residential central air conditioning energy charge discount for Energy Controlled Service (Non-Demand Metered) customers will also apply to their standard service energy charge.

6. Rider availability for heat pump installations is limited to those sized for summer cooling requirements, as determined by Company.

Northern States Power Company, a Minnesota corporation
Minneapolis, Minnesota 55401
MINNESOTA ELECTRIC RATE BOOK – MPUC NO. 2

COMMERCIAL AND INDUSTRIAL Section No. 5
CONTROLLED AIR CONDITIONING RIDER 8th Revised Sheet No. 99

AVAILABILITY
Available to non-residential customers with Company controlled central air conditioning. Availability is restricted to customers with single and/or dual stage air conditioning units.

RIDER
A $5.00 per ton per month credit shall be applied to customer's bill during each of the four summer billing months (June through September).

TERMS AND CONDITIONS OF SERVICE

1. The duration and frequency of interruptions will be determined by the Company. Customer single and dual stage air conditioners will be cycled on a schedule designed to achieve a 50% reduction in the building air conditioning requirements during a load management period. Dual stage air conditioners will be allowed to have the first stage run without interruption while the second stage will be shut off for the entire load management period. Air conditioning interruptions will normally occur on high demand days during summer months. Interruption will normally be based on meeting peak demands and system economic dispatch requirements of Company. However, interruption may also occur at times when, in the Company's opinion, the reliability of the system may be at risk. Air conditioning interruptions will not normally occur during the observation day of the following holidays: New Year's Day, Good Friday, Memorial Day, Independence Day, Labor Day, Thanksgiving Day, and Christmas Day. The interruptions as described above, will be made so as to benefit native load and may occur up to a maximum of 300 hours per calendar year.

2. Company shall not be liable for any loss or damage caused by or resulting from any interruption of service.

3. To be eligible for this service, customer must be on Small General Service, Small General Time of Day Service, General Service, or General Time of Day Service and customer must agree to Company load control for no less than one year.

4. Rider will not be available to customers that have an air conditioning system which significantly exceeds summer cooling requirements, as determined by Company.

5. Company will normally control every air conditioning unit at the customer's building. Subject to Company approval, customers may exclude individual air conditioning units from Company control where those units serve either a sufficiently isolated area within a building or a separate building.

6. Availability is limited to customers located within the operating range of radio control transmitters.

7. Those air conditioning units that the Company is not able to install equipment on will be excluded.

CONTROLLED AIR CONDITIONING RIDER (Continued) 5th Revised Sheet No. 99.1

TERMS AND CONDITIONS OF SERVICE (Continued)

8. If the Company determines that its load management equipment on the customer's premises has been rendered ineffective due to tampering by use of mechanical, electrical, or other devices or actions, then the Company may discontinue the customer's participation in the program. The customer would be billed for all expenses involved with the removal of the load management equipment and any charges resulting from the investigation of the device tampering. The Company may rebill all prior load management credits received by the customer to the date the tampering appears to have first occurred or the previous twelve months, which ever is longer. The customer will be removed from the program and is not eligible to participate again for twelve months. The Company will verify installation has been corrected before the customer is permitted to participate in the program.

OFF SEASON LOAD RIDER

Section No. 5
5th Revised Sheet No. 100

AVAILABILITY
Available to any General Service customer whose maximum monthly demand occurs during the usage months of April, May, October, or November. Typical applications would be agricultural grain drying and handling loads.

RATE
The General Service rate provisions apply except the adjusted demands established during the usage months of April, May, October, and November are not included in determining the 50% demand ratchet contained in the General Service determination of demand provision.

TERMS AND CONDITIONS OF SERVICE
1. The customer's usage months for this Rider must be contained by the following meter reading schedule. The two month fall season begins no earlier than the billing cycle 11 meter reading date in mid-September and ends no later than the billing cycle 10 meter reading date in mid-December. The two month spring season begins no earlier than the billing cycle 11 meter reading date in mid-March and ends no later than the billing cycle 10 meter reading date in mid-June.

2. Customer must compensate Company for the costs associated with local distribution facilities required to serve customer load during the months of April, May, October, and November, which is in excess of customer's base load during the remaining months.

STANDBY SERVICE RIDER

Section No. 5
20th Revised Sheet No. 101

AVAILABILITY

Applicable to customers that use a customer-sited generation source with a capacity greater than 100 kW to serve a defined portion of the customer's total electric energy requirements and where customer chooses to use the Company's electric service to serve that defined load when the customer-sited generation is either partly or wholly unavailable. Customer must select one of the following services types: Firm Unscheduled Maintenance, Firm Scheduled Maintenance, or Non-Firm service. This Rider is not available to solar photovoltaic generation systems and is closed to new wind generation systems.

Under this tariff the Company will provide Standby Service in accordance with the provisions of this tariff as well as those of Section 2.4 of the General Rules and Regulations.

RATE

	Firm Standby		Non-Firm	
	Unscheduled Maintenance	Scheduled Maintenance	Standby	
Customer Charge per Month	$25.64	$25.64	$25.64	
Reservation Demand Charge per Month per kW of Contracted Standby Capacity				
Secondary Voltage Service	$3.06	$2.96	$2.35	R
Primary Voltage Service	$2.26	$2.16	$1.55	R
Transmission Transformed Voltage Service	$1.51	$1.41	$0.80	R
Transmission Voltage Service	$0.71	$0.61	$0.00	R
Peak Period Standby Energy Surcharge per kWh				
June – September		$0.06312		R
Other Months		$0.04130		R

Energy Charge per kWh. All energy used under this Rider will be charged at the applicable energy rate of the base tariff to which this Rider is attached and is not applicable to the base tariff Energy Charge Credit.

STANDBY ENERGY USAGE

Standby energy usage occurs when the customer-sited generation source output in kW is less than contracted standby kW capacity. Standby energy usage in kWh is measured in 15-minute intervals and is defined as the kWh energy associated with constant operation of customer-sited generation at the contract standby kW capacity level less actual energy production of customer-sited generation, but not less than zero kWh for each 15-minute interval. Actual energy production of customer-sited generation will be measured by Company-owned and installed production metering equipment.

STANDBY SERVICE RIDER (Continued)

Section No. 5
Original Sheet No. 101.1

PEAK PERIOD STANDBY ENERGY USAGE N
Peak period standby energy usage is the amount of Standby Energy Usage occurring during the peak period N
that does not occur during a qualifying scheduled maintenance period or is associated with Non-Firm service. N
Peak period standby energy usage is subject to the Peak Period Standby Energy Surcharge. N

DEFINITION OF PEAK PERIOD N
Peak period hours are the six hours between 1:00 p.m. and 7 p.m. for all days. N

In addition, customer bills under this rate are subject to the following adjustments and/or charges. L

FUEL CLAUSE L
Bills are subject to the adjustments provided for in the Fuel Clause Rider. L

RESOURCE ADJUSTMENT L
Bills are subject to the adjustments provided for in the Conservation Improvement Program Adjustment Rider, the State Energy Policy Rate Rider, the Renewable Development Fund Rider, the Transmission Cost Recovery Rider, the Renewable Energy Standard Rider and the Mercury Cost Recovery Rider.

ENVIRONMENTAL IMPROVEMENT RIDER
Bills are subject to the adjustments provided for in the Environmental Improvement Rider.

SURCHARGE
In certain communities, bills are subject to surcharges provided for in a Surcharge Rider.

LOW INCOME ENERGY DISCOUNT RIDER
Bills are subject to the adjustment provided for in the Low Income Energy Discount Rider.

In addition, customer bills under this rate are subject to the following adjustments and/or charges.

LATE PAYMENT CHARGE
Any unpaid balance over $10.00 is subject to a 1.5% late payment charge or $1.00, whichever is greater, after the date due. The charge may be assessed as provided for in the General Rules and Regulations, Section 3.5. L

STANDBY SERVICE RIDER (Continued)

Section No. 5
14th Revised Sheet No. 102

L

DETERMINATION OF DEMAND

C

The billing demand in kW for application to the Standby Service Reservation Demand Charge rate will be the contracted Standby capacity specified in the customer's Electric Service Agreement, which is the maximum capacity of Standby Service the Company is obligated to supply, and is the amount of load expected to be served by the customer-sited generation source. In no case shall the contracted Standby capacity be established at more than the capacity of the customer-sited generation source. Contracted Standby capacity may be different for the summer and winter seasons or by month.

The metered capacity in kW supplied by Company for Standby Energy Usage by customer will be excluded from the actual demand in kW used to determine any billed demand for the base tariff to which this Rider is attached. This exclusion is determined as the maximum total customer demand, defined as the total of capacity supplied by the customer-sited generation source and the Company measured in 15-minutes intervals, less contracted Standby capacity. All demand measurements will be determined with Company owned and installed meters. The exclusion of capacity supplied by Company for Standby Energy Usage by customer from any base tariff determination of demand calculation is represented by the equation: Base tariff actual demand in kW = Site load (Company supplied capacity in kW measured by the base tariff service meter + Customer supplied capacity in kW measured by production metering of customer-sited generation) – Contracted Standby capacity in kW as determined by the customer nomination in effect for the applicable billing period.

Any billing demand in kW for the base tariff to which this Rider is attached will be calculated using the applicable determination of demand provision defined in the base tariff. For a time of day base tariff, the on-peak and off-peak periods used for billed demand calculations will be based on the definition of peak periods included in the time of day base tariff.

C

TERMS AND CONDITIONS OF SERVICE

1. Standby Service Rider is applicable to any customer who requires greater than 100 kW of Standby capacity. Standby Service may not be used by a customer to serve controllable demand that is subject to interruption as determined by the Company under the Company's controllable service schedules.

(Continued on Sheet No. 5-103)

Northern States Power Company, a Minnesota corporation
Minneapolis, Minnesota 55401
MINNESOTA ELECTRIC RATE BOOK - MPUC NO. 2

STANDBY SERVICE RIDER (Continued) Section No. 5
13th Revised Sheet No. 102

RESOURCE ADJUSTMENT
Bills are subject to the adjustments provided for in the Conservation Improvement Program Adjustment Rider, the State Energy Policy Rate Rider, the Renewable Development Fund Rider, the Transmission Cost Recovery Rider, the Renewable Energy Standard Rider and the Mercury Cost Recovery Rider.

ENVIRONMENTAL IMPROVEMENT RIDER
Bills are subject to the adjustments provided for in the Environmental Improvement Rider.

SURCHARGE
In certain communities, bills are subject to surcharges provided for in a Surcharge Rider.

LOW INCOME ENERGY DISCOUNT RIDER
Bills are subject to the adjustment provided for in the Low Income Energy Discount Rider.

In addition, customer bills under this rate are subject to the following adjustments and/or charges.

LATE PAYMENT CHARGE
Any unpaid balance over $10.00 is subject to a 1.5% late payment charge or $1.00, whichever is greater, after the date due. The charge may be assessed as provided for in the General Rules and Regulations, Section 3.5.

DETERMINATION OF DEMAND
The billing demand applicable to this Standby Service Rider is determined separately from the billing demand applicable to the base tariff to which this Rider attaches. The demand associated with actual use of Standby Service will be subtracted from the total metered demand, to determine the demand for standard service, to which the base tariff demand charge applies.

For applying the Standby Service Reservation Rate, the billing demand will be the contracted Standby capacity specified in the customer's Electric Service Agreement, which is the maximum capacity of Standby Service the Company is obligated to supply, and is the amount of load served by the customer's alternative generation. In no case shall the contracted Standby capacity be established at more than the capacity of the customer's generation facility. This contracted Standby capacity may be different for the summer and winter seasons.

For applying the demand component of the Usage Rates, the billing demand shall be the capacity actually used by the customer, when customer's generator is wholly or partly out of service. This amount of Standby capacity actually used shall be the contracted Standby capacity less the actual capacity supplied by the customer's generating facilities (assuming it is operating, but not at full capacity), but not less than zero.

TERMS AND CONDITIONS OF SERVICE
1. Standby Service Rider is applicable to any customer who requires greater than 100 kW of Standby capacity. Standby Service may not be used by a customer to serve controllable demand that is subject to interruption as determined by the Company under the Company's controllable service schedules.

STANDBY SERVICE RIDER (Continued) Section No. 5
7th Revised Sheet No. 103

TERMS AND CONDITIONS OF SERVICE (Continued)

2. Customer will execute an Electric Service Agreement with the Company which will specify:
   a. Type of Standby Service elected by the customer and the base tariff to which this Rider is attached.
   b. The total Standby capacity requirements for which Company will be providing Standby power and to which the Standby Service reservation rate applies as well as the expected level of standard service the customer will take, even if the standard service level is expected to be zero. T
   c. The process and requirements for nominating contracted Standby capacity, including seasonal or monthly levels. N N

3. The Company's standard service meter will be detented to measure only the amount of capacity and energy provided by the Company to the customer.

4. Company will not be obligated to supply Standby Service to back-up a customer's generator at a level in excess of the Standby capacity for which customer has contracted. This restriction in no way limits the amount of standard service the customer requires from the Company under the standard service tariff to which this Rider is attached. Any limits on standard service are governed by the provisions contained in the standard service tariffs.

5. Customer will be liable for all damages allowed by law to the extent caused by customer's use of Standby power in excess of contracted Standby capacity.

6. Company will require customer to revise the Electric Service Agreement to contract for additional Standby capacity if the customer exceeds the contract amount in any three of the preceding 12 months.

7. Customer will annually furnish documentation to Company confirming the maximum capacity and reliability of the power source for which customer requires Standby Service. The Company and the customer will review the actual output and performance of the power source relative to the capacity nominated for Standby Service in the Electric Service Agreement. If this review shows a significant and consistent shortfall between the power source's actual performance and the nominated capacity due to factors reasonably within the customer's control, the Company will notify the customer of its intent to refuse to provide Standby Service. Upon receipt of such notice, the customer may agree to reduce the Standby Service nomination in its Electric Service Agreement or to take such action as necessary to operate the power source at or reasonably near the nominated Standby Service capacity. If the customer's power source does not operate at or reasonably near that level during the 12 months immediately following the Company's notice, the Company may refuse to provide Standby Service until such time as the customer agrees to reduce its Standby Service nomination or provide the Company with documentation demonstrating the power source's actual performance at or reasonably near the nominated Standby Service capacity for a trial period of three consecutive months.

8. Customer will remain on Standby Service for a period of not less than 12 months.

STANDBY SERVICE RIDER (Continued) Section No. 5
8th Revised Sheet No. 104

TERMS AND CONDITIONS OF SERVICE (Continued)

9. In the event Company provides advance notice to customer of expected system peak load conditions for a specified time period and customer uses unscheduled standby backup demand during that time period, the backup demand quantity used will be billed at the firm service demand charge from the base tariff to which this Rider is attached instead of the Reservation Demand charge. The quantity of unscheduled standby backup demand used for this provision will be the maximum 15-minute measured interval of unscheduled standby backup demand used during the specified system peak hours, measured as contracted standby capacity less the capacity provided by the customer-sited generation source. Company notice of expected system peak load conditions for this provision will be provided through the same means Company uses to notify interruptible customers of an interruption requirement. N N N N N N N N N

10. Company will install and charge customer for the additional metering necessary, to allow for determining Peak Period Standby Energy usage. In particular, the Company will install a separate meter that measures the flow of power and energy from the customer's own generating facility. Customer shall reimburse the Company for the costs of installing, operating, and maintaining the required additional metering and for any other facilities required to serve the customer's Standby load. If, as a result of the customer's construction and installation of their generating facility, it is more practical for the customer to install some or all of the metering equipment required, the customer may be permitted to do so, subject to Company's approval of such equipment. MINNESOTA ELECTRIC RATE BOOK – MPUC NO. 2

STANDBY SERVICE RIDER (Continued) Section No. 5
7th Revised Sheet No. 104

TERMS AND CONDITIONS OF SERVICE (Continued)

9. Customer will be allowed annually a Grace Period as specified above for use of unscheduled Standby Service without incurring additional demand charges for use of Standby Service. Use of this Grace Period will be measured in terms of Standby energy used by customer with the maximum amount of grace energy being the hours specified above times the contracted Standby capacity. After the Grace Period has been exhausted and customer uses unscheduled Standby Service, the customer shall pay the Demand Charge specified in the Usage Rates instead of the Reservation Fees as listed above. In a billing month, when customer uses Standby Service, the base tariff billing demand and the Standby Service billing demand will be determined individually. The base tariff billing demand will be the greatest 15 minute load determined after separating Standby Service usage from the total metered demands. The time of this determined greatest 15 minute demand for application to the base tariff may or may not occur at the same time when Standby Service is used. Billed demand charges for usage of Standby Service will be in addition to the billed demand charges for the base tariff as just described.

   Customers contracting for Standby Service to back up a solar photovoltaic system have the option to move their annual start date and subsequent Grace Periods forward to June 1. However, a customer shall not receive two annual Grace Periods for the same solar photovoltaic system in any rolling 12-month billing period.

10. Notwithstanding the Grace Period noted in provision 9 above, in the event customer requires unscheduled Standby Service at the times of Company's system peak hours in which the Company would have insufficient accredited capacity under the Midwest Reliability Organization (MRO) or any successor organization, and the Company incurs additional capacity costs as a result of such unscheduled Standby Service, customer shall pay Peak Demand Charges described below for the month in which such unscheduled Standby Service occurs and for each of the five succeeding months, instead of the above listed demand charges, or the demand charges under Section 9 above. Such Peak Demand Charges shall be based upon the following:

    a. If customer has notified Company of an unscheduled outage at least three hours prior to Company's system peak hour, such Peak Demand Charges shall be based on one-sixth of any additional capacity costs incurred by the Company as a result of the unscheduled outage. Such additional capacity costs shall not include any after-the-fact capacity purchase costs incurred by the Company.

    b. If customer has not notified the Company of any unscheduled outage at least three hours prior to the Company's system peak hour, such peak demand charges shall be based on one-sixth of any additional capacity costs or after-the-fact purchase costs incurred by the Company as a result of the unscheduled outage. The demand for billing purposes for the succeeding five months shall be equal to the demand placed on the system during the time of the Company's system peak hour in which the said additional capacity costs were incurred.

ADDITIONAL TERMS AND CONDITIONS OF SERVICE ASSOCIATED WITH THE SCHEDULED MAINTENANCE OPTION

1. The optional Scheduled Maintenance rates are available to Standby Service customers who agree to schedule maintenance of their power source during qualifying scheduled maintenance periods.

2. Qualifying Scheduled Maintenance Periods

   Maintenance may occur within the calendar months of April, May, October, and November without written customer notice to Company prior to the beginning of the maintenance period regardless of the size of the contracted Standby capacity.

   C
   C
   LC

   In other months for customers with a base time of day tariff to which this Rider is attached, regardless of the size of the contracted Standby capacity, scheduled maintenance may occur, with Company approval, during weekends and holidays as identified in the time of day base tariff, where a documented customer request is provided no less than 48 hours prior to the beginning of the planned maintenance period. Company will endeavor to approve or deny the customer request within 24 hours of receiving the request.

   N

   For months other than April, May, October, and November, customers with a minimum contracted Standby capacity of 1,000 kW may schedule maintenance at a time period mutually agreed to by Company and customer, following a documented customer request. These time periods for scheduled maintenance will normally not include those times when Company expects high system seasonal peak load conditions or high energy production costs.

   N
   D
   L

   Customer shall provide an annual projection of scheduled maintenance to the Company. Customer shall be allowed changes or additions to this projection upon notice to the Company based on the following schedule:

Outage Length	Required Notice
Less than 72 hours	24 hours
3 days to 30 days	7 days
Over 30 days	90 days

   C
   C

3. The duration of qualifying scheduled maintenance periods may not exceed a total of 56 days in any 12 month period.

   C
   L

STANDBY SERVICE RIDER (Continued) Section No. 5
7th Revised Sheet No. 105

TERMS AND CONDITIONS OF SERVICE (Continued)

The provisions of this Section 10 shall not apply if appropriate capacity accreditation has been obtained for the customer's generation from the Midwest Reliability Organization (MRO), or any successor organization. Customer must take responsibility for the preparation of the information necessary for the accreditation filing. The Company will advise and assist the Customer in this process but failure of customer in the preparation of the information and/or failure to obtain accreditation of the customer's generation will result in the customer being ineligible for the exemption from the provisions of this Section 10.

11. In the event any portion of the capacity obtained by the Company, at additional costs, and which is attributable to the customer's use of Standby Service under Section 10 above, is subsequently also used to satisfy the requirements of the Company's other customers, the Peak Demand Charges under Section 10 above shall be reduced relative to the portion of said capacity used to serve other customers.

12. The Company shall provide notice to the Standby customers when peak load conditions are expected to occur through the same means that the Company notifies interruptible customers of the potential interruption.

13. Company will install and charge customer for the additional metering necessary, to allow for determination of the separate billing demand applicable to the base tariff and Standby Rider and for determining energy use under the Grace Period identified above. In particular, the Company will install a separate meter that measures the flow of power and energy from the customer's own generating facility. Customer shall reimburse the Company for the costs of installing, operating, and maintaining the required additional metering and for any other facilities required to serve the customer's Standby load. If, as a result of the customer's construction and installation of their generating facility, it is more practical for the customer to install some or all of the metering equipment required, the customer may be permitted to do so, subject to Company's approval of such equipment.

ADDITIONAL TERMS AND CONDITIONS OF SERVICE ASSOCIATED WITH THE SCHEDULED MAINTENANCE OPTION (Continued)

4. If customer does not comply with all terms and conditions for qualifying scheduled maintenance periods during any billing month, all use of Standby Service for the same month will be subject to the Peak Period Standby Energy charge provision. Company may determine partial non-compliance and limit the quantity of Standby Service usage subject to the Peak Period Standby Energy charge provision. Company reserves the right to remove availability of the Scheduled Maintenance Option for any customer upon a determination of significant and multiple occurrences of failure to comply with all associated terms and conditions.

5. The use of Standby Service during qualifying scheduled maintenance periods will not be included in the determination of Peak Period Standby Energy usage.

ADDITIONAL TERMS AND CONDITIONS OF SERVICE ASSOCIATED WITH THE SCHEDULED MAINTENANCE OPTION

1. The optional Scheduled Maintenance rates are available to Standby Service customers who agree to schedule maintenance of their power source during qualifying scheduled maintenance periods.

2. Qualifying Scheduled Maintenance Periods

   Customers With Greater Than 100 kW to 10,000 kW of Contracted Standby Capacity. Maintenance must occur within the calendar months of April, May, October, and November. Customer must provide Company with written notice of scheduled maintenance prior to the beginning of the maintenance period.

   Customers With Greater Than 10,000 kW of Contracted Standby Capacity. Maintenance must occur at a time period mutually agreed to by Company and customer. These time periods will normally not include those times when Company expects system seasonal peak load conditions to occur, nor at those times when Company is required to use generation or to purchase power, with production costs of $70 or more per MWh. Customer shall provide an annual projection of scheduled maintenance to the Company. Customer shall be allowed changes or additions to this projection upon notice to the Company based on the following schedule:

Outage Length	Required Notice
Less than 48 hours	24 hours
2 days to 30 days	7 days
Over 30 days	90 days

3. The duration of qualifying scheduled maintenance periods may not exceed a total of six weeks in any 12 month period.

4. An additional charge shall apply if customer does not comply with all terms and conditions for qualifying scheduled maintenance periods. The additional charge shall be determined by calculating the additional charges which would have applied if customer were billed on the Unscheduled Maintenance Option for the period extending back to the customer's last scheduled maintenance period.

5. The demand charges of the base tariffs shall not apply to use of Standby Service during qualifying scheduled maintenance periods. Also, use of Standby Service during qualifying scheduled maintenance periods, will not count against the grace period.

ADDITIONAL TERMS AND CONDITIONS OF SERVICE FOR NON-FIRM STANDBY OPTION

1. Non-firm standby rates are available to customers who agree to use Standby Service only by prearrangement with the Company.

2. Company makes no guarantee that Standby Service will be available to Non-Firm Standby Service customers; however, the Company will make reasonable efforts to provide Standby Service whenever possible.

3. Customer must request use of Standby Service and receive approval from the Company prior to actually using Standby Service.

4. Use of Standby Service without prior approval by the Company shall subject the Non-Firm Standby Service customer to the following:
   a. The monthly demand charges from the base tariff applied to the unapproved Standby Service used in the month in which unapproved use of Standby Service occurred, plus
   b. Firm Standby Service unscheduled maintenance option reservation fees retroactively applied to the six months prior to the month in which unapproved use of Standby Service occurred.

5. If unapproved use of Standby Service occurs twice in any 12 month period, the Company reserves the right to convert the Non-Firm Standby Service customer to Firm Standby Service.

6. Non-Firm Standby Service customers will remain on Non-Firm Standby Service for a period of not less than five years which includes a one year trial period.

SUPPLEMENTAL GENERATION SERVICE RIDER Section No. 5
12th Revised Sheet No. 108

AVAILABILITY
Applicability of Supplemental Service is similar to that of Standby Service Rider, where customers with an alternative generation source greater than 60 kW, which serves all or a portion of the customer's electric energy requirements and where customer chooses to use the Company's electric service when the alternative generation is either partly or wholly unavailable.

Specifically, Supplemental Service is targeted at applications where the output of the alternative generation is designed primarily to meet the customer's thermal-load requirements and as such, the generator's electric energy output is variable because it is dependent on the customer's thermal requirements.

The normal expectation of this Rider is that the customer will contract for a firm portion of their backup supply from the Company under the Standby Service Rider and will contract for the variable portion under this Supplemental Generation Service Rider. Each customer request for service under this Rider will be evaluated on a customer specific basis to determine eligibility.

Under this service, the Company will provide Supplemental Generation Service in accordance with the provisions of the General Rules and Regulations, Section 2.4.

In addition, customer bills under this rate are subject to the following adjustments and/or charges.

RESERVATION RATES

Customer Charge per Month	$25.64	
Demand Charge per Month per kW of Contracted Supplemental Service		
Secondary Voltage Service	$3.40	R
Primary Voltage Service	$2.60	R
Transmission Transformed Voltage Service	$1.85	R
Transmission Voltage Service	$1.05	R

USAGE RATES
Demand Charge per Month per kW of Supplemental Generation Capacity Used. There will be no Usage Rate demand charge for Supplemental capacity actually used under this Rider except if that capacity is used during one of the Company's energy controlled or peak controlled interrupt periods. In such case, the demand will be charged as described below.

Energy Charge per kWh of Supplemental Generation Energy Used. Energy actually used under this Rider during normal time periods will be charged at the same energy and fuel cost charges as contained in the base tariff to which this Rider is attached. However, if energy is used during one of the Company's energy controlled or peak controlled interrupt periods, the energy will be charged as described below.

10th Revised Sheet No. 108

AVAILABILITY
Applicability of Supplemental Service is similar to that of Standby Service Rider, where customers with an alternative generation source greater than 60 kW, which serves all or a portion of the customer's electric energy requirements and where customer chooses to use the Company's electric service when the alternative generation is either partly or wholly unavailable.

Specifically, Supplemental Service is targeted at applications where the output of the alternative generation is designed primarily to meet the customer's thermal-load requirements and as such, the generator's electric energy output is variable because it is dependent on the customer's thermal requirements.

The normal expectation of this Rider is that the customer will contract for a firm portion of their backup supply from the Company under the Standby Service Rider and will contract for the variable portion under this Supplemental Generation Service Rider. Each customer request for service under this Rider will be evaluated on a customer specific basis to determine eligibility.

Under this service, the Company will provide Supplemental Generation Service in accordance with the provisions of the General Rules and Regulations, Section 2.4.

In addition, customer bills under this rate are subject to the following adjustments and/or charges.

RESERVATION RATES

Customer Charge per Month	$25.64	R
Demand Charge per Month per kW of Contracted Supplemental Service		
Secondary Voltage Service	$3.44	R
Primary Voltage Service	$2.64	R
Transmission Transformed Voltage Service	$1.89	R
Transmission Voltage Service	$1.09	R

USAGE RATES
Demand Charge per Month per kW of Supplemental Generation Capacity Used. There will be no Usage Rate demand charge for Supplemental capacity actually used under this Rider except if that capacity is used during one of the Company's energy controlled or peak controlled interrupt periods. In such case, the demand will be charged as described below.

Energy Charge per kWh of Supplemental Generation Energy Used. Energy actually used under this Rider during normal time periods will be charged at the same energy and fuel cost charges as contained in the base tariff to which this Rider is attached. However, if energy is used during one of the Company's energy controlled or peak controlled interrupt periods, the energy will be charged as described below.

(Continued on Sheet No. 5-109)

Northern States Power Company, a Minnesota corporation
Minneapolis, Minnesota 55401
MINNESOTA ELECTRIC RATE BOOK - MPUC NO. 2

SUPPLEMENTAL GENERATION SERVICE RIDER Section No. 5
(Continued) 15th Revised Sheet No. 109

FUEL CLAUSE
Bills are subject to the adjustments provided for in the Fuel Clause Rider.

RESOURCE ADJUSTMENT
Bills are subject to the adjustments provided for in the Conservation Improvement Program Adjustment Rider, the State Energy Policy Rate Rider, and the Renewable Development Fund Rider, the Transmission Cost Recovery Rider, the Renewable Energy Standard Rider and the Mercury Cost Recovery Rider.

ENVIRONMENTAL IMPROVEMENT RIDER
Bills are subject to the adjustments provided for in the Environmental Improvement Rider.

SURCHARGE
In certain communities, bills are subject to surcharges provided for in a Surcharge Rider.

LOW INCOME ENERGY DISCOUNT RIDER
Bills are subject to the adjustment provided for in the Low Income Energy Discount Rider.

In addition, customer bills under this rate are subject to the following adjustments and/or charges.

LATE PAYMENT CHARGE
Any unpaid balance over $10.00 is subject to a 1.5% late payment charge or $1.00, whichever is greater, after the date due. The charge may be assessed as provided for in the General Rules and Regulations, Section 3.5.

DETERMINATION OF SUPPLEMENTAL GENERATION DEMAND
The billing demand applicable to this Supplemental Generation Service Rider is determined separately from the billing demand applicable to the base tariff to which this Rider is attached. The billing demand for this Rider will be the quantity specified in the customer's Electric Service Agreement which is the maximum capacity of Supplemental Generation Service the Company is obligated to supply. The demand applicable to this Rider may be a different amount specified for each month where it is dependent on the variable thermal load requirements.

The amount of Supplemental Service capacity actually used by the customer, when customer's generator is wholly or partly out of service, will have no effect on the billing demand under the base tariff and will be subtracted from the total metered demand, to determine the demand for standard service, to which the base tariff demand charge applies. The amount of Supplemental Service capacity actually used, is the amount of the Supplemental Service capacity contracted for, less the actual capacity supplied by the customer's generating facilities (assuming it is operating, but not at full capacity) but not less than zero. For applying the Usage Rate, as referenced in Section 10 below of this Rider, the Supplemental Generation Demand will be the maximum actual demand (as adjusted for power factor) that is supplied by the Company to serve that portion of the customer's load, up to the contracted Supplemental Generation Capacity, not served by the customer's alternative source of electric energy supply.

Northern States Power Company, a Minnesota corporation
Minneapolis, Minnesota 55401
MINNESOTA ELECTRIC RATE BOOK - MPUC NO. 2

SUPPLEMENTAL GENERATION SERVICE RIDER Section No. 5
(Continued) 8th Revised Sheet No. 110

DETERMINATION OF SUPPLEMENTAL GENERATION ENERGY

Supplemental Generation Energy shall be that portion of the customer's total energy requirements provided by the Company to supplement the customer's generation. Supplemental Generation Energy shall be calculated hourly, and shall be Supplemental Generation Capacity for which the customer has contracted, less generation output above the contracted Standby capacity (as defined in the Standby Service Rider), but not less than zero.

TERMS AND CONDITIONS OF SERVICE

1. This Supplemental Generation Service Rider is applicable to any customer who requires greater than 60 kW of backup capacity from the Company. Supplemental Generation Service may not be used by a customer to serve controllable demand that is subject to interruption as determined by the Company under the Company's controllable service schedules.

   The Company and customer will develop and attach to the Electric Service Agreement, a load control procedure for the customer that specifies the customer's demand side load reductions or alternative generation capacity the customer intends to use to avoid Supplemental Generation Demand Usage Rate charges. This attachment will specifically state that when customer has been notified that an energy control or peak control period has been initiated, the customer must reduce the load served by Company by an amount equal to the difference between actual generator output and contracted Supplemental Generation Capacity. Additionally, the customer's demand served under the base tariff to which this rider is attached, shall not increase during any energy control or peak control period. If customer fails at either of these requirements, customer will incur Supplemental Generation usage charges as defined in Section 10 below.

2. Customer will execute an Electric Service Agreement with the Company which will specify:
   a. Type of Standby Service elected by the customer under the Standby Service Rider and the base tariff to which the Standby and Supplement Service Riders are attached,
   b. The individual and total capacity requirements for which Company will be providing Standby and Supplemental Generation Service and to which the respective Rider charges apply, and
   c. The expected initial level of firm service the customer will take under their base tariff, even if that expected level is zero, as well as any expected changes in load over the term of the agreement.

Minneapolis, Minnesota 55401
MINNESOTA ELECTRIC RATE BOOK - MPUC NO. 2

SUPPLEMENTAL GENERATION SERVICE RIDER Section No. 5
(Continued) 7th Revised Sheet No. 111

TERMS AND CONDITIONS OF SERVICE (Continued)

3. The Company's standard service meter will be detented to measure only the amount of capacity and energy provided by the Company to the customer.

4. Company will not be obligated to supply Supplemental Generation Service to backup a customer's generator at a level in excess of the Supplemental Generation Capacity for which customer has contracted. This restriction in no way limits the amount of standard service the customer requires from the Company under the base tariff to which this Rider is attached. Any limits on standard service are governed by the provisions contained in the standard service tariffs.

5. Customer will be liable for all damages allowed by law to the extent caused by customer's use of Supplemental power in excess of contracted Supplemental Generation Capacity.

6. Company will require customer to revise the Electric Service Agreement to contract for additional Supplemental Generation Capacity if the customer exceeds the contract amounts in any three of the preceding 12 months.

7. Customer will annually furnish documentation to Company confirming the maximum capacity and reliability of the power source for which customer requires Supplemental Generation Service. Company and customer will review actual output and performance of the power source relative to the capacity nominated for Supplemental Generation Service in the Electric Service Agreement. If this review shows a significant and consistent shortfall between the power source's actual performance and the nominated capacity due to factors reasonably within customer's control, Company will notify customer of its intent to refuse to provide Supplemental Generation Service. Upon receipt of such notice, customer may agree to reduce the Supplemental Generation Service nomination in its Electric Service Agreement or to take such action as necessary to operate the power source at or reasonably near the nominated Supplemental Generation Service Capacity. If customer's power source does not operate at or reasonably near that level during the 12 months immediately following Company's notice, Company may refuse to provide Supplemental Generation Service until such time as customer agrees to reduce its Supplemental Generation Service nomination or provide Company with documentation demonstrating the power source's actual performance at or reasonably near the nominated Supplemental Generation Service for a trial period of three consecutive months.

8. Customer will remain on Supplemental Generation Service for a period of not less than 12 months.

SUPPLEMENTAL GENERATION SERVICE RIDER Section No. 5
(Continued) 8th Revised Sheet No. 112

TERMS AND CONDITIONS OF SERVICE (Continued)

9. Customer will be allowed to take Supplemental Generation Energy from the Company at any time, up to the maximum contracted level of Supplemental Generation Demand, without incurring any usage demand charges except during the periods listed below.

10. In the event customer requires Supplemental Generation Service during one of the Company's energy control periods, customer will pay for the Supplemental Generation Energy used during the energy control period at the applicable control period energy rate as listed in Company's Energy Controlled Service tariff.

    In the event customer requires Supplemental Generation Service during one of the Company's peak control periods, as defined in the Rules for Application of Peak Controlled Services, customer will pay for the Supplemental Generation Energy used during the peak control period at twice the applicable control period energy rate as listed in Company's Energy Controlled Service tariff plus a fee of $10.00 per kW of maximum Supplemental Generation Capacity used during the peak control period.

    However, if this use occurs at the times of Company's system peak hours in which the Company would have insufficient Accredited Capacity under the Midwest Reliability Organization (MRO) or any successor organization, and the Company incurs additional capacity costs as a result of such Supplemental Generation Service used by customer, customer shall pay Peak Demand Charges for the month in which such Supplemental Generation Service use occurs and for each of the five succeeding months, instead of the above listed demand charges and/or Reservation Fees. Such Peak Demand Charges shall be based upon the following:

    a. If customer has notified Company of the need to use Supplemental Generation Service at least three hours prior to Company's system peak hour, such Supplemental Generation Peak Demand charges shall be based on one-sixth of any additional capacity costs incurred by the Company as a result of using Supplemental Generation Service. Such additional capacity costs shall not include any after-the-fact capacity purchase costs incurred by the Company.

    b. If customer has not notified the Company of any need for Supplemental Generation Service at least three hours prior to the Company's system peak hour, such Supplemental Generation Peak Demand charges shall be based on one-sixth of any additional capacity costs or after-the-fact purchase costs incurred by the Company as a result of using Supplemental Generation Service. The demand for billing purposes for the succeeding five months shall be equal to the Supplemental Generation Demand placed on the system during the time of the Company's system peak hour.

Northern States Power Company, a Minnesota corporation
Minneapolis, Minnesota 55401
MINNESOTA ELECTRIC RATE BOOK - MPUC NO. 2

SUPPLEMENTAL GENERATION SERVICE RIDER Section No. 5
(Continued) 8th Revised Sheet No. 113

TERMS AND CONDITIONS OF SERVICE (Continued)

The potential capacity charge provisions of this Section 10 shall not apply if appropriate capacity accreditation has been obtained for the customer's generation from the Midwest Reliability Organization (MRO), or any successor organization. Customer must take responsibility for the preparation of the information necessary for the accreditation filing. The Company can advise and assist the Customer in this process but failure of customer in the preparation of the information and/or failure to obtain accreditation of the customer's generation will result in the customer being ineligible for the exemption from the capacity charge provisions of this Section 10.

11. In the event any portion of the capacity obtained by the Company at additional costs and which is attributable to the customer's use of Supplemental Service under Section 10 above, is subsequently also used to satisfy the requirements of the Company's other customers, the peak demand charges under Section 10 above shall be reduced relative to the portion of said capacity used to serve the other customers.

12. The Company shall provide notice to the Supplemental Generation Service customers when energy control or peak control conditions are expected to occur through the same means that the Company notifies interruptible customers of the potential interruption.

13. Company will install and charge customer for the additional metering necessary, as determined by the Company, to allow for determination of the separate billing demands applicable to the base tariff, Standby Service Rider and Supplemental Generation Service Rider demands. In particular, the Company will install a separate meter that measures the flow of power and energy from the customer's own generating facility. Customer shall reimburse the Company for the costs of installing, operating, and maintaining the required additional metering and for any other facilities required to serve the customer's Supplemental Generation load. If, as a result of the customer's construction and installation of their generating facility, it is more practical for the customer to install some or all of the metering equipment required, customer may be permitted to do so subject to Company's approval of such equipment.

(Continued) 7th Revised Sheet No. 114

ADDITIONAL TERMS AND CONDITIONS ASSOCIATED WITH SCHEDULING MAINTENANCE

1. Supplemental Generation Service customers shall schedule maintenance of their power source during qualifying scheduled maintenance periods.

2. Qualifying Scheduled Maintenance Periods

   Customers With Greater than 60 kW up to 10,000 kW of Contracted Standby and Supplemental Generation Capacity. Maintenance must occur within the calendar months of April, May, October, and November. Customer must provide Company with written notice of scheduled maintenance prior to the beginning of the maintenance period.

   Customers With Greater Than 10,000 kW of Contracted Standby and Supplemental Generation Capacity. Maintenance must occur at a time period mutually agreed to by Company and customer. These time periods will normally not include those times when Company expects system seasonal peak load conditions to occur, nor at those times when Company is required to use generation equipment or to purchase power that results in production costs of $70 or more per MWh. Customer shall provide an annual projection of scheduled maintenance to the Company. Customer shall be allowed changes or additions to this projection upon notice to the Company based on the following schedule:

Outage Length	Required Notice
Less than 48 hours	24 hours
2 days to 30 days	7 days
Over 30 days	90 days

3. The duration of qualifying scheduled maintenance periods may not exceed a total of six weeks in any 12 month period.

4. An additional charge shall apply if customer does not comply with all terms and conditions for qualifying scheduled maintenance periods. The additional charge shall be determined by calculating the additional charges which would have applied if customer were billed on the Unscheduled Maintenance Option for the period extending back to the customer's last scheduled maintenance period.

5. The demand charges of the base tariffs of General Service or General Time of Day Service shall not apply to use of Supplemental Service during qualifying scheduled maintenance periods.

TIER 1 ENERGY CONTROLLED SERVICE RIDER Section No. 5
RATE CODE A27 13th Revised Sheet No. 115

AVAILABILITY
Availability is restricted to customers who are taking service on the Tier 1 option of the Peak Controlled Time of Day Service.

In addition, customer bills under this rate are subject to the following adjustments and/or charges.

RATE
The rates and provisions of Tier 1 of the Peak Controlled Time of Day Service schedule shall apply except that the on peak and off peak energy charges for secondary voltage are replaced as follows:

Energy Charge per kWh		
Firm On Peak Period Energy	$0.04855	R
Firm Off Peak Period Energy	$0.02341	R
Controllable On Peak Period Energy	$0.04647	R
Controllable Off Peak Period Energy	$0.02280	R
Control Period Energy	$0.09000	

TERMS AND CONDITIONS OF SERVICE
1. Failure to Control Charge: Except as provided for under Control Period Energy Service described below, the following charges will apply in any month customer fails to control load to Predetermined Demand Level or fails to control the full amount of their fixed Controllable Demand under the Optional PDL:
   a. An additional charge of $10.00 per kW will apply during each Company specified control period to the amount by which customer's Maximum Adjusted Demand exceeds their Predetermined Demand Level, and
   b. The Control Period Energy charge will apply to the energy used during the control period that is associated with the customer's Controllable Demand.

   After three such customer failures to control load to their Predetermined Demand Level, Company reserves the right to increase the Predetermined Demand Level or remove customer from Tier 1 Energy Controlled Service Rider and apply the cancellation charge specified in customer's Electric Service Agreement.

TERMS AND CONDITIONS OF SERVICE (Continued)

2. The duration and frequency of interruption periods shall be at the discretion of Company. Interruption periods will normally occur at such times when:
   a. Company is required to use generation equipment or to purchase power that results in production costs in excess of $70 per MWH,
   b. Company expects a reasonable possibility of system load levels surpassing the level for which NSP has sufficient accredited capacity under the Midwest Reliability Organization (MRO) or any successor organization, including reserve requirements, or
   c. In Company's opinion, the reliability of the system is endangered.

3. Customer's Electric Service Agreement with Company will include a maximum of 300 hours of interruption per year.

4. All other provisions of Tier 1 of the Peak Controlled Time of Day Service schedule not in conflict with the Tier 1 Energy Controlled Service Rider shall apply.

CONTROL PERIOD ENERGY SERVICE

AVAILABILITY

Available to Tier 1 Energy Controlled Service Rider customers for supply of Controllable Demand related energy during control periods. The Control Period Energy charge will apply when the Company is required to use generation equipment or to purchase power that results in production costs in excess of $70 per MWh. Control Period Energy Service will not be available when Company expects system peak load conditions or during system emergencies.

In addition, customer bills under this rate are subject to the following adjustments and/or charges.

RATE

The control period energy charge will apply to all Controllable Demand related energy used during the control period.

TERMS AND CONDITIONS OF SERVICE

1. Control Period Energy Service will be available provided such service will not adversely affect firm service to any customer.

2. Company reserves the right to refuse or control the supply of Control Period Energy Service if its capacity is not adequate to furnish such service.

REVENUE DECOUPLING MECHANISM RIDER Section No. 5
PILOT PROGRAM 5th Revised Sheet No. 117

APPLICABILITY
Applicable to bills for electric service provided under the Company's Residential and non-demand-metered Small General Service schedules, excluding lighting services.

RIDER
For customers subject to this rider, there shall be included on each customer's monthly bill a Revenue Decoupling Mechanism Rider (RDM Rider) which shall be the applicable Revenue Decoupling Mechanism Rider factor multiplied by the customer's monthly kWh electric consumption.

DETERMINATION OF RDM RIDER FACTORS
Annual RDM Rider Factor
Each year during the term of this rider the Company will calculate an RDM Rider factor for each applicable class. These factors will be based on revenues billed through December 31 and applied to bills from April 1 through the March 31 of the following year. The RDM Rider factors are:

Residential without Space Heating (A01, A02, A03, A04, A05, A06)	$0.001625 per kWh credit	R
Residential with Space Heating (A00, A01, A02, A03, A04, A05, A06)	$0.001056 per kWh credit	R
Small General Service (non-demand) (A05, A06, A09, A10, A11, A12, A16, A18, A22)	$0.000213 per kWh credit	R

The calculation for the RDM Rider factor is:

Annual RDM Rider factor = RDM Rider Deferral / Forecasted Sales

For purposes of this section the following definitions apply:

RDM Rider Deferral — Annual RDM Rider Deferral = the sum of the 12 monthly RDM Rider Deferrals plus any under- or over-recovery of the previous Annual RDM Rider Deferral as described in item 3 of the RDM Rider Deferral Account on tariff sheet 5-118.

Forecasted Sales — Forecasted Usage = forecasted use in kWh for the timeframe the RDM Rider factor to be in place.

The Annual RDM Rider factor to collect under-recovered revenues shall be capped at +3% of the total customer group base revenue for each of the rate classes, unless the Company is granted approval from the Minnesota Public Utilities Commission (Commission) to recover revenues in excess of the 3% cap. The RDM Rider factor to return over-recovered revenues shall not be capped.

Docket No. E002/GR-13-868 & E002/GR-15-826 & E002/M-19-127 Order Date: 08-31-15 & 06-12-17

Northern States Power Company, a Minnesota corporation
Minneapolis, Minnesota 55401
MINNESOTA ELECTRIC RATE BOOK - MPUC NO. 2

REVENUE DECOUPLING MECHANISM RIDER Section No. 5
PILOT PROGRAM 4th Revised Sheet No. 117

APPLICABILITY
Applicable to bills for electric service provided under the Company's Residential and non-demand-metered Small General Service schedules, excluding lighting services.

RIDER
For customers subject to this rider, there shall be included on each customer's monthly bill a Revenue Decoupling Mechanism Rider (RDM Rider) which shall be the applicable Revenue Decoupling Mechanism Rider factor multiplied by the customer's monthly kWh electric consumption.

DETERMINATION OF RDM RIDER FACTORS
Annual RDM Rider Factor
Each year during the term of this rider the Company will calculate an RDM Rider factor for each applicable class. These factors will be based on revenues billed through December 31 and applied to bills from April 1 through the March 31 of the following year. The RDM Rider factors are:

Residential without Space Heating (A01, A02, A03, A04, A05, A06)	$0.003064 per kWh surcharge	R
Residential with Space Heating (A00, A01, A02, A03, A04, A05, A06)	$0.002361 per kWh surcharge	R
Small General Service (non-demand) (A05, A06, A09, A10, A11, A12, A16, A18, A22)	$0.001245 per kWh surcharge	R

The calculation for the RDM Rider factor is:

Annual RDM Rider factor = RDM Rider Deferral / Forecasted Sales

For purposes of this section the following definitions apply:

RDM Rider Deferral — Annual RDM Rider Deferral = the sum of the 12 monthly RDM Rider Deferrals plus any under- or over-recovery of the previous Annual RDM Rider Deferral as described in item 3 of the RDM Rider Deferral Account on tariff sheet 5-118.

Forecasted Sales — Forecasted Usage = forecasted use in kWh for the timeframe the RDM Rider factor to be in place.

The Annual RDM Rider factor to collect under-recovered revenues shall be capped at +3% of the total customer group base revenue for each of the rate classes, unless the Company is granted approval from the Minnesota Public Utilities Commission (Commission) to recover revenues in excess of the 3% cap. The RDM Rider factor to return over-recovered revenues shall not be capped.

Northern States Power Company, a Minnesota corporation
Minneapolis, Minnesota 55401
MINNESOTA ELECTRIC RATE BOOK – MPUC NO. 2

REVENUE DECOUPLING MECHANISM RIDER (Continued) Section No. 5
PILOT PROGRAM 3rd Revised Sheet No. 118

DETERMINATION OF RDM RIDER FACTORS (Continued)
RDM Rider Deferral Account

1. Each month the Company will calculate the Monthly RDM Rider Deferral, which will be entered in the RDM Rider Deferral Account. Separate deferrals will be calculated for Residential Standard, Residential with Electric Space Heating, and non-demand-metered Small General services.

   Monthly RDM Rider Deferral = (FRC x C) – (FEC x Sales)

   For purposes of this section, the following definitions apply:

   FRC Fixed Revenue per Customer = Energy charge revenues divided by customer count, calculated monthly from test year data. Expressed in dollars per customer

   C Customer Count = Actual customer count for deferral month.

   FEC Fixed Energy Charge = Average energy charge for each month of test year. Expressed in dollars per kWh

   Sales Actual Sales = Actual billed sales for deferral month. Expressed in kWh.

2. The Company will defer and amortize the Monthly RDM Deferrals in Account 182.3 or 254.

3. Any under- or over-recovery of the Annual RDM Rider Deferral will be included as a deferral in the RDM Rider Deferral Account and reflected in the calculation of the following year's Annual RDM Rider factor.

TERM
The Company will begin calculating Monthly RDM Rider Deferrals in the first full month after receiving a Final Order from the Commission in Docket No. E002/GR-13-868, but not before January 1, 2016.

The Company will file its proposed Annual RDM Rider factor surcharge or credit with the Commission annually on February 1, beginning on February 1, 2017. The proposed rate will become effective on April 1 each year and remain in effect for the next 12 months, or until April 1 of the following year. In the event the Company files a rate case during the pilot program, the RDM rider factors from deferrals in a test year will not be applied to bills until final rates in that proceeding have been approved by the Commission.

AREA DEVELOPMENT RIDER Section No. 5
5th Revised Sheet No. 119

AVAILABILITY
Available to new or existing demand metered customers located in Area Development Zones whose proper Standard Industrial Classification (SIC) is manufacturing or wholesale trade and who qualify for other development incentives offered by local government entities. The availability of this Rider is limited to specific Area Development Zones that meet the criteria listed below as set forth by the Commission.

ZONE DESIGNATION
Area Development Zones in the seven county Twin Cities' metropolitan area (Anoka, Carver, Dakota, Hennepin, Ramsey, Scott, and Washington Counties) must be located within one of the cities lying within the "Fully Developed Area" as classified by the Metropolitan Council in the document entitled "Metropolitan Development and Investment Framework (December 1988)" that has experienced a decline in combined employment in manufacturing and wholesale trade between 1980 and the most recent year for which data are available as published by the Minnesota Department of Economic Security. Eligible communities are Bloomington, Columbia Heights/Hilltop, Crystal, Fridley, Golden Valley, Hopkins, Minneapolis, New Brighton, Roseville, South St. Paul, St. Louis Park, and St. Paul. Area Development Zones in cities located outside the seven county Twin Cities' metropolitan area must be located in a city with a minimum population of 25,000 based on the most recent U.S. Census of Population and must be located in a county (or counties) that have experienced a decline in combined employment in manufacturing and wholesale trade between 1987 and the most recent year for which data are available as published by the Minnesota Department of Economic Security. The Area Development Zone must be an existing or proposed industrial park with a minimum size of ten acres. The maximum total number of active zones at any time is 18; the maximum number of active zones in the seven county Twin Cities' metropolitan area is 15. The maximum number of active zones in any community is three. A zone can be "decertified" and a new Area Development Zone established at any time as long as there are no more than three Area Development Zones in a community at any point in time.

RATE
The rates and provisions of the customer's regular rate schedule shall apply except monthly demand charges for customer's Qualified Billing Demand shall be reduced as follows:

Years	Percent Reduction
1 - 3	50%
4	30%
5	20%
6	0%

AREA DEVELOPMENT RIDER (Continued)

Section No. 5
5th Revised Sheet No. 120

QUALIFIED BILLING DEMAND
The portion of the customer's billing demand that qualifies for reduced demand charges.

New Customers. The total billing demand of new customers shall be defined as Qualified Billing Demand.

Existing Customers. The billing demand in excess of customer's base billing demand shall be defined as qualified billing demand. The base billing demand for each month will be calculated by averaging the monthly billing demands from the two-year period immediately preceding the customer's application for this Rider.

NEW CUSTOMERS
To be considered a new customer for the purpose of this Rider, an applicant must demonstrate one of the following:

1. That business has not been conducted at the premises for at least three monthly billing periods prior to application,
2. That the predecessor customer is in bankruptcy and the applicant has obtained the business in a liquidation of assets sale,
3. Customer's activities are largely or entirely different in nature from that of the previous customer, or
4. If the activities are not so different, that the owner(s), operator(s), or manager(s) are substantially different.

EXISTING CUSTOMERS
Existing customers who materially increase their use of electric service may qualify for service under this Rider, provided such material increase is the result of the addition of equipment, or expansion of the customer's facility or operations. The customer shall notify the Company in writing and document the basis for the material increase in its use of electric service. Following such notification, the Company will review the customer's monthly billing demands. If the billing demands for each of the next three consecutive months exceed that from the comparable monthly period of the preceding year by at least 25%, the customer will be eligible thereafter to receive service under this Rider.

RIGHT TO REFUSE SERVICE
The Company reserves the right to refuse applicants for service under this Rider if it determines that significant additional capital expenditures will be required to provide service to that applicant. In such cases, an applicant may be able to qualify for service by making a non-refundable contribution to compensate for the significant additional capital costs incurred by the Company to supply service to the applicant.

Section No. 5
5th Revised Sheet No. 121

ENERGY EFFICIENCY
For service taken on this Rider, the Company will conduct an energy audit and inform the customer of the conservation programs available from the Company.

ELECTRIC SERVICE AGREEMENT
Any customer taking service under this Area Development Rider shall execute an Electric Service Agreement, or amend their existing Electric Service Agreement, with the Company for a period of six years beginning on the effective date on which the customer commences taking service under this Rider; however, customers who began service under the Pilot Area Development Rider before June 28, 1995, with Electric Service Agreement terms of five years, will not be required to amend or modify those agreements. Such Electric Service Agreements (new or amended) shall state the increased or new load level of the customer as well as the customer's obligation to continue to purchase all of their electric power and electric energy from the Company during the term of the agreement.

Northern States Power Company, a Minnesota corporation
Minneapolis, Minnesota 55401
MINNESOTA ELECTRIC RATE BOOK – MPUC NO. 2

COMPETITIVE RESPONSE RIDER Section No. 5
5th Revised Sheet No. 122

AVAILABILITY
Available at Company's discretion to demand-metered commercial and industrial customers that are subject to effective competition.

Effective competition exists if a customer is located in Company's service territory and has the ability to obtain its energy requirements from an energy supplier not rate regulated by the Minnesota Public Utilities Commission.

RATE
Standard service rates and provisions, including controllable service provisions, apply except the level of the demand charges, energy charges, or both may be reduced for each customer as described below.

TERMS AND CONDITIONS OF SERVICE
1. Customer must provide Company with information that documents that service to the customer is subject to effective competition. The Company will treat information provided by the customer to the Company concerning load or effective competition that meets the definition of trade secret information under the Minnesota Government Data Practices Act ("Act") as trade secret information and, if provided to the Commission or other state agency, will request that the Commission or any other state agency treat the information as trade secret under the Act..

2. Minimum load served under this Rider is 2 MW. Any rate offered under this Rider shall not be available for any month in which the load served under this Rider falls below 2 MW.

3. Customer must execute an Electric Service Agreement with Company, or amend its existing Electric Service Agreement with the Company, to include:
   a. The rate under this Rider, which:
      i) must recover at least the incremental cost of providing service, including the cost of incremental capacity that is to be added while the rate is in effect and any applicable on peak or off peak differential;
      ii) must not exceed the difference between the standard tariff and the cost to the customer of the lowest cost competitive energy supply; and
      iii) includes an annual minimum charge to fully recover distribution costs.

MINNESOTA ELECTRIC RATE BOOK – MPUC NO. 2

COMPETITIVE RESPONSE RIDER (Continued) Section No. 5
6th Revised Sheet No. 123

TERMS AND CONDITIONS OF SERVICE

3. Customer must execute an Electric Service Agreement with Company, or amend its existing Electric (Continued)
   b. The term of service under this Rider, which must be no less than one year and no longer than seven years, beginning on the date the customer begins taking service under this rider,
   c. The size of the load served under this Rider,
   d. Verification that customer has been fully informed of the availability of energy audits. If no energy audit is performed for customer, an explanation of why an energy audit was not necessary will be included.
   e. Establishing the effective date of the rate, which must be at least 60 days after the date upon which the Company files its petition for Commission approval of the Electric Service Agreement,
   f. If the Customer requests that the rate be implemented on an interim rate basis, a statement that the rate will be treated as an interim rate as of the effective date and until Commission approval, modification or disapproval is received. If a modified rate is approved and accepted by the customer and Company, or if the rate is disapproved, the Company will recover the difference between the interim rate and the approved rate (modified or base) from the customer, and
   g. Requirements for a bond or other security acceptable to the Company to provide full recovery of any portion of any interim rate discount disallowed by the Commission.

4. For existing customers receiving a discount, the Company, within a general rate case, is allowed to seek recovery of the difference between the applicable commercial and industrial tariff and this Rider times the usage level during the test year period.

5. A rate under this Rider shall meet the conditions of Minnesota Statutes, Section 216B.03, Reasonable Rate, for other customers in this same customer class.

6. Unless the Commission determines that it would be in the public interest, a rate under this Rider shall not compete with district heating or cooling provided by a district heating utility defined by Minnesota Statutes, Section 216B.166, Subdivision 2, Paragraph (c).

7. A rate offered under this Rider may not be offered to a customer in which the Company has a financial interest greater than 50%.

COMPETITIVE RESPONSE RIDER (Continued)

Section No. 5
6th Revised Sheet No. 124

REGULATORY REVIEW

If the Customer requests that the rate be implemented on an interim rate basis, the rate offered under this Rider will be effective on an interim basis after filing by Company of the proposed rate with the Commission and upon the date specified in the Electric Service Agreement. If the Commission does not approve the rate, Company may seek to recover the difference in revenues between the interim competitive rate and the modified rate or the standard tariff rate, as applicable, from the customer who was offered the competitive rate.

The Commission has the authority to approve, modify, or reject a rate under this Rider. If the Commission approves the rate, it is effective as agreed to by the Company and customer. If the rate is modified by the Commission, the Commission shall issue an order modifying the rate subject to the approval of the Company and the customer. Each party has ten days in which to reject the proposed modification. If no party rejects the proposed modifications, the Commission's order becomes final. If either party rejects the Commission's proposed modifications, the Company on its behalf or on the behalf of the customer, may submit to the Commission a modified version of the Commission's proposal, which modified rate shall become an interim rate. The Commission shall accept or reject the modified version within 30 days. If the Commission rejects the rate, it shall issue an order indicating the reasons for the rejection.

PHOTOVOLTAIC DEMAND CREDIT RIDER
RATE CODE A85 (CLOSED)
RATE CODE A86

Section No. 5
4th Revised Sheet No. 125

D
N

AVAILABILITY – GENERAL
Applicable by customer request to demand-metered commercial and industrial customers that use Solar Photovoltaic as a customer-sited generation source with a capacity greater than 40 kW (AC) with a single production meter to serve all or a portion of customer's electric energy requirements. Not available to customer-sited generation that is the subject of another incentive program such as Solar*Rewards.

AVAILABILITY – CLOSED RATE
Availability of the closed rate is limited to qualifying customer account locations that: 1) are receiving Standby Service Rider tariff service with the Photovoltaic Solar Credit on the date this Rider is originally approved by the Commission, or 2) have enrolled for the Rider before the date the credit rate in this Rider is revised by the Commission. The closed rate will remain fixed for a six year period beginning with the original Commission order date approving this Rider, expiring April 20, 2024. After expiration of the closed rate, the applicable standard rate will replace the closed rate.

The standard rate will apply to customer account locations that do not qualify for the closed rate. The standard rate may be revised at any time subject to approval by the Commission.

RATE
Customer Charge per Month $25.75

Credit per kWh of Peak Period Solar Photovoltaic Generation (A85 - Closed)	$0.07139
Credit per kWh of Peak Period Solar Photovoltaic Generation (A86 - Standard)	$0.07139

CREDIT KWH LIMIT
The maximum kWh applied to the Rider credit per kWh each billing period is the Peak Period maximum 15-minute Solar Photovoltaic kW output for the billing period times 100 hours for billing periods ending in the months of June, July, August or September and 75 hours for billing periods ending in other months.

CREDIT LIMIT
The maximum credit for each billing period is the applicable standard or on-peak billed demand charge from the base tariff associated with this Rider. For Peak-Controlled Service and Peak-Controlled Time of Day Service customers, the maximum credit for each billing period is the billed demand charge for Firm Demand.

DEFINITION OF PEAK PERIOD
Peak period hours are the six hours between 1:00 p.m. and 7 p.m. for all days.

TERMS AND CONDITIONS OF SERVICE
1. Customer will execute an Electric Service Agreement with the Company that will specify:
   a) The base tariff associated with this Rider, and
   b) The installed capacity (AC) of customer's Solar Photovoltaic generation.
2. Company will install, own, and maintain the metering to measure the electric power and energy supplied by customer generation to allow for proper billing of the customer under this Rider. If, as a result of the customer's construction and installation of their generating facility, it is more practical for the customer to install some or all of the metering equipment required, the customer may be permitted to do so, subject to Company's approval of such equipment.
3. Company reserves the right to limit availability of this Rider to customer situations where the Solar Photovoltaic generation used by customer does not significantly affect the monthly peak demand of customer.
4. For Solar Photovoltaic generation, this Rider supersedes other Standby Service tariff provisions. N

TIER 1 PEAK CONTROLLED SHORT NOTICE RIDER Section No. 5
11th Revised Sheet No. 126

AVAILABILITY
Availability is restricted to customers who are taking service on the Tier 1 option of Peak Controlled Service or Peak Controlled Time of Day Service. Customers choosing service under this rider shall agree to allow the Company to interrupt customer's load to a predetermined level within 10 minutes notice of a control period. Availability is restricted to customers with a minimum certified controllable load of 3,000 kW. Participation is limited to 100,000 kW of controllable demand, which may be exceeded if part of a customer's controllable load is within the participation limit, subject to Company approval.

CONTRACT
Customers must contract for this service rider through an Electric Service Agreement with Company. Contract period will normally be for 24 months.

RATE
The rates and provisions of Tier 1 of the applicable Peak Controlled Service schedule shall apply with the customer's Controllable Demand billed at the Short Notice Controllable Demand charge.

TERMS AND CONDITIONS OF SERVICE
1. Within 10-minutes of notification from the Company, customer's controllable load shall be curtailed by Company-initiated automatic control for the duration of the control period as determined by the Company.

2. Customers taking service under this rider will be required to certify their interruptible load as described below under Certification of Interruptible Load. Customer will cooperate fully with and assist in the required certification process. Failure of customer to assist in the certification process and/or failure to obtain certification of the Controllable Demand level will result in the customer being ineligible for this tariff.

3. Certification of Interruptible Load: To be eligible, the customer's interruptible load must complete an annual control test, prior to the beginning of the Company's summer peak load season. The control test must:
   - Demonstrate that the load is controlled by the Company from its control center;
   - That the load is curtailed within ten minutes of a Company declared control period.
   - The controlled load must remain off for at least four (4) hours in the first year of application and at least one (1) hour in subsequent years.
   - The timing of the control test will be coordinated with the customer but must be conducted at a time when the customer's load is at or near the level expected during actual control periods.

CITY REQUESTED FACILITIES SURCHARGE RIDER Section No. 5
7th Revised Sheet No. 131

APPLICABILITY
Applicable to bills for electric service provided under the Company's retail rate schedules in a City ordering the installation of non-standard underground Distribution Facilities. The Excess Expenditure costs for these Special Facilities are to be collected from customers located within such City in accordance with the provisions in the General Rules and Regulations, Section 5.3, SPECIAL FACILITIES.

The Company will provide notice to the affected City of any miscellaneous rate filing by Company under Minn. Stat. §216.B16, Subd. 1 to establish a Special Facilities surcharge applicable to customers in such City.

RATE
In each applicable City, there shall be included in the monthly minimum billing on each customer's bill a separately itemized surcharge line item determined in accordance with this Rider entitled "City Req Fac Srchg". The City Requested Special Facilities Surcharge shall not be subject to current month billing adjustments or City surcharges and shall be subject to any applicable sales taxes.

DETERMINATION OF CITY REQUESTED FACILITIES SURCHARGE
The City Requested Special Facilities Surcharge for each applicable City project shall be calculated by determining a Class Facilities Surcharge to be applied to the Average Monthly Customers in the designated City such that the total Excess Expenditure plus carrying charges in the City Project Tracker Account are recovered over the designated Recovery Period.

Average Monthly Customers shall be the projected average number of active customers in each applicable customer classification located in the City for the designated Recovery Period.

Class Facilities Surcharge shall be the surcharge amount for each applicable customer classification determined in accordance with the Rules for Application.

City Project Tracker Account is a regulatory asset account representing the sum of the following:

(1) The total Excess Expenditures for each Distribution Facilities undergrounding project in such City,

(2) Monthly carrying charges on the under recovered or over recovered monthly balance in the City Project Tracker Account based on the overall rate of return from the Company's most recent electric general rate case decision,

(3) Less the recovered project costs collected to date through the applicable City's Facilities Surcharge.

Recovery Period is the number of months the City Requested Special Facilities Surcharge shall be applied to bills for a designated City project determined in accordance with the Rules for Application.

Excess Expenditures shall be determined in accordance with the provisions in the General Rules and Regulations, Section 5.3.

(Continued on Sheet No. 5-132)

Northern States Power Company, a Minnesota corporation
Minneapolis, Minnesota 55401
MINNESOTA ELECTRIC RATE BOOK – MPUC NO. 2

CITY REQUESTED FACILITIES SURCHARGE RIDER Section No. 5
(Continued) 6th Revised Sheet No. 132

RULES FOR APPLICATION

1. The Recovery Period shall not commence until the City Requested Facilities Surcharge to be applied to bills is at least $0.25 per customer per month. A surcharge of $0.25 up to and including $1.00 per customer regardless of customer class may be applied for a Recovery Period of exactly one month (e.g., a one-time surcharge).

2. For a Recovery Period greater than one month, the Class Facilities Surcharge per month per customer in each non-residential customer class for any month in which a Residential Class Facilities Surcharge is applicable shall be as follows:

   a. Commercial & Industrial (C&I), Street Lighting and Municipal – Non-Demand Billed: Equal to the Residential Class Facilities Surcharge.

   b. Small C&I and Small Municipal – Demand Billed: Three times the Residential Class Facilities Surcharge.

   c. Large C&I – Demand Billed (actual demand greater than 100 kW): Four times the Residential Class Facilities Surcharge.

   However, whenever the Non-residential Class Facilities Surcharges to be billed exceed the Customer Charge applicable on a customer account, the Class Facilities Surcharge for that account shall be equal to such Customer Charge.

3. A Residential Class Facilities Surcharge of $0.25 up to and including $1.00 per Residential customer per month will be applied each month whenever the City Project Tracker Account balance to be collected allows for a Recovery Period of 36 months or less.

4. A Residential Class Facilities Surcharge of over $1.00, up to and including $5.00, per Residential customer per month will be applied each month for a Recovery Period of 36 months whenever the City Project Tracker Account balance is uncollectable at a Residential Class Facilities Surcharge level of $1.00 or less, provided that the surcharge amount for any Residential class customer account receiving a Low Income Energy Discount shall not exceed $1.00 per month.

5. A Residential Class Facilities Surcharge of $5.00 per Residential customer per month for a Recovery Period of 36 months up to and including 60 months will be applied only when necessary to recover the City Project Tracker Account balance, provided a surcharge of $5.00 may be collected pending Commission action on a Company petition or City complaint to modify the design of the rate surcharge for a specific project which cannot be recovered in 60 months.

CITY REQUESTED FACILITIES SURCHARGE RIDER Section No. 5
(Continued) 6th Revised Sheet No. 133

RULES FOR APPLICATION (Continued)

6. The Class Facilities Surcharges may be adjusted annually and in the last 6 months of the Recovery Period to more closely recover the balance remaining in the City Project Tracker Account.

7. Subject to the limits on monthly surcharge amounts set forth above, the Class Facilities Surcharges may also be increased at any time and the Recovery Period may be updated, with notice as provided in Section 5.3 of the General Rules and Regulations, in order to recover Excess Expenditures associated with additional Distribution Facilities undergrounding projects requested or ordered by City.

VOLUNTARY RENEWABLE AND HIGH-EFFICIENCY ENERGY PURCHASE (WINDSOURCE PROGRAM) RIDER
Section No. 5
7th Revised Sheet No. 134

AVAILABILITY
Available to any customer who elects to apply an adjustment to the customer's electric energy usage to contribute to the development of renewable and high-efficiency energy resources as defined by Minn. Stat. §216B.169.

In addition, customer bills under this rate are subject to the following adjustments and/or charges.

RIDER
A Voluntary Renewable Adjustment ("Adjustment") may be elected in blocks of 100 kWh or for the customer's entire monthly usage or for a single event. Each month the Adjustment will add **$3.53** per 100 kWh block of renewable usage and will be prorated on a kWh basis based on the customer's actual metered energy usage for the billing period not to exceed their subscription level. The Adjustment shall be applied to the customer's bill under the standard retail tariff each billing month according to the number of energy block(s) or total amount purchased. The Adjustment is not subject to the Fuel Clause Rider but is subject to any other applicable adjustments and surcharges, including city surcharge or sales tax. The Voluntary Renewable Adjustment will appear on the bill as "Windsource Program." Amounts collected pursuant to the Adjustment will be expended on a program, filed with the Commission, to develop renewable and high efficiency energy resources.

DETERMINATION OF VOLUNTARY RENEWABLE ADJUSTMENT
The Voluntary Renewable Adjustment shall be calculated by dividing the recoverable program expenses and annual tracker balance by the forecasted renewable energy for a designated recovery period. The recoverable program expenses include renewable energy purchases, marketing, other costs and true up of tracker balance for this program. The Adjustment may be revised annually with approval of the Minnesota Public Utilities Commission.

FORECASTED RENEWABLE ENERGY
Forecasted renewable energy sales shall be the estimated total Windsource MWh sales for the designated annual tracker recovery period.

TRACKER ACCOUNT
Due to the variability of renewable resources, the Windsource program may have an excess or shortage of supply in any given hour but will approximately balance out during the year. The Company will maintain accounting of the monthly balance of total revenues collected under the Adjustment and the expenses associated with offering this Adjustment, including the renewable energy purchases, marketing and other costs for this program. The Company may petition the Commission annually to true up the tracker balance in its November 1st report.

VOLUNTARY RENEWABLE AND HIGH-EFFICIENCY ENERGY PURCHASE (WINDSOURCE PROGRAM) RIDER (Continued)

Section No. 5
6th Revised Sheet No. 134.1

TERMS AND CONDITIONS OF SERVICE

1. A customer may elect to subscribe either by purchasing a specified number of 100 kWh blocks or the customer's entire usage. The minimum subscription to be billed each month is one 100 kWh block. In the event a customer's metered energy usage results in the partial consumption of a 100 kWh block, the charge on that block will be prorated accordingly.

2. The minimum subscription periods are one year for residential customers and three years for non-residential customers. After the minimum period, a customer may continue to subscribe on a month to month basis and may terminate the customer's subscription with a 30-day notice.

3. The Company will submit reports to the Commission each May 1 and November 1, or as otherwise ordered in relation to the tracker accounting.

4. For customers on time of day tariffs, their Windsource usage and any excess, non-Windsource usage shall both be assigned to the on-peak and off-peak periods in proportion to the customer's total billing period on-peak and off-peak usage.

5. Xcel Energy may in its discretion allow a non-Windsource customer a limited subscription to Windsource to apply the Adjustment to the energy used by a single event or series of events without making a long-term purchase commitment.

6. The discounts under Residential Controlled Air Conditioning and Water Heating Rider and Commercial and Industrial Controlled Air Conditioning Riders are not applicable to the charges under this Rider.

7. This Rider is provided to satisfy the conditions of Minn. Stat. §216B.169, subd.2 related to renewable and high-efficiency energy rate options. The sales arrangements of renewable energy from the Windsource program supplies are such that the power supply is sold only once to retail customers.

Northern States Power Company, a Minnesota corporation
Minneapolis, Minnesota 55401
MINNESOTA ELECTRIC RATE BOOK - MPUC NO. 2

WAPA BILL CREDITING PROGRAM RIDER Section No. 5
5th Revised Sheet No. 135

AVAILABILITY
This rider is available on a voluntary basis and is limited to customers who are eligible for the Western Area Power Administration ("Western" or "WAPA") Bill Crediting Program.

TERM OF SERVICE
Service under this rider shall be for a period not less than 90 days.

PRICING METHODOLOGY
The WAPA Bill Credit shall be calculated as specified in the Commission approved Bill Crediting Agreement between the customer and the Company.

BILL DETERMINATION
The WAPA Bill Credit will be applied to the customer's standard monthly bill rendered after each monthly billing period.

SPECIAL PROVISIONS
1. Eligibility for the Program, and thus this Rider, is determined by the customer and Western, and not by Xcel Energy.

2. If there is a change in the legal identity of the customer receiving service under this Rider, credit under this Rider shall be terminated unless Xcel Energy, Western and the customer determine otherwise.

3. Changes are subject to the Agreement for Bill Crediting arrangements between Xcel Energy, Western and the customer, a copy of which is contained in Section 7 of this Electric Rate Book.

RULES AND REGULATIONS
Service under this Rider is subject to orders of the Minnesota Public Utilities Commission and to the General Rules and Regulations section of this Electric Rate Book.

Northern States Power Company, a Minnesota corporation
Minneapolis, Minnesota 55401
MINNESOTA ELECTRIC RATE BOOK - MPUC NO. 2

MERCURY COST RECOVERY RIDER

Section No. 5
8th Revised Sheet No. 136

APPLICATION
Applicable to bills for electric service provided under the Company's retail rate schedules.

RIDER
There shall be included on each customer's monthly bill a Mercury Cost Recovery (MCR) Rider adjustment which will be the MCR Adjustment Factor multiplied by the customer's monthly billing kWh for electric service. This MCR adjustment shall be calculated before city charges and sales tax.

DETERMINATION OF MERCURY COST RECOVERY FACTOR
The MCR Adjustment Factor shall be the average retail cost per kWh. The average retail cost per kWh shall be determined by the forecasted balance of the MCR Tracker Account plus the Mercury Costs divided by the forecast retail sales for the designated period. The MCR Adjustment Factor shall be rounded to the nearest $0.000001 per kWh.

The MCR Adjustment Factor may be adjusted with the approval of the Minnesota Public Utilities Commission (Commission). The MCR Adjustment Factor for each rate schedule is:

All Classes	$0.000000 per kWh

MERCURY COSTS
Recoverable mercury costs shall be the revenue requirements for the designated period including operation and maintenance (O&M) expenses associated with projects eligible for recovery under Minnesota Statute Sections 216B.68 to 216B.688 that are determined by the Commission to be eligible for recovery under this Mercury Cost Recovery Rider. A standard model will be used to calculate the total forecasted revenue requirements for eligible projects for the designated period that is determined by the Commission to be eligible for recovery under this MCR Rider.

FORECASTED RETAIL SALES
Forecasted Retail Sales shall be the estimated total retail electric sales for the designated recovery period.

MCR TRACKER ACCOUNT
For each designated true-up period, a true-up adjustment to the MCR Tracker Account will be calculated reflecting the difference between the MCR Adjustment recoveries and the actual expenditures for such period. The true-up adjustment shall be included in calculating the MCR Adjustment Factor effective with the start of the next designated recovery period.

The MCR Adjustment Factor includes a true-up of actuals as available for the previous recovery period and forecast information for the remainder of the recovery period. The Final true-up adjustment for a previous recovery period will be determined by October 1 of the following year, at which time the Company will record a Final adjustment to the MCR Tracker Account. All costs appropriately charged to the MCR Tracker Account shall be eligible for recovery through this rider.

PROVISION OF FORECAST DATA

To assist commercial and industrial customers in budgeting and managing their energy costs, the Company will annually make available on October 1st a 24-month forecast of the MCR Adjustment Factor applicable to demand billed C&I customers under this Rider. The forecast period begins January 1st of the following year. This forecast will be provided only to customers who have signed a protective agreement with the Company.

Northern States Power Company, a Minnesota corporation
Minneapolis, Minnesota 55401
MINNESOTA ELECTRIC RATE BOOK - MPUC NO. 2

ENVIRONMENTAL IMPROVEMENT RIDER Section No. 5
12th Revised Sheet No. 137

APPLICATION
Applicable to bills for electric service provided under the Company's retail rate schedules.

RIDER
There shall be included on each customer's monthly bill an Environmental Improvement Rider (EIR) adjustment. For all but demand-billed customers, the adjustment shall be the Full EIR Energy Adjustment Factor multiplied by the customer's monthly billing kWh for electric service. For demand-billed customers, the adjustment shall be the Reduced EIR Energy Adjustment Factor multiplied by the customer's monthly billing kWh for electric service, plus the EIR Demand Adjustment Factor multiplied by the customer's monthly kW billing demand. These EIR adjustments shall be calculated before city surcharge and sales tax.

DETERMINATION OF EIR ADJUSTMENT FACTORS
The Full EIR Energy Adjustment Factor shall be the quotient obtained by dividing the forecasted balance of the EIR Tracker Account by the forecasted retail sales for the calendar year. The Reduced EIR Energy Adjustment Factor shall be the Full EIR Energy Adjustment Factor multiplied by 50%. The EIR Demand Adjustment Factor shall be the difference between the Full and Reduced factors, multiplied by the class load factor of 53.27% and multiplied by 730 hours in an average month. All factors shall be rounded to the nearest $0.000001 per kWh. The EIR Adjustment Factors may be adjusted annually with approval of the Minnesota Public Utilities Commission (Commission). The EIR Adjustment Factors shall apply to bills rendered on and after January 1st of the year.

The EIR Adjustment Factor for each customer group may be adjusted annually. Each EIR Adjustment Factor shall apply to bills rendered on and after January 1 of the year. The EIR factor for each rate schedule is:

Non-Demand Customers	$0.000000 per kWh
Demand Customers	$0.000000 per kWh and $0.00 per kW

Recoverable EIR Costs shall be the annual revenue requirements associated with emissions reduction projects (a) not recovered through base rates, (b) recorded in the EIR Tracker Account for the designated period, and (c) determined by the Commission to be eligible for recovery under this Rider pursuant to the terms of the Settlement Agreement approved by the Commission on March 8, 2004. A standard model will be used to calculate the total forecasted revenue requirements for eligible projects for the designated period. All costs appropriately charged to the EIR Tracker Account shall be eligible for recovery through this Rider, and all revenues recovered from the EIR Adjustment shall be credited to the EIR Tracker Account.

Forecasted retail sales shall be the estimated retail electric sales for the designated recovery period.

TRUE-UP

For each 12-month period ending December 31, a true-up adjustment to the EIR Tracker Account will be calculated reflecting the difference between the EIR Adjustment recoveries and the revenue requirements for such period. The true-up adjustment shall be calculated and recorded by no later than May 1 of the following calendar year and will be included in calculating the EIR Adjustment Factor for each customer group effective with the start of the next designated recovery period. No carrying cost shall be applied.

PROVISION OF FORECAST DATA

To assist commercial and industrial customers in budgeting and managing their energy costs, the Company will annually make available on October 1st a 24-month forecast of the EIR Adjustment Factors applicable to demand billed C&I customers under this Rider. The forecast period begins January 1st of the following year. This forecast will be provided only to customers who have signed a protective agreement with the Company.

BUSINESS INCENTIVE AND SUSTAINABILITY RIDER Section No. 5
2nd Revised Sheet No. 139

AVAILABILITY
Available to new or existing demand-metered commercial and industrial customers with significant new Qualified Billing Demand. Service under the Rider is limited to customers whose application for service under the Rider is approved by the Company.

RATE
The rates and provisions of the customer's regular demand-metered rate schedule shall apply except monthly demand charges for customer's Qualified Billing Demand, before the application of voltage discounts, shall be reduced as follows:

Years:	1 - 3	4	5	6
Percent Reduction:	40%	20%	10%	0%

QUALIFIED BILLING DEMAND
The portion of the customer's billing demand that qualifies for reduced demand charges. Qualified billing demand includes billing demands for standard demand, on-peak period demand, firm demand and controllable demand. Qualified billing demand does not include billing demands for off-peak period demand, distribution demand, transmission and distribution demand, contracted standby demand or contracted supplemental demand.

New Customers. This Rider is available for new load that is associated with initial permanent service. For new Customers, the Qualified Billing Demand under this Rider must be a minimum of 350 kW at a single delivery point. The demand charge reduction shall not apply during any month in which the Qualified Billing Demand is below 350 kW; provided, however, the demand charge reduction shall apply during any month in which the Qualified Billing Demand is below 350 kW as a consequence of new conservation or load control by the customer.

Existing Customers. For existing customers, Qualified Billing Demand is the new load of 350 kW or greater at a single delivery point incremental to that existing prior to approval for service under this Rider. The demand charge reduction shall not apply during any month in which the Qualified Billing Demand is below 350 kW; provided, however, the demand charge reduction shall apply during any month in which the Qualified Billing Demand is below 350 kW as a consequence of new conservation or load control by the customer.

NEW CUSTOMERS
To be considered a new customer for the purpose of this Rider, an applicant must demonstrate one of the following:
1. That business has not been conducted at the premises for at least three monthly billing periods prior to application,
2. That the predecessor customer is in bankruptcy and the applicant has obtained the business in a liquidation of assets sale; or
3. Customer's activities are largely or entirely different in nature from that of the previous customer.

Minneapolis, Minnesota 55401
MINNESOTA ELECTRIC RATE BOOK - MPUC NO. 2

BUSINESS INCENTIVE AND SUSTAINABILITY RIDER Section No. 5
(Continued) 2nd Revised Sheet No. 140

EXISTING CUSTOMERS
Existing customers who materially increase their use of electric service may qualify for service under this Rider, provided such material increase is the result of the addition of equipment, or expansion of the customer's facility or operations. The customer shall notify the Company in writing and document the basis for the material increase in its use of electric service. Following such notification, the Company will review the customer's monthly billing demands. If the billing demands for each of the next three consecutive months exceed that from the comparable monthly period of the preceding year by at least 350 kW at one delivery point, the customer will be eligible thereafter to receive service under this Rider. If a customer's activities are very similar to the customer's previous activities, then the customer is considered to be an existing customer whether or not the owner(s) operator(s), or manager(s) are substantially different.

APPLICATION
As a condition of qualifying for a discount, Customer must make an application on a Commission approved form demonstrating that it meets the Qualified Billing Demand requirement. Information related to the Qualified Billing Demand and Investment is trade secret information under the Minnesota Government Data Practices Act ("Act").

RIGHT TO REFUSE SERVICE
The Company reserves the right to refuse applicants for service under this Rider if it determines that significant additional capital expenditures will be required to provide service to that applicant. In such cases, an applicant may be able to qualify for service by making a non-refundable contribution to compensate for the significant additional capital costs incurred by the Company to supply service to the applicant.

ENERGY EFFICIENCY
For service taken on this Rider, the Company will conduct an energy audit and inform the customer of the conservation programs available from the Company. Customer will be responsible for some portion of the cost of the energy audit. Customer must also participate in the Company's Energy Assistance Design program or other energy efficiency program.

ELECTRIC SERVICE AGREEMENT
Any customer taking service under this Stimulation Rider shall execute an Electric Service Agreement, or amend their existing Electric Service Agreement, with the Company for a period of six years beginning on the effective date on which the customer commences taking service under this Rider. Such Electric Service Agreements (new or amended) shall state the increased or new load level of the customer as well as the customer's obligation to continue to purchase all of their electric power and electric energy from the Company during the term of the agreement. The effective date of service under this rider will be set forth in the Electric Service Agreement but not before three months of qualified billing demand has occurred after the application. The Electric Service Agreement entered into pursuant to this Agreement and provision of the discount is not subject to Commission Approval.

REPORTING REQUIREMENT
No later than 30 days after the Company signs a new ESA with a customer to be served under the BIS Rider, the Company must file with the Commission a report showing the incremental revenues and the incremental costs associated with the new ESA. If no party objects to the ESA within 30 days of the filing date, the ESA is deemed to be approved. One year from the effective date of this tariff, and annually thereafter, the Company shall file a report with the Commission identifying the number of customers receiving service under this Rider and the associated incremental additional revenues received by the Company and the incremental additional costs experienced by the Company.

REVENUE RECOVERY
The Company, within a general rate case, is allowed to seek recovery of the difference between the applicable commercial and industrial tariff and this Rider times the usage level during the test year period.

STATE ENERGY POLICY RATE RIDER Section No. 5
15th Revised Sheet No. 142

APPLICATION
Applicable to bills for electric service provided under the Company's retail rate schedules.

RIDER
There shall be included on each customer's monthly bill a State Energy Policy Rate Rider which shall be the applicable State Energy Policy Rate Rider factor multiplied by the customer's monthly kWh electric consumption.

DETERMINATION OF STATE ENERGY POLICY RATE FACTOR
The applicable State Energy Policy Rate Rider shall be the quotient obtained by dividing the annual State Energy Policy Tracker amount by the annual forecasted kWh sales. The factor may be adjusted annually with approval of the Minnesota Public Utilities Commission.

Residential	$0.000000 per kWh
Commercial	$0.000000 per kWh

Recoverable State Energy Policy Rate Expense
All costs appropriately charged to the State Energy Policy Tracker account shall be eligible for recovery through this Rider, and all revenues received from the State Energy Policy adjustment portion of the Resource Adjustment shall be credited to the State Energy Policy Tracker account.

PROVISION OF FORECAST DATA
To assist commercial and industrial customers in budgeting and managing their energy costs, the Company will annually make available on March 1st a 24-month forecast of the State Energy Policy Rate Factor applicable to demand billed C&I customers under this Rider. The forecast period begins January 1st of the following year. This forecast will be provided only to customers who have signed a protective agreement with the Company.

RENEWABLE DEVELOPMENT FUND RIDER

Section No. 5
22nd Revised Sheet No. 143

APPLICATION
Applicable to bills for electric service provided under the Company's retail rate schedules.

RIDER
There shall be included on each customer's monthly bill a Renewable Development Fund charge that shall be the applicable Renewable Development Fund factor multiplied by the customer's monthly kWh electric consumption.

DETERMINATION OF RENEWABLE DEVELOPMENT FUND FACTOR
The applicable Renewable Development Fund factor shall be the quotient obtained by dividing the annual Renewable Development Fund Tracker amount by the annual forecasted kWh sales. The factor may be adjusted annually with approval of the Minnesota Public Utilities Commission.

Residential	$0.001357 per kWh	R
Commercial	$0.001357 per kWh	R

Recoverable Renewable Development Fund Expense
All costs appropriately charged to the Renewable Development Fund Tracker account shall be eligible for recovery through this Rider, and all revenues received from the Renewable Development Fund portion of the Resource Adjustment shall be credited to the Renewable Development Fund Tracker account.

PROVISION OF FORECAST DATA
To assist commercial and industrial customers in budgeting and managing their energy costs, the Company will annually make available on October 1st a 24-month forecast of the Renewable Development Fund Factor applicable to demand billed C&I customers under this Rider. The forecast period begins January 1st of the following year. This forecast will be provided only to customers who have signed a protective agreement with the Company.

EXEMPTION
For customer premises recognized by the Company as not being subject to any of the costs of satisfying the solar energy standard under Minn. Stat. § 216B.1691, subd. 2f ("SES Costs"), the SES Costs reflected in the Renewable Development Fund charge assessed to the accounts associated with these premises may be credited to these accounts, and the dollar amount of these credits shall be added as part of the annual Renewable Development Fund Tracker applicable to the time period when the credit is issued.

TRANSMISSION COST RECOVERY RIDER Section No. 5
13th Revised Sheet No. 144

APPLICATION
Applicable to bills for electric service provided under the Company's retail rate schedules.

RIDER
There shall be included on each customer's monthly bill a Transmission Cost Recovery (TCR) adjustment, which shall be the TCR Adjustment Factor multiplied by the customer's monthly billing energy or demand for electric service as described below. This TCR Adjustment shall be calculated before city surcharge and sales tax.

DETERMINATION OF TCR ADJUSTMENT FACTORS
A separate TCR Adjustment Factor shall be calculated for the following four customer groups: (1) Residential, (2) Commercial Non-Demand, (3) Demand Billed, and (4) Street Lighting. The TCR Adjustment Factor for each group shall be the value obtained by multiplying each group's weighting factor by the average retail cost per kWh. The average retail cost per kWh shall be determined by the forecasted balance of the TCR Tracker Account, divided by the forecasted retail sales for the calendar year. The Demand Billed customers' TCR Adjustment Factor is calculated similarly, but the resulting per kWh charge is converted to a per kW charge for application to billed kW rather than billed kWh. TCR Adjustment Factors shall be rounded to the nearest $0.000001 per kWh or $0.001 per kW.

The TCR Adjustment Factor for each customer group may be adjusted annually with approval of the Minnesota Public Utilities Commission (Commission). Each TCR Adjustment Factor shall apply to bills rendered subsequent to approval by the Minnesota Public Utilities Commission. The TCR factor for each rate schedule is:

Residential	$0.003503 per kWh
Commercial (Non-Demand)	$0.003384 per kWh
Demand Billed	$1.017 per kW

Recoverable Transmission Costs shall be the annual revenue requirements for transmission costs associated with transmission projects eligible for recovery under Minnesota Statute Sections 216B.1645 or 216B.16, subd. 7b that are determined by the Commission to be eligible for recovery under this Transmission Cost Recovery Rider. A standard model will be used to calculate the total forecasted revenue requirements for eligible projects for the designated period. All costs appropriately charged to the Transmission Tracker Account shall be eligible for recovery through this Rider, and all revenues recovered from the TCR Adjustment shall be credited to the Transmission Tracker Account.

Forecasted retail kWh sales and kW demands shall be those for the designated recovery period.

(Continued on Sheet No. 5-145)

Northern States Power Company, a Minnesota corporation
Minneapolis, Minnesota 55401
MNNESOTA ELECTRIC RATE BOOK - MPUC NO. 2

TRANSMISSION COST RECOVERY RIDER Section No. 5
(Continued) 5th Revised Sheet No. 145

TRUE-UP

For each 12-month period ending December 31, a true-up adjustment to the Tracker Account will be calculated reflecting the difference between the TCR Adjustment recoveries and the revenue requirements for such period. The total retail true-up adjustment shall be calculated and recorded by no later than May 1 of the following calendar year and will be included in average retail cost used to calculate the TCR Adjustment Factor for each customer group effective with the start of the next designated recovery period.

For example, the Year 1 revenue requirements versus TCR Adjustment recoveries would be determined by May 1 of Year 2, at which time the Company would record an adjustment to the Tracker Account. The difference between the Year 1 revenue requirements and Year 1 TCR Adjustment recoveries would be included in the calculation of the TCR Adjustment factors filed on September 1 of Year 2 to be effective January 1 of Year 3.

PROVISION OF FORECAST DATA

To assist commercial and industrial customers in budgeting and managing their energy costs, the Company will annually make available on September 1st a 24-month forecast of the TCR Adjustment Factor applicable to demand billed C&I customers under this Rider. The forecast period begins January 1st of the following year. This forecast will be provided only to customers who have signed a protective agreement with the Company.

RENEWABLE ENERGY STANDARD RIDER Section No. 5
10th Revised Sheet No. 146

APPLICATION
Applicable to bills for electric service provided under the Company's retail rate schedules.

RIDER
There shall be included on each customer's monthly bill a Renewable Energy Standard (RES) adjustment which will be the RES Adjustment Factor applied to:

1. Customer, Energy, Demand and Minimum Charges
2. Energy Charge Credits
3. Limited Energy Surcharges
4. Controllable Demand Credits
5. Voltage Discounts
6. Lighting Rates per Luminaire and Lighting Rates per Unit
7. Siren Service Rate per Horsepower
8. Residential Controlled Air Conditioning and Water Heating Discounts (Energy and Fuel Cost Charges)
9. Commercial and Industrial Controlled Air Conditioning Credits
10. Standby Service Rider
11. Supplemental Service Rider
12. Tier 1 Energy Controlled Service Rider
13. Tier 1 Peak Controlled Short Notice Rider
14. Area Development Rider
15. Fixed Charges for Low Wattage Unmetered Devices

The RES Adjustment Factor does not apply to:

1. Fuel Clause Rider
2. Conservation Improvement Program Rider
3. Off Season Load Rider
4. Revenue Decoupling Mechanism Rider
5. Competitive Response Rider
6. City Requested Facilities Surcharge Rider
7. Windsource Program Rider
8. WAPA Bill Credit Program Rider
9. Mercury Cost Recovery Rider
10. Environmental Improvement Rider
11. Business Incentive and Sustainability Rider
12. State Energy Policy Rate Rider
13. Renewable Development Fund Rider
14. Transmission Cost Recovery Rider
15. Renewable Energy Standard Rider
16. Net Energy Billing Service
17. Late Payment Charge
18. Any currently applicable Interim Rate Surcharge Rider
19. Low Income Program Surcharge
20. Low Income Discounts

This RES adjustment shall be calculated before city surcharge and sales tax.

RENEWABLE ENERGY STANDARD RIDER (Continued)

Section No. 5
12th Revised Sheet No. 147

DETERMINATION OF RES ADJUSTMENT FACTOR

The Renewable Energy Standard ("RES") Adjustment Factor shall be the RES annual forecasted revenue requirement as a percentage of "base" revenues. The RES annual forecasted revenue requirement shall be the sum of the Renewable Energy Standard Costs for the forecast period and any residual Tracker balance in the RES Tracker Account.

The RES Adjustment Factor may be adjusted with the approval of the Minnesota Public Utilities Commission (Commission). The RES Factor is:

All Classes	0.497%

RENEWABLE ENERGY STANDARD COSTS

The RES Costs shall be the annual revenue requirements including operation and maintenance (O&M) expenses for Company owned Renewable Energy Project costs and capacity related renewable energy purchased power costs not recoverable through the FCR, that are eligible for recovery under Minnesota Statute Section 216B.1645. A standard model will be used to calculate the total forecasted revenue requirements for each annual period that is determined by the Commission to be eligible for recovery under this Renewable Energy Standard Rider.

RES TRACKER ACCOUNT

For each annual true-up period, a true-up adjustment to the RES Tracker Account (residual Tracker balance) will be calculated reflecting the difference between the RES Adjustment recoveries and the actual expenditures for such period. The true-up adjustment shall be included in calculating the RES Adjustment Factor effective with the start of the next annual recovery period.

The RES Adjustment Factor includes a true-up of actuals as available for the previous recovery period and forecast information for the remainder of the recovery period. The Final true-up adjustment for a previous recovery period will be determined by September 1 of the following year, at which time the Company will record a Final adjustment to the RES Tracker Account.

All costs appropriately charged to the RES Tracker Account shall be eligible for recovery through this rider.

PROVISION OF FORECAST DATA

To assist commercial and industrial customers in budgeting and managing their energy costs, the Company will annually make available on September 1st a 24-month forecast of the RES Adjustment Factor applicable to demand billed C&I customers under this Rider. The forecast period begins January 1st of the following year. This forecast will be provided only to customers who have signed a protective agreement with the Company.

Northern States Power Company, a Minnesota corporation
Minneapolis, Minnesota 55401
MINNESOTA ELECTRIC RATE BOOK - MPUC NO. 2

VOLUNTARY RENEWABLE*CONNECT PILOT PROGRAM RIDER
Section No. 5
Original Sheet No. 149

AVAILABILITY N

The Voluntary Renewable*Connect™ ("R*C") Pilot program will be available, subject to capacity made available within the program, to any customer who elects to participate in the program that would otherwise receive service under a rate schedule that is subject to the adjustments provided for in the Fuel Clause Rider.

DEFINITIONS

The following definitions apply:

"Applicable Retail Electric Usage" means the measured retail electric usage of the Customer on the account(s) during the monthly billing cycle for the Customer's premises identified in the Service Agreement as being associated with the Customer's subscription to the R*C Service.

"R*C Adjustment" means the product resulting from the multiplication of the R*C Price by the Subscription Level.

"R*C Price" means the price as shown in the Rate section below.

"R*C Resources" for this pilot program means portions of renewable sources applicable to the R*C Service.

"R*C Service" means the service offered under this Voluntary Renewable*Connect Pilot Program Rider.

"Service Agreement" means the tariffed service agreement associated with the R*C Service which the Customer signs.

"Subscription Level" means the Customer's allocated share set forth in the Service Agreement, in kWh, of the energy from the R*C Resources. The Subscription Level is a blend of renewable resources.

RIDER

Customer may elect to receive R*C Service. The following types of R*C Service are available ("R*C Service Type") in the following billing methods ("R*C Billing Method"):

R*C Service Types	R*C Billing Methods
Month-to-Month	100 kWh Blocks
5 Years	Entire Monthly Usage
10 Years	Single Event Usage
Single Event	

Each billing month the R*C Price associated with the R*C Service Type chosen by the Customer will be applied to the Subscription Level chosen by the Customer, the product of the R*C Price and Subscription Level being the R*C Adjustment. Customers receiving R*C Service shall not be subject to the Minnesota Electric Fuel Clause Rider for the portion of its Applicable Retail Electric Usage that is less than or equal to the Customer's Subscription Level. All usage shall be subject to any other applicable adjustments and surcharges, including city surcharge or sales tax. The cost to the Customer for participating in the R*C Service will appear on the Customer's retail electric bill.

DETERMINATION OF R*C PRICE

The R*C Price shall be calculated as follows: for the month-to-month and single event R*C Service Type, pricing will be based on the partially levelized delivered cost of the R*C Resources, adjusted for capacity credits and neutrality charges, plus recoverable program expenses. For the 5-year and 10-year R*C Service Types, pricing shall be based on the actual delivered cost of the R*C Resources, adjusted for capacity credits and neutrality charges, plus recoverable program expenses. Recoverable program expenses include renewable energy purchases, marketing, and other costs approved by the Minnesota Public Utilities Commission ("Commission"). The R*C Price for the month-to-month R*C Service Type may be revised annually with approval of the Commission. N

VOLUNTARY RENEWABLE*CONNECT PILOT PROGRAM Section No. 5
RIDER (Continued) 3rd Revised Sheet No. 150

RATE
The R*C Price for the pilot phase R*C Resources of each R*C Service Type shall be as follows based on year of production, unless otherwise provided for in this tariff:

Month-To-Month R*C or Single Event R*C Service Type	
Year number	$/kWh
2 (2018)	$0.03577
3 (2019)	$0.03599

DL
LN

5-Year and 10-Year R*C Service Type

Year	5-Year Contract ($/kWh)	10-Year Contract ($/kWh)
2017	$0.03243	$0.03193
2018	$0.03280	$0.03230
2019	$0.03317	$0.03267
2020	$0.03330	$0.03280
2021	$0.03345	$0.03295
2022	$0.03361	$0.03349
2023	$0.03429	$0.03404
2024	$0.03497	$0.03460
2025	$0.03569	$0.03519
2026	$0.03642	$0.03580

NEUTRALITY CHARGE
The R*C Price includes a neutrality charge to mitigate the impact of the R*C Pilot program on non-participating customers. The standard neutrality charge is as follows:

Year number	$/kWh
2 (2018)	$0.00477
3 (2019)	$0.00483

DL
LN

Customers receiving service under the Company's Business Incentive and Sustainability Rider, Competitive Response Rider, Residential Electric Vehicle Service (Rate Code A08), or Residential Electric Vehicle Pilot Service (Rate Code A80, A81) shall not be subject to the neutrality charge portion of the R*C Price.

TRACKER ACCOUNT
Due to the variability of renewable resources, the Renewable*Connect program tracker account may have an excess or shortage of supply in any given hour or month. The Company will balance Renewable*Connect program usage at the end of the program year in accordance with the expected resource blend. As a result, the program may require more or less of a share of the expected program allocation. Energy produced by the R*C Resources that is not associated with any R*C Service subscription and therefore not allocated to an R*C Customer will be sold to all customers at the delivered cost through the Fuel Clause Adjustment. The Company will maintain accounting of the monthly balance of total R*C Resources production, total program usage, total revenues collected under the program and the expenses associated with offering the R*C Service, including the renewable energy purchases, marketing and other costs for this program. The Company may petition the Commission annually to true up the marketing and administrative cost tracker balance and apply the resulting true-up factors to the Month-To-Month R*C Price.

MINNESOTA ELECTRIC RATE BOOK - MPUC NO. 2

VOLUNTARY RENEWABLE*CONNECT PILOT PROGRAM Section No. 5
RIDER (Continued) 1st Revised Sheet No. 151

TERMS AND CONDITIONS OF SERVICE

1. Any Customer enrolling in this R*C Service shall execute the Service Agreement with the Company. The effective date of such service, and the Customer's Subscription Level, will be set forth in the Service Agreement. A Customer's ability to continue receiving this R*C Service terminates upon the termination of the Service Agreement.

2. A Customer may elect to subscribe by: (i) purchasing a specified number of 100 kWh blocks; (ii) the Customer's entire Applicable Retail Electric Usage; or (iii) the Customer's entire Retail Electric Usage for a special event; provided, however, that in no event shall the customer's total Subscription Level exceed 10% of the total expected average output of the available R*C Resources.

2a. Limited Exception to Subscription Level. Customers who subscribe to the first tranche of resources approved for the Renewable*Connect Pilot Program may purchase a total Subscription Level from the first tranche without limitation. N N N

3. Unless otherwise agreed to by the Company, for a Customer electing to receive the R*C Service by the 100 kWh Blocks R*C Billing Method, the Subscription Level shall be set so that when combined with other distributed generation resources serving the premises designated in the Service Agreement the subscription size does not exceed one hundred (100) percent of the previous annual (12-month) consumption of electric energy by Customer at Premises. If twelve (12) months of historical electric energy consumption data is not available for a particular Customer Premise, the Company will calculate the estimated annual electric energy consumption as follows: if there is less than twelve (12) months but four (4) months or more of consumption history, the average monthly consumption is multiplied by twelve (12) to figure the yearly consumption. In cases where there is less than four (4) months of consumption history, home usage is estimated based on the historical average energy use of homes of a similar size. Homes are assumed to have central A/C, electric appliances, and natural gas water and space heating. For commercial properties and all properties over 4,500 square feet with less than four (4) months of consumption history, the Customer must submit an energy audit (HERS Rating or similar) or load calculations for the property stating the estimated annual consumption. Load calculations must be documented and sent to the Renewable*Connect Program Manager for approval. The compliance check by the Company with this 100% rule will be performed once at the beginning of a subscription and later only if the Customer changes his or her subscription size or relocates to a new premise. In the event a customer's Applicable Retail Electric Usage in a given billing month results in the partial consumption of a 100 kWh Block, the charge on that partial block will be prorated accordingly.

4. For a Customer electing to receive its entire Applicable Retail Electric Usage pursuant to the R*C Service, Xcel Energy reserves the right to provide system energy in any given billing month for any portion of the Customer's Applicable Retail Electric Usage that exceeds its monthly average usage (calculated as the actual or estimated 12-month annual electric energy consumption described in paragraph 3, divided by 12).

MINNESOTA ELECTRIC RATE BOOK - MPUC NO. 2

VOLUNTARY RENEWABLE*CONNECT PILOT PROGRAM Section No. 5
RIDER (Continued) 1st Revised Sheet No. 152

TERMS AND CONDITIONS OF SERVICE (Continued)

5. A Customer's subscription period becomes effective on the first day of Customer's billing period immediately following the Company counter-signing the Service Agreement (but not before January 1, 2017). Subscription periods are month-to-month, 5 years and 10 years, or are for a designated Special Event. Any termination by the Customer ahead of the 5 year, 10 year or Special Event term shall be provided by notice by the Customer to the Company at least 30 days prior to the Termination Date. The Termination Date is the last day of the billing month following 30 days from Company receipt of the termination notice provided by the Customer. Month-to-month subscriptions shall continue until terminated by the customer, and shall end on the last day of the billing month following 30 days from Company receipt of the termination notice provided by the Customer. A Customer that terminates a 5-Year or 10-Year R*C Service prior to the completion of that 5-Year or 10-Year term shall be subject to an Early Termination Fee. The Early Termination Fee shall be equal to the customer's actual R*C Service usage for the 12-month billing period ending on the Termination Date multiplied by a per MWh amount of $10 (R*C Early Termination Fee Rate). If the Customer does not have at least 12 billing months of R*C Service usage, the anticipated 12-month R*C Service usage will be calculated as follows:
   a. For Customers choosing the 100 kWh Blocks R*C Billing Method, the number of 100 kWh Blocks subscribed will be multiplied by twelve (12).
   b. For Customers choosing the Entire Monthly Usage R*C Billing Method, the estimated annual (12-month) usage for the Customer using the methodology described in paragraph 3.

   This anticipated 12-month R*C Service usage will then be multiplied by the R*C Early Termination Fee Rate to determine the value of the Early Termination Fee.

6. Xcel Energy may cancel this R*C Service and any Service Agreement applicable to the R*C Service on written order from the Commission based on good cause shown. Additionally, Xcel Energy may, upon reasonable notice to a Customer, cancel any Service Agreement applicable to the R*C Service to assure that the Service Agreement does not extend beyond the term of this R*C Pilot Program. The term of this R*C Pilot Program ends on December 31, 2026. N N N N

7. The Company will submit reports to the Commission each April 1, or as otherwise ordered in relation to the tracker accounting.

8. For customers on time of day tariffs, their usage met by R*C Service and any excess usage not met by R*C Service shall both be assigned to the on-peak and off-peak periods in proportion to the Customer's total billing period on-peak and off-peak usage.

9. Xcel Energy may, in its discretion, allow customers to subscribe to the R*C Program on a limited basis for the energy used by a single event or series of events without making a long-term purchase commitment.

10. The discounts under Residential Controlled Air Conditioning and Water Heating Rider and Commercial and Industrial Controlled Air Conditioning Riders are not applicable to the charges under this Rider.

RIDER (Continued) Original Sheet No. 153

TERMS AND CONDITIONS OF SERVICE (Continued)

11. This Rider is provided to satisfy the conditions of Minn. Stat. §216B.169, subd. 2 related to renewable and high-efficiency energy rate options. The sales arrangements of renewable energy from the Renewable*Connect program supplies are such that the power supply is sold only once to retail customers.

12. The R*C Service shall only apply to the Applicable Retail Electric Usage of a Customer in excess of other renewable or other energy self-supplied by the Customer or supplied to the Customer by a different entity.

13. Any customer taking service under this Rider shall execute a Renewable*Connect Service Agreement. The effective date of service under this Rider will be set forth in the Service Agreement.

14. All R*C Resources are located in Minnesota. The Company shall assign to Customer, or retire on Customer's behalf, all renewable energy credits (RECs) associated with the Customer's Subscription Level for which the Customer has paid to the Company the applicable R*C Price. RECs assigned to Customer or retired on the Customer's behalf will not also be claimed by the Company as its renewable energy for other purposes.

VOLUNTARY RENEWABLE*CONNECT GOVERNMENT PILOT PROGRAM RIDER
Section No. 5
Original Sheet No. 154

AVAILABILITY

The Voluntary Renewable*Connect™ Government ("R*CG") Pilot Program will be available, subject to capacity made available within the program, to any political subdivision or agency customer that: (i) elects to participate in the program; (ii) would otherwise receive service under a rate schedule that is subject to the adjustments provided for in the Minnesota Electric Fuel Clause Rider; and (iii) has the equivalent of an Investment Grade Credit Rating or, if such rating is unavailable, has satisfactory creditworthiness as determined by Northern States Power Company in its reasonably exercised discretion. For purposes of this Rider, a political subdivision or agency means a regional, territorial, or local authority, such as a county or municipality (including a municipal corporation) that is created or recognized by statute or other authority to exercise sovereign powers and that has governing officers appointed by officials of a recognized political subdivision or that are publicly elected. As used in this Pilot Program, a political subdivision or agency includes the Minnesota Department of Administration and those State of Minnesota agencies it assists in administering. Investment Grade Credit Rating, for the purposes of this Rider, means a senior unsecured bond rating (unenhanced by third party support) assigned by Standard & Poors Rating Group (or its successor) of BBB- or higher and/or Moody's Investor Service Inc. (or its successor) of Baa3 or higher; provided, however, that if any senior unsecured bond rating (unenhanced by third party support) is exactly equivalent to BBB-/Baa3, the rated entity shall not be on credit watch by such rating agency, and, provided further, that if the ratings of S&P and Moody's are not equivalent, the lower rating shall apply.

N

DEFINITIONS

The following definitions apply:

(i) "Applicable Retail Electric Usage" means the measured retail electric usage of the Customer on the account(s) during the monthly billing cycle for the Customer's premises identified in the Service Agreement as being associated with the Customer's subscription to the R*CG Service.

(ii) "R*CG Adjustment" means the product resulting from the multiplication of the R*CG Price by the R*CG Energy.

(iii) "R*CG Energy" means the electric power, in kWh, from the R*CG Resources associated with the Customer's Subscription Level.

(iv) "R*CG Price" means the price as shown in the Rate section below.

(v) "R*CG Resources" for this pilot program means portions of renewable sources applicable to the R*CG Service.

(vi) "R*CG Service" means the service offered under this Voluntary Renewable*Connect-Government Pilot Program Rider.

(vii) "Service Agreement" means the tariffed service agreement associated with the R*CG Service which the Customer signs.

(viii) "Subscription Level" means the Customer's allocated share set forth in the Service Agreement, in MW, of the capacity from the R*CG Resources. The Subscription Level is a blend of renewable resources.

N

(Continued on Sheet No. 5-155)

Northern States Power Company, a Minnesota corporation
Minneapolis, Minnesota 55401
MINNESOTA ELECTRIC RATE BOOK - MPUC NO. 2

VOLUNTARY RENEWABLE*CONNECT GOVERNMENT PILOT PROGRAM RIDER (Continued)

Section No. 5
Original Sheet No. 155

RIDER

Customer may elect to receive R*CG Service. Under the R*CG Service, the Customer shall subscribe for a fixed amount of the capacity of the R*CG Resources. Each billing month, the R*CG Price will be applied to the Customer's R*CG Energy, the product being the R*CG Adjustment.

If the Customer's Applicable Retail Electric Usage is less than the R*CG Energy in any given billing month, then:

1. The Company will bill the Customer for the Customer's Applicable Retail Electric Usage based on the R*CG Price for that billing month;
2. The kWh surplus shall be carried over and applied to a subsequent billing month for the Customer.
3. Any such surplus may be carried over up to the day before the yearly anniversary of the Customer's Subscription Term as defined in the Service Agreement. If there is a positive kWh carry-over balance at the end of that day, the Customer shall incur a charge on its retail bill for that balance in kWh multiplied by the then-current R*CG Price along with a credit for the balance in kWh multiplied by the Net Resources Cost (defined as the resource cost less the current capacity credit). The accumulated Customer surplus then will be reduced to zero.

Customer receiving R*CG Service shall only be subject to the Minnesota Electric Fuel Clause Rider for the portion of its Applicable Retail Electric Usage that is greater than the Customer's R*CG Energy plus any applicable applied kWh surplus. All usage shall be subject to any other applicable adjustments and surcharges, including city surcharge or sales tax. The cost to the Customer for participating in the R*CG Service will appear on the Customer's retail electric bill.

DETERMINATION OF R*CG PRICE

The R*CG Price is based on the actual delivered cost of the R*CG Resources adjusted for capacity credits and neutrality charges, plus recoverable program expenses. Recoverable program expenses include renewable energy purchases, marketing, and other costs approved by the Minnesota Public Utilities Commission ("Commission").

N

RENEWABLE*CONNECT GOVERNMENT RESOURCES

The Renewable*Connect Government program will be supplied by R*CG Resources, which produce renewable energy as set forth in Minn. Stat. § 216B.169 (as the same may be amended or revised from time to time). The Customer's share of the output of the R*CG Resources is the "R*CG Energy".

The Company shall not be liable to the Customer in the event that the R*CG Energy is greater than or less than the Customer's Applicable Retail Electric Usage. The Customer assumes all production risk of the R*CG Resources.

To the extent the Company is not required to pay the operator of the R*CG Service because R*CG Resources are unavailable, then on a pro-rata basis the R*CG Energy level of the Customer shall be reduced while such resources are unavailable.

Minneapolis, Minnesota 55401
MINNESOTA ELECTRIC RATE BOOK - MPUC NO. 2

VOLUNTARY RENEWABLE*CONNECT GOVERNMENT PILOT PROGRAM RIDER (Continued)

Section No. 5
Original Sheet No. 157

TRACKER ACCOUNT

Customers enrolled in the R*CG Service subscribe to a fixed amount of the capacity of the R*CG Resources, which is the Customer's Subscription Level. The R*CG Resources are variable in nature and may produce more or less energy than the Customer's Applicable Retail Electric Usage. The Company shall apply the R*CG Price to the Customer's Applicable Retail Electric Usage up to the level of the R*CG Energy plus any applied kWh surplus from previous months. If the Customer's Applicable Retail Electric Usage in a given billing month is greater than the R*CG Energy plus unused kWh surplus, then to that extent the Customer's electric usage will be subject to the Minnesota Electric Fuel Clause Rider. The Company will balance the usage of R*CG Service Customers at the end of the program month and year with the actual output of the R*CG Resources over the same periods in accordance with the expected resource blend. Energy produced by the R*CG Resources that is not associated with any R*CG Service subscription and therefore not allocated to an R*CG Customer will be sold to all customers at the delivered cost through the Fuel Clause Adjustment.

The Company will maintain accounting of the monthly balance of total program production, total program usage, total revenues collected under the program and the expenses associated with offering the R*CG Service, including the renewable energy purchases, marketing and other costs for this program.

TERMS AND CONDITIONS OF SERVICE

1. Any Customer enrolling in this R*CG Service shall execute the Service Agreement with the Company. The effective date of such service, and the Customer's Subscription Level, will be set forth in the Service Agreement. A Customer's ability to continue receiving this R*CG Service terminates upon the termination of the Service Agreement.

2. Unless otherwise agreed to by the Company, a Customer's Subscription Level initially shall be set so that when combined with other distributed generation resources serving the premises designated in the Service Agreement the subscription size does not exceed one hundred (100) percent of the previous annual (12-month) consumption of electric energy by Customer at Premises to which the subscription is attributed (using a conversion factor based on expected production from the R*CG Resources). If twelve (12) months of historical electric energy consumption data is not available for a particular Customer premise, the Company will calculate the estimated annual electric energy consumption as follows: if there is less than twelve (12) months but four (4) months or more of consumption history, the average monthly consumption is multiplied by twelve (12) to figure the yearly consumption. In cases where there is less than four (4) months of consumption history, for commercial properties and all properties over 4,500 square feet with less than four (4) months of consumption history, the Customer must submit an energy audit (HERS Rating or similar) or load calculations for the property stating the estimated annual consumption. Load calculations must be documented and sent to the Renewable*Connect Government Program Manager for approval. The compliance check by the Company with this 100% rule will be performed once at the beginning of a subscription and later only if the Customer changes the Premise(s) associated with the Customer's Subscription Level.

VOLUNTARY RENEWABLE*CONNECT GOVERNMENT Section No. 5
PILOT PROGRAM RIDER (Continued) Original Sheet No. 158

3. Subscription periods become effective on the first day of Customer's billing period immediately following the Company counter-signing the Service Agreement (but not before January 1, 2017), and shall expire on December 31, 2035. Customers that terminate R*CG Service prior to the termination date in the Service Agreement shall be subject to an early termination fee (the "Early Termination Fee"). The Early Termination Fee shall be equal to the Subscription Level in kW multiplied by $20/kW. N

4. A Customer may assign all or part of its Subscription Level to one or more other accounts associated with other premises where it receives retail electric service from the Company and which otherwise qualify under this program under a process which the Company establishes for this.

5. Xcel Energy may cancel this R*CG Service and any Service Agreement applicable to the R*CG Service on written order from the Commission based on good cause shown.

6. The Company will submit reports to the Commission each April 1, for the prior calendar year, or as otherwise ordered in relation to the tracker accounting.

7. For Customers on time of day tariffs, their usage met by R*CG Service and any excess usage not met by R*CG Service shall both be assigned to the on-peak and off-peak periods in proportion to the Customer's total billing period on-peak and off-peak usage.

8. The discounts under Residential Controlled Air Conditioning and Water Heating Rider and Commercial and Industrial Controlled Air Conditioning Riders are not applicable to the charges under this Rider.

9. This R*CG Service shall only apply to the Applicable Retail Electric Usage of a Customer in excess of net metering or other renewable energy supplied by or for the Customer for the premises designated in the Service Agreement.

10. All R*CG Resources are located in Minnesota.

11. The Company shall assign to Customer, or retire on Customer's behalf, all renewable energy credits (RECs) associated with the Customer's R*CG Energy for which the Customer has paid to the Company the applicable R*CG Price. RECs assigned to Customer or retired on the Customer's behalf will not also be claimed by the Company as its renewable energy for other purposes. N

REPORT PERIOD ENDING: 2018

SCHEDULE 3. PART B.
DISTRIBUTION SYSTEM RELIABILITY DATA

Who is required to complete this schedule?

This schedule collects System Average Interruption Frequency Index (SAIFI) and System Average Interruption Duration Index (SAIDI) statistics. If your organization does not compute these indexes, answer 'no' to Question 1 and then skip to Schedule 4A. You do not have to complete any other part of this schedule 3B or 3C.

Should you complete Part B or Part C?

If your organization computes the SAIFI and SAIDI indexes and determines Major Event Days using the IEEE 1366-2003 or the IEEE 1366-2012 standard, answer 'YES' to Questions 1 and 2, and complete Part B. Then skip to Schedule 4A. (You do not complete Schedule 3, Part C.)

If your organization does not use the IEEE 1366-2003 or the IEEE 1366-2012 standard but calculates SAIDI and SAIFI indexes via other method, answer 'yes' to question 1 and 'no' to question 2 and complete Part C. Then go to Schedule 4A.

1	Do you calculate SAIDI and SAIFI by any method? If Yes, go to Question 2. If No, go to Schedule 4, Part A.	[x] Yes	[ ] No
2	Do you calculate SAIDI and SAIFI and determine Major Event Days using the IEEE1366-2003 standard or IEEEE-2012 standard? If Yes, complete Part B. If No, go to complete Part C.	[x] Yes	[ ] No

Part B: SAIDI and SAIFI in accordance with IEEE 1366-2003 standard or IEEE 1366-2012 standard

		State MN
3a.	SAIDI value including Major Event days	124.950
3b.	SAIDI value excluding Major Event days	95.020
4	SAIDI value including Major Event days minus loss of supply	118.780
5a.	SAIFI value including Major Event days	0.950
5b.	SAIFI value excluding Major Event days	0.880
6.	SAIFI value including Major Event days minus loss of supply	0.890
7.	Total number of customers used in these calculations	1,265,163.0
8.	What is the highest voltage that you consider part of the distribution system, as opposed to the supply system? (kV)	34.5
9.	Do you receive information about a customer outage in advance of a customer reporting it?	[x] Yes [ ] No

Thank You for completing this part. Skip Part C and go directly to Schedule 4 Part A.

7610.0600 F

US Department of Energy Energy Information Administration Form EIA-861	ANNUAL ELECTRIC POWER INDUSTRY REPORT	Form Approved OMB No. 1905-0129 Approved Expires 03/31/2020

SCHEDULE 3. PART B.
DISTRIBUTION SYSTEM RELIABILITY DATA

Who is required to complete this schedule?

This schedule collects System Average Interruption Frequency Index (SAIFI) and System Average Interruption Duration Index (SAIDI) statistics. If your organization does not compute these indexes, answer 'no' to Question 1 and then skip to Schedule 4A. You do not have to complete any other part of this schedule 3B or 3C.

Should you complete Part B or Part C?

If your organization computes the SAIFI and SAIDI indexes and determines Major Event Days using the IEEE 1366-2003 or the IEEE 1366-2012 standard, answer 'YES' to Questions 1 and 2, and complete Part B. Then skip to Schedule 4A. (You do not complete Schedule 3, Part C.)

If your organization does not use the IEEE 1366-2003 or the IEEE 1366-2012 standard but calculates SAIDI and SAIFI indexes via other method, answer 'yes' to question 1 and 'no' to question 2 and complete Part C. Then go to Schedule 4A.

1	Do you calculate SAIDI and SAIFI by any method? If Yes, go to Question 2. If No, go to Schedule 4, Part A.	[x] Yes	[ ] No
2	Do you calculate SAIDI and SAIFI and determine Major Event Days using the IEEE1366-2003 standard or IEEEE-2012 standard? If Yes, complete Part B. If No, go to complete Part C.	[x] Yes	[ ] No

Part B: SAIDI and SAIFI in accordance with IEEE 1366-2003 standard or IEEE 1366-2012 standard

		State	SD
3a.	SAIDI value including Major Event days		76.520
3b.	SAIDI value excluding Major Event days		58.570
4	SAIDI value including Major Event days minus loss of supply		66.670
5a.	SAIFI value including Major Event days		0.680
5b.	SAIFI value excluding Major Event days		0.480
6.	SAIFI value including Major Event days minus loss of supply		0.540
7.	Total number of customers used in these calculations		92,713.0
8.	What is the highest voltage that you consider part of the distribution system, as opposed to the supply system? (kV)		34.5
9.	Do you receive information about a customer outage in advance of a customer reporting it?	[x] Yes	[ ] No

Thank You for completing this part. Skip Part C and go directly to Schedule 4 Part A.

EIA861 ERROR LOG

Part		State	BA ID	Error No.	Error Description/Override Comment	Type	Override
6	D	MN	56669	6045	Commercial Meter counts (Line 5) cannot be less than Commercial Customers (4A+4C). Advanced Meters (AMR/AMI) or non-AMR/AMI - "Standard Meters" (Line 4) maybe be missing. Please provide revised data. The difference between meter count data by customer class on Schedule 6 of the Form 861 and customer count data by customer class on Schedule 4 of the Form 861 is due to reporting differences between the metering departments and the department that handles the customer count information. The metering departments have their information disaggregated with more detail by customer class (which also would encompass premise locations), whereas the department that handles customer count has the information only available by residential and C&I. In preparation of the Form 861, we do our best to split out commercial and industrial customer count data from the `C&I? bucket, but due to the fact that this customer count reporting is designed for our billing and FERC reporting and the metering data is at a much different level of detail, there are differences between the two.	W	
6	D	SD	0	6111	The number of Industrial customers with direct load control on line 8 cannot be greater than number of Industrial customers on 4A plus 4C. Please provide revised data. The difference between meter count data by customer class on Schedule 6 of the Form 861 and customer count data by customer class on Schedule 4 of the Form 861 is due to reporting differences between the metering departments and the department that handles the customer count information. The metering departments have their information disaggregated with more detail by customer class (which also would encompass premise locations), whereas the department that handles customer count has the information only available by residential and C&I. In preparation of the Form 861, we do our best to split out commercial and industrial customer count data from the `C&I? bucket, but due to the fact that this customer count reporting is designed for our billing and FERC reporting and the metering data is at a much different level of detail, there are differences between the two. MINNESOTA ELECTRIC UTILITY INFORMATION REPORTING - FORECAST SECTION

INSTRUCTIONS

These worksheet tabs correspond closely to the tables in the forecast instructions received by the utility.
The forecast instructions pertain to the data to be entered in each of the worksheet tabs.
PLEASE DO NOT CHANGE THE **NAME** OR **ORDER** OF ANY OF THE WORKSHEET TABS OR CHANGE THE NAME OF THIS WORKBOOK.

In general, the following color scheme is used on each worksheet:
Cells shown with a light green background correspond to headings for sections, columns, row, or individual fields on each worksheet tab.
Cells shown with a light yellow background require data to be entered by the utility.
Cells shown with a light brown background generally correspond to fields that are calculated from the data entered, or correspond to fields that are informational and not to be modified by the utility.

Each worksheet tab contains a section labeled "Comments" below the main data entry area.
You may enter any comments in that section to provide an explaination or clarification on the data entered; OR why data IS NOT being entered on the worksheet tab (for example: cells left blank).

Cells with automatic calculations (typically totals) are provided on some worksheets to assist with the accuracy of the data provided by the utility. It is recognized that there may be circumstances in which the data entered by the utility is more appropriate or accurate than the value in the corresponding automatically-calculated cell. If the value in the automatically-calculated cell does not match the value that your utility entered, please provide an explanation in the Comments area at the bottom of the worksheet tab.

Please complete the required worksheet tabs and save the completed workbook to your local computer.
Then attach the completed workbook to an email message, include your contact information, and send it to the following email address:
rule7610.reports@state.mn.us

If you have any questions please contact:
Anne Sell

MINNESOTA ELECTRIC UTILITY INFORMATION REPORTING - FORECAST SECTION (Continued)

7610.0500 TRANSMISSION LINES

Subpart 1. **Existing transmission lines**. Each utility shall report the following information in regard to each transmission line of 200 kilovolts now in existence:

A. a map showing the location of each line;
B. the design voltage of each line;
C. the size and type of conductor;
D. the approximate location of d.c. terminals or a.c. substations; and
E. the approximate length of each line in Minnesota.

Subpart 2. **Transmission line additions**. Each generating and transmission utility, as defined in part 7610.0100, shall report the information required in subpart 1 for all future transmission lines over 200 kilovolts that the utility plans to build within the next 15 years.

Subpart 3. **Transmission line retirements**. Each generating and transmission utility, as defined in part 7610.0100, shall identify all present transmission lines over 200 kilovolts that the utility plans to retire within the next 15 years.

	X		345 kV	Bundled 954 kcmil Hawk	ACSR/T2	A.C.	Huntley - Wilmarth *	2022	40-50

COMMENTS
Huntley - Wilmarth is a MTEP16 Approved Market Efficiency project in which the line mileage is estimated and may change depending on the routing process.

MINNESOTA ELECTRIC UTILITY INFORMATION REPORTING - FORECAST SECTION (Continu

7610.0600, item A. 24 - HOUR PEAK DAY DEMAND

Each utility shall provide the following information for the last calendar year:

A table of the demand in megawatts by the hour over a 24-hour period for:

1. the 24-hour period during the summer season when the megawatt demand on the system was the greatest; and
2. the 24-hour period during the winter season when the megawatt demand on the system was the greatest.

COMMENTS

REMEMBER TO SEND/UPLOAD THE FOLLOWING ATTACHMENTS:	
DO NOT INSERT THE ATTACHMENT INTO THIS WORKBOOK	
1	Each utility shall report the following information in regard to each transmission line of 200 kilovolts now in existence: a. a map showing the location of each line; b. the design voltage of each line; c. the size and type of conductor; d. the approximate location of d.c. terminals or a.c. substations; and e. the approximate length of each line in Minnesota. (pursuant to MN Rules Chapter 7610.0500 Subpart 1, Existing transmission lines)

When submitting this workbook and attachments, please following the file naming format of:

MINNESOTA ELECTRIC UTILITY ANNUAL REPORT (Continued)

7610.0600 OTHER INFORMATION REPORTED ANNUALLY (continued)

A utility shall provide the following information for the last calendar year:

E. RATE SCHEDULES	**The rate schedule and monthly power cost adjustment information must be submitted in electronic format.**

See Instructions for details of the information required on the Rate Schedules and Monthly Power Cost Adjustments.

F. REPORT FORM EIA-861	**A copy of report form EIA-861 filed with the US Department of Energy must be submitted in electronic format.**

A copy of the report form EIA-861 filed with the Energy Information Administration of the US Department of Energy must be submitted.

G. FINANCIAL AND STATISTICAL REPORT	**If applicable, a copy of the Financial and Statistical Report filed with the US Department of Agriculture must be submitted in electronic format.**

For rural electric cooperatives, a copy of the Financial and Statistical Report to the US Department of Agriculture must be submitted.

H. GENERATION DATA

If the utility has Minnesota power plants, enter the fuel requirements and generation data on the Plant1, Plant2, etc. worksheets.

I. ELECTRIC USE BY MINNESOTA RESIDENTIAL SPACE HEATING USERS

See Instructions for details of the information required for residential space heating users.

COLUMN 1 NUMBER OF RESIDENTIAL ELECTRICAL SPACE HEATING CUSTOMERS	COLUMN. 2 NUMBER OF RESIDENTIAL UNITS SERVED WITH ELECTRICAL SPACE HEATING	COLUMN 3 TOTAL MWH USED BY THESE CUSTOMERS AND UNITS
35,430	NA	417,199

MINNESOTA ELECTRIC UTILITY ANNUAL REPORT (Continued)

7610.0600 OTHER INFORMATION REPORTED ANNUALLY (continued)

ELECTRICITY DELIVERED TO ULTIMATE CONSUMERS IN MINNESOTA SERVICE AREA IN LAST CALENDAR YEAR

See Instructions for details of the information required concerning electricity delivered to ultimate consumers.
Exclude station use, distribution losses, and unaccounted for energy losses from this table altogether.

Classification of Energy Delivered to Ultimate Consumers (include energy used during the year for irrigation and drainage pumping)	This column reports the number of farms, residences, commercial establishments, etc., and not the number of meters, where different. Number of Customers at End of Year	This column total should equal the grand total in the worksheet labeled "ElectricityByCounty" which provides deliveries by county. Megawatt hours (round to nearest MWH)	This column total will be used for the Alternative Energy Assessment and should NOT include revenues from sales for resale (Minnesota Statutes, Section 216B.62, Subd. 5). Revenue ($)
Farm	NA	NA	NA
Non-Farm Residential	1,154,330	8,905,592	1,259,859,426
Commercial	132,981	13,225,312	1,381,657,732
Industrial	511	8,127,676	661,416,078
Street & Highway Lighting	5,207	113,974	24,029,120
All other	2,039	76,819	8,674,796
Entered Total	1,295,068	30,449,373	3,335,637,152
CALCULATED TOTAL	1,295,068	30,449,373	3,335,637,152

DEFINITIONS

Forced Outage Rate = (percentage)
$$\frac{\text{Hours Unit Failed to be Available X 100}}{\text{Hours Unit Called Upon to Produce}}$$
Note: Failure of a unit to be available does not include down time for scheduled maintenance.

Operating Availability = (percentage)
100 - Maintenance percentage - Forced Outage percentage
Note: Maintenance percentage is the number of hours of scheduled maintenance divided by 8,760.

Capacity Factor = (percentage)
$$\frac{\text{Total Annual MWH of Production X 100}}{\text{Accredited Capacity Rating (MW) of the Unit X 8,760}}$$

POWER PLANT AND GENERATING UNIT DATA REPORT 2018

INSTRUCTIONS: Complete one worksheet for each power plant
Scroll down below the data entry tables to see the ALLOWABLE CODES to be used for Unit Status, Unit Type, Energy Source, Fuel Type, and Unit of Measure fields
Scroll down below the ALLOWABLE CODES to see DEFINITIONS for Capacity Factor, Operating Factor and Forced Outage Rate.

A. PLANT DATA

PLANT NAME	Jim Falls Hydro Generating Statior	**PLANT ID**	85035
STREET ADDRESS			
CITY	Jim Falls		
STATE	WI	**NUMBER OF UNITS**	3
ZIP CODE	54748		
COUNTY	Chippewa		
CONTACT PERSON	Will Mills		
TELEPHONE	303-571-7418		

B. INDIVIDUAL GENERATING UNIT DATA

Unit ID #	Unit Status *	Unit Type **	Year Installed	Energy Source ***	Net Generation (mwh)	Comments
1	USE	HC	1988	HYD	72,799.00	
2	USE	HC	1988	HYD	73,769.00	
3	USE	HC	1986	HYD	1,409.97	
				Plant Total	147,977.97	

C. UNIT CAPABILITY DATA

Unit ID #	CAPACITY (MEGAWATTS) Summer	Winter	Capacity Factor (%)	Operating Factor (%)	Forced Outage Rate (%)	Comments
1	12.30	12.30	28.08	100.00	0.00	
2	12.50	12.50	28.45	99.71	0.60	
3	0.20	0.20	26.83	34.27	0.00	
Plant Total	25.00	25.00				

D. UNIT FUEL USED

	PRIMARY FUEL USE				SECONDARY FUEL USE			
Unit ID #	Fuel Type ***	Quantity	Unit of Measure ****	BTU Content (for coal only)	Fuel Type ***	Quantity	Unit of Measure ****	BTU Content (for coal only)
1	HYD

RE: NORTHERN STATES POWER COMPANY
BIENNIAL TEN-YEAR PLAN

Dear Mr. Nitschke:

In accordance with Section 49-22-04 of the North Dakota Century Code, Northern States Power Company, doing business as Xcel Energy, hereby submits 10 copies of its Annual Ten-Year Plan for Major Generation and Transmission Facilities in the state of North Dakota. The information contained in the report is in compliance with the rules and regulations of the North Dakota Public Service Commission, as well as the provisions of the Settlement Agreement in Case No. PU-10-657.

In compliance with section 69-06-02-02, notice of the filing has been given to each state agency and officer entitled to notice as designated in section 69-06-01-05. A service list is attached.

Please feel free to contact me at dave.sederquist@xcelenergy.com or (701) 241-8632 if you have any questions regarding this report.

Sincerely,

David H. Sederquist

STATE OF NORTH DAKOTA
BEFORE THE
NORTH DAKOTA PUBLIC SERVICE COMMISSION

IN THE MATTER OF THE 2018 TEN-YEAR PLAN OF NORTHERN STATES POWER COMPANY, DOING BUSINESS AS XCEL ENERGY

TEN-YEAR PLAN

INTRODUCTION

Northern States Power Company, doing business as Xcel Energy with operations in North Dakota, (Xcel Energy or the Company) is pleased to submit our biennial Ten-Year Plan to the North Dakota Public Service Commission (Commission) in compliance with Section 49-22-04 of the North Dakota Century Code.

The NSP-Minnesota operating company (NSPM) has service territory in North Dakota, South Dakota, and Minnesota. NSP-Wisconsin (NSPW) has service territory in Wisconsin and Michigan. The Company operates the NSPM and NSPW generation and transmission as the NSP System. We presently serve approximately 92,000 retail electric customers in North Dakota around Fargo, Grand Forks, and Minot, and 54,000 natural gas customers in the Fargo and Grand Forks areas. The Company owns just over 430 miles of transmission lines and 20 substations (69kV and above) in North Dakota.

This Ten-Year Plan contains expanded information in compliance with the Settlement Agreement in Case No. PU-07-776 and Order points in Case Nos. PU-08-907 and PU-08-908 including:

- A summary of the major generation and transmission investments and purchase agreements we plan to pursue over the next 5 years; and
- A schedule of anticipated future applications for Advance Determination of Prudence (ADP) (Appendix B).
- A report of reductions in energy production at its base load generation units due to the existence of wind generation, and the impacts and costs of cycling coal plant production to accommodate off-peak wind generation (Appendix C).

I. ELECTRIC GENERATION FACILITIES

A. Existing Facilities

In this section, we describe the general location, size, and type of all facilities in North Dakota to be owned or operated by Xcel Energy during the next ten years, as well as those facilities to be removed from service during the ten-year period.

1. Border Winds Wind Facility.

The company owns and operates the 150 MW Border Winds wind facility near Rolla, North Dakota. The facility is comprised of 75 Vestas V100 2.0 MW turbines with variable pitch blades. The Border Winds footprint spans nearly 25,000 acres in the northeastern part of Rolette County. The plant went into service in December, 2015.

2. Courtenay Wind Facility.

The company owns and operates the 200 MW Courtenay wind facility north of Jamestown, North Dakota. The facility is comprised of 100 Vestas V100 2.0 MW turbines with variable pitch blades. The Courtenay facility spans nearly 25,000 acres in northeastern Stutsman County. The plant went into service in December, 2016.

3. Purchases of Power Produced in North Dakota.

In its previously filed 2016 Ten-year Plan, the Company reported that it had a Transmission Service Agreement (TSA) known as the "Stanton Displacement Agreement" in which 188 MW was supplied from Great River Energy's Stanton Unit, located in the vicinity of Stanton, North Dakota, for NSP's North Dakota loads. However, Great River Energy (GRE) retired the Stanton unit in 2017, and the TSA was terminated on October 22, 2017. FERC accepted the termination of the TSA in Docket No. ER17-2344-000.

Xcel Energy also has a twenty-year power purchase agreement (PPA), through January 18, 2026, with Acciona Wind Energy USA for energy supplied from its 11.88 MW Velva Windfarm located in McHenry County, North Dakota.

See Appendix A for a listing of *all* generating plants owned and operated by Xcel Energy that serve the Company's Upper Midwest (NSP) System.

B. Proposed Facilities – Next Five Years

In this section, we provide the locations of the preferred sites for all electric generating facilities tentatively planned to be constructed in North Dakota within the next five years. In addition, we provide brief summaries of key generation additions contemplated within the larger NSP System, per the terms of the Settlement in Case No. PU-07-776.

We note that the Company filed its 2016-2030 Upper Midwest Resource Plan (IRP) with the Minnesota Public Utilities Commission (MPUC) (Docket No. E002/RP-15-21) on January 2, 2015, and filed a substantive supplement on January 29, 2016. Copies of the plan and supplement were also filed with the North Dakota Commission (Case No. PU-15-019). The MPUC approved the IRP in October 2016.

The Company plans to file its next IRP on February 1, 2019. Our resource plan modeling includes a planning scenario based on meeting North Dakota requirements – specifically, the exclusion of environmental externalities, as required by N.D.C.C.§49-02-23, and removing energy-related mandates imposed on the Company by other states.

We propose to continue to fulfill our future NSP System electric generating resource needs through multiple resource acquisition processes including competitive bidding, Company ownership, PPAs, and demand side management.[1] This multi-pronged and flexible approach to resource acquisitions facilitates multiple generation technologies and locations.

North Dakota Generation

1. *Foxtail Wind.*

The Company is pursuing the addition of 1,850 MW of wind on its NSP System as a result of a comprehensive RFP issued in September 2016. As part of this portfolio, the Company is constructing a 150 MW wind facility in Dickey County on a 20,000 acre site about 20 miles west of Ellendale, North Dakota. It is anticipated that commercial operations will commence by September 2019.

[1] While the Company has included proposed resources in its Resource Plan, at this point there are no specific plans with sufficient information for listing in the Anticipated ADP Petitions table in Appendix B.

2. Clean Energy #1Wind.

As part of its 1,850 MW wind portfolio proposal, the Company has entered into a PPA with Allete Clean Energy (ACE) for the purchase of power from a 100 MW wind facility being constructed in Dickey County on a 20,000 acre site about 20 miles west of Ellendale, North Dakota. It is anticipated that commercial operations will commence by September 2019.

Other NSP System Generation

3. Other Projects in the 1,850 MW Wind Portfolio.

The Company solicited several wind projects through an RFP issued in September 2016. As a result, the Company is pursuing multiple wind resources as Power Purchase Agreements, Build-Own-Transfer agreements, and Company self-build projects, totaling 1,850 MW. In addition to the two projects in North Dakota, there are seven other sites located in South Dakota, and Minnesota. ADP's were filed for these projects with the Commission on March 29, 2017 in Case No. PU-17-120 and October 10, 2017 in Case No. PU-17-372. We submitted supplemental filings on May 18, 2018 and March 23, 2018, in each respective docket, that address the impacts of the Tax Cuts and Jobs Act (TCJA) on the costs of the propose wind projects. The dockets are still pending. Below is the list of wind projects located outside of North Dakota with commercial operation dates indicated.

Wind Farm	**Size**	**Location**	**COD**
Blazing Star I Wind Farm	200 MW	Hendricks, MN	2019
Blazing Star II Wind Farm	200 MW	Hendricks, MN	2020
Freeborn Wind Farm	200 MW	Glenville, MN	2020
Crowned Ridge Wind Farm	300 MW	Watertown, SD	2019
Crowned Ridge Purchase Agreement	300 MW	Watertown, SD	2019
Lake Benton Wind Farm	100 MW	Lake Benton, MN	2019
Dakota Range Wind Farm	300 MW	Watertown, SD	2021

4. Mankato Energy Center Unit 2.

In 2015, the Minnesota Commission approved a proposal made by the Calpine Corporation for the expansion of the Mankato Energy Center (MEC). The Company subsequently filed an ADP Application with the North Dakota Commission for 345 MW of capacity and associated energy to be added to the NSP System through a 20-year PPA with MEC in Case No. PU-15-96. On March 23, 2016, the Commission

dismissed our application without prejudice. Commercial operation is anticipated for 2nd Quarter 2019.

C. Proposed Facilities – Next 10 Years

At this time, specific plans for additional electric generation facilities in the State of North Dakota over the next 10 years include the 150 MW Foxtail wind energy facility and the 100 MW Clean Energy #1 PPA as previously discussed.

Additionally, on March 9, 2016, the Commission approved the First Revised Negotiated Agreement between the Company and Commission Advocacy Staff that included a commitment by the Company to build generation in North Dakota. Specifically, the terms of the agreement are as follows:

> *By the end of 2025, [the Company] will build or have located in eastern North Dakota a natural gas-fired electric generation facility with a capacity of at least 200 MW. The combustion turbine will be treated as an [Xcel Energy] System resource and its costs will be allocated to all states and customers served by the [Xcel Energy] System. If the combustion turbine is not in-service by December 31, 2025, [the Company] will refund to its North Dakota customers 50 percent of the revenues collected from North Dakota customers that exceed the revenues that would have been collected from January 1, 2016 through December 31, 2025 if North Dakota customers had paid an adjusted system average cost for fuel, and energy and associated capacity, for the six biomass PPAs identified in the Negotiated Agreement.* [2]

The Commission's March 9, 2016 Order also outlined the need for a long-term Resource Treatment Framework (RTF) to appropriately address resource energy policy differences in the states within the NSP System, which the Company was required to file with the Commission by January 1, 2017.[3] The Company filed its RTF proposal on December 31, 2016, consistent with the terms of the Negotiated Agreement. The RTF docket is still pending before the commission.

See Appendix B for a schedule of the pending and future ADP requests by the Company for generation resources.

---

Mayville-Hatton	768	69	14.8
Elk Valley-Larimore	776	69	1.7
Total 69 kV			**105.0**

B. Proposed Facilities – Next Five Years

In this section, we provide a brief description of significant transmission developments planned by the Company on its NSP System in North Dakota, which includes updates on previously proposed facilities.

1. Fargo Load Serving

NSPM's yearly planning assessments have indicated that the existing Fargo area 115 kV system and the 230-115 kV transformers are deficient in the ability to serve the load during double contingency conditions. NSPM performed the "Fargo Load Serving Study" to identify transmission plan to address these load serving deficiencies in this area, and determined that a five mile 115 kV line from Maple River substation to Red River substation would be the least cost option.

The facilities include building five miles of new 115 kV line from Maple River substation to Red River substation, and substation work at Maple River and Red River to accommodate the new line. The Commission approved our application for Red River-Maple River 2nd 115 kV line. The expected in-service date is by the end of 2019.

2. Minot Load Serving Plan

A joint study with Basin Electric Power Cooperative, Western Area Power Administration, and Central Power Electric Cooperative has been completed for the Minot Area. NSP is proposing to construct a new 20 mile 230 kV from GRE's existing McHenry substation to a new propose NSP 230/115 kV substation called Magic City. The new 230 kV will help offload the existing 115 kV lines in the area and provide additional transformation capacity and voltage support to the Minot area. The expected in-service date is the end of 2018.

C. Proposed Facilities – Next 10 Years

Xcel Energy participated in a large regional Multi Value Project (MVP) study with Midcontinent Independent System Operator (MISO) to determine what large regional transmission build-outs would be necessary to increase the overall reliability and efficiency of the transmission system. The costs of these projects are being shared to beneficiaries across the entire MISO North/Central footprint. These projects qualify for MVP cost treatment based on their contributions to increased reliability, economic benefits, or supporting compliance with one or more of the states' renewable requirements.

In addition to the MISO MVP process, Xcel Energy participates in transmission planning with a larger group of utilities called the Minnesota Transmission Owners (MTO). The MTO consists of all of the investor-owned, cooperative, and municipal utilities that own transmission facilities 100 kV and above in Minnesota. Several MTO members (e.g., Xcel Energy, Great River Energy, Otter Tail Power, etc.) also own significant transmission facilities in North Dakota.

III. NATURAL GAS PIPELINE FACILITIES

A. Existing Facilities

We operate an 11.9 mile intrastate natural gas pipeline facility in the state of North Dakota, from an interconnection with Williston Basin Interstate Pipeline Company near Mapleton, North Dakota, to our natural gas distribution system in Fargo, North Dakota. The Commission granted a Certificate of Public Convenience and Necessity and Corridor Certificate for this facility in Case No. PU-400-89-426. We have no plans to retire any intrastate natural gas pipeline facilities in North Dakota within the next 10 years.

B. Proposed Facilities - Next Five Years

At this time we do not have plans to construct any new intrastate natural gas pipeline transmission facilities in North Dakota within the next five years.

C. Proposed Facilities - Next 10 Years

At this time we do not have formal plans to construct any new intrastate natural gas pipeline transmission facilities in North Dakota within the next 10 years. However, we are continually reviewing the potential for serving additional gas retail demand in eastern North Dakota. We will inform the Commission if these projects become viable.

IV. REGIONAL COORDINATION

All major transmission planning performed by the Company is now coordinated through MISO on a regional basis. MISO issues its annual transmission expansion plan MTEP after coordinated planning and stakeholder review.

As a result of complying with the Federal Energy Regulatory Commission Order No. 890 rules, MISO has also implemented Sub-Regional Planning Meetings as part of their annual MTEP development process. We participate in the Western Region meetings. These Sub-Regional Planning meetings provide forums for stakeholder input and coordination of plans and we actively participate in each one. This joint planning is intended to maximize use of existing facilities and minimize the amount of new facilities. More information regarding this joint planning is available at the following link:

https://www.misoenergy.org/planning/transmission-studies-and-reports/#nt=%2Freport-study-analysistype%3AMTEP&t=10&p=0&s=&sd=

Another example of coordination by the utilities is the formalization of the MTO organization, as noted above. In addition to the biennial transmission planning work of the MTO, the MTO utilities also coordinate their transmission planning activities with MISO's MTEP process.

The Company participates in all MISO targeted planning studies, which are studies that happen outside the normal MTEP process. MISO has performed three targeted studies in the last two years.

The first targeted study was the Renewable Integration Impact Assessment. The primary purpose of the Renewable Integration Impact Assessment (RIIA) is to methodically find system integration inflection points driven by increasing levels of renewable generation. Industry studies have shown that the complexity for renewable integration escalates non-linearly with increasing penetrations of renewables. Over certain ranges of renewable penetration, complexity is constant when spare capacity and flexibility exist, but at specific penetration levels when they are depleted, complexity rises dramatically. These are system inflection points, where the underlying infrastructure and/or system operations need to be modified to reliably achieve the next tranche of renewable deployment. This study aims to find those inflection points, and examine potential solutions to mitigate them. This study is available at the following link:

https://cdn.misoenergy.org/20170927%20PAC%20Item%2003i%20Renewable%20Integration%20Impact%20Assessment%20Assumptions%20Document89950.pdf

The second study was the Southwest Power Pool Coordinated System Plan. This study was performed to examine if any potential transmission projects between the two markets had mutual benefits. The study examined seven unique transmission projects for the regional planning process. MISO and SPP staff worked together with stakeholders from both markets to determine benefits through a collaborated effort. The transmission options were tested using Adjusted Production Cost (APC) benefits. No projects met the criteria for selection. The Southwest Power Pool Coordinated System Plan is available at the following link:

https://cdn.misoenergy.org/MTEP17%20Book%203%20Policy%20Landscape106028.pdf

Finally, MISO performed the Footprint Diversity Study. This studies focus was on the transfer rights between MISO North and MISO South using MISO operated facilities. The primary focus was on potential ways to increase the interface capability using economic drivers. Thirty Five transmission projects were analyzed for potential benefits and none passed the minimum 1.25 Benefit/Cost ratio needed to move on in the next phase of the analysis. The Footprint Diversity Study is available at the following link:

https://cdn.misoenergy.org/MTEP17%20Book%201%20Transmission%20Studies106030.pdf

V. ENVIRONMENTAL PROTECTION

Specific environmental information and efforts to involve land-use planning agencies will be provided to the Commission in future regulatory filings pertaining to specific facilities identified for construction.

VI. DEMAND PROJECTIONS

The NSP System integrates electric generation and transmission to serve customers in North Dakota, South Dakota, Minnesota, Wisconsin, and Michigan. The North Dakota portion of the NSP System's 25-year historical native energy requirements and non-coincident peak demand are shown in Table 2. We produce long-range "median" NSP System forecasts of native energy requirements, summer peak, and winter peak demand. For planning purposes, we also develop a bandwidth to supplement our median forecasts. These scenarios are intended to describe uncertainty in a business-as-usual context: a relatively narrow range of U.S. economic growth with no fundamental change in the relationship between the regional and national economies. Table 3 shows the long-range system forecast of native energy requirements, summer peak, and winter peak demand for the NSP System. Table 4 shows the North Dakota portion of the NSP System forecast.

The forecast for the NSP System is based on forecasts of state jurisdictional sales by major customer class: residential (with and without space heating), small commercial and industrial, and large commercial and industrial. Each customer class is modeled independently for the five states in the NSP System. The native energy requirements are determined by applying a loss factor on total sales.

The NSP System peak is apportioned to state jurisdictions based on their native energy requirements and respective load factors. Consequently, the summer and winter "coincident peak loads" provided in Table 4 represent the North Dakota jurisdiction customer demand at time of the NSP System seasonal peak demand. This coincident peak demand is appropriate for generating capacity requirement forecasting.

"Non-coincident" peak demand is also used in evaluating transmission capacity requirements. This is because the transmission system must be able to supply the full local customer demand at all times. Due to load diversity caused primarily by weather variations among states within the NSP System, peak customer demands in our North Dakota service area can be higher than it is during the hour in which the total system peak demand occurs. These local "non-coincident" peak demands are also factored in

to the determination of the need for transmission improvements required for load serving functions.

Table 2. Historical Energy and Peak Load Requirements
North Dakota portion of NSP System (1989 – 2017)

Year	Energy (GWh)	Annual Growth	Non-Coincident Peak Load (MW)	Annual Growth
1989	1,844		374	
1990	1,904	3.3%	399	6.7%
1991	1,925	1.1%	373	-6.5%
1992	1,883	-2.2%	376	0.8%
1993	1,771	-5.9%	333	-11.4%
1994	1,796	1.4%	360	8.1%
1995	1,916	6.7%	362	0.6%
1996	1,984	3.5%	382	5.5%
1997	1,911	-3.7%	351	-8.1%
1998	1,958	2.5%	352	0.3%
1999	1,950	-0.4%	363	3.1%

APPENDIX C
Report on the Effect of Wind Generation on Baseload Plants

In the Commission's orders on the Company's applications for Advance Determination of Prudence for the Nobles and Merricourt Wind Projects dated August 12, 2009 in Case Nos. PU-08-907 and PU-08-908, the Commission included the following order points:

2. NSP will report to the extent possible, as part of its annual 10-year plan, all reductions in the energy produced at its base load generation units that would not have occurred except for the existence of wind generation. The report will include the time of the event, length of the event, base load plant affected and the amount of energy not produced at the base load plant during the event.
3. NSP will report, as part of its next 10-year plan, on the impacts and costs associated with taking coal plant production up and down to accommodate wind resources during off peak hours.

Order Point 2

In response to order point 2, we performed an analysis of the NSP system performance over 8,760 hours from the first hour on April 1, 2017 through the last hour on March 31, 2018. To establish a criteria as to what would constitute reductions in energy production, we looked at the set points for each unit established in our Energy Management System. Units have an economic maximum and an economic minimum set point that comprise the normal dispatch range. For the purposes of this study, we assumed that any time a unit was not operating at its economic maximum, it was "backed down". We then attributed the cause of the reduced baseload production each hour to load, wind, market dispatch, or some combination based on the net energy position for the NSP system over the hour.

As an example, let's assume load is 500 MWs, wind is 100 MWs and Sherco Unit 1 is the only baseload resource online with a maximum capability of 680 MWs. By itself, the NSP system would only need 400 MWs from Sherco to serve load. If the unit were in fact dispatched to 400 MWs by MISO, we would attribute 180 MWs of backed down generation to our load (680 – 500), and 100 MWs to the wind. If MISO backed the unit down further to 300 MWs, the additional 100 MW reduction would be attributed to market dispatch. There are also times when baseload units remain loaded above the level necessary to serve the NSP system load net of wind generation due to the market wide demand for energy.

It is important to note that the cause of reductions in baseload energy production cannot be determined with certainty given the regional dispatch of generation in MISO. Wind generation may play a role in MISO market dispatch decisions, but the

Company does not have enough information to determine definitively the cause of these decisions. Nevertheless, the analysis described above provides a reasonable framework for assessing the impact of wind on the NSP system.

The results show that the total amount of energy that was not produced that could have been produced during the study period if no baseload generation was backed down was 2,514,261 MWhs. Wind production contributed to 1,295,715 MWh or 51.5% of MWhs backed down. Changes in customer load accounted for 45,063 MWh or 1.8% of the MWhs backed down. MISO Market Dispatch was responsible for 1,173,484 MWh or 46.7% of the MWhs backed down. There were many hours where baseload generation was backed down for a combination of market dispatch, wind production and customer loads.

Out of the 365 days evaluated, there were 328 cycles in which wind generation contributed to backing down base load generation. We define a cycle as the period of time over which the base load generation was backed down. As an example, on April 6, 2017, base load generation was backed down for three consecutive hours in part due to wind generation. This was considered a cycle. On May 16, 2017, base load generation was backed down for one hour in part due to wind generation. This was also counted as one cycle.

Order Point 3

The Company complied with Order Point 3 in its 2010 ten-year plan.

10-YEAR PLAN FOR MAJOR GENERATION AND TRANSMISSION FACILITIES

Northern States Power Company, doing business as Xcel Energy (Xcel Energy or the Company), submits its 10-year plan to the South Dakota Public Utilities Commission as required by S.D. Admin. R. § § 20:10:21:02 to 20:10:21:21 and SDCL § 49-41B-3.[1]

These administrative rules and legislative provision require every utility that owns or operates, or plans within the next ten years to own or operate, energy conversion facilities to develop and submit a 10-year plan that contains the following:

(1) A description of the general location, size, and type of energy conversion facilities or transmission facilities of two hundred fifty kilovolts or more to be owned or operated by the utility during the ensuing ten years, as well as those facilities to be removed from service during the planning period;

(2) A description of the efforts by the utility to coordinate the plan with other utilities so as to provide a coordinated regional plan for meeting the utility needs of the region;

(3) A statement of the projected demand for the service rendered by the utility for the ensuing ten years and the underlying assumptions for the projection, with such information being as geographically specific as possible and a description of the manner and extent to which the utility will meet the projected demand; and

(4) Any other relevant information as may be requested by the commission.

We present the information required for our 10-year plan in sequence as provided in §§ 20:10:21:04 to 20:10:21:18 inclusive, and additionally provide any further information required by SDCL 49-41B03 along with the closest related administrative rule requirement.

BIENNIAL REPORT

20:10:21:04 EXISTING ENERGY CONVERSION FACILITIES

This section outlines the Company's electric generation facilities. We provide the details required by S.D. Admin. R. § § 20:10:21:04 for Company generating facilities located in South Dakota, and provide a list of the other generating facilities that comprise the NSP System that serves our South Dakota customers.[2]

Xcel Energy has one existing energy conversion facility in South Dakota. The table below provides the required information on this facility.

[1] The rules incorporate and put into effect the requirements outlined under S.D. Codified Laws § 49-41B-3

[2] The NSP System is comprised of electric generating plants and transmission facilities located and serving customers in the states of Michigan, Minnesota, North Dakota, South Dakota, and Wisconsin.

South Dakota Electric Generating Facilities

Table 1. Angus C. Anson Plant

1	Location	Minnehaha County, South Dakota	
2	Type Nameplate Capacity	Simple Cycle Combustion Turbine 119.7 MW (unit 2) 119.7 MW (unit 3) 166.3 MW (unit 4)	
3	Net Capacity	2016 Summer	 90 MW (unit 2) 90 MW (unit 3) 147 MW (unit 4)
		Winter	109 MW (unit 2) 109 MW (unit 3) 168 MW (unit 4)
		2017 Summer	 90 MW (unit 2) 90 MW (unit 3) 147 MW (unit 4)
		Winter	109 MW (unit 2) 109 MW (unit 3) 168 MW (unit 4)
	Annual Production	2016: 2017:	65,698 MWh (total) 70,125 MWh (total)
4	Water Source and Annual Consumption	Ground Water 2016: 2017:	 7,482,510 gal 5,578,546 gal
5	Fuel Type Source Annual Consumption	Natural Gas Northern Natural Gas Co.[3] 2016: 805,279.64 MMBtu 2017: 845,279.92 MMBtu	Fuel Oil 2016: 103,380 gal 2017: 21,542 gal
6	Projected Retirement Date	Unit 2 & 3: Unit 4:	2026 2035

We provide a list of our other NSP System generating facilities and Power Purchase Agreements (PPA) as Appendix A to this report.

[3] The natural gas fuel is purchased from independent third party suppliers and delivered through the Northern Natural Gas interstate pipeline system.

20:10:21:05 PROPOSED ENERGY CONVERSION FACILITIES

This rule requires utilities to provide the specific electric generating facilities that have been proposed but are not yet in commercial operation in the 10-year period of the biennial report. In addition to providing the details for each of these planned facilities as required by S.D. Admin. R. § § 20:10:21:04, we note that the Company's Resource Plan proposes additional changes to its generation resources and mix. We provide a high level summary of our resource planning process and the procedural timeline for the proceeding in our Minnesota jurisdiction below.

Resource Planning Overview

Resource Planning is a complex and integrated process of planning for the capacity, energy, and emission requirements of the electric system. The process incorporates a number of key assumptions or industry projections that helps to inform a common vision of what the future planning environment may look like. This ongoing planning process requires utilities to examine and establish a long-term proposal for management, operation, and expansion or contraction of their generating and demand management resources to meet customer needs.

Traditionally the primary focus of resource planning has been to identify the least-cost approach to provide reliable service and meet growing demand. While these goals remain critical to the resource planning process, we have broadened the scope of planning considerations by incorporating new generation technologies, increasing renewable energy, reducing emission profiles, and evaluating the retirement of large baseload facilities, thereby positioning the NSP System for the future.

The planning landscape underlying the Resource Plan greatly informs the planning efforts. We believe that proactive leadership in the face of evolving industry, new and proposed environmental regulation, customer expectations, emerging technologies, and changes to the NSP System will allow us to affirmatively address these trends rather than being shaped by them. Our planning also calls for sufficient flexibility to allow us to adjust and react as we gain more clarity on the planning landscape.

The criteria we apply as as we evaluate and propose our preferred plan in relation to a reference plan is its ability to: (1) maintain or improve the adequacy and reliability of utility service; (2) keep customers' bills and our rates as low as practicable, given regulatory and other constraints; (3) minimize adverse socioeconomic effects and adverse effects upon the environment; (4) enhance the utility's ability to respond to changes in the financial, social, and technological factors affecting its operations; and (5) limit the risk of adverse effects on the utility and its customers from financial, social, and technological factors that the utility cannot control.

The Company filed the 2016-2030 Upper Midwest Resource Plan (IRP) on January 2, 2015, and filed a substantive supplement on January 29, 2016. The Minnesota Public Utilities Commission approved the IRP in October 2016. The approved plan was developed to address the planning landscape in which it was developed – and based on five key considerations:

- The solid foundation that has resulted from our investment cycle;
- Innovative use of renewable energy to drive down emissions and preserve flexibility;
- Strategic flexibility;
- Cost effectiveness; and
- A plan to address the future of Sherco Units 1 and 2.

The preferred plan for our Upper Midwest customers builds on our strong foundation of environmental performance, while continuing to reliably meet our customers' electricity needs in a cost-effective mannerThe Company plans to file its next IRP onFebruary 1, 2019.

20:10:21:06 EXISTING TRANSMISSION FACILITIES

This rule requires utilities to provide a description of its existing transmission facilities. Similar to the information we provided about our electric generating facilities, we provide the details required by S.D. Admin. R. § § 20:10:21:04 for Company transmission facilities located in South Dakota, and provide information about other transmission facilities that comprise the NSP System that serves our South Dakota customers as Appendix B.

South Dakota Transmission Facilities

Listed below are our existing transmission facilities operating at 115 kV or above in South Dakota. They are all located in the eastern portion of the state. As noted

above, a map showing the location of our transmission lines is included as Appendix B. Currently none of these facilities are projected to be removed from service.

A. Type 115 kV – AC

1. Lawrence Substation in Sioux Falls to the Lincoln County Substation south of Sioux Falls – 11 miles.
2. Lincoln County Substation south of Sioux Falls to the Louise Substation (southwest side of Sioux Falls) – 3 miles.
3. Louise Substation (southwest corner of Sioux Falls) to the Cherry Creek Substation (west side of Sioux Falls) – 7 miles.
4. Cherry Creek Substation to the Grant Substation west of Sioux Falls – 24 miles.
5. Grant Substation west of Sioux Falls to Northwestern Energy (Northwestern) at Mitchell – 24 miles to Wolf Creek Interconnection owned by Xcel Energy; the remainder is owned by Northwestern.
6. Lawrence Substation in Sioux Falls to the Western Area Power Administration (WAPA) Substation in Sioux Falls – 1 mile.
7. Lawrence Substation in Sioux Falls to the Split Rock Substation approximately 5 miles northeast of Sioux Falls (circuit #1) – 2 miles.
8. Split Rock Substation to the Pathfinder Substation to the Pipestone Substation in Pipestone, Minnesota. Approximately 35.5 miles of this line are in the state of South Dakota – 44.5 miles total.
9. Lawrence Substation in Sioux Falls to the Split Rock Substation approximately 5 miles northeast of Sioux Falls (circuit #2). Approximately 1 mile of this line is double-circuited with the Split Rock-Magnolia 161 kV line; 2.2 miles total.
10. Split Rock Substation to the West Sioux Falls Substation – 17.3 miles.
11. West Sioux Falls Substation to the Cherry Creek Substation – 3.5 miles.
12. Split Rock Substation to Renner Substation – 8.7 miles.
13. Renner Substation to Cherry Creek-7.8 miles.
14. Split Rock to Angus C. Anson generating plant – 0.28 miles.
15. Split Rock to Angus C. Anson generating plant # 2 – 0.43 miles.
16. Brookings County to Yankee #1 – 3.7 miles of this line is in South Dakota; 13 miles total.
17. Brookings County to Yankee #2 – 6.5 miles of this line is in South Dakota; 13 miles total.
18. West Sioux Falls to Falls Substation-3.6 miles
19. Falls Substation to Split Rock Substation-8.25 miles

B. Type 161 kV – AC

1. Split Rock Substation approximately 5 miles northeast of Sioux Falls to ITC Midwest, LLC (ITC Midwest) interconnection near Luverne, Minnesota.[4] Approximately 1 mile of this line is double-circuited with the second Lawrence- Split Rock 115 kV line. Approximately 11 miles of this line are in the state of South Dakota - 20 miles total.

C. Type 230 kV – AC

1. Split Rock Substation to the WAPA Sioux Falls Substation – 1 mile.

D. Type 345 kV – AC

1. Split Rock Substation northeast of Sioux Falls to the WAPA's 345 kV line to Watertown. This is a 5.1 mile line with 2.5 miles double circuit but one circuit is not energized.
2. Split Rock Substation northeast of Sioux Falls to the WAPA's 345 kV line to Sioux City. This is a double-circuit line – 5.1 miles with the Split Rock-Nobles line.
3. Split Rock-Nobles County-Lakefield Junction. 345 kV line approximately 10 miles of this line are in the state of South Dakota – 90.8 miles total. 5.1 miles are double circuit with the Split Rock-Sioux City line.
4. Brookings County-White 345 kV line #1. This is a 0.4 mile line.
5. Brookings County-White 345 kV line #2. This is a 0.4 mile line.
6. A 230 mile, 345 kV line between Brookings, South Dakota, and the southeast Twin Cities, plus a related 30 mile, 345 kV line between Marshall, Minnesota, and Granite Falls, Minnesota (Brookings Project).
7. Big Stone South to Brookings Co Substation is a 72 mile long line with the ownership split evenly between Xcel Energy and Otter Tail Power Company.

As noted above, a map of our total NSP System transmission facilities is provided as Appendix B to this report.

20:10:21:07 PROPOSED TRANSMISSION FACILITIES

This rule requires utilities to provide the specific transmission facilities that have been proposed but are not yet in operation in the 10-year period of the biennial report.

There are no transmission facilities proposed in the 10-year period. The transmission system is analyzed on an annual basis and any future projects will included when necessary.

[4] In early 2008, ITC Midwest purchased all of the high voltage electric transmission facilities of Interstate Power and Light Company (Alliant Energy) in Iowa, Minnesota and Illinois.

20:10:21:08 COORDINATION OF PLANS

This rule requires utilities to describe how their plans coordinate with other utilities serving the region.

Xcel Energy is a member of the Midwest Reliability Organization (MRO). The purpose of the MRO is to ensure the reliability and security of the bulk power system covering the states of Wisconsin, Iowa, Minnesota, Nebraska, and most of South Dakota as well as the Canadian provinces of Saskatchewan and Manitoba. As such, the members of the non-profit organization meet to discuss reliability and security issues. There are numerous committees that develop standards, guidelines, and reporting procedures for everything from load shedding to vegetation management. More information about the organization can be found at: http://www.midwestreliability.org.

The Company is also a participant in the Minnesota Transmission Assessment & Compliance Team (MN-TACT) along with several other utilities covering Minnesota, Western Wisconsin and parts of North Dakota and South Dakota. The purpose of this analysis is to develop an understanding of the transmission system topology, behavior and operation. This analysis is performed to meet NERC Transmission Planning Standards TPL-001.

All major transmission planning performed by the Company is now coordinated through the MISO on a regional basis, consistent with the Federal Energy Regulatory Commission (FERC) Orders (a) dated May 19, 2000 (FERC Docket No. EC00-60-000) authorizing the transfer of functional control of our high voltage transmission system to the MISO; (b) dated December 20, 2001[5] finding the MISO to be the first FERC-approved regional transmission organization (RTO); and dated February 15, 2007 (Order No. 890), requiring RTOs and their member utilities to use coordinated regional planning.[6] MISO issues an annual MTEP after coordinated planning and stakeholder review. Prior to 2007, these plans were issued biennially. The current MTEP 2017 series of projects was approved by the MISO Board of Directors in December of 2017 and is available at the MISO website at www.misoenergy.org.

[5] FERC Docket Nos. RT01-87-000, RT01-001, ER02-106-000 and ER02-108-000.
[6] *Preventing Undue Discrimination and Preference in Transmission Service*, Order No. 890, 72 FR 12266 (March 15, 2007), FERC Stats. & Regs. ¶ 31,241 (2007) (Order No. 890), *order on reh'g*, 73 Fed. Reg. 2984 (Jan. 16, 2008), FERC Stats. & Regs. ¶ 31,261 (2008) (Order No. 890-A); *order on reh'g* 123 FERC ¶ 61,299 (Order No. 890B) (June 23, 2008). MISO's Order No. 890 regional transmission planning process was conditionally accepted for filing in *Midwest Independent Transmission System Operator, Inc.*, 123 FERC ¶ 61,164 (May 15, 2008).

As a result of complying with the FERC Order No. 890 rules, MISO has implemented its own Sub-Regional Planning Meetings. We participate in the Western Region meetings. This group provides a forum for stakeholder input and coordination of plans and we actively participate in this. This joint planning is intended to maximize use of existing facilities and minimize the amount of new facilities.

Another example of this coordination by the utilities is the formalization of the Minnesota Transmission Owners (MTO) organization. The MTO consists of all transmission owning utilities in Minnesota. The MTO was formed to submit coordinated biennial transmission planning reports to the Minnesota Commission as required by Minn. Stat. § 216B.2425. Some MTO utilities also serve eastern North Dakota and eastern South Dakota. The MTO group is presently developing coordinated short-term regional plans and longer term vision plans for the bulk transmission needs throughout the upper Midwest and the transmission required to meet the various states' Renewable Energy Standards. The MTO group also performs an annual 10-year assessment of the members' utility systems for compliance with the North American Electric Reliability Corporation Transmission Planning (TPL) standards. The MTO utilities also coordinate their planning with the CapX2020 planning processes and the MTEP processes.

We also participate in Interconnection-wide transmission planning, currently being facilitated under the Eastern Interconnection Planning Collaborative (EIPC) effort, funded by the Department of Energy. The EIPC effort is focused on a high level look at the transmission needs east of the Rocky Mountains (excluding parts of Texas).

In addition, as noted previously, the Company prepares Integrated Resource Plans for the NSP System and submits a copy of those plans to the Commission consistent with the Commission's requirements in Docket No. EL08-028 and the Settlement Stipulation and Commission Order in Docket No. EL09-009.

20:10:21:09 SINGLE REGIONAL PLANS

This rule requires utilities to state whether the facilities it has proposed comprise all or part of a single regional plan. As described in the previous sections, the Company serves its South Dakota customers from an integrated NSP System that serves portions of Michigan, Minnesota, North Dakota, South Dakota, and Wisconsin. We periodically evaluate our customers' needs and federal and state requirements, and develop Integrated Resource Plans that look 15 years into the future to ensure we continue to meet our reliability requirements and customer needs. We additionally continue to work with MISO and other coordinated regional utility groups to evaluate

potential transmission needs in the future and to develop coordinated regional plans as required to meet those needs.

20:10:21:10 SUBMISSION OF REGIONAL PLANS

This rule requires utilities proposing facilities that comprise all or part of a regional plan to submit the plan(s). As noted previously, we submit our Integrated Resource Plans to the Commission as they are developed.

Regional transmission plans, by virtue of their geographic coverage, involve a collaborative effort of multiple utilities. As the CapX2020 effort has shown, we and the other utilities in this region are actively analyzing and developing coordinated regional plans. This analysis includes the active participation of the MTO and the MISO planning efforts. This effort is part of the MTEP regional planning process. As specific plans for additional facilities are developed, they will be submitted with subsequent 10-year plans. The MTEP is subject to review and approval by MISO's independent Board of Directors. Proposals to construct specific MTEP approved facilities in South Dakota would be submitted for Commission approval as required.

20:10:21:11 UTILITY RELATIONSHIPS

This rule requires utilities to describe any relationship of the utility to other utilities and regional associates, power pools, and networks.

Northern States Power Company-Minnesota (NSPM) is an operating company subsidiary of Xcel Energy Inc., a public utility holding company, and we are affiliated with three other regulated public utilities: Northern States Power Company-Wisconsin (NSPW), Public Service Company of Colorado, and Southwestern Public Service Company. NSPM is a member of MISO, the first FERC-approved RTO. As an RTO, MISO provides regional tariff administration services and operates a Day-ahead and Real-time regional wholesale energy market pursuant to its Open Access Transmission, Energy and Operating Reserve Markets Tariff. MISO implemented a regional planning reserve market in 2009, pursuant to Module E of the Open Access Transmission, Energy and Operating Reserve Markets Tariff. MISO is also the Regional Reliability Coordinator for the NSPM and NSPW integrated electric generation and transmission system (NSP System).

Outside of MISO, NSPM serves a small amount of retail load in Berthold, ND. For that, NSPM is also a transmission customer and market participant under Southwest Power Pool's Open Access Transmission Tariff.

We are also a member of the MRO, which is the Regional Entity responsible for enforcement of mandatory electric reliability standards adopted by the North American Electric Reliability Corporation.

20:10:21:12 EFFORTS TO MINIMIZE ADVERSE EFFECTS

This rule requires utilities to describe in detail its methodology used and efforts to identify, minimize, or avoid adverse environmental, social, economic, health, public safety, and historic or aesthetic preservation effects.

The Company uses a multi-step effort to minimize adverse effects resulting from siting, constructing, operating and maintaining large electric generating plants and high voltage transmission lines. These efforts relate to long-range planning and coordination, environmental site and route analysis, and to ensure the effects of construction and operation practices are minimized.

High voltage transmission facility plans are coordinated with MISO, other area power suppliers and load serving entities in order to develop, whenever possible, joint use facilities. Coordination with others can reduce the number of facilities by providing for joint ownership and operation of facilities.

Once the need for generation or transmission is identified, an initial site or route search is begun by defining a broad study area to locate the facility. A broad range of information about the physical, biological and cultural environment within the study area is then collected. As information on such factors as land use, air and water quality, plants and animals, transportation and social services, and local and regional employment becomes available, various siting criteria are used to define preferred and alternate routes and sites. We prefer to develop a project with the cooperative assistance of state and local agency officials, neighboring transmission utilities (such as Northwestern, WAPA, Missouri River Energy Services and ITC Midwest), and affected landowners in order to assure the widest possible considerations of information, concerns and options. It is our policy to ensure compliance with all local, state and federal regulatory requirements in the development and location of proposed projects.

Because of the detail involved in a major generation or transmission project, we continue to refine site and route engineering once permits have been granted. This allows us to adjust for new developments that may arise during construction, such as the need for changes in locations, land use or construction techniques, and allows any concerns to be addressed and mitigated without undue delay and expense. We are committed to working with affected landowners to mitigate environmental and land use problems which may arise as a result of construction and maintenance activities.

We discuss our other efforts to respond to the evolving utility landscape in our 2016-2030 Upper Midwest Integrated Resource Plan in Docket No. EL09-009.[7] For ease of reference, we provide the public version our January 29, 2016 Supplement as Appendix C to this 10-year plan.

20:10:21:13 LOAD MANAGEMENT EFFORTS

This rule requires utilities to describe its efforts toward efficient load management.

The Company's load management efforts in South Dakota reduce peak demands, especially during the summer months, which can help delay or avoid more expensive electric generation and purchased power needs.

On January 1, 2012 we launched a demand side management (DSM) program in South Dakota, approved in the Order in Docket No. EL11-013. The DSM portfolio includes load management, energy efficiency, and consumer education programs aimed at both residential and commercial customers.

Commercial programs in the DSM portfolio include:

- Lighting Efficiency (conservation)
- Business Saver's Switch (load management)
- Peak and Energy Control (load management)

Residential programs in the DSM portfolio include:

- Residential Home Lighting (conservation)
- Residential Saver's Switch (load management)
- Consumer Education

Since their launch, these programs have reduced peak demand by about 13.8 MW and have conserved almost 30 GWh. It is forecasted that in the next two years (2017-2019) the programs will achieve an additional 2.6 MW in peak reduction and 10 GWh.

We additionally provide details regarding the Company's load management and conservation efforts in our Resource Plan.

20:10:21:14 LIST OF REPORTS RELATED TO PROPOSED FACILITIES

This rule requires utilities to provide a list of all reports or studies filed or proposed to be filed with federal or other state agencies relating to the proposed facilities.

[7] *See* January 29, 2016 Supplement.

B. Transmission Facilities

Minnesota Transmission Assessment and Compliance Team 2014 Transmission Assessment: December 2016

MTEP16 Report: December 2016

Minnesota Transmission Assessment and Compliance Team 2017 Transmission Assessment: February 2018

MTEP17 Report: December 2017

20:10:21:15 CHANGES IN STATUS OF FACILITIES

This rule requires utilities to list changes in the status of the utility's facilities during the past two years, or since submission of its most recent 10-year plan.

There have been no changes in the status of Xcel Energy's facilities in South Dakota in the past two years.

20:10:21:16 PROJECTED ELECTRIC DEMAND

This rule requires utilities to provide its projected customer demand for the 10-year period, in South Dakota and outside of South Dakota. Additionally, SDCL § 49-41B-3 requires utilities to describe the underlying assumptions for their projections, with

such information being as geographically specific as possible – and a description of the manner and extent to which the utility will meet the projected demand.

As we have described, our South Dakota customers are served by the integrated NSP System, which is how we plan for and meet the needs of NSP System customers – including our South Dakota customers.

We produce long-range "median" forecasts of native energy requirements, summer peak, and winter peak demand. For planning purposes, we also develop a bandwidth (called semi-high and semi-low scenarios) to supplement our "median" forecasts. These two scenarios are intended to describe uncertainty in a business-as-usual context: a relatively narrow range of US economic growth with no basic change in the relationship between the regional and national economies. Tables 10, 12, and 12 below show the long-range system forecast of native energy requirements, summer peak, and winter peak demand for the NSP System. While this is how we plan and meet the needs of the NSP System, in compliance with Rule 20:10:21:16, we provide a forecast of our native energy requirements and peak demand for the State of South Dakota jurisdiction in Table 9 below.

The forecast for the NSP System is based on forecasts of jurisdictional sales by major customer class: residential with and without space heating, small commercial and industrial, and large commercial and industrial. Each customer class is modeled independently for the five states included in the NSP System. The native energy requirements are determined by applying a loss factor on total sales. The NSP System peak is apportioned to jurisdictions based on the native energy requirements by state and the load factor by state. Consequently, the summer and winter "peak loads" provided in Table 9 represent the South Dakota jurisdiction customer demand at time of total System seasonal peak demand. This "coincident" demand is appropriate for generating capacity requirement forecasting.

It is important to note, however, that a "non-coincident" peak demand must be used in evaluating transmission capacity requirements. This is because the transmission system must be able to supply the full local customer demand at all times. Due to load diversity caused by weather variations within the multi-state NSP System, peak customer demands in our South Dakota service areas can be as much as ten percent higher than the demands registered during the hour in which the total System peak demand occurs. It is these local "non-coincident" peak demands that determine the need for transmission improvements required for load serving functions.

We have described in our current Resource Plan how we propose to meet our customers' needs, federal and state policy requirements and objectives, and transition to the future, which we summarize below.

While forecasts are always subject to change, we expect to have sufficient capacity to meet our customers' needs through 2024. However, our current forecast indicates that beginning in 2025 our capacity position shifts from a surplus of nearly 500 MW to a deficit of over 2,200 MW by 2030. Much of this shift is due to the retirement of approximately 800 MW of peaking plants, as well as the expiration of nearly 1,700 MW of hydro and natural gas PPAs during the period, including the expiration of our existing 850 MW PPA with Manitoba Hydro in 2025.

Our plan proposes to address the capacity deficit through a combination of renewable resource additions in the early years, and the addition of natural gas CT and CC units. In summary, our proposed resource additions are:

- 1,400 MW of large solar additions, including 400 MW by 2020,
- 1,800 MW of additional wind, including 800 MW by 2020,
- A 786 MW CC addition at the Sherco site in 2026 to replace the capacity of Sherco Unit 1 before it ceases operation,
- A 230 MW CT located in North Dakota by the end of 2025, and
- Over 1,800 MW of additional CT capacity.

The early renewable energy additions we have proposed as part of our plan will allow us to capitalize on favorable market pricing associated with the recently extended Federal Investment Tax Credit and Production Tax Credit incentives, reducing the cost impacts of our proposed plan. Locating the proposed 786 MW Combined Cycle Unit at Sherco will allow us to cost-effectively address the transmission issues identified by the MISO Attachment Y2 Study, ensure the stability and reliability of our transmission system, mitigate impacts to the local community and our employees, and potentially provide improved access to natural gas supplies for communities in central Minnesota.

20:10:21:17 CHANGES IN ELECTRIC ENERGY

This rule requires utilities to show the increase or decrease in projected electric energy demand and allocation by volume and percentage for each year relative to the prior year.

We provide this information in Table 9 for our South Dakota service area for each year below.

Table 9. Forecast of Electric Energy Requirements & Peak Demand
State of SD

	Summer Peak (MW)	Winter Peak (MW)	Energy (GWh)	Change In Energy (GWh)	% Change In Energy
2016	450	322	2,194		
2017	452	328	2,210	15	0.7%
2018	455	329	2,220	10	0.4%
2019	460	332	2,238	19	0.8%
2020	460	335	2,265	27	1.2%
2021	467	339	2,282	17	0.8%
2022	469	338	2,297	15	0.7%
2023	480	346	2,320	23	1.0%
2024	480	348	2,351	31	1.4%
2025	486	350	2,372	21	0.9%
2026	490	353	2,392	20	0.8%
2027	494	356	2,421	29	1.2%
2028	498	359	2,460	38	1.6%
2029	502	362	2,489	30	1.2%
2030	506	365	2,525	36	1.4%
2031	510	368	2,569	44	1.7%
2032	514	372	2,618	49	1.9%
2033	518	375	2,661	43	1.6%
2034	522	378	2,700	38	1.4%
Avg Annual Growth Rate 2016-2034 % growth:	**0.8%**	**0.8%**	**1.1%**		

1) Peak Load is ***coincident*** to the Xcel Energy system peak.
2) Winter Peak = MISO Winter Peak season, 2016 is –2016-2017 winter peak.
3) Peak Load forecast growth from 2026 - 2034 is based on average summer and winter SD peak growth rates from 2016 through 2025.

Table 10. NSP System Net Energy Requirements (MWh)

Year	Semi-Low (MWh)	Median (MWh)	Semi-High (GWh)

St. Paul, Minnesota 55101-2147

RE: SUPPLEMENT – CURRENT PREFERRED PLAN
2016-2030 UPPER MIDWEST RESOURCE PLAN
DOCKET NO. E002/RP-15-21

Dear Mr. Wolf:

Northern States Power Company, doing business as Xcel Energy, submits the enclosed Supplement to its 2016-2030 Upper Midwest Resource Plan to the Minnesota Public Utilities Commission as required by its January 6, 2016 ORDER REQUIRING SUPPLEMENTAL FILING in the above-referenced docket.

This Supplement provides the detailed analysis supporting the proposal we outlined in our October 2, 2015 Reply Comments, as well as the information required in the Commission's January 6 Order. It also provides a detailed discussion of Prairie Island and our support for operating the plant through the end of each unit's respective current licensed life.

Our plan consists of the following:

- Accelerating our transition away from coal by ceasing coal operations at our Sherco Units 1 and 2 in the 2020s,
- Adding 1,400 megawatts of large solar to our system, including 400 megawatts by 2020,
- Adding 1,800 megawatts of wind, including 800 megawatts by 2020,
- Adding natural gas generation in the 2020s,
- Operating our carbon-free nuclear fleet through their existing plant licenses, and
- Continuing our commitment to increased energy efficiency and seeking out new technologies that will advance customer-driven solutions.

PUBLIC DOCUMENT
TRADE SECRET INFORMATION AND NON-PUBLIC DATA EXCISED

Collaboration has been the hallmark of this proceeding. We developed the changes to our initial plan with input from stakeholders and believe our plan offers an energy vision that will benefit our customers, communities, and the states we serve. Together, the actions outlined in our Current Preferred Plan will result in a significant transformation in our generation fleet, including a nearly 60 percent reduction in our carbon emissions by 2030 without significantly impacting customer costs, reliability, Company employees, or the communities we serve. In fact, due to recent extensions to federal tax credits for solar and wind generation, the cost of our Current Preferred Plan is even lower than we anticipated in our October Reply Comments.

Request for Protection of Trade Secret Information

The Company recognizes and supports the need for transparency in review of our Resource Plan. Non-Public data included in this filing is limited to certain portions of the Supplement and four attachments as discussed below. We have identified the Trade Secret and other Non-Public information pursuant to Minn. Rule 7829.0500.

1. Forecasted Capital and O&M Costs

Section V of the Supplement contains forecasted cost details. This information is Trade Secret information as defined by Minn. Stat. §13.37(1)(b), because it derives independent economic value from not being generally known or readily ascertainable by others who could obtain a financial advantage from its use. The disclosure of this information could adversely impact contract negotiations, potentially increasing costs for these services for our customers. Thus, the Company maintains this information as a trade secret.

2. Attachment D – Grid Primer and Study Summary Report

Attachment D is a summary of the technical studies analyses the Company conducted to examine the technical impacts of potentially retiring Sherco Units 1 and 2. It is marked as Non-Public, as it contains Critical Electrical Infrastructure Information (CEII) including a summary of the results of the Midcontinent Independent System Operator Attachment Y2 Study and the Xcel Energy Transmission Reliability Study provided as Attachments D1, D2 and D3. Attachment D also discusses the Company's analysis of its Black Start Plan, which specifies the process of restoring the grid to full operation without relying on the external transmission network following a full- or partial-black out. Portions of this analysis are also CEII and marked as Trade Secret for the same security purposes noted in parts 3 and 4 below.

PUBLIC DOCUMENT
TRADE SECRET INFORMATION AND NON-PUBLIC DATA EXCISED

3. Technical Study Reports

- *Attachment D1 - System Support Resource Attachment Y2 Study – The Sherburne County Generating Plant ("Sherco") Units 1 & 2 (Final Report of Midcontinent Independent System Operator (MISO) – August 28, 2015)*
- *Attachment D2 - Sherco 1 Replacement Power Study – Phase 1 (Siemens Power Technologies International - January 22, 2016)*
- *Attachment D3 - Sherco 1 and 2 Replacement Power Study – Phase 2 (Siemens Power Technologies International - January 22, 2016)*

Attachment D1 is marked as Non-Public in its entirety and is provided with critical infrastructure and highly-sensitive information redacted. Attachment D1 contains information regarding the MISO area grid, including specific information about the Xcel Energy and other transmission owner systems as it relates to the potential retirement of Xcel Energy's Sherburne County Generating Plant (Sherco) Units 1 and 2. While MISO has redacted all critical infrastructure and highly-sensitive information from the report, Xcel Energy maintains that the balance of the information is "security information" as defined by Minn. Stat. § 13.37, subd. 1(a).

Attachments D2 and D3 are marked as Non-Public in their entirety and contain CEII and highly-sensitive information redacted for the same reasons noted for Attachment D1. Xcel Energy maintains that the balance of the information is "security information" as defined by Minn. Stat. § 13.37, subd. 1(a). The reports by Siemens Power Technologies International resulted from studying the effects of potential retirement of one or both Sherco Units on the transmission system, and technical implications and upgrade costs associated with replacement of one or both Units at alternate locations on the NSP System. We believe that the information could potentially be used to determine vulnerabilities in the grid or in disrupting electric service to our customers, in the event Sherco Units 1 and or 2 were not in service. The public disclosure or use of this information creates an unacceptable risk, because those who want to disrupt the electrical grid may learn which facilities to target to create the greatest disruption. For this reason, pursuant to Minn. Stat. § 13.37, subd. 2, we have excised this data from the study results provided with this filing.

We take seriously our responsibility to maintain the security of the information and systems involved in the delivery of safe, reliable energy to our customers. A key tenet of our security program is limiting the extent to which sensitive information is accessed or shared. This is designed to help prevent key information about our system and the grid from being accessible. While we are not providing full Attachment Y2 and Siemens study reports available with this filing, we are open to

PUBLIC DOCUMENT
TRADE SECRET INFORMATION AND NON-PUBLIC DATA EXCISED

discussing the specifics of the reports with parties to this docket who have signed a supplementary Non-Disclosure Agreement, provided that the information would remain adequately protected. Alternatively, the Company will make the full study reports available for inspection by Xcel Energy regulators who have fulfilled MISO's CEII requirements and will also consider making them available to certain other parties to the proceeding who have fulfilled MISO's CEII requirements and Xcel Energy's supplementary non-disclosure requirements.

We have electronically filed this document with the Commission, and copies have been served on the parties on the attached service list. Interested parties will be able to obtain copies from our web site at:

http://www.xcelenergy.com/Company/Rates_&_Regulations/Resource_Plans.

Please contact me at (612) 215-4663 or Aakash.Chandarana@xcelenergy.com if you have any questions regarding this filing.

PUBLIC DOCUMENT
TRADE SECRET INFORMATION AND NON-PUBLIC DATA EXCISED

I. EXECUTIVE SUMMARY

Partnerships with communities, customers, and stakeholders have helped to make Minnesota a leader in energy policy - collaboration has been the hallmark of this proceeding. As our industry enters an era of increasing responsiveness to evolving expectations – from those of individual customers, to federal and state carbon emissions goals – these partnerships will become even more important to charting a path that provides certainty in uncertain times.

The Commission noted in its January 6, 2016 Order that resource planning is a collaborative and iterative process and that a full understanding of the relevant facts requires exposure to the views of engaged and knowledgeable stakeholders. The Commission also explained that the process of analyzing future energy needs and preparing to meet them is not a static process, and that strategies for meeting future needs evolve in response to changing conditions. We agree. Through significant collaboration with our stakeholders, our Current Preferred Plan has evolved from a plan that would achieve a 40 percent carbon dioxide emissions reduction from 2005 levels to one that achieves a nearly 60 percent reduction in the same timeframe.

After filing our initial resource plan in January 2015, we engaged in informal discussions and conducted several technical workshops to receive feedback from our stakeholders. We listened carefully to this feedback, we reviewed and analyzed the comments filed in this docket, and we shared an updated vision of our energy future that resulted from this collaboration in our October 2, 2015 Reply Comments.

As described in those Reply Comments, we envision an energy future that transitions our generation fleet such that we will achieve a dramatic reduction in carbon and by 2030, our energy mix will be 63 percent carbon-free. Taking action to transition our fleet now mitigates the costs and risks of retiring a significant proportion of our baseload generation in the same time period. It will also mitigate environmental regulatory risks that could affect the economic viability of our older coal units, and provides certainty to our customers and stakeholders throughout the planning period. Our proposal to achieve this vision will benefit our customers, states, and the communities we serve in a variety of ways. It will benefit our customers by providing for a cost-effective transition to the cleaner energy future they want, while preserving the reliable and safe service they expect. As discussed further below, we can accomplish this transition for just a fraction of a percent more in incremental cost over earlier plans.

PUBLIC DOCUMENT
TRADE SECRET INFORMATION AND NON-PUBLIC DATA EXCISED

Our Current Preferred Plan will also benefit our states by advancing both federal and state energy policies and by being nearly certain to comply with the final Clean Power Plan rules. Finally, our Current Preferred Plan will benefit our communities. It allows adequate time to transition our workforce during this fleet evolution, and provides for new investments and the creation of new jobs in current and future host communities. For these reasons, we believe that our Current Preferred Plan charts the right path forward for our Company and stakeholders.

Our Current Preferred Plan consists of the following course of action:

- Accelerating our transition away from coal by ceasing operation of our Sherco Units 1 and 2 in the 2020s,
- Adding 1,400 megawatts of large solar to our system, including 400 megawatts by 2020,
- Adding 1,800 megawatts of wind, including 800 megawatts by 2020,
- Adding natural gas generation in the 2020s,
- Operating our carbon-free nuclear fleet through their existing plant licenses, and
- Continuing our commitment to increased energy efficiency and seeking out new technologies that will advance customer-driven solutions.

As we make this transition, maintaining the reliability of the system is critical. Our reliability studies confirm that, before ceasing coal operations at the second Sherco unit in 2026, we must take measures to maintain reliability. Our operational analysis confirms that the most cost-effective way to stabilize the transmission system and meet our customers' load requirements is to build a combined cycle plant at the existing Sherco site. By locating the plant at Sherco, we are able to use existing infrastructure and interconnection rights, which will result in significantly lower costs as compared to locating it elsewhere. We can also use our existing water allocation to wet-cool the plant, further improving cost and performance. Finally, we believe that the impacts on the Becker community should be properly considered in this proceeding, and the siting of a combined cycle at Sherco will promote economic development for the community. We also propose to add a combustion turbine near one of our load centers in North Dakota. This will balance the interests of the states that we serve and maintain the benefits of an integrated system for all of our customers, while also addressing the reliability concerns of the North Dakota commission, which wants the Company to build cost-effective and dispatchable generation in their state.

PUBLIC DOCUMENT
TRADE SECRET INFORMATION AND NON-PUBLIC DATA EXCISED

We recognize that site-specific generation is not typically a part of traditional resource planning analysis. However, the plan components we are proposing will have wide-ranging impacts on our system and region, making a locational analysis imperative to ensuring continued reliability and maximizing customer benefits. For these reasons, and those discussed later in this Supplement, we believe that a locational analysis is appropriate and in the public interest.

Our ownership of these assets, along with a balanced portfolio of the renewable generation we propose to add to the system, is a critical component of our vision, because it results in a balanced generation portfolio that will minimize customer costs and mitigate risk. The specific benefits of ownership include investment in our communities, continued use of our interconnection rights at Sherco, long-term value for our customers arising from the asset life of owned resources, increased diversity in our generation portfolio, and a demonstration of our commitment to being a leading provider of cleaner and greener energy. Our ability to secure these benefits for our customers is a critical component of our Current Preferred Plan and, we believe, an important factor in the public interest analysis.

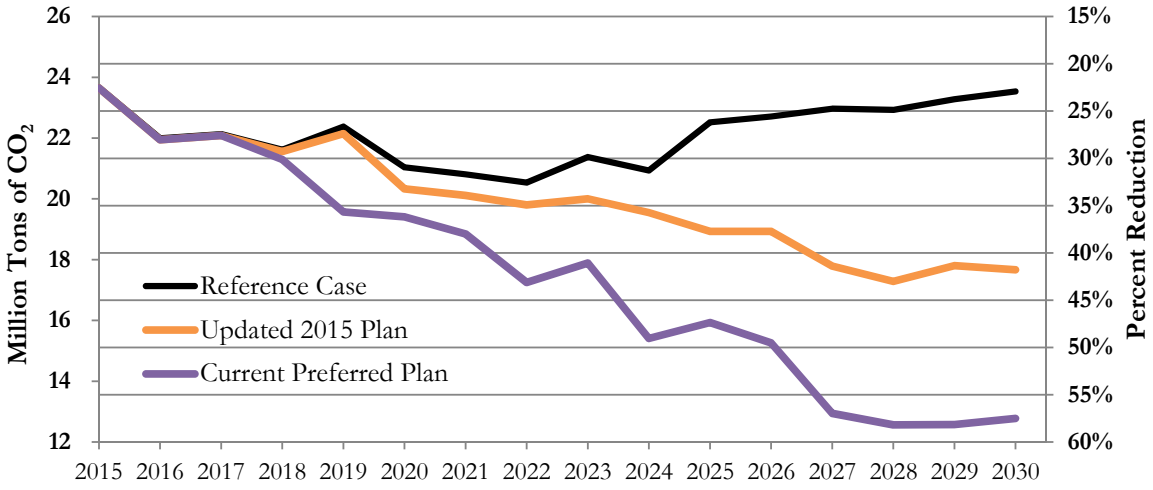
Finally, because our nuclear fleet comprises more than half of the Company's carbon-free generation, it is a cornerstone to our carbon-reduction goals. We continue, therefore, to support operating our nuclear fleet through the end of each plant's respective current licensed life. In October, we acknowledged our projected increase in the capital costs necessary to run the Prairie Island nuclear plant to the end of its current licensed life. At the hearing on December 3, 2015, the Commission sought additional information on the increased capital forecast, and we have since studied the Prairie Island numbers in greater depth. Two key conclusions emerged from this study. First, the lower fixed operating and maintenance costs we have experienced relative to our 2008 modeling projections more than offset the increased capital projections – by more than $950 million. Second, even with the increased capital costs (the bulk of which occur in 2021 and beyond), Prairie Island has been, and continues to be, a cost-effective resource.

We recognize however, that stakeholders would like to better understand the implications of our updated forecast, as well as the potential for future updates. To help promote a better understanding of these costs, we are including a detailed discussion of Prairie Island in this Supplement. We believe that this information supports our continued operation of the plant, including the near-term investments we must make to safely and reliably operate our plants over the next few years. We acknowledge, however, that it is impossible to perfectly forecast costs for the

PUBLIC DOCUMENT
TRADE SECRET INFORMATION AND NON-PUBLIC DATA EXCISED

remaining 19 years of the plant's licensed life and recognize that stakeholders may want to explore alternatives based on that uncertainty. We therefore provide some preliminary analysis relating to an alternative path for Prairie Island (an "off-ramp") sometime in the mid-2020s. We recognize that there are other alternatives, but our analysis confirms that any near-term retirement would be significantly more costly than one in the mid-2020s or beyond. We agree that it makes sense to continue a dialogue regarding the future of Prairie Island. If the Commission wishes to further explore alternatives to operating Prairie Island through its current licenses, we are committed to doing the work necessary to advance this discussion, and anticipate that it could be completed within 18 months. At the same time, we believe that this Supplement demonstrates that the continued operation of Prairie Island is cost-effective and in the public interest in the near term, such that our continuing dialogue should not impede approval of our Current Preferred Plan.

Together, these actions will result in a significant transformation in our generation fleet, including a nearly 60 percent reduction in carbon emissions by 2030. The following graph shows the dramatically reduced carbon emissions that would result from our Current Preferred Plan, as compared to both our Updated 2015 Plan and Reference Case:



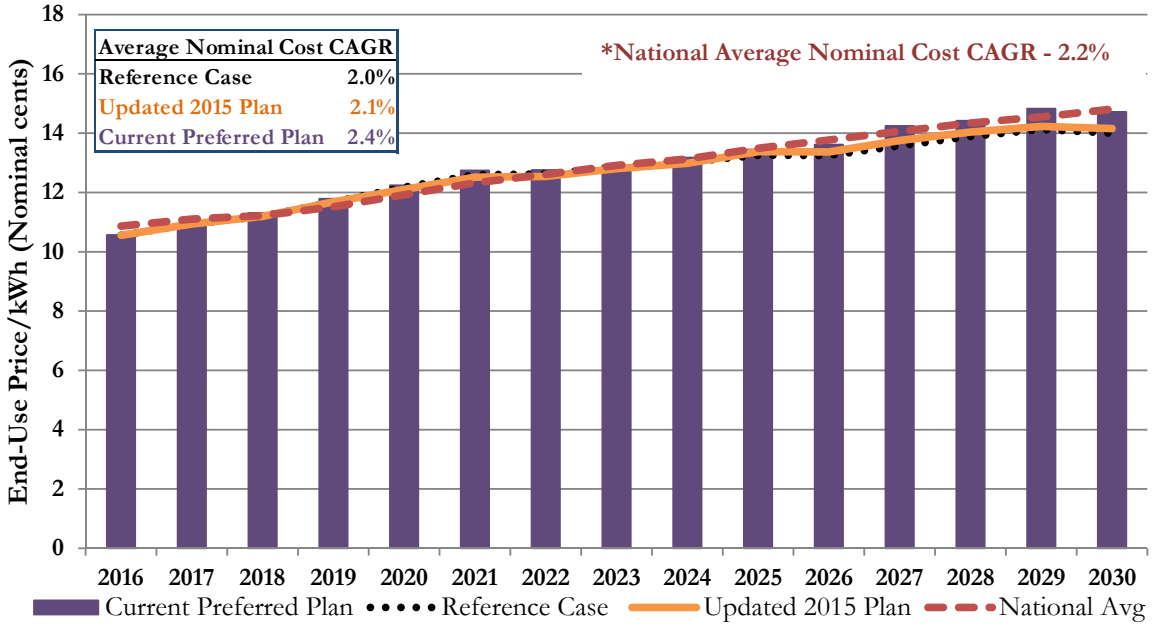
While the Updated 2015 Plan would have achieved substantial progress toward federal and state energy goals, the Current Preferred Plan – which grew out of the 2015 Plan through hard work and collaboration with stakeholders – does more. It

PUBLIC DOCUMENT
TRADE SECRET INFORMATION AND NON-PUBLIC DATA EXCISED

moves Minnesota significantly closer to achieving its goal of 80 percent carbon reduction by 2050, and it is the only scenario that is nearly certain to be compliant with the Clean Power Plan.

Our Current Preferred Plan achieves these goals without significantly impacting customer costs, reliability, our employees, or the communities we serve. In fact, due to recent extensions to federal tax incentives for solar and wind generation, the cost of our Current Preferred Plan is even lower than we anticipated in our October Reply Comments. We can now offer a plan that achieves 50 percent more carbon reduction than our Updated 2015 Plan for a nominal customer cost of less than one-half of one percent Compound Annual Growth Rate (CAGR) over that plan. The opportunity to achieve such significant reductions in our carbon emissions for a nominal increase in customer cost is one of the principal benefits of our Current Preferred Plan, which is reflected in the Strategist modeling discussed in detail later in this supplement.

As we would expect, the trajectory of our Current Preferred Plan deviates from our Reference Case and Updated 2015 Plan mostly in the out years of the planning period, after we complete the transition away from coal operations at Sherco Units 1 and 2. The following graph shows the relative cost growth of our Current Preferred Plan, Updated 2015 Plan, and Reference Case, in comparison to the national average:



PUBLIC DOCUMENT
TRADE SECRET INFORMATION AND NON-PUBLIC DATA EXCISED

*National energy cost forecast from Energy Information Administration (EIA) Annual Energy Outlook 2015, Table Energy Supply, Disposition, Prices and Emissions. End use prices, all sector average.

As shown above, the cost of the three plans are comparable and roughly consistent with the expected national average increase in energy prices over the planning period.

Our Current Preferred Plan is in the public interest. It builds on our strong foundation of environmental performance, and ensures we will continue to reliably meet our customers' electricity needs in a cost-effective manner. It puts the Company on a path to transform its fleet in a planful, coordinated way that ensures we will meet our obligations under the Clean Power Plan and the most stringent of our state renewable energy and carbon reduction requirements. Implementation of our plan will put Minnesota at the forefront to lead the nation in clean energy, and at the same time, acknowledges and constructively addresses the unique policy preferences of the NSP System states. It provides our customers, employees, and communities with certainty while also maintaining flexibility to adjust and respond to changes along the way. Our Current Preferred Plan maintains a balanced diversity of energy sources and provides investment opportunities that will benefit the economies and communities in the states we serve. Finally, it promotes an orderly, gradual transition of our generation fleet and thus avoids a scenario where the Company may have to retire and replace five baseload generating facilities in the early 2030s.

To be sure, the process for approving this Resource Plan has taken longer than anticipated, and our Current Preferred Plan charts a path that is longer still. We believe, however, that a fleet transformation of this magnitude and scope requires a deliberate process, and that our Current Preferred Plan is a direct result of our deep engagement with stakeholders throughout this process. We have completed an extensive analysis since our October Reply, as well as in response to the Commission's January 6, 2016 Order. We are therefore appreciative of this opportunity to share our analysis and additional information in support of our Current Preferred Plan and look forward to engaging with our stakeholders to continue the constructive dialogue that brought us this far.

II. BACKGROUND

The Company submitted its 2016-2030 Upper Midwest Resource Plan on January 2, 2015, as required by the Commission's May 23, 2014 Order in the Competitive Acquisition Process (CAP) proceeding, which was an outcome from our last

PUBLIC DOCUMENT
TRADE SECRET INFORMATION AND NON-PUBLIC DATA EXCISED

Resource Plan.[1] The Commission made determinations in that proceeding in December 2014, which, due to the timing, we were unable to incorporate into our Initial Filing.

On January 16, 2015, the Commission issued a NOTICE requiring the Company to supplement its Resource Plan with a revised Preferred Plan that incorporated the CAP resource decisions. On March 16, 2015, we submitted a Supplement incorporating the CAP resources, the 187 MW Solar RFP Portfolio the Commission approved in February 2015 in Docket No. E002/M-14-162, an acceleration of small solar additions to reflect the Community Solar Gardens proceeding, and additional modeling and discussion that resulted from our stakeholder engagement.[2]

Parties commented on the completeness of our Resource Plan on April 3, 2015, and as part of our April 17, 2015 Reply to those Comments, we submitted a detailed five-year rate analysis of our updated Preferred Plan. On July 2, 2015, parties commented on our Preferred Plan.

On October 2, 2015, we replied to parties' comments, in part committing to maintain a goal of 1.5 percent Demand Side Management (DSM) through the planning period and find ways to stimulate greater demand response with our customers – and in addition, outlined a Revised Proposal that would transition our system from coal generation, advance the acquisition of significant levels of renewable generation, recognize nuclear energy as a critical carbon-free baseload resource, and confirm our commitment to energy efficiency efforts. We also proposed to supplement the record with a detailed analysis supporting our Revised Proposal on January 29, 2016.

On January 6, 2016, the Commission approved our request to submit a Supplement on January 29, 2016, and set forth several informational requirements for the Supplement.[3] The Commission's Order additionally set a 30-day period within which the Minnesota Department of Commerce (Department) is to submit a letter to the Commission recommending a comment period and whether any additional information is needed. After reviewing the Department's recommendation and recommendations from any other party, the Executive Secretary is authorized to set a Reply Comment period.

PUBLIC DOCUMENT
TRADE SECRET INFORMATION AND NON-PUBLIC DATA EXCISED

We note that in this Supplement, we have updated the naming of our scenarios from our past filings to properly reflect our Current Preferred Plan for which we seek regulatory approval as follows:

January 2, 2015 Initial Filing	March 16, 2015 Supplement	October 2, 2015 Reply Comments	January 29, 2016 Supplement
Reference Case	Reference Case	Reference Case	Reference Case
Preferred Plan	Updated Preferred Plan	Preferred Plan	Updated 2015 Plan
N/A	N/A	Revised Proposal	Current Preferred Plan

The Updated 2015 Plan in this Supplement is named as such because we allowed our updated modeling for this scenario to select Production Tax Credit (PTC)- and Investment Tax Credit (ITC)-priced renewable resources, as a result of the December 2015 extension of these Federal tax incentives. Implementing this change allows for improved comparability of our Current Preferred Plan and our previous filings in this proceeding.

III. CURRENT PREFERRED PLAN

Our Current Preferred Plan proposes a bold energy vision that is centered around four principles:

First, accelerate the transition from coal energy to lower- and zero-carbon resources. Specifically we propose to:

- Achieve a reduction of in carbon dioxide (CO_2) emissions of nearly 60 percent (from 2005 levels) by 2030,
- Cease coal generation at Sherco Unit 2 in 2023 and Sherco Unit 1 in 2026, and
- Advance the addition of substantial renewable generation (1,200 MW by 2020).

Second, preserve regional system reliability. The preservation of system stability will be critical as we make the transition from coal energy to renewables, and we will preserve it by adding natural gas to our system and by continuing to operate our carbon-free nuclear fleet. We therefore propose to:

- Reaffirm our commitment to nuclear energy through the current licenses of our existing units,
- Add a combustion turbine (CT) in North Dakota by the end of 2025, and

PUBLIC DOCUMENT
TRADE SECRET INFORMATION AND NON-PUBLIC DATA EXCISED

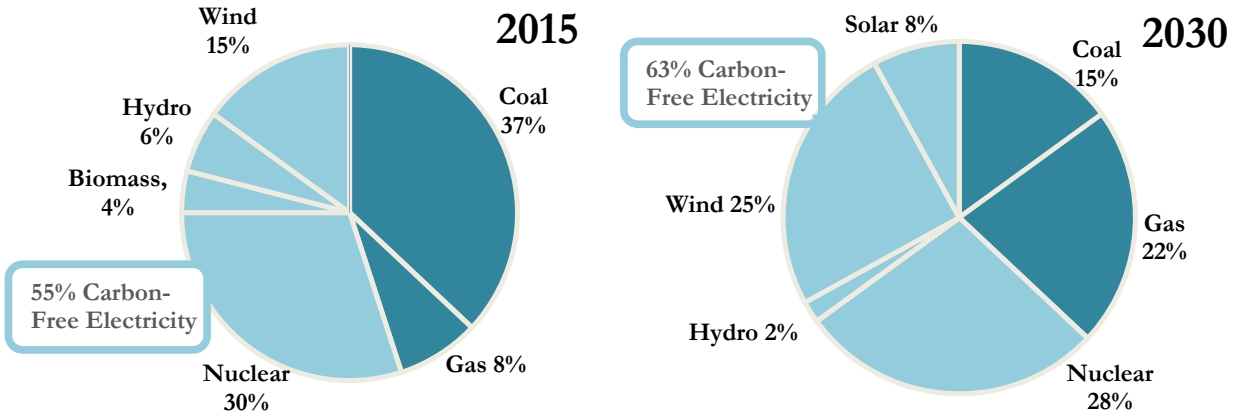
- Replace Sherco generation onsite with a combined cycle (CC) no later than 2026.

Third, pursue energy efficiency gains and grid modernization. We will continue our commitment to energy efficiency and new technologies and look to capitalize on these efforts rather than seeking to replace coal capacity megawatt for megawatt. We believe that modernizing the grid will further enable customer-driven solutions.

Fourth, ensure customer benefits. We will work with our state Commissions, the Minnesota Pollution Control Agency (MPCA) along with its counterpart environmental agencies in our other states, and our stakeholders to ensure our customers get the full benefit of our proposal. Specifically, we will work to maximize the benefits of complying with the Clean Power Plan (CPP) State Plans for our customers and communities.

In short, our vision for the future is cleaner at an affordable price. While our Current Preferred Plan includes slight variations in the timing and siting of our resource additions as compared to the proposal we outlined in our October 2 Reply, the resulting 2030 energy mix is the same. Likewise, the primary resource changes – ceasing coal operations at Sherco Units 1 and 2 and more than doubling the renewable resources on our system – remain unchanged. Figure 1 below provides a side-by-side comparison of our energy mix in 2015 and 2030.

Figure 1: 2015 Energy Mix Compared to Current Preferred Plan in 2030



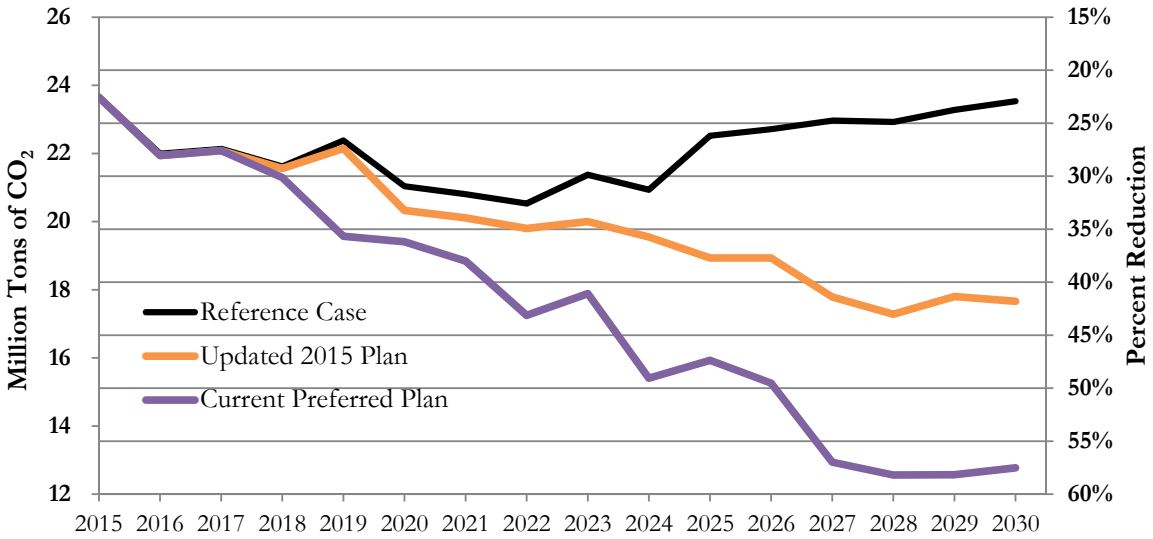
Our Current Preferred Plan dramatically changes the NSP System energy mix at the end of the planning period. Coal *reduces* from 37 to 15 percent; natural gas *increases*

PUBLIC DOCUMENT
TRADE SECRET INFORMATION AND NON-PUBLIC DATA EXCISED

from 8 percent to 22 percent; solar, which makes up less than 1 percent of our energy mix in 2015, *increases* to 8 percent by 2030; wind *increases* from 15 to 25 percent; biomass and hydro *drop* to zero and two percent, respectively (due to contract expirations), while nuclear remains relatively constant at around 30 percent.

While our Updated 2015 Plan would have reduced our 2030 CO_2 emissions 40 percent from 2005 levels, our Current Preferred Plan puts us on an even greater CO_2 reduction trajectory. It will reduce CO_2 emissions by nearly 60 percent from 2005 levels by 2030, and it will move us significantly closer to achieving Minnesota's policy objective of an 80 percent reduction by 2050.

Figure 2: Projected Carbon Reduction from 2005 Levels



As discussed in greater detail below, we will achieve this dramatic reduction for just a fraction of a percent in incremental cost over our Updated 2015 Plan. Figure 2 below compares the projected CO_2 reduction of our Current Preferred Plan to our Updated 2015 Plan and the Reference Case.

It is also important to note that – given what we now know about the final CPP rules – the Reference Case would clearly not comply with the CO_2 reductions required of the Company under Minnesota's state plan to implement the CPP, nor may the Updated 2015 Plan. Further, we believe additional environmental compliance regulations will continue to place pressure on coal operations at Sherco. It is possible that installation of Selective Catalytic Reduction (SCR) equipment for tighter nitrogen oxide (NOx) control might be required near the end of the planning

PUBLIC DOCUMENT
TRADE SECRET INFORMATION AND NON-PUBLIC DATA EXCISED

period.[4] We believe the actions we are proposing to take with our Current Preferred Plan positions us well to serve our customers into the future, and reduces the risk of potential future increased costs to maintain environmental compliance.

IV. MINIMUM SYSTEM NEEDS & EXPANSION PLAN

In this section, we discuss our strategy and proposal to address the future capacity deficit that results from our proposal to cease coal operations at Sherco Units 1 and 2, combined with a number of other large changes in our generating resources.

A. Load & Resources Analysis and Future Capacity Deficits

We provide in Table 1 below an updated Load and Resources (L&R) analysis that reflects our excess/deficit capacity position for the planning period, starting with the approved and existing resource additions reflected in our March 2015 Supplement. It also addresses the impact of the resource changes we propose as part of our Current Preferred Plan and summarizes our resulting capacity position through the planning period. Consistent with our January 2015 initial filing and all subsequent filings, we have used the same fall 2014 load forecast in this analysis, and maintained the same available resources to the Strategist model.

[4] In January 2016, the Eighth Circuit issued an opinion that upheld EPA's approval of the Minnesota regional haze plan, which did not require installation of SCRs on Sherco Units 1 and 2. The next regulatory developments that could include a requirement to install SCRs on these units will occur in the early 2020s, with installation potentially required in the late 2020s. The ozone standard, if made more stringent in 2020, might drive SCR installation in the 2027-2032 timeframe. The next round of regional haze planning is expected to occur in the early 2020s (EPA has announced plans to delay the 2018 deadline by 2-3 years), which could drive SCR installation in the late 2020s. We estimate that the capital cost for the installation of an SCR is approximately $250 million per unit in 2015 dollars.

The "Capacity Excess/Deficit March 16, 2015 Filing" line in Table 1 represents our updated capacity position before adding any of the resource changes proposed in our Current Preferred Plan. Consistent with our March 2015 Supplement and our October 2015 Reply, it shows we expect to have sufficient capacity to meet our customers' needs through 2024. However, beginning in 2025 our capacity position shifts from a surplus of nearly 500 MW to a deficit of over 2,200 MW by 2030. Much of this shift is due to the retirement of approximately 800 MW of peaking plants, as well as the expiration of nearly 1,700 MW of hydro and natural gas Power

[5] MISO Unforced Capacity values, summer ratings.

PUBLIC DOCUMENT
TRADE SECRET INFORMATION AND NON-PUBLIC DATA EXCISED

Purchase Agreements (PPAs) during the period, including the expiration of our existing 850 MW PPA with Manitoba Hydro in 2025.

The "Capacity Excess/Deficit Jan 29, 2016" line represents our position after applying the changes to existing resources that are part of our Current Preferred Plan.[6]

B. Current Preferred Plan Expansion Plan

Our Current Preferred Plan proposes to address the capacity deficit through a combination of renewable resource additions in the early years, and the addition of natural gas CT and CC units. In summary, our proposed resource additions are:

- 1,400 MW of large solar additions, including 400 MW by 2020,
- 1,800 MW of additional wind, including 800 MW by 2020,
- A 786 MW CC addition at the Sherco site in 2026 to replace the capacity of Sherco Unit 1 before it ceases operation,
- A 230 MW CT located in North Dakota by the end of 2025, and
- Over 1,800 MW of additional CT capacity.

The early renewable energy additions in our Current Preferred Plan will allow us to capitalize on favorable market pricing associated with the recently extended Federal ITC and PTC tax incentives, reducing the cost impacts of our Current Preferred Plan.

Our modeling results, described in more detail below, consistently show the addition of a CC in 2027.[7] We propose to locate the CC at Sherco because it will allow us to cost-effectively address the transmission issues identified by the Midcontinent Independent System Operator (MISO) Attachment Y2 Study, ensure the stability and reliability of our transmission system, mitigate impacts to the local community and our employees, and potentially provide improved access to natural gas supplies for communities in central Minnesota.

[6] Unit retirements typically occur during a period of the three to nine months following the summer peak (months October-May). Commercial operation of replacement generation would commence between the months of October and March to maintain adequate capacity resources to meet MISO obligations.
[7] 2027 represents the year the CC resource is needed to address a capacity deficit; our Current Proposed Plan proposes that a replacement CC unit go in-service at Sherco such that there will be no gap in MISO capacity accreditation.

PUBLIC DOCUMENT
TRADE SECRET INFORMATION AND NON-PUBLIC DATA EXCISED

In order to balance the perspectives of the stakeholders in the states we serve and maintain the benefits of an integrated system for all of our customers, we also propose to add a CT near our North Dakota load. This would address the reliability concerns of the North Dakota commission, while preserving the objective of both the North Dakota and Minnesota commissions for the Company to develop cost-effective generation proposals.

We show the resource additions we propose with our Current Preferred Plan in Table 2 below.

Table 2: Current Preferred Plan Expansion Plan[8] (MW ICAP[9])

	2015	2016	2017	2018	2019	2020	2021	2022	2023	2024	2025	2026	2027	2028	2029	2030	Total
Large Solar	-	-	-	-	200	-	200	100	100	200	100	100	-	400	-	-	1,400
Wind	-	-	-	-	800	-	-	400	-	-	400	200	-	-	-	-	1,800
CT	-	-	-	-	-	-	-	-	-	-	460	690	230	230	-	230	1,840
Fargo CT	-	-	-	-	-	-	-	-	-	-	230	-	-	-	-	-	230
Sherco CC	-	-	-	-	-	-	-	-	-	-	-	-	786	-	-	-	786

Note: Resources are shown in their first full year of operation and will go into service the year prior.

We note that, with respect to solar, only the utility-scale resource additions proposed as part of our Current Preferred Plan are identified in this Expansion Plan. All small solar and previously-approved large solar resources are included as available resources in the L&R in Table 1 above. We discuss an update to our *small* solar forecast in Attachment B to this Supplement. To the extent small-scale solar additions out- or under-pace our updated small solar forecast, we will make corresponding adjustments to our large solar acquisition plan.

For reference, we provide updated Renewable Energy Standard and Solar Energy Standard compliance information, as well as the Expansion Plans for the Reference Case and Updated 2015 Plan in Attachment C.

V. RESOURCE PLANNING ANALYSIS

We provide as Attachment B details regarding our revised modeling assumptions, the scenarios and sensitivities analyzed, potential alternatives, an economic analysis,

[8] We clarify that we do not show the small solar additions, the 187 MW Solar RFP, or the competitive acquisition process resources in our Expansion Plan. These are included as existing/approved resources in the Updated L&R (Table 1).
[9] MISO Installed Capacity values.

PUBLIC DOCUMENT
TRADE SECRET INFORMATION AND NON-PUBLIC DATA EXCISED

a discussion on our treatment of dump energy, and a methodology for our long-term rate impact projections – which we also summarize below.

We analyzed and compared five key scenarios in our analysis. We summarize the assumptions underlying these scenarios in Table 3 below.

Table 3: Summary of Scenarios Analyzed

Scenario Name	Description
Current Preferred Plan	• Ceases operation of a total of 1,400 MW of capacity and associated energy at Sherco Unit 2 in 2023 and Unit 1 in 2026 • Adds 1,800 MW of wind • Adds 1,400 MW of large solar • Includes 700 MW of small solar • All renewable costs updated for Federal ITC/PTC extension • Includes goal of 50 percent ownership of renewables • Adds Company-owned Fargo CT by 2025 and Sherco CC in 2027
Current Preferred Plan – All Generics	Same resource changes as Current Preferred Plan, with all generic thermal replacements
Reference Case	• Continues operation of Sherco Units 1 and 2 through the end of the planning period • Adds 400 MW of wind • Includes 400 MW of small solar additions • Includes 287 MW of large solar additions
Updated 2015 Plan	• Continues operation of Sherco Units 1 and 2 through the planning period • Adds 1,800 MW of wind • Adds 1,400 MW of large solar • Includes 700 MW of small solar • Updated for Federal ITC/PTC extension
North Dakota Plan	No additional renewables beyond currently committed 750 MW of wind; no assumptions changes.

We additionally considered the following alternative scenarios, which we discuss in Attachment B:

- A scenario that converts a Sherco Unit to a Gas Boiler, and
- A scenario that relies only on renewables.

PUBLIC DOCUMENT
TRADE SECRET INFORMATION AND NON-PUBLIC DATA EXCISED

We also discuss Demand Response, Distributed Energy Resources, and Grid Modernization as Alternative Resources in Attachment F.

We evaluate these scenarios holistically by analyzing their environmental performance, strategic flexibility, and cost using a "Run Key" to summarize and compare key Strategist modeling metrics. The Run Key below includes the results of the Present Value Revenue Requirements (PVRR) and Present Value of Societal Costs (PVSC) analysis for each of our key scenarios to provide a reference point, but it also identifies key policy outcome metrics such as the reduction in CO_2 emissions from 2005 levels and the amount of renewable energy added to the NSP System under each scenario. We note that the PVRR and PVSC results are the result of the Strategist model, which extends beyond the planning period to 2053.

Table 4: Run Key[10]

	PVSC Results ($M)	PVRR Results ($M)	2030 Coal Gen vs. Ref Case	2030 Gas Burn (Bcf)	2030 Percent CO_2 Reduction	Total Expansion Plan Renewable Additions (MW)	CPP Compliant?
Current Preferred Plan	$51,293	$45,606	-59%	83	58%	3,200	Yes
Current Preferred Plan, All Generics	$51,280	$45,582	-59%	84	57%	3,200	Yes
Updated 2015 Plan	$51,458	$45,302	-16%	32	42%	3,200	Uncertain
Reference Case	$52,422	$45,605	-	58	23%	400	No
North Dakota Plan	$52,620	$45,473	+3%	68	19%	0	No

The comprehensive Run Key analysis shows that our Current Preferred Plan has the strongest performance in terms of CO_2 reductions and renewable energy additions to the NSP System. The amount of renewable energy additions in our Updated 2015 Plan and Current Preferred Plans are consistent, but the timing and ownership assumptions have shifted. Our Current Preferred Plan continues to provide the best value for our customers – achieving a balance between multiple objectives including reasonable costs, dramatic emissions reductions, anticipated compliance with the CPP, and sustained reliability on our system.

[10] In this Run Key Table, the PVRR Results, change in coal generation in 2030 as compared to the Reference Case (2030 Coal Gen vs. Ref Case), amount of gas burned at our plants in 2030 in Billions of cubic feet (2030 Gas Burn (Bcf)), and the percent reduction of CO_2 from 2005 levels (2030 Percent CO_2 Reduction) are all considered under a cost sensitivity that excludes regulatory costs and CO_2 externalities in the dispatch (Sensitivity T, explained in detail in Attachment B). Under this sensitivity, there will be a tendency to overestimate CO_2 emissions, as coal would be 'priced' at a lower cost and the likelihood of dispatching the resource more frequently would therefore be increased.

PUBLIC DOCUMENT
TRADE SECRET INFORMATION AND NON-PUBLIC DATA EXCISED

A. Modeling Approach

This resource planning process begins the transformation of our generating fleet and signals a step change. It is additionally important to the states in the Upper Midwest Region in terms of alignment and compliance with the requirements of the CPP.

Over the last 20 years, resource plans have traditionally centered on meeting the needs of a growing system, or replacing smaller generators that have reached the end of their lives. In this Resource Plan, we are proposing to cease operation of 1,400 MW of coal generation at Sherco Units 1 and 2, which represents over 30 percent of our baseload generating capacity within the short 2023-2026 timeframe. Because these resources are concentrated in a single geographic area and proximate to other baseload generation, it is important to consider the location of replacement generation. This is a departure from traditional resource planning. In this instance however, the location of new or replacement generation requires additional consideration due to the potential impact to the system of removing such large important assets.

In considering the replacement of key components of an existing system, such as Sherco Units 1 and 2, the analysis must take into account a number of additional considerations that cannot always be captured in economic modeling or analysis terms. These other considerations are both technical and policy-based and include the security and reliability of the combined operation of the generation fleet and the transmission system.

We therefore conducted both traditional "generic" and location-specific Strategist modeling to inform the Current Preferred Plan we propose. We provide an optimized capacity Expansion Plan that considered only generic capacity alternatives as Table 5 below.

Table 5: Generic Unit Expansion Plan (MW ICAP)

Current Preferred Plan - All Generic	2015	2016	2017	2018	2019	2020	2021	2022	2023	2024	2025	2026	2027	2028	2029	2030	Total
Large Solar	-	-	-	-	200	-	200	100	100	200	100	100	-	400	-	-	1,400
Wind	-	-	-	-	800	-	-	400	-	-	400	200	-	-	-	-	1,800
CT	-	-	-	-	-	-	-	-	-	-	690	690	230	460	-	-	2,070
CC	-	-	-	-	-	-	-	-	-	-	-	-	778	-	-	-	778

These analyses resulted in the same conclusions in terms of the size and type of expansion resources and nearly identical in their timing. Both the site-specific and

PUBLIC DOCUMENT
TRADE SECRET INFORMATION AND NON-PUBLIC DATA EXCISED

generic modeling shows a need for CT capacity in the 2025 timeframe and a CC addition in 2027.[11]

However, as part of the determination to cease coal operations at Sherco Units 1 and 2, we believe it is important and appropriate to also consider the impacts to the transmission system, the local community, state and federal policies, customer and community preferences and cost impacts. We have undertaken numerous studies to better understand these and other implications of our Current Preferred Plan. We believe our plan addresses these issues through our proposal to locate a CT in North Dakota by the end of 2025 and to locate a CC at the Sherco site in 2026 in order meet the capacity deficit resulting from ceasing coal operations at the second Unit.

Table 6 below outlines our capacity surplus/deficit position after applying the proposed resource additions of our Current Preferred Plan.

Table 6: Capacity Position with Current Preferred Plan Expansion Plan (MW UCAP)

Current Preferred Plan Proposed Additions	2016	2017	2018	2019	2020	2021	2022	2023	2024	2025	2026	2027	2028	2029	2030

As shown above, our resulting capacity position is a surplus through the planning period. In 2025 and beyond, our position reflects the expiration of significant capacity resource PPAs and peaking retirements we discussed above, resulting in our more narrow capacity position in the out-years of the planning period. Because

[11] The Department noted in its November 6, 2015 Comments that the Updated 2015 Plan we filed in our initial January 2015 filing and March 2015 Supplement did not include the addition of a CC resource prior to 2030. We note that at the time of those filings, we had not proposed to cease operation of any major generating units in the planning period like we now propose with Sherco Units 1 and 2. Ceasing coal operations of Sherco Units 1 and 2 results in the loss of nearly 1,400 MW of high-capacity-factor generation, which drives our need to add a CC resource prior to 2030. The model selects a natural gas CC unit in 2027 as a cost-effective resource addition to fill this gap. In addition to the favorable economics of adding a CC instead of a CT, at the time the second Sherco Unit ceases coal operation, we must also consider the technical system benefits the Sherco Units provide through their spinning mass to help maintain system reliability. We would not expect a simple-cycle CT to be online very often – nor would that be cost-effective as compared to a CC.

PUBLIC DOCUMENT
TRADE SECRET INFORMATION AND NON-PUBLIC DATA EXCISED

these changes will occur in the out-years, we can continue to monitor our position over time and through the course of upcoming resource planning cycles. Addressing any potential necessary resource additions to meet capacity needs in the mid to late 2020s will be analyzed in our next Resource Plan filing, which we expect to occur by 2018.

B. Locational Analysis

As we have discussed, Resource Plans typically do not analyze location-specific alternatives. However, we believe that our Current Preferred Plan – as well as state and federal policies – present unique challenges that are not easily addressed through a traditional resource planning framework. Sherco Units 1 and 2 are critical components of our energy supply and the Upper Midwest grid. In addition to the energy and capacity they provide to customers, the sheer mass and operating characteristics of these Units provide important system benefits that impact customer reliability. For these reasons, and because the maintenance of system reliability is critical to serving the public interest, a location-specific analysis is essential. With respect to the CT needed in 2025, our North Dakota regulators have stated a preference, and the Company has agreed, to have dispatchable generation located close to our largest load centers in North Dakota, which we discuss in part 3 below.

In order to examine various aspects of the technical and policy-based issues associated with Sherco Units 1 and 2, we undertook several studies to understand the impacts of ceasing coal operations at Sherco Units 1 and 2. The studies we conducted to examine the implications of potentially ceasing coal operations at Sherco Units 1 and 2 are as follows: (1) a MISO Attachment Y2 Study, which assessed grid implications if Units were no longer operating; (2) an Xcel Energy Transmission Reliability Study, which assessed grid implications of replacing all or a portion of the Units' capacity at other locations on the NSP System; (3) a Black Start Plan Analysis that assessed the implications associated with altering our system restoration path and would be necessary because the Units currently play an essential role in the event of a major system outage; and (4) a socioeconomic analysis conducted by the Leeds School of Business at the University of Colorado Boulder and the Labovitz School of Business and Economics at the University of Minnesota Duluth.

We discuss each of these location-specific resources below.

PUBLIC DOCUMENT
TRADE SECRET INFORMATION AND NON-PUBLIC DATA EXCISED

1. On-Site Combined Cycle Unit at Sherco

First, we are proposing to construct a 786 MW (ICAP) natural gas CC onsite at the current Sherco site. Because we are not replacing all of the MWs that result from ceasing coal operations at Units 1 and 2 with the CC unit, there will be additional interconnection injection capabilities at the site, which we are proposing to partially utilize by also constructing photovoltaic (PV) solar generation on existing property.[12]

As outlined in Attachment B, our updated modeling for this Supplement includes several options for a CC: (1) at the site of the current Sherco 1 and 2 Units, (2) at a generic brownfield site, and (3) at a generic greenfield site. We developed the option of onsite replacement to incorporate into our Strategist modeling an economic analysis of locating generation at the Sherco site. We believe there are significant benefits associated with siting the CC at the Sherco site, which we discuss below.

a. Benefits of Onsite Generation at Sherco

There are number of benefits to locating a replacement CC at the Sherco site. Importantly, our Strategist demonstrates that the addition of a CC unit onsite at Sherco is part of a least-cost capacity expansion plan. However, not all relevant factors are easily converted to an economic basis for inclusion in Strategist. For instance, there are benefits to using existing infrastructure and an existing brownfield site that do not easily reduce to economic terms, including the fact that the transmission grid has been studied, designed, engineered and operated for decades to provide a high degree of reliability and resiliency for customers by incorporating significant generation injection at the Sherco site. Similarly, it is important to consider that our host community of Becker, Minnesota and the greater Sherburne County area has come to depend on local employment opportunities, property taxes, and other economic benefits associated with the existing units. We discuss these factors below.

Use of Existing Infrastructure. As an existing brownfield generation site, the Sherco site offers a number of advantages over new greenfield sites, both in terms of operations and cost. For example, we can use our existing interconnection rights and existing substation and transmission outlet capacity once Units 1 and 2 cease

[12] We have identified two areas on the existing Sherco site for solar development. One location would be atop the closed and capped ash ponds 1 and 2 and the second would be on open land on the north side of the Mississippi River between the Sherco plant and the Monticello plant.

PUBLIC DOCUMENT
TRADE SECRET INFORMATION AND NON-PUBLIC DATA EXCISED

coal operations. The existing Sherco site also comprises sufficient available land to site a CC unit and is already permitted for a large industrial generating facility. Further, existing water and wastewater treatment facilities can support the proposed CC unit, and existing facility staff, administration, warehousing, and maintenance facilities can likewise be utilized. Finally, the site's water allocation is sufficient for cooling approximately 2,300 MW of generation (the current combined installed capacity of Sherco Units 1, 2 and 3), which means that once Units 1 and 2 cease coal operations, an allocation equivalent to approximately 1,400 MW will become available. Consequently, portions of the Unit 2 cooling system can be reused by the new CC facility, allowing the replacement CC at the Sherco site to be wet-cooled, improving both performance and cost.

The System is Designed to Reliably Operate with Significant Generation Injection at Sherco. From the technical studies conducted by MISO and the Company we concluded that we can avoid anticipated impacts on the electric transmission system and related costs by replacing generation at Sherco. In contrast, siting replacement thermal generation at other locations on the NSP System have disadvantages compared to siting a CC at Sherco, including a significant level of uncertainty with regard to final costs and performance. The *Xcel Energy Transmission Reliability Study* confirmed that the existing transmission system with significant generation injection at Sherco works well, and plays a significant role in providing reliable service for NSP System customers and other customers in our portion of the MISO region. It also concluded that there are transmission upgrade costs and other trade-offs associated with replacing Sherco Units 1 and 2 at an alternative location, such as increased energy losses the farther the replacement generation is located from the Twin Cities load center.

Unlike an onsite CC that will have injection capability and interconnection rights, replacement generation at other locations will be subject to the MISO generator interconnection process, and may incur additional network upgrade costs beyond those we have identified. The MISO interconnection queue has changed significantly since these technical studies were initiated in early 2015. Since March 2015, requests to add nearly 10,000 MW of wind have entered the queue in the Iowa, Minnesota, North Dakota, and South Dakota area.[13] Nearly 70 percent, or 7,000 MW have paid all required study deposits and achieved milestones, qualifying them to participate in MISO's upcoming interconnection studies. This significant

[13] MISO Generator Interconnection Queue is located at: https://www.misoenergy.org/Planning/GeneratorInterconnection/Pages/InterconnectionQueue.aspx.

PUBLIC DOCUMENT
TRADE SECRET INFORMATION AND NON-PUBLIC DATA EXCISED

number of projects that have entered MISO's interconnection queue creates uncertainty with respect to the identified transmission impacts and associated interconnection costs. Replacement generation at the Sherco site, as we have proposed, has the added benefit of not being impacted by this uncertainty.

Locating a CC at the Sherco Site Avoids Significant Transmission Costs. Our technical studies each identified costs associated with siting replacement generation at locations other than Sherco. We summarize the study results below and provide a full summary of the studies and our conclusions as Attachment D.

MISO Y2 Study. MISO concluded that retirement of Sherco Unit 1 and Sherco Unit 2 would result in violations of applicable planning criteria that would require transmission upgrades and the need for Units to be designated as System Support Resources (SSR). Assuming a future Attachment Y study would have similar results, MISO would require that the identified violations be mitigated to its satisfaction prior to retirement of Sherco Units 1 and 2, if replacement generation is not located at Sherco. Specifically, the MISO Y2 study identified significant thermal and voltage violations in the Twin Cities if Sherco Units 1 and 2 are retired. The voltage violations impact our Monticello Nuclear Plant's operation and Nuclear Regulatory Commission (NRC) requirements. Both the thermal and voltage violations would need to be addressed through transmission investment in the Sherco area, regardless of the location of any replacement generation at an alternative site before the units could cease operation. Additional transmission upgrades that may be necessary due to the location of replacement generation, were not within the scope of the MISO Y2 study, but were studied in the Xcel Energy Transmission Reliability Study we discuss below. We provide this study report as Attachment D1.

Xcel Energy Transmission Reliability Study. Our study, conducted in conjunction with Siemens Power Technologies International, involved a full thermal analysis, full voltage analysis, and transient stability analysis. As noted above, it confirmed that the existing transmission system with significant generation injection at Sherco works well, and that there are transmission upgrade costs and other trade-offs associated with replacing Sherco Units 1 and 2 at an alternative location. We provide these study reports as Attachments D2 and D3.

PUBLIC DOCUMENT
TRADE SECRET INFORMATION AND NON-PUBLIC DATA EXCISED

Black Start Plan Analysis. Our analysis of our current Black Start Plan examined impacts if our current Sherco Units 1 and 2 target units cease coal operations.[14] Our analysis concluded that our proposal to construct a natural gas CC unit at the Sherco site would provide for use of the current and most efficient restoration path. Altering the restoration path away from the Sherco site will require the addition of various equipment and/or facilities and results in a longer restoration period, which is of greatest concern in winter/cold months. We have included the approximate costs of altering our restoration path as part of the costs associated with siting the 2027 CC at alternative locations.

If replacement generation is not sited at Sherco, we must mitigate the reliability issues our technical studies identified. For example, the Monticello Plant cannot operate if its voltage is outside the permissible range. As discussed further in Attachment D, we have determined that the best option to address these issues is to convert Sherco Unit 1 or Unit 2 to a Synchronous Condenser (SC). Importantly, SCs provide not only the required continuous range of voltage support, but are also a rotating mass that helps hold the grid electrically together following a disturbance such as a major fault. These additional costs stem from transmission upgrades and the need for additional equipment onsite at Sherco and other locations on the NSP System. We refer to these costs as "leave-behind" costs, which are therefore appropriately added to the cost of any combined cycle generator at an alternative location. The total leave-behind costs are shown below in Table 7.

[14] A Black Start Plan specifies the process of restoring the grid to full operation without relying on the external transmission network following a full or partial black out. Black Start Plans are required by the North American Electric Reliability Corporation (NERC), developed in concert with neighboring utilities, and are subject to review and approval by MISO.

Retiring Sherco Units 1 and 2 would have negative impacts on employment, GDP, and disposable personal income in Sherburne County. We understand the Commission has previously expressed interest in understanding the socioeconomic impacts on the Becker area, so therefore commissioned a socioeconomic study. We summarize the study below and provide a full summary and the study itself as Attachments G and G1, respectively. This Study assessed impacts on employment, Gross Domestic Product (GDP), and disposable personal income on the locations impacted by a change in operating expenditures, capital expenditures, property taxes, and electricity rates resulting from Unit retirement and replacement at an alternative location. The scenarios analyzed in the Study, included various potential Unit retirement dates and a scenario that included the replacement of the two Sherco Units with one CC at the Sherco site and one CC located in Dakota County. The Study found that all early retirement scenarios, when compared to a baseline where the Units continued operations through the planning period, result in moderately slower growth in the Minnesota economy. The closure of the Units showed negative impacts on employment, GDP, and disposable personal income in Sherburne County. However, if the generation is replaced elsewhere in Minnesota, those impacts are partially offset by positive economic impacts in the replacement location – mitigating on an overall state-level, the negative impacts. While the Study did not model a scenario that directly reflects our Current Preferred Plan, our proposed 2023 and 2026 dates fall within the range of scenarios analyzed.

PUBLIC DOCUMENT
TRADE SECRET INFORMATION AND NON-PUBLIC DATA EXCISED

As we stated in our October 2, 2015 Reply, ceasing coal operations at Sherco Units 1 and 2 will impact our employees and their families, the City of Becker and surrounding area, and Liberty Paper, which relies on steam from the Units for its operations. Charting a path certain for these stakeholders particularly, will provide an 8-10 year transition period, and with our proposal to site replacement generation onsite, will promote economic development, and reaffirm our commitment to central Minnesota. We are committed to mitigating impacts on our employees by working closely with our International Brotherhood of Electrical Workers union local to successfully manage the transition. Finally, our proposed onsite CC will provide additional options to continue to supply steam to Liberty Paper, who is a valued Xcel Energy customer, an important employer in the Becker area, and a critical part of Minnesota's recycling industry.

b. Costs of Onsite CC

Generating Equipment. We developed the costs for the onsite CC generation based on the installation of a 2x1 CC wet-cooled facility in 2026, which would begin commercial operation prior to the second Sherco Unit ceasing coal operations. The summer-rated capacity of the CC facility would be approximately 763 MW UCAP (786 MW ICAP). We developed our initial capital cost estimates for the onsite Sherco CC by adjusting the cost of the generic CC used in the modeling throughout this proceeding for the site-specific benefits associated with utilizing existing infrastructure. Because of the site's available water allocation, the replacement CC at the Sherco site is to be wet-cooled, improving both performance and cost. We expect the initial capital cost of the generic CC to be approximately **[TRADE SECRET BEGINS… …TRADE SECRET ENDS]** higher than our proposed onsite CC at Sherco.[15]

Because we have not obtained formal estimates for the turbine equipment or performed detailed engineering, we have developed delta cost estimates in order to compare the unique attributes of locating a CC onsite and at alternative locations. The ultimate project pricing will vary based on the final design definition, equipment price negotiations, contractual commercial terms, and other factors.

[15] 2015 dollars on a PVRR basis. We use the same Fixed Operating and Maintenance (Fixed O&M) costs and on-going capital costs as the generic CC alternative.

PUBLIC DOCUMENT
TRADE SECRET INFORMATION AND NON-PUBLIC DATA EXCISED

Natural Gas Infrastructure. Our proposed CC unit at Sherco will be fueled entirely by natural gas. Even though the community of Becker enjoys the benefits of heating their homes and commercial businesses with natural gas from Xcel Energy, there is not currently adequate pressure and capacity with the existing natural gas infrastructure to serve a new CC unit.

Therefore we performed a high-level cost analysis of bringing new natural gas infrastructure to serve the proposed CC unit at Sherco, so as to estimate a gas demand charge, which we estimate to be approximately **[TRADE SECRET BEGINS… … TRADE SECRET ENDS]** to the Sherco site. We based this estimate on our experience in designing, engineering, and constructing competitive natural gas infrastructure, which we do through the use of a competitive bidding process for each component or phase of the construction process. We also benchmarked the costs of some of our past significant, similar construction projects within the industry to ensure that our estimates are in-line with other contractors. We will leverage our knowledge, expertise, and competitive advantage to minimize costs for our customers. We note that we are also assessing opportunities arising from the new natural gas infrastructure that may afford numerous adjacent Minnesota communities along the proposed route greater access to a natural gas supply.

In determining the cost to construct the natural gas infrastructure, there are two primary aspects to consider: (1) the cost of the facilities from the source of supply to the new market (in this case, Sherco); and (2) the costs from the source of the supply, to ensure the new infrastructure has adequate pressure and capacity. We evaluated several alternatives to determine the best way to source the new supply to Sherco.

The associated capital cost estimates incorporated into our modeling are indicative. The cost estimates we provide for this analysis are based on current system constraints and associated capital construction project costs required to alleviate those constraints, which are subject to change. We believe however, they are reasonable and appropriate for planning purposes.

Transmission Infrastructure. As discussed above, because the new CC unit can use existing transmission interconnection rights, there will not be any associated network upgrade costs. Generators located at other locations would have to go through the MISO generator interconnection process in order to obtain

PUBLIC DOCUMENT
TRADE SECRET INFORMATION AND NON-PUBLIC DATA EXCISED

interconnection rights, and may additionally incur transmission upgrade costs. We estimate onsite substation modifications to cost approximately **[TRADE SECRET BEGINS… …TRADE SECRET ENDS]**. We note that we are proposing a 786 MW CC unit, which is below the current 1,400 MW capacity and associated energy output of Sherco Units 1 and 2. We also intend to locate a portion of the proposed solar resource additions at the Sherco site.

We outline the cost deltas from a generic CC on a PVRR basis below.[16] This approach allows us to show the site-specific costs associated with locating a CC at the Sherco site and to compare the site-specific costs of onsite replacement to alternative site locations.

Table 8: Site-Specific Cost Comparison – Onsite CC Replacement ($Millions – 2015 dollars)

[TRADE SECRET BEGINS…

PVRR Delta from Generic Unit	
Site Specific PVRR Costs	
Transmission Facilities[17]	
Gas Demand Charge

Total	***$155***

2. Alternatives to Retirement and Onsite Replacement

We considered several alternatives to our proposed partial replacement of the Sherco Units with an onsite CC generating unit. In addition to examining another brownfield site and a greenfield site, we explored alternatives such as all renewables and alternative resource such as Distributed Energy Resources, Demand Response, and grid efficiencies. We discuss the brownfield and greenfield alternatives below and the renewables and alternative resources in Attachments B and F, respectively.

[16] All costs have been discounted to 2015 dollars. Actual costs will be influenced by the year in which they are incurred. Therefore, in order to compare these estimates with future expenditures, these estimates must be escalated.
[17] The substation modification costs noted above are included in the delta from the generic unit.

PUBLIC DOCUMENT
TRADE SECRET INFORMATION AND NON-PUBLIC DATA EXCISED

Our Current Preferred Plan does not propose to replace all of the Sherco Units 1 and 2 capacity with gas-fired generation. As explained in our October Reply, we are committed to reducing the CO_2 emissions of the NSP System and advancing the acquisition of significant levels of renewable generation. Thus, we plan to acquire significant amounts of wind and solar resources to help meet our future energy and capacity needs. Below we discuss alternatives to replacing the Sherco Units with an onsite CC, in conjunction with additional renewable generation.

a. Offsite Brownfield CC

The Offsite Brownfield CC alternative included in our updated modeling is based on representative costs associated with locating a CC at the existing Black Dog site in Burnsville, Minnesota. Black Dog coal-fired Units 3 and 4 were suspended in early 2015, and the coal and ash storage and handling areas are currently being remediated and closed. When this work is complete, there will be sufficient land area protected from the 100-year flood plain to construct a 2x1 CC facility and 345 kV switchyard. The Twin Cities 345 kV ring is nearby – approximately just one-half mile from the plant site – and could be used as the transmission outlet from the new facility, making this site an appropriate proxy for an off-site brownfield CC.

Current information indicates that a new 345 kV substation would be required to accommodate the installation of this CC Unit. However, as noted above, additional transmission upgrade and interconnection costs could be incurred through the MISO generator interconnection process. Gas costs for this facility are based on anticipated demand charges for use of the Northern Natural Gas (NNG) system. The site has significant water allocations and would be able to support a wet-cooled CC facility through conversion of the existing Black Dog facility from a once-through cooling system to a cooling tower system.

Similar to the onsite Sherco alternative, locating generation on a brownfield site results in savings related to transmission upgrades, gas infrastructure, and other existing infrastructure such as land, access to water supplies, and existing maintenance facilities and facility staff.[18] As we did for the onsite CC alternative, we have adjusted the generic CC cost to incorporate the advantages of a brownfield location. However, this analysis must include the costs to mitigate the loss of

[18] While the Brownfield site is located near existing transmission facilities, the availability of interconnection capacity is uncertain until the MISO interconnection process is complete.

PUBLIC DOCUMENT
TRADE SECRET INFORMATION AND NON-PUBLIC DATA EXCISED

generation at the Sherco site. Table 9 below summarizes the cost deltas from a Generic CC in the representative Offsite Brownfield CC alternative:

Table 9: Site-Specific Cost Comparison – Offsite Brownfield Alternative ($Millions – 2015 dollars)

	Brownfield Alternative	Sherco CC
	[TRADE SECRET BEGINS…	
PVRR Delta from Generic Unit		
Site Specific PVRR Costs		
Leave-Behind Costs		
345 kV Interconnection Facilities		
Annual Gas Demand Charge		
		…TRADE SECRET ENDS]
Total	***$221***	***$155***
PVRR Delta from Sherco Site	**$66**	

The Offsite Brownfield CC results in approximately $66 million in additional costs as compared to siting the CC at Sherco. In addition, locating the replacement CC offsite results in greater risk of additional transmission expense and reliability impacts, and does not consider the important economic benefits of replacing generation at the Sherco site, nor the potential of expanding access to natural gas supplies to residents of central Minnesota.

b. Offsite Greenfield CC

We also included an Offsite Greenfield CC alternative in our updated modeling. The Greenfield site is based on a location in Western Minnesota near existing transmission and interstate natural gas lines. Water resources are limited, and it is expected that such a facility would have to be dry-cooled to minimize water use. We have evaluated the costs for transmission interconnection and upgrades and natural gas infrastructure, and included those costs in our analysis. As noted above, additional transmission upgrade and interconnection costs could be incurred through the MISO generator interconnection process. Gas costs for this facility assume construction of new infrastructure. Table 10 below summarizes the costs included in the representative Offsite Greenfield alternative:

PUBLIC DOCUMENT
TRADE SECRET INFORMATION AND NON-PUBLIC DATA EXCISED

Table 10: Site-Specific Cost Comparison – Offsite Greenfield Alternative ($Millions – 2015 dollars)

	Greenfield Alternative	Sherco CC
	[TRADE SECRET BEGINS…	
PVRR Delta from Generic Unit		
Site Specific PVRR Costs		
Leave-Behind Costs		
345 kV Interconnection Facilities		
Annual Gas Demand Charge		
		…TRADE SECRET ENDS]
Total	***$172***	***$155***
PVRR Delta from Sherco Site	**$17**	

The Offsite Greenfield CC results in approximately $17 million in additional costs as compared to siting the CC at Sherco. The Offsite Greenfield alternative is a CC located along the Brookings 345 kV line, so will use available transmission outlet capability that could otherwise be used for renewables in the wind-rich western and southwestern areas of Minnesota, which may increase transmission upgrade costs for those types of facilities during the planning period. These costs are difficult to quantify, but could be significant. As with the offsite brownfield alternative, locating the replacement CC offsite results in greater risk of additional transmission expense and reliability impacts, and does not consider the important economic benefits of replacing generation at the Sherco site, nor the potential of expanding access to natural gas supplies to residents of central Minnesota.

c. Conclusion

The addition of a CC at the Sherco site is a critical part of our proposal to cease coal operations of Sherco Units 1 and 2 and ensure reliability at a reasonable cost to ratepayers. By locating a CC at Sherco, we eliminate the need to address the issues identified in the MISO Y2 Study, avoid the costs associated with locating the CC offsite, support economic development in the Becker area, and mitigate reliability risks and implications stemming from the shutdown of two of the largest baseload generating units in the Upper Midwest. Our Strategist analysis, transmission studies, and socioeconomic studies support this proposal, and we believe it best advances the interest of our customers, as well as the Becker economy and our employees.

PUBLIC DOCUMENT
TRADE SECRET INFORMATION AND NON-PUBLIC DATA EXCISED

3. North Dakota Combustion Turbine

a. Policy Considerations

Our regulators in North Dakota have stated that they believe it would be in the best interest of our customers to have cost-effective, dispatchable generation located in North Dakota and close to major load centers in that state. In an effort to balance the interests of the states that we serve and to maintain the benefits of an integrated system for all of our customers, the Company set out to find CT options that address the reliability concerns of the North Dakota commission, while preserving the Company's desire to develop cost-effective generation alternatives. To that end, we embarked on a review of possible generation sites located reasonably close to Company load centers in North Dakota that could also satisfy traditional resource planning criteria. We discuss the results of that review below.

b. Alternative Sites

In our review, we identified two potential areas where a CT could be located that satisfies the common desires of Minnesota and North Dakota commissions for a selection of a cost-competitive and reliable generation resource. The two locations include an area west of Fargo (Fargo CT) and a location in the south-central portion of North Dakota (South Central CT). These two sites appear to satisfy the traditional resource planning criteria, while also aligning policies regarding energy security, reliability, and energy policy objectives.

Recognizing that the Company is the largest utility in North Dakota, and that the Company does not yet have any dispatchable generation (either owned or in the form of a PPA) in that state, we decided to start the search for potential generation sites with a focus on North Dakota. While a formal project development and engineering estimate has yet to begin, it appears that both sites have adequate access to natural gas supplies and transmission injection capacity as well as available land and workforce.[19]

We also looked at alternative locations in Minnesota and Wisconsin. The potential site in Minnesota included the development of a second CT at our existing Black

[19] While generators at both sites would be required to go through the MISO generation interconnection process, a CT has an advantage over a CC as it is a peaking resource and will only be studied on-peak where we believe significantly more transmission capacity exists in the locations considered for the alternative CTs.

PUBLIC DOCUMENT
TRADE SECRET INFORMATION AND NON-PUBLIC DATA EXCISED

Dog site. Consistent with the Black Dog 6 CT that was recently approved by the Minnesota and North Dakota commissions, the Black Dog 7 site takes advantage of an already owned brownfield location with access to transmission and an existing workforce.

While we also identified a possible site for a CT in Wisconsin, we did not perform any additional development work on that site at this time due to the need for more robust transmission studies. While all of the sites in Minnesota also appear to satisfy traditional resource planning criteria, they obviously do not address the concerns about the lack of dispatchable generation near the Company's North Dakota load.

Table 11 below contains a summary table of the key resource planning characteristics of the three locations investigated by the Company.

Table 11: Summary of CT Alternatives

	Fargo	South Central	Black Dog 7
Generator	Generic 230 MW Dual-Fuel CT[20]	Generic 230 MW Gas-Fired CT	Generic 230 MW Gas-Fired CT
Gas Supply	Lateral Gas Pipeline	Lateral Gas Pipeline	Demand Charges on NNG
Transmission	345 kV Interconnection Facilities	345 kV Interconnection Facilities and 230 kV Line Upgrades	345 kV Interconnection Facilities

Since both the Minnesota and North Dakota commissions have a keen interest in determining if the proposed CT alternatives are cost-effective and reliable when compared with other alternatives, we have performed an initial analysis of the three sites identified by the Company. While we have not obtained formal estimates on the turbine equipment or performed detailed engineering on the projects, as with the analysis of CC site alternatives above, we developed delta cost estimates from the generic CT unit used in the modeling. The deltas show the site-specific cost differences for each location based on the unique factors of the generator site, including transmission access, gas supply costs, and operation and maintenance costs. We summarize this cost comparison in Table 12 below.

[20] We are proposing oil back-up at the Fargo site to allow for the unit to have firm accreditation year-round, similar to the Company's Angus Anson Units 2 and 3 in South Dakota.

PUBLIC DOCUMENT
TRADE SECRET INFORMATION AND NON-PUBLIC DATA EXCISED

Table 12: Site-Specific Cost Comparison – CT Alternatives ($Millions – 2015 dollars)

	Fargo	South Central	Black Dog 7
	[TRADE SECRET BEGINS…		
PVRR Delta from Generic Unit			
Site-Specific PVRR Costs			
Transmission			
Annual Gas Demand Charge			
		…TRADE SECRET ENDS]	
Total	***$79***	***$106***	***$85***
PVRR Delta from Fargo Site		**$27**	**$6**

This preliminary cost analysis shows that the Fargo CT site is cost competitive to the Black Dog 7 CT project, while the South Central North Dakota CT site is somewhat higher in cost.

4. Conclusion

The impact to our customers, reliability, the transmission system, the local community, and state and federal policies are all appropriately considered as part of the determination to cease coal operations at Sherco Units 1 and 2. We have undertaken numerous studies to better understand the implications of our Sherco proposal and believe our Current Preferred Plan addresses these issues in a cost-effective manner. For these reasons, we believe our location-specific expansion plan is in the public interest.

C. Ownership of New Resources

We propose to own the Sherco and North Dakota natural gas plants, along with a portion of the renewable generation additions contemplated by our Expansion Plan. Our ownership of these assets is a critical component of our vision, as it will result in a balanced generation portfolio that will minimize customer costs and mitigate risk of future cost increases. We discuss the specific benefits of ownership in greater detail below and explain how our customers will realize these benefits.

PUBLIC DOCUMENT
TRADE SECRET INFORMATION AND NON-PUBLIC DATA EXCISED

1. Proposed CC at Sherco Site and CT in North Dakota

By owning the CC that we propose to add at the Sherco site, we are able to use our existing site and interconnection rights, we will continue to employ current Sherco-based Xcel Energy employees, we will preserve options to continue to supply a large customer with steam, and we will avoid additional cost and risks associated with modifying our Black Start Plan. Our ownership of the CC allows the Company to secure these important benefits for our customers, and we believe it is in the public interest.

Ownership of a CT in North Dakota provides important options to be able to expand generation onsite in the future to serve our customers in the Red River Valley region. Expansion options could include a partnership with another utility or converting the facility to a CC. If a third-party owns the CT, these options may not be available or may be more expensive and difficult to implement. In addition, the North Dakota commission has expressed a preference for an ownership model to a PPA model. Thus, ownership best allows us to provide reliable service to our customers in the region.

2. Proposed Renewable Resources

An important and significant component of our proposed plan is the accelerated acquisition of renewable resources. Table 13 below, shows our proposed renewable resource additions during the planning period.

Table 13: Proposed Renewable Additions (MW ICAP)

	2015	2016	2017	2018	2019	2020	2021	2022	2023	2024	2025	2026	2027	2028	2029	2030	Total
Large Solar	-	-	-	-	200	-	200	100	100	200	100	100	-	400	-	-	1,400
Wind	-	-	-	-	800	-	-	400	-	-	400	200	-	-	-	-	1,800

As discussed below, we propose that approximately half of the renewable additions be Company-owned resources, which we have assumed in the Strategist modeling supporting our Current Preferred Plan. A balance between PPA and Company-owned resources ensures that our customers obtain the benefits of each ownership structure, and that the cost and risks are appropriately balanced. Table 14 below shows the renewable additions that we propose to own.

PUBLIC DOCUMENT
TRADE SECRET INFORMATION AND NON-PUBLIC DATA EXCISED

Table 14: Proposed Owned Renewable Additions (MW ICAP)

	2015	2016	2017	2018	2019	2020	2021	2022	2023	2024	2025	2026	2027	2028	2029	2030	Total
Large Solar	-	-	-	-	100	-	100	50	50	100	50	50	-	200	-	-	700
Wind	-	-	-	-	400	-	-	200	-	-	200	200	-	-	-	-	1,000

Table 15 below summarizes our current portfolio of wind resources, which contains approximately two-thirds purchased wind resources and one-third owned resources.[21]

Table 15: Current Wind Generation by Asset Type (MW)

Asset Type	Capacity Type	MW	Percent of Total
Owned	Nameplate	851.5	33%
PPA	Contracted*	1,759.9	67%

** Since we contract for a specific amount of energy, we do not maintain nameplate capacities in our records.*

Our solar portfolio, which primarily includes the Aurora project and the 187 MW resulting from our 2014 RFP is exclusively PPAs and third-party providers.

While we will also continue to acquire renewable resources through PPAs and third-party providers, concentrated efforts to improve the balance of our portfolio through expanded ownership of renewable resources is appropriate and necessary to minimize customer costs and balance risks. In this way, we believe our plan will capitalize on the strengths of each structure while ensuring that resources are acquired at reasonable costs for our customers.

Understanding the customer impacts of utility ownership versus purchased power is important to assessing the benefits of a balanced portfolio. While utility participation in competitive bidding may on its face be a means for such comparison, we have found that it is difficult to obtain an accurate assessment of the full economic and life-cycle costs and other benefits solely through this perspective. We believe a framework that allows the relative costs and benefits of our future acquisition of renewable resources to be assessed is a more reasonable and appropriate approach.

[21] Includes the most recently-approved Odell, Courtenay, Pleasant Valley, and Border Winds projects.

PUBLIC DOCUMENT
TRADE SECRET INFORMATION AND NON-PUBLIC DATA EXCISED

Given similar access to suppliers, sites, and transmission, we also believe it is reasonable to assume that the capital costs of renewable development will be very similar between a utility-owned project and third-party development; thus, customer impacts will stem from the respective cost recovery mechanisms of the projects rather than development costs. Key issues affecting customer costs include differences regarding contract versus asset life and balance sheet impacts. We discuss each of these issues below.

3. Contract vs. Asset Life

Asset life affects the comparative costs of utility-owned versus purchased wind energy. A PPA is for a specific term that is likely shorter than the useful life of the facility. After the expiration of a PPA, the Company must return to the marketplace to procure replacement renewable energy. The market price of this replacement renewable energy will be based on a number of factors, including:

- Costs for new wind and solar generating facilities,
- Costs of capital,
- Market prices for electricity,
- The value of embedded environmental attributes, including Renewable Energy Credits (RECs) and Emission Rate Credits (ERCs) under the CPP, and
- PTC and ITC status and values.

Under utility ownership, by contrast, the asset remains in the utility portfolio until it is retired. Customers benefit when the actual useful life of the asset exceeds a comparable PPA's term, as they will continue to receive the capacity and energy for a longer period of time, lowering lifecycle costs. While we have modeled a 25-year life for both utility-owned and PPA renewable resources, there is the potential that the 25-year PPAs may not be widely available and also that utility-owned assets will exceed a 25-year life.

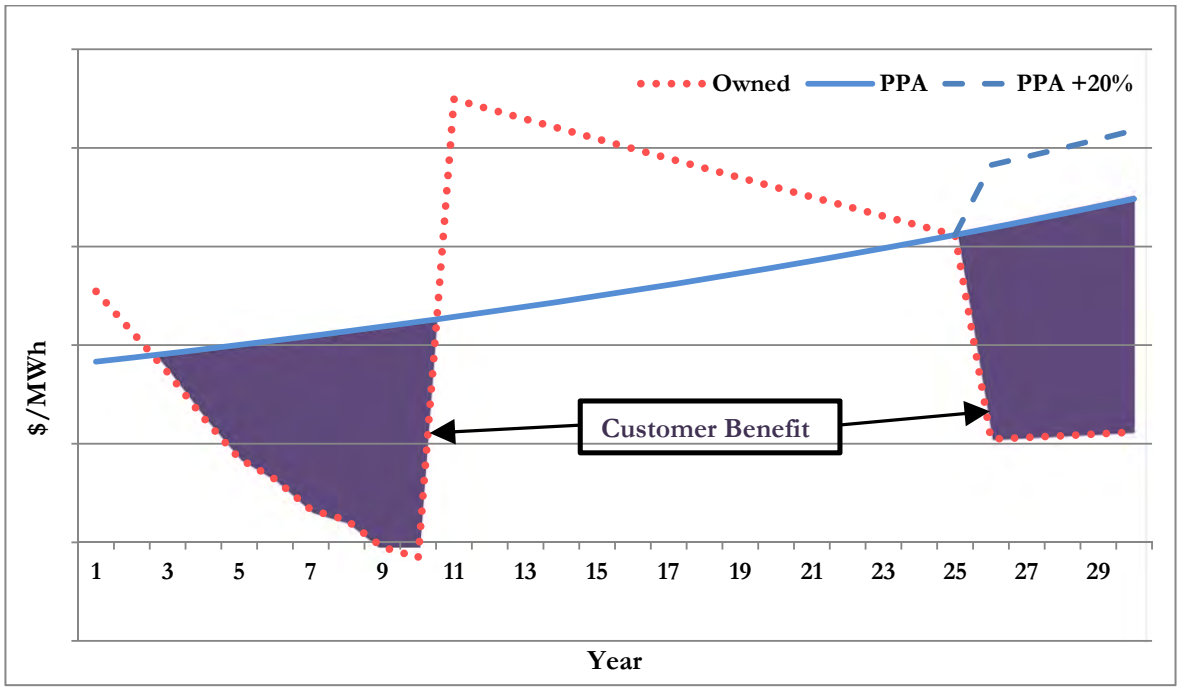
Based on our 2013 Wind RFP and 2014 Solar RFP, wind projects typically have PPA terms of 15 to 20 years with an asset life of 25-30 years, and solar projects typically have PPA terms of 20 to 25 years with an asset life of 25-30 years. While utility-owned assets may require refurbishment to extend their useful life, we would expect such costs to be lower than the market price of replacement renewable energy that would be required when a PPA expires. Life extension options for utility assets have traditionally offered cost-savings benefits for customers.

PUBLIC DOCUMENT
TRADE SECRET INFORMATION AND NON-PUBLIC DATA EXCISED

The tradeoff for these long-term benefits is that relative to a PPA, utility-owned assets generally have higher costs in the early years when the rate base value is highest. For wind resources, direct pass-through to customers of the PTC will help offset this impact. Although there is no guarantee that ownership will provide significant present value savings compared to a PPA, it is certain that by using only PPAs to meet renewable resource needs, customers lose the opportunity for overall longer-term savings from the value of depreciating plant.

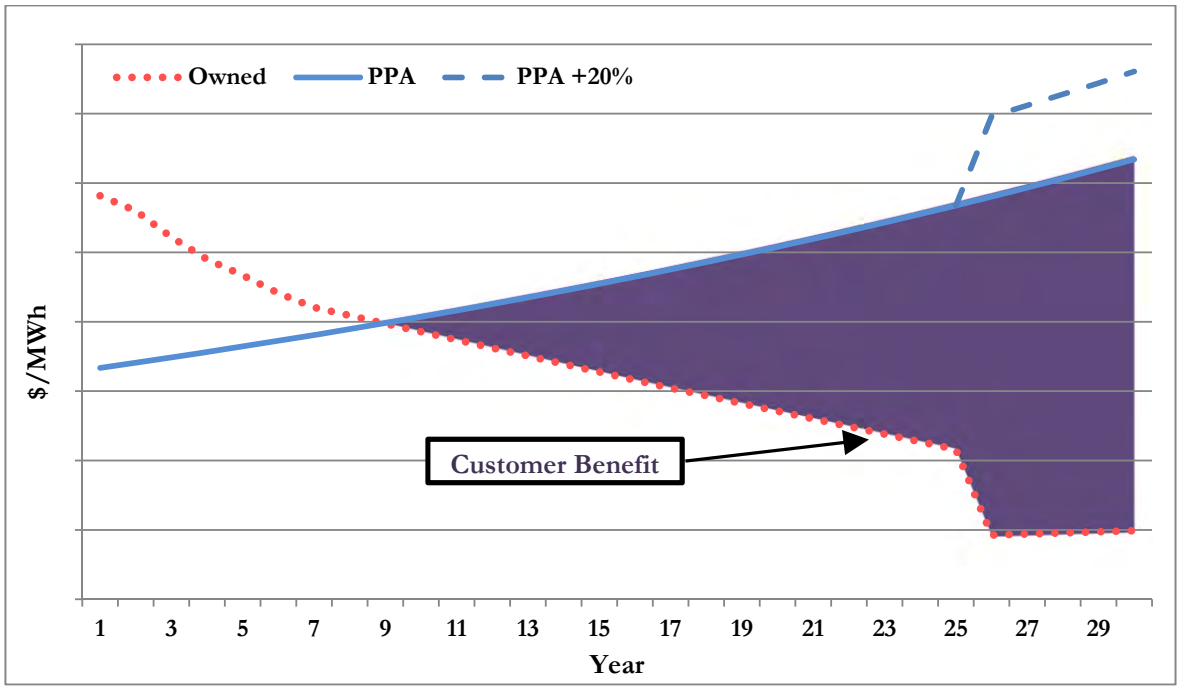
Figures 3 and 4 below illustrate the potential benefits provided by Company ownership of wind and solar resources. Customers could obtain significant benefits as shown by the shaded areas in the below figures.

Figure 3: Benefit Provided by Ownership
Illustrative 200 MW Wind Resource



PUBLIC DOCUMENT
TRADE SECRET INFORMATION AND NON-PUBLIC DATA EXCISED

Figure 4: Benefit Provided by Ownership
Illustrative 50 MW Solar Resource



The cost per MWh for the PPA and utility-owned resources were derived from the wind and solar resources included in our modeling which assume a 25-year life. The utility-owned wind resource costs show additional reductions in the first 10 years due to the PTC while the PPA wind costs spread the benefits over the PPA term. The solar resources include the benefits of the ITC. These benefits are not achieved under a PPA structure, as the PPA must either be renegotiated or replaced when the contract term expires. In addition, ownership may help smooth rate impacts as the renewable resources procured in the near term will experience several years of depreciation prior to our projected procurement of significant additional resources in the mid-2020s.

4. Balance Sheet Impacts

Debt accounts for approximately half of the Company's total capital structure. The cost of debt is highly dependent on the credit profile of the utility, and higher-cost debt results in higher costs for customers. Generally speaking, companies with higher percentages of debt in their capital structure are considered riskier and pay higher rates for this debt, due to concerns that the company may be over-leveraged.

PUBLIC DOCUMENT
TRADE SECRET INFORMATION AND NON-PUBLIC DATA EXCISED

PPAs are obligations the utility must pay that are viewed as additional debt on the utility's balance sheets – affecting the credit profile of the utility, which in turn affects costs to customers. Credit rating agencies also consider off balance sheet obligations in their risk assessment to determine credit ratings. These agencies impute additional debt to a utility's balance sheets based on the size, type, and terms of PPAs, thus increasing the financial leverage and risk of a company and also its cost of debt.

Likewise, auditors scrutinize PPAs to evaluate the effects of imputed debt and the lease-like characteristics of PPAs to ensure fair representation of obligations and creditworthiness on financial statements. Imputed debt and lease accounting effects have the potential to add significant debt-like obligations to the balance sheet used to determine the credit rating for the Company. In contrast to a PPA, owned projects are financed through both equity and debt which allows us to maintain our capital structure.

These issues highlight some of the implications of PPAs. Imputed debt has the potential to raise costs for customers in one of two ways: (1) through higher debt costs, as already described; and (2) through additional equity costs, as the utility may require additional equity in its capital structure to compensate for the additional debt-like obligations associated with the PPAs. Because these impacts affect the overall capital structure and capital costs, the costs of financing other utility infrastructure requirements are higher than they otherwise would be. While wind and solar PPAs are viewed more favorably than more traditional PPAs due to their energy-based payment structure, they nonetheless have imputed debt implications for the utility that will, over time, raise costs for customers.

Finally, we believe there are additional factors to consider when determining an appropriate balance between owned and purchased assets:

Potential unknown valuable attributes. If and when new value is attached to attributes of renewable resources (such as renewable energy credits were in the past), ownership of resources ensures that customers benefit from those attributes. If the resource is purchased through a PPA, those attributes may not accrue to customers. In the Silent REC Docket, the Commission was presented with this issue.[22] Under a PPA structure, there is uncertainty and risk associated with the allocation of any new valuable attribute that was not anticipated by the PPA. If the resource is utility-

[22] *See* Docket No. E002/M-08-440.

PUBLIC DOCUMENT
TRADE SECRET INFORMATION AND NON-PUBLIC DATA EXCISED

owned, however, our Commissions will have increased control over how the value associated with any attribute is allocated.

Increased diversity in supply portfolio. Our proposed portfolio reflects an appropriate resource mix that achieves compliance with regulatory requirements, such as the CPP, and state policy objectives. Investors would be appropriately concerned if a utility's owned assets did not include the renewable assets required to achieve compliance. Thus, the financial health of the utility can be affected both by the aggregate mix of resources used to supply customers and the Company's mix of owned resources.

Complement to Xcel Energy's overall business plan. A key component of our overall business plan is environmental leadership. We believe that a balanced, clean energy portfolio is in the long-term best interests of our customers. Ownership of renewable resources is one means of demonstrating this commitment for our customers, regulators, and shareholders. We believe we must increase our investment in owned renewable resources to help maintain our financial health, minimize risks through a balanced portfolio, and reduce costs for our customers.

D. Proposed Acquisition Process

In this section, we describe our plan to acquire the replacement generation resources that will be necessary to address the capacity deficit created by our proposal to cease coal operations at Sherco Units 1 and 2.

Consistent with the Commission's January 6, 2016 Order, we will not submit a Sherco conversion plan proposal pursuant to Minn. Stat. § 216B.1692 (Emissions Reduction Statute) any earlier than one month following the Order in this Resource Plan proceeding. We expect that our proposal will take a similar approach to our 2002 Metro Emissions Reduction Project (MERP) petition under the Emissions Reduction Statute.[23] Following an overview and summary of the proposed projects, we will present further details including projected book life, capacity, capital cost, annualized emissions reductions, and proposed project schedule for the proposed thermal and renewable projects. We will address the benefits of our proposal, along with costs, customer impacts, and an analysis of alternatives. Our proposal will also contain a suggested procedural schedule, which we intend to develop in consultation with appropriate state agencies.

[23] Docket No. E002/M-02-633.

PUBLIC DOCUMENT
TRADE SECRET INFORMATION AND NON-PUBLIC DATA EXCISED

Also similar to our approach in 2002, we intend to submit a cost recovery petition within 60 days of our proposal. The Emissions Reduction Statute gives the Commission the authority to implement rate riders to recover the cost of qualifying projects if they appropriately achieve environmental benefits without unreasonable consumer costs. Our filings will provide the factual and analytical support necessary for the Commission to affirm the two key issues in the matter:

- Whether the selections in our Proposal are appropriate, given their environmental benefits and costs, and
- If so, whether our proposed rate mechanism is appropriate and consistent with the terms of the statute.

Following approval of the Sherco conversion plan and associated cost recovery filing we would proceed using a similar approach to our previous MERP conversion efforts. The Company would commence the project under an owner-managed multi-contract approach similar to the previous MERP, CapX2020 and other major projects we have successfully completed in the NSP regions over the past 13 years. We would establish an agreed upon scope, schedule, and budget with the Commission prior to proceeding and would expect to provide regular updates to the Commission on the status of the project through completion.

We would utilize a competitive request for proposal (RFP) process to purchase the major equipment and acquire specialized engineering design and construction resources. An RFP bidding process for the major components of the project ensures we obtain the most competitive pricing. As with the MERP projects, the Company's Engineering and Construction organization would provide overall project management and oversight with support from departments within the Company for environmental, purchasing, safety, and startup & commissioning. Maintaining direct control through project management and oversight of contracts for associated equipment, materials, and service contracts will reduce costs and ensure project quality and timeliness.

We have demonstrated through our successful large scale, multi-year MERP and CapX2020 initiatives, a transparent owner-managed approach that includes regular Commission updates and project costs that stem from competitively-bid contracts for all materials and services delivers on-time and on-budget projects that are in the public interest.

PUBLIC DOCUMENT

VI. CUSTOMER COST IMPACTS

As we have discussed, our Reference Case is a continuation of the plan we laid out in our 2010 Resource Plan. We now know that it would not achieve compliance with CPP requirements, nor is it consistent with our vision of being a leading provider of cost-effective clean energy. The Updated 2015 Plan that we proposed in January 2015 began to shift the Company to a significantly lower-carbon system; however, with the information currently available it is not certain that the Updated 2015 Plan will be sufficient to achieve CPP compliance under reasonable assumptions of the CO_2 reductions that could be required of the Company under Minnesota's CPP State Plan. Conversely, we are confident that our Current Preferred Plan will achieve CPP compliance, and also provide the reasonably-priced clean energy that our customers are asking for, appropriately balance state energy policy priorities, and optimize the system investments our customers have made to-date with new investments that will maintain reliability.

In this Section, we provide a long-term view of the cost impacts of our Current Preferred Plan. Additionally, at the request of the Commission and the Department at the December 2015 hearing regarding the procedural schedule for this proceeding, we discuss our view and provide illustrative concepts of a potential future market for CO_2 allowances.

A. Long-Term View

To show the cost impact of our proposal over the course of the planning period, we provide a Compound Average Growth Rate (CAGR) comparison of our Current Preferred Plan, Updated 2015 Plan, and Reference Case. We derived this long-term projection using a shorter-range financial forecast and a special purpose Strategist model, similar to how we projected the long-range cost of our plans in previous filings in this proceeding.[24]

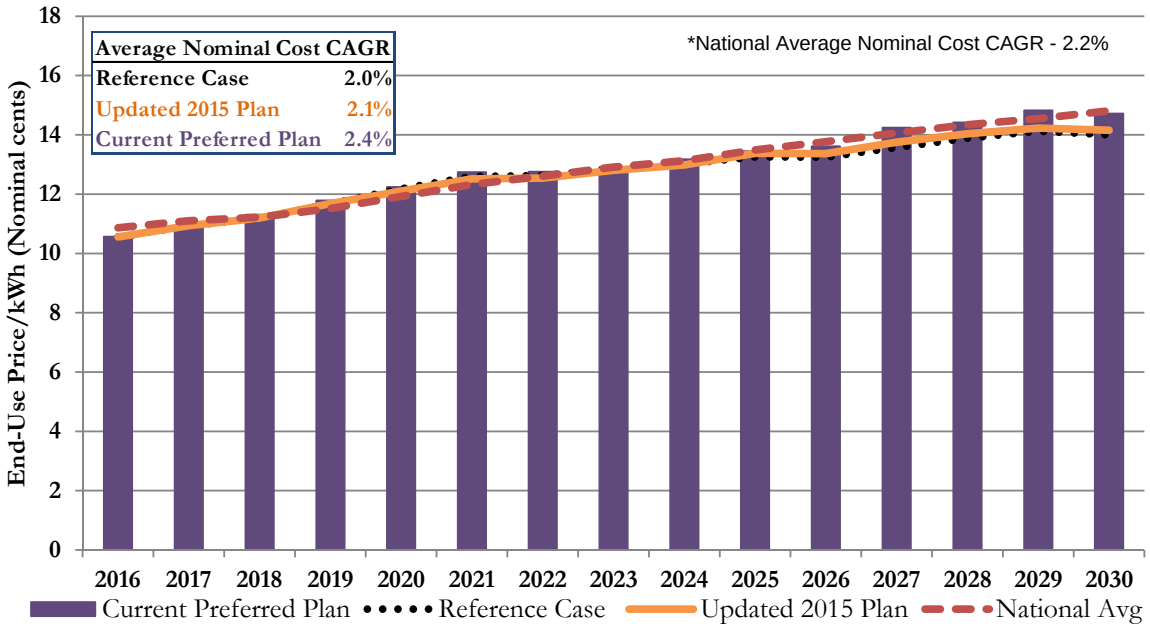
Figure 5 below illustrates the cost differences between the Reference Plan, Updated 2015 Plan and our Current Preferred Plan, compared to the national average nominal cost CAGR. Specifically, the annual average cost delta between our Reference Case and our Current Preferred Plan is less than one-half of one percent. Our Current Preferred Plan also achieves significantly greater CO_2 emissions reductions and is the only one of the three plans that is virtually certain to achieve

[24] We describe this methodology in more detail in Attachment B.

PUBLIC DOCUMENT
TRADE SECRET INFORMATION AND NON-PUBLIC DATA EXCISED

CPP compliance. Moreover, Figure 5 shows that the cost impacts associated with our Current Preferred Plan are roughly consistent with the expected national average increase in electricity prices, and over the long-term closely mimic the rate of inflation.

Figure 5: Current Preferred Plan Average Nominal Cost Comparison (NSP System)



*National energy cost forecast from Energy Information Administration (EIA) Annual Energy Outlook 2015, Table Energy Supply, Disposition, Prices and Emissions. End use prices, all sector average.[25]

While this view of the estimated long-term plan costs is different than presented in previous filings, the relative values are consistent.

B. Potential Customer Benefits of CO_2 Allowance Proceeds

While our Current Preferred Plan is not primarily driven by the CPP, based on what we know now of the state implementation plan, we believe this plan not only achieves, but likely exceeds, the CO_2 emissions reductions that could be required of

[25] The EIA's Annual Energy Outlook was published in April of 2015, and based on federal, state, and local laws and regulations in effect as of the end of October 2014. Therefore, the potential impacts of pending or proposed legislation, regulations, or standards such as the CPP would not be reflected in these projections.

PUBLIC DOCUMENT
TRADE SECRET INFORMATION AND NON-PUBLIC DATA EXCISED

the Company. As a result, the Current Preferred Plan may generate surplus reductions in the form of CO_2 allowances (if Minnesota's CPP state plan is mass-based) or Emission Rate Credits (if the plan is rate-based). Depending on the design of the state plan, the Company could monetize these surplus reductions on our customers' behalf to mitigate some of the cost impacts of transitioning to a significantly lower-carbon system.

We provide as Attachment H a preliminary analysis of the potential value of CO_2 allowances, in excess of compliance needs, under two hypothetical State Plan scenarios and assuming different CO_2 allowance prices. This analysis is preliminary and speculative because the size of the allowance budget allocated to the Company under the State Plan is not yet known; further, and CO_2 allowance prices in future markets can only be estimated. We describe in Attachment H the rationale we used for the CO_2 allowance prices used below, and provide details of the hypothetical State Plan scenarios labeled "Scenario 1" and "Scenario 2."

If we assume a constant CO_2 allowance price of $21.50 per ton (the midpoint of the Commission's regulatory cost range under Minn. Stat. §216H.06), and assume a "Scenario 1" State Plan that regulates existing units only, contains no allowance set-asides other than the Clean Energy Incentive Program, allocates allowances based on 2010-2012 generation at CPP-regulated units,[26] and does not limit the number of years of allowance allocation to a retired unit, the Current Preferred Plan would generate allowance revenues of about $540 million over 2022-2030 ($258 million in Net Present Value or NPV terms). At the same CO_2 allowance price, if we assume a "Scenario 2" State Plan that contains many allowance set-asides and only allocates allowances for two years after unit retirement, the Current Preferred Plan would generate allowance revenues for our customers of only $75 million over 2022-2030 ($33 million NPV). We have not reflected these speculative potential revenues in any of the cost estimates of our Current Preferred Plan, and provide them here as only a preliminary analysis.

Table 16 below shows the value at three different CO_2 allowance prices that correspond to the Commission's low, midpoint, and high regulatory cost values.

[26] We note that EPA leaves the allowance allocation decision to states, and that discussion of the most appropriate allocation basis (generation or emissions, and whether any allowance set-asides are appropriate) is ongoing as of this filing.

PUBLIC DOCUMENT
TRADE SECRET INFORMATION AND NON-PUBLIC DATA EXCISED

Table 16: Value of Potential CO_2 Allowance Sales Under Two State Plan Scenarios
(millions, undiscounted, over 2022 to 2030)

	State Plan Scenarios		
Allowance Price	**– 1 – Customer Value**	**– 2 – Customer Value**	**Value Impact to Customers**
$9/ton	$226	$31	($194)
$21.50/ton	$540	$75	($465)
$34/ton	$853	$119	($735)

The "Value Impact to Customers" column in this table represents the estimated CO_2 allowance value transferred from the Company's customers to other parties by a State Plan that sets aside significantly more allowances, and discounts the value of retiring coal units by allocating allowances for only a short time post-unit retirement.

Since all allowance values are assumed to accrue to the Company's customers, a "Scenario 1" State Plan would provide around $540 million to help mitigate the cost impacts of transitioning to a lower-carbon energy system. A "Scenario 2" State Plan would provide only $75 million, which is $465 million *less* value to mitigate customer cost impacts, shifting much of the value from our customers to other parties.

We believe that through our involvement in the MPCA's CPP State Plan development process, we can identify opportunities to further offset the cost impact of our proposal and achieve the greatest value for our customers. We also believe there are rate mechanisms, described in more detail below, which can provide predictable cost recovery and help to smooth cost impacts for our customers.

C. Near-Term Customer Rate Impacts

In compliance with the Commission's January 6, 2016 Order and in order to approximate the near-term impacts of plan implementation on customer rates and bills, we provide as Attachment E a detailed rate analysis of our Current Preferred Plan and Updated 2015 Plan. This includes a five-year detailed rate impact analysis with the estimated impacts by class per year.

We note the following factors could impact rates in 2016-2020:

PUBLIC DOCUMENT
TRADE SECRET INFORMATION AND NON-PUBLIC DATA EXCISED

- *Tax credit extension*: With the extension of the Production Tax Credit, the costs of 600 MW wind PPAs beginning in 2020 is reduced significantly from the Base Cost of Energy forecast (Docket No. E002/MR-15-827), which assumed those PPAs would not benefit from PTCs. Wind PPAs are recovered through the fuel clause, which is where the cost reduction would appear for customers.
- *Renewables ownership:* The addition of 200 MW of owned solar and 400 MW of owned wind would result in an increase in base rates or rider rates due to the ownership of 200 MW of solar and 400 MW of wind, presumably recovered in the RES Rider.
- *Ceasing coal operations at Sherco:* The ceasing of coal operations at Sherco Units 1 and 2 would result in increased depreciation expense.

Primarily due to the tax credit extension, both our estimated Updated 2015 Plan and our Current Preferred Plan forecasts show lower fuel costs than our 2016-2020 fuel forecast prepared at the time of the Base Cost of Fuel filing. For example in 2020, the ITC and PTC tax incentives would reduce fuel costs by $99 million in the Current Preferred Plan, while the Updated 2015 Plan results in a $66 million reduction.

VII. NUCLEAR RESOURCE UPDATE

In our October 2 Reply, we expressed our support for utilizing our carbon-free nuclear baseload resources through the existing plant licenses as a means of achieving our goal of a 60 percent reduction of CO_2 emissions from 2005 levels by 2030. At the same time, we explained that our projected capital spend for Prairie Island is outpacing the estimates included in our Changed Circumstance filing in 2012.

We noted specifically that our five-year capital expenditure forecast from 2016 through 2020 has increased by roughly $175 million above what was anticipated in 2012, and that our forecast for the thirteen-year period from 2021 through 2034 would likely need to increase by roughly $600 to $900 million. We also noted that our fixed operating and maintenance (Fixed O&M) costs are lower than previously modeled and that our decreased Fixed O&M forecast largely offsets the increase in our forecasted capital spend.

PUBLIC DOCUMENT
TRADE SECRET INFORMATION AND NON-PUBLIC DATA EXCISED

The Commission expressed understandable concern over our updated capital forecast during hearings in December 2015. We address those concerns here by providing additional information and analysis relating to our support for nuclear and to the costs associated with the continuing operation of Prairie Island. In particular, we provide modeling that takes into account our updated capital and Fixed O&M forecasts and demonstrates that Prairie Island has been, and continues to be, a cost-effective resource for our customers. We also discuss our updated capital expenditure forecasts for the periods from 2015-2020 and 2021-2034 at Prairie Island.

We believe the information provided in this section supports our continued operation of Prairie Island, including the investments we need to make to safely and reliably operate the plant over the next few years. We nevertheless recognize that our opinion is one of several that need to be considered in this process, that stakeholders would like to better understand the implications of our updated forecasts, and that there is some uncertainty at play when considering the costs to operate a two-unit nuclear plant for the remaining 19 years of its licensed life. Utilities, regulators, and stakeholders around the country are grappling with similar issues as they try to balance the increased regulatory pressure and costs associated with nuclear against emerging policies aimed at reducing CO_2 emissions.

We believe that any decision regarding the long-term future of Prairie Island should be made after a deliberate and thoughtful dialogue between the Company, our regulators, and our stakeholders. We further believe this dialogue should be informed by a longer-term, in-depth analysis of the cost-effectiveness of Prairie Island and the alternative paths that could be taken with respect to the plant. In fact, we have begun this work and share a preliminary analysis of one potential alternative later in this section. If the Commission and our stakeholders want to further explore this or other alternatives, we are committed to doing the additional work necessary to advance a fully informed and thoughtful decision-making process. We expect that a full analysis of the operations, economics, and potential alternatives for Prairie Island could be completed in the next 18 months, and we welcome the opportunity to cooperate with our regulators and our stakeholders on such a significant decision.

A. Relation to Supplemental Rate Case Testimony

Following our October 2 Reply, the Commission ordered the Company to file supplemental schedules and testimony in its pending electric rate case that describe

PUBLIC DOCUMENT
TRADE SECRET INFORMATION AND NON-PUBLIC DATA EXCISED

and compare projected and actual Life Cycle Management costs (and, to the extent relevant, Extended Power Uprate costs) from 2008 through 2020 by generating unit and year, including the proposed 2016 test year, and the 2017 and 2018 plan years. As part of those descriptions and comparisons, the Company was ordered to include all changes and updates to projected costs from 2008 onward and to include all cites to relevant certificate of need, resource plan, and general rate case dockets. The Commission also ordered the Company to provide as part of those schedules and testimony a comparison of the relevant parts of the proposed 2016 test year, the 2017 plan year, and the 2018 plan year to the proposed five-year capital budget in the Company's pending Resource Plan proceeding.

In compliance with that Order, we are filing supplemental Direct Testimony in our pending rate case docket from Company Witnesses Christopher B. Clark (President), Timothy J. O'Connor (Senior Vice President and Chief Nuclear Officer), Scott L. Weatherby (Vice President for Nuclear Finance and Planning), and John J. Reed (Chief Executive Office at Concentric Energy Advisors). That testimony focuses on the period from 2016 through 2020, the additional $175 million of capital expenditure above what was anticipated in 2012 for that period, and why the capital projects underlying that forecast are necessary during those years and in our customers' best interest.

In this Resource Plan Supplement, by contrast, we address not only the next five years but also the latter portion of Prairie Island's licensed life and the additional $600 to $900 million in capital that we anticipate spending between 2021 and 2034. Because resource planning takes this longer view, we believe it is the appropriate forum to consider whether it is economic and prudent to operate Prairie Island through the end of its licensed life. We therefore welcome an in-depth discussion regarding the future of Prairie Island and, to that end, propose a process to continue that discussion after we have had additional time to study the impacts of continued operations, as well as potential alternatives.

B. Prairie Island's Past and Current Cost-Effectiveness

Our support for utilizing our nuclear baseload through the existing plant licenses is primarily driven by our conclusion that it is beneficial for our customers to do so. We recognize that the principal question in this regard is the plant's cost-effectiveness on a going-forward basis. We believe that it is also helpful, though, to consider the forecasts and modeling we presented in connection with our 2008 certificate of need and 2012 changed circumstance filings. These demonstrate that

PUBLIC DOCUMENT
TRADE SECRET INFORMATION AND NON-PUBLIC DATA EXCISED

Prairie Island has always been cost-effective, even when we account for our updated capital forecast. We therefore briefly address these earlier forecasts and models before turning to our prospective analysis.

1. Past Forecasts & Modeling

At the time we filed our certificate of need in 2008, we provided an estimate of capital costs running to the end of Prairie Island's licensed life in 2034 in an effort to measure the plant's cost-effectiveness compared to either a super critical pulverized coal unit or a natural gas CC unit. We provided this information in response to Minn. Stat. §216B.243, subd. 3b, which states that "[a]ny certificate of need for additional storage of spent nuclear fuel for a facility seeking a license extension shall address the impacts of continued operations over the period for which approval is sought."

Because we sought authorization for enough casks to operate Prairie Island until 2034, we provided our best judgment with respect to the "impacts of continued operations" until that time. Looking to historical capital expenditures, we estimated that our routine capital investment would average approximately $20 million annually ($10 million per unit) and that we would spend an additional $600 million on large capital investments from 2008 through 2034. Using these numbers, we concluded that continued operation of Prairie Island was cost-effective by a margin of $2,194 million in PVRR. We then updated our capital forecast for Prairie Island in our 2012 changed circumstance filing and included additional capital expenditures in that model.

For a number of reasons that are discussed below, our 2008 capital forecast has proven to be lower than the actual costs incurred to-date. Likewise, our 2012 forecast appears to be lower with respect to our updated forecast for the out-years of Prairie Island's licensed life. As an initial matter, however, it is important to contrast our 2008 capital expenditure forecast from one more typically associated with a certificate of need filing and from the Monticello prudence review. In the Monticello docket, for instance, we had already spent more than forecasted in our LCM/EPU certificate of need filing, and we sought recovery of those capital expenditures after the construction project was completed.

There is no construction project at issue here. Our 2008 filing related to dry-storage casks and provided a forecast related to the "impacts of continued operation" for a two-unit nuclear plant over a twenty-six-year period. It was the first time we

PUBLIC DOCUMENT
TRADE SECRET INFORMATION AND NON-PUBLIC DATA EXCISED

provided such an estimate and the first time we forecasted capital expenditures for the out-years of an extended-life nuclear plant. And unlike Monticello, we are updating the Commission with respect to our increased capital forecast having not yet exceeded our 2008 forecast and not expecting that we will exceed the total cost (capital plus Fixed O&M) we forecasted in our 2008 filing.

That said, one reason for the higher-than-anticipated capital expenditures is that our Nuclear Regulatory Commission (NRC) mandated compliance expenses have increased substantially in recent years, both as a result of new NRC requirements following the Fukushima Daiichi incident, and as a result of increased oversight and regulation by the NRC generally. Additionally, our estimate of spending $10 million per unit annually for routine capital investment has proven to be insufficient, despite that having been a reasonable estimate in light of historical spending up to and including 2008. Our experience with routine capital investment over this period mirrors that of other utilities operating similar nuclear plants.

Although our capital expenditure forecasts have increased since 2008, our Fixed O&M forecasts have decreased in nearly equal measure. In 2008, we provided a conservative estimate of Fixed O&M costs in connection with our certificate of need filing, which was based on our historic spending up to that point. Since that time, however, we have observed significantly lower-than-forecasted Fixed O&M spend, which caused us to revisit that forecast in conjunction with our resource plan and to reconsider what future Fixed O&M growth will be over the next 19 years of Prairie Island's licensed life. Based on historical spending from 2008 to present, we now forecast spending more than $1 billion less in Fixed O&M at Prairie Island from 2015 through 2034. And if we look at total spend (capital plus Fixed O&M) in connection with Prairie Island, our current forecast results in PVRR that is $981 million less than our 2008 certificate of need forecast and $91 million less than our 2012 changed circumstance forecast. Thus, our revised Fixed O&M forecast not only offsets our revised capital expenditure forecast, it results in a projected total project cost that is substantially less than we anticipated in both 2008 and 2012.

Had we used our current capital expenditure projections in our 2008 model, it would have shown that Prairie Island remained a valuable, cost-effective resource by a margin of approximately $2.04 billion in PVRR. Likewise with our 2012 changed circumstance proceeding, Prairie Island would have remained a cost-effective resource by a margin of approximately $305 million in PVRR, using the model from that filing. Further, because our 2012 modeling assigned no cost to CO_2, the PVSC of Prairie Island under that analysis would have been substantially higher. As a

PUBLIC DOCUMENT
TRADE SECRET INFORMATION AND NON-PUBLIC DATA EXCISED

result, our updated capital and Fixed O&M forecasts would not have changed our conclusions with respect to the continued operation of Prairie Island in either the 2008 certificate of need or 2012 changed circumstance proceedings.

2. Prairie Island's Current and Future Cost-Effectiveness

We now turn to the present-day cost-effectiveness of Prairie Island. For this analysis, we used our current Strategist modeling from this docket and considered a base case with the current forecast for ongoing capital and O&M expenditures compared with a scenario where Prairie Island is retired immediately. In a number of ways, this analysis is highly conservative. First, we have assumed that all of the capital and O&M expenditures for Prairie Island for 2016 through end of life can be avoided entirely, despite the fact that nuclear units continue to experience significant Fixed O&M costs during the various stages of decommissioning and despite the fact that the NRC would likely require a number of Fukushima-related and other mandated projects to be completed even following a shutdown.

Second we have not included any adjustments for accelerated depreciation of the existing asset, or changes to decommissioning costs or fund accruals, both of which we address in greater detail later in this section. Third, we have not included the costs of addressing transmission system impacts that would be caused by shutting down a significant baseload unit, as we have not yet studied these transmission effects in detail. Finally, we have assumed that replacement capacity could be installed "overnight" in 2016, and Strategist was allowed to optimize both the immediate replacements and balance of the expansion plan through the end of the study period. For a number of reasons discussed later in this section, it is simply not possible to immediately retire Prairie Island, or any nuclear plant. Major system transitions of this sort take years to study, plan, and execute, and industry experience teaches that unplanned shutdowns can be enormously expensive by comparison.

The results of this very conservative analysis are shown below in Table 17:

PUBLIC DOCUMENT
TRADE SECRET INFORMATION AND NON-PUBLIC DATA EXCISED

Table 17: Prairie Island Compared to a Natural Gas Combustion Turbine

Resource	PVSC	PVRR
Prairie Island	$52,519	$46,618
Combustion Turbine	$53,750	$46,824
Difference	$1,231	$206

Even our most conservative analysis, then, shows that "overnight" replacement of Prairie Island would result in $1.231 million of additional PVSC. We also evaluated the PVSC and PVRR associated with the capital expenditure and Fixed O&M forecasts over the near-term period from 2016-2020. Continued operations of Prairie Island through this period results in a PVSC savings of $456 million and PVRR savings of $177 million compared to the overnight replacement scenario.

To be sure, the PVRR of running Prairie Island results in a closer call. In this way, the social cost of carbon plays a role in driving our support for continuing to operate Prairie Island through its licensed life, just as it does our decision to cease coal operations at Sherco Units 1 and 2 in the 2020s. We further recognize that changes to certain modeling assumptions, such as lower gas forecasts, could cause the PVRR numbers to suggest – under this limited analysis – that retiring Prairie Island in the near term might result in lower PVRR. It is important to keep in mind, however, this is a theoretical analysis intended to provide a preliminary look at Prairie Island's baseline economics, that it cannot substitute for an in-depth study that accounts for actual retirement and replacement costs, and that there are significant benefits to our nuclear fleet that are not captured by this, or any, Strategist model.

3. Operational & Policy Concerns

We believe that continued operation of our nuclear fleet is also the best path forward from both a policy and reliability perspective. Nuclear comprises more than half of our carbon-free generation and – at the same time – provides our system with a baseload energy resource that ensures critical system reliability. In this way, it is a keystone of the carbon-reduction goals set forth in our Current Updated 2015 Plan. Renewable technology such as wind and solar cannot fulfil this role at a reasonable cost today. As a result, any near-term replacement of our nuclear plants would involve the addition of more natural gas to our fleet, meaning the closure of Prairie Island would have twin effects of heightening our customers' exposure to gas

PUBLIC DOCUMENT
TRADE SECRET INFORMATION AND NON-PUBLIC DATA EXCISED

price volatility and significantly increasing our CO_2 emissions. We do not believe this is in the best interest of our Company, our customers, or the states we serve.

We recognize, however, that battery technology is evolving, that renewable costs have decreased in recent years, and that reliable renewable baseload energy may be on the horizon. With that in mind, we see our nuclear units as critical to meeting our carbon-reduction and reliability goals in the near-term (including our compliance with the CPP) and also as a bridge that can facilitate a transition to even greater renewable generation in the longer-term as battery technology improves and costs decline. At the same time, our nuclear fleet is an integral part of our diversified generation portfolio and provides an important hedge to gas price volatility.

Finally, combining the cessation of coal operations of Sherco Units 1 and 2 along with the shutdown of Prairie Island all in the 2020s would present enormous challenges and costs with respect to replacement generation, transmission, and system reliability. The continued operation of our nuclear fleet as a bridge resource will allow for a careful and focused transition away from coal generation in the 2020s before addressing the future of other baseload units.

C. Forecasted Investments

1. Forecasted Investments from 2016-2020

In total, we anticipate investing approximately $490 million in capital at Prairie Island from 2016 through 2020. This is roughly $175 million more than we forecasted as part of our 2012 changed circumstance filing. There are a few key drivers of our increased capital spend during this period. First, $84 million of this increase is due to regulatory mandates from the NRC. As described in our previous two rate cases, these NRC Fukushima, fire safety, physical security, and cyber security requirements did not exist or were not fully known between 2008 and 2012.

More than half of the remaining $90 million is a result of our decision to defer certain projects from the rough timeframes anticipated in our 2008 and 2012 forecasts. In fact, we invested $51 million less from 2008-2015 than we forecasted in our 2012 changed circumstance filing. The remaining capital expenditures during this period simply reflect our inability to perfectly forecast costs in a certificate of need proceeding broadly focused on the remaining life of a plant, as well as increasing costs of nuclear construction and life-cycle maintenance across the industry.

PUBLIC DOCUMENT
TRADE SECRET INFORMATION AND NON-PUBLIC DATA EXCISED

As detailed in Mr. O'Connor's Supplemental Direct Testimony in our pending rate case, the major capital investments forecasted for 2016-2018 include reactor coolant pump replacements, heater drain tank pump speed controls, motor rewinds/replacements, cooling tower replacements, and the main electrical generator replacement for Prairie Island Unit 1. In his Supplemental Direct Testimony, Mr. O'Connor describes each of these projects and explains why they are necessary to safely and reliably operate the plant, even if Prairie Island were not to operate until the end of its licensed life.
Department of Commerce Information Request No. 74 in our currently pending electric rate case requested that we provide an estimate of the necessary retirement dates for Prairie Island Units 1 and 2 under the assumption that substantial (over $40 million per year for the site) new capital expenditures would not occur starting in 2016. Our forecasted capital expenditures for the combination of mandated compliance projects and dry fuel storage alone total $38.9 million in 2016, $36.1 million in 2017, and 34.8 million in 2018. These expenditures are necessary to operate the plant within the NRC's mandates and would leave very little additional capital within the $40 million annual budget to complete basic and necessary LCM projects during these years. Given this, and the fact that any single outage could require more than the remaining amount of budgeted capital to resume operations, it is impossible to predict how long Prairie Island could operate under these budget constraints.

2. Forecasted Investments from 2021-2034

In our October 2 Reply, we explained that our forecast for the fifteen-year period of 2021 through 2034 would likely need to increase by roughly $600 to $900 million. We revised our forecast following a project-by-project analysis of anticipated capital investments at Prairie Island from 2015 through 2034, and we believe that it is responsible to anticipate and plan for all of the projects underlying our forecast. In other words, our updated forecast reflects our best judgment regarding these costs, which we presented to the Commission in October so that it can undertake a thorough assessment of our Current Preferred Plan. That said, it is not possible to accurately predict not only which projects will be necessary over a 19-year period, but also what those projects will cost. It is likewise not possible to predict what regulatory mandates will arise in the future, and what compliance with those unknown mandates might cost. Given this uncertainty, we understand certain stakeholders' desire to explore and maintain future optionality with respect to Prairie Island, and we address those concerns below.

PUBLIC DOCUMENT
TRADE SECRET INFORMATION AND NON-PUBLIC DATA EXCISED

D. Future Optionality at Prairie Island

As already discussed, we believe that Prairie Island continues to benefit our customers by producing cost-effective, carbon-free baseload energy that is a keystone to our carbon-reduction goals and a bridge to additional renewable development in the future. We recognize, however, that it is impossible to perfectly forecast costs for the remaining 19 years of Prairie Island's licensed life and that certain of our stakeholders may want to explore alternatives based on that uncertainty. To that end, we have begun to identify and analyze one potential alternative for the plant around the 2025 timeframe. We recognize that other alternatives exist. We present this preliminary analysis as an example of the considerations and analyses that would go into an in-depth discussion of alternatives, and we welcome further dialogue regarding this or other alternatives.

Before proceeding with any in-depth discussion of alternatives for Prairie Island, we would need to conduct a detailed study of its effect on our transmission system, as we did in connection with our proposal to cease coal operations of Sherco Units 1 and 2. This would include a MISO Y2 Study, our own reliability study, and a black start study – just as we are providing in connection with our Current Preferred Plan. And as we did for Sherco, we would need to conduct impact studies relating to our employees at Prairie Island and the community around Red Wing, Minnesota. Finally, the technical studies completed in connection with our Sherco proposal may need to be reconsidered, as the study models assumed that Prairie Island would continue to operate.

If the Commission and our stakeholders wish to have a longer-term discussion concerning the future of Prairie Island, we are committed to completing this work, which we expect would take approximately 18 months. At that point, we would welcome input from stakeholders and the Commission, and we believe that a decision could be made with respect to Prairie Island's future sometime in 2018. If a decision was reached to pursue an early retirement for Prairie Island, we would need an additional seven years to plan for the shutdown and decommissioning, including the construction of replacement generation and any transmission projects that would be needed to maintain system stability. This planning period is critical, as recent industry experience teaches that hastily planned (or unplanned) shutdowns can be extraordinarily expensive as compared to shutdowns that are preceded by several years of planning. Company witness Mr. John Reed discusses the importance of advanced planning for nuclear retirements in his Supplemental Direct

PUBLIC DOCUMENT
TRADE SECRET INFORMATION AND NON-PUBLIC DATA EXCISED

Testimony, which is being filed in our pending rate case contemporaneously with this Supplement. The seven-year timeline is also similar to the one we have proposed in connection with Sherco Units 1 and 2, and would result in a shutdown of Prairie Island around 2025.

To be clear, we do not currently foresee an economically prudent time to retire Prairie Island prior to the end of its licensed life. That said, we believe that an off-ramp in the 2025 time period would result in certain financial benefits as compared to an earlier retirement. Net plant balance is set to peak in 2018 at $1.127 billion. A retirement in that time period would result in substantially increased stranded costs, in addition to the costs otherwise associated with early retirement. During the early 2020s, however, net plant balance begins to decrease and, by 2025, would be within approximately $125 million of today's value of $917 million. That additional $125 million of net plant would itself be more than offset by the additional 10 years of investment growth in our decommissioning fund, which has a current market value of approximately $725 million and earns a return of approximately 5-6 percent (or between $36 million and $43 million) annually.

Additionally, if a decision were made around 2018 to retire Prairie Island in the mid-2020s, we could reduce our capital expenditures during the intervening years, as we normally anticipate lower capital spend in the years leading up to a plant's planned retirement. While we have not yet studied this capital adjustment in-depth, we estimate that our capital expenditures could be reduced such that net plant in 2025 would be significantly less than today's value of $917 million—provided we have several years to plan for the retirement. The strategy of reduced capital expenditures in the 2020s would come with a risk of a modest capacity derate at Prairie Island beginning around 2022 due to decreased capital investment, but we see this as a reasonable risk if the Commission and our stakeholders wish to pursue an early retirement.

The growth of our decommissioning fund is a significant factor that should be taken into account when considering alternatives to operating Prairie Island through its licensed life. Table 18 below compares the approximate amounts of customer contributions versus investment growth that would be needed to fully fund decommissioning at Prairie Island for three examples of potential retirement years:

PUBLIC DOCUMENT
TRADE SECRET INFORMATION AND NON-PUBLIC DATA EXCISED

Table 18: Decommissioning Funding Broken Into Customer Contributions and Investment Growth

	2020	2025	2034
Customer Contributions	$518 million (58.67%)	$374.5 million (40.87%)	$10 million (0.64%)
Investment Growth	$319 million (41.33%)	$541.8 million (59.13%)	$1.552 billion (99.36%)

In short, the longer our decommissioning fund enjoys market growth, the less our customers will be required to pay to fund decommissioning at Prairie Island. This, in combination with the decreasing trend in forecasted net plant balance over the early 2020s, suggests that a retirement significantly before 2025 would involve substantially higher decommissioning and stranded costs.

As already discussed, we have conducted some preliminary modeling around the replacement of Prairie Island with a natural gas CT plant in 2025. Doing so would result in an increase of $929,614 million in PVSC and $601,257 million in PVRR. This analysis incorporates our current best judgment as to the costs of building replacement generation, the depreciation associated with Prairie Island, and the acceleration of decommissioning costs at Prairie Island – including most significantly, the elimination more than a dozen years of investment growth. Our PVSC model also incorporates the regulatory cost of emitting additional CO_2, which we have valued at $21.50 per metric ton beginning in 2019.

It is important to note that we have not conducted an in-depth replacement study with respect to Prairie Island. That analysis would include many of the technical studies that have already been completed for Sherco and the inclusion of specific costs related to transmission remediation and decommissioning that we are not currently in a position to forecast. We view this high-level analysis as buttressing our earlier cost-effectiveness modeling and as supporting the continued operation of the plant, at the very least through the next few years as we further study alternative scenarios.

E. Next Steps

There is much work to be done if the Commission wishes to pursue an in-depth discussion concerning the future of Prairie Island. As already discussed, we would need to complete several technical and impact studies, as we did in connection with

PUBLIC DOCUMENT
TRADE SECRET INFORMATION AND NON-PUBLIC DATA EXCISED

our Sherco proposal. We may also need to reevaluate the technical studies completed in connection with our Sherco proposal, in which we assumed the continued operation of Prairie Island on our system. We believe this analysis is critical to making a fully informed judgment on this significant planning issue, and we are committed to doing this work over the next 18 months if the Commission wishes to further explore alternatives to operating Prairie Island through its current licensed life.

Prairie Island remains cost-effective, and our near-term investments are necessary to continue operating the plant today. Additionally, the bulk or our anticipated capital investments will occur in the out-years of Prairie Island's licensed life. As a result, there is time to engage in a thoughtful process, and we welcome this opportunity to dialogue with our stakeholders in hopes of charting a path that is best for our customers and the states we serve.

VIII. ACTION PLANS

A. Five Year Action Plan (2016-2020)

Our Five Year Action Plan discusses near-term actions by resource type, which is primarily focused on wind and solar resource additions.

Wind. The remaining 400 MW of the 750 MW of wind generation resulting from our 2013 RFP is expected to achieve commercial operation in 2016, which includes the 200 MW Courtenay project for which the Company took over ownership in 2015. In light of the recent PTC extension, we plan to develop and finalize our acquisition plan later in 2016 for securing an additional 800 MW of PTC wind by 2019. Currently, in order to obtain the full benefit of the PTC, wind projects must secure a "safe harbor" designation by the end of 2016 by incurring at least 5 percent of the project costs. Construction must be completed by the end of 2018. The PTC is reduced in subsequent years for projects meeting these milestones. We believe it is in the best interest of our customers to obtain the full PTC value; it may therefore be necessary to bring a wind acquisition proposal before the Commission in the latter half of this year for approval on an accelerated schedule.

Solar. The 187 MW of utility-scale solar generation resulting from our 2014 RFP, and the 100 MW Aurora Solar project resulting from the 2012 CAP proceeding are expected to achieve commercial operation in 2016. In light of the recent federal 30 percent ITC extension, we plan to develop and finalize an acquisition plan later in

PUBLIC DOCUMENT
TRADE SECRET INFORMATION AND NON-PUBLIC DATA EXCISED

2016 to secure an additional 400 MW of 30 percent-ITC eligible utility-scale solar resources by 2020. There are similar safe-harbor provisions for the ITC as there are for the PTC for wind, however we have a longer runway. We note that we may adjust the amount of utility-scale solar resources we would seek based on the amount of small solar resources added to our system. The amounts indicated in our Expansion Plan (Table 2) are based on the updated small solar forecast we discuss in Attachment B to this Supplement.

Hydro. We will continue to evaluate the potential and value of hydro resource options including the potential for hydro resources from Manitoba Hydro beyond the current contracts that expire in the mid-2020s.

Natural Gas/Oil Peaking. We will continue to analyze older CTs on the NSP System to avoid impact of increased forced outages due to a major equipment failure and associated unexpected loss of capacity.

Coal. After this Resource Plan proceeding concludes, we will develop and submit a proposal that seeks to implement our proposal to cease operation of Sherco Unit 2 in 2023 and Sherco Unit 1 in 2026, and construct replacement generation resources needed as a result of these changes

Nuclear. Continue to utilize our cost-effective nuclear resources to achieve carbon-reduction goals and maintain reliability. Continue to dialogue with our regulators and stakeholders regarding the future of Prairie Island. If the Commission wishes to further explore alternatives to operating Prairie Island through its current license, complete the economic, technical, socioeconomic studies necessary to advance that discussion.

North Dakota. If the North Dakota commission takes action to approve our proposed Negotiated Agreement, we expect to begin working with Commission staff in 2016 toward developing a Resource Treatment Framework that would likely be filed with the Commission sometime in 2017. We believe additional discussions with all of our state Commissions will be necessary during the five-year action planning period to address divergent energy policies and changes in cost allocations that may result.

B. Long Term Plan Action Plan (2021-2030)

Proposed actions during the 2021-2030 period:

PUBLIC DOCUMENT
TRADE SECRET INFORMATION AND NON-PUBLIC DATA EXCISED

- Complete preparations for ceasing coal operation of Sherco Unit 2 in 2023 and Sherco 1 in 2026.
- Complete preparations to add our proposed natural gas CC at the Sherco site in 2026, achieving commercial operation prior to ceasing coal operations at Sherco Unit 1.
- Complete the natural gas infrastructure to supply the proposed Sherco CC.
- Complete preparations to add the proposed natural gas CT in North Dakota by the end of 2025.
- Effectively manage planned retirement of older CTs.
- Evaluate and determine the merits of extending or renewing expiring wind, thermal and hydro generation PPAs.
- Actively work to identify and act on opportunities to implement cost-effective and reliable distributed generation, electric storage units and other commercial ready technologies that are responsive to customer needs and comply with applicable requirements.

Minn. Stat. § 216H.02, subd. 1 requires that we provide an update on our progress toward the goal of achieving 80 percent CO_2 reduction by 2050. We expect our Current Preferred Plan to achieve at least at 35 percent CO_2 reduction from 2005 levels by 2020 and nearly 60 percent by 2030 – positioning us well to help Minnesota achieve its objective to reduce CO_2 by 80 percent by 2050. We note that our Monticello and Prairie Island nuclear facilities are essential to achieving the reductions we propose in our Current Preferred Plan and the 2030 CPP objectives. We discuss our nuclear units and their role on the NSP System more in depth in Section VII of this Supplement.

Our Current Proposed Plan achieves a 60 percent reduction in CO_2 emissions by 2030 milestone by adding 3,200 MW of new renewables and ceasing coal operations at Sherco Units 1 and 2 during the 2016-2030 planning period. Renewable additions begin with an 800 MW addition of competitively-priced PTC wind additions by 2020 and an additional 1,000 MW of non-PTC wind by 2030. Solar additions include adding 400 MW of competitively priced utility-scale ITC solar by 2020 and additional 1,000 MW by 2030. This adds to the 287 MW of utility-scale solar going into service in 2016. We note that we now expect small-scale solar resources to potentially reach 1,100 MW by 2030, which we discuss in Attachment B.

IX. PUBLIC INTEREST ANALYSIS

PUBLIC DOCUMENT
TRADE SECRET INFORMATION AND NON-PUBLIC DATA EXCISED

Based on our detailed analysis, we conclude that the Current Preferred Plan is in the public interest. It puts the Company on a path to transform its fleet in a planful, coordinated manner that ensures we will meet our obligations under the CPP and the most stringent of our state renewable energy and carbon reduction requirements, while effectively managing costs and preserving flexibility on behalf of our customers. It provides our customers, employees, and our communities with certainty, while also maintaining a balanced diversity of energy sources, and investment opportunities that benefit our state economies and communities. Finally, it promotes an orderly, gradual transition of our generation fleet and thus avoids a scenario where the Company may have to retire and replace five baseload generating facilities in the early 2030s.

Minnesota Commission rules (Minn. R. 7843.0500, subp. 3) identify the factors that the Commission is to consider when determining if the Resource Plan selected is in the public interest. More specifically, these rules require that resource options and resource plans are to be evaluated on their ability to:

A. Maintain or improve the adequacy and reliability of utility service,
B. Keep the customers' bills and the utility rates as low as practicable, given regulatory and other constraints,
C. Minimize adverse socioeconomic effects and adverse effects upon the environment,
D. Enhance the utility's ability to respond to changes in the financial, social, and technological factors affecting its operations, and
E. Limit the risk of adverse effects on the utility and its customers from financial, social, and technological factors that the utility cannot control.

Our Current Preferred Plan is best able to meet these criteria, especially when analyzed on a comprehensive basis in light of the planning landscape facing the Company and the industry.

A. Reliability

Our Current Preferred Plan is designed to maintain the adequacy and reliability of the NSP System and will allow the Company to continue to provide safe and reliable service to its customers. Our plan promotes an orderly, gradual transition of our generation fleet and thus avoids a scenario where the Company may have to retire and replace five baseload generating facilities in the early 2030s.

PUBLIC DOCUMENT
TRADE SECRET INFORMATION AND NON-PUBLIC DATA EXCISED

B. Impact to Customers' Bills

We developed our Current Preferred Plan with impacts to customers in mind. Given the regulatory and other constraints of the planning landscape, we sought to achieve additional flexibility and achievement of policy goals at a reasonable additional cost. For an incremental increase of less than one-half of one percent over the planning period compared to business as usual, we achieve nearly 60 percent reduction in our CO_2 emissions from 2005 levels, near certain CPP compliance, and assured reliability for our customers.

C. Socioeconomic and Environmental Effects

Our Current Preferred Plan will benefit our states by advancing both federal and state energy policies and by being nearly certain to comply with the final Clean Power Plan rules. It will also benefit our communities by allowing adequate time to transition our workforce and promoting economic development during this fleet transition. For these reasons, we believe that our Current Preferred Plan charts the right path forward for our Company and stakeholders.

D. Flexibility to Respond to Change

Our Current Preferred Plan was developed to position the Company well in the current planning landscape. Obtaining strategic flexibility is a key component of doing so. This flexibility enhances our ability to respond to changes in the financial, social, and technological factors affecting our operations during the planning period – and preserves optionality for us to respond to these factors beyond the planning period.

E. Limiting Risks

Much like the flexibility to respond to change, the strategic flexibility inherent in our Current Preferred Plan limits the risk of adverse effects on the Company and our customers from financial, social, and technological factors beyond our control. Key to limiting such risk is our planful and coordinated fleet transition that ensures we will meet our obligations under the CPP and the most stringent of our state renewable energy objectives and carbon reduction requirements.

PUBLIC DOCUMENT
TRADE SECRET INFORMATION AND NON-PUBLIC DATA EXCISED

We envision an energy future that includes a dramatic reduction in carbon emissions so that, by 2030, our energy mix will be 63 percent carbon-free. Taking action to transition our fleet now mitigates the costs and risks of retiring a significant proportion of our baseload generation in the same time period along with environmental regulatory risks to the economic viability of our older coal units, and provides certainty to our customers and stakeholders throughout the planning period. Our proposal to achieve this vision will benefit our customers, communities, and the states we serve. Our customers will benefit from our cost-effective transition to the cleaner energy future they want, while preserving the reliable and safe service they expect, which we can accomplish for just a fraction of a percent more in incremental cost over earlier plans. Our Current Preferred Plan represents the best option to meet customers' needs in light of the planning landscape and presents the best path forward for the Company, our customers, and the energy future of the Upper Midwest area. For these reasons, we believe our Current Preferred Plan is in the public interest, and we respectfully request the Commission's approval for planning purposes.

Compliance Matrix

This Supplement to Xcel Energy's 2016-2030 Upper Midwest Resource Plan in part responds to the Minnesota Public Utilities Commission's ORDER REQUIRING SUPPLEMENTAL FILING issued January 6, 2016 in Docket No. E002/RP-15-21. The following table lists each Order requirement and cross-references the section in Supplement where we address each item.

The Supplement also responds to the November 6, 2015 Minnesota Department of Commerce request for various information , as well as the Department's December 17, 2015 Information Requests Nos. 66 through 74, in which the Department requested responses be provided concurrently with the Supplement. We have addressed the IRs either in IR format via standard email delivery and uploaded to the eDockets site or in the Supplement as noted below.

Order Requirements

Order Point	Content of Order Point	Location of Order Point as Addressed in Supplement
Order Point 1	Xcel shall file a supplement to its resource plan no later than January 29, 2016, and shall continue to share information with stakeholders. Upon submission, the Department will review Xcel's supplemental resource plan filing to determine the time the Department will need to analyze the new filing. Within 30 days of the supplemental filing, the Department will submit a letter to the Commission recommending a comment period and whether any additional information is needed. After reviewing the Department's recommendation and recommendations from any other party, the Executive Secretary is authorized to set a reply comment period.	January 29, 2016 Supplement to the 2016-2030 Upper Midwest Resource Plan ("Supplement")
Order Point 2	As part of its January 29, 2016 supplement, Xcel shall file:	
	a. A rate impact analysis of the revised proposal;	Supplement Sections VI, Attachment E

Order Requirements

Order Point	Content of Order Point	Location of Order Point as Addressed in Supplement
	b. A copy of the "Y-2 Study" by the Midcontinent Independent System Operator (MISO) about the effects of shutting down one or two of the Sherco facilities;	Attachment D1
	c. An analysis of alternatives to all or part of the energy and capacity that would otherwise be provided by natural gas combined cycle and combustion turbine resources, including alternatives such as demand response, improved system or grid efficiencies, and distributed energy resources;	Attachment F
	d. A proposed method to acquire proposed combined cycle and combustion turbine resources (e.g., a Company-issued request for proposals, a certificate of need, or some other process);	Supplement Section V.C.
	e. Information about potential sites for any proposed combined cycle facility;	Supplement Sections I., V.A., V.B.1.,2. Attachment B
	f. If the site for the proposed combined cycle facility is known, the estimated total costs, including costs of any extension of natural gas service and transmission lines, along with the basis for choosing the site; and	Supplement Section V.B.
	g. Estimated total costs, including costs of any extension of natural gas service and transmission lines, for adding a combustion turbine in North Dakota by 2025.	Supplement Sections V.A., V.B., Attachment B

Order Requirements

Order Point	Content of Order Point	Location of Order Point as Addressed in Supplement
Order Point 3	If Xcel files a Sherco Conversion Plan Proposal, it shall do so no earlier than one month following the issuance of a Commission order ruling on the merits of Xcel's resource plan. In any such initial filing, Xcel shall include a suggested procedural schedule, following consultation with the MPCA.	Supplement Sections V.D., VIII.A.

Department of Commerce – December 17, 2015 Information Requests

IR No.	Inquiry	Disposition of Response to IR
DOC-66	At the time Xcel files the January 29, 2016 supplement in this proceeding, please provide an updated *.FSV file for the reference case used by the Company in the new supplement or confirm that the most recently provided *.FSV file remains valid.	Submitted in IR format via email and uploaded to eDockets.
DOC-67	At the time Xcel files the January 29, 2016 supplement in this proceeding, please provide macro files (*.INP) which adjust Xcel's reference case *. FSV file to implement the contingencies explored by the Company in the new supplement or confirm that the most recently provided *.INP files remain valid.	Submitted in IR format via email and uploaded to eDockets.
DOC-68	At the time Xcel files the January 29, 2016 supplement in this proceeding, please provide macro files (*.INP) which adjust Xcel's reference case *. FSV file to implement the scenarios explored by the Company in the new supplement or confirm that the most recently provided *.INP files remain valid.	Submitted in IR format via email and uploaded to eDockets.
DOC-69	At the time Xcel files the January 29, 2016 supplement in this proceeding, please provide the post-processing spreadsheets, if any, which adjust the Strategist outputs to match those reported by the Company in the new supplement. Please provide such post-processing spreadsheets for the base case in each scenario explored by the Company in the supplement.	Submitted in IR format via email and uploaded to eDockets.

Department of Commerce – December 17, 2015 Information Requests

IR No.	Inquiry	Disposition of Response to IR
DOC-70	At the time Xcel files the January 29, 2016 supplement in this proceeding, please provide a macro file (*.INP) which adjusts the reference case to retire the A.S. King power plant in 2027. As part of the macro file, please include any expected impacts on: • Variable operations and maintenance costs; • Fixed operations and maintenance costs; • On-going capital expenditures; and • Any other expected impacts. (See pages 11-12 of Xcel's March 16, 2015 supplement for background information on such adjustments). If such adjustments are better incorporated in a post-processing spreadsheet, please provide such a post-processing spreadsheet.	Pursuant to a January 25, 2016 conversation with the Department of Commerce, the Company will provide the requested information by February 26, 2016. Noted as such and submitted in IR format via email and uploaded to eDockets.
DOC-71	At the time Xcel files the January 29, 2016 supplement in this proceeding, please provide a discussion of the potential transmission impacts of retiring the A.S. King power plant in 2027, to the extent they are known.	Pursuant to a January 25, 2016 conversation with the Department of Commerce, the Company will provide the requested information by February 26, 2016. Noted as such and submitted in IR format via email and uploaded to eDockets.

Department of Commerce – December 17, 2015 Information Requests

IR No.	Inquiry	Disposition of Response to IR
DOC-72	At the time Xcel files the January 29, 2016 supplement in this proceeding, please provide a brief discussion of whether the generating unit shut down scenarios explored by the Company in the new supplement include the present value of the expected impact of an earlier shut down on depreciation expense and related rate base costs (return on equity, deferred taxes, and so forth).	Submitted in IR format via email and uploaded to eDockets.
DOC-73	Regarding the generating units at Monticello and Prairie Island, at the time Xcel files the January 29, 2016 supplement in this proceeding, please explain why the fixed cost input in the most recent Strategist database are lower than the non-fuel production expenses (subtracting line 20 from line 34) listed in Xcel's FERC Form 1 for 2014.	Submitted in IR format via email and uploaded to eDockets.
DOC-74	At the time Xcel files the January 29, 2016 supplement in this proceeding, please provide an estimate of the necessary retirement dates for Prairie Island units 1 and 2 under the assumption that substantial (over $40 million per year for the site) new capital expenditures do not occur starting in 2016.	Reference Supplement Section IV.D.1.

Attachment B
Updated Strategist Modeling and Outputs

In addition to the summary provided in body of the Supplement document, this Attachment presents and explains detailing Strategist modeling analysis that supports our Current Preferred Plan. Included here are a description of the revised modeling assumptions, the scenarios and sensitivities analyzed, and the results of an economic analysis comparing the Present Value Revenue Requirements (PVRR) and Present Value of Societal Costs (PVSC) outputs for each scenario. We also respond here to the Department of Commerce's July 2, 2015 Comments related to the treatment of dump energy in our modeling.

I. REVISED MODELING ASSUMPTIONS

Our January 2, 2015 Initial Filing detailed the Planning Framework, Strategist Assumptions and Sensitivities, and Scenarios Analyzed that formed the basis of our resource planning analysis. The updates and additional modeling presented in this Supplement build on all the planning analysis done since initially filing this Resource Plan. We clarify that we made no changes to our base assumptions, such as our underlying sales and natural gas price forecasts.

Our March 16, 2015 Resource Plan Supplement forms the basis of the analysis supporting the Current Preferred Plan we present in this Supplement. Two key changes that have occurred since the March 2015 Supplement and the October 2015 Reply filing are the extension of federal tax credits for renewable energy and the growth in our Community Solar Garden forecast. In the narrative below, we explain the impact to our Current Preferred Plan of these changes on our resource additions and the associated costs.

We have included the impacts of the tax credit extension in all of our economic analysis of our Current Preferred Plan, to incorporate the changed circumstances related to renewable energy costs. We have outlined the impact of the small solar adjustments to in the section below, but have not reflected those cost changes in the PVRR and PVSC comparisons in Section III below. As these changes are the result of policy recommendations outside the scope of our Current Preferred Plan, we felt it was appropriate to include only those resource changes proposed in our plan, in our cost impact analysis. Although we did not submit a detailed economic analysis with our October 2015 revised proposal, we note that the extension of the Production Tax Credit (PTC) and Investment Tax Credit (ITC) reduces the PVRR of our Current

Preferred Plan by $202 million; the changes to the small solar increases the PVRR by approximately $760 million.

A. Tax Extender (PTC, ITC) Updates to Wind and Solar Prices

Legislation was enacted in December 2015 that extended the availability of PTCs (primarily relating to wind projects) to 2019 and the 30 percent ITC (primarily related to solar projects) to 2022. The Consolidated Appropriations Act of 2016 also provided step downs in tax incentives in various years depending on the type of project and the date construction commences and/or the project is placed into commercial operation.

To incorporate these changes into the modeling, it was necessary to develop updated pricing for wind and solar for the varying tax levels, as well as develop additional alternatives to capture the year-by-year changes. In developing these new alternatives, it was assumed that the Internal Revenue Service will ultimately promulgate a safe harbor memorandum for the new law that has similar timing requirements related to construction start and in-service dates as the current memorandum (i.e. approximately two years of construction time allowed for safe harbor). The assumptions used are shown below in Table 1.

Table 1: Wind and Solar Tax Benefit Assumptions

Construction Start	COD, by End of:	First Full Year of Ops	PTC	ITC
2016	2018	2019	100%	30%
2017	2019	2020	80%	30%
2018	2020	2021	60%	30%
2019	2021	2022	40%	30%
2020	2022	2023		26%
2021	2023	2024		22%
2022	2024	2025		10%

The pricing for each alternative was developed in the same manner as described in the Appendix to the March 16, 2015 Resource Plan Supplement document, using a spreadsheet financial model to convert an owned project to Power Purchase Agreement (PPA) equivalent pricing. For the Current Preferred Plan that includes owned renewables, the original ownership revenue requirements were used, resulting

equivalent costs on a net present value basis of owned vs. PPA projects for a given tranche. The PPA equivalent pricing is shown below in Table 2.

Table 2: PPA Equivalent Pricing for Wind and Solar ($/MWh)

Tech Type:	Solar	Solar	Solar	Solar	Solar	Solar	Wind	Wind	Wind	Wind
Construction Start:	2016	2018	2019	2020	2021	2022+	2016	2017	2019	2020+
First Full Year of Ops:	2019	2021	2022	2023	2024	2025+	2019	2020	2022	2023+
Tax Benefit:	30% ITC	30% ITC	30% ITC	26% ITC	22% ITC	10% ITC	100% PTC	80% PTC	40% PTC	0% PTC
2019	67.30						21.98			50.78
2020	68.80						22.48	26.78		51.92
2021	70.35	69.54					22.98	27.38		53.08

2023	73.53	72.69	71.29	70.96			24.02	28.62	38.72	55.49
2024	75.18	74.31	72.89	72.55	72.20		24.56	29.26	39.58	56.73
2025	76.86	75.98	74.52	74.18	73.82	95.00	25.11	29.91	40.47	58.00
2026	78.58	77.68	76.19	75.84	75.47	95.00	25.67	30.58	41.38	59.30
2027	80.35	79.42	77.90	77.54	77.16	95.00	26.25	31.27	42.30	60.63
2028	82.14	81.20	79.64	79.28	78.89	95.00	26.83	31.97	43.25	61.99
2029	83.98	83.02	81.43	81.05	80.66	95.00	27.44	32.68	44.22	63.38
2030	85.87	84.88	83.25	82.87	82.46	95.00	28.05	33.42	45.21	64.80
2031	87.79	86.78	85.12	84.72	84.31	95.00	28.68	34.17	46.22	66.25
2032	89.76	88.72	87.02	86.62	86.20	95.00	29.32	34.93	47.26	67.73
2033	91.77	90.71	88.97	88.56	88.13	95.00	29.98	35.71	48.32	69.25
2034	93.82	92.74	90.97	90.55	90.10	95.00	30.65	36.51	49.40	70.80
2035	95.92	94.82	93.00	92.57	92.12	95.00	31.34	37.33	50.51	72.39
2036	98.07	96.94	95.09	94.65	94.19	95.00	32.04	38.17	51.64	74.01
2037	100.27	99.12	97.22	96.77	96.30	95.00	32.76	39.02	52.80	75.67
2038	102.52	101.34	99.39	98.94	98.45	95.00	33.49	39.90	53.98	77.36
2039	104.81	103.61	101.62	101.15	100.66	95.00	34.24	40.79	55.19	79.09
2040	107.16	105.93	103.90	103.42	102.91	95.00	35.01	41.70	56.42	80.87

This extension provides material reductions in the cost of renewable energy acquisitions proposed in our each of our Resource Plan scenarios. We have therefore

adjusted our proposed wind additions in 2020 to be PTC-eligible in all scenarios analyzed in this Supplement, to allow for an apples-to-apples comparison between the plans. These changes were made to all scenarios in order to reflect how the current law impacted changing individual plans differently and therefore changes the delta analysis of the various plans.

The impact of this change on our Current Preferred Plan is a decrease in the overall PVRR of $202 million and a decrease in the overall PVSC of $203 million.

B. Small Solar Forecast Update

We launched our Solar*Rewards Community program in December 2014. As we have previously noted, we received an overwhelming response to our program – receiving nearly two thousand applications to-date. Modeling data regarding distributed solar was developed for the January 2, 2015 Initial Filing prior to the Company or Commission finalizing the tariffs and program offerings for individual distributed solar or community solar gardens installations. Subsequent to development of the initial models, the regulatory structure for distributed solar has become much clearer. We have more information on issues in the Community Solar Gardens proceeding (Docket No. E002/M-13-867) that were previously unresolved, and have therefore been able to update our forecast for purposes of this Supplement.

The initial data for cost and payment terms was estimated by the Company using its experience in other jurisdictions, primarily Colorado. In the Initial Filing, and carried forward into the Supplemental filing in March 2015, the assumption used was payments for 10 years at 8¢/kWh. Due to the magnitude of the solar programs proposed and modeled in these scenarios, the cost assumptions should be adjusted closer to current practice. In the alternative analysis with the small solar forecast adjustment discussed here, the costs and payment terms have been revised to payments for 20 years at 12¢/kWh.

In Table 3 below, we have accelerated the addition of small solar resources – a total of 422 MW in the pre-2020 timeframe in anticipation of the completion of several Solar*Reward Community projects and continuing our commitment to growing renewable resources.[1] While the current project pipeline for community solar gardens

[1] We adjusted our forecast for small solar, including community solar gardens and distributed generation (DG) in this Supplement based on a mixture of regulatory adjustments, detailed design, and project movement in the pipeline for our Solar*Rewards Community program.

exceeds this projection, we anticipate that some projects will experience difficulties in permitting, financing, or interconnection, therefore never reaching full operation.

Although the ITC has been extended, we believe that a majority of projects will be completed in the next year for the Solar*Rewards Community program based on established financing. Therefore, we have forecasted 259 MW of projects reaching operation by the end of 2016, and lowered the forecast after this time. Table 3 below shows the impact this adjusted small solar forecast has on our capacity/deficit position from the L&R analysis in the Supplement document.

Table 3: Small Solar Forecast Adjustment (MW) ICAP

	2016	2017	2018	2019	2020	2021	2022	2023	2024	2025	2026	2027	2028	2029	2030	Total
Current Preferred Plan – Proposed Solar Additions																
Small Solar Additions	42	45	49	53	58	17	20	24	29	34	41	49	59	71	85	675
Large Solar Additions	0	0	0	200	0	200	100	100	200	100	100	0	400	0	0	1,400
Total Additions by Year	42	45	49	253	58	217	120	124	229	134	141	49	459	71	85	2,076
Current Preferred Plan – Alterative Analysis w/Small Solar Forecast adjustment																
Small Solar Additions	259	159	91	83	76	17	20	24	29	34	41	49	59	71	85	1,097

Total Additions by Year	259	159	91	283	76	217	120	124	229	134	141	49	59	71	85	2,097
Impact of Small Solar Forecast Adjustment on Current Preferred Plan																
Increased Small Solar	217	114	43	31	18	0	0	0	0	0	0	0	0	0	0	422
Adjusted Large Solar	0	0	0	0	0	0	0	0	0	0	0	0	-400	0	0	-400
Change in Total Additions by Year	217	114	43	31	18	0	0	0	0	0	0	0	-400	0	0	22

The impact of this adjusted small solar forecast is a shift in the type and timing of solar additions in our plan, which impacts the overall cost of the Current Preferred Plan. In order to accommodate the increase to the small solar forecast in the early years of the plan, the utility-scale solar additions we propose in our Current Preferred Plan would be reduced. As Table 3 above shows, we would remove the remaining 400 MW of utility-scale solar in the plan in 2028 at a fixed flat price of $95/MWh in order to add the more than 400 additional MW of small solar between 2016 and 2020 at a fixed flat price of $120/MWh. While this change does not significantly impact the net solar additions in the plan, it accelerates the installation of the solar, but would also increase the cost of the plan by moving to a different, less cost-effective form of solar.

The impact of this change is an increase in the overall PVRR of our Current Preferred Plan by approximately $759 million. The PVSC impact of this change on our Current Preferred Plan is an increase of $737 million.

C. Updated Nuclear Forecast

Certain fixed costs that do not affect the relative economics of plans being considered are typically not included in the Strategist database. As an example, costs related to the distribution and corporate services business areas, transmission costs not related to generation plans, and recovery of current ratebase for owned units that are not subject to change are not typically included in the model. Strategist does include all costs related to the operations of owned and PPA units (fuel, variable and fixed O&M, PPA payments), and the models used for this resource plan do include future capital expenditures and recovery of ratebase for the Sherco units, as the costs for Sherco vary among the different retirement scenarios. In total, the Strategist model represents about 46 percent of the total system revenue requirements that go into rates, with the other 54 percent being unrelated to decisions around resource selection or planning.

In an effort to provide increased transparency around our nuclear cost assumptions, we have elected to include an analysis of scenarios with the full costs of nuclear in the Scenario Outcomes below. We have updated the model for that analysis to include specific forecasted Capital and Fixed O&M (FOM) costs for the planning period for the Monticello and Prairie Island units.

The O&M costs that were in the model previously for those units have been updated to the most recent estimate of future O&M. In addition, costs that were not in the model previously related to future capital expenditures and recovery of current rate base were added to the model. The net results of adding these costs in, as well as the much lesser impact of adjusting the O&M forecast, results in an increase in the net present value of revenue requirements (or societal cost) that Strategist reports of around $3.6 billion. We clarify that this total Capital and FOM cost is not the "increase" in our nuclear cost forecast that we discussed in our October 2, 2015 Reply Comments; we discuss the $600-$900 million forecasted cost increase in Section VII of the Supplement document.

This does not result in an increase to the relative cost of any plan, but simply adds in costs that were never reported before. Essentially, Strategist was adjusted from reporting 46 percent of total system costs to around 51 percent of total system costs and, as the same adjustment was made to all plans, the delta in costs between the various plans is unchanged. The impact of these adjusted cost assumptions to the overall PVRR/PVSC of the modeling scenarios is shown below in Section VII on Table 10.

II. SCENARIOS AND SENSITIVITIES SUMMARY

A. Scenario Summary

To analyze our Current Preferred Plan, we included five key scenarios from our previous Resource Plan filings. Each of these scenarios was updated with the assumptions described above. All previous scenarios were run as they were described in the Initial Filing; however Sherco 2 is now the first unit retiring instead of Sherco 1.

1. Updated Previous Scenarios

Each of the scenarios described below used the baseline data from our March 2015 Supplemental filing, updated with the relevant modeling assumption revisions described above.

- *Reference Case:* Includes the continued operation of Sherco Units 1 and 2 through 2030, 400 MW of wind additions, over 400 MW of small solar additions, 287 MW of large solar additions, no assumptions changes.
- *Updated 2015 Plan:* Includes the continued operation of Sherco Units 1 and 2 through 2030, 1,800 MW of wind additions, over 1,600 MW of large solar additions, nearly 700 MW of small solar additions, updated for Federal ITC/PTC.
- *North Dakota Plan:* Consistent with March Supplement, contains no additional renewables beyond currently committed 750 MW of wind, no assumptions changes.

2. Current Preferred Plan and Variants

The scenarios below reflect the Current Preferred Plan, with various alternatives for replacement capacity of the Sherco unit retirements. We allowed the model to select both site-specific and generic replacement capacity alternatives for the Sherco units. The modeling of the site-specific alternatives is discussed in detail in Section V of the Supplement.

- *Current Preferred Plan*: Cease operation of a total of 1,400 MW of capacity and associated energy at Sherco Unit 2 in 2023 and Unit 1 in 2026, 1,800 MW of wind additions, over 1,400 MW of large solar additions, nearly 700 MW of small solar additions, updated for Federal ITC/PTC extension, goal of 50 percent ownership of renewables, Company-owned Fargo CT and Sherco CC.

- *Current Preferred Plan – All Generics*: Same as Current Preferred Plan, but with all generic thermal alternatives. Leave behind costs for not replacing generation at the Sherco site are not modeled within Strategist so are not included in the PVSC/PVRR's, but are calculated outside of models. Updated for tax credit extension.

3. Full Optimization Scenarios

We performed an unconstrained optimization incorporating the option of adding incremental Demand Response and Distributed Energy Resources.

- *Resource-Need Optimization:* Unconstrained optimization simultaneously filling energy and capacity needs.
- *Capacity-Need Optimization:* Unconstrained optimization filling capacity needs only.

The results of this analysis are included in Attachment F. A summary of the primary scenarios included in this Supplement is shown in Table 4 below.

Table 4: Summary of Scenarios Analyzed in this Supplement

Primary Sherco / Carbon / Renewable Alternatives	Strategist Output Code
Continued Operation (Run Both Units to 2030)	
Reference Case	1
Updated 2015 Plan	
Updated 2015 Plan - PTC Wind in 2020	10
North Dakota Plan	
Original North Dakota Plan - No additional renewables beyond currently committed	15
Current Preferred Plan	
Current Preferred Plan - Retire Sherco 2023 and 2026, accelerate renewables, Sherco CC, Fargo CT	28
Current Preferred Plan with all generic thermal replacements, excluding leave behind costs	28_A

B. Sensitivity Summary

To determine how changes in our assumptions impact the costs or characteristics of different Resource Plans, we examined our plans under a number of sensitivities. If a plan is extremely sensitive to changes in assumptions, it is not a robust course of action for the Company to pursue. Instead, we could conceivably propose an expansion plan that is less sensitive to assumption changes, but slightly more costly than the least-cost scenario under starting assumptions. For this Supplement, we used a subset of the same sensitivity cases that were used in the January 2, 2015 Initial and March 16, 2015 Supplemental Filings, selecting the sensitivities that are most relevant to the decisions being contemplated and that are of the most interest to the various parties to this case. Additionally, what was referred to as the "Traditional View" in the March 2015 Supplement (Sensitivity "R", Do Not Maintain CAPCON Length) is incorporated into all cases and is no longer considered a sensitivity.

Table 5 below gives a summary of the Modeling Sensitivities included in this Supplemental filing.

Table 5: Modeling Sensitivities

Base CO_2 (Mid) Costs	**Strategist Output Code**
Low Gas Prices	C
High Gas Prices	D
Zero CO_2 Costs	
No Regulated CO_2 (Contains Externality CO_2)	K
ND Assumptions (No Extern, No CO_2 Costs)	T
"Customer impact" (No Cap Credit, No Extern, No CO_2 Costs)	U
Other CO2 Sensitivities	
CO_2 $9, Start 2019	L
CO_2 $34, Start 2019	M
CO_2 $9, Start 2024	N
CO_2 $34, Start 2024	O
CO_2 at Federal SCC 3%	P

III. ECONOMIC ANALYSIS

After identifying the scenarios and sensitivities to update for this Supplement, we performed an updated resource planning analysis in largely the same manner we used for both our Initial Filing and our March 16, 2015 Supplement. To provide a comparison between the various cases we considered, we use a traditional resource planning method and rank the scenarios based on cost. In addition to a least-cost analysis, we perform a more holistic analysis to determine if our Current Preferred Plan is appropriately balanced within our planning framework when compared to the other scenarios.

We analyze the economics of the scenarios in both PVRR and PVSC terms. The PVSC results provide a baseline ranking of the overall societal benefits of each of the scenarios analyzed – applying the Minnesota Commission's regulatory cost of carbon dioxide and externalities values for criteria pollutants – and the externality for carbon in non-regulated years in the modeling period of 2015-2053. The PVRR-based analysis excludes carbon costs and all externalities values over the modeling period.

Because actual customer cost impacts are a key consideration within our planning framework, and due to the fact that not all of the NSP System states allow for an analysis that includes carbon costs or externalities, we also perform a least-cost analysis on a PVRR basis (North Dakota Plan). We present the results of these analyses in this section, and demonstrate that our Current Preferred Plan provides the most reasonable outcome under both a least-cost analysis and under a more comprehensive analysis.

1. Traditional Resource Planning Analysis

We first analyzed our modeling outputs on a PVSC basis to determine the least-cost plan including societal impacts. Table 6 below provides the PVSC outcomes for each of the key scenarios we analyzed for this Supplement.

Table 6: PVSC Results ($Millions)

Scenarios	PVSC Results
Current Preferred Plan	$51,293
Current Preferred Plan, All Generics	$51,280
Updated 2015 Plan	$51,458
Reference Case	$52,422
North Dakota Plan	$52,620

As shown above in Table 6, our Current Preferred Plan is the second lowest cost plan on a PVSC basis. Only the Current Preferred Plan with a generic Sherco Unit replacement ranks higher on a PVSC basis – with a minimal $13 million difference in PVSC. This difference is due to the exclusion of leave-behind costs for not replacing generation at the Sherco site, which are not modeled in Strategist.

Table 7 below provides the PVRR rankings of the same key scenarios.

Table 7: PVRR Results ($Millions)

Scenarios	PVRR Results
Current Preferred Plan	$45,606
Current Preferred Plan, All Generics	$45,582
Updated 2015 Plan	$45,302
Reference Case	$45,605
North Dakota Plan	$45,473

From a strictly PVRR perspective, as Table 7 above shows, the Reference Case is the lowest-cost plan. Table 7 also indicates that the North Dakota Plan ranks the next best on a PVRR basis, since it relies heavily on natural gas generation additions as compared to the Preferred or Current Preferred Plans. As we have mentioned previously, we do not believe that either of those plans would meet Clean Power Plan (CPP) compliance. Our Current Preferred Plan, with variations for site-specific and generic replacements for Sherco capacity, has the lowest PVRR ranking, as the benefits of the carbon emissions impacts of the plan are not captured in a PVRR analysis. A full matrix of PVRR and PVSC results is included in Section VII below.

After performing the PVSC and PVRR analyses, we evaluate the scenarios more holistically by analyzing their environmental performance, strategic flexibility, and cost. Table 8 below, the Run Key carries forward the PVSC and PVRR ranking of each scenario to provide a reference point for the broader analysis, but it also identifies key policy outcome metrics such as amount of CO_2 emissions reductions from 2005 levels and the amount of renewable energy added to the NSP System under each scenario.

Table 8: Run Key[2]

	PVSC Results ($M)	PVRR Results ($M)	2030 Coal Gen vs. Ref. Case	2030 Gas Burn (Bcf)	2030 Percent CO_2 Reduction	Total Expansion Plan Renewable Additions (MW)	CPP Compliant?
Current Preferred Plan	$51,293	$45,606	-59%	83	58%	3,200	Yes
Current Preferred Plan, All Generics	$51,280	$45,582	-59%	84	57%	3,200	Yes
Updated 2015 Plan	$51,458	$45,302	-16%	32	42%	3,200	Uncertain
Reference Case	$52,422	$45,605	-	58	23%	400	No
North Dakota Plan	$52,620	$45,473	+3%	68	19%	0	No

The comprehensive Run Key analysis shows that our Current Preferred Plan has the stronger performance in terms of carbon reductions and renewable energy additions to the NSP System. The renewable energy additions in our Updated 2015 Plan and Current Preferred Plans are consistent, but the timing and ownership has shifted, as shown in our Expansion Plans. This plan continues to provide the best value for our customers – achieving a balance between multiple objectives, including: reasonable costs, dramatic emissions reductions, anticipated compliance with the CPP, and maintaining reliability on our system. Our Current Preferred Plan proposes to time these resource changes such that we minimize the socioeconomic and technical impacts by allowing sufficient time to plan for fleet transitions.

IV. ALTERNATIVE SCENARIOS CONSIDERED

As part of the process of developing our Current Preferred Plan, we evaluated a broad range of alternatives. Our updated Strategist modeling included consideration of several alternative scenarios, including conversion of a Sherco Unit to a Boiler, and solar and wind resources in addition to generic and site-specific CT and CC alternatives. Here, we discuss these alternative Scenarios in greater detail.

[2] In this Run Key Table, the PVRR Results, change in coal generation in 2030 as compared to the Reference Case (2030 Coal Gen vs. Ref Case), amount of gas burned at our plants in 2030 in Billions of cubic feet (2030 Gas Burn (Bcf)), and the percent reduction of CO_2 from 2005 levels (2030 Percent CO_2 Reduction) are all considered under a cost sensitivity that excludes regulatory costs and CO_2 externalities in the dispatch. Under this sensitivity, there will be a tendency to overestimate CO_2 emissions, as coal would be 'priced' at a lower cost and the likelihood of dispatching the resource more frequently would therefore be increased.

2. Conversion of a Sherco Unit to Gas

As noted above, one unit at Sherco could be converted to a gas boiler, as the Department recommended in its July 2, 2015 Comments. We commissioned an external study of impacts and costs for converting either of Sherco Units 1 or 2 boilers to gas-fired and to evaluate the economic aspects of such a conversion. We note that a gas-fired boiler would be a capacity resource only, as the technical limitations of a long start-up time, a slow ramp rate, high O&M, and a high heat rate as compared to gas fired turbines would likely result in very low annual capacity factors of less than two percent due to the Unit's economic dispatch order position. Compared to our Current Preferred Plan, replacing a unit at Sherco with a gas boiler and adding a CC increases the PVSC by $36 million dollars.

In addition, continued operation of a large coal boiler that is converted to utilize gas also results in a number of operational issues. While the unit can be counted as a capacity resource after conversion, we believe that in order to qualify as a capacity resource in the Midcontinent Independent System Operator's (MISO) evolving capacity construct, firm gas supply may be required. The current capacity construct in MISO is on an annual basis from June 1 to May 31. If MISO changes to a seasonal capacity construct, firm gas may not be required during the summer season. However, as one Sherco unit is a large portion of the entire system capacity, it may not be practical from an operations perspective to have the unit available for only part of the year. In addition, the operating characteristics of the large unit that was designed for base load operation will push it to near the bottom of the dispatch order even with low gas costs being directly competitive with coal, if not better.

A converted gas unit would have a ramp rate of approximately 5 MW per minute from a minimum load level of 260 MW to full load. This is considerably slower than a CT, which has a ramp rate of approximately 10 MW per minute. We would expect that when the unit is dispatched it could be kept online for several days in order to cover the start costs, anticipated to be approximately $100k for labor plus 3,500 to 4,000 MMBTU of start fuel. Once taken through and orderly shut-down the unit will not be available for restart for at least one to two days.

3. All Renewables

We also considered replacing the capacity and energy from retirement of Sherco Units 1 and 2 with replacement of the capacity and energy entirely from renewable sources, as is required under Minn. Stat. § 216B.2422, subd. 4. Our Current Preferred Plan

includes 1200 MW of renewable additions by 2020. However, in addition to the significant amount of renewable generation we plan to add to our system, gas-fired generation plays an important role on the system and was also selected as a cost-effective resource addition to meet customer needs.

Variable resources such as wind and solar must be integrated with dispatchable gas-fired generation in order to ensure adequate system reliability. Gas-fired generation will likely be distributed at several locations around the NSP System to provide grid support and to efficiently utilize existing transmission infrastructure. If replacement generation is not located at the Sherco site, we would need to otherwise resolve a voltage deficiency in the Becker, Minnesota area and for the Monticello nuclear plant, which would require the conversion of one of the Sherco units to a synchronous condenser, a Static Var Compensator (SVC) or Statcom device.

The goal of a sustainable, cleaner energy future depends upon sufficient infrastructure to support delivery of utility-scale and distributed renewable resources. In particular, modernized transmission and distribution systems are critical to meet the challenges of emerging technologies, expanding renewable policies, and a comprehensive view of resource planning. Appendix H of our initial filing discussed some of the effort undertaken at both the transmission and distribution level to ensure increased levels of renewable generations can be accommodated.

V. TREATMENT OF DUMP ENERGY

As the Department noted in their July 2, 2015 Comments, our modeling shows a significant level of dump energy. In Strategist, DSM, wind, and solar are modeled as must-run resources and their generation is used to reduce customer load prior to performing thermal dispatch. The thermal dispatch includes several must-run units, such as large coal plants, as well as must-take PPAs, such as biomass. There are hours during which the modified load (customer load less DSM, wind, and solar generation) is less than the minimum physical operating level of the must-run thermal resources. Strategist reports the energy when generation is greater than load as dump energy. Dump energy occurs because Strategist does not allow the must-run thermal units and must-take PPAs to reduce their generation to balance load. The Department correctly explained in its comments that dump energy increases as more wind resources are added to the system. This occurs because the modified load will decrease as wind additions are increased. This results in more instances where the modified load is less than the must run thermal resources and there is a corresponding increase in dump energy.

In our analyses we assign a revenue credit to dump energy equal to 50 percent of the market energy price. In addition, by requiring the thermal units to operate at their minimum, the costs and emissions for the thermal generation related to the dump energy are included. Dump energy does not impact the optimization of the expansion plans or the dispatch of the generators in the model. We assigned the revenue credit outside the model after the optimization and dispatch is complete. We believe this modeling approach is appropriate and provides for the full value of wind to be accounted for, as it allows all the energy available from both wind and thermal units to be included in the analysis.

It is also important to note that over-builds would be immediately apparent if the reserve margin significantly exceeded the required reserve margin. This does not occur in our modeling. We conclude that our approach provides a consistent comparison of renewable and thermal resources.

The Department has also expressed concern that dump energy may indicate there is excess energy that can be applied to reduce the resource additions needed to meet customer load. Dump energy typically occurs, however, during low-load or off-peak periods. While the resources available during these low load periods may greater than the resources needed to serve these lower loads, it is not possible to "save" this energy and use it later when loads are higher.

Finally, as the Department noted, dump energy is a challenging issue from both a cost and CO_2 perspective. We propose to work with the Department to arrive at an agreed-upon methodology.

VI. LONG-TERM RATE IMPACT METHODOLOGY

Figure 5 in the body of the Supplement illustrates the estimated cost impact of our proposal over the course of the planning period. To calculate these long-term rate impacts of the Current Preferred Plan as compared to the Reference Case, we first developed a forecast of total rates through 2020 under the Reference Case assumptions. To do this, we used a combination of the Company's shorter range financial forecasts and a special-purpose Strategist model used to project total system revenue requirements for extended periods.

Typically, the Strategist model develops projections for generation-related costs. To derive a total system (including transmission, distribution, A&G, etc.) forecast, we expanded the standard Strategist model by adding capital and expense items

associated with the other costs that are not typically modeled. We input starting net plant and deferred tax balances, capital spend forecasts and O&M forecasts for the existing generation, transmission, distribution and overhead business areas, and calibrated the model such that the total revenue requirements through 2020 approximately tracked the more refined short-term financial forecasts during those years.

Developing a total rate forecast beyond 2020 when detailed company financial models are not available would depend on making assumptions for capital expenditures and O&M expenses for all areas of the business, including generation (both new and existing), transmission, distribution and corporate support services. Many of these assumptions would be highly speculative, and the resulting total rate forecast would be similarly speculative. As discussed in this Attachment in describing the modeling changes for the nuclear fleet, Strategist normally models only the generation-related portion of the business, or around 50 percent of the total revenue requirements. For the period beyond 2020, the costs not typically modeled in Strategist were escalated at a generic "inflation-proxy" rate of 2 percent, and were added to the annual costs from the IRP Scenario 1 (Reference Case) model results that are presented throughout this filing. This approach avoids speculation on areas of the business not related to resource planning, while preserving the detailed generation-related information from the Strategist model.

The annual deltas of the various scenarios (including the Updated 2015 Plan and the Current Preferred Plan) to the Reference Case were added to this underlying Reference Case total rate forecast to determine the total rates for these scenarios.

VII. SCENARIO OUTCOMES

An updated summary of the Strategist model's PVRR/PVSC outputs for the various scenarios and sensitivities is shown below in Table 9. Table 10 below shows the results including the nuclear cost assumptions described in Section I, Part C above.

Table 9: PVSC/PVRR Total ($M) for all Scenarios/Sensitivities

Scenarios	Number	Base	LOW GAS PRICE C	HIGH GAS PRICE D	ZERO CO2 K	LOW CO2 L	HIGH CO2 M	LATE LOW CO2 N	LATE HIGH CO2 O	SOCIAL COST OF CARBON P	ND ASSUM-PTIONS T	CUSTO-MER IMPACT U

Attachment C
Resource Plan Comparisons

As our Resource Plan has evolved substantially since our initial January 2015 filing, we provide here a comparison and update on the Expansion Plans for our Reference Case, Updated 2015 Plan, and Current Preferred Plan, to provide readers an easy reference between the scenarios. We have also included data on our updated Renewable Energy Standard (RES) and Solar Energy Standard (SES) Compliance positions under the Current Preferred Plan.

A. Expansion Plans

The Expansion Plans below represent only those resource additions we are proposing in each scenario. The Updated Load and Resources Table in the body of the Supplement included all of the existing and approved resource changes that we anticipate over the course of the planning period. Table 1 below provides our Reference Case Expansion Plan.

Table 1: Reference Case Expansion Plan – Installed Capacity (ICAP)

	2015	2016	2017	2018	2019	2020	2021	2022	2023	2024	2025	2026	2027	2028	2029	2030	Total
Wind	-	-	-	-	-	400	-	-	-	-	-	-	-	-	-	-	400
Combustion Turbine	-	-	-	-	-	-	-	-	-	-	690	690	460	-	-	-	1,840
Combined Cycle	-	-	-	-	-	-	-	-	-	-	-	-	-	778	-	-	778

Only the utility-scale resource additions proposed as part of our Reference Case are identified in Table 1. All small solar, as well as the 187 MW Solar Request for Proposals Portfolio[1] and the competitive acquisition process[2] (CAP) resources, are reflected as existing/approved resources, and therefore not included in the Expansion Plans. The 400 MW of wind in 2020 represents non-Production Tax Credit (PTC) additions, as we did not update the Reference Case to include the tax credit extension.

Table 2 below shows the Expansion Plan for our Updated 2015 Plan, referred to in previous filings as the Preferred Plan.

[1] Approved by the Commission in February 2015 in Docket No. E002/M-14-162.
[2] Docket No. E002/M-12-1240, includes 100 MW Aurora Solar project, 345 MW Calpine Mankato project, and the 232 MW Xcel Energy Black Dog 6 project.

Table 2: Updated 2015 Plan Expansion Plan (ICAP)

	2015	2016	2017	2018	2019	2020	2021	2022	2023	2024	2025	2026	2027	2028	2029	2030	Total
Large Solar	-	-	-	-	-	-	-	-	-	-	300	200	200	500	-	200	1,400
Wind	-	-	-	-	-	600	-	-	200	-	600	-	400	-	-	-	1,800
Combustion Turbine	-	-	-	-	-	-	-	-	-	-	460	460	230	230	-	-	1,380

The Updated 2015 Plan Expansion Plan is largely consistent with what we filed in the March 2015 Supplement, although the assumptions have been updated to reflect the extension of renewable energy tax credits. As a result, the 600 MW of wind in 2020 is modeled as benefiting from the PTC. Finally, the Current Preferred Plan Expansion Plan is included in Table 3 below.

Table 3: Current Preferred Plan Expansion Plan (ICAP)

	2015	2016	2017	2018	2019	2020	2021	2022	2023	2024	2025	2026	2027	2028	2029	2030	Total
Large Solar	-	-	-	-	200	-	200	100	100	200	100	100	-	400	-	-	1,400
Wind	-	-	-	-	800	-	-	400	-	-	400	200	-	-	-	-	1,800
CT	-	-	-	-	-	-	-	-	-	-	460	690	230	230	-	230	1,840
Fargo CT	-	-	-	-	-	-	-	-	-	-	230	-	-	-	-	-	230
Sherco CC	-	-	-	-	-	-	-	-	-	-	-	-	786	-	-	-	786

This Expansion Plan for the Current Preferred Plan matches the total proposed renewable resource additions included in our October 2, 2015 Reply. The updated assumption related to the renewable energy tax credit extension results in a shift in the type – from non-PTC to PTC – and timing of those resources, and an associated cost reduction for the 800 MW of wind added in 2019. Our October proposal included a proposed generic North Dakota CT in 2023, which after further analysis has shifted to a Company-owned CT in Fargo in 2025, although the unit may be placed in-service before 2025. Due to the site-specific resource additions we have selected for our Current Preferred Plan, the model's selection of natural gas capacity additions have adjusted. While a Sherco boiler conversion was considered in our October Reply Comments, it was not selected in our Current Preferred Plan for reasons discussed in Attachment B. Of note, the retirement of the Sherco units result in the need for additional CT capacity and the addition of a combined cycle in 2027.

B. Renewable Energy Standard Compliance Position

Our Current Preferred Plan continues to support and exceed our compliance through 2030 with the Renewable Energy Standard (RES) and objectives across the NSP

system that we presented in our January 2015 filing. Minnesota's RES requires the Company to generate or procure 30 percent of retail electric sales from renewable sources by 2020.[3] This scenario assumes the 3,900 MW of renewable energy additions laid out in our Current Preferred Plan and includes: 700 MW of small solar, 1,400 MW of large solar, and 1,800 MW of wind. Table 4 below details our compliance position through the generation of Renewable Energy Credits (RECs) with NSP System RES obligations in 2016 and 2020.

Table 4: Renewable Energy Standard Compliance, Current Preferred Plan

	2016	2020
NSP Calendar Year RECs	11,216,449	17,274,331
NSP RECs Available for Compliance	26,887,161	55,532,748
RECs Needed for Compliance	8,833,247	10,917,122

In our Current Preferred Plan, we expect to generate sufficient RECs to exceed the renewable energy obligations of those states in the NSP system.

C. Solar Energy Standard Compliance Position

The SES requires an additional 1.5 percent of retail sales to come from solar energy resources by 2020. Of the 1.5 percent SES, 10 percent must come from systems with capacity less than 20 kW.

Table 5: Solar Base Case

	2020
S-RECs Needed for SES Compliance	453,483
S-RECs Available to Meet Requirement	4,620,918
Total Compliance Energy	1,396,551

Table 5 above demonstrates that in our Current Preferred Plan, the 1,400 MW of additional utility-scale solar energy in the out-years of the planning period combined with the small solar and community gardens additions take us beyond our SES compliance obligations, and put us on a path toward fulfillment of Minnesota's energy policy vision.

[3] Minn. Stat. § 216B.1691.

Examining the Grid Impacts of Retiring Sherco Units 1 and/or 2

A Grid Primer and Summary Report of:

Midcontinent Independent System Operator (MISO) Attachment Y2 Study performed by: MISO (August 28, 2015)

Xcel Energy Transmission Reliability Study performed by: Xcel Energy Transmission Planning in conjunction with Siemens Power Technologies International (January 22, 2016)

Black Start Plan Analysis performed by: Xcel Energy Realtime Transmission Planning

January 29, 2016

This is designed to help prevent key information about our system and the grid from being accessible.

Contains Non-Public Information:
The Company developed this grid primer and summary report in an effort to provide a public report of its technical analyses and conclusions as they relate to the potential retirement of its Sherburne County Generating Plant (Sherco) Units 1 and 2. The reports and analyses themselves contain critical electrical infrastructure information (CEII) and other highly-sensitive information about the Xcel Energy and other regional transmission owner systems, so are entirely not public. We maintain that the partially-redacted study reports are "security information" as defined by Minn. Stat. § 13.37, subd. 1(a). We have also redacted limited portions of this summary report. We take seriously our responsibility to maintain the security of the information and systems involved in the delivery of safe, reliable energy to our customers. A key tenet of our security program is limiting the extent to which sensitive information is accessed or shared. This is designed to help prevent key information about our system and the grid from being accessible. While we are not providing full Attachment Y2 and Siemens study reports available with this filing, we are open to discussing the specifics of the reports with parties to this docket who have signed a supplementary Non-Disclosure Agreement, provided that the information would remain adequately protected. Alternatively, the Company will make the full study reports available for inspection by Xcel Energy regulators who have fulfilled MISO's CEII requirements and will also consider making them available to certain other parties to the proceeding who have fulfilled MISO's CEII requirements and Xcel Energy's supplementary non-disclosure requirements. We provide a full justification of our non-public treatment of this information in the cover letter accompanying our January 29, 2016 Resource Plan Supplement.

I. INTRODUCTION

Xcel Energy initiated three technical studies to examine the transmission reliability impacts of its Sherburne County Generating Plant (Sherco) Units 1 and/or 2 if they were to cease operations: (1) a *Midcontinent Independent System Operator (MISO) Attachment Y2 Study*; (2) an *Xcel Energy Transmission Reliability Study*, performed in conjunction with Siemens Power Technologies International (Siemens); and (3) a *Black Start Plan Analysis*. The Company's conclusions from these studies is that: (1) ceasing operation of Sherco Units 1 and 2 would create system conditions that require mitigation; and (2) siting dispatchable, thermal generation at the Sherco site is the most cost-effective solution and provides the greatest level of certainty in terms of cost and reliability to meet the Company's energy and capacity requirements, maintain reliability for its customers, and support the Company's vision of a clean energy future.

The electric "grid" is a large complex machine consisting of generation and transmission facilities that operates across a very large geographic area. The NSP System is part of the Eastern Interconnection, which connects the electrical grids from the Rocky Mountains to the East Coast, and from Canada to the Gulf of Mexico. This interconnected network of generating resources and transmission infrastructure works together to seamlessly respond and adjust to dynamic and sometimes adverse circumstances to provide an adequate and reliable supply of electricity to customers. Each resource and system component plays a unique role based on its size, type and location on the system – and because the grid is so integrated, generation changes made to one utility's system can impact other portions of the system.

The Sherco Plant is the largest power station in the Midwest, consisting of three units that have a total generating capacity of 2,250 MW. Units 1 and 2 that are a focus in the 2016-2030 Resource Plan are wholly-owned baseload facilities with generating capacity of approximately 700 MW each for a total of approximately 1,400 MW. Both the Company's Sherco Plant and Monticello Nuclear Plant are located in Sherburne County Minnesota, making the location of these large, baseload generating facilities a very important consideration in maintaining system stability and reliability. Together, these plants total nearly 3,000 MW of generating capacity, or approximately 30 percent of the Company's total existing generating capacity.[1]

With the concentration of so much generation in one geographic area, the electrical

[1] Generating capacities are expressed as MISO Unforced Capacity (UCAP) values. Values for the Sherco Plant include both the Xcel Energy and the SMMPA ownership shares of Sherco Unit 3.

performance of the regional transmission system – and the entire mix of resources on the NSP System – is fundamentally designed around these Units. At its core, to preserve system stability and customer reliability the system must balance generation with changing load conditions and fluctuations caused by other disturbances. Large generating units like Sherco Units 1 and 2 afford the capability for the system to "ride through" these frequency disturbances by virtue of their sheer mass. Without the inertia, or resistance to a change in state of motion, afforded by these large units, system stability could be compromised.

Similarly, the frequency regulation of the transmission system is governed by the connected generating units. If system frequency deviates beyond allowable levels, protective devices will disconnect generation and/or customer load from the rest of the system. These disconnections can further exacerbate any imbalance between load and generation, which may cause further disconnections and shedding of load. Sherco Units 1 and 2 provide the spinning mass that assists in maintaining the 60 hertz (Hz) frequency for the region. They are uniquely able to do this because of their size and operating characteristics, which include the ability to quickly increase or decrease their output in response to system conditions. Therefore, potentially ceasing coal operations of one or both Sherco Units 1 and 2 as we have proposed in our Current Preferred Plan must consider more than replacement of the capacity and energy they provide to our customers.

When performing technical studies, we simulate a number of varied conditions that can consider changes in customer loads, projected changes to the generation mix, and ways to use the transmission system most efficiently. The studies generally analyze the way power flows over the grid, and search for places where the system might overload or fail, assuming specific circumstances. We measure these results against North American Electric Reliability Corporation (NERC) requirements.[2] NERC is designated by the Federal Energy Regulatory Commission as the Electric Reliability Organization, which is the independent entity that develops and enforces mandatory standards for the reliable operation and planning of the bulk-power system throughout North America, as called for in the Energy Policy Act of 2005.

NERC defines a reliable bulk-power system as one that is able to meet the electricity needs of end-use customers even when unexpected equipment failures or other factors reduce the amount of available electricity, and divides reliability into two categories:[3]

[2] We provide an abbreviated list of NERC Event Categories in Table 13 in Section IV.C.3 of this Summary Report.
[3] http://www.nerc.com/AboutNERC/Documents/NERC%20FAQs%20AUG13.pdf

- *Adequacy*. Adequacy means having sufficient resources to provide customers with a continuous supply of electricity at the proper voltage and frequency, virtually all of the time. Maintaining adequacy requires system operators and planners to take into account scheduled and reasonably expected unscheduled outages of equipment, while maintaining a constant balance between supply and demand.
- *Security*. For decades, NERC and the bulk power industry defined system security as the ability of the bulk-power system to withstand sudden, unexpected disturbances, such as short circuits or unanticipated loss of system elements due to natural causes. In today's world, the security focus of NERC and the industry has expanded to include withstanding disturbances caused by manmade physical or cyber attacks. The bulk-power system must be planned, designed, built and operated in a manner that takes into account these modern threats, as well as more traditional risks to security.

NERC additionally authorizes regional entities, which in the Upper Midwest is the Midwest Reliability Organization. Also a regional entity MISO is an independent, not-for-profit company authorized by FERC to provide open-access transmission service, operate the transmission grid, administrate a wholesale energy market, and perform regional transmission planning in 15 states throughout the Midwest and Southern United States, and Manitoba, Canada.[4] MISO is also the Regional Transmission Organization that ensures electric reliability and optimizes supply and demand bids for wholesale electric power in their region. The Xcel Energy operating companies that comprise the NSP System (Northern States Power Company-Minnesota and Northern States Power Company-Wisconsin) are signatories to the MISO Transmission Owners Agreement and are therefore members of MISO and thus subject to MISO Tariffs and requirements.

The three studies we initiated examined differing aspects of potentially retiring Sherco Units 1 and 2, as follows:

MISO Attachment Y2 Study. The MISO Tariff requires that any generation retirement be studied and approved by MISO to ensure that it results in no adverse effects to the reliability of the system. Therefore, the focus of this Study was on the impacts to the grid if one or both of Sherco Units 1 and 2 ceased operation. We initiated a Study

[4] Independent System Operators grew out of FERC Orders Nos. 888/889 where FERC suggested the concept of an Independent System Operator as one way for existing tight power pools to satisfy the requirement of providing non-discriminatory access to transmission. Subsequently, in Order No. 2000, FERC encouraged the voluntary formation of Regional Transmission Organizations to administer the transmission grid on a regional basis throughout North America (including Canada).

under Attachment Y2 of the MISO Tariff, which is a non-binding, informational study. The Y2 Study is intended to determine whether it is likely that the system resource would qualify as a System Support Resource (SSR) in conjunction with an Attachment Y Study, which is a final, binding study that must be conducted under the MISO tariff once a retirement date-certain is determined.[5]

The MISO Y2 Study concluded that retirement of Sherco Units 1 and 2 would result in violations of applicable planning criteria that would require transmission upgrades and the need for the Units to be designated as SSRs. Assuming a future Attachment Y study would have similar results, MISO would require that the identified violations be mitigated to its satisfaction prior to retirement of Sherco Unit 1 and Unit 2, if replacement generation is not located at Sherco.[6]

The Study found that retirement of both units would result in a major reactive power deficiency in the Monticello area that would cause a violation of Monticello's Nuclear Plant Interface Requirements (NPIR) voltage requirements that would be a violation of Monticello's Nuclear Plant Operating Agreement.[7] The plant would not be allowed to operate if the voltage falls below its NPIR minimum threshold. The Study also identified a number of other reliability issues, including thermal overloads of 115 kV and 345 kV transmission lines and some smaller scale voltage deficiencies.

Xcel Energy Transmission Reliability Study. We retained Siemens to study the effects of potential retirement of one or both Sherco Units on the transmission system, and technical implications and upgrade costs associated replacement of one or both Units at alternate locations on the NSP System. Our Study used the same system models as MISO used for its Y2 Study, but differed in that the Y2 Study did not examine replacement of all or a portion of Unit 1 and 2 generation. Our Reliability Study also set out to examine the potential impacts from the cumulative effect of additional larger generation unit retirements on the NSP System by also studying the shutdowns of the Monticello Nuclear Plant due to its proximate location to Sherco, and one Prairie Island Unit in combination with Sherco Units 1 and 2. We decided however to pause this work, in light of the increased interest in the future of our nuclear

[5] Per Section 38.2.7 of the MISO Open Access Transmission, Energy, and Operating Reserve Markets tariff.
[6] MISO has proposed tariff changes to the Attachment Y notification process that could make such Notice unnecessary. If a generating unit is being replaced with an equal- or larger-sized (MW) unit, an Attachment Y notice would not be required; only an Interconnection request for the new unit utilizing the existing interconnection rights would be required. An SSR study under Attachment Y of MISO's tariff would only be required if the new/replacement generating unit is smaller (MW) than the unit being retired.
[7] The Monticello Nuclear Plant, along with all nuclear plants in the United States have NPIR voltage requirements that are required to support FERC/NERC Regulation NUC-001. NUC-001 requires coordination between nuclear plant operators and transmission entities for the purpose of ensuring safe nuclear plant operation and shutdown.

units. As we discuss in Section VII of our January 29, 2016 Resource Plan Supplement, we intend to initiate a more broad and in-depth study of the effects of a potential shutdown of our nuclear units on our transmission system in 2016.

Our Reliability Study involved a full thermal analysis, full voltage analysis, and transient stability analysis, and confirmed that the existing transmission system with significant generation injection at Sherco works well, and plays a significant role in providing reliable service for NSP System customers and other customers in our portion of the MISO region. It also concluded that there are transmission upgrade costs and other trade-offs associated with replacing Sherco Units 1 and 2 at an alternative location, such as increased energy losses the farther the replacement generation is located from the Twin Cities load center.

Black Start Plan Analysis. A Black Start Plan specifies the process of restoring the grid to full operation without relying on the external transmission network following a full- or partial-black out. Black Start Plans are required by NERC, developed in concert with neighboring utilities, and are subject to review and approval by MISO. Sherco Units 1 and 2 are currently the primary Target Units, or first generating units to be repowered as part of our Black Start Plan. This analysis examined the viability and costs associated with changing the current system restoration path from Sherco Units 1 and 2.

Our Black Start Plan analysis concluded that without the current Sherco Unit 1 and 2 restoration path from our Initial Unit(s), we would need to rely on different restoration paths to multiple Target Units.[8] We will need additional facilities on the alternative restoration paths and altering our path causes restoration of our system and customer load to take longer. The expediency of the restoration path is particularly important in winter/cold weather, because a delay of as little as one hour could mean that we may have to begin draining our boiler systems or taking additional measures at our steam generating plants before they freeze and are damaged. If this is necessary, restarting those plants could take several days, which could impact restoration of our customers.

It is important to note that the assumptions used in these studies are based on expected conditions at the time they were initiated in early 2015. The system is dynamic and expected conditions can change when new generation comes online, new transmission lines are constructed, or existing lines are reconfigured.

[8] The Initial Unit is the first generating unit that sets restoration in motion. Target Units are the generating Units on the restoration path that was started by the Initial Unit.

We believe a combination of EPA's Clean Power Plan along with aging generation assets will significantly change the generation mix in the United States over the next 15 years. Not only have we started to perform studies to understand the potential impact of significant generation changes, the industry is also beginning to examine the potential impacts of a changing generation mix. Entities such as NERC and MISO are beginning to study the potential cumulative impacts of significant generation changes across the country.[9]

We have many years ahead of us to try to simulate and understand the cumulative effect of a different mix of generating units. We know what we have today works well, and to the extent replacement generation is located in similar electrical locations, we are confident the grid will continue to perform well.

II. CURRENT SYSTEM/GRID

A. Overview

The "grid" is a large complex machine consisting of existing generation and transmission facilities that operates across a very large area. The NSP System is part of the Eastern Interconnection, which connects the electrical grids from the Rocky Mountains to the East Coast and from Canada to the Gulf of Mexico.

The Twin Cities metro area is surrounded by a double circuit 345 kV *bulk* transmission system that extends from Benton County in the north, east to Chisago County, south to Dakota County, west to Scott County, and back north to Becker, Minnesota. This 600 mile ring of 345 kV lines encompassing nearly 1,300 square miles forms the backbone of the bulk transmission system feeding the Twin Cities load center. This 345 kV ring is connected through several bulk 345 kV lines tying to our neighboring utilities, and a 500 kV bulk transmission line to Manitoba Hydro in the north. These tie-lines connect the Twin Cities load center to the MISO generation market and the Eastern Interconnection – providing important "back-up," should there be an unexpected event that requires the Company to rely on the grid to maintain reliability for our customers.

---

[9] *See* NERC Potential Reliability Impacts of EPA's Proposed Clean Power Plan (Phase I) at: http://www.nerc.com/pa/RAPA/ra/Reliability%20Assessments%20DL/Potential%20Reliability%20Impacts%20of%20EPA%E2%80%99s%20Proposed%20Clean%20Power%20Plan%20-%20Phase%20I.pdf and MISO Analysis of EPA's Final Clean Power Plan Study Scope (November 2015) at: https://www.misoenergy.org/Library/Repository/Meeting%20Material/Stakeholder/PAC/2015/20151111/20151111%20PAC%20Item%2003e%20Clean%20Power%20Plan%20Final%20Rule%20Analysis%20Scope.pdf

The 345 kV ring that surrounds the Twin Cities feeds the underlying Twin Cities 115 kV transmission grid, which connects to our low voltage distribution system that delivers the power directly to businesses, houses and other loads. The transmission system and the lower voltage distribution system in the Twin Cities area has developed over the past 100 years to serve the growing area, and is constantly being analyzed and updated to ensure optimal and reliable power delivery.

Our bulk transmission system is anchored at the corners by several large coal and nuclear generators that act as the baseload generation for the NSP System. They include Sherco (coal) and Monticello (nuclear) in the northwest and A. S. King (coal) and Prairie Island (nuclear) in the east and southeast. Together these plants provide over 4,020 MW of capacity and over 29,000 GWh of energy to our customers, which represents 46 percent of the NSP System generating capacity and 65 percent of the system energy. This generation is supplemented by several natural gas generating plants located on the 115 kV system in the Twin Cities. These generating units include Riverside, Highbridge, Black Dog, and Blue Lake. The 500 kV line that ties into Chisago County substation in the northeast connects the hydro power produced by Manitoba Hydro to the Twin Cities load center. A significant proportion of our wind power is located in southwest Minnesota and is tied into the Twin Cities through a number of lines developed over a period of years to connect the wind-rich areas in southwest Minnesota and South Dakota to the Twin Cities load center. A robust transmission system such as this facilitates the provision of reliable, low cost power to our customers from a diverse mix of generation resources, and mitigates risk from catastrophic events.

The existing grid is a valuable asset and an enabler that has and will continue to support the evolution and growth of our system. The grid has facilitated integration of substantial wind generation onto the NSP System by absorbing the inherent fluctuations of this variable generation type over a large area. Transmission enables the transfer of wind and solar and other types of generation from where it is most effectively located to customer load located elsewhere where it can be utilized to the fullest extent.

Over time, we expect that there will be more and more development of microgrids and other new technologies such as batteries. Rather than competing with the existing grid, these new technologies will be complementary, in that each system can support and help the other. For example, to the extent microgrids have challenges, the grid can help provide reliability to those areas – and as microgrids develop over time, there will be more and more integration of the capabilities they can provide into grid operations.

B. Key Elements Ensure Reliable Service

Electrical system reliability can be defined as the ability of the electrical grid, which includes transmission, generation, distribution and related components, to serve customer load under any system condition. Maintaining a reliable electricity supply for customers requires that generation, load and electrical losses balance – and maintain a 60 Hz frequency. If the frequency varies only one or two tenths of a hertz from 60 Hz, it can cause damage to equipment, and automated protection schemes will disconnect pieces of the grid to avoid damaging equipment.

A strong transmission system improves the reliability of the electric power system, and facilitates a diverse and low cost resource portfolio for customers – allowing lower cost resources with diverse fuel types, and resource types not available in the immediate area to be efficiently transported to serve their needs. For example, wind resources need to be constructed where the wind is strongest and most consistent; large-scale solar resources where there is sufficient land and the most consistent sunshine – both of which are generally away from large population centers. A robust transmission system brings together varied generating units – some built to run continually, others only to run at peak times when they are most needed, and renewable resources on an intermittent basis – together into an integrated grid.

The system must also be able to facilitate both "active" and "reactive" power, which are typically produced by non-renewable generating unit types. Active power, measured in watts, is the form of electricity that powers equipment. Reactive power, measured in volt-amperes reactive (VARs), is the energy supplied to create or be stored in electric or magnetic fields in and around electrical equipment. Reactive power is particularly important for equipment that relies on magnetic fields for the production of induced electric currents (e.g., motors, transformers, pumps and air conditioning). Reactive power can be transmitted only over relatively short distances, and thus must be supplied as needed from nearby generators. If reactive power cannot be supplied promptly and in sufficient quantity, voltages deteriorate and, in extreme cases, can result in a voltage collapse.

The grid must also be able to adjust to changing customer loads, the availability of diverse resources, and have sufficient redundancy built-in, making it capable to withstand the failure of its most critical lines, generators, or other components. As customer load changes over the course of a day, generation must change to accommodate the load at any given time. With the high penetration of renewables on the NSP System, we must ensure that we have adequate dispatchable generation to

both accommodate the load and whatever generation mix we have at each point in time. We must also maintain a spinning reserve – generation that is available at a moment's notice – to account for the largest contingency in the area.[10] Having large coal generating units has helped, because they have the ability to be "turned up" and "turned down" based on the level of renewable generation being delivered to the system at any given time.

C. Role of Sherco Units 1 and 2

Sherco Units 1 and 2, located in Becker, Minnesota play an important role in the reliable electrical service we provide to our customers. Together, they produce approximately 1,400 MW of capacity and associated energy, and are tied to the transmission grid through five 345 kV and two 115 kV lines.

As we have discussed, the ability to provide reliable electric service depends on a complex and interconnected network of generating resources and transmission infrastructure that provides capacity and delivers energy to customers. Each resource and system component in the network plays a unique role based on its size, type and location on the system. Sherco Units 1 and 2 are no different. In fact, the Upper Midwest system, and the NSP System, has been designed around Sherco Units 1 and 2, and relies on the unique aspects of these Units to not only generate capacity and energy for our customers, but also to provide numerous essential system operational services.

Potentially ceasing coal operations of one or both of these Units must consider more than replacement of their energy output. The Units' technical characteristics include:

- *Power Deliverability.* The existing transmission system has been developed to be able to receive the approximately 1,400 MW of power injected from Sherco Units 1 and 2 and to deliver it to various area substations to meet the electrical power demands of customers. This power deliverability capability is often referred to as "transfer capability" or "thermal limits" of the system. Transmission systems are made capable of receiving and moving power from specific generators at specific locations; changing generator characteristics or locations requires corresponding changes to grid capabilities.
- *Dynamic Stability.* The transmission grid is a vast interconnected machine with many parts. There are a mix of large and small gears in this machine, all spinning at the same rate (i.e. synchronous), simultaneously producing and

[10] Spinning Reserve is unloaded operating capacity available on units connected to and synchronized with the interconnected electric system and ready to take load immediately in response to a frequency deviation.

delivering electricity to customers. Generating units are the spinning gears in this machine. Large generators like Sherco Units 1 and 2 have large spinning shafts that provide a strong backbone for the machine's operation. With enough of these big "gears" spinning, the machine can stay electrically stable and continue operating without interruption when small gears drop in and out of operation (like when the wind stops blowing or sun stops shining), or when another big gear drops out, or a "contingency," happens to some part of the machine. These large gears are also more likely to stay connected to the grid during a contingency than the small gears because large rotating masses have more inertia and are therefore not as easily jarred, or disrupted by a disturbance. Having the large gears in place also enables more small gears to be connected to the machine because they don't have as much impact with the large gears in place. The large generating units thus provide "dynamic stability" to the grid.

- *Fault Current.* Large synchronous generating units provide "fault current," which is necessary for the system protection equipment to function properly. If the system has too little fault current, it is difficult for system protection systems to differentiate customer load from an electric fault, which could cause the protection system to not function properly.[11] The protection system is the overarching electrical monitoring scheme that assesses the real time condition of the transmission grid and acts to prevent damage to system components and prevent cascading failures. The large generating units operating today are important sources of fault current, and the protection system and existing deployed assets rely on sufficient fault current for the protection system and other electrical facilities to work as designed. Many of the electric devices that are deployed on the grid and in service today, such as wind generators and other assets, are engineered and designed to function properly with the amount of fault current that has been historically available on the grid. Therefore, changing the amount of fault current on the grid could not only impact protection systems, but could also impact other electric assets.
- *Black Start Capability.* In the event of a major regional grid outage, Sherco Units 1 and 2 are an integral resource to restoring power to the electrical grid, or "restarting the machine." Only dispatchable generating units of a certain size that are capable of creating and absorbing reactive power are eligible to perform black start functions. Our current plan requires Initial Unit(s) of approximately 110 MW and up to 300 MW to get the restoration started. Sherco Units 1 and 2, because of their ability to operate at lower outputs, along with their reactive capabilities, are considered eligible Target Units, which are

[11] For example, the protective equipment could misinterpret the load as a fault, and de-energize an unfaulted circuit.

the next units used in the restoration. Sherco Unit 3 is not a viable Target Unit, because it is too large for the Initial Unit(s) to start, so is started later in the process. Additionally, nuclear units are not viable Target Units, because they cannot vary their output and can only come online after the system is fully stable. Renewable generation, such as solar and wind are not currently considered eligible Target Units due to their inherent intermittent nature, and their inability to provide or absorb reactive power.

- *Voltage Support.* The real time conditions on the transmission system are constantly changing and require ongoing adjustments to maintain voltages at required levels. The Sherco 1 and 2 Units, as large synchronous power sources, provide significant system voltage support along with necessary "reactive power." Reactive power is required to start and run motors, like in air conditioners and industrial equipment (called "inductive loads"). Large population centers generally require large generating units located reasonably nearby to support system voltage effectively. As in the dynamic stability discussion, without enough large units in place, the machine isn't as capable and robust when it runs.

- *System Regulation.* System regulation essentially means the ability of the system to respond instantly to changes in usage, i.e. keeping the generators and loads exactly matched at all times. Sherco Units 1 and 2 have the electrical characteristics to provide this fast response balancing in real time. The system frequency, required to be maintained at 60 Hz in the US grid, is an active measure of this balance. When there are sudden large changes to the generation/load balance, as when a generating unit drops offline or a large industrial load (like a smelter) comes online, the frequency drops if there is insufficient regulation capability on the system. This is another aspect of the dynamic stability of the system.

III. TECHNICAL STUDIES OVERVIEW

As we have discussed, the grid is a complex machine that is integrated over very large portions of the country. The bulk and load serving NSP System has been developed over the past 100 years to serve the growing area, and is constantly being analyzed to ensure optimal and reliable power delivery. We have a great deal of experience both in studying the existing grid and operating it in many varying conditions (during high load, low load, high transfers, low transfers, storm conditions, outages or equipment).

When performing technical studies, we simulate a number of varied conditions that can consider changes in customer loads, projected changes to the generation mix, and

ways to use the transmission system most efficiently. The studies generally analyze the way power flows over the grid and search for places where the system might overload or fail, assuming specific circumstances. While studies are essential and provide important insights, our decades of operating and studying the existing system provides valuable insights and perspective in siting considerations for replacing Sherco Unit 1 and 2 generation.

We have stated previously that our initial assessment was that completely replacing the baseload energy from Sherco Units 1 and 2 with renewable energy facilities was likely infeasible from a reliability perspective. Our Studies support the conclusion that the addition of dispatchable, thermal generation at the Sherco site will ensure ongoing reliability of the NSP System for our customers in the most cost-effective manner. Having sufficient dispatchable generation on the system also supports the addition of the significant levels of renewable generation we propose with this Resource Plan.

We are confident that generation injections in locations where those electrical injections occur today will result in a high level of reliability and good performance from our transmission system. With that said, we have proposed to replace a portion of Sherco Units 1 and 2 energy and capacity with a natural gas combined cycle (CC) at the Sherco site. We believe this proposal is superior to alternatives, will provide necessary voltage support to the Monticello Nuclear Plant and surrounding area, and is cost-effective for our customers.

We note that the MISO Y2 Study and our Reliability Study identify transmission upgrades necessary to resolve the respective issues the studies identified. In addition to these transmission upgrades, there are additional (interconnection) transmission costs involved to connect generation to the grid. Therefore, to get a full picture of the costs, interconnection costs must to be added to the transmission upgrade costs.

A. Studies Performed

As outlined previously, we initiated three studies to understand the technical implications and to identify any mitigating measures that must be undertaken, as follows:

- *MISO Y2 Study*,
- *Xcel Energy Transmission Reliability Study,* and
- *Black Start Study*.

Our Studies used the best information available at the time they were initiated to develop the models used to conduct the analyses; MISO performed its Y2 Study in

accordance with their Business Practice Manuals.[12] However, all studies are essentially an attempt to predict what is going to happen in the future – and the conditions and underlying assumptions of a dynamic system are subject to change. Therefore, there are inherent limitations in any study effort.

B. MISO Attachment Y2 Study

1. Overview

As we discussed in our October 2, 2015 Reply Comments, we initiated a MISO Attachment Y2 Study to examine the reliability impacts from the potential retirement of one or both Sherco Units 1 and 2. The Y2 Study is intended to determine whether it is likely that the system resource would qualify as a System Support Resource (SSR) in conjunction with an Attachment Y Study, which is a final, binding study that must be conducted under the MISO tariff once a generation owner determines a retirement date-certain. The study impacts are measured based on the criteria set forth in the MISO Business Practices Manuals, which apply NERC requirements, and include monitoring and identifying the steady state branch/voltage violations and the transient stability violations on transmission facilities due to the unavailability of the generating resources.

The Company's request was for MISO to analyze retirement of Sherco Units 1 and 2 under two retirement scenarios: (1) retire Sherco Unit 1 and Sherco Unit 2 on May 31, 2021; and (2) retire Sherco Unit 2 on May 31, 2021 and Sherco Unit 1 on May 31, 2024. Because Sherco Units 1, 2, and 3 (in addition to Monticello) are the largest reactive power resources in the Twin Cities area, MISO specifically assessed the voltage implications under certain power transfer scenarios if all of these plants were out of service. Finally, due to the electrical proximity between the Monticello Nuclear Plant and Sherco, MISO assessed the voltages at Monticello's 115 kV and 345 kV busses to ensure they remained within the very specific and narrow range specified in Monticello's NPIR.

2. Study Results

The MISO Y2 Study concluded that ceasing operations at Sherco Units 1 and 2 would create system conditions that violate NERC requirements that would require transmission upgrades and the need for the Units to be designated as SSRs.

[12] *See* MISO Business Practice Manual BPM-020 at: https://www.misoenergy.org/Library/BusinessPracticesManuals/Pages/BusinessPracticesManuals.aspx

Assuming a future Attachment Y study would have similar results, MISO would require that the Company mitigate identified violations to its satisfaction prior to retirement of Sherco Unit 1 and Unit 2, if replacement generation is not located at Sherco.

At a high level, the MISO Y2 Study identified several voltage violations due to a substantial reactive power deficiency in the Monticello area that is a major concern and needs to be addressed to maintain voltages at Monticello Nuclear Plant within its permissible range. The Monticello Nuclear Plant cannot operate if its voltage is outside the permissible range. If only one Sherco Unit retires and the other Unit remains in service, the analysis identified a smaller reactive power deficiency that would need to be addressed, and some other relatively minor reliability issues that can be addressed by minor equipment installations such as capacitors.

The MISO Y2 Study also identified thermal violations (transmission lines above their rated capability) created when replacement generation was dispatched from others areas of the MISO system. For example, a rebuild of a 345 kV line to 3,000 Amperes was an identified action that would be needed to alleviate some identified thermal violations. With regard to system stability, the transient stability assessment showed acceptable behavior without Sherco Units 1 and 2.

The specific Study conclusions that require mitigation are as follows:

- Several voltage violations due to a reactive power deficiency in the area that violate Monticello's NPIR voltage requirements, would be a violation of Monticello's Nuclear Plant Operating Agreement, and would require the plant to cease operation until the voltage is within the NPIR range,
- A 25 MVAR capacitor bank would need to be installed in 2017 at WMU-Priam 115 kV bus to alleviate local voltage issues. (*Note*: this is existing MISO MTEP Project 4380, so will not result in incremental cost to the Company),
- A capacitor bank(s) would be needed at the 115 kV bus of a generating station to maintain the voltage above their minimum voltage requirements,
- The rebuild of a 345 kV line to 3,000 Amperes to alleviate a portion of the identified thermal violations,
- A 115 kV line may also need to be rebuilt to alleviate other thermal issues per the SSR criteria, and
- Voltages at Monticello's 115 kV and 345 kV buses are lower than the plant's voltage requirements.

We note that the CC generating unit we have proposed for the Sherco site would fully resolve these issues.

3. Mitigation of Identified Issues

The CC generating unit we have proposed for the Sherco site is our preferred option for mitigating the violations identified in the MISO Y2 Study. However, in the alternative, MISO identified potential ways to mitigate the identified impacts, which we estimate would cost approximately **[TRADE SECRET BEGINS… …TRADE SECRET ENDS]** in capital, plus significant ongoing operating and maintenance costs to mitigate. We outline these measures in Table 1 below, and also discuss the Synchronous Condenser, which at approximately **[TRADE SECRET BEGINS… …TRADE SECRET ENDS]** in capital, is the most significant of the mitigating measures.

Table 1: MISO Potential Mitigation Measures and Xcel Energy Estimated Cost ($Millions – 2015)

MISO Identified Potential Mitigation Measure	**Xcel Energy Potential Mitigation Measure and Estimated Cost**
Reductions and runbacks to existing generators	None
Transfer of certain feeder loads	None
Tripping of certain transmission lines	None
Install reactive capacity on system to maintain voltages at Monticello Nuclear Plant within permissible range as per the Monticello NPIR	Convert Sherco Unit 1 or Unit 2 to a Synchronous Condenser – **[TRADE SECRET BEGINS… …TRADE SECRET ENDS]**
Install Proposed Project including a 25 MVAR capacitor bank to be installed at substation in 2017 *(already planned)*	No incremental cost to Company
An MTEP project addresses the 115kV system voltage issues resulting from events *(already planned)*	No incremental cost to Company
Increase capacity of a 115 kV line	Rebuild the line – **[TRADE SECRET BEGINS… …TRADE SECRET ENDS]**
Install capacitor banks at generator station 115 kV bus.	Install capacitor bank(s) & upgrade substation – **[TRADE SECRET BEGINS… …TRADE SECRET ENDS]**
Rebuild of 345 kV line to 3000 Amperes is needed to alleviate some identified thermal violations	Rebuild the line – **[TRADE SECRET BEGINS… …TRADE SECRET ENDS]**

Synchronous Condenser – As we have described, large generators play a very important role on the system, one of which is providing necessary reactive power to the grid. If reactive power cannot be supplied promptly and in sufficient quantity, maintaining voltage is challenging, which is the case with Monticello's NPIR. Therefore, if no replacement generation is installed at Sherco, we would need to install other equipment that can both generate and absorb reactive power as needed to adjust the grid's voltage. Sherco would be a good location for this other equipment because reactive power can only be practically transmitted over relatively short distances.

There are currently three available options to address this issue: (1) a Synchronous Condenser (SC); (2) a Static Var Compensator (SVC); or (3) a Static synchronous compensator (Statcom). Considering the three alternatives, we believe the best option for the NSP System is to convert Sherco Unit 1 or Unit 2 to an SC. Installation and operation of an SC is identical to large electric motors and generators. It is controlled by a voltage regulator to either generate or absorb reactive power as needed to adjust the grid's voltage, or to improve power factor. Its principal advantage is the ease with which the amount of correction can be adjusted. However, importantly, SCs provide not only the required continuous range of voltage support, but are also a rotating mass that helps hold the grid electrically together following a disturbance such as a major fault. As we have described, there are significant system stability benefits associated with the inertia provided by large rotating masses.

As a point of reference, an SVC is a set of electrical devices for providing fast-acting reactive power. Unlike an SC, which is a rotating electrical machine, an SVC has no significant moving parts (other than internal switchgear). The main advantage of SVCs over simple mechanically-switched compensation schemes is their near-instantaneous response to changes in the system voltage. Similarly, a Statcom is a regulating device that can either provide or absorb reactive power. It is inherently modular and has better characteristics than an SVC. In contrast to an SVC, its maximum reactive output current will not be affected by the voltage magnitude, whereas the SVC's reactive output is proportional to the square of the voltage magnitude, which makes the provided reactive power decrease rapidly when voltage decreases, thus reducing its stability. In addition, the speed of response of a Statcom is faster than that of an SVC and its harmonic emission is lower. Statcoms typically exhibit higher losses and are generally more expensive than SVCs, so are not in widespread use.

Both SVCs and Statcoms are generally less expensive than SCs, however, neither offers the significant stability benefits that come from having large, rotating mass around our system – and both introduce harmonics into the grid. In general, harmonics cause power quality problems, and result in increased heating in equipment

and conductors, misfiring in variable speed drives, and torque pulsations in motors, which would potentially affect both our equipment and that of our customers. Additionally, there are other electronic devices on the system, such as the D.C. terminal in the western Twin Cities that has electronic equipment that can be negatively impacted by harmonics. For these reasons, we have determined the SC is the best solution for the NSP System.

4. Summary

We note that these results are based on assumptions and the MISO system as it was known in March 2015. We believe it is reasonable to conclude that the MISO Y2 Study results could be viewed as optimistic, since other generators assumed to be running at the time of this study will likely be different than when MISO performs their official Attachment Y analysis, which is currently required in the 26-week period preceding an actual planned Unit retirement.[13]

We are confident, however, that regardless of the status of other generators in the MISO system, the natural gas CC we have proposed to construct at the Sherco site in 2026 is the best solution to mitigate any technical issues associated with retiring Sherco Units 1 and 2.[14] As we have discussed, a large generator plays a very important role on the system, in terms of providing necessary reactive power and maintaining its voltage, frequency and overall stability. For the reasons we have discussed, by placing a large generator at the same injection point on the transmission system, we have absolute confidence that the system will function as well as it does today.

Placing a large generating unit at Sherco will handle the inevitable disturbances the grid successfully deals with every day, which range from ever-changing electric use (i.e., as people/businesses turn on and off electrical equipment), periodic changes to power transfers as electric markets dispatch generation every five minutes, to periodic outages (planned or unplanned), to adverse weather, and other impacts caused by humans, animals, trees, etc.

We discuss the MISO Y2 Study approach, assumptions and inputs in Section IV. below.

[13] As noted previously, MISO is contemplating changes to its Attachment Y requirements.
[14] The MISO Y2 Study identified minor issues related to retirement of the first Unit, which we believe can be resolved without the need for significant upgrades.

C. Xcel Energy Transmission Reliability Study

In early 2015, we engaged Siemens Power Technologies International to gain technical insights as to the local and regional transmission impacts of ceasing coal operations at Sherco Units 1 and 2. The study consisted of two components: (1) analyze alternative locations for replacement generation for Sherco Units 1 and 2, and (2) identify deficiencies in ensuring ongoing reliable energy delivery to our Upper Midwest customers by performing a full technical analysis of the impacts of retiring significant baseload generation from our system and determine potential long-term solutions.

We conducted our Reliability Study in phases: (1) Retirement of one of the Sherco Units 1 and 2; and (2) Retirement of both Sherco Units 1 and 2. The Study included the following analysis for both local and regional transmission facility impacts and disturbances with one or both Sherco Units 1 and 2 out of service:

- *Full thermal analysis*. Thermal analysis evaluates the steady-state flows (greater than 30 seconds) on the transmission system following a disturbance and identifies transmission facilities that are outside their allowable thermal ratings. The thermal analysis also calculates system losses.
- *Full voltage analysis*. Voltage analysis evaluates the steady-state voltages (greater than 30 seconds) on the transmission system following a disturbance, and identifies transmission facilities that are outside their allowable voltage limits.
- *Transient stability*. A transient stability analysis evaluates whether the power system electrically "stays together" and the impact on the transmission system following a disturbance, and identifies transmission facilities that are outside their allowable stability limits. Specifically, we looked at the ability of the grid to maintain electrical connection following disturbances.

Our Reliability Study used the same MISO MTEP14 models as the MISO Y2 Study, adjusted to reflect the 2020 timeframe, and applied the same planning criteria. However, because the MISO Y2 and the Reliability Studies have different base input assumptions, the two studies investigate different perspectives on the issue of retiring one or two Units at Sherco. Additionally, our Reliability Study differs from the MISO Y2 Study in that the MISO Y2 Study analyzed the impacts of turning off one or both Sherco Units 1 and 2 assuming no replacement generation. Its purpose was to determine how the system would behave in the absence of these generators. Our Reliability Study also analyzed impacts on the transmission system and estimated transmission upgrade costs related to ceasing coal operations at Sherco Unit 1 and 2 *and replacing the generation* at alternate locations as follows: (1) Metro – a location near the Twin Cities; (2) Southwest – a location in southwest Minnesota; and (3) Northwest – a location in eastern North Dakota.

Our Reliability Study's conclusions were consistent with the MISO Y2 Study conclusions, in that they also identified NERC violations that would need to be mitigated if Sherco Unit 1 and 2 are retired. Specifically, we concluded:

1) Siting replacement generating units outside of Sherco is technically feasible but would require transmission system upgrades.
2) The required transmission system upgrades for replacement generation outside of Sherco is dependent on other generation that is included in the study.
3) The further the replacement generation was located from the Twin Cities load center, the greater the transmission losses.

Importantly, our Reliability Study concluded that replacement with a large generating unit that provides similar benefits to the NSP System as Sherco Units 1 and 2 will cost-effectively ensure voltage, frequency, and reliable service for our customers. Additionally, the Study in combination with other identified costs supports that replacement at the current Sherco site is superior and the most economical of the alternatives studied. Finally, our Reliability Study supports the conclusion that locating thermal replacement generation at Sherco provides the most cost certainty with regard to required transmission upgrades, since the Sherco site can utilize existing transmission facilities and interconnection rights – and the grid is constructed such to expect a large generation injection at that location.

It is important to note that our Reliability Study was initiated in early 2015. Since that time, significant amounts of generation have entered the MISO interconnection queue, so the estimated transmission mitigation costs we outline are very likely optimistic, because the generating resources that are in the queue will come online and will "use up" transmission capacity that our Study assumed would be available in the future.

1. Siting Replacement Generating Units Outside of Sherco is Technically Feasible but Would Require Transmission System Upgrades

In this section, we outline the transmission mitigation costs of locating replacement generation at studied locations other than Sherco. The Reliability Study showed that transmission mitigation costs (not including interconnection costs) increase the further away you move the generation from the Twin Cities load center.

Table 2: Estimated Costs – One 750 MW Combined Cycle Unit
($millions - 2015)

Alternate Location	Transmission Mitigation	Generation Interconnection	Total
[TRADE SECRET BEGINS…			
Metro			
Northwest			
Southwest			
			…TRADE SECRET ENDS]

Table 3: Estimated Costs – Two 750 MW Combined Cycle Units
($ millions - 2015)

Alternate Location	Transmission Mitigation	Generation Interconnection	Total
[TRADE SECRET BEGINS…			
Southwest Metro			
Northwest Metro			
Northwest Southwest			
			…TRADE SECRET ENDS]

The indicated Generator Interconnection costs in Tables 2 and 3 above are planning level estimates for the electrical facilities necessary to connect the generating plant to the Point of Interconnection (POI) and include a 345 kV substation that will accommodate a CC unit with two simple cycle turbines and one steam turbine and the 345 kV line which will connect the generator to the MISO POI. The costs vary between generator locations due to the assumed lengths of the transmission line. The generation interconnection costs also include the expected cost to expand the POI substation to accommodate the line from the generator, costs for metering and relaying and other interconnection facilities required by the MISO generation interconnection process. The basis for the costs is historical facility studies performed for other Xcel Energy generator interconnections.

2. The Required Transmission System Upgrades for Replacement Generation Outside of Sherco is Dependent on Other Generation Included in the Study

Greater amounts of generation sited at locations other than Sherco result in the need for more significant transmission upgrades (and costs) to support delivery and interconnection of the generation, as shown in Table 3 above.

3. The Further the Replacement Generation was Located From the Twin Cities Load Center, the Greater the Transmission Losses

The Reliability Study results indicate that the further from the Twin Cities load center that the replacement generation is located, the higher the losses. Tables 4 and 5 below show transmission system losses for peak load and shoulder load conditions for the alternate replacement generation location.

Table 4: Total System Losses by Replacement Location – at Peak Load
(Megawatts)

One 750 MW CC Unit			Two 750 MW CC Units		
Alternate Location	**Total MW**	**Delta MW**	**Alternate Location**	**Total MW**	**Delta MW**
Base Scenario	1,739		Base Scenario	1,738	
Southwest	1,743	4	SW Metro	1,736	-2
Northwest	1,753	14	NW+Metro	1,743	5
Metro	1,725	-14	NW+SW	1,768	29

Note: Point of peak load is during 2020 Summer

Table 5: Total System Losses by Replacement Location – Shoulder Conditions
(Megawatts)

One 750 MW CC Unit			Two 750 MW CC Units		
Alternate Location	**Total MW**	**Delta MW**	**Alternate Location**	**Total MW**	**Delta MW**
Base Scenario	2,207		Base Scenario	2,199	
Southwest	2,221	13	SW+Metro	2,196	-3
Northwest	2,272	65	NW+Metro	2,256	57
Metro	2,180	-27	NW+SW	2,300	102

Note: Shoulder conditions is during 2020 Summer

These tables demonstrate that losses increase the farther away generation is located from the Twin Cities load center.

4. Summary

Our Reliability Study analyzed three alternate locations for siting replacement generation and concluded that siting replacement generation at locations other than Sherco will result in transmission upgrade costs that would not be needed if replacement generation is sited at Sherco. The number and cost of any required transmission upgrades is dependent on the location of the replacement generation, the amount of transmission capacity available from that location, and the amount of

"other" generation that will be competing with the replacement generation for transmission capacity.

Additionally, because significant generation has been added to the MISO generation interconnection queue since we started our Reliability Study in early 2015, the costs we have estimated for alternate locations are likely low and less certain because of how the MISO system will evolve as a result. Finally, the further the replacement generation is sited from the Twin Cities load center, the higher the amount of losses the generation experiences – and while not specifically evaluated in our Study, we believe siting replacement generation in wind rich areas such as southwest Minnesota will "use up" transmission capacity that can be used for the installation of additional wind or other renewable generation.

D. Black Start Analysis

As explained in our March 16, 2015 Supplement, Sherco Units 1 and 2 play a significant role on our system and in the entire Upper Midwest. One of the key roles these Units play is in restarting the system in the event of a catastrophic loss of power to all or a significant part of a geographic area. Normally, the electric power used within a generating plant is provided from the station's own generators. If all of the plant's main generators are shutdown, station power is provided by drawing power from the transmission grid, which can be used to start the plant. However, during a wide-area outage, power from the grid will not be available. In the absence of grid power, a so-called "black start" needs to be performed to "bootstrap," or self-start the power grid into operation without the use of external resources.

We are required by NERC to maintain a plan to restart the system, which must be coordinated with neighboring utilities and is subject to acceptance by MISO. In this section, we discuss the considerations that go into black start planning, and our conclusion that other restoration paths, while less efficient, are viable with various equipment upgrades.

1. Overview

Black Start planning involves developing models, strategies and procedures to configure the system such that one or more generators can be brought online – and at the same time, picking-up sufficient customer load to satisfy the generator's minimum requirements for stability. This process sets up "islands" where part of the transmission and distribution systems in a geographic area begin serving at least part of the load in that area. Once we determine an island is stable, we can synchronize

and reconnect/restore more generators and load, essentially expanding the island and restoring our interconnections with other utilities until the system is fully recovered. The longer the system is down, the harder it is to restore, so we work to determine the most efficient path(s) possible.[15]

We generally plan restoration assuming that the event that caused the outage caused no damage to the system. However, because this is a possibility, we must also plan alternate restoration paths that we can take in the event a portion of the system is damaged as part of the catastrophic event. We also must incorporate differing procedures based on the weather extremes in our geographic footprint. For example, any large generating unit that uses steam will take approximately one hour to wind down and fully stop operating. If ambient temperatures are cold, the water that remains in the Unit's pipes and boiler can freeze. Therefore, if we expect restoration of that Unit to take three or more hours, we may need to begin draining the pipes and boilers. If this occurs, our restoration of that generating unit will likely be delayed to the following day, after the unit goes through operational procedures that prepares it for a cold restart.

Sherco Unit 3 is the largest generating unit in the region and during a restoration event, we need it to provide the generating output necessary to restore customer load and the spinning reserves required for the NSP Island.[16] In the circumstance that a generator fails, Sherco Unit 3 has the capacity and the capability to ramp-up generation quickly to pick up the customer load that was lost by the failed generator. This becomes essential as the island grows, incorporating the neighboring utilities. However, Sherco Unit 3 is too large to be a Target Unit, so can only be started after we have at least one additional generator over-and-above the Initial Unit(s).

Our current plan gets from the Initial Unit(s) to Sherco Units 1 and 2 within a couple of hours. Because of their proximate location to Sherco Unit 3, the balance of the restoration plan is set in motion quickly to fully restore the system. As a steam unit, Sherco Unit 3 is impacted by the freeze potential we explained above if it takes longer than approximately four hours to power it up in the winter months. Therefore, getting

[15] The longer the system is down, equipment and facilities cool. Additional impacts include effects such as the fact that substation batteries will only keep the substations operational for a limited time. If the substation batteries deplete, we cannot easily isolate or energize the substation.

[16] In this case, the spinning reserves are the amount of additional generation that is on stand-by in the event that another generator within the island fails. To help ensure consistent availability and reliability of electricity during the restoration process, utilities keep generation capacity on reserve that can be accessed quickly if there is a disruption to the power supply. For example, if another generator or a major transmission line within the NSP/GRE/MP Island goes down, then NSP will access its reserve capacity at Sherco Unit 3 to compensate for that loss.

Sherco Unit 3 up and running quickly not only allows the Company to restore load faster and begin reaching out to neighboring utilities sooner – it also eliminates the concern of broader restoration delays associated with preventing the Unit from freezing.

2. Planning Considerations

Only certain types and sizes of generation are eligible to be considered Initial Units or Target Units. As noted previously, the Initial Unit(s) is the first generating unit that sets restoration in motion, and needs to be at least 110 MW and no more than 300 MW. It needs to be big enough to restore a larger Target Unit, but small enough to be able to start with an independent fuel source, such as fuel oil. Target Units are the generating units on the restoration path that are started by the Initial Unit(s). Eligible Target Units include coal, natural gas, hydro, and fuel oil – all of which are controllable and capable of both providing and absorbing reactive power. Renewable generation, such as solar and wind are not currently considered eligible Target Units due to their inherent intermittent nature, and their inability to provide or absorb reactive power. Nuclear units are also not eligible because they cannot vary their output, and can only come online after the balance of the system is fully stable.

When choosing a potential Target Unit as part of a black start study, we consider the following items (other than fuel source):

- Multiple generating units at the site
- Low minimum operating limits
- Ramp rate of the units
- How fast a unit can come on-line once it receives station power
- Unit's ability to act as a stabilizing unit in the island
- Amount of switching required in order to energize the unit

Special care is needed when energizing transmission lines during a system restoration due to the especially light loads present on the system. When lines are energized with little or no real power load, the charging current produces reactive power. We provide an example of how much reactive power may be needed when energizing an overhead transmission line in Table 6 below.

Table 6: Reactive Power Requirement for Energizing Overhead Transmission Lines

Transmission Voltage (kV)	MVAR per mile of line
69	0.011
115	0.033
230	0.125
345	0.164
500	0.770

Underground transmission lines produce even more reactive power that must be absorbed. The reactive power needs of an underground cable is *ten times* that of an overhead transmission line.

The same concern occurs when energizing transformers. The generation that is online must be able to absorb the reactive power injected into the system due to the energization of the transformer.

Table 7: Reactive Power Requirement for Energizing Transformers

Transformer Size (MVA)	MVAR Requirement
28	2.25
47	3.25
70	5.7
187	15
336	27-30
448	36
672	50.25

Before a line or transformer is energized, there must be sufficient generation MVAR capacity online to absorb the capacitive reactance produced by that line/transformer. If not balanced properly, it is easy to overwhelm the generator by collapsing its magnetic field, causing the generator to trip off-line, and potentially re-collapse the system.

When we begin to start-up motors and pumps at the next generating plant, the Initial Unit(s) must be capable of providing that reactive component back to the system in order to start the motors. Table 8 below outlines the amount of reactive power that is needed to start various sized motors at a typical power plant.

Table 8: Reactive Power Requirement for Starting Typical-Sized Generating Unit Motors

	Motor Start		Motor Running	
Motor HP	**MW Load**	**MVAR Load**	**MW Load**	**MVAR Load**
350	0.36	1.78	0.33	0.16
700	0.73	3.55	0.65	0.32
1500	1.55	7.61	1.4	0.68
2000	2.07	10.15	1.87	0.90
3000	3.11	15.23	2.8	1.35
6000	6.22	30.46	5.6	2.71

Starting large Target Units on our system requires around 30-40 MVAR of reactive power just to start the unit, which is substantial. The restoration path from the Initial Unit(s) to the Target Unit will inject an additional 75-110 MVAR of reactive power onto the system as transmission lines and transformers are energized, which the Initial Unit must absorb until the voltage reactors in our substations are energized.

The amount of MVARs needed for the restoration path will vary depending the on the path. Our current Black Start Plan requires an Initial Unit(s) of approximately 110 MW to 300 MW to restore our Target Unit – setting restoration in motion. Sherco Unit 3 is too large to be a viable Target Unit, because it is too large for the Initial Unit(s) to start, so is started later in the process. Additionally, as noted previously, nuclear units are not viable Target Units, nor are renewable generating units.

During this time, we must also be energizing transmission lines and transformers to bring customer load onto the system. We must balance the load and generation carefully, as without sufficient load, damage to our or customer equipment can occur from an overload of reactive power; if we energize lines and restore load too quickly, we can trip relays and will have to begin the process again. All substations on the current restoration path have emergency generators for maintaining full operating capability of switches, breakers, and relays at those substations. The emergency generators provide the AC power required to operate transformer pumps and fans as well as the transformer Load Tap Changers (LTCs). The emergency generators also maintain the battery chargers and ensure we maintain full battery capabilities. The substation batteries provide the DC power necessary for protective relaying, the motor operated disconnects, breaker trip coils, and communication equipment.

Generating units that interconnect with other utilities must also have a "sync scope," which is a device that measures frequency, voltage, and phase angle (Volts/VARs) to

ensure the two islands (one on each side of the interconnection) are perfectly in sync before interconnecting. If they are not perfectly in sync, both islands could go back down and equipment could sustain damage. This becomes important when we start to reconnect our system with our neighboring systems, or when we bring Minnesota and Wisconsin or North Dakota and South Dakota back together.

3. Summary

Each of our current non-renewable generating plants plays a unique role in the black start process. In addition to the key roles currently played by Sherco Units 1 and 2, our **[TRADE SECRET BEGINS… …TRADE SECRET ENDS]** plant plays a key role in restoring the **[TRADE SECRET BEGINS… …TRADE SECRET ENDS]** portion of our system. Altering the restoration path away from the Sherco site will require the addition of various equipment and/or facilities to other generating units and result in a longer restoration period. As we have discussed, restoration time is of greatest concern in winter/cold months.

The study determined that the existing **[TRADE SECRET BEGINS… …TRADE SECRET ENDS]** site as well as the **[TRADE SECRET BEGINS… …TRADE SECRET ENDS]** site were workable for future restoration plans, provided additional emergency generations were added to the system. There is still a delay of several hours in getting from the Initial Unit(s) to Sherco Unit 3, since additional time will be needed to bring either **[TRADE SECRET BEGINS… …TRADE SECRET ENDS]** up to a stable minimal load level, before getting to Sherco.

The existing **[TRADE SECRET BEGINS… …TRADE SECRET ENDS]** plant requires more switching to be part of the restoration plan and has more underground cables in the area that would add a substantial level of complexity to the switching procedures. It is not advisable to utilize **[TRADE SECRET BEGINS… …TRADE SECRET ENDS]** as a Target Unit if **[TRADE SECRET BEGINS… …TRADE SECRET ENDS]** are available as well as the **[TRADE SECRET BEGINS… …TRADE SECRET ENDS]** units. In order to utilize the **[TRADE SECRET BEGINS… …TRADE SECRET ENDS]** plant, at least 13 new emergency generators would be needed, which would also not be cost-effective or practical from an operational perspective. In comparison, the **[TRADE SECRET BEGINS… …TRADE SECRET ENDS]** would only require a combined five new emergency generators to be installed.

We outline the estimated costs of altering the current Sherco Units 1 and 2 restoration path in Table 9 below. We note that if generation is not replaced at Sherco, at least two of the new restoration paths would need to be used in order to ensure a viable path to Sherco Unit 3. For context, we also include the numbers of operating steps involved for each of the alternative paths, with greater numbers increasing the complexity and extending restoration time.

Table 9: Alternate Restoration Path – Estimated Cost and Operational Steps

Restoration Path	**Operational Steps** (Transmission)	**Estimated Additional Equipment Cost**
Current ME	22	
Current MW	16	
New Metro West 345 kV line	25	**[TRADE SECRET BEGINS… …TRADE SECRET ENDS]**
New Metro East 345/115 kV	32	**[TRADE SECRET BEGINS… …TRADE SECRET ENDS]**
Existing Paths with new Metro West 345 kV line	18	**[TRADE SECRET BEGINS… …TRADE SECRET ENDS]**
New Metro West 115 kV	24	**[TRADE SECRET BEGINS… …TRADE SECRET ENDS]**

Note: as discussed below, additional costs may be involved with the alternative 115 kV paths.

Our current restoration path relies on the 345 kV transmission system. Some of the above alternatives rely on the 115 kV system. When considering whether or not to use a 115 kV path over a 345 kV path, we must consider the active and reactive power required to energize the line. The higher voltage (345 kV) lines have a higher reactive power requirement for energization, but the lower voltage (115 kV) lines have higher resistance, which results in more line losses, which requires the generator(s) to provide more power (MW) to energize the equivalent 115 kV path.

We provide as Table 10 below, an example of two lines from our system that demonstrates these differences.

Table 10: 115 kV Compared to 345 kV Resistance and Reactive Power

Line voltage	Line Resistance	Reactive Power MVAR/mile
Blue Lake – Black Dog 115 kV	0.009531	0.033
Blue Lake – Black Dog 345 kV	0.000578	0.164

In blackstart planning, we try to balance the role of active and reactive power in the generator, so that there is enough reactive power to energize the next piece of equipment – but not so much so to lose too much active power to line losses, which reduces the numbers of customers we can restore initially.

We also need to maintain control of the system voltage as the restoration paths are energized. The 115 kV path will have a lower VAR requirement, which can lead to lower bus voltages as more equipment is energized. In this case, capacitor banks may need to be energized to boost the voltage. Conversely, the 345 kV path will have a higher VAR requirement than the 115 kV path, which can lead to higher bus voltages and the need to energize existing voltage reactors in order to lower the bus voltages.

Our current Black Start Plan and the NSP System have been designed around the 345 kV system and the understanding that during light loads, the bus voltages may be higher at one end of the transmission line than the other. We therefore have reactors strategically installed throughout the system to help control these voltages. We also have capacitor banks on the 345 kV system for high load periods, where the bus voltages may become depressed. However, while the proposed 115 kV restoration paths currently have some capacitor banks installed, more may be needed, depending on where the new generation is sited and which restoration path is chosen.

Our proposal to construct a natural gas CC unit at the Sherco site would provide for our current and most efficient Black Start Plan to remain in place. The proposed Unit would be big enough to start Sherco Unit 3 without incurring restoration delays, and the additional equipment and/or facilities costs and operational complexities in other parts of the system.

E. Conclusion

While our **[TRADE SECRET BEGINS… …TRADE SECRET ENDS]** generation sites are good potential Target units for the restoration plan, there are costs associated with system upgrades as well as a delay in getting

Sherco Unit 3 started. The best solution from a restoration perspective would be to install black start eligible replacement generation onsite at Sherco.

IV. STUDY ASSUMPTIONS, INPUTS, and ALTERNATIVES

A. MISO Y2 Study

MISO Attachment Y2 studies are performed at the request of the generator owner considering retirement of a generating unit(s), and are performed in accordance with the MISO Business Practice Manuals. Their purpose is to determine how the system behaves in the absence of whatever generating unit(s) is being requested to be shut down. MISO runs scenarios with and without the generating units in-service to determine the impacts to the regional transmission system and to identify any potential issues. The identified issues are shared with an adhoc study group made up of neighboring transmission owners and other entities to determine if the issues are real, and what potential solutions are needed to mitigate all of the system deficiencies. MISO does not look at replacement generation alternatives unless they proposed as solutions by members of the adhoc group.

1. Assumptions

We provide a summary of the MISO Y2 Study assumptions and inputs below. The study assumptions are detailed beginning on page 8 of the NON-PUBLIC MISO *System Support Resource Attachment Y2 Study Final Report, Xcel Energy, The Sherburne County Generating Plan ("Sherco") Units 1 & 2*, dated August 28, 2015.

Unit Power Output. Each Sherco Units 1 and 2 are rated at 730 MW total output power. Station service load is 47.5 MW for each unit, making the net output per Unit 682.5 MW.[17]

Retirement Scenarios. The Company's March 11, 2015 Attachment Y2 Study request sought study of two retirement scenarios for Sherco Units 1 and 2 as follows:

(1) Both Sherco Units 1 and 2 on May 31, 2021, and
(2) Sherco Unit 2 on May 31, 2021 and Sherco Unit 1 on May 31, 2024.

Study Models. Studies were performed using the following power flow models:

Scenario 1:

- 2021 Summer Peak (MTEP15_2020 Summer Peak starting point)

[17] 2015-2016 UCAP Unit Ratings: Sherco Unit 1 – 696.1 MW; Sherco Unit 2 685.8 MW.

- 2021 Shoulder (MTEP15_2020 Shoulder 90% wind starting point)
- 2021 Winter Peak (MTEP15_2020 Winter Peak starting point)
- 2025 Summer Peak (MTEP15_2025 Summer Peak) Scenario 2:
- 2021 Summer Peak (MTEP15_2020 Summer Peak starting point)
- 2021 Shoulder (MTEP15_2020 Shoulder 90% wind starting point)
- 2021 Winter Peak (MTEP15_2020 Winter Peak starting point)
- 2025 Summer Peak (MTEP15_2025 Summer Peak)
- 2024 Shoulder (MTEP14_2024 Shoulder)

For the model, two sub-scenarios were created which represent the "before" and "after" generator retirements for each retirement scenario. The most relevant 2014 Security Constrained Economic Dispatch (SCED) input data from MTEP14 series was used and updated to reflect conditions in MTEP15 series models.

Model Assumptions - Generation. Units for which an Attachment Y had been completed during the relevant period were modeled as offline. Additionally, Attachment Y Units whose suspensions end before 2020 were modeled in-service.

Model Assumptions – Transmission. Significant transmission projects in service prior to the potential retirement dates were as follows:

- MTEP Project 3831 Great Northern Transmission Line (June 2020). To be added to MTEP14 2024SSH model only, MTEP15 models will have it already.
- MTEP Project 7910 Mud Lake – Brainerd 5L upgrade. Minnesota Power confirmed expected I/S date to be in 2019.
- MTEP Project 7913 Little Falls – Langola Tap – St. Stephen (115 kV) upgrade. Minnesota Power confirmed expected in-service date to be in 2019.
- MTEP Project 3127 N La Crosse – N Madison – Cardinal – Eden – Hickory Creek 345 kV. To be added to MTEP15 2020SUM and MTEP15 2020SSH only, later models already have them.

Additionally, Minnesota Power (MP) provided topology updates to MTEP14-2024SSH and a correction to all cases for its Silver Bay Generation and Iron Range-Forbes 230kV Line summer rating (summer cases only). Finally, each Units station service load was disconnected in the "after" as part of the retirement of the corresponding Unit(s), and the Xcel Energy (XEL) area slack bus was changed due to the potential retirement of Sherco Unit 2.

2. Criteria and Methodology

PTI PSS/E was used to perform AC contingency analysis. Cases were solved with automatic control of LTCs, phase shifters, DC taps, switched shunts enabled (regulating), and area interchange disabled. Contingency analysis was performed on before and after cases. The results were compared to determine if there were any criteria violations due to the Unit(s) change of status.

The *Steady State Thermal* and *Steady State Voltage* Planning Criteria for each Transmission Owner (XEL, Great River Energy (GRE), MP, American Transmission Company (ATC), Dairyland Power Cooperative (DPC), Southern Minnesota Municipal Power Agency (SMMPA), and Ottertail Power (OTP)) were applied.

MISO Transmission Planning Business Process Manuals – SSR Criteria. As specified in the MISO BPM-020-R12, (Section 6.2 beginning on page 133)[18] the System Support Resource criteria for determining if an identified facility is impacted by the suspension of the units will be:

- Under system intact and category B contingencies, branch thermal violations are only valid if the flow increase on the element in the "after" suspension scenario is equal to or greater than:
    a) 5 percent of the "to-be-retired" unit(s) MW amount (i.e. 5% PTDF) for a "base" violation compared with the "before" suspension scenario, or
    b) 3 percent of the "to-be-retired" unit(s) amount (i.e. 3% OTDF) for a "contingency" violation compared with the "before" suspension scenario.
- Under system intact and category B contingencies, high and low voltage violations are only valid if the change in voltage is greater than 1% as compared to the "before" suspension voltage calculation.
- Under category C contingencies, for the valid thermal and voltage violations as specified above, generation re-dispatch, system reconfiguration, or load shedding were considered if applicable.
- Angle/voltage stability studies will be performed if necessary.

3. Summary of Retirement Scenario Cases

Tables 11, 12 and 13 below provide summaries of the Case results, as they relate to NERC Event Categories. We note that Case 1 is Sherco Units 1 and 2 out of service

[18] MISO Business Practice Manual BPM-020 can be found at https://www.misoenergy.org/Library/BusinessPracticesManuals/Pages/BusinessPracticesManuals.aspx

and Case 2 is Sherco Unit 2 out of service. In order to make the results more easily understandable, we have included a brief definition of the NERC Event Categories in the Table 14 immediately following our summary of the Case results.

Table 11: Scenario 1 Case Summary

	Events/Violations		
NERC Event Category	**Summer Peak**	**Shoulder**	**Winter Peak**
P1		84/84 Thermal (MP) 2/2 Line Loading (MP) 119/907 Voltage (MP) 99/110 Voltage (XEL) 5/5 Voltage (GRE) 6/11 Voltage (*resolved by switching on local capacitor banks*) 2/3 Voltage (*addressed within GRE service area*)	
P2		2/2 Line Loading (MP) 119/907 Voltage (MP) 99/110 Voltage (XEL) 5/5 Voltage (GRE) 3/21 Voltage (*resolved by MTEP 9064*)	1/1 Thermal (MP) 2/2 Voltage (*addressed by transferring feeder load onto adjacent sources*)
P3		1/1 Thermal (XEL) 84/84 Thermal (MP) 97/142 Voltage (XEL) 119/907 Voltage (MP) 99/110 Voltage (XEL)	
P4		3/21 Voltage (*resolved by MTEP 9064*)	
P5		99/110 Voltage (XEL) 5/5 Voltage (GRE) 6/11 Voltage (*resolved by switching on local capacitor banks*) 1/3 Voltage (*resolved by Coal Creek generation reduction*)	1/1 Voltage (GRE – *resolved by MTEP 4380*)
P6	4 Voltage (XEL)	97/142 Voltage (XEL) 99/110 Voltage (XEL)	
P7		99/110 Voltage (XEL) 6/11 Voltage (*resolved by switching on local capacitor banks*)	

Table 12: Scenario 2 Case Summary

	Events/Violations		
NERC Event Category	**Summer Peak**	**Shoulder**	**Winter Peak**
P1		9/13 Voltage (XEL)	
P2		9/13 Voltage (XEL) 2/2 Voltage (GRE – *resolved by MTEP 4380*)	1/1 Thermal (MP)
P3		9/13 Voltage (XEL) 14/549 Voltage (MP) 6/11 Voltage (MP) 59/59 Thermal (MP)	
P4			
P5		2/2 Voltage (GRE – *resolved by MTEP 4380*)	
P6	3/3 Voltage (XEL)		
P7			

Table 13: Shared Cases (Scenarios 1 and 2) Summary

	Events/Violations		
NERC Event Category	**Summer Peak**	**Shoulder**	**Winter Peak**
P1	2/2 Voltage (GRE)		
P2			
P3		5/1 Thermal (XEL) 2/2 Thermal (MP) 8/10 Voltage (XEL) 4/7 Voltage (MP)	
P4			
P5			
P6		8/10 Voltage (XEL)	
P7			

Table 14: Abbreviated List of NERC Event Category Definitions[19]

P1	Single Contingency – Loss of one of the following: * Generator * Transmission Circuit * Transformer * Shunt Device * Single Pole of a DC line
P2	Single Contingency – * Opening of a line section w/o a fault * Bus Section fault * Internal Breaker fault (non-Bus-tie-Breaker) * Internal Breaker Fault (bus-tie Breaker)
P3	Multiple Contingency – Loss of one of the following: * Generator * Transmission circuit * Transformer * Shunt Device * Single pole of a DC line
P4	Multiple Contingency – (Fault plus stuck breaker) Loss of multiple elements caused by a stuck breaker (non-Bus-tie Breaker) attempting to clear a Fault on one of the following: * Generator * Transmission Circuit * Transformer * Shunt Device * Bus Section * Loss of multiple elements caused by a stuck breaker (Bus-tie Breaker) attempting to clear a Fault on the associated bus
P5	Multiple Contingency (*Fault plus relay failure to operate)* – Delayed Fault Clearing due to the failure of a non-redundant relay protecting the Faulted element to operate as designed, for one of the following: * Generator * Transmission Circuit * Transformer * Shunt Device * Bus Section
P6	Multiple Contingency (*two overlapping single contingencies)* – Loss of one of the following: * Transmission Circuit * Transformer * Shunt Device * Single pole of a DC line
P7	Multiple Contingency (*Common Structure)* – The loss of: * Any two adjacent (vertically or horizontally) circuits on common structure * Loss of a bipolar DC line

http://www.nerc.com/pa/Stand/Reliability%20Standards/TPL-001-4.pdf beginning at page 8.

4. Special Voltage Stability Study – Monticello Nuclear

As noted previously, due to the electrical proximity between the Monticello Nuclear generating plan and Sherco, the voltages at Monticello's 115 kV and 345 kV buses received special attention. This special study was to determine whether Monticello's voltage will remain within the plant's NPIR limits at all times, and whether the region around Monticello would be at risk of voltage collapse under certain power transfer scenarios.

Model Preparation. The voltage results of the steady state power flow showed a significant number of voltage violations in the 2021 shoulder case compared to the number of voltage violations in the 2021 summer case in the Twin Cities area, which can be attributed to the number of online units in each case. Only few units in the Twin Cities area are online in the shoulder case, however all the units in the Twin Cities are online in the summer case. The presence of these units supports the voltage stability in the summer case compared to the shoulder case.[20] For this reason, MISO determined the 'Source' and the 'Sink' to implement the power transfer needed for the voltage stability study based on the 2021 shoulder case. All the online units within the Twin Cities area were used as the 'Sink' subsystem (their output was reduced) and all the units outside the Twin Cities are the 'Source' subsystem.

Contingencies. The voltage stability studies selected the events observed to cause the highest voltage drop at Monticello combined with the loss of Sherco Unit 3 to implement NERC P3 contingencies.

Methodology. MISO used the PSS-E PV Analysis tool. For the base case, all taps and switched shunts were allowed for automatic adjustments and Area interchange control was disabled. For the contingency case, all taps and switched shunts were locked and Area interchange control was disabled. The branch loading check (thermal violations check) was disabled to study only the impact of the power transfer on the voltage, and the Machine active power limits were honored.

Verification of the Voltage Collapse Conditions. To verify that power flow solution blows-up due to true voltage collapse conditions and not due to some numerical issues, numerous switched shunt actions were verified right before reaching the blow-up status. All online generators within the Twin Cities reached their Qmax limit, which proved that the case blow-up as the power transfer reached the knee of the P-V curve as shown.

[20] The status of each unit in that area was determined automatically during the SCED process.

Transient Stability. Considering the size of the two Sherco Units and due to their proximity from the two nuclear plants (Monticello and Prairie Island) that have special frequency requirements, a transient stability assessment was needed. This assessment was done to study the impact of the retirement of Sherco Units 1 and 2 in 2021. A similar study must be conducted if the Company decides to retire only one of the Sherco Units 1 and 2.

MISO used the dynamic model MTEP14-2019 Summer Shoulder with specific assumptions including Sherco unit 1 and unit 2 kept offline and all of the applicable generation and transmission assumptions listed earlier. As per MTEP14 Transient Stability Assessment, the MISO West Sub-region is more stressed during high transfers in shoulder periods.[21] After applying all the above changes, SCED was performed on the case. Ten disturbances selected from the MTEP14 study in addition to three disturbances provided by GRE were each simulated for 20 seconds. PSS-E version 32 was used in simulating these disturbances. Again, the Transmission Owner Planning Criteria and Monticello NPIR were considered; the rotor angle, bus voltage, and bus frequency channels in XEL, MP, GRE, and MH were selected.

5. Limitations

The MISO Y2 study is a "first come, first served" study where only generators that have already requested to retire are considered when performing the study. MISO does not attempt to predict which generators they believe will retire in the future. With the Clean Power Plan, it is very likely additional generators not included in the MISO Y2 Study performed for Sherco Unit 1 and 2 scenarios will be retired, which could impact Sherco Unit 1 and 2 retirement.

B. Xcel Energy Transmission Reliability Study

1. Sherco 1 Study Replacement Scenarios

We initiated our Reliability Study to further investigate the transmission impacts associated with replacement generation for one or two Sherco units being located at various locations on the NSP System. We identified three potential locations that include both greenfield and brownfield conditions. Our considerations in choosing the locations include proximity to existing transmission facilities, generation facilities, and natural gas pipelines – and other factors, such as potential land availability needed to accommodate new generation. The alternative locations are as follows:

[21] The MTEP15 dynamic model was not yet ready.

- Metro
- Southwest
- Northwest

2. Sherco 1 and 2 Study Replacement Scenarios

We considered nine scenarios for Sherco Units 1 and 2 replacement:

1. CAPCON 700 MW, Metro 600 MW[22]
2. CAPCON 700 MW, Northwest 700 MW
3. CAPCON 700 MW, Southwest 700 MW
4. Northwest 700 MW, Metro 600 MW
5. Northwest 700 MW, Southwest 700 MW
6. Northwest 1,400 MW
7. Southwest 700 MW, Metro 600 MW
8. Southwest 1,400 MW
9. Metro 1,200 MW

Linear power flow methods (DCCC) were used to perform contingency analysis on each of the nine scenarios for the summer and shoulder peak system conditions. Based on these thermal results potential mitigation was identified and estimated.

Four scenarios were selected for further analysis based internal stakeholder input.

1. Southwest 750 MW, Metro 750 MW
2. Northwest 750 MW, Metro 750 MW
3. Northwest 750 MW, Southwest 750 MW
4. Sherburne County 1,500 MW (Stability Only)

3. Study Methodology

The replacement scenarios were evaluated for the study year 2020. Summer peak and shoulder peak cases were developed based on the MISO MTEP14, 2019 summer peak and summer shoulder cases. These cases were updated from 2019 to 2020 by adding in the MISO MTEP14 Appendix A projects with an in-service date before June 1, 2020. In addition to transmission projects, all generator projects located in the MISO DPP study cycle through the DPP 2014 February benchmark cases that were

[22] CAPCON is the generating resources being added to the NSP System as a result of the Competitive Acquisition proceeding in Docket No. E002/CN-12-1240. These resource include: Mankato Energy Center II, Aurora Solar, and Black Dog 6.

located in the region were added to the cases. The CC generation was dispatched based on a merit order in the shoulder peak cases.

a. Steady State Analysis

Summer peak and shoulder cases were evaluated for steady-state thermal and voltage issues using PSSE version 33 and PSSMUST version 10.2 Contingency criteria was based on the MTEP14 contingencies files.

- NERC Category A with system intact (no contingencies)
- NERC Category B contingencies
  - Single element outages, at buses with a nominal voltage of 100 kV and above, in the following areas: WEC (area 295), XEL (area 600), MP (area 608), SMMPA (area 613), GRE (area 615), OTP (area 620), ITCM (area 627), MEC (area 635), WAPA (area 652), MDU (area 661), DPC (area 680), ALTE (area 694), WPS (area 696), MGE (area 697), UPPC (area 698)
  - multiple-element outages initiated by a fault with normal clearing such as multi-terminal lines, in Iowa, North Dakota, South Dakota, Minnesota and Wisconsin.
- NERC Category C
  - NERC Category C events, in Iowa, North Dakota, South Dakota, Minnesota and Wisconsin.

Monitored elements for each of the areas are described in the Table 15 below.

Table 15: Monitored System Elements

Owner/ Area	Monitored Facilities	Thermal Limits		Voltage Limits	
		Pre-Disturbance	Post-Disturbance	Pre-Disturbance	Post-Disturbance
ATCLLC	69 kV and above	100% of Rate A	100% of Rate B	1.05/0.95	1.1/0.9
DPC	69 kV and above	100% of Rate A	100% of Rate B	1.05/0.95	1.1/0.9
GRE	69 kV and above	100% of Rate A	100% of Rate B	1.05/0.95	1.1/0.92
ITCM	69 kV and above	100% of Rate A	100% of Rate B	1.05/0.95	1.07/1.05/0.93
MDU	57 kV and above	100% of Rate A	100% of Rate B	1.05/0.95	1.1/0.9
MEC	69 kV and above	100% of Rate A	100% of Rate B	1.05/0.96/0.95	1.05/0.96/0.95
MHEB	69 kV and above	100% of Rate A	100% of Rate B	1.12/1.1/1.07/1.05/1.04/0.99/0.97/0.96/0.95	1.15/1.1/0.94/0.9
MP	69 kV and above	100% of Rate A	100% of Rate B	1.05/1.0	1.1/0.95
OTP	40 kV and above	100% of Rate A	100% of Rate B	1.07/1.05/0.97	1.1/0.92
SMMPA	69 kV and above	100% of Rate A	100% of Rate B	1.05/0.95	1.1/0.9
WAPA	69 kV and above	100% of Rate A	100% of Rate B	1.05/0.95	1.1/0.9
XEL	69 kV and above	100% of Rate A	100% of Rate B	1.05/0.95	1.1/0.92
Monticello	345 kV	100% of Rate A	100% of Rate B	1.0492/0.9914	1.0492/0.9914
Monticello	115 kV	100% of Rate A	100% of Rate B	1.05/1.0087	1.05/1.0087
Prairie Island	345 kV	100% of Rate A	100% of Rate B	1.05/0.9911	1.05/0.9911
Prairie Island	161 kV	100% of Rate A	100% of Rate B	1.05/0.9969	1.05/0.9969

A branch is considered thermally constrained if the following conditions are met.

1. The branch is loaded above its applicable normal or emergency rating, and
2. A replacement scenario generator has a larger than 5% DF on the overloaded facility under system intact or post contingent, or
3. The impact of the replacement scenario is greater than 10% of the applicable rating of the overloaded facility

A bus is considered a voltage constraint if both of the following conditions are met.

1. The bus voltage is outside of applicable normal or emergency limits, and
2. The change in bus voltage is greater than 0.01 per unit.

b. System Loss Analysis

Real power losses for the study were based on a comparison of total system losses from the benchmark base cases and the replacement scenario cases.

c. Reactive Power Analysis

Reactive power production for the study was studied by comparing the amount of reactive power produced in the Xcel Energy area in the benchmark base case compared to the replacement scenario cases.

4. Transient Stability

Transient stability was performed using PSSE version 32.2. Transient stability analysis was performed using the MTEP14 stability package. Disturbances were simulated on the benchmark case and the study cases to identify any significant impacts.

a. Disturbance Criteria

The stability simulations as part of this study took into account both regional and local contingencies. For local contingencies generic clearing times were used and the fault admittances for single line to ground faults were estimated by assuming the Thevenin impedance of the positive, negative, and zero sequence networks at the point of the fault are equal.

b. Performance Criteria

Simulation results were evaluated using the MRO System Performance Table in the MRO System Performance Standard TPL-503-MRO-01. Transient voltages must be within the default limits of 0.70-1.20 per unit with the exception of specific buses, areas or companies that have different requirements. All machine rotor angle oscillations must be positively damped with a minimum damping factor of 5% for disturbances with a fault, or 10% for line trips without a fault.

Transient apparent impedance swings on all lines were monitored after fault clearing using the mrely1 user written model. The mrely1 model uses a generic three-zone mho characteristic. Apparent impedance transient swings into the inner two zones are unacceptable for NERC Category B disturbances. Apparent impedance transient swings into the inner two zones of distance relays are unacceptable for NERC

Category C disturbances, unless a relay trip will not result in instability (including voltage instability), uncontrolled separation, or cascading outages.

5. Mitigation Cost Assumptions

Unit cost tables were developed for the overhead transmission lines, substation, transformers, and any reactive power instillations that were needed for the study effort. These costs were based on new construction and in 2015 dollars.

6. Limitations

The Reliability Study, when it was initiated in early 2015, included a number of projects from the MISO interconnection queue that were assumed to be going into service at the time the study was performed. Because of this, any changes to the MISO Queue could have an impact on the conclusions of the our Reliability Study – with the likely outcome of increasing the identified estimated interconnection costs for projects analyzed.

C. Black Start Analysis

1. Assumptions and Inputs

The primary purpose of the study was to investigate the impacts of retiring Sherco Units 1 and 2, on the NSP Power System Restoration Plan. The study looked at future blackout scenarios where Sherco Units 1 and 2 are not available for restoration efforts. The intent was to identify potential new Target Units and the associated restoration paths for those units. The Study also identified potential challenges with the various scenarios and what potential upgrades would be required to make those viable options for future restoration plans. The Study assumed that the natural gas pipeline supplies for potential new Target Units is adequate to start and run the plants for the restoration plan.

The Black Start Study utilized the same study models that were created for the Xcel Energy Transmission Reliability Study, modified for the blackout scenario base cases, from which multiple Target Units and associated restoration paths were studied. Due to the proximity from where the proposed replacement generation in the model was sited to the primary Twin Cities load center, we eliminated the Northwest generation and the Southwest generation locations – only studying the Metro location and other existing plant locations.

2. Alternatives Examined

We analyzed four new potential restoration paths: (1) a 345kV path to **[TRADE SECRET BEGINS… …TRADE SECRET ENDS]**, (2) a 115kV path to **[TRADE SECRET BEGINS… …TRADE SECRET ENDS]** with underground cable, (3) another 115kV path to **[TRADE SECRET BEGINS… …TRADE SECRET ENDS]** using overhead lines, and then (4) a combination 345/115 kV path to **[TRADE SECRET BEGINS… …TRADE SECRET ENDS]**. After the generation was started at each of the new Target Units, the restoration paths were energized to Sherco.

3. Study Methodology

To demonstrate generator capability is adequate to perform its black start functions, the Initial and Target Units must stay within real and reactive limitations based on that unit's most recent D-curve, or operating limits.[23] Unit loading must be dispatched so that the contingent loss of one of the units will not cause the other online units to exceed their real and reactive power capabilities or their governor response capability.

The Initial Unit(s) requires that the terminal voltage of the generators must be 13.1 kV (95%), if the loading on that generator exceeds 10 MW. A temporary reduction to 12.8 kV (93%) is allowed for unit output less than 10 MW. Due to these restrictions and the current tap settings on the generator step-up transformers (GSU), there are additional voltage constraints for the 115 kV bus.

For the Initial and Target Units to be considered capable of performing their functions within the our Black Start Plan, they must be able to energize at least one restoration path between the black start substation, and the new Target Unit. The Initial Unit(s) must be able to start the new Target Unit and then continue the restoration path to the Sherco substation and be able to complete the Sherco Unit 3 load start-up sequence without causing violations to the above criteria.

[23] In addition to producing capacity and energy to meet customer load requirements, generating units help control voltage on the grid by producing and absorbing reactive power (MVAR); *producing* MVAR helps *increase* the voltage, and *absorbing* MVAR helps *decrease* the voltage. When a generator is producing or absorbing reactive power, it cannot produce its maximum MW output because its operating capability is partially "used up" from producing or absorbing reactive power. Therefore, a generating unit's D-curve shows the operating limits for a generating unit in terms of the relationship between the active power (MW) it is producing and the reactive power it is either producing or absorbing – and how they are balanced within the unit's maximum operating limits.

To effectively analyze the restoration paths, we created scripts to simulate the major switching steps outlined for each switching step along the restoration path. For each major step in the restoration path development, we monitored bus voltages at key transmission substations and the Initial Units' real and reactive power output. Both the steady-state and immediate post-switching (time 0+) results were displayed for each step, as outlined in Table 16 below.

Table 16: Steady-State and Immediate Post-Switching Results

	Switching Limits		Steady State Limits	
	Low Voltage	High Voltage	Low Voltage	High Voltage
All buses	0.90 pu	1.05 pu	0.95 pu	1.05 pu

We did not actively monitor transmission equipment loadings because the amount of load energized to support each restoration path did not exceed the lowest rating of any one piece of series connected equipment.

4. General Findings

The Study determined that **[TRADE SECRET BEGINS… …TRADE SECRET ENDS]** would not be a good Target Unit due to the difficulty in switching to get there for the operators, as well as the number of emergency generators that would need to be added to the system. The overhead path, while longer and requiring an additional generator to be installed, was a better option than the underground path. The reactive power requirements for the underground path were a challenge and could require an additional Initial Unit(s).

The Metro East 345/115 kV path and the Metro West 345 kV paths were the preferred paths to the alternate Target Units. However the process of bringing the Target Unit online and up to minimum load will delay the restart of Sherco Unit 3, and the restoration of off-site station power to both Monticello and Prairie Island. Importantly, the existing paths to Sherco Units 1 and 2 or the new proposed onsite CC unit allows restoration of offsite station power to both nuclear plants and start-up procedures for Sherco Unit 3 in the most efficient timeframe.

Attachment E
Estimated Rate Impacts

In order to show the impacts of our plan on customer rates and bills, we have included an estimated rate impact analysis of our Updated 2015 and Current Preferred Plan below that includes the breakdown of anticipated increases by customer class. The estimated customer impacts are shown for the five-year period from 2016-2020 at the Minnesota customer class levels. In this Attachment, we present the results of that analysis and discuss the methodology we used to calculate the revenue requirements associated with our Updated 2015 and Current Preferred Plans.

A. Rate Forecast Methodology

To calculate the rate impacts of the Updated 2015 and Current Preferred Plans, we started with the 2016 Budget forecast of total revenue requirements for 2016-2020, developed in July 2015. This is the forecast that formed the basis for the 2016 MN Electric Rate Case (Docket No. E002/GR-15-826) filed in November 2015. [1]

The assumption differences between the Rate Case, the Updated 2015 Plan, and the Current Preferred Plan are as follows:

1. *Rate Case:* Our rate case model includes the following resource additions:

   - 287 MW of solar Power Purchase Agreements (PPA) in 2017, made up of the 100 MW Aurora distributed solar project (Docket No. E002/M-15-330) and 187 MW from our Solar Request for Proposals (Docket No. E002/M-14-162)
   - Updated Community Solar Gardens forecast we reflected in our March 2015 Supplement, totaling over 200 MW by 2020
   - Rooftop solar additions of 9 MW per year through 2020, reflecting Solar Rewards and Made in Minnesota projects
   - 200 MW Courtenay wind project, expected to achieve commercial operation by end of 2016
   - 200 MW Odell wind PPA, expected to achieve commercial operation in 2016

[1] The Company filed an electric rate case application for a 2016-2018 multi-year rate plan in November, 2015. The information contained in that filing includes specific assumptions and adjustments for ratemaking, and will therefore differ from the estimated rate impact information provided in this filing.

- 600 MW of non-Production Tax Credit (PTC) PPA wind, reflecting the proposal in our Updated 2015 plan, before the extension of the PTC
- 345 MW Calpine Corporation Mankato Energy Center natural gas combined cycle project, expected in-service no later than 2019
- 232 MW Xcel Energy Black Dog natural gas combustion turbine project, expected to achieve commercial operation no later than 2019
- Sherco Units 1 and 2 operational through 2030

These changes are summarized in Table 1 below.

Table 1: 2016 Rate Case Resource Additions

	Rate Case				
	2016	**2017**	**2018**	**2019**	**2020**
Solar PPA MW	0	287	0	0	0
Solar Gardens MW	33	36	40	44	49
Rooftop Solar MW	9	9	9	9	9
Owned Wind w/ PTCs MW	200	0	0	0	0
PPA Wind w/ PTCs MW	200	0	0	0	0
PPA Wind wo/ PTCs MW	0	0	0	0	600
Black Dog MW	0	0	0	232	0
Calpine expansion PPA MW	0	0	0	345	0

2. Updated 2015 Plan

The Updated 2015 Plan reflects the same resources shown in the rate case above, with the exceptions of the 600 MW of non-PTC PPA wind in 2020 switches to PTC wind in the Updated 2015 Plan, to reflect the extension of the renewable energy tax credits.

The changes from the Rate Case forecast to the Updated 2015 Plan are shown in Table 2 below.

Table 2: Changes from 2016 Rate Case to Updated 2015 Plan

	2016	**2017**	**2018**	**2019**	**2020**
PPA Wind w/ PTCs MW	-	-	-	-	+600
PPA Wind wo/ PTCs MW	-	-	-	-	-600

3. Current Preferred Plan

The resource additions in our Current Preferred Plan reflect all the changes described above, as well as the resource adjustments described below and shown in Table 3 below:

- Ceasing operations of Sherco Unit 1 in 2026 and Sherco Unit 2 in 2023
- 200 MW of owned solar, added in 2018 and in 2020
- 200 MW of PPA solar, added in 2018 and in 2020
- 400 MW of owned PTC wind in 2018
- 400 MW of PPA wind with PTC in 2018

The changes from the Updated 2015 Plan to the Current Preferred Plan are shown in Table 3 below.

Table 3: Changes from Updated 2015 Plan to Current Preferred Plan

	2016	2017	2018	2019	2020
Owned Solar MW	-	-	+100	-	+100
Solar PPA MW	-	-	+100	-	+100
Owned Wind w/ PTCs MW	-	-	+400	-	-
PPA Wind w/ PTCs MW	-	-	+400	-	-

Table 4 below summarizes all the resources included in our Revenue Requirements analysis of the Current Preferred Plan costs.

Table 4: Current Preferred Plan Resources

	Current Preferred Plan				
	2016	2017	2018	2019	2020
Owned Solar MW	-	-	100	0	100

PPA Wind wo/ PTCs MW	0	0	0	0	0
Black Dog MW	0	0	0	232	0
Calpine expansion PPA MW	0	0	0	345	0

B. Estimated Rate Impacts by Class per Year

We note that a detailed analysis of rate impacts in a resource planning process with long-time horizons is difficult to produce due to changes in our rates and resource needs that will occur over time. Because of the simplifying assumptions made in both the calculation methodology and the input variables, these estimated impacts may not correspond with actual rates that the Commission sets for various rate classes in the future.

To estimate customer impacts for the immediate five-year period, we estimated revenue requirements similar to a Jurisdictional Cost of Service (JCOSS) for each year, and then performed an estimated Class Cost of Service (CCOSS) analysis – both of which required us to make a number of assumptions.

To determine the JCOSS, we had to make a number of assumptions, including the following:

- Full recovery of the Company's internal five-year forecasts of capital, O&M, and sales,[2]
- Return on Equity (ROE) requested in Docket No. E002/GR-15-826 of 10.00 percent,
- A forecast of debt and equity ratios and debt rates appropriate for the five-year modeling term,
- Estimated typical and precedential regulatory adjustments made in rate cases, such as Advertising, Association Dues, Corporate Aviation, Customer Deposits, Foundation Administration, Incentive Compensation, Investor Relations, the Monticello Extended Power Uprate (EPU) prudence decision from Docket No. E002/CI-13-754, Nobles Amounts over the Certificate of Need, the Prairie Island EPU Amortization, Removal of Non-Asset Trading, and the Sherco Life Extension,

We added the following adjustments appropriate to the Updated 2015 Plan scenario and to the Current Preferred Plan.

Updated 2015 Plan scenario:

- The generation resources described in Table 2 above were modeled to create a fuel forecast. The differences in purchased energy and purchased capacity were added as expenses to the revenue requirements model. Since purchased energy is recovered through the fuel clause, we also assumed an equal amount of fuel

[2] Data as of August, 2015.

clause revenue.

Current Preferred Plan scenario:

- The generation resources described in Table 4 above were modeled to create a fuel forecast. The differences in purchased energy and purchased capacity were added as expenses to the revenue requirements model. Since purchased energy is recovered through the fuel clause, we also assumed an equal amount of fuel clause revenue.
- We estimated rate base, operating expenses, and tax credits related to the owned wind and solar resources and added them to the revenue requirements model.
- We estimated book and tax depreciation expenses, associated balances, and associated property taxes related to an earlier retirement of Sherco Units 1 and 2. These were added to the revenue requirements model.
- We estimated changes to variable O&M at coal, gas combined cycle, and gas combustion turbine plants due to the different fuel dispatch assumptions associated with the generation resource assumptions and adjusted the revenue requirements model.

We caution, however, that this information should not be interpreted as directly comparable to the customer rate impact information we provide as part of a rate case filing for reasons such as the following:

- The internal forecast for 2019-2020 is not prepared at the level of detail necessary for support of a rate case,
- While the forecast includes typical regulatory adjustments, we have not attempted to remove one-time effects or other one-time adjustments that are not specifically known at this time,
- We have made no determination of a rate case filing schedule over this period; the forecast provided assumes full recovery of annual deficiencies, suggesting a full rate case annually, and
- All factors of the Cost of Capital, including debt rates, return on equity, and debt-equity ratios, are subject to change through a rate case.

C. Determining Class Rate Impacts

After the Minnesota jurisdiction projected total revenue requirements for the period are developed, the costs are allocated to customer class based on the approved CCOSS allocation methods from the Company's last rate case order (Docket No.

E002/GR-13-868). Below, we provide detail on the Commission approved methods for allocating all production-related costs.

1. Allocation of Production Related Costs

a. Capital-Related Production Costs

When allocating capital-related production costs, the Company uses the plant stratification approach approved by the Commission in the Company's last five rate cases.

The plant stratification approach begins by comparing the replacement cost of each type of generation plant (fossil, combined cycle, etc.) to the replacement cost of a combustion turbine. Combustion turbines are 100 percent capacity/demand-related since they are the generation source with the lowest capital cost and the highest operating cost. For each generation type, the percent of total generation costs that exceeds the cost of combustion turbine peaking plant are classified as being energy-related. These costs are in excess of the capacity/demand-related portion, and as such, were not incurred to obtain capacity, but rather to obtain lower cost energy.

We show the Commission-approved plant stratification analysis that we applied to capital-related production costs for each plant type in Table 5 below:

Table 5: Stratification Analysis by Plant Type

Plant Type	Replacement Value $/kW	Capacity Ratio	Capacity/Demand Percentage	Energy Percentage
Combustion Turbine	$792	$792 / $792	100.0%	0.0%
Fossil	$2,022	$792 / $2,022	39.2%	60.8%
Nuclear	$4,146	$792 / $4,146	19.1%	80.9%
Combined Cycle	$1,037	$792 / $1,037	76.3%	23.7%
Wind	$14,894	$792 / $14,894	5.3%	94.7%
Solar	$8,182	$792 / $8,182	9.7%	90.3%

After production capital costs for each type of generation plant are split into capacity-related and energy related components based on the percentages shown in Table 5 above, those costs that have been classified as being energy-related are allocated to class using the E8760 energy allocator. The E8760 allocator is calculated by taking the forecast hourly load for each of the 8,760 hours of the test year for each customer class, then weighting the hourly load by the forecasted hourly marginal energy cost in each respective hour. The approved E8760 allocator from the last rate case order is

shown in Table 6 below:

Table 6: Approved E8760 Energy Allocator

MN	Residential	Commercial Non-Demand	C&I Demand	Lighting
100.00%	29.24%	3.33%	67.01%	0.42%

The capital costs that have been classified as being capacity or demand-related are allocated to customer class using the Commission-approved D10S capacity allocator. The D10S allocator is simply each class's load that is coincident with the NSP System peak load. The Commission approved D10S class allocator percentages are shown in Table 7 below:

Table 7: Approved D10S Capacity Allocator

MN	Residential	Commercial Non-Demand	C&I Demand	Lighting
100.00%	34.86%	3.72%	61.42%	0.00%

b. Fuel and Purchased Energy Expenses

These costs are allocated to class using the Commission approved E8760 energy allocator shown in Table 6 above.

c. Production O&M Expense

When allocating Other Production O&M expenses, the Company used the Commission ordered "Location" method. This method starts by identifying those production O&M expenses that vary directly with energy output. Using this criteria, the only expenses that vary directly with output are expenses for chemicals and water use. These costs are allocated to class using the E8760 allocator shown in Table 6. The remaining O&M costs are split into capacity and energy-related components based on the type of production plant associated with the costs. The stratification percentages shown in Table 5 were used to separate costs. Energy-related costs are allocated to class using the E8760 allocator, while capacity-related costs are allocated using the D10S allocator.

2. Calculation of Class Rate Impacts of the Updated 2015 Plan

After all costs had been allocated and revenue requirements by class were calculated, we then determined the estimated bill impacts by class relative to the current rate level. To do this, we calculated the current rate level using the compliance ordered revenues by class with riders included from Docket E002/GR-13-868. We used this calculation to estimate monthly billing units by customer class and resulting typical bills. The CCOSS allocation based estimates of relative percent class increases for the period were then applied to current typical bills to estimate the average dollar per month increase by customer class (see Table 8 below).

Using the above methodology, the incremental costs in the last year of the period (2020) for the Preferred Plan would be expected to increase the average Residential rate by about 4.5 percent on a compounded annual basis through 2020. That is equivalent to a total increase of $20.48 per month above the current rate level.

The impact to the average Large Demand Billed rate would be an increase of about 3.0 percent on a compounded annual basis through 2020, which is equivalent to an increase of 1.37 cents per kWh above the 2015 level.

Table 8: Updated 2015 Plan Estimated Rate Impacts by Class per Year

Rate Class Impacts \1	2015	2016	2017	2018	2019	2020	Comp'd Incr/Yr

1/ Average 2015 Rates are Based on the Outcome of Docket No. E002/Gr-13-868.							

3. Calculation of Class Rate Impacts with the Current Preferred Plan

Table 9 below shows the estimated bill impacts by class relative to the current rate level for the Current Preferred. The incremental costs in the last year of the period (2020) for the Current Preferred Plan would be expected to increase the average Residential rate by about 4.7 percent on a compounded annual basis through 2020. That is equivalent to a total increase of $21.39 per month above the current rate level.

The impact to the average Large Demand Billed rate would be an increase of about 3.25 percent on a compounded annual basis through 2020, which is equivalent to an increase of 1.5 cents per kWh above the 2015 level.

Table 9: Current Preferred Plan Estimated Rate Impacts by Class per Year

Rate Class Impacts \1	2015	2016	2017	2018	2019	2020	Comp'd Incr/Yr

Attachment F
Demand Response, Grid Efficiency, and Distributed Energy Resources as Alternative Resources

The Commission's January 6, 2016 Order required an analysis of the potential for demand response (DR), improved system or grid efficiencies, and distributed energy resources (DER) to replace all or part of the energy and capacity that would otherwise be provided by new gas-fired resources. Below we provide our view of the future viability of DR and DER, including supply-side, demand-side and grid efficiencies as replacement for large generators.

We have also included a Strategist simulation where all possible alternatives, including incremental demand response, distributed generation, grid modernization, utility scale renewables, and thermal units are simultaneously considered and optimized. In various Stakeholder sessions, the Company has referred to such a process as a "Grand Optimization."

As discussed in greater detail below, conducting an analysis that considers all possible alternatives is difficult given the solution option capacity constraints of the Strategist software and current desktop computer processing capabilities. However, the Company has attempted to conduct such an exercise to the greatest extent possible reflecting the above limitations. Ultimately, our Strategist modelling found that the Company's Current Preferred Plan provides a balanced approach that allows us to add significant amounts of renewable resources while also considering impacts on customer costs, procurement, construction and operations.

A. DER as Replacement of Central Station Generation

We believe there are three fundamental and sequential questions related to technological viability, economics and policy that must be addressed in order to assess whether DERs are a viable replacement for central station generation in the planning horizon considered in this resource plan.

1) **Technological Viability** - Do technologies currently exist to meet the required reliability, safety and operational standards at the scale necessary to effectively replace large central station generation?
2) **Economics** - If replacement is technologically viable, how does the cost of DER options compare to the alternatives over the near and long-term?

3) **Policy** - Are there policy reasons that support expansion of distributed resources as an alternative to new central station generation?

We address each of these questions below.

1) Do technologies currently exist to meet the required reliability and operational standards at the scale necessary to effectively replace large central station generation?

As we consider the retirement of Sherco Units 1 and 2, it is important to understand the services and functions that will need to be replaced, particularly those beyond energy and capacity. As noted in our March 16, 2015 Supplement, the Units' size, location and operating characteristics make them unique in the NSPM system and provide important services related to system stability, grid support, and black start capabilities. This is in addition to the replacement capacity and energy required to reliably meet system demand. For context, Sherco Units 1 and 2 are approximately 750 MW each for a combined 1,500 MW of generation.

Given the role of Sherco Units 1 and 2 in the system, a comparable replacement portfolio of distributed resources must be able to:

- Supply the necessary long-term capacity and energy when and where it is needed, in accordance with established safety, security and reliability standards;
- Balance generation with changing load conditions and fluctuations to maintain proper voltage and frequency for the region; and
- Stabilize the grid in the event of a wide-area outage.

Other technical issues and system requirements may emerge upon further study. For example, as discussed in our response to Clean Energy Organizations' Information Request No. 29, advanced inverters may provide some benefits for managing high penetrations of renewable resources, but inverter-connected resources at high levels of penetration generally do not provide the fault current necessary for utility protective relays to operate. As noted in our March Supplement, we have contracted with an independent third party to study the technical impacts of our proposal.

While we recognize the future potential of distributed technologies, it is our understanding that no precedent exists to confidently prove that a distributed portfolio comprised of today's distributed technologies could consistently satisfy all three of these conditions. While it may be possible to design a theoretical portfolio

that addresses these requirements, committing to such a plan in practice introduces significant uncertainty and risks, particularly to reliability. Until more operational and performance information is available to better understand what capabilities these technologies do and do not have under a full range of operating conditions and in the context of a large-scale shift away from centralized resources, we recommend continued presence of large-scale, centralized generation in our fleet.

That said, we see the potential for distributed resources to take on a growing role in coming years and are committed to leveraging them as they become technically viable, cost-competitive, and have an established and acceptable operational record. Over time, it is possible that DER technology could advance to the point that distributed resources could become viable alternatives to centralized generation, but such a decision must be based on well-established capabilities, instead of projections.

Below we provide an overview of the likely core components of a hypothetical distributed resource portfolio consisting of DR, DER, and grid efficiencies. As noted above, it is untested and unknown if and to what extent these resources may work together to replace new large-scale, centralized generation.

- *Supply-side Resources* – These resources are necessary to provide the energy and capacity necessary to meet customers' needs.
    - Distributed Generation. Distributed generation would need to be deployed at an unprecedented scale, strategically dispersed and centrally managed to maintain reliable service.
    - Energy Storage. Storage is a critical complement to DG that addresses the intermittency of renewable DG and allows DG to be dispatchable. Battery storage may also provide other system services, such as voltage and frequency regulation, black start capabilities and spinning and non-spinning reserve, though more research is needed to test how those services can be dispatched and "stacked."

- *Demand-side Resources* – These resources have the potential to reduce and/or shift customer demand, thus deferring or avoiding the need for supply-side investments. Demand-side resources, by definition, rely on actions on the customer's side of the meter, which introduces questions of dispatchability and dependability.

- Demand Response. Existing demand response programs could be expanded to reduce peak demand and reduce the need for additional peaking capacity.
- Energy Efficiency. Aggressive energy efficiency could lower customer demand and energy, which could reduce the need for generation.
- Rate Design. With the enabling metering technology, rates could be redesigned to encourage customers to shift energy use more to off-peak, thus reducing the need for additional peaking capacity. Examples include time-of-use rates and demand charges.

- *Grid Efficiencies* – Through technological advances, the grid can be operated to reduce losses and potentially provide capacity benefits.
  - Voltage control. Voltage control, as enabled by an Advanced Distribution Management System (ADMS), Field Area Network (FAN), and other distribution system technologies, can provide energy or capacity benefits. Voltage can be controlled to reduce energy use by maintaining voltage at the lowest acceptable level (often referred to as Distribution Voltage Optimization). An alternative control scheme is to use the system as a stand-by resource or spinning reserve. This is done by maintaining voltage in the typical range (as we do today), and lowering the voltage only when a capacity shortage occurs. Such a reduction can have a significant initial impact, but is expected to taper off over time to a lower plateau. A hybrid scheme may be possible where the system is operated in the conservation mode normally, but if a capacity need is identified, the control reverts to a "Virtual Spinning Reserve" mode.

It is important to acknowledge the pivotal role that grid modernization investments have in enabling DER to play an increased role in the future. For example, communications and control software and technologies such as ADMS, FAN, and Distributed Energy Resources Management System (DERMS), are vital for the control, management and optimization of these resources, making them necessary prerequisites for treating DERs as reliable system resources. For example, the ADMS will enable increased hosting capacity, which is the amount of distributed energy that can be hosted on the distribution system, by allowing, in conjunction with other controls, active mitigation of potentially problematic voltage and load situations.

2) If replacement is technologically viable, how does the cost of DR and DER options compare to the alternatives over the near and long-term?

As discussed above, we believe technology has not sufficiently matured to enable DERs as alternatives to new large-scale generation additions. As is common with technologies still climbing the maturity or commercialization curve, many of the distributed resource technologies that would be needed are not cost-competitive with established technologies. As discussed below, the DER and incremental DR alternatives were not selected in our Grand Optimization due to their higher cost.

However, our existing DR programs continue to be an important part of our resource portfolio, as demonstrated by the increase in our DR forecast. The Company has a long history of success with DR. Currently, we have exceeded 930 MW in the Upper Midwest since we began offering load management programs for customers in the 1980s. While we remain committed to providing customer options, we must continue to be vigilant in adjusting the portfolio in order to be compliant with the rules set by federal regulation and MISO. Further, we must take the opportunity to develop and test customer programs using new technology prior to depending upon them as a resource on our system or in the MISO market.

We have acknowledged that it is likely there will be some attrition over the planning period, wherein customers begin to choose new opportunities with lower demand reduction potential. This may at times be a trade-off between further participation and the ability to self-control, which could reduce our portfolio in the short-term.

Given the modeling result, we have not adjusted our moderate demand response forecast. However, we continue to review new customer choices for DR including dynamic pricing options (time-of-use, peak pricing, etc.), new technologies (smart thermostats), and updated rates to encourage participation. We have also begun investing in a Demand Response Management System to help facilitate new opportunities as they arise due to changing technology.

While the cost declines observed for solar DG and storage over the past few years are encouraging, it is unclear and perhaps unlikely that these cost declines can overcome the economies of scale inherent in larger-scale alternatives. Similarly, while distributed resources may provide other benefits over time, such as deferred or avoided transmission and distribution investments, it is premature to assign a definitive timeline and value to those benefits.

3) Are there policy reasons that support expansion of distributed resources as an alternative to new central station generation?

We recognize the growing interest among our regulators, stakeholders and customers In transitioning to a 21st century electric system and are advancing these interests in several different ways. We agree that it is a worthwhile goal to make plans to move away from coal and other carbon-emitting resources in favor of carbon-free alternatives, as demonstrated by our proposal in this transformational Resource Plan. These proposals are responsive to state energy policy goals, which seek to dramatically lower the state's contribution to climate change, maximize energy efficiency and conservation, and promote renewable energy, among others. The question is in how best to meet those policy goals, while also satisfying the basic requirements of safe, reliable, secure and affordable energy.

With the technological and economic challenges currently facing DERs, we believe we are not yet at the point where DERs can fulfill or have an advantage in satisfying those basic requirements at the scale and speed implicit in this question. We are taking steps to reduce the challenges and prepare for the future grid, such as through our grid modernization efforts and solar plus storage demonstration project proposal, but it is still too early to confidently choose DERs as a reasonable and complete alternative to new central station generation additions.

B. Strategist Analysis

The first step in beginning the optimization was to define the available alternatives to be considered. To narrow the scope of the exercise, the alternatives were reduced to the following representative options:

- *Incremental Demand Response Option* - The DR option was constructed by extrapolating results from the Brattle DR Potential Study[1] to future years. The Brattle study did not contemplate or produce results directly related to this use, and extrapolating the results of the study is inherently an estimate or proxy. To adequately project costs and availability of DR resources many years out would require a new analysis, and could likely produce very different results. Nevertheless, the proxy DR resource was developed as a new optional resource that is incremental to the "Base" DR included in all cases. The incremental capacity and costs were derived by taking the difference between the "High"

[1] Appendix O of our Initial Filing.

and "Base" DR scenarios included in our initial filing. Costs for the new program were then escalated at inflation to determine the costs for an incremental program starting at various years. The incremental DR capacity made available is greater than two new combustion turbines.

- *Incremental Distributed Generation Option* – The alternative reflects current information on distributed small solar projects with representative pricing at $120/MWh with no escalation. Flat pricing assuming technology and project development improvements are expected to offset any inflation.
- *Incremental Grid Modernization* – Costs and operational attributes for grid modernization are not clear enough at this time to develop a reasonable optimization alternative for inclusion in the modeling. We discussed grid modernization qualitatively above.
- *Incremental Renewables* – The same expansion alternatives with vintages and tax benefits that were used in the main scenarios were also included in the Grand Optimization. However, tranches with identical tax benefits were limited to certain specified years to reduce the computational requirements of the model. As an example, 30% ITC solar was limited to be installed in 2021, and full PTC wind was limited to 2018, rather than being available in all years. Late wind with no PTC benefit and late solar with 10% ITC benefit were also offered as options after the expiration of the PTC and ITC benefits.
- *Thermal Alternatives* – The generic thermal CT and CC units were made available in all years. Generic not site specific alternatives were used.

The Grand Optimization tests many resource options for cost-effectiveness including DR, distributed generation, wind generation with and without PTC benefits, and solar generation with 30% or 10% ITC benefits, along with the thermal generation options. Because of the number of resource options available to choose from in each year, the cumulative number of possible combinations is enormous. If there were no limits placed on the Strategist model's logic, the model would need to evaluate every resource option added an arbitrarily large number of times every year to ensure every possible resource combination was evaluated. The size of the problem quickly becomes too large for the software.

Strategist automatically begins to disregard combinations when the problem gets too large, a process called "truncation." Strategist truncates the excess combinations (in the Company's version there are 2,500 combinations retained) based on accumulated cost to the year it needs to truncate. Thus, a plan might get truncated in 2020 if it was not one of the lowest cost 2,500 plans in 2020, even though later in the simulation it

might have ultimately ended up being lower-cost had it been allowed to continue in the process. There must be a balance between limiting the number of options per year while ensuring every option has equal chance for its benefits and costs to be included in the final results of the optimization.

There are multiple ways to solve the truncation problem. One way is to prescreen options before putting them into the Strategist model based on relative costs. The Company has done this in evaluating thermal generation technologies. Some thermal generation technologies have been prescreened based on having a cost advantage for similar benefits. An example of a prescreened option is how the Company compared the cost of a 2x1 combined cycle versus a 1x1 combined cycle (CC). The Company determined that over a typical range of capacity factors, the installed cost of a 2x1 CC on a $/kW basis is significantly more favorable than the cost of a 1x1 CC, while providing very similar energy benefits. By prescreening and removing the 1x1 CC option from Strategist, the scale of the problem is reduced.

The Company has not prescreened DR, DG, wind, or solar resource options in the Grand Optimization as these options and the timing of their additions is the main focus of the analysis.

Solving an optimization of this size also requires a "trial and error" iterative approach. Initially, the model is allowed to select any type of resource, but only in smaller quantities. As iterative results indicate what types of technologies are consistently selected at particular times, a small number of these consistently-selected alternatives can be switched from being part of the optimization to being locked in. When the model no longer has to consider them as alternatives, it reduces the problem size. In the next run, the model is allowed to consider additional alternatives beyond those locked in to the plan. If more are taken, then those additional resources are also locked in. By iteratively offering and then locking in resources, a stable point can be determined when the model has just as much of a particular resource as it desires; that is, no additional resources are selected even when available. This iterative approach is essentially the same process that the Company has followed in determining its proposals in March and October 2015.

The Grand Optimization was analyzed in two steps. The first step is a capacity-need only optimization, with the second step including the system energy benefits of non-capacity (or "superfluous") resources in a resource-need optimization. Both steps find the lowest PVSC based on the assumptions and meet the required reserve margin; however, a capacity-need optimization allows the Strategist Model to add

resource options only if there is a capacity need to meet the required reserve margin. By contrast, a resource-need optimization allows the Strategist Model to add resource options even if there is not a capacity need to meet the required reserve margin. An example to explain the distinction between the two optimizations is to consider a wind resource option with production tax credit benefits - the wind alternative contributes relatively little to firm capacity, and a very large amount of wind would be required to offset the need for even one CT. However, the low-cost energy could very well be below the marginal system energy costs, resulting in significant economic value if added as a resource. The wind would most likely not be selected in a capacity-need optimization, but could very likely be selected in the resource-need optimization.

1. Capacity-Need Optimization Process and Results

The Company started the capacity-need optimization from the results of the Company's Current Preferred Plan. In this Plan, which adds 1,800 MW of wind and 1,000 MW of solar and retires Sherco Units 1 and 2 in 2026 and 2023 respectively, there is one combined cycle unit added and nine combustion turbine units added from 2018 to 2030. An optimized capacity-view with wind, solar, DR, and DG options should add a similar amount of firm capacity. An iterative process as described above was followed, and the PVSC from each iteration was compared to the prior iteration to ensure that the optimization was getting more efficient. The least-cost solution of the capacity-need optimization is displayed below in Table 1. It is important to note that no "real-world" constraints were placed on the number or type of options that could be added in a given year, and no attempt was made to smooth the rate impact of the additions. In actuality, the results of this exercise need to be tempered with considerations of system operational limitations, contracting, negotiating and construction logistics (especially wind equipment transport and limited tall crane availability for turbine erection), large step increases in customer costs, etc. Since there is no capacity need until 2024, after a Sherco unit is retired, all the resource additions are in 2024 or later. The capacity-need optimization adds 800 MW of late wind, 3600 MW of late solar, four CTs, and one CC from 2024 to 2030. The DR and DG alternatives were not selected due to the higher cost of those resources.

Table 1: Capacity-Need Expansion Plan

28_C: Capacity-Need Optimization	2015	2016	2017	2018	2019	2020	2021	2022	2023	2024	2025	2026	2027	2028	2029	2030	Total

Sherco CC/BD CC	-	-	-	-	-	-	-	-	-	-	-	-	-	-	-	-	-
Incremental DR	-	-	-	-	-	-	-	-	-	-	-	-	-	-	-	-	-
Incremental DG	-	-	-	-	-	-	-	-	-	-	-	-	-	-	-	-	-

2. Resource-Need Optimization

The number of possible combinations in the resource-need optimization is much greater than the possible combinations in the capacity-need optimization. The resource-need optimization considers increments of wind, solar, and DR options above the number required to meet the reserve margin and internally adds them to the system to evaluate cost effectiveness. Since Strategist quickly exceeds its maximum number of combinations with these incremental superfluous resources, the Company had to extensively use an iterative process.

As we discussed earlier, the iterative process uses the results of a prior incremental test to determine if in the next run a resource should be locked in place or removed. The Company took the PVSC results of each run to verify that the solution to the optimization was becoming more efficient with each iteration.

The resource-need optimization used the results of the capacity-need optimization as well as the Company's Current Preferred Plan to help set the initial constraints. As an example, since the PTC wind and 30% ITC solar are similar or lower cost than corresponding non-PTC late wind and 10% ITC late solar additions of the capacity-need optimization, the resource-need optimization would be expected to add no less renewable energy than the capacity-need optimization.

Using run results and the iterative process, the least-cost plan consisted of PTC wind, combustion turbines, and late solar as the best options. The least-cost solution of the resource-need optimization is displayed below in Table 2. The resource-need optimization adds 5,200 MW of PTC wind, 2,600 MW of late solar, and seven combustion turbines. Again, the DR and DG alternatives were not selected due to the higher cost of those resources. As with the capacity-need results, no "real-world"

constraints were set on the options by year and the same considerations would apply to convert theoretical results such as this into an actual plan.

Table 2: Resource-Need Expansion Plan

28_B: Resource-Need Optimization	2015	2016	2017	2018	2019	2020	2021	2022	2023	2024	2025	2026	2027	2028	2029	2030	Total
Small Solar	48	42	45	49	53	58	17	20	24	29	34	41	49	59	71	85	723

Incremental DG	-	-	-	-	-	-	-	-	-	-	-	-	-	-	-	-	-

In summary, the capacity-need and resource-need optimizations indicate that the Company's Current Preferred Plan is consistent and prudent. Applying a more rateable approach to renewables, while still incorporating large amounts of PTC-eligible wind and tax incented solar makes sense for customers. Our Current Preferred Plan represents a balance of the Resource-Need and Capacity-Need Expansion Plans. Adding 5,200 MW of wind in 2018 based on the results of the Resource-Need Optimization is not a viable option from a rate-impact, contracting, construction or operations perspective. Likewise, waiting until 2026 to add additional renewables based on the Capacity-Need Optimization fails to account for the energy and environmental benefits of adding competitive fixed price renewable energy resources to our system in the near-term. Our plan balances the advantages of adding significant amount of renewables–1,200 MW by 2020–but in a manner that also considers the impacts on customer costs.

Attachment G
Socioeconomic Study Summary

The Company has worked with the Leeds School of Business at the University of Colorado Boulder and the Labovitz School of Business and Economics at the University of Minnesota Duluth to prepare an analysis of the economic impacts on the state of Minnesota, including Sherburne County, of alternative retirement and replacement scenarios for the Sherburne County generating Units 1 and 2 (Sherco). This study was initiated in response to the Commission's request in our Sherco Life Cycle Management (LCM) proceeding.[1] This study – Economic Impacts of Sherco Plant Alternatives – is included with this filing as Attachment F1 and looked at impacts on employment, gross domestic product (GDP), and disposable personal income on those locations impacted by a change in operating expenditures, capital expenditures, and electricity rates. The scenarios, explained in more detail below, included various Sherco unit retirement dates and the replacement of the two Sherco units with one combined cycle (CC) at the Sherco site and one CC located in Dakota County.

While this study did not model a scenario that directly reflects our Current Preferred Plan (ceasing coal generation at Sherco Unit 1 in 2026 and Sherco Unit 2 in 2023), those dates do fall within the range of scenarios analyzed, with retirement dates ranging from Sherco 1 and 2 in 2020 to Sherco 1 in 2031 and Sherco 2 in 2025. Retirement of either of the Sherco units generates initial positive economic impacts in Sherburne County as a result of decommissioning activities and the construction of a combined cycle at the Sherco site and is then followed by negative economic impacts. The pattern of positive impacts followed by negative impacts is due to shifting the retirement to a date earlier than the economic end of life. The long-term economic effect on Sherburne County after this initial activity is negative under most scenarios due to lost operating and maintenance activity. The construction of replacement generation for one Sherco unit retirement, sited in Dakota County in the scenarios examined for this study, generates positive economic impacts in Dakota County during the construction phase and the succeeding years as a result of ongoing operations. The effect of Sherco unit retirements is a shift in employment from Sherburne County to Dakota County, or the location in which replacement generation is constructed. The timing of those impacts varies in relation to the timing of

[1] *In the Matter of Xcel Energy's Sherco Life Cycle Management Study/2014 Integrated Resource Plan*, Docket No. E002/RP-13-868.

generator retirement and replacement. Construction of replacement generation within Minnesota helps to offset some of the negative economic impacts in the State of Minnesota associated with lost generation.

A. Methodology

The research analysis method used for this study was the Regional Economic Models, Incorporated's (REMI) input-output, general equilibrium, econometric, and economic geography model, using state and national economic and demographic data, as well as data from the Company including capital expenditures, operating expenditures, and revenue requirements for each scenario. The study covered a period from 2015 through 2040, looking at near-term, mid-term, and long-term impacts of alternative retirement and replacement scenarios for Sherco Units 1 and 2. This study period was selected in order to capture the economic activity in the near-term related to decommissioning and the construction of replacement generation, as well as the longer-term impacts of operations and employment at the replacement facilities.

While the specific location of replacement generation for the Sherco units is unknown, Dakota County was selected because it is within Minnesota and the study's purpose was to examine impacts on the State of Minnesota. In addition, it allows for the transfer of economic impacts, such as jobs from Sherco to another location, to be quantified. Therefore, economic impacts were analyzed in this report for Sherburne County, Dakota County, and the rest of Minnesota.

The study examined four scenarios and a baseline scenario, detailed in Table 1 below. We include for comparison the Current Preferred Plan scenario, to illustrate the similarity of the retirement dates and replacement plans between our plan and the scenarios studied. These scenarios correspond to the Updated 2015 Plan and alternative retirement scenarios that were presented in the March 16, 2015 Supplement. The results of the retirement scenarios included in the study are reported as the change in economic impacts relative to the baseline scenario. Replacement generation options included in the study were modeled based on combinations of comparatively-sized gas-fired CC generators, located at the site of our Black Dog plant in Dakota County and at the existing Sherco site.

Table 1: Scenarios Analyzed in the Socioeconomic Study

Scenario	Unit 1 Retirement Date	Unit 2 Retirement Date	Unit 1 Replacement	Unit 2 Replacement
Baseline/ Updated 2015 Plan	2031	2031	Combined Cycle at Sherco	Combined Cycle at Black Dog
SHC1 2031 SHC2 2025	2031	2025	Combined Cycle at Sherco	Combined Cycle at Black Dog
SHC1 2025 SHC2 2025	2025	2025	Combined Cycle at Sherco	Combined Cycle at Black Dog
SHC1 2020 SHC2 2020	2020	2020	Combined Cycle at Sherco	Combined Cycle at Black Dog
SHC1 2023 SHC2 2020	2023	2020	Combined Cycle at Sherco	Combined Cycle at Black Dog
Current Preferred Plan*	2026	2023	Combined Cycle at Sherco	Combustion Turbine in Fargo

**Not analyzed in this study, but included for comparison.*

B. Results

Overall, the study found that all early retirement scenarios, when compared to the Baseline, result in comparatively slower growth within the Minnesota economy. This impact, however, represents a relatively small percentage of the overall Minnesota economy, as the state's total Gross Domestic Product (GDP) for 2014 was $316 billion. The impact on statewide GDP, shown in Table 2 below, was between $16 million and $90 million, representing a less than one percent impact. None of the scenarios reviewed has a recessionary impact on the state.

Table 2: Sherco Retirement Impacts on the Minnesota Economy, 2015-2040 Averages

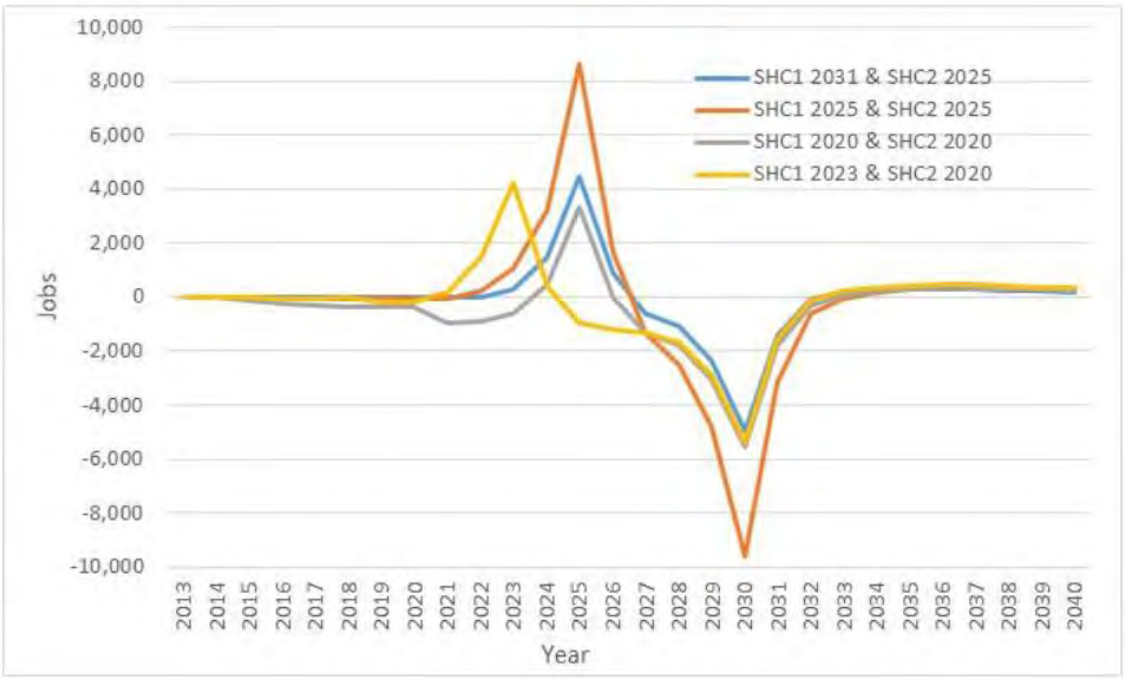
Metric	Units	2015–2040			
		SHC1 2031/ SHC2 2025	SHC1 2025/ SHC2 2025	SHC1 2020/ SHC2 2020	SHC1 2023/ SHC2 2020
Total Employment	Jobs	-75	-258	-570	-300
	Percent Change	*0.00%*	*-0.01%*	*-0.01%*	*-0.01%*
Gross Domestic Product	Dollars (Thousands)[1]	-16,021	-53,257	-89,966	-49,813
	Percent Change	*0.00%*	*-0.01%*	*-0.02%*	*-0.01%*
Real Disposable Personal Income	Dollars (Thousands)[1]	-13,719	-47,919	-83,485	-52,443
	Percent Change	*0.00%*	*-0.01%*	*-0.03%*	*-0.02%*

[1] Fixed (2014) dollars.

All scenarios will result in increased revenue requirements associated with the capital cost of replacement generation. The increase in revenue requirements will result in increased electricity rates for residential, commercial, and industrial utility customers, which will in turn have a negative economic impact on the state overall. The extent of the economic impacts is affected by factors that include the retirement cost of existing units, the source of inputs for capital investments, the ongoing operating costs, the sources of fuels, and the revenue requirements assigned to the customer base.

The study showed the impacts of the various retirement scenarios on private employment, shown in Figure 1 below, as compared to the baseline. This illustrates how the timing of the impacts on employment shifts relative to the retirement dates. In each scenario, there is a near-term increase in employment relative to the baseline due to decommissioning and the construction of replacement generation. The subsequent dip in employment below the baseline is due to the retirement of the Sherco units.

Figure 1: Sherco Retirement Impact on Minnesota Private Employment



C. Summary

While the Socioeconomic Study did not model a scenario that directly reflects our Current Preferred Plan, our proposed 2023 and 2026 retirement dates fall within the range of scenarios analyzed. Results show that all early retirement scenarios, when compared to a baseline, result in moderately slower growth in the Minnesota economy. The closure of Units 1 and 2 showed negative impacts on employment, GDP, and disposable personal income in Sherburne County. However, construction of replacement generation within Minnesota creates positive impacts where the replacement is constructed and helps to offset some of the negative economic impacts in the state associated with early retirement. The path charted by our Current Preferred Plan provides certainty for stakeholders, as well as an 8 to 10 year transition period. With our proposal for on-site replacement generation, we demonstrate our commitment to promoting economic development in Central Minnesota.

DEFINITIONS

Employment: Includes the number of full-time and part-time jobs (headcount) by business physical location.

Deflators: Measure of price changes within an industry.

Gross Domestic Product: Total value of final goods and services produced each year within a country or region.

Leakage: Economic activity that occurs outside the area of study but is driven by activity within the study area.

Metropolitan Statistical Area: Geographic areas with 50,000 or more population.[1]

Multiplier: Change in total economic activity driven by a change in direct economic activity.

Output: Total production value of goods and services, including intermediate goods purchased and value added.

Personal Income: Includes all sources of income, including employee compensation, proprietors' income, rental income, capital income, and transfer payments.

EXECUTIVE SUMMARY

This document presents the results of an analysis prepared by the Leeds School of Business to quantify the economic impacts on the state of Minnesota of alternative retirement dates for the Northern States Power Company (NSP) coal-fired Sherco 1 and Sherco 2 generating units. The purpose of an economic impact study is to identify the impacts on employment, gross domestic product, disposable personal income, and other economic metrics for those locations impacted by a change in operating expenditures, capital expenditures, property taxes, and electricity rates.

The study area was the state of Minnesota. Impacts on Sherburne County and Dakota County are reported separately from all other counties in the state. Sherburne County is reported separately because the Sherco generating units are both located there, and this separation allows the local effect of an early Sherco retirement to be identified. Dakota County is reported separately because it may be a viable location for the construction of the generation needed to replace the retired Sherco generation. While the location of replacement generation is currently unknown, the purpose of the study was to examine impacts on the state of Minnesota. Therefore, it was important to select a location for replacement generation within the state in order to maintain the focus on Minnesota economic impacts.

The study period was the years 2015 through 2040. This period was selected to capture the near-term economic activity related to decommissioning Sherco and constructing replacement generation, as well as the effects of a change in electricity rates. An abbreviated description of the four retirement scenarios is provided below. A detailed description of the scenarios is provided in the Scenarios section of the report.

The study examined four retirement scenarios and a baseline scenario. The baseline scenario included operating Sherco 1 and Sherco 2 through 2031, then replacing them with the combined cycle generators. Four retirement scenarios were included, and the study results are reported as the change in economic impacts of these scenarios relative to the baseline scenario. The replacement generation that was modeled was based on combinations of comparatively sized gas-fired combined cycle generators located at the Black Dog site in Dakota County and at the Sherco site.

- SHC1 2031 & SHC2 2025: Sherco 1 and Sherco 2 will stop operation in 2031 and 2025, respectively. Sherco 2 will be replaced with a combined cycle generator constructed at Black Dog, and Sherco 1 will be replaced with a combined cycle generator constructed at the Sherco site.
- SHC1 2025 & SHC2 2025: Sherco units 1 and 2 will stop operation in 2025 and be replaced with combined cycle generators constructed at the Sherco site and the Black Dog site.
- SHC1 2020 & SHC2 2020: Sherco units 1 and 2 will retire in 2020 and be replaced with combined cycle generators constructed at the Sherco site and the Black Dog site.
- SHC1 2023 & SHC2 2020: Sherco 2 will retire in 2020 and be replaced with a combined cycle generator constructed at the Black Dog site. Sherco 1 will retire in 2023 and be replaced with a combined cycle generator constructed at the Sherco site.

The research team used the REMI model for the analysis. The model used by Leeds was provided by REMI specifically for the state of Minnesota using national and Minnesota economic and demographic data. The REMI model used for this analysis is the three region, PI+ model 1.6.8 for Sherburne County, Dakota County, and the rest of Minnesota. The 1.6.8 model includes historical data through 2012. NSP provided data that included capital expenditures, operating expenditures, revenue requirements, and taxes for each scenario. The research team worked under the assumption that the company provided good-faith estimates for each scenario.

The study findings show that the continued operation of and investments in Sherco units 1 and 2 through 2031, followed by replacement with combined cycle generators, will have the greatest ongoing positive economic contribution to the Minnesota economy. The retirement and replacement scenarios have varying degrees of impact on the Sherburne County and Dakota County economies. Retiring either of the Sherco units generates positive economic activity in Sherburne County during the decommissioning phase, but produce a negative economic cost during the succeeding years under most scenarios due to lost operating and maintenance activity. The construction of replacement generation in Dakota County generates positive economic activity during the construction phase and during the succeeding years given the change in local operations. There will be an increase in revenue requirements for all retirement scenarios due to the capital-related costs of replacement generation. These higher costs will increase electricity rates for residential, commercial, and industrial utility customers and will have a negative economic impact on Sherburne County, Dakota County, and the rest of Minnesota. The extent of the economic impacts is affected by factors that include the retirement costs of existing units, the sources of inputs for capital investments, the ongoing operating costs, the sources of fuels, and the revenue requirements assigned to the customer base.

Comparing the four alternative scenarios to the baseline scenario, the time series of economic impacts on Minnesota GDP is illustrated in Figure 1. The figure shows the near-term benefits accrued during the decommissioning and construction phase, followed by a negative impact due to higher revenue requirements over the remainder of the study period. The smallest negative economic impact results from the retirement and replacement of generators in 2025 and 2031. The greatest negative economic impact relative to the baseline results from the earlier retirement of both Sherco 1 and Sherco 2 in 2020 and the replacement in 2026 and 2031.

The lack of indigenous fossil resources in Minnesota limits potential gains in fuel switching. Since Minnesota does not have indigenous coal or natural gas resources, it necessitates importing fuel from other states and requiring gas pipeline upgrades. The baseline scenario and each early retirement scenario require additional investments in gas pipelines and transmission totaling about 10% of total capital expenditures.

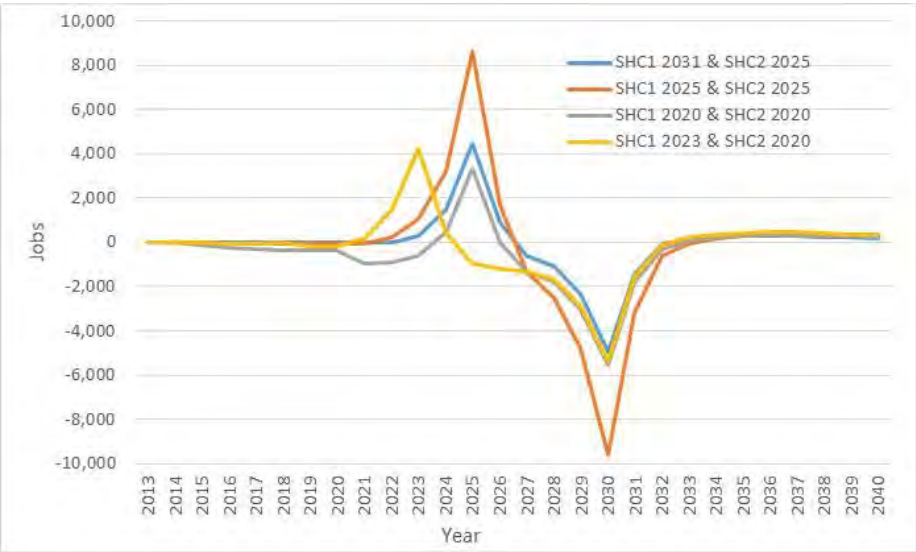
Since all scenarios involve generator retirement and replacement, the spikes and dips in economic activity are largely due to timing—specifically the timing of activity compared to the baseline scenario. Retiring units in 2020 instead of 2031, for instance, increases economic activity in the 2020s, but decreases economic activity in the 2030s. Since all of the alternative scenarios retire and replace Sherco

1 and Sherco 2 sooner than the baseline scenario, then all of the alternative scenarios also shift economic activity earlier.

FIGURE 1: SHERCO RETIREMENT IMPACT ON MINNESOTA GDP

A similar pattern is shown for Minnesota private employment, which is shown in Figure 2. Likewise, the near-term activity related to the decommissioning of existing generation and the constructing of replacement generation increases jobs. While employment continues to increase in Minnesota under all scenarios over the study period, early retirement of the Sherco generators results in a decrease in Minnesota employment compared to the baseline scenario.

FIGURE 2: SHERCO RETIREMENT IMPACT ON MINNESOTA PRIVATE EMPLOYMENT



In addition to the differences between near-term and long-term effects shown above, there are also location specific impacts for Sherburne County, Dakota County, and the rest of Minnesota. Compared to the baseline scenario, most retirement scenarios show negative impacts on Sherburne County given that this location will experience decreasing generation operations over time. Dakota County benefits from early retirement of the first Sherco generator because the construction and new operating activity at the Black Dog site will be a boost to the county economy, effectively outweighing the economic costs associated with higher revenue requirements. However, while the near-term benefits of constructing the replacement generation in Dakota County may be large, these employment benefits decline rapidly and are not large over the entire study period. Locally, the impact of early retirement is a shift in employment from Sherburne County to Dakota County; statewide, employment continues to grow but at a slower rate.

A summary of all economic metrics for each retirement scenario is shown in Table 1 for the state of Minnesota. Each of the retirement and replacement scenarios place Minnesota on a slightly slower economic growth trajectory between 2015 and 2040, though the change in growth is relatively small. From 2015 to 2040, under the various scenarios, total statewide employment is lower, on average, by 75 jobs to 570 jobs as compared to the baseline; GDP is lower by $16 million to $90 million, and real disposable personal income is lower by $14 million to $83 million. In percentage terms, the change from the baseline scenario is less than one-tenth of 1%.

While the economic impacts of the retirement and replacement scenarios may appear large in absolute values, the percentage change of the impacts is relatively small in light of the magnitude of the overall Minnesota economy. Accordingly, the impacts are not recessionary—the economy continues on a trajectory of growth, albeit slightly slower growth.

TABLE 1: SHERCO RETIREMENT IMPACTS ON THE MINNESOTA ECONOMY, AVERAGE 2015–2040

		Average 2015–2040

A summary of all economic metrics for each retirement scenario is shown in Table 2 for Sherburne County. Most of the retirement and replacement scenarios place Sherburne County on a slightly slower economic growth trajectory between 2015 and 2040, though the change in growth is relatively small. From 2015 to 2040, under the various scenarios, the changes in total statewide employment ranges between 5 and -140 jobs as compared to the baseline; the changes in GDP range between -$4 million and -$19 million, and the changes in real disposable personal income range between -$2 million and -$11 million. In percentage terms, the change from the baseline scenario is less than 1%.

A summary of all economic metrics for each retirement scenario is shown in Table 3 for Dakota County. Most of the retirement and replacement scenarios place Dakota County on a slightly faster economic growth trajectory between 2015 and 2040, though the change in growth is relatively small. From 2015 to 2040, under the various scenarios, the changes in total statewide employment ranges between 18 and -12 jobs as compared to the baseline; the changes in GDP range between -$445,000 and -$6 million, and the changes in real disposable personal income range between -$714,000 and -$7 million. In percentage terms, the change from the baseline scenario is less than 1%.

STUDY METHODOLOGY

The Business Research Division at the University of Colorado Boulder was hired by Northern States Power to conduct economic impact analyses on retirement scenarios for the Sherco generating units in Sherburne County, Minnesota. This analysis examines the economic impacts of various early retirements of Sherco 1 and Sherco 2. Economic impact studies detail the direct spending that a company or activity has on the area of study, as well as the indirect impact, which is the ripple effect that direct spending has on other businesses in the community. This term is also referred to as the *multiplier effect*, wherein companies utilize the local supply chain. A multiplier is a numeric way of describing the full effects of money changing hands within an economy. For instance, when NSP purchases natural gas, this affects the mining and transportation industries. This is the indirect impact. Additionally, spending by employees has an inherent effect on local communities as they purchase groceries, clothes, and gas; pay rent or a mortgage; get haircuts, etc. This is understood as the induced impact.

The research team used the REMI model for the analysis. Appendix 1 provides an overview of the REMI model. The REMI model is a dynamic forecasting and policy analysis model that incorporates econometric, input-output, and computable general equilibrium techniques. The model was created by REMI specifically for the state of Minnesota using national and Minnesota economic and demographic data. The REMI model used for this analysis is the three region, PI+ model 1.6.8 for Sherburne County, Dakota County, and the rest of Minnesota, with 2012 data as the last historical year within the model.

NSP defined the scenarios to be examined in this study. These are described in detail in the Scenarios section. A baseline scenario was provided by NSP which included operating Sherco units 1 and 2 through 2031, followed by replacement with combined cycle generators. The research team developed economic scenarios that included spending and rate changes brought about by four different Sherco retirement and replacement scenarios. The result is a simulated forecast of the economy under scenarios where utility rates and spending on operating and capital expenditures change. Last, the report compares the simulations to the baseline scenario to quantify the economic impacts on the Minnesota economy and on Sherburne County and Dakota County.

The research team collected data on NSP estimates related to ongoing operating and maintenance expenditures, capital expenditures, and revenue requirements. The timing of operating and capital

expenditures is specific to each scenario. The research team worked under the assumption that the company provided good-faith estimates for each scenario.

Data were provided in nominal dollars, quantified in the year of expected impact. The impacts are presented in fixed, 2014 dollars, and discounted by the model using industry price deflators.

Costs were entered into the REMI model based on total activity expenditures. The researchers deferred to the model for the local purchasing coefficients for each economic region modeled, which included Sherburne County, Dakota County and the rest of Minnesota. This reduces subjectivity and error associated with asking NSP the source and composition of labor, capital, and intermediate inputs to production by community. The local purchasing coefficients within REMI change over time based on changing demand.

ECONOMIC MODEL AND THE MINNESOTA ECONOMY

The REMI model used for this analysis is the three region, PI+ model 1.6.8 for Sherburne County, Dakota County, and the rest of Minnesota. The model used for this study excludes the government spending response to changes in GDP. The REMI model includes an input-output table, industry spending patterns, and local purchasing coefficients.

When working with statewide models, the research team calibrates demographics using state demography forecasts for age, gender, and race. However, given the detailed economic regions, which included Sherburne County, Dakota County, and rest of Minnesota, no further model calibration was applied given the detailed data available for these economic regions.

Sherburne County and Dakota County are part of the Minneapolis-St. Paul-Bloomington Metropolitan Statistical Area. Data from the Bureau of Labor Statistics' Quarterly Census of Employment and Wages show the area recorded 1.8 million total nonfarm covered employees in 2014; Sherburne County represented 1.4%, or 25,835 of the total, and Dakota County represented 10%, or 180,324 of the total. Data from the Bureau of Economic Analysis shows Minnesota GDP of $316 billion in 2014. Real GDP in the state grew at a rate of 1.4% year-over-year. Per capita personal income for the state in 2014 was $48,711. Per capita personal income in 2013, which is the most current data available, was $50,687 in Dakota County and $36,358 in Sherburne County.

The REMI standard regional control places Sherburne County, Dakota County, and the rest of Minnesota on a growth trajectory throughout the analysis horizon, with faster rates of growth in the short term and slowing growth over the entire study period (Figure 3). Similar to recent years, Sherburne County is projected to grow employment at a faster rate than Dakota County and the rest of the state.

FIGURE 3: EMPLOYMENT FORECAST, 2015–2040

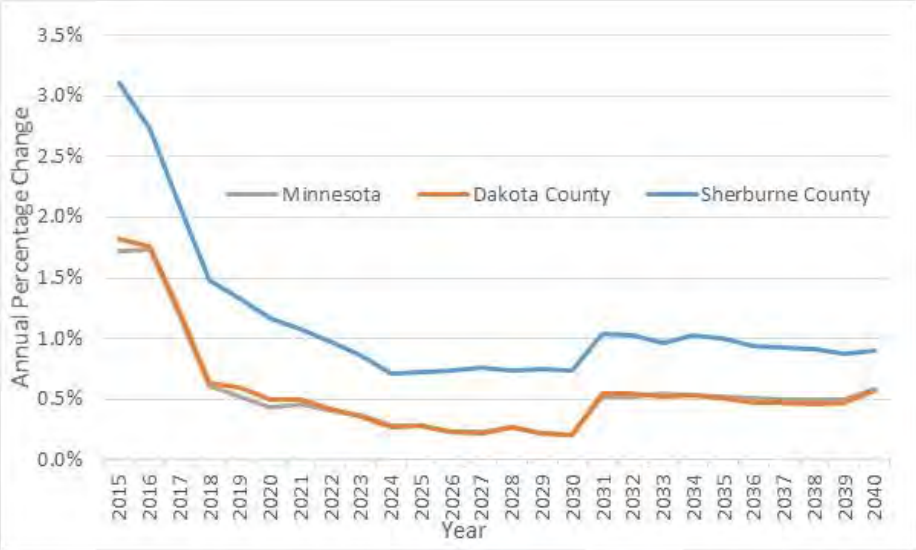

TABLE 4: PROJECTED COMPOUND ANNUAL GROWTH RATES, 2015–2040

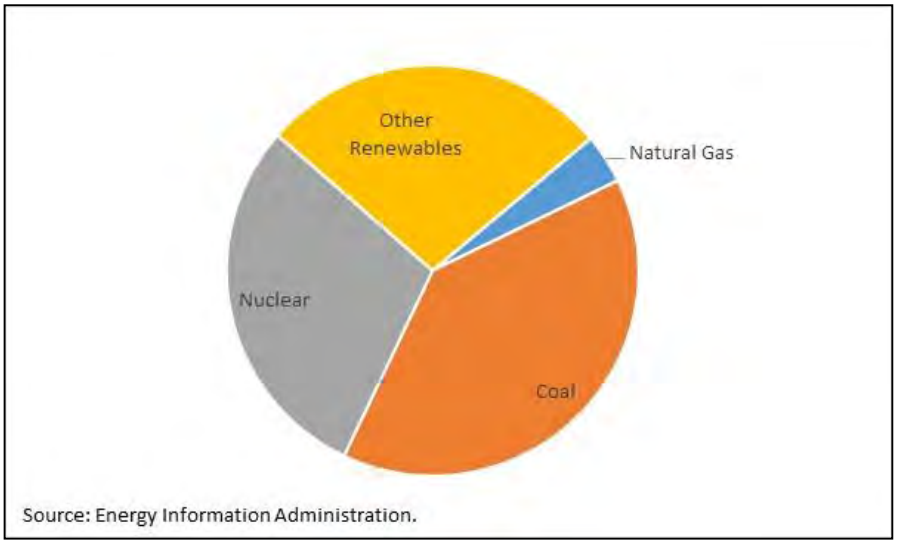
COUNTY	EMPLOYMENT	GDP	PERSONAL INCOME
Sherburne County	1.1%	2.4%	3.0%
Dakota County	0.5%	2.1%	2.5%
Rest of Minnesota	0.5%	2.1%	2.3%

As a side point, Minnesota ranked 33rd in the nation in total energy production and 18th for total energy consumed per capita in 2012. As shown in Figure 4, approximately 46% of energy generated in the state came from coal-fired power plants, and an additional 21% was produced by nuclear power plants. Minnesota ranked 7th in wind-generated electricity and is also a top producer of ethanol, with more than 20 corn-based ethanol production plants.

FIGURE 4: MINNESOTA ELECTRICITY GENERATION, GIGAWATT HOURS, 2012



SCENARIOS

Sherco Generating Units 1 and 2 were built in the 1970s, and a third unit was built in the 1980s. Since installation, these units have been operating for 38, 37, and 27 years, respectively, as of 2014. The 2,400 MW station burns an estimated 30,000 tons of Montana and Wyoming coal daily. In addition to normal operating maintenance, investments have been made to improve the ability of wet scrubbers in Units 1 and 2 to capture sulfur dioxide and ash, as well as in technology to reduce particulates. Modifications and upgrades have been completed to achieve over 90% reduction of sulfur dioxide (SO_2) to meet Best Achievable Retrofit Technology (BART) criteria.

The five scenarios include one baseline scenario where Sherco 1 and Sherco 2 are operated through the Xcel Energy 2016–2030 Upper Midwest Resource Planning period and four retirement scenarios. These scenarios correspond to the Preferred Plan and Preferred Plan Sherco retirement scenarios provided in the March 16, 2015 Supplement. The only change in these scenarios was to replace the first two combined cycle units represented by generic combined cycle units with location specific combined cycle units. This change was required to quantify the economic impacts of Sherco retirements on the local and the state economy.

Baseline

This is the "Preferred Plan" (Resource Plan Scenario 10, Sensitivity RU) presented in the Supplement with location specific combined cycles used instead of the generic combined cycle units for the first two

combined cycle additions. Sherco 1 and Sherco 2 continue operation through the end of the Resource Planning period (2030). On-going capital replacement projects continue for both units to maintain reliable operations. The level of investment declines a few years before retirement. These units stop generating January 1, 2031 and remain in standby operating condition until they are retired June 1, 2031. This delay occurs in order to retain accreditation for the Midcontinent Independent System Operator (MISO) capacity year. No Selective Catalytic Reduction (SCR) technology is installed on Sherco 1 and Sherco 2. The replacement combined cycle generators are installed in 2031.

SHC1 2031 & SHC2 2025

This is the "Preferred Plan with Retire 1 Unit 2025" (Resource Plan Scenario 10B, Sensitivity RU) presented in the Supplement with location specific combined cycles used instead of the generic combined cycle units for the first two combined cycle additions. Sherco 2 will stop generating at the end of the year 2025. This unit will remain in standby operating condition until it is retired June 1, 2026. A replacement combined cycle generator will be constructed at the Black Dog site and begin operation upon the Sherco 2 retirement in 2026. No SCR will be added to Sherco 2. On-going capital replacement projects will continue until a few years before the retirement date, then decline to zero the year of retirement.

Sherco 1 will stop generating January 1, 2031, and remain in standby operating condition until it is retired June 1, 2031. No SCR will be added to Sherco 1. A replacement combined cycle generator will be constructed at the Sherco site and begin operation upon the retirement of Sherco 1 in 2031. On-going capital replacement projects will continue until a few years before the retirement date, then decline to zero the year of retirement.

SHC1 2025 & SHC2 2025

This is the "Preferred Plan with Retire 2 Units 2025" (Resource Plan Scenario 10G, Sensitivity RU) presented in the Supplement with location specific combined cycles used instead of the generic combined cycle units for the first two combined cycle additions. Sherco 2 will stop generating at the end of the year 2025. This unit will remain in standby operating condition until it is retired June 1, 2026. A replacement combined cycle generator will be constructed at the Black Dog site and begin operation upon the Sherco 2 retirement in 2026. No SCR will be added to Sherco 2. On-going capital replacement

projects will continue until a few years before the retirement date, then decline to zero the year of retirement.

Sherco 1 will stop generating at the end of the year 2025. This unit will remain in standby operating condition until it is retired June 1, 2026. A replacement combined cycle generator will be constructed at the Sherco site and begin operation June 1, 2031. No SCR will be added to Sherco 1. On-going capital replacement projects will continue until a few years before the retirement date, then decline to zero the year of retirement.

SHC1 2020 & SHC2 2020

This is the "Preferred Plan with Retire 2 Units 2020" (Resource Plan Scenario 10E, Sensitivity RU) presented in the Supplement with location specific combined cycles used instead of the generic combined cycle units for the first two combined cycle additions. Sherco 1 and Sherco 2 will stop generating at the end of the year 2020. Both units will remain in standby operating condition until they are retired June 1, 2021. A replacement combined cycle generator will be constructed at the Black Dog site and begin operation June 1, 2026. An additional replacement combined cycle generator will be constructed at the Sherco site and begin operation June 1, 2031. No SCR will be added to Sherco 1 or to Sherco 2. On-going capital replacement projects continue for both units to maintain reliable operations. The level of investment declines a few years before retirement.

SHC1 2023 & SHC2 2020

This is the "Preferred Plan with Retire 1 Unit 2020, 1 Unit 2023" (Resource Plan Scenario 10F, Sensitivity RU) presented in the Supplement with location specific combined cycles used instead of the generic combined cycle units for the first two combined cycle additions. Sherco 2 will stop generating at the end of the year 2020. This unit will remain in standby operating condition until it is retired June 1, 2021. A replacement combined cycle generator will be constructed at the Black Dog site and begin operation June 1, 2024. No SCR will be added to Sherco 1. On-going capital replacement projects will continue until a few years before the retirement date, then decline to zero the year of retirement.

Sherco 1 will stop generating at the end of the year 2023. This unit will remain in operating status and be retired June 1, 2024. A replacement combined cycle generator will be constructed at the Sherco site and begin operation June 1, 2031. No SCR will be added to Sherco 2. On-going capital replacement

projects will continue until a few years before the retirement date, then decline to zero the year of retirement.

DATA AND ASSUMPTIONS

NSP provided the research team with capital expenditures, operating expenditures, and revenue requirements for each scenario. The timing of operating and capital expenditures is specific to each scenario. The research team worked under the assumption that the company provided good-faith estimates for each scenario. For modeling purposes, cost assumptions were provided in nominal dollars. For comparison purposes, NSP converted inputs from nominal to real dollars using internal deflators. Costs in real dollars are presented in the following section.

Real costs were entered into the REMI model based on total activity expenditures. The researchers deferred to the model for the local purchasing coefficients for inputs given that three subregions are specified for this study. This reduces subjectivity and error associated with obtaining the source and composition of labor, capital, and intermediate inputs to production by community from NSP. The local purchasing coefficients within REMI change over time based on changing demand.

Capital Expenditures

The lowest capital cost scenario is the SHC1 2020 & SHC2 2020 in which NSP continues to operate Sherco units 1 and 2 until 2020 and then replaces them with combined cycle units at the Black Dog site and the Sherco site. This scenario, as shown in Table 5, has an estimated capital cost of $1.6 billion between 2015 and 2040, which includes on-going capital needs to repair and replace individual components to reliably continue operation of both units until 2020.

Alternatively, the baseline scenario is the highest capital cost scenario, estimated at nearly $1.9 billion as both Sherco units 1 and 2 in Sherburne County are retired in 2031 and are replaced with combined cycle generating units in Dakota County and Sherburne County (Table 5 and Table 6).

TABLE 5: CAPITAL EXPENDITURES (2014 DOLLARS), 2015–2040

Scenario	Total Spending (Millions)	Difference from Baseline (Millions)	Percentage Change
Baseline	$1,860.8	$0.0	0.0%
SHC1 2031 & SHC2 2025	$1,814.6	-$46.2	-2.5%
SHC1 2025 & SHC2 2025	$1,812.7	-$48.1	-2.6%
SHC1 2020 & SHC2 2020	$1,631.1	-$229.7	-12.3%
SHC1 2023 & SHC2 2020	$1,689.7	-$171.1	-9.2%

TABLE 6: CHANGE IN CAPITAL EXPENDITURES BY LOCATION (2014 DOLLARS), 2015–2040

Scenario	Difference in Sherburne County (Millions)	Difference in Dakota County (Millions)	Difference from Baseline (Millions)
Baseline	$0.0	$0.0	$0.0
SHC1 2031 & SHC2 2025	-$63.0	$16.8	-$46.2
SHC1 2025 & SHC2 2025	-$65.0	$16.8	-$48.1
SHC1 2020 & SHC2 2020	-$246.5	$16.8	-$229.7
SHC1 2023 & SHC2 2020	-$194.6	$23.5	-171.1

Operating and Maintenance

In addition to the consideration of capital expenditures, fixed and variable operating and maintenance costs vary by scenario. At $982 million, the baseline scenario has the highest operating and maintenance costs—3.5% to 25.8% higher than the alternative scenarios (Table 7). The various retirement and replacement scenarios reduce total fixed and variable operating costs.

TABLE 7: OPERATING EXPENDITURES (2014 DOLLARS), 2015–2040

Scenario	Total Fixed Operating and Maintenance (Millions)	Total Variable Operating and Maintenance (Millions)	Total Spending (Millions)	Difference from Baseline (Millions)	Percentage Change
Baseline	$923.0	$59.1	$982.0	$0.0	0.0%
SHC1 2031 & SHC2 2025	$897.6	$49.9	$947.5	-$34.5	-3.5%
SHC1 2025 & SHC2 2025	$855.3	$39.3	$894.6	-$87.4	-8.9%
SHC1 2020 & SHC2 2020	$663.1	$65.2	$728.3	-$253.7	-25.8%
SHC1 2023 & SHC2 2020	$715.2	$43.7	$758.9	-$223.1	-22.7%

Total fixed and variable operating costs would increase in Dakota County under the alternative scenarios, while costs would decrease in Sherburne County (Table 8).

TABLE 8: CHANGE IN OPERATING EXPENDITURES (2014 DOLLARS), 2015–2040

Scenario	Difference in Sherburne County (Millions)	Difference in Dakota County (Millions)	Difference from Baseline (Millions)
Baseline	$0.0	$0.0	$0.0
SHC1 2031 & SHC2 2025	-$64.5	$30.0	-$34.5
SHC1 2025 & SHC2 2025	-$117.1	$29.7	-$87.4
SHC1 2020 & SHC2 2020	-$310.5	$56.8	-$253.7
SHC1 2023 & SHC2 2020	-$264.8	$41.6	-$223.1

Property Taxes

Property taxes were a separate consideration given the location of the alternative scenarios. While other taxes, such as income taxes and sales taxes, are important considerations, property taxes are particularly important because of the localized impact of the revenue stream. The tax impact was not

explicitly modeled in this study. However, a reduction in activity at Sherco would result in a reduction in property taxes in Sherburne County, and an increase in activity at Black Dog would result in an increase in property taxes in Dakota County.

Revenue Requirements

Based on the level of operation and capital expenditures detailed in this report, NSP estimated the increase in revenue requirements included in electricity rates for electric customers for the four early retirement scenarios compared to the baseline scenario. This effectively isolates the revenue requirements and the electricity rate impact for the alternative scenarios and holds economic growth and electricity demand constant.[2] Revenue requirements are not equal to the sum of operation and capital expenditures because capital expenditures are recovered over the life of the asset. Therefore, revenue requirements occur over the life of the asset and include both a return of and return on capital. The revenue requirements estimate the additional electric revenues that would be recovered from customers for each scenario, despite the location of the supply chain for operating and capital purchases. At $1.1 billion, the change in revenue requirements is largest for the SHC1 2020 & SHC2 2020 Scenario between 2015 and 2040 (Table 9). Changes in revenue requirements were applied to residential, commercial, and industrial customers in Minnesota.

TABLE 9: CHANGE IN REVENUE REQUIREMENTS FOR MINNESOTA CUSTOMERS (NOMINAL), 2015–2040

Scenario	Dollar Change (Millions)	Percentage Change
Baseline	$0.0	0.0%
SHC1 2031 & SHC2 2025	$146.6	0.1%
SHC1 2025 & SHC2 2025	$806.4	0.7%
SHC1 2020 & SHC2 2020	$1,111.9	0.9%
SHC1 2023 & SHC2 2020	$826.9	0.7%

RESULTS

Continued operation of and investments in Sherco units 1 and 2 will have an ongoing positive economic contribution to the Minnesota economy. Scenarios involving early retirement and replacement of one or both of the units would also have near-term economic benefits, but the economic benefits of the baseline scenario are comparatively larger than the early retirement scenarios. The extent of the economic impacts is affected by factors that include the retirement costs of existing generating units,

[2]Electricity costs were entered as fuel cost variables: "Electricity (Commercial Sectors) Fuel Cost (amount)" for nonresidential sectors, and "Consumer Price (amount) for the residential sector."

the sources of inputs for capital investments, the ongoing operating costs, the sources of fuels, and the revenue requirements assigned to the customer base.

The retirement and replacement scenarios have varying degrees of impact on the Dakota County and Sherburne County economies. Retiring Sherco units in Sherburne County generates positive economic activity during the decommissioning phase but instills a negative economic cost during the other years due to lost operating and maintenance activity and to higher revenue requirements placed on residential and business utility customers. The construction and new operating activity at the Black Dog site in Dakota County would be a boost to the county economy, effectively outweighing the economic costs associated with higher revenue requirements. While these benefits accrue to Dakota County, it essentially shifts economic benefits from Sherburne County to Dakota County, and the overall impact on the Minnesota economy is marginally negative compared to the baseline scenario. The economic impacts of the retirement and replacement scenarios may appear large in absolute values, but the percentage change of the impacts is relatively small compared to the magnitude of the overall Minnesota economy. Accordingly, the impacts are not recessionary—the economy continues on a trajectory of growth, albeit slightly slower growth.

To quantify the economic contribution of the baseline scenario, the projected capital expenditures and operating expenditures from 2015 through 2040 were removed from the Minnesota economy. The resulting decrease in economic activity is the economic contribution of projected operations. This analysis excludes the revenue requirements associated with current operations of Sherco 1 and 2 since those revenue requirements are imbedded in the overall system revenue requirements for the company. The alternative scenarios were modeled using the changes in spending compared to baseline scenario on capital expenditures, operating expenditures, taxes, and revenue requirements. The revenue requirements for the alternative scenarios were supplied for the overall system, and it was possible to model the impact of *change* in revenue requirements for the retirement scenarios because the only system changes between the baseline scenario and the retirement scenarios include the retirement and replacement effects. Everything else in the system was left unchanged.

The following is a net analysis, examining the benefits as well as the costs. The growing demand for energy and plant energy output is controlled by comparing the economic impacts of the retirement

scenarios to the baseline scenario. This section reports the impacts in fixed (2014) dollars and the following paragraphs summarize the economic impacts by scenario.

Baseline Scenario Economic Contribution

In terms of economic contributions to the state of Minnesota, the baseline scenario, which includes continued long-term operation of Sherco units 1 and 2 until retirement and replacement in 2031, yields 980 jobs on average over the 26-year time horizon (Table 10). The baseline scenario would yield a contribution to total GDP of $2.8 billion in fixed 2014 dollars over the forecast horizon from 2015–2040, excluding the revenue requirements to customers.[3,4] Despite the Sherburne County location of Sherco units 1 and 2, the economic benefits of capital and operating expenditures extend beyond Sherburne County as direct and indirect goods and services are purchased from vendors throughout the state and as employee disposable income is spent in the larger Minnesota economy. Detailed results are available in Appendices 2,3, and 4.

TABLE 10: ECONOMIC CONTRIBUTION OF SHERCO 1 AND 2, AVERAGE 2015–2040

Metric	Units	Sherburne County	Dakota County	Rest of MN	Total
Total Employment	Jobs[1]	527	228	224	980
	Percent Change	*1.3%*	*0.1%*	*0.0%*	*0.0%*

[1]Dollars are fixed (2014) dollars. Note: The baseline scenario is the total economic impact (excluding rate impact); other scenarios are in comparison to the baseline scenario.

SHC1 2031 & SHC2 2025 Economic Impacts

This scenario includes the retirement of Sherco 2 in 2025 and its replacement with a combined cycle generator at Black Dog, and the retirement of Sherco 1 in 2031 and its replacement with a combined cycle generator at Sherco. This early retirement scenario has the second-highest capital expenditures and operating costs, and the second-lowest revenue requirements. This scenario records mixed economic impacts on the Minnesota economy and on Sherburne and Dakota counties. Economic benefits are recorded during the intensive decommissioning and construction phases, while economic costs are generally recorded during the nonconstruction phases. This is due to the rate burden on

[3] Revenue requirements for each scenario are calculated for the entire NSP system rather than just for Sherco 1 and 2.

[4] Total contributions to GDP are summed over the entire period while averages are shown in Table 10 (26 years times $107,273K equals $2.8 billion).

consumers (both residential and commercial/industrial) as the higher revenue requirements overshadow the benefits associated with construction activity and lower operating costs. The higher revenue requirements are levied on all customers, while the economic benefit from construction is diluted due to leakage—some goods and services are sourced from outside the state.

The costs and benefits are not shared equally by location in Minnesota—Dakota County is a net beneficiary while Sherburne County and the rest of Minnesota incur higher costs. These deviations are relatively small compared to the overall Minnesota economy, while they are slightly larger in Sherburne County and Dakota County. The magnitude and periodic variation in economic impacts is apparent in the private employment figures. Compared to the baseline scenario, over the 26-year horizon, Sherburne County employment is lower by an average of 31 jobs per year, Dakota County is higher by an average of 18 jobs per year, and the rest of Minnesota is lower by an average of 62 jobs per year, as shown in Table 11.

TABLE 11: SHC1 2031 & SHC2 2025 ECONOMIC IMPACTS COMPARED TO BASELINE, AVERAGE 2015–2040

[1]Dollars are fixed (2014) dollars.

Since this scenario involves generator retirement and replacement sooner than the baseline scenario, the spike and dip in economic activity is largely due to timing—specifically the timing of activity compared to the baseline scenario. Retiring Sherco 2 in 2025 instead of 2031 increases economic activity in the 2020s, but decreases economic activity in the 2030s—hence, the spike in employment followed by the decrease. (See Figure 5.)

As shown in Figure 5, Dakota County records the greatest employment impact. This is due to the new construction and operations within Dakota County. Sherburne County records only a modest dip in employment, buoyed by activity during the Sherco unit shutdown and decommissioning phase.

FIGURE 5: SHC1 2031 & SHC2 2025 IMPACT ON PRIVATE EMPLOYMENT

Total capital spending and operating and maintenance costs for this early retirement scenario are less than those for the baseline scenario. Revenue requirements are greater than in the baseline scenario, and this increase is greater than the decrease in total operating costs. The economic impacts are tempered, however, due the size of these impacts relative to the large local economy. The Minnesota economy ranked 17th nationally in 2014 in terms of state GDP at $316 billion and 17th in terms of employment at 2.8 million. As shown in Table 11, slower growth in GDP of $16 million and 75 fewer jobs represent less than one-tenth of a percent change in economic growth statewide. The impacts are greater for Sherburne County and Dakota County given they are the locations incurring the greatest operating changes.

SHC1 2025 & SHC2 2025 Economic Impacts

This scenario includes the retirement of Sherco units 1 and 2 in 2025, replaced with combined cycle generators at Sherco and Black Dog. This scenario has the third-highest fixed capital costs, operating costs, and revenue requirements, and records mixed economic impacts on the Minnesota economy and on Sherburne and Dakota counties. Economic benefits are recorded during the intensive decommissioning and construction phases, while economic costs are generally recorded during the nonconstruction phases. This is due to the rate burden on residential and business consumers as the

higher revenue requirements overshadow the benefits associated with construction activity and lower operating costs. The higher revenue requirements are levied on all customers, while the economic benefit from construction is diluted due to leakage—some goods and services are sourced from outside the state.

The costs and benefits are not shared equally by location in Minnesota—Dakota County is a net beneficiary while Sherburne County and the rest of Minnesota incur higher costs. These deviations are relatively small compared to the overall Minnesota economy, although slightly larger relative impacts are recorded in Sherburne County and Dakota County. The magnitude and periodic variation in economic impacts is apparent in the private employment figures. As shown in Table 12, over the 26-year horizon, Sherburne County employment is lower by an average of 22 jobs, Dakota County is flat, and the rest of Minnesota is lower by 237 jobs compared to the baseline scenario.

TABLE 12: SHC1 2025 & SHC2 2025 ECONOMIC IMPACTS COMPARED TO BASELINE, AVE. 2015–2040

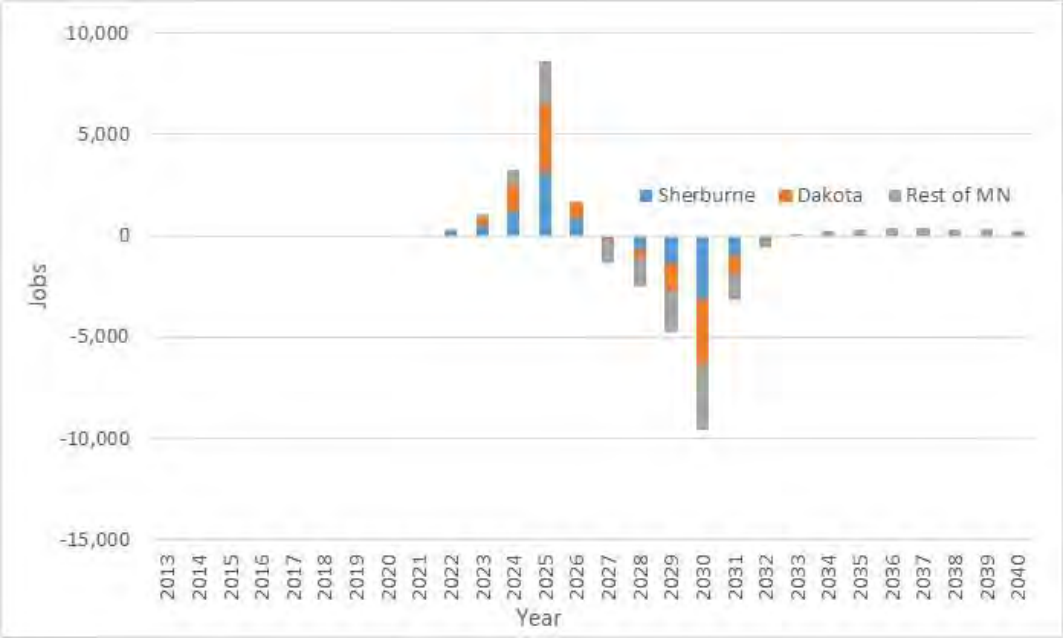
Real Disposable Personal Income	Dollars (Thousands)[1]	-2,920	-4,508	-40,494	-47,919
	Percent Change	*-0.1%*	*0.0%*	*0.0%*	*0.0%*

[1]Dollars are fixed (2014) dollars.

Since this scenario involves generator retirement and replacement sooner than the baseline scenario, the spike and dip in economic activity is largely due to timing. Retiring Sherco 1 and Sherco 2 in 2025 instead of 2031 increases economic activity in the 2020s, but decreases economic activity in the 2030s—hence, the spike in employment followed by the decrease. (See Figure 6.)

Visible in Figure 6, Dakota County records the greatest employment impact. This is due to the new construction and operations within Dakota County. Sherburne County only records a modest dip in employment, buoyed by activity during the decommissioning phase and the reconstruction of Sherco 1.

FIGURE 6: SHC1 2025 & SHC2 2025 IMPACT ON PRIVATE EMPLOYMENT



Despite the decrease in total capital spending and decrease in operating and maintenance costs for this early retirement scenario, the economic impacts are dampened by the project horizon, the higher revenue requirements, and the relatively large local economy. The Minnesota economy ranked 17th nationally in 2014 in terms of state GDP at $316 billion and 17th in terms of employment at 2.8 million. Slower growth in GDP of $53 million and 258 fewer jobs represent less than one-tenth of a percent change in economic growth statewide (Table 12). The impacts are greater for Sherburne County and Dakota County given they are the locations incurring the greatest operating changes.

SHC1 2020 & SHC2 2020 Economic Impacts

This scenario includes placing Sherco 1 and 2 in standby mode in 2020, replaced with new combined cycle generators at Black Dog in 2026 and at Sherco in 2031. This scenario has the lowest fixed capital costs and operating costs and the highest revenue requirements, and records mixed economic impacts on the Minnesota economy and on Sherburne and Dakota counties. Economic benefits are recorded during the intensive decommissioning and construction phases, while economic costs are generally recorded during the nonconstruction phases. This is due to the rate burden on residential and business consumers as the higher revenue requirements overshadow the benefits associated with construction activity and lower operating costs. The higher revenue requirements are levied on all customers, while

the economic benefit from construction is diluted due to leakage—some goods and services are sourced from outside the state.

The costs and benefits are not shared equally by location in Minnesota—Dakota County averages modest employment losses despite gaining a generating facility—mostly due to the delayed replacement facility in Dakota County. Sherburne County loses some operating activity and the rest of Minnesota incurs higher utility costs. These deviations are relatively small compared to the overall Minnesota economy, although slightly larger relative impacts are incurred in Sherburne County and Dakota County. The magnitude and periodic variation in economic impacts is apparent in the private employment figures. As shown in Table 13, over the 26-year horizon, Sherburne County employment is lower by an average of 140 jobs, Dakota County is lower by an average of 12 jobs, and the rest of Minnesota is lower by 418 jobs compared to the baseline scenario.

TABLE 13: SHC1 2020 & SHC2 2020 ECONOMIC IMPACTS COMPARED TO BASELINE, AVERAGE 2015–2040

Metric	Units	Sherburne County	Dakota County	Rest of MN	Total
Total Employment	Jobs	-140	-12	-418	-570
	Percent Change	*-0.3%*	*0.0%*	*0.0%*	*0.0%*

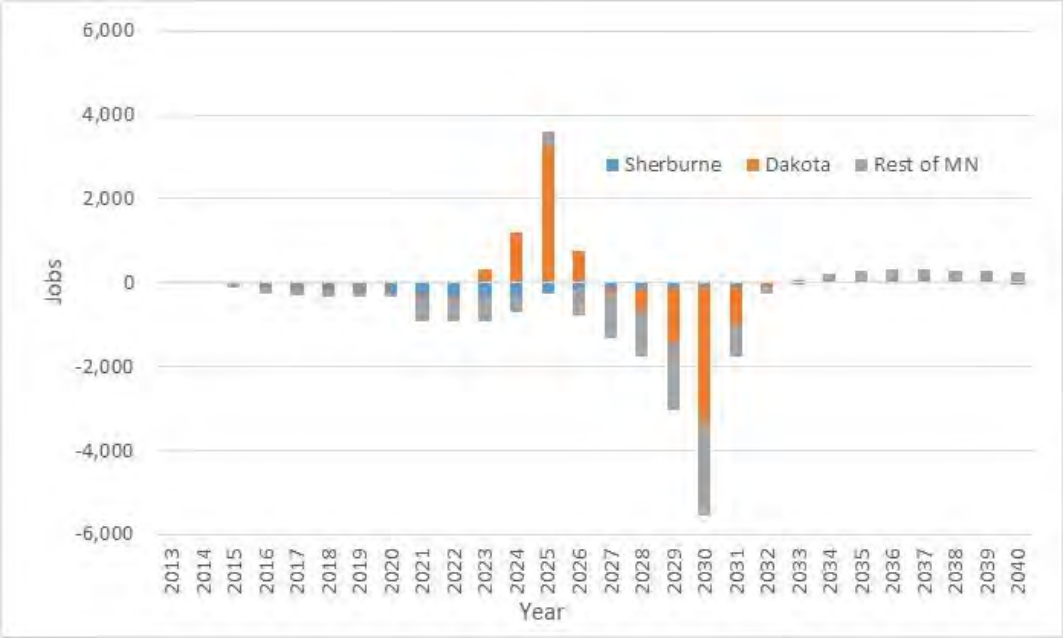
	Percent Change	*-0.2%*	*0.0%*	*0.0%*	*0.0%*

[1]Dollars are fixed (2014) dollars.

Since this scenario involves generator retirement and replacement sooner than the baseline scenario, the spike and dip in economic activity is largely due to timing. Retiring Sherco 1 and Sherco 2 in 2020 instead of 2031 increases economic activity in the 2020s, but decreases economic activity in the 2030s—hence, the spike in employment followed by the decrease. (See Figure 7.)

As Figure 7 shows, Dakota County records the greatest employment impact. This is due to the new construction and operations within the county. Sherburne County only records a modest dip in employment, buoyed by activity during the decommissioning phase and the construction of a natural gas combined cycle unit at the Sherco site.

FIGURE 7: SHC1 2020 & SHC2 2020 IMPACT ON PRIVATE EMPLOYMENT



Despite the decrease in total capital spending operating and maintenance costs for this early retirement scenario, the economic impacts are dampened by the project horizon, the higher revenue requirements, and the relatively large local economy. The Minnesota economy ranked 17th nationally in 2014 in terms of state GDP at $316 billion and 17th in term of employment at 2.8 million. Slower growth in GDP of $90 million and 570 fewer total jobs represent less than one-tenth of a percent change in economic growth statewide. The impacts are greater for Sherburne County and Dakota County given they are the locations incurring the greatest operating changes.

SHC1 2023 & SHC2 2020 Economic Impacts

This scenario includes the retirement of Sherco 2 in 2020, replaced with a combined cycle generator at Black Dog, and the retirement of Sherco 1 in 2023, replaced with a combined cycle generator at Sherco. This alternative scenario has the second-lowest fixed capital costs and operating costs, and the second-highest revenue requirements, and records mixed economic impacts on the Minnesota economy and on Sherburne and Dakota Counties. Economic benefits are recorded during the intensive decommissioning and construction phases, while economic costs are generally recorded during the nonconstruction phases. This is due to the rate burden on residential and business consumers as the higher revenue requirements overshadow the benefits associated with construction activity and lower operating costs.

The higher revenue requirements are levied on all customers, while the economic benefit from construction is diluted due to leakage—some goods and services are sourced from outside the state.

The costs and benefits are not shared equally by location in Minnesota—Dakota County and Sherburne County record a net increase in economic activity, while the rest of Minnesota incurs higher utility costs. However, these deviations are relatively small compared to the overall Minnesota economy. The magnitude and periodic variation in economic impacts is apparent in the private employment figures. As shown in Table 14, over the 26-year horizon, Sherburne County employment is higher by an average of 5 jobs, Dakota County is higher by an average of 7 jobs, and the rest of Minnesota is lower by 313 jobs compared to the baseline projection.

TABLE 14: SHC1 2020 & SHC2 2023 ECONOMIC IMPACTS COMPARED TO BASELINE, AVERAGE 2015–2040

Metric	Units	Sherburne County	Dakota County	Rest of MN	Total

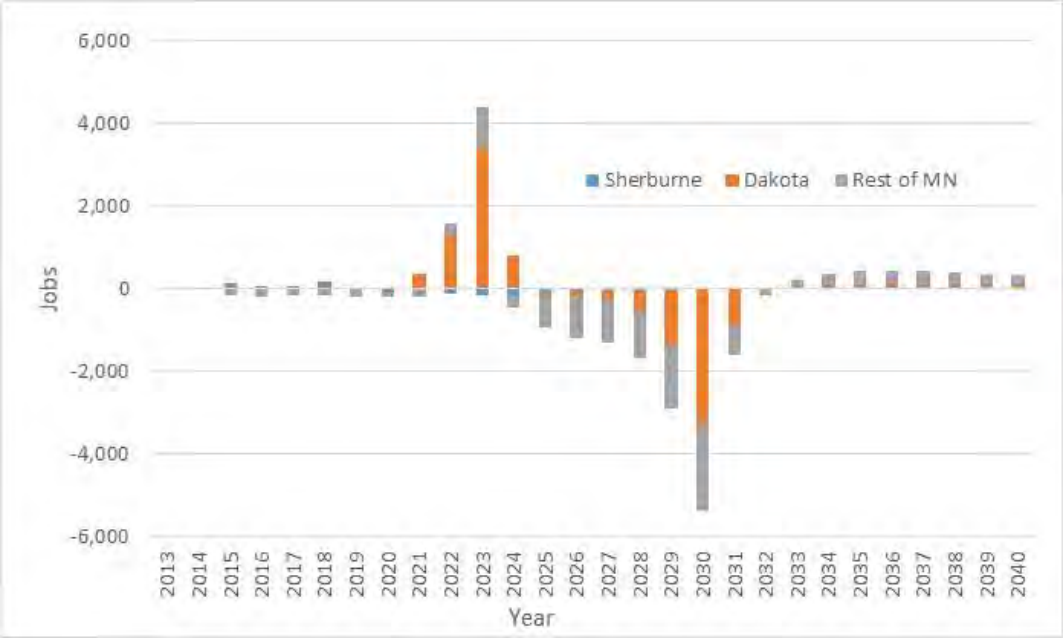
	Percent Change	*0.4%*	*0.0%*	*0.0%*	*0.0%*
Personal Income	Dollars (Thousands)[1]	2,668	-5,182	-49,930	-52,443
	Percent Change	*0.1%*	*0.0%*	*0.0%*	*0.0%*
Real Disposable Personal Income	Dollars (Thousands)[1]	5	7	-313	-300
	Percent Change	*0.0%*	*0.0%*	*0.0%*	*0.0%*

[1]Dollars are fixed (2014) dollars.

Since this scenario involves generator retirement and replacement sooner than the baseline scenario, the spikes and dips in economic activity are largely due to timing. Retiring Sherco 1 in 2023 instead of 2031, and retiring Sherco 2 in 2020 instead of 2031 increases economic activity in the 2020s, but decreases economic activity in the 2030s—hence, the spike in employment followed by the decrease. (See Figure 8.)

As Figure 8 indicates, Dakota County records the greatest employment impact. This is due to the new construction and operations within Dakota County. Sherburne County records only a modest dip in employment, buoyed by activity during the decommissioning phase and the construction of a natural gas combined cycle unit at the Sherco site.

FIGURE 8: SHC1 2023 & SHC2 2020 IMPACT ON PRIVATE EMPLOYMENT



Despite the decrease in total capital spending and operating and maintenance costs for this early retirement scenario, the economic impacts are dampened by the project horizon, the higher revenue requirements, and the relatively large local economy. The Minnesota economy ranked 17th nationally in 2014 in terms of state GDP at $316 billion and 17th in term of employment at 2.8 million. Slower growth in GDP of $50 million and 300 fewer total jobs represent less than one-tenth of a percent change in economic growth statewide. The impacts are greater for Sherburne County and Dakota County given they are the locations incurring the greatest operating changes.

CONCLUSION

This paper provides an analysis of the economic impact of early retirement and replacement of the coal-fired Sherco 1 and Sherco 2 units with an equivalent MW amount of combined cycle gas-fired generation capacity. This report finds the costs associated with an increase in revenue requirements to pay for early retirement and replacement are modestly greater than the economic benefits associated with the change in capital investments and operating costs.

This analysis uses data on operations, maintenance, capital expenditures, and revenue requirements provided by NSP on the current Sherco 1 and 2 units and on four retirement scenarios.

Overall, the study found the following:

- Current Sherco operations have an impact that extends beyond Sherburne County as NSP purchases goods and services from vendors throughout Minnesota and as income earners spend disposable personal income throughout the state.
- Some of the construction and operating benefits do not impact the Minnesota economy as goods and services are sourced from out of state while the increase in revenue requirements (costs) are placed on all Minnesota NSP customers (residential, commercial, and industrial).
- The lack of indigenous fossil resources in Minnesota limits potential gains in fuel switching. Since Minnesota does not have indigenous coal or natural gas resources, it necessitates importing fuel from other states and requiring gas pipeline upgrades.
- The baseline scenario and each early retirement scenario require additional investments in gas pipelines and transmission totaling about 10% of total capital expenditures.
- All early Sherco retirement scenarios will result in higher revenue requirements of $147 million–$1.7 billion, or 0.1%–0.9% for NSP's Minnesota electricity customers, partially due to fuel costs. This negative economic impact is greater than the economic benefits associated with the construction of replacement generation and changes in operations.
- Continued operation of and investments in Sherco units 1 and 2 through 2031 will have the greatest ongoing positive impact to the Minnesota economy.
- Compared to the baseline scenario, all early Sherco retirement scenarios result in comparatively slower growth within the Minnesota economy in terms of:
    - Employment (-75 to -570 jobs on average)
    - GDP (-$16 million to -$90 million on average), and

  - Real disposable personal income (-$14 million to -$83 million).

Note: These changes represent a relatively small percentage of the overall Minnesota economy, Sherburne County economy, and Dakota County economy, and none of the scenarios are recessionary.

- The statewide economic losses compared to the baseline scenario increase as the retirement of Sherco units are moved to earlier dates because of the need for earlier capital expenditures and increased costs to rate payers.
  - Scenario SHC1 2020 & SHC2 2020 results in the greatest statewide decrease in GDP compared to the baseline scenario.
  - The SHC1 2031 & SHC2 2025 retirement scenario results in the smallest economic loss compared to the baseline scenario.
- As a percentage of local economic activity, Sherburne County experiences the greatest negative impact under most retirement scenarios due to the reduction in local operating activity, while Dakota County records the largest positive impacts due to the construction of replacement generation at the Black Dog site. The study period impacts are generally a decrease in employment in Sherburne County, as well as a shift of employment from Sherburne County to Dakota County. Construction of replacement generation on the Sherco site buffers some of the negative economic impacts associated with lost generation.

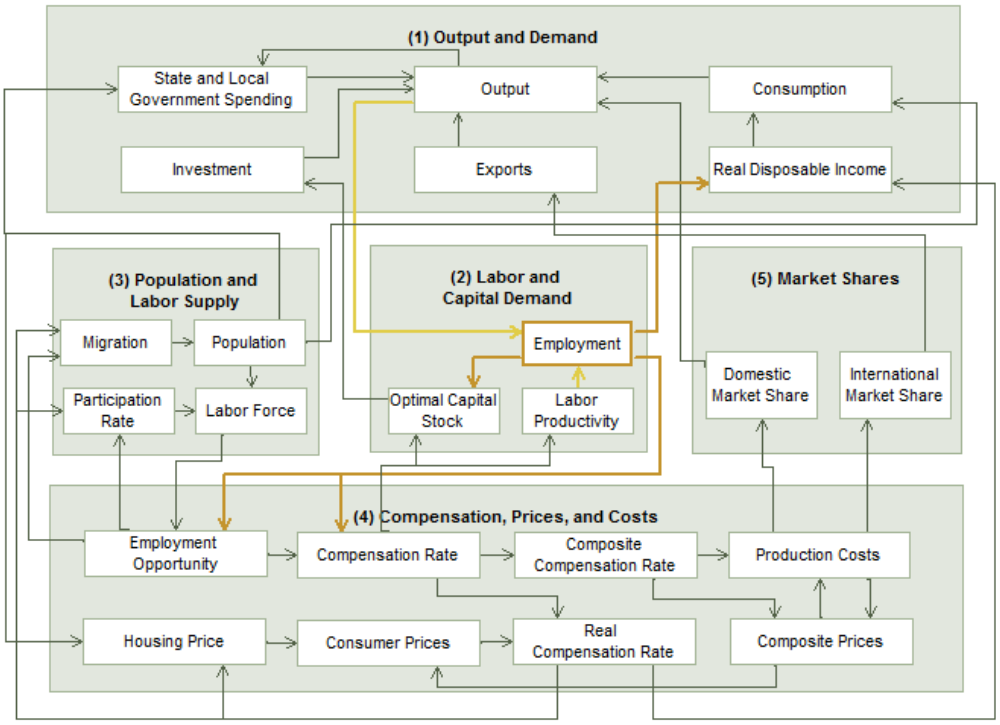
APPENDIX 1: OVERVIEW OF REMI POLICY INSIGHT

This summary was provided by REMI, Inc.

Policy Insight is a structural economic forecasting and policy analysis model. It integrates input-output, computable general equilibrium, econometric, and economic geography methodologies. The model is dynamic, with forecasts and simulations generated on an annual basis and behavioral responses to wage, price, and other economic factors.

The REMI model consists of thousands of simultaneous equations with a structure that is relatively straightforward. The exact number of equations used varies depending on the extent of industry, demographic, demand, and other detail in the model. The overall structure of the model can be summarized in five major blocks: (1) Output and Demand, (2) Labor and Capital Demand, (3) Population and Labor Supply, (4) Wages, Prices and Costs, and (5) Market Shares.



Block 1. Output and Demand

This block includes output, demand, consumption, investment, government spending, import, product access, and export concepts. For each industry, demand is determined by the amount of output, consumption, investment and capital demand on that industry. Consumption depends on real disposable income per capita, relative prices, differential income elasticities and population. Input productivity depends on access to inputs because the larger the choice set of inputs, the more likely that

the input with the specific characteristics required for the job will be formed. In the capital stock adjustment process, investment occurs to fill the difference between optimal and actual capital stock for residential, non-residential, and equipment investment. Government spending changes are determined by changes in the population.

Block 2. Labor and Capital Demand

The Labor and Capital Demand block includes the determination of labor productivity, labor intensity and the optimal capital stocks. Industry-specific labor productivity depends on the availability of workers with differentiated skills for the occupations used in each industry. The occupational labor supply and commuting costs determine firms' access to a specialized labor force.

Labor intensity is determined by the cost of labor relative to the other factor inputs, capital and fuel. Demand for capital is driven by the optimal capital stock equation for both non-residential capital and equipment. Optimal capital stock for each industry depends on the relative cost of labor and capital, and the employment weighted by capital use for each industry. Employment in private industries is determined by the value added and employment per unit of value added in each industry.

Block 3. Population and Labor Supply

The Population and Labor Supply block includes detailed demographic information about the region. Population data is given for age and gender, with birth and survival rates for each group. The size and labor force participation rate of each group determines the labor supply. These participation rates respond to changes in employment relative to the potential labor force and to changes in the real after tax compensation rate. Migration includes retirement, military, international and economic migration. Economic migration is determined by the relative real after tax compensation rate, relative employment opportunity and consumer access to variety.

Block 4. Wages, Prices, and Costs

This block includes delivered prices, production costs, equipment cost, the consumption deflator, consumer prices, the price of housing, and the wage equation. Economic geography concepts account for the productivity and price effects of access to specialized labor, goods and services.
These prices measure the price of the industry output, taking into account the access to production locations. This access is important due to the specialization of production that takes place within each industry, and because transportation and transaction costs of distance are significant. Composite prices for each industry are then calculated based on the production costs of supplying regions, the effective

distance to these regions, and the index of access to the variety of output in the industry relative to the access by other uses of the product.

The cost of production for each industry is determined by cost of labor, capital, fuel and intermediate inputs. Labor costs reflect a productivity adjustment to account for access to specialized labor, as well as underlying compensation rates. Capital costs include costs of non- residential structures and equipment, while fuel costs incorporate electricity, natural gas and residual fuels.

The consumption deflator converts industry prices to prices for consumption commodities. For potential migrants, the consumer price is additionally calculated to include housing prices. Housing price changes from their initial level depend on changes in income and population density.

Compensation changes are due to changes in labor demand and supply conditions and changes in the national compensation rate. Changes in employment opportunities relative to the labor force and occupational demand change determine compensation rates by industry.

Block 5. Market Shares

The Market Shares equations measure the proportion of local and export markets that are captured by each industry. These depend on relative production costs, the estimated price elasticity of demand, and effective distance between the home region and each of the other regions. The change in share of a specific area in any region depends on changes in its delivered price and the quantity it produces compared with the same factors for competitors in that market. The share of local and external markets then drives the exports from and imports to the home economy.

The Labor and Capital Demand block includes labor intensity and productivity as well as demand for labor and capital. Labor force participation rate and migration equations are in the Population and Labor Supply block. The Wages, Prices, and Costs block includes composite prices, determinants of production costs, the consumption price deflator, housing prices, and the wage equations. The proportion of local, inter-regional and export markets captured by each region is included in the Market Shares block.

APPENDIX 2: DETAILED ECONOMIC IMPACTS OF SCENARIOS ON THE MINNESOTA ECONOMY

The following tables exhibit the economic impacts of the baseline scenario on the Minnesota economy, as well as the economic impacts of the alternative scenarios compared to the baseline scenario.

TABLE 15: ECONOMIC CONTRIBUTION OF BASELINE SCENARIO ON THE MINNESOTA ECONOMY

Category	Units	Average					
		Year 1-5	Year 6-10	Year 11-15	Year 16-20	Year 21-25	2015-2040
Total Employment	Jobs	545	511	631	3,115	241	980
Private Non-Farm Employment	Jobs	515	454	567	2,920	112	885
Gross Domestic Product	Dollars (Thousands)[1]	58,758	56,019	73,325	345,997	18,944	107,273
Real Disposable Personal Income	Dollars (Thousands)[1]	29,475	33,754	45,510	207,539	40,525	70,141

[1]Dollars are fixed (2014) dollars. Note: Scenario 1 is the total economic impact (excluding rate impact); other scenarios are in comparison to Scenario 1.

TABLE 16: ECONOMIC CONTRIBUTION OF SHC1 2031 & SHC2 2025 ON THE MINNESOTA ECONOMY

Category	Units	Average					
		Year 1-5	Year 6-10	Year 11-15	Year 16-20	Year 21-25	2015-2040
Total Employment	Jobs	-23	349	286	-1,286	246	-75
Private Non-Farm Employment	Jobs	-21	348	262	-1,192	269	-57

Attachment H
Preliminary Assessment of CO_2 Markets under the Clean Power Plan

We present this preliminary assessment of potential revenues from carbon dioxide (CO_2) credits in future markets under the Clean Power Plan (CPP), in response to requests by the Department of Commerce and Commissioners during the December 3, 2015 Minnesota Public Utilities Commission hearing.

Although our Current Preferred Plan is not primarily driven by the CPP, we believe this plan will not only achieve, but likely exceed, the CO_2 reductions that could be required of the Company under Minnesota's CPP State Plan. As a result, the Current Preferred Plan may generate excess reductions in the form of CO_2 allowances (if Minnesota's plan is mass-based) or Emission Rate Credits (if the plan is rate-based), which under the CPP would be tradable to the owners of other CPP-regulated units within the state or in other states. As long as Minnesota's plan allows the Company to monetize the value of these reductions on behalf of our customers, this value could be used to help reduce the rate impact of transitioning our generation portfolio to a much lower-carbon system.

This Attachment estimates the value to our customers of excess CO_2 reductions under two State Plan scenarios. However, we emphasize the preliminary nature of this assessment: both the size and value of the allowances or ERCs we generate, beyond those used for our own compliance, are subject to uncertainty because they depend on State Plan decisions yet to be made and predictions about prices in CO_2 credit markets not yet in existence.

A. CPP Final Rule, State Plans and CO_2 Credit Markets

The CPP final rule sets CO_2 targets, for 2022 and each year thereafter, for each of the states in our Upper Midwest System. The targets are provided in "rate-based" form (pounds of CO_2 per MWh, both specific to coal and gas units and for each state as a whole) and "mass-based" form (total tons of CO_2, by year, on aggregate for all the CPP-regulated units in a state). Only the Minnesota targets affect the Company directly, since we own and operate CPP-regulated units only in Minnesota; however, the costs and benefits of compliance will be shared among customers in all our five states.

The rule allows each state to develop a State Plan to achieve the targets, providing states considerable flexibility in how they do this. It allows EPA to impose a Federal

Plan on any state that fails to submit an approvable plan. Initial State Plan submittals are due in September 2016, with the option to seek an extension to September 2018 to submit a final plan. The Minnesota Pollution Control Agency (MPCA) is the lead agency with responsibility to develop Minnesota's State Plan, in consultation with other agencies and stakeholders. The Company has been an active participant in MPCA's stakeholder group, as well as similar processes in our other states and regional stakeholder processes, discussing State Plan design decisions. We have been working to identify areas of agreement among utilities and other stakeholders.

A key decision in State Plan design is whether to take a rate-based or mass-based approach. A rate-based approach would seek to achieve the pounds of CO_2 per MWh targets, either on a statewide level or using the subcategory rates specific to coal and natural gas combined cycle units, and would allow eligible activities – including renewable energy, energy efficiency, and nuclear uprates – to earn Emission Rate Credits (ERCs) that could be used by regulated units for compliance. A mass-based approach would seek to achieve the total tons of CO_2 targets, requiring all regulated units to surrender CO_2 allowances equivalent to their emissions in a compliance period.

One of the most important flexibility mechanisms in the CPP is the option for states to create CO_2 credit markets – i.e. allow the owners of CPP-regulated units in a state to transact CO_2 allowances or ERCs with other regulated units, or with other entities, within the state or in other states. This would enable regulated unit owners to purchase allowances or ERCs for compliance, if this is more cost-effective than reducing emissions on their own system, or sell allowances or ERCs, if a regulated unit owner is able cost-effectively to reduce emissions such that it holds more allowances or ERCs than it needs for compliance.

EPA views this compliance flexibility as key to containing costs, and appropriate for CO_2, since the climate benefits of reducing emissions are independent of location. EPA does not mandate that State Plans allow trading, but provides much of the necessary infrastructure, including presumptively approvable model trading rules, EPA-administered allowance and ERC tracking systems, accreditation of credit verifiers, etc. EPA also allows trading between State Plan states and states who accept a Federal Plan. However, EPA proposes that regulated units in mass-based states may only trade with those in other mass-based states, and units in rate-based states may only trade with those in other rate-based states.

Minnesota and the other states the Company serves in the Upper Midwest are all actively considering allowing CO_2 credit trading in their CPP State Plans. However, none of our states has yet determined whether their plan will be mass-based or rate-based, and because of EPA's proposed restriction on trading between rate and mass, the geographic scope and liquidity of future CO_2 credit markets is unknown.

B. Scenario Analysis: Potential Value of CO_2 Credits to Our Customers

The Current Preferred Plan includes actions – coal unit retirement, maintenance of nuclear units, renewable energy additions, and ongoing energy efficiency savings – that are projected to reduce CO_2 potentially beyond what the State Plan requires of the Company. These actions may put the Company in the position of being a net allowance or ERC seller, after the Company has surrendered sufficient allowances or ERCs to bring its own units into compliance. This section presents a preliminary analysis of the value to our customers of these actions, under different possible credit prices and State Plan designs.

Uncertainties affecting the size of the Company's allowance budget include whether Minnesota and other states in the region take mass-based or rate-based approaches to compliance, how the State Plan allocates allowances in a mass-based approach, and which actions are eligible for ERC issuance in a rate-based approach. Uncertainties affecting the price obtainable for any allowances or ERCs include whether states allow trading in their plans, how much EPA's proposed restriction on trading between rate and mass limits the geographic scope and liquidity of CO_2 credit markets, and the structure of CO_2 credit markets that may emerge.

1. Credit Prices

Estimating the market value of CO_2 reductions requires assuming a price for allowances or ERCs in markets not yet in existence. The Commission's current regulatory cost range under Minn. Stat. § 216H.06 – $9 to $34 per short ton of CO_2 emitted – represents one potential price range for allowances (not ERCs).[1] The Company applies the midpoint of this range, $21.50 per ton, as a base assumption in resource planning, and applies the two ends of the range as sensitivities. The MPCA and Minnesota Department of Commerce recently released a request for comments on

[1] April 28, 2014 Order. *In the Matter of Establishing an Updated Estimate of the Costs of Future Carbon Dioxide Regulation on Electricity Generation Under Minn. Stat. § 216H.06*. Docket No. E999/CI-07-1199.

the 2016 update of the regulatory cost range, making a preliminary recommendation to retain the range at $9 to $34 per ton.[2]

The Company agreed with the agencies that this range remains reasonable with the information currently available.[3] The Commission's regulatory cost range was first established in 2008, at a time when Congress was contemplating economy-wide, mass-based CO_2 "cap and trade" proposals, and reflected expert predictions of the CO_2 price that might emerge in such markets. While none of these proposals was signed into law, and today power sector CO_2 regulation is proceeding under section 111(d) of the Clean Air Act, as noted above, EPA has provided for market-based compliance mechanisms in both State and Federal Plans. Minnesota and other states in the region appear to be strongly considering this option, so a market-based regulatory cost appears to be a reasonable assumption.

We do not, however, know whether Minnesota's plan will involve allowance or ERC trading, what other states in the region might choose, or how broad or liquid CO_2 credit markets might be. Experience with existing CO_2 markets in the United States and internationally suggests that efficient market design and geographically broader markets lead to lower CO_2 prices, and prices in existing United States CO_2 markets have historically been in the lower end of the Commission's range.[4] However, with CPP State Plans still in such early stages, and actual CPP markets not yet in existence, it seems premature to conclude that prices will be lower than $9 (or higher than $34). For this analysis, we have used the same $9, $21.50, and $34 per ton that we use in Strategist modeling.

---

[2] December 3, 2015 Request for Comments. *In the Matter of Establishing an Updated Estimate of the Costs of Future Carbon Dioxide Regulation on Electricity Generation Under Minn. Stat. § 216H.06*. Docket No. E999/CI-15-708, Docket No. E999/CI-07-1199. The Agencies recommended shifting the date utilities are required to begin applying the range to 2022, which reflects the first year utilities will face a cost to comply with the CPP.
[3] January 14, 2016 *Comments on Updating the Estimated Cost of Future Carbon Dioxide Regulation under Minn. Stat. § 216H.06*. Docket No. E999/CI-15-708.
[4] For example, $12.73 per metric ton ($11.55 per short ton) in the most recent allowance auction in California, and $7.50 per short ton in the most recent allowance auction in the northeastern states Regional Greenhouse Gas Initiative. Prices in prior auctions were lower. See http://www.arb.ca.gov/cc/capandtrade/auction/auction.htm and http://www.rggi.org/market/co2_auctions/results.

The Commission has no corresponding estimate that could be applied as a price per ERC, and there are no existing rate-based CO_2 markets from which to estimate a price of ERCs.[5]

2. State Plan Decisions Affecting Company's Allowance Budget

The size of the Company's allowance budget will depend on many decisions yet to be made in Minnesota's State Plan. Strategist modeling provides a forecast of CO_2 emissions from our CPP-regulated units; however, whether and by how much the allowance budget allocated to the Company (under a mass-based plan) exceeds those emissions will depend on how the plan allocates allowances. Similarly, our overall ERC position (under a rate-based plan) will depend on the activities eligible for ERC crediting.

We here provide analysis of a mass-based plan simply because the Commission's regulatory cost range under Minn. Stat. § 216H.06 provides an allowance price in dollars per ton of CO_2, and we have no comparable basis for predicting a price per ERC. We note that the Company has not yet concluded whether a mass- or rate-based plan is better for our customers.

To estimate our allowance position, we compare projected emissions from CPP-regulated units to the allowance budget that would be allocated to the Company under two hypothetical State Plan scenarios. Both begin with the statewide CO_2 budget for existing units from the CPP, and apply a set of allocation assumptions to derive the share of this budget allocated to the Company.

Scenario 1 assumptions:

- Plan covers existing units only, not new units;
- MPCA demonstrates to EPA that the risk of emission leakage[6] is low in Minnesota, and does not implement allowance set-asides to address leakage;

[5] There are existing markets providing prices for Renewable Energy Credits (RECs) of different types and vintages, and there is some overlap between the types of activities that can generate ERCs and those that can generate RECs. However the overlap is partial, and ERCs and RECs will be separate compliance instruments (ERCs for CPP compliance, RECs for compliance with state renewable energy mandates). Currently low REC prices reflect, among other factors, that relatively cost-effective renewable energy has put many utilities in the situation of having ample RECs for compliance with state renewable energy mandates. However, eventual prices for ERCs will be driven by supply and demand in new CPP markets, which will depend on how many states choose rate-based plans. We have not assumed REC prices provide a proxy for ERC prices.
[6] The CPP defines emission leakage as the incentive to shift generation from affected units regulated under section 111(d) of the Clean Air Act to non-affected units (e.g. new units regulated under section 111(b)).

- Plan includes the Clean Energy Incentive Program (CEIP) allowance set-aside to encourage pre-2022 renewable energy and low-income energy efficiency, and the corresponding matching allowances from EPA;
- Plan includes no other allowance set-asides;
- Plan allocates allowances to affected unit owners based on 2010-2012 generation;[7]
- Plan does not limit the years of allowance allocation to a retired unit;
- The Company earns some allowances back from the CEIP set-aside by implementing eligible activities (wind and solar installed, and low-income energy efficiency implemented, after September 2018).[8]

Scenario 2 assumptions:

- Plan covers existing units only, not new units;
- MPCA adopts EPA's proposed allowance set-asides to address leakage: a set-aside for renewable energy at five percent of the state's allowance budget, and an output-based set-aside for existing natural gas combined cycle units;
- Plan includes the CEIP allowance set-aside to encourage pre-2022 renewable energy and low-income energy efficiency, and the corresponding matching allowances from EPA;
- Plan includes other set-asides, for purposes yet to be determined, totaling an additional 20 percent of the statewide allowance budget;
- Plan allocates allowances to affected unit owners based on 2010-2012 generation;
- Plan allocates no allowances to a retired unit after two years, redirecting these allowances to the renewable energy set-aside;[9] and

[7] We here adopt the default allowance allocation method from EPA's proposed Federal Plan, while noting that EPA leaves the allowance allocation decision to states, and that discussion of the most appropriate allocation basis (generation or emissions, and whether any allowance set-asides are appropriate) is ongoing as of this filing.

[8] Xcel Energy, MPCA and others have urged EPA to shift the eligibility date for the CEIP earlier, making new wind and solar installed, and low-income energy efficiency implemented, after initial plan submittal in September 2016 (rather than after final plan submittal in September 2018) eligible for CEIP allowances or ERCs. Since EPA's decision on this issue is not yet known, this analysis assumes CEIP eligibility as currently proposed.

[9] As proposed by EPA in the proposed Federal Plan. Neither this nor any other allowance allocation provision is binding for an approvable State Plan.

- The Company earns some allowances back from the CEIP, renewable energy, and existing natural gas combined cycle allowance set-asides, but is not assumed to earn any allowances back from other set-asides.

3. Results

The difference in the allowances available to monetize on behalf of our customers (after surrendering sufficient allowances to cover our CPP-regulated unit emissions) is significant between the two State Plan scenarios above.

Scenario 1, because it includes no allowance set-asides except the CEIP and does not limit the years of allowance allocation to retired units, results in a larger Company budget and therefore larger compliance buffer. Once the Company surrenders sufficient allowances to cover its CPP-regulated unit emissions each year, there is a remainder of between 1 and 4 million tons per year, totaling about 25 million tons cumulatively over 2022-2030. These allowances are assumed available for sale to the owners of CPP-regulated units in any state that adopts a mass-based plan. At $21.50 per ton, the undiscounted value over 2022-2030 is $540 million ($258 million in net present value terms).

Scenario 2 has significantly more allowance set-asides: for renewable energy (5 percent of the state budget), for existing natural gas combined cycle units, and for other purposes (20 percent of the state budget); in all, set-asides amount to 29-33 percent of the state budget, before accounting for additional allowances redirected from retired units to the renewable energy set-aside. Scenario 2 also discontinues allowance allocation to a retired unit two years after retirement, which significantly reduces the Company's budget. The Company earns some allowances back from the CEIP, renewable energy, and existing NGCC set-asides by implementing those actions, but is assumed to receive no allowances from the other set-asides, which simply redirect allowance value to other entities and purposes. Once the Company surrenders sufficient allowances to cover its CPP-regulated unit emissions each year, there is a deficit in some years and a small remainder in others, and over 2022-2030 a much smaller remainder of 3.5 million tons cumulatively. These allowances are assumed available for sale to the owners of CPP-regulated units in any state that adopts a mass-based plan. At $21.50 per ton, the undiscounted value over 2022-30 is $75 million ($33 million in net present value terms).

At $21.50 per ton, the difference between State Plan scenarios 1 and 2 is an undiscounted value of $465 million over 2022-2030 ($225 million in net present value

terms). The value at three different CO_2 allowance prices, corresponding to the Commission's low, midpoint, and high regulatory cost values, is shown below:

Table 1: Value of allowances, in excess of compliance needs, under two State Plan scenarios (hundreds of million dollars, undiscounted, over 2022 to 2030)

Allowance Price	Scenario 1	Scenario 2	Difference
$9/ton	$226	$31	$194
$21.50/ton	$540	$75	$465
$34/ton	$853	$119	$735

The "difference" column in this table essentially represents the value transferred from the Company's customers to other parties, in or out of state, by shifting to a State Plan that sets aside significantly more allowances, and discounts the value of retiring coal units by allocating allowances for only a short time post-retirement.

Since all allowance value is assumed to accrue to the Company's customers, a state plan similar to Scenario 1 would provide around $540 million to help mitigate the rate impacts of transitioning to a lower-carbon energy system. A state plan similar to Scenario 2 would provide $465 million less to mitigate customer cost impacts, and would shift much of this value from our customers to other parties.

4. Rate-Based Compliance

The actions in our Current Preferred Plan would also generate a large number of ERCs if Minnesota adopts a rate-based State Plan. Actions eligible for ERC issuance ultimately depend on the State Plan, but the eligible actions under the CPP include:

- *Renewable energy*: generation starting January 1, 2022 from new facilities placed in service after January 1, 2013. The Company's new wind and solar placed in service after 2012, including projects earlier approved by the Commission, and projects proposed in the Current Preferred Plan, are eligible;
- *Energy efficiency*: electricity savings starting January 1, 2022, from measures placed in service after January 1, 2013, are eligible;
- *Nuclear uprates*: the 71 MW uprate at our Monticello nuclear generating station is eligible, since it was placed in service after 2012;
- *New Canadian hydro*: if the Company executes a new power purchase agreement with a new or uprated hydro facility in Canada, this would be eligible;

- *Affected units*: ERCs generated by natural gas combined cycle units operating below the subcategory rate specified for that year, as well as combined cycle units generating gas-shift ERCs, are eligible;[10]
- *CEIP*: generation and savings in 2020-21 from renewable energy projects that commence construction, and low-income energy efficiency measures placed in service, after final state plan submittal in 2018, including ERCs from the EPA match of 1:1 for renewable energy and 2:1 for low-income energy efficiency.[11]

Greater uncertainty surrounds the ERC eligibility of actions such as distributed generation, repowering on-site of an existing renewable energy facility built before 2012, combined heat and power, etc.

Based on preliminary estimates of the ERCs generated from our proposed actions, we expect the Company would generate more ERCs than needed to bring our regulated units into compliance. These ERCs are assumed available for sale to the owners of CPP-regulated units in any state that adopts a rate-based plan. We have not attempted to estimate a value of excess ERCs, since we have no basis for predicting an ERC price comparable to the available methods for CO_2 allowance prices; however, as with allowances, the value of any excess ERCs accrues to our customers and could be used to reduce the electricity rate impacts of transitioning the Company's generation portfolio to a lower-carbon system.

C. State Plan Positions

The Company has not yet taken a position whether a rate-based or mass-based State Plan is best for our customers, since that decision is dependent on the specifics of each plan. A mass-based plan has advantages in terms of simplicity of administration and compliance, but – as indicated by the two Scenarios above – poses risks of allowance allocation decisions that could significantly increase costs to our customers. A rate-based plan has lower allocation risks, but is significantly more complex to administer as proposed by EPA. We are currently in the process of identifying, in discussion with the MPCA, other utilities, and other stakeholders, areas of agreement for each plan type.

[10] Gas-shift ERCs are a special type of ERCs awarded to combined cycle units that operate above their unit-specific 2012 baseline level of operation. Gas-shift ERCs may only be used for compliance by coal units.
[11] As mentioned above, we are not assuming for this analysis that EPA moves the CEIP eligibility dates earlier, nor that MPCA submits its State Plan earlier than the September 2018 deadline.

If MPCA selects a mass-based plan, we believe this plan should:

- Enable interstate trading through a "trading-ready" approach;
- Cover existing affected coal and natural gas combined cycle units only, not new units;[12]
- Demonstrate to EPA that the risk of emission leakage is low in Minnesota, using state Renewable Energy Standard and Conservation Improvement Program mandates, integrated resource plans, etc.;
- Allocate allowances to the owners of affected units on behalf of their customers. Allowance auctions serve no policy objective in a fully regulated state like Minnesota, merely increasing costs to customers without achieving additional CO_2 reductions;
- Allocate allowances to an affected unit that retires after 2012 for the duration of the CPP program. The analysis above illustrates the significant amount of value transferred from our customers to other parties, in and out of state, by redirecting these allowances;
- Not assign a "shelf life" to previously issued allowances;
- Allocate allowances among affected unit owners based on 2010-12 operations;[13]
- Minimize allowance set-asides, which utilities agree are likely to increase costs, except for the Clean Energy Incentive Program (CEIP) set-aside;[14]
- Require that the state allowance budget be used only for purposes of compliance, and that allowances may not be retired for other purposes;
- Include, but explore the ability to improve, the CEIP.

If the State Plan significantly deviates from the above principles, a rate-based plan may be better for our customers. If MPCA selects a rate-based plan, we believe this plan should:

---

[12] The Clean Air Act defines existing units as those constructed prior to, and new units as those constructed subsequent to, January 8, 2014 – the date of EPA's release of the proposed New Source Performance Standard under Clean Air Act section 111(b).

[13] For example, allowances could be allocated based on 2010-12 generation (as proposed by EPA in the proposed Federal Plan), 2010-12 emissions, or another basis. EPA leaves the allocation method to states' discretion. The most appropriate method (both whether based on generation or emissions, and whether any allowance set-asides are appropriate) remains under discussion as of this filing. Whatever the method, the plan should incorporate EPA's correction in the final CPP for Sherburne County Unit 3, replacing 2012 data with typical-year generation or emissions.

[14] Whether any targeted set-asides are appropriate likewise remains under discussion as of this filing. In general, utilities agree allowance set-asides should be minimal and used with caution, since each set-aside reduces the budget allocated to utility customers and thus increases their costs.

- Enable interstate trading through a "trading-ready" approach;
- Use the subcategory-specific emission performance rates for fossil fuel-fired steam generating units and stationary combustion turbines;
- Leverage Minnesota's robust renewable energy and energy efficiency policies to streamline EPA's evaluation, monitoring and verification requirements for ERC crediting;
- Make the broadest possible set of zero-carbon actions eligible to earn ERCs, including but not limited to:
    - renewable energy (all types defined as renewable in state statute),
    - renewable energy uprates and repowering,
    - distributed generation,
    - end-use energy efficiency,
    - demand response and demand-side management,
    - nuclear uprates,
    - Canadian hydro,
    - existing natural gas combined cycle operating below the applicable subcategory rate or generating gas-shift ERCs, and
    - transmission and distribution efficiency improvements;
- Not assign a "shelf life" to ERCs;
- Award ERCs to existing (pre-2012) renewable energy facilities that are significantly repowered on the same site after 2012;
- Include, but explore the ability to improve, the CEIP.

CERTIFICATE OF SERVICE

I, SaGonna Thompson, hereby certify that I have this day served copies or summaries of the foregoing document on the attached list of persons.

xx by depositing a true and correct copy thereof, properly enveloped with postage paid in the United States mail at Minneapolis, Minnesota;

or

xx by electronic filing.

Docket No. E002/RP-15-21

Dated this 29th day of January 2016

APPENDIX N4 – RENEWABLE ENERGY COMPLIANCE POSITIONS

Our Upper Midwest Integrated System provides service to five states—and each state has varying levels of renewable energy requirements. Each state's target is expressed as a percentage of electric retail sales from qualifying resources by a certain date. Specific targets are as follows:

- North Dakota and South Dakota each has a voluntary Renewable and Recycled Energy Objective to have 10 percent renewable or recycled energy by 2015.[1]
- Michigan has a Renewable Energy Standard that requires Xcel Energy to have 10 percent renewable energy by 2015.
- Wisconsin has a Renewable Portfolio Standard that requires Xcel Energy to have approximately 12.9 percent renewable energy by 2015.
- Minnesota has a Renewable Energy Standard that requires Xcel Energy to have 30 percent by 2020, including interim targets of:
    - Of the 30 percent, Minnesota's RES requires Xcel Energy to have 25 percent of the Minnesota retail sales to come from wind energy by 2020.[2]
    - In addition, Minnesota's SES requires Xcel Energy an additional 1.5 percent of the electricity it provides to Minnesota retail customers to come from solar energy by 2020.

A. Renewable Energy Credit Accounting and Management

We plan and operate our NSP system generation and transmission facilities as an integrated system in the most cost effective way possible to the benefit of all customers across the five state jurisdictions and that complies with the regulations of each of these states. In order to meet each of the Renewable Energy Standards in those states, we maintain a set of banked Renewable Energy Credits (REC) for future compliance. We maintain our REC inventory in the regional Midwest Renewable Energy Tracking System (M-RETS), which was established for compliance tracking

[1] As defined in North Dakota Century Code, 49-02-25, recycled energy means "systems producing electricity from currently unused waste heat resulting from combustion or other processes into electricity and which do not use an additional combustion process. The term does not include any system whose primary purpose is the generation of electricity unless the generation system consumes wellhead gas that would otherwise be flared, vented, or wasted." South Dakota Codified Law 49-34A-94 contains a similar definition.

[2] This requirement is included in the total 30 percent RES, and we are authorized to count a limited amount of solar energy towards this 25 percent. Large hydro does not count as a renewable energy source for purpose of the Minnesota RES. Minn. Stat. § 216B.1691

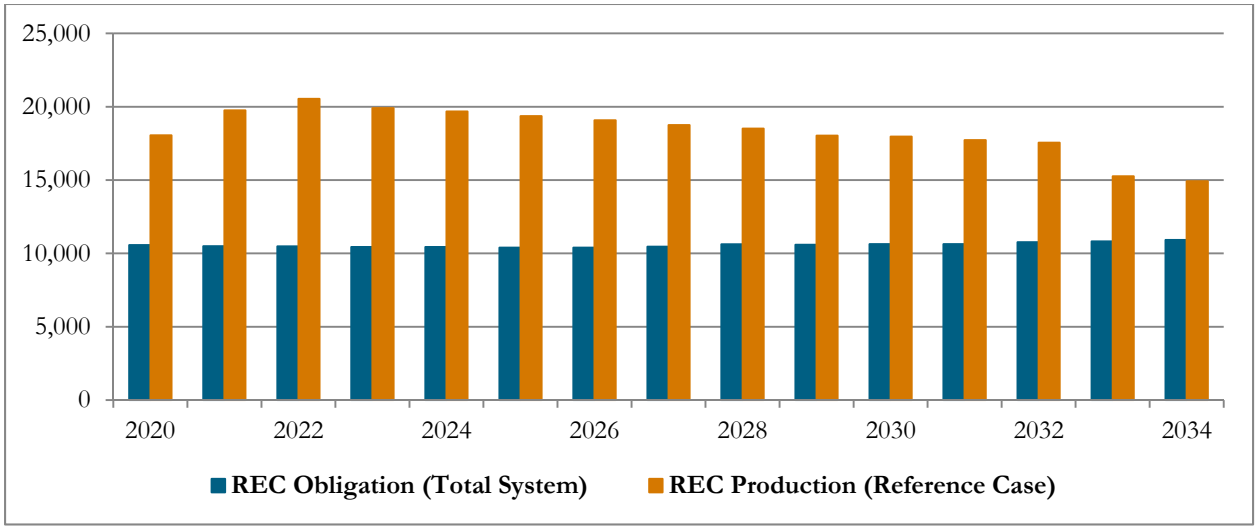
relative to state renewable energy standards. In M-RETS, one MWh of generation from a renewable source equates to one REC.

The Company currently expects to generate a sufficient amount of RECs throughout the planning period to satisfy our current renewable obligations without adding any renewable capacity beyond the projects we currently have under contract.

B. Renewable Energy Standard and Objective Compliance

Figure 1 below demonstrates our compliance through the Resource Plan planning period with all renewable energy standards and objectives across the NSP system with existing and currently approved resources. This evaluation assumes no large scale solar or wind additions, however includes modest distributed solar additions throughout the planning period. Appendix N5, filed June 1, 2018, is the company's most recent Minnesota biennial RES Compliance filing.

Figure 1: Annual RES & REO REC
NSP System Obligation & Production



C. Solar Energy Standard Compliance

Figure 2 below demonstrates our compliance with the Minnesota 1.5 percent Solar Energy Standard (SES) through the Resource Plan planning period with existing and currently approved programs. This evaluation assumes no large scale solar additions, however includes modest distributed solar additions throughout the planning period. Appendix N7, filed June 1, 2019, is the company's most recent Minnesota SES Compliance filing.

REFILED

Mr. Daniel P. Wolf
Executive Secretary
Minnesota Public Utilities Commission
121 7th Place East, Suite 350
St. Paul, Minnesota 55101-2147

RE: RENEWABLE ENERGY OBLIGATION (REO)-RENEWABLE ENERGY STANDARD (RES) COMPLIANCE REPORT

COMMISSION CONSIDERATION AND DETERMINATION ON COMPLIANCE WITH RENEWABLE ENERGY STANDARDS
DOCKET NO. E999/M -18-78

RENEWABLE ENERGY CERTIFICATE RETIREMENT AND REPORTING FOR COMPLIANCE YEAR 2017
DOCKET NO. E999/PR-18-12

GREEN PRICING VERIFICATION FILING PROCESS
DOCKET NO. E999/PR-02-1240

Dear Mr. Wolf:

On June 1, 2018, Northern States Power Company, a Minnesota corporation, submitted a Non-Public version of the attached compliance report to fulfill the verification and filing requirements for the Renewable Energy Standards (RES) Renewable Energy Credit (REC) retirement and Green Pricing REC retirement, along with the RES biennial filing obligations required by Minn. Stat. § 216B.1691, Subd. 3.

On June 13, 2018, the MN Department of Commerce (DOC) made a request that we refile the report with public information on subscriptions to Renewable*Connect – Government to allow the DOC to communicate overall trends in voluntary purchases to the public. The Company contacted the Renewable*Connect-Government customer and received written authorization to refile the information as public. The Company submits this letter and the attached report containing the requested public information in the above-referenced docket.

This filing is made pursuant to the Minnesota Public Utilities Commission's April 17, 2014 NOTICE OF BIENNIAL FILING OBLIGATIONS, which established Docket No. E999/M-14-237. We have provided the required information in the attached Excel spreadsheet templates. Attachment A contains REC retirements, biennial reporting obligations, and REC sales and purchases.

Attachment A contains certain portions that have been designated as Trade Secret information pursuant to Minnesota Statute § 13.37, subd. 1(b). In particular, the information designated as Trade Secret derives independent economic value, actual or potential, from not being generally known to, and not being readily ascertainable by proper means by, other persons who can obtain economic value from its disclosure or use.

REC Retirement

By May 1, 2018, the Company retired approximately 7.4 million RECs, representing 25 percent of annual retail sales for calendar year 2017, using the Midwest Renewable Energy Tracking System (M-RETS). The Company is therefore in compliance with the Minnesota RES requirements identified in Minn. Stat. § 216B.1691 and the Commission's March 19, 2010 Order in Docket No. E999/CI-03-869. In addition, by May 1, 2018, the Company retired a large number of RECs for our Green Pricing Programs as detailed in Attachment A.

The required information specified in the Commission's April 17, 2014 NOTICE and the May 28, 2013 ORDER FINDING UTILITIES IN COMPLIANCE WITH MINN. STAT. § 216B.1691 AND MODIFYING BIENNIAL REPORTING PROCEDURES in Docket No. E999/M-12-958, including the RES calculations, the RECs retired and the names of the M-RETS retirement sub-accounts, is provided in Attachment A.

As noted in Attachment A.6, we sold 356,310 RECs allocated to the Company's Minnesota jurisdictional share during the 2017 calendar year. The Company also

purchased 169,500 RECs for our Windsource program and has included those quantities in Attachment A.6.

Biennial REO-RES Compliance

This report provides the Company's actual retail sales data from 2017 and forecasted retail sales data for 2018 – 2020, generation data summary for this reporting period, other state RES or Objectives to which the utility is subject, actions taken to address the RES requirements, and a discussion of potential obstacles to meeting our requirements and solutions to the same.

Pursuant to Minn. Stat. § 216.17, subd. 3, we have electronically filed this document and served copies on all parties on the attached service list. If you have any questions about this information, please contact me at bria.e.shea@xcelenergy.com or (612) 330-6064.

Sincerely,

/s/

BRIA E. SHEA

Renewable Energy Certificate Retirement Report for Renewable Energy Standards and Green Pricing Programs
REC Retirement Compliance Reporting

Due: June 1st, 2018
For the Reporting Period:
January 1, 2017 - December 31, 2017*
*Exception for Worksheet A.6: Ordering pt. 4C requires reporting REC sales & purchases for the **2 preceding calendar years**.

Instructions

Note: items in red indicate changes in reporting from previous year
Complete the following worksheets and e-file in **Excel (XLS or XLSX)** format:

- Worksheet 1, Utility Info
- Worksheet 2, Renewable Energy Standard Retail Sales
- Worksheet 3, Green Pricing Program Retail Sales
- Worksheet 4, RES & Green Pricing REC Retirements
- Worksheet 5, Biennial Compliance Reporting
- Worksheet 6, RECs Bought and Sold During the Reporting Period

To e-file, login, or register, at: https://www.edockets.state.mn.us/EFiling/home.jsp
For directions on how to e-file, see: http://www.commerce.state.mn.us/eDocFile/eFilingHelp.html
For questions about Renewable Energy Certificate retirement or compliance with Renewable Energy Standards, contact Kelly Martone at 651-201-2245 or at kelly.martone@state.mn.us.
For questions about Green Pricing or about filling out this spreadsheet, send an email to: DG.Energy@state.mn.us.
For questions about e-filing, contact Karen Santori at 651-539-1530 or at karen.santori@state.mn.us .

Minnesota Department of Commerce: Docket No. E999/PR-02-1240 Reporting Period: **January 1, 2017 - December 31, 2017**

Total Retail Sales to Minnesota Customers and
Renewable Energy Certificates Required to be Retired for RENEWABLE ENERGY STANDARD Compliance

Retail Sales Total (MWh)	29,739,386
RES Percentage Obligation	25%
RECs Required to be Retired	7,434,847
Actual RECs Retired	7,434,847

Enter current reporting year data.

Utility ID #	Utility	Retail Sales Amount (MWh)	Notes
85	Xcel Energy (NSP-MN)	29,739,386	

Minnesota Public Utilities Commission: Docket No. E999/PR-18-12, Docket No. E-999/M-18-78 **Attachment 3**
Minnesota Department of Commerce: Docket No. E999/PR-02-1240 Reporting Period: **January 1, 2017 - December 31, 2017**

GREEN PRICING Program Sales

TOTAL **GREEN PRICING** Sales (MWh)	220,817
RECS retired for **GREEN PRICING** programs	220,817

List the cumulative retail sales of green pricing electricity, including utility-managed community solar, and the number of customers as of December 31, 2017.

Utility ID # (on Worksheet 1)	Utility Name	Program Name	No. of Program Customers	Program Sales (MWh)	Retail Rate ($/kWh)	Notes
85	Xcel Energy (NSP-MN)	Windsource Minnesota	52,872	178,613	$0.0353	
85	Xcel Energy (NSP-MN)[1]	Renewable * Connect	882	3,097	$0.03555	2017 Month-to-Month Rate
85	Xcel Energy (NSP-MN)[1]	Renewable * Connect	794	5,082	$0.03243	2017 5-year rate
85	Xcel Energy (NSP-MN)[1]	Renewable * Connect	534	28,459	$0.03193	2017 10-year rate
85	Xcel Energy (NSP-MN)[1]	Renewable * Connect Government	1	5,566	$0.03093	2017 Rate
85	Xcel Energy (NSP-MN)	Community Solar Gardens		0		No sales since company receives all RECs and subscribers do not get CSG energy

[1] The total amount of program sales stated above and the equivalent REC Retirement quantities are approximately 95 MWh higher than what was filed in the 2017 Renewable*Connect compliance filing dated April 1, 2018, due to a discovered discrepancy between company billing data reports and company program subscription reports. It was found that customers' sales continued to be accounted for although some customers had previously terminated their subscriptions. This artificial increase in sales, lead to an increase in REC retirements. The reporting issue has been corrected and the same 95 RECs will be reduced from the 2018 Renewable*Connect sales numbers.

Biennial Compliance reporting

Please report the following items in compliance with the PUC May 28, 2013 Order in Docket No. E999/M-12-958

Ordering Point

4.A. & 5.H. The year through which the utility can maintain compliance with its current renewable portfolio*
*Include banked Renewable Energy Credits (RECs)

Beyond 2040

4.B. & 5.I. Projected compliance for the current plus three (3) upcoming years. Include banked RECs.

Year	Actual/Projected MN retail sales (MWh)	RES Req.(%)	RES Req. (MWh)	Projected Resources (MWh)	Projected Surplus/ (Deficit) (MWh)
2017	29,739,386	25%	7,434,847	8,377,040	7,951,109
	[TRADE SECRET BEGINS		TRADE SECRET BEGINS		
2018		25%			
2019		25%			
2020		30%			
	TRADE SECRET ENDS]				TRADE SECRET ENDS]

5.E.2 & 5.F. Identify other State Renewable Standards or Objectives to which the utility is subject, and the percentage of renewable energy allocated to meet the renewable requirements.

State	RES Req. (MWh)	RES Req. (%)	Percent of utility's total system renewable generation apportioned to this state (%)*

WI	842,719	12.89%	15.97%
MI	14,118	10%	0.33%
SD	205,031	10% Voluntary	5.14%
ND	0	Voluntary	5.43%

*apportionment of renewable energy should reflect each state's percentage of the utility's total system sales.

5.E.3 (i) **The status of the utility's renewable energy mix relative to the objective & standards.**

The Company's overall renewable energy mix exceeds the renewable portfolio standard (RPS) obigations for the state of Minnesota, and other states it operates in, and is sufficiently able to comply with the current requirements. The Company continues to increase its renewable energy mix, primarily in wind and solar, in an effort to maintain compliance with increased obligations, reduce costs, and decrease the carbon footprint.

5.E.3(ii) **Efforts taken to meet the objective and standards**

The Company recently has received approval to add 1850 MW of wind resources to add to the renewable portfolio. These resources are a combined mixture of Self-Build, Build-Own-Transfers(BOT), and Power Purchased Agreement (PPAs) projects and are all expected to achieve commercial operations prior to 2021 in order to qualify for the Production Tax Credit (PTC). The approval of these projects continues to prove to be a reasonable and prudent way for NSP to meet its obligations under the MN Renewable Energy Standard.

5.E.3(iii) **Obstacles encountered or anticipated in meeting the objective or standards**

In 2020, the Renewable Portfolio Standard (RPS) increases the overall RES, has a 24% wind requirement as part of the 30% RES, as well as an additional 1.5% solar obligation. The existing and approved resources will satisfactorily meet all requirements through 2030. The 2030 SES 10% goal will substantially increase the solar need, and will necessitate the addition of solar resources in the future.

5.E.3(iv) **Potential solutions to the obstacles**

See question 5.E.3(ii) for potential solutions to meet required objectives and standards. This issue will be addressed in future resource plans.

5.G. **List any renewable generation facilities expected to become operational during the upcoming year**

Facility Name	Type	Capacity (MW)	Cap. Factor (%)	Expected Comm'l Operation Date
Community Solar Gardens	Solar	various	16-19%	various
Small Solar - RDF Projects	Solar	various	16-19%	various
Solar*Rewards Incentive Installations	Solar	various	16-19%	various

5.K. **Identify efforts taken to adequately protect against undesirable economic impacts on ratepayers, including, but not limited to keeping customer's bills and the utility's rates as low as practicable, given regulatory and other constraints.**

In an effort to acquire low cost wind energy, the Company issued an RFP in late 2016. The timing of this RFP permitted the projects to qualify for the PTC tax benefits. The Company will continue to take advantage of market opportunities, as these are identified as beneficial to the rate payer.

APPENDIX N6 – RENEWABLE ENERGY STANDARD (RES) RATE IMPACT REPORT

Renewable Energy Standard (RES) Rate Impact Report

Northern States Power Company
July 2019

I. REGULATORY CONTEXT

A. Procedural History

Minn. Stat. §216B.1691 (Renewable Energy Objectives) identifies the eligible renewable generation technologies, the percentage of retail sales that must come from renewables, and the reporting requirements that each electric utility shall undergo with regard to the statute's objectives. In 2011, subd. 2(e) was enacted to require electric utilities to file reports with the Commission estimating the rate impacts resulting from utility actions taken to comply with the renewable energy objectives of the state. During the 2013 legislative session, Minn. Stat. §216B.1691 subd. 2(e) was amended to require the Commission, in consultation with the Department of Commerce, to devise a uniform rate impact reporting system.

On November 6, 2013, the Commission issued a Notice of Comment Period that included a staff proposal for a format for a uniform reporting system. The Notice also proposed four "general guiding principles" to assist the Commission with developing the uniform reporting system. The general guiding principles were to: 1) Foster transparency; 2) Support consistency, coordination, and non-burdensome administration; 3) Provide realistic representation of baseline, actual-to-date and future expected costs for achieving and maintaining standard compliance; and 4) Enable comparison across utilities.

On October 2, 2014 in Docket E999/CI-11-852, the Commission deliberated regarding the matter of utility renewable energy cost impact reports required by Minn. Stat. § 216B.1691, subd.2e. During these deliberations, the Commission decided on a variety of motions regarding the information that utilities were to provide when reporting on the estimated rate impacts resulting from actions taken to comply with the Renewable Energy Standard (RES) and Solar Energy Standard (SES) established in Minn. Stat. § 216B.1691, including the requirement that utilities file the report as an appendix in their Integrated Resource Plan.

On January 6, 2015 the Commission issued an Order establishing a uniform report system for estimating the rate impact of complying with the RES and SES.

II. FORMAT USED FOR RATE IMPACT CALCULATIONS

The RES and SES rate impacts provided in this report incorporate a general template format consistent with Commission's January 6, 2015 Order. This report:

a. Includes direct costs including payments under PPAs and revenue requirements associated with utility-owned renewable energy projects;

b. Provides a narrative discussion about the cost impacts that adding generators powered by renewable sources could have on a utility (See Appendix Q: NSP Wind & Solar Integration Study (Enernex);

c. Includes estimates of transmission costs attributable to renewables;

d. Includes direct avoided costs, including avoided energy and capacity costs, and/or avoided costs of facilities the utility could have added to its system instead of renewable resources as necessary to meet RES/SES;

e. Includes consideration of indirect avoided SO2 and NOx permit costs and avoidance of future CO_2 emissions based on costs set by Minn. Stat. § 216H.06;

f. Calculates separate rate impacts for the RES and SES;

g. Provides rate impacts on both annualized and levelized formats;

h. Includes rate impact calculations consistent with those outlined on page 21 of the Briefing Papers;

i. Includes all facilities used to comply with the RES and SES, regardless of when they were constructed.

III. METHODOLOGY

As required by the statute, we calculated separate rate impacts for the RES and for the SES. The RES rate impact calculations were performed for two different time frames: Historic Years 2005-2019 and Future Years 2020-2034. Recognizing that the SES was adopted in 2013, the first full calendar year was 2014. However, there was minimal solar on our system prior to 2017. Therefore, the SES rate impact we present herein uses Historical Years 2017-2019 and Future Years 2020-2034.

A. Historic RES Rate Impact (2005-2019)

We determined historic rate impacts by comparing the actual direct costs associated with all the Company's renewable generation each year with an estimate of the direct costs that would have been incurred had we acquired the same accredited generation capacity (MW)[1] and energy (MWh) from non-renewable resources. We used historic Midcontinent Independent System Operator (MISO) cost of new entry (CONE) values from 2005-2013, with updates to align with Strategist assumptions[2] to estimate avoided capacity costs. We estimated avoided energy costs using historic MISO locational marginal prices (LMPs) for the NSP market node.[3] For 2019, we estimated avoided energy costs using the Minnesota Hub forward curve. Included in the cost of renewables are estimates of transmission costs directly attributable to renewable resources. Tables 9 and 10 in Part III.D of this report identify transmission projects that, from the Company's perspective, are directly attributable to renewable generation resources. Three of the identified transmission projects are MISO multi-value projects[4] (MVPs). Since MVP transmission projects provide a variety of benefits to the electric system, 70 percent of the MVP transmission projects costs that are allocated to NSP customers were included as a direct cost of renewables for purposes of this report. For all other transmission projects identified in Tables 9 and 10, we included 100 percent of the project costs allocated to NSP customers as a direct cost of renewables.

In developing the historic RES rate impact calculations, the Company focused its efforts on estimating and reporting impacts to retail customers. The Tables below show only retail customer impacts of complying with the RES and SES. These costs are reflective of the entire NSP System.

1 MW in this instance refers to the aggregate MW of MISO accredited capacity NSP claimed for its fleet of renewable generation resources (both owned and purchased).
2 See Appendix F2: Strategist Assumptions and Inputs for additional detail
3 See Table 10 in this report for historical MISO values used in these calculations.
4 The MVPs are Lacrosse-Madison, Big Stone-Brookings, and CAP X 2020-Brookings.

B. Future RES Rate Impact (2020-2034)

Future RES rate impacts were derived by comparing NSP electric system cost projections within the Strategist computer model for two different futures: 1) a "RES" future that reflects the Reference Case in the 2020-2034 Resource Plan, and, 2) a "No RES" future in which only RES resources existing on the system today are removed, and instead are replaced with an equivalent amount of our new generic wind and solar resource options at current pricing levels. In doing so, the Company was able to isolate the cost of bringing early RES and SES resources onto the system for compliance purposes rather than economics.

It is important to note that we slightly modified our approach to the future RES rate impact in this analysis as compared to previous reports, in which we replaced all existing RES resources with thermal generation. Unlike in previous years, new wind and solar resources are now least-cost options relative to thermal replacement resources – and as a result, wind are solar are selected ahead of thermal options in the Strategist Expansion Plan Optimizations. Therefore, the future rate impact calculations contained herein isolate the higher costs of early wind and solar additions made to satisfy RES requirements, as opposed to adding the equivalent amount of renewables at current, economic cost levels.

For biomass resources, the "No RES" case assumes market energy and capacity replacement costs. We used the Minnesota Hub forward curve to forecast replacement energy costs and our generic CT capacity costs to forecast replacement capacity costs. Comparing the costs of the existing biomass resources to market pricing allowed us to identify the above market costs of these resources. For hydro resources, we opted to include the costs associated with existing resources in both the "RES" and "No RES" scenarios. Our small hydro resources were not added for RES compliance purposes or due to any mandates, and therefore do not contribute to any RES related rate impacts.

As stated, the "RES" case is represented by the "Reference Case" that is discussed throughout this Resource Plan document. Details as to the major assumptions contained in the "Reference Case" (e.g., fuel prices, sales forecast, resource additions, resource retirements, CO_2 costs/values, etc.) can be found in Appendix F2 of this Resource Plan. The "Reference Case" assigns a cost to CO_2 emissions of $25.00/ton starting in 2025 and escalates annually at the inflation rate; this value also represents the avoided costs of CO_2 attributed to renewables. As existing renewable

resources are now being replaced with new lower cost generic renewables instead of thermal resources in this rate impact analysis, the carbon impacts between the two scenarios are not impactful.

By taking the difference between the annual system costs of the "RES" and "No RES" cases, we estimated the future costs (or savings) associated with all of the Company's actions to comply with the RES. It is important to emphasize that this comparison of a "RES" future and "No RES" future focuses exclusively on existing RES resources, as we are able to meet the RES requirements during the planning period with existing resources alone. We excluded any of the new 1,850 MW of wind, and also excluded additional future renewables contained in the "Reference Case," as these renewable additions are driven by economics as opposed to RES compliance. As a result, the future rate impacts identified in this report are not inclusive of all renewables and may be markedly different from rate impacts calculated for incremental renewable resources.[5]

For future years in the "RES" scenario, we included transmission costs associated with RES wind resources using the same methodology as described above for the historical rate impact. For the "No RES" scenario, future wind avoided transmission costs were derived using an average of the transmission costs associated with owned projects in our 1,850 MW wind portfolio. Since in the "No RES" scenario, we are assuming that existing RES resources are replaced with new generic wind additions in 2020, we felt the timing coincided well with the 1,850 MW of wind additions and therefore that using transmission cost assumptions informed by those projects was appropriate. We did not assume any transmission costs or avoided transmission costs for biomass or hydro resources in either the "RES" or "No RES" scenario.

C. Historical SES Rate Impact (2017-2019)

Historical SES rate impacts were derived using the same methodology as described above for the historical RES rate impact. The historical rate impact report starts in 2017. This is because there were minimal amounts of solar on the system in years prior. Counting these prior years would dilute the overall historical rate impact on a levelized basis.

[5] Incremental in this instance refers to additional renewables added to the system in the future.

D. Future SES Rate Impact (2020-2034)

Future SES rate impacts were derived in a manner similar to that described above for future RES rate impacts. We made comparisons between Strategist computer model runs for two different futures: (1) a "SES" that includes all existing renewables as well as additional renewables (including solar) that the optimization selects based on economics, and (2) a "No SES" future in which existing solar generation resources contained in the "SES" case are stripped out and replaced with equivalent amount of our new generic solar resource options priced at current market levels starting in 2020. The difference in annual system direct costs between these analyses represents the future year costs or savings associated with the Company's future actions to comply with the SES. The "SES" case is identical to the "Reference Case" discussed throughout this Resource Plan.

We assumed that no transmission costs were attributable to SES resources, given the relatively smaller quantities of solar that are currently interconnected to our system. The MISO MVP and CAPX2020 buildouts were primarily driven by wind, and thus solar additions are assumed to have not yet prompted any major transmission expenditures. Given this, we also assumed no avoided transmission costs for the generic replacement solar that was included in the "No SES" future.

E. Conclusions

Our analysis shows that the RES and SES mandates have generally increased costs for customers, as they prompted renewable adoption before these resources were economic. In past Resource Plans, removing the RES and SES resources generally resulted in higher thermal generation adoption. We have now reached a point, however, where wind and solar resources are the most economic options, and therefore are selected in portfolio optimization modeling ahead of thermal resources. Because of this new reality, we had to slightly modify our approach to calculating the RES/SES rate impact, as discussed above. Modifying the analysis to include renewable replacement, as opposed to thermal replacement, reveals higher rate impacts caused by RES and SES resources over time, driven the reality that new wind and solar resources are now much lower cost resource options than they were in the past.

Table 1: Annualized Historic RES Rate Impact (2005-2012)[6]

	Historic Period

RE: ANNUAL REPORT
SOLAR ENERGY STANDARD
DOCKET NO. E999/M-19-276

Dear Mr. Wolf:

Enclosed for filing is the 2018 Annual Report on Progress in Achieving the Solar Energy Standard of Northern States Power Company, doing business as Xcel Energy, submitted in compliance with the Commission's April 25, 2014 Order in Docket No. E999/CI-13-542.

Please note that we have marked as "Non-Public" certain information identifying customer names, locations, energy usage or bill credits. This is considered to be private data pursuant to Minn. Stat. §13.02, Subd. 9, and is non-public pursuant to Minn. Stat.§ 13.37, Subd.2.

We have also marked as "Non-Public" capacity factor information relating to specific Purchase Power Agreements (PPAs). The terms of the Commission approved PPAs require that this information be non-public. Further, this is considered to be "nonpublic data" pursuant to Minn. Stat. §13.02, Subd.9, and is also "Trade Secret" information pursuant to Minn. Stat. §13.37, subd. 1(b) as it derives independent economic value, actual or potential, from not being generally known to, and not being readily ascertainable by proper means by other persons who can obtain economic value from its disclosure or use.

We have electronically filed this document with the Minnesota Public Utilities Commission, and copies have been served on the parties on the attached service list. Please contact Amber Hedlund at amber.r.hedlund@xcelenergy.com or (612) 337-2268 or me at bria.e.shea@xcelenergy.com or (612) 330-6064 if you have any questions regarding this filing

Sincerely,

/s/

BRIA E. SHEA
DIRECTOR, REGULATORY & STRATEGIC ANALYSIS

Solar Energy Standard Annual Report

Due:	May 31, 2019
Reporting period:	January 1, 2018 – December 31, 2018
Statute/Rule reference:	216B.1691 Subd. 2f(g). (g) Beginning July 1, 2014, and each July 1 through 2020, each public utility shall file a report with the commission reporting its progress in achieving the solar energy standard established under this subdivision. Order, issued April 25 in Docket No. E-999/CI-13-542 Order, issued October 23, 2014 in Docket No. E-999/M-14-321 Order, issued November 28, 2016 in Docket No. E-999/M-16-342 Order, issued October 20, 2017 in Docket No. E-999/M-17-283 Order, issued September 21, 2018 in Docket No. E-999/M-18-205

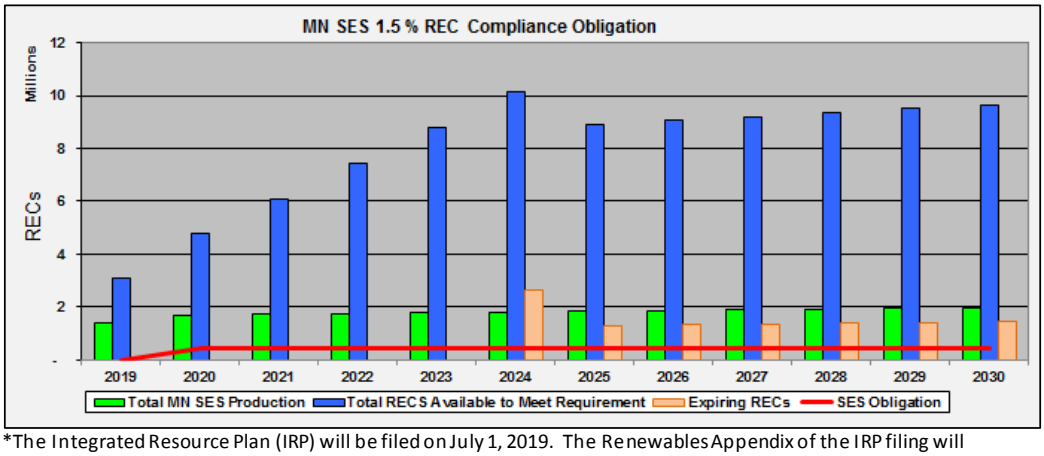
Comments/Notes	

1. **Summary of ongoing efforts to obtain solar energy, including a brief summary of the anticipated mix of project sizes for SES compliance.**
Docket No. E999/CI-13-542, Commission Order (April 25, 2014), Order Point 4.H

For purposes of this Section 1, Solar Energy Standard (SES) compliance means the requirement set forth in Minn. Stat. § 216B.1691, Subd. 2f, whereby Xcel Energy, by the end of 2020, needs to generate or procure sufficient electricity generated by solar energy so that at least 1.5 percent of the Company's total retail electric sales to retail customers in Minnesota is generated by solar energy. The other requirement in Subd. 2f regarding systems of 40 kW (AC) or less is not addressed in the Company's response to Section 1 of this report, but instead is addressed in its response to Section 2 below.

The Company has developed a large portfolio of programs to provide renewable options to residential and commercial customers. Since the passage of the SES under the 2013 Energy Omnibus Bill, we have also grown our utility portfolio of solar resources to expand access to solar benefits to all customers while achieving compliance in 2020. The expected cumulative impact of the programs and efforts detailed below are graphically displayed below in Graph 1, and in the attached Excel file (Tab 5 – Additional Graphs). The Company expects to accumulate and exceed the amount of Solar RECs (SREC) required to satisfy the MN SES compliance requirements beginning in 2020 and continue well beyond 2030.

Graph 1*



*The Integrated Resource Plan (IRP) will be filed on July 1, 2019. The Renewables Appendix of the IRP filing will provide updated SES compliance graphs and resource related information.

A. Solar*Rewards (Second Generation) – For PV installations of 40 kW_{DC} or less

Our Solar*Rewards program offers customers installing solar photovoltaic (PV) systems sized 40 kW_{DC} or less an incentive based on the system's energy production. The program offers differing production incentives depending on the project for a 10-year period under a Solar*Rewards contract. The legislature under Minn. Stat. § 116C.77792 has authorized this program to be available for eight consecutive years at an annual budget of $5 million for the first four years, $15 million in the fifth year, $10 million in the sixth and seventh years and $5 million in the eighth year from the renewable development account beginning in August 2014. More details

about the results of the program are available in our Solar*Rewards Annual Report.[1] The RECs generated under the Solar*Rewards program are assigned to the Company for the first 10 years of each installation.[2]

B. Solar*Rewards (First Generation) – For PV installations of 40 kW_{DC} or less

Our SES compliance also includes RECs established under our first generation program (2010 – 2014). This program was part of the Company's Conservation Improvement Program and provided one-time incentives for projects sized 40 kW_{DC} or less. The program was discontinued when the second generation Solar*Rewards program was redeveloped in 2013 because of the passage of Minn. Stat. § 116C.7792. The program was closed for incoming applications in August 2014. Existing contracts remain in place for their contract term. These contracts have assigned the RECs to the Company for the 20-year contract term.

C. Made in Minnesota – For PV installations of 40 kW_{DC} or less

Established by legislation in 2013, the Made in Minnesota program provided incentives to systems manufactured in Minnesota that were up to 40 kW_{DC}, with the majority being over 20 kW_{DC}. The program was launched in 2014 and cancelled by the legislature in 2017 (Minn. Stat. § 216C.417). The program continues to be administered by the Department of Commerce. The RECs generated under this program by Company customers belong to the Company for 10 years from installation.

D. Buy-Back Option

Commission Staff suggested that the Company should continue to receive SRECs from these programs throughout the lifetime of the systems. Staff briefing papers on August 29, 2018 state:

> "The easiest way for Xcel to maintain control over the coveted small SRECs would be a tariff option allowing customers to elect to sell their SRECs to the company after the expiration of a Solar*Rewards contract. Xcel could then enroll interested customers in this new tariff offering and use the existing metering infrastructure to continue the uninterrupted transfer of SRECs for SES compliance."[3]

Staff's recommended approach is an option for the Company to consider and we will review the recommendation closer to 2024 when contracts begin expiring. If that is the desired approach, we will file a Petition requesting approval of this program or tariff change closer to that time. For transparency purposes, Graph 3 provided in part 2 below includes a compliance look at an assumed Solar*Rewards SREC buyback program based on an assumed participation level of 75 percent.

E. Solar*Rewards Community – For PV installations up to 1 MW

The Company launched its community solar garden program, called Solar*Rewards Community, in December 2014.[4] Solar gardens are shared PV arrays up to one MW that interconnect with the distribution grid under a 25-year contract term. Customers who subscribe to a solar garden receive a bill credit for their portion of the system's production and the Company receives the

[1] Annual Reports are filed on or around June 1 of every year beginning in 2015 in Docket No. E002/M-13-1015.
[2] Docket No. E002/M-13-1015, Solar*Rewards, Deputy Commissioner Decision, February 24, 2014.
[3] See Staff's briefing papers issued August 29, 2018 in Docket Nos. E999/M-13-542 & E999/M-18-205, Pages 3-4.
[4] See Docket No. E002/M-13-867.

RECs for the term of the contract.[5] There is no statutory budget or capacity limit for the Solar*Rewards Community program.

F. Universal Solar

Since the passage of the SES legislation, the Company has developed a portfolio of three universal scale solar projects. The Company has 162.25 MW of large-scale solar generation from two projects under Power Purchase Agreement (PPA) contracts, consisting of the North Star project (100 MW) and the Marshall Solar project (62.25 MW). These projects began operating in late 2016 and early 2017. These resources were approved by the Commission as part of a Solar Portfolio from a Request for Proposals process.[6] However, the Company has allotted as much as 25 percent of the expected output of the North Star facility to the Renewable*Connect program. The Company portfolio also includes the 100 MW Aurora Solar PPA which was approved through the Company's Competitive Acquisition Process proceeding[7]. This project is made up of multiple distributed generation solar sites. All phases of this project were in commercial operation by summer 2017. These projects will generate more than 400,000 SRECs annually.

G. Renewable Development Fund (RDF)

The 1994 Legislature mandated the creation of the RDF for the purpose of developing renewable sources of electricity, including solar. Recipients of RDF grant funds that install renewable energy generators are required to assign and transfer all RECs created from the facility's renewable energy production for the life of that facility. The Company currently has a total of 31 installed and operating solar RDF facilities, for a total of 9.962 MW of capacity. An additional 13 facilities are planned or under construction and will add an additional 3.522 MW of capacity. Legislation passed in 2017 made significant changes to the RDF statute (Minn. Stat. § 116C.779). These changes include the creation of the Renewable Development Account as a special account within the Minnesota treasury. Additional changes include the purposes for how funds may be expended and how projects are selected. Therefore it is not known at this time if any new RDF facilities will be installed which affect the SES.

[5] Prior to 2017, Garden Operators had the choice as to whether or not to receive the RECs directly. Currently, all community solar gardens have chosen to provide them to the Company.

[6] See Dockets No. E002/M-14-162, In the Matter of Xcel Energy's Petition for Approval of a Solar Portfolio to Meet Initial Solar Energy Standard.

[7] See Docket No. E002/CN-12/1240, In the Matter of the Petition of Northern States Power Company d/b/a Xcel Energy for Approval of Competitive Resource Acquisition Proposal and Certificate of Need.

Table 1: RDF/RDA Solar Facilities Through December 31, 2018*

Facility Size	Number	Capacity (MW)
Commissioned Facilities		
≤40 kW	14	0.187
>40 kW	17	9.755
Total Commissioned Facilities	**31**	**9.962**
Planned Facilities		
≤40 kW	3	0.120
>40 kW	10	3.402
Total Planned Facilities	**13**	**3.522**
TOTAL RDF FACILITIES	**44**	**13.483**

*Please note, the data provided in the "Table 1: RDF/RDA Solar Facilities through December 31, 2017" of our October 22, 2018 compliance filing incorrectly included a 2 MW wind project in the commissioned facilities totals. We have removed the wind project from Table 1 above.

2. Progress towards the 10% carve-out for systems 40 kW_{ac} or less, including the method by which the utility will meet the carve-out. ***Docket No. E999/CI-13-542, Commission Order (April 25, 2014), Order Point 4.I***

A subset of programs from Section 1 above, can be used towards our 10 percent small solar carve out. Table 2 describes these impacts. These are further detailed in this section.

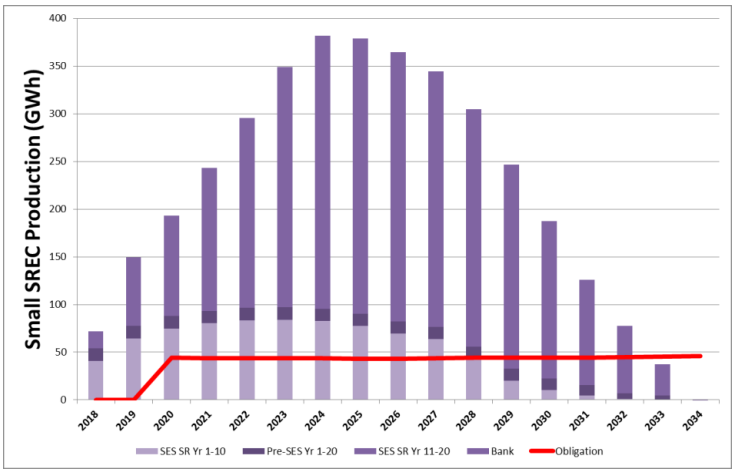
Table 2: Small Solar Carve Out – Programs

Program Name	Size (DC)*	Years Available
Solar*Rewards (First Generation)	**≤40 kW**	**2010 – August 2014**
Solar*Rewards (Second Generation)	**≤ 20 kW** **≤ 40 kW**	**August 2014 – May 2018** **June 2018 – 2021**
Made in Minnesota	**≤40 kW**	**2014 – 2017**

*Energy produced in DC goes through an inverter to get converted to AC. In this process there is energy loss, meaning that DC output results in a lower AC output.

Graph 2 below represents our current projection for REC compliance with the 10 percent small solar carve out. This chart shows the Company may be in compliance with the small solar carve out through 2032. However, this representation uses program assumptions and thus has embedded risk that the actual results could be significantly different than the forecast. The Company cannot predict what the market installation rate will be for small solar rooftop.

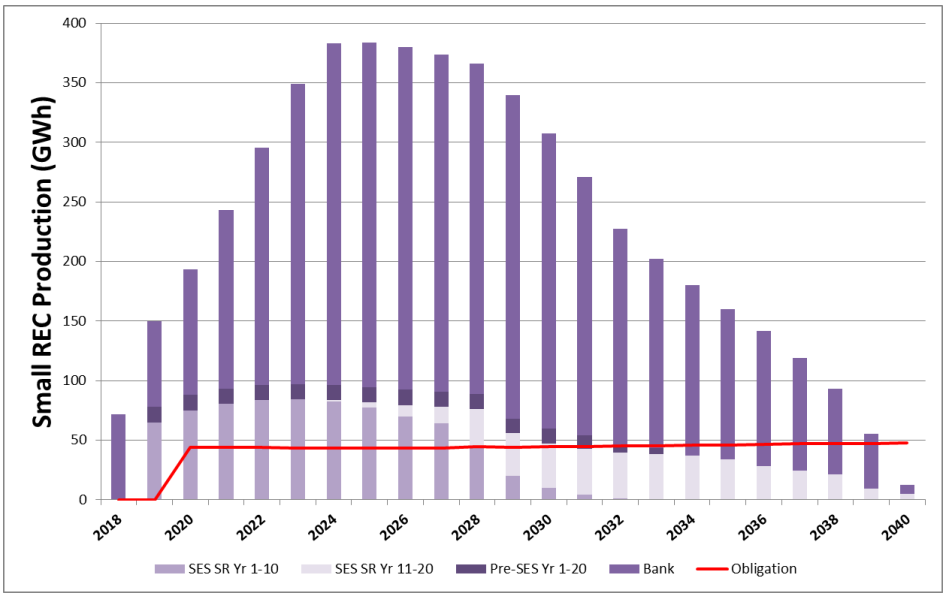
Graph 2
Small SREC Production with Solar*Rewards
Program Extension through 2021



The chart above assumes 100 percent of funds are awarded and that of these there will be an installation rate of 75 percent for the Solar*Rewards program. The Solar*Rewards program awarded 100 percent of the 2018 funding. If actual solar installations are lower than forecasted levels, the Company may not be able to meet the small solar carve-out requirements through 2032 as projected in the chart above.

Graph 3 below provides a projection for small solar carve out compliance with the addition of an assumed future buy-back option. The additional RECs would extend compliance with the small solar carve out until approximately 2039. The Company cannot predict customer participation in a future program; however, an assumption of 75 percent participation is made for this projection.

Graph 3
Small SREC Production with Solar*Rewards
Program Extension with Buy-Back Option

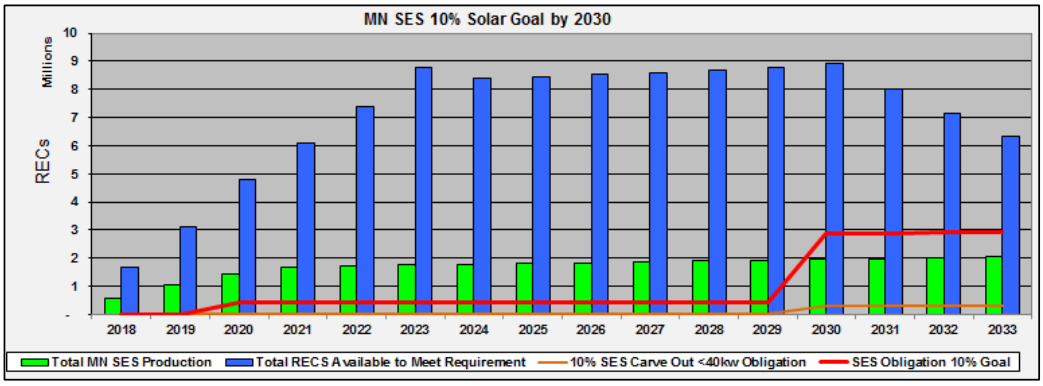


Also, the above analysis is based on the understanding that the nameplate capacity for purposes of this statute is measured in alternating current (AC). This is consistent with the definition of capacity in Minn. Stat. § 216B.164, Subd. 2a.(c)., as well as how capacity is used or interpreted under the following statutes: Minn. Stat. §§ 216B.1611, Subd.2(a), and Subd.3a(a)(1); 216B.1613; 216B.164, and Subd. 4c; 216B.1641 (b).

3. Discussion on the utilities' efforts to reach, by 2030, the energy goal that ten percent of the retail electric sales in Minnesota be generated by solar energy.
Docket Nos. E999/CI-13-542, E999/M-16-342, Commission Order (November 28, 2016)

The 10 percent by 2030 goal is an energy goal of the state of Minnesota. We understand this question to be requesting our efforts to reach our proportional share of the state's energy goal. As shown in Graph 4 below and in the attached Excel file (Tab 5 – Additional Graphs), the Company forecasts that we will meet the 10 percent by 2030 goal. The compliance fulfillment in those years will significantly be derived from the heavy use of our SREC bank that will have been accumulated up to that point. We expect to review the need of additional solar resources in a future resource plan.

Graph 4



4. Any additional comments or materials the utility may wish to include.

SES Cost Exclusion

No new SES exclusion applications were approved by the March 1, 2019, deadline for this report, and no applications are pending. We provide the production information and solar costs excluded for the two customers at six premises that became eligible for exclusion on June 1, 2017 in the attached Excel file (Tab 2 – Retail and Excluded). Per the exclusion process approved by the Commission in Docket No. E002/M-17-425, we issued bill credits in March 2019 to customers approved for exclusion for SES-eligible costs incurred between January 1 and December 31, 2018. See Tab 2 of the attached Excel file (Retail and Excluded) for the excluded customer sales and refund amount issued to each excluded premise.

Cost Recovery of 2018 SES Exclusion Amount

To recover the 2018 SES excluded costs from non-exempt customers, **[PROTECTED DATA BEGINS PROTECTED DATA ENDS]** was included in the May 2019 monthly fuel clause rate (Docket No. E002/AA-19-296; **[PROTECTED DATA BEGINS PROTECTED DATA ENDS]** was included in the CIP Rider tracker filed in Docket No. E002/M-19-258 on April 1, 2019; and **[PROTECTED DATA BEGINS PROTECTED DATA ENDS]** will be added to the RDF tracker to be filed with the Commission by October 1, 2019.

Future SES Cost Exclusion

In its January 16, 2018 Order in Docket No. E002/M-17-425, the Commission found that only those costs associated with SRECs that are retired for the purpose of meeting the requirements of Minn. Stat. § 216B.1691, subd. 2f, can be excluded from rates charged to exempt customers. We anticipate that all SRECs being generated at this time will be retired in order to meet the SES. At some point in the future, however, we may begin generating more SRECs than are needed for SES compliance. In a future annual report, we will discuss refinements to our SES cost exclusion methodology that will account for the fact that not all SRECs generated in a given year will be needed for SES compliance.

CERTIFICATE OF SERVICE

I, Paget Pengelly, hereby certify that I have this day served copies of the foregoing document on the attached list of persons.

Small Solar - RDF Projects	various	15-18%	58%	planned
Small Solar (<=40 kW)[8]	various	10-18%	BTMG[6]	planned

Information on Assumed Capacity Factor

8. Capacity factor reflects calendar year 2018, for the 90th to the 10th percentile. This includes all resources, not specific to 1st year production.

Information on effective load carrying capability and MISO Capacity Accreditation

Capacity Accreditation represents an estimate of reliable resource capability during periods of system peak demand. The capacity accreditation is based on the reporting period of 1/1/2018 - 12/31/2018.

MISO has added Solar Accreditation practices to the Business Practice Manual for the 2018/19 Planning Year. For Year 1, solar resource accreditation will be 50% of nameplate rating; subsequent years the accreditation will be calculated based on historic operation data.

MISO BPM 11 - 4.2.3.1 Intermittent Generation and Dispatchable Intermittent Resources that are not powered by wind (example: run of river or solar) must supply MISO with the most recent consecutive three years of hourly net output (in MW) for hours ending 15, 16, and 17 EST from June, July and August. For new resources, or resources on qualified extended outage where data does not exist for some or all of the previous 36 historical months, a minimum of 30 consecutive days' worth of historical data during June, July or August for the hours ending 15, 16, and 17 EST must be provided prior to participating in the PRA.

1. The Company presumes that effective load carrying capability is addressed through the reporting of MISO's accreditation.
2. Capacity accreditation for Aurora Distributed Solar represents contractual agreement value. Capacity accreditation for other resources represent MISO first year of operation value.
4. Community Solar Garden installations are registered with MISO following COD.
5. Community Solar Garden and Solar Rewards installations continue to be added.
6. Behind the meter generation
7. Capacity accreditation based on MISO PY 2018/2019 (to include EOY 2018)
8. Capacity factor reflects calendar year 2018, for the 90th to the 10th percentile. This includes all resources, not specific to 1st year production.

RE: MONTHLY UPDATE
COMMUNITY SOLAR GARDENS
DOCKET NO. E002/M-13-867

Dear Mr. Wolf:

Northern States Power Company, doing business as Xcel Energy, submits this Monthly Compliance Report to the Minnesota Public Utilities Commission. This Report provides the status of the Solar*Rewards Community program as of June 3, 2019.

We have electronically filed this document with the Minnesota Public Utilities Commission, and copies have been served on the parties on the attached service list. Please contact Jessica Peterson at jessica.k.peterson@xcelenergy.com or (612) 330-6850 if you have any questions regarding this filing.

Sincerely,

/s/

SHAWN WHITE

IN THE MATTER OF THE PETITION OF NORTHERN STATES POWER COMPANY FOR APPROVAL OF ITS PROPOSED COMMUNITY SOLAR GARDENS PROGRAM	DOCKET NO. E002/M-13-867 **MONTHLY COMPLIANCE REPORT**

INTRODUCTION

Northern States Power Company, doing business as Xcel Energy, submits this Monthly Compliance Report to the Minnesota Public Utilities Commission (Commission) regarding our Solar*Rewards Community® program. This Monthly Compliance Report provides information current as of June 3, 2019 on the status of projects in the Solar*Rewards Community program as well as other compliance items such as engineering cost review and tariffed timelines.

MONTHLY REPORT

I. SOLAR*REWARDS COMMUNITY PROGRAM STATUS

Our June status report on the Solar*Rewards Community program finds 559 MW of connected solar generation online and over 200 projects completed. In May, there were a limited number of new applications.
On June 3, there were 287 project sites at various stages of development. We provide additional metrics regarding the queue in Tables 1 and 2 showing application status.

Table 1: Status of Applications

	Project Sites	MW (AC)	# of Co-Located Sites (>1 MW)
Active Applications	**287**	**332**	**17**
Commercial Operation (In-Service)	**201**	**559**	**118**
Withdrawn	NA	1,684	NA

Table 2: Active Applications: Progress Summary

	Project Sites	MW (AC)
Application	**18**	**17**
Initial Application	8	7
Applications in Review	10	10
Study	**95**	**97**
Waiting for Study Proposal	5	5
SOW Waiting for Developer	10	10
In process	47	47
Interconnection Agreement Issued	33	35
Design	**89**	**93**
Design	81	85
On Hold	8	8
Construction	**85**	**125**

The Company provides Attachment F, the Solar*Rewards Community Dashboard in addition to these details regarding program status.

II. ENGINEERING COST REVIEW

We provide the analysis of final bills provided to garden operators with a variance outside of +/- 20 percent within one of the required categories (substation or distribution) in Attachment A.[1] Ten projects were sent final interconnection bills in May. Variances continue to be observed for these projects. Whether it was omitted from the original IA or estimated higher than anticipated, many of the substation

[1] Attachment A is in compliance with ordering point 5 of the Commission's November 1, 2016 Order in this docket and does not include instances of which fall under this threshold.

variances are due to telemetry. Distribution variances were due to construction coming at a lower cost to developers for unneeded equipment, site conditions and changes from overhead to underground wiring.

III. COMPLETED PROJECTS

The Minnesota Solar*Rewards Community program has 559 MW in commercial operation. In this section, we provide specific details regarding completed projects.

A. Applications by County

Attachment B to this Report provides the application status of projects by county.[2] Completed projects are found in 41 separate counties with a significant amount of production located in Chisago which has over 50 MW of solar community installations.

B. Disconnected Gardens

Three operational gardens were disconnected (either voluntarily or by the Company) for violations in operation. Two CSG's were, in-part, disconnected due their failure to pass their open phase testing multiple times. Notices were submitted to the Commission. These projects remain disconnected as of the writing of this report. We will continue to provide further information as it becomes available.

C. Subscribers

Bill credits are provided to subscribers of completed community solar gardens. The compensation rate for these subscriptions is determined by when the garden operator completed its Solar*Rewards Community application and has been "deemed complete". At this time, most subscribers are receiving the Applicable Retail Rate for their compensation level. Table 3 provides further detail regarding the VOS bill credit rate vintage of projects in the pipeline today.

[2] Attachment B is in compliance with Order Point 3 of the Commission's February 13, 2015 Order addressing SoCore Energy's Petition for Clarification submitted in Docket E002/M-13-867.

Table 3: Active Project Sites - Bill Credit Vintage

	ARR	VOS 2017	VOS 2018	VOS 2019	Not yet Deemed Complete
Application Submitted	0	0	0	0	18
Study	3	1	69	22	0
Design and Construction	79	36	59	0	0
Commercial Operation	198	3	0	0	0
Total Sites	**280**	**40**	**128**	**22**	**18**

In June, there were two additional projects completed under the 2017 VOS; these two projects have not yet begun to receive bill credits. In total, there are now three projects constructed under the VOS. The one project receiving bill credits has seven subscriptions and has a 43 percent allocation to residential subscribers who hold less than 1 percent of the total capacity allocation to the CSG.

Bill credits begin to accrue the first day of the first full month of garden operation. Subscription information is collected when the bill credits begin to accrue.[3] There are over 15,000 subscriptions (or premises) in the community solar garden program. Residential customers make up 84 percent of the overall number of subscriptions (and 93 percent of subscribers), and 11 percent of the subscribed capacity. We offer further metrics in Table 4 below.

Table 4. April Subscription Metrics

	Residential	Small General Service	General Service	Other	Total
Number of Subscriptions	12,486	883	1180	366	14,915
% of Subscriptions	84%	6%	8%	2%	100%
Subscribers (Unique by Rate)	12,236	220	518	138	13,112
% of Subscribers	93%	2%	4%	1%	100%
DC Capacity Allocation (kW)	78,921	8,298	621,350	14,101	722,670
% of Subscription Capacity	11%	1%	86%	2%	100%
AC Monthly Production Allocation (kWh)	7,823,516	792,193	62,155,118	1,447,993	72,218,819
April Bill Credits	$ 1,222,899	$ 115,087	$ 7,710,971	$ 183,980	$ 9,232,938

[3] For purposes of the Report, the Company provides its subscription analysis for gardens receiving bill credits in April 2019.

In addition to subscribed energy there were 44 project sites with unsubscribed energy. These projects accounted for 384,517 kWh (AC) associated with unsubscribed energy payments in April (for March production). The payments to the Garden Operators for unsubscribed energy equaled $13,093 in bill credits during this timeframe.

IV. TARIFFED TIMELINES

Attachments C through E to this Report are provided in compliance with the Commission's August 6, 2015 Order at Order Point 2.[4]

We offer the following summary of compliance below:

- ***Application Completeness***[5]: The Company has met this timeline for ninety-five percent of all active applications; those that did not meet this timeline were generally sent the next business day.
- ***Statement of Work***[6]: Approximately ninety-eight percent of program SOWs for all active applications have been delivered within the timeframes outlined in Section 9 Tariff.
- ***Study Delivery***[7]: To determine whether this criterion has been met, the Company reviews the studies delivered to solar garden developers in 2019 and whether or not they were timely sent. Fifteen percent of program studies due in 2019 were timely delivered within the allocated timeframe. The remaining projects were delayed by an average of 21 days.

As noted in previous reports, recent study delays have occurred due to study resource issues, an increase in applications, a backlog of current projects, the complexity of studies at high penetration locations and continued focus on the quality of our study analysis. There have also been several instances in which the Company has received incorrect primary/secondary information impacting projects and those behind them in queue.

[4] Our Revised Tariff, effective on December 18, 2015, added new timeline requirements under our Electric Rate Book, Section 9. This timeline was added to these requirements.
[5] The Solar*Rewards Community tariff includes a 30-day timeline from the applicant submitting a complete application for the Company to advance projects into the interconnection process. Xcel Energy Electric Rate Book Section 9, beginning on Original Sheet No. 67
[6] This requirement was modified in our Revised Tariff dated December 18, 2015, at Original Sheet No. 68.3. Prior to this time, Section 10 governed this requirement at 15 business days.
[7] We note however, this metric has become increasingly more difficult to track given the amount of restudies completed over time and therefore may vary given the differing timeframes –currently we are only tracking the first delivery date in Attachment E.

The Company has contracted with additional resources to help meet upcoming deadlines. Forty-five percent of the studies due in May were submitted within tariffed timelines compared to 30 percent in previous months showing a decrease in study delays.

CONCLUSION

We appreciate the opportunity to report on the progress of the Solar*Rewards Community program. The Company will continue to report progress as projects move through the interconnection queue into commercial operation.

Dated: June 14, 2019

Northern States Power Company

Project #	Substation Costs				Distribution Costs				Total Cost				
	Indicative Cost	Actual Cost	Variance	Variance Explanation	Indicative Cost	Actual Cost	Variance	Variance Explanation	Indicative Cost	Detailed Design Cost	Actual Cost	Variance (Indicative/ Actual)	Variance (Detailed/ Actual)
1	$ 258,600	$ 195,109	-25%	Initial estimate included a satellite communication equipment that was not required any more as substation SCADA communication system was allowed to be used by Xcel Energy.	$ 311,500	$ 403,029	23%	Developer changed from OH to UG resulting in increased costs	$ 570,100	$ 549,600	$ 598,138	5%	9%
2	$ 61,426	$ 11,691	-81%	The feeder load monitoring in revised IA estimate was performed on another site on the feeder.	$ 475,450	$ 254,339	-87%	Developer changed to secondary metering resulting in less costs. - Developer changed scope of project resulting in less distribution material.	$ 536,876	$ 481,800	$ 266,030	-50%	-45%
3	$ 20,000	$ 11,691	-42%	Actual telemetry solution cost less than initial blanket estimate.	$ 166,000	$ 183,610	10%		$ 186,000	$ 294,200	$ 195,301	5%	-34%
4	$ 272,900	$ 330,262	21%	Telemetry was not included in the initial estimate.	$ 33,500	$ 41,479	19%	Muddy site conditions due to rain while building slowing construction down. Remobilization to the site by construction .	$ 306,400	$ 321,700	$ 371,741	21%	16%
5	$ -	$ 11,691	100%	Telemetry was not included in original estimate.	$ 83,631	$ 53,238	-57%	Less materials were used in detailed design & construction resulting lower costs.	$ 83,631	$ 81,700	$ 64,929	-22%	-21%
6	$ -	$ 45,408	100%	Transfer trip communication equipment was installed. Telemetry was not included in the initial estimate.	$ 127,126	$ 44,856	-183%	Metering costs were over-estimated in the IA.	$ 127,126	$ 68,700	$ 90,265	-29%	31%
7	$ -	$ 13,792	100%	Telemetry was not included in the initial estimate.	$ 95,495	$ 87,072	-10%	N/A	$ 95,495	$ 174,000	$ 100,865	6%	-42%
8	$ 20,000	$ 270,551	1253%	This garden moved from 2nd to 1st in queue absorbing reconductoring of feeder with voltage regulator and VSR.	$ 73,500	$ 77,575	5%	N/A	$ 93,500	$ 141,100	$ 348,126	272%	147%
9	$ -	$ -	0%	N/A	$ 14,305	$ 3,546	-303%	Garden was withdrawn by Developer after work had begun.	$ 14,305	$ 44,500	$ 3,546	-75%	-92%
10	$ -	$ 11,691	100%	Telemetry was not included in the initial estimate.	$ 162,047	$ 94,933	-71%	Recloser costs came in less than estimated. Detailed design determined fewer poles needed to be used.	$ 162,047	$ 159,300	$ 106,624	-34%	-33%

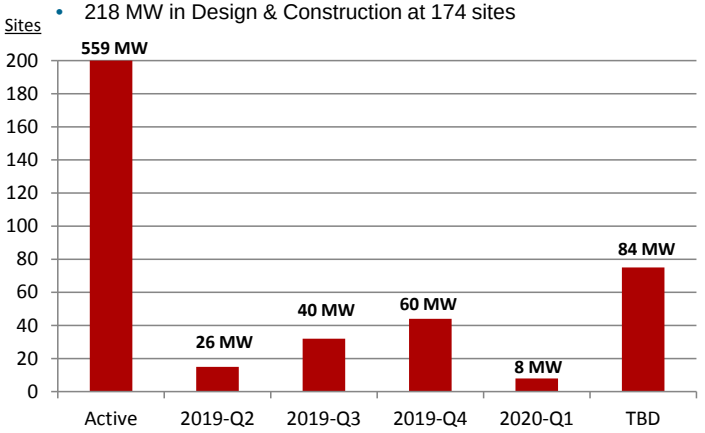
PROJECT SITES BY STAGE

PROGRAM UPDATE

- The next SRC Implementation Workgroup meeting will be 7/31/19 with a focus on the VOS calculation.
- MN DIP goes into effect as of June 17, 2019.
- Summer and fall construction work is underway; contact SRCMN@xcelenergy.com immediately if you have not yet set your in-service date.
- New study providers are quickly becoming adept and correction delays are decreasing. 45% of studies due in May were delivered on time.

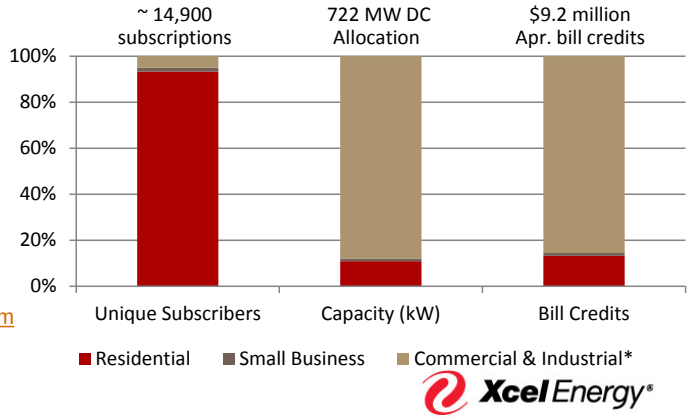
SOLAR GARDENS IN DESIGN & CONSTRUCTION

- 218 MW in Design & Construction at 174 sites



ACTIVE SOLAR GARDENS

- $114.8 million – Bill Credits paid (full production months through Apr 2019)
- Details below are as of April 2019



Xcel Energy®

RE: PETITION
2019-2021 TRIENNIAL NUCLEAR PLANT DECOMMISSIONING STUDY & ASSUMPTIONS
DOCKET NO. E002/M-17-828

Dear Dr. Haar:

Northern States Power Company, doing business as Xcel Energy, submits a Petition for approval of our 2019-2021 Triennial Nuclear Decommissioning Study & Assumptions, along with supporting materials.

We have electronically filed this Petition and supporting materials with the Minnesota Public Utilities Commission, and copies have been served on the parties on the attached service list. In addition, a one page summary of the filing has been provided to persons on the attached service list. The one-page summary provided also contains directions on how to access an electronic copy of the full filing via the Commission's website. Please contact me at (612) 215-4663 or aakash.chandarana@xcelenergy.com or Lisa Perkett at (612) 330-6950 or lisa.h.perkett@xcelenergy.com if you have any questions regarding this filing.

Sincerely,

/s/

IN THE MATTER OF THE PETITION OF NORTHERN STATES POWER COMPANY FOR APPROVAL OF THE 2019-2021 TRIENNIAL NUCLEAR DECOMMISSIONING STUDY & ASSUMPTIONS

DOCKET NO. E002/M-17-828

PETITION

OVERVIEW

Pursuant to Minn. Stat. § 216B.11 and § 216B.2445 and Minn. R. 7825.0500 through 7825.0800, and prior Minnesota Public Utilities Commission (Commission) Orders, Northern States Power Company, doing business as Xcel Energy, submits our Petition for approval of the 2019-2021 Nuclear Decommissioning Study and Assumptions.

The objective of a decommissioning docket is to arrive at a reasonable cost estimate for decontamination and removal of nuclear facilities at the end of their operating lives and to set an accrual to accumulate funds sufficient to pay those decommissioning costs. This triennial filing is unique in that it closely precedes our 2019 Integrated Resource Plan (2019 IRP), in which we—along with the Commission, the Department, and other stakeholders—will consider the long-term future of our nuclear plants because, among other things, all three of our units will reach the end of their respective license life during the fifteen-year planning period.[1] We anticipate discussions in the upcoming 2019 IRP related to several alternatives for our nuclear fleet, including the continued operation of the units through the end of their licensed lives, possible early retirements of one or more units, and/or possible life extensions. In this way, decisions coming out of the 2019 IRP are likely to have a substantial impact on our decommissioning analysis and accrual calculation.

[1] *In the Matter of Xcel Energy's 2016–2030 Integrated Resource Plan,* Docket No. E002/RP-15-21, ORDER APPROVING PLAN WITH MODIFICATIONS AND ESTABLISHING REQUIREMENTS FOR FUTURE RESOURCE PLAN FILINGS (January 11, 2017)

The order of these two dockets—with the 2019 IRP coming approximately a year after our triennial—makes planning for decommissioning in this docket a challenge. It also has the potential of introducing substantial swings in the accrual calculation, as any accrual set in this docket could soon be inaccurate as a result of decisions made in the 2019 IRP. For these reasons, we recommend (1) using the information provided in this docket to inform upcoming discussions in the 2019 IRP; (2) maintaining the accrual set in the 2014 Triennial Nuclear Decommissioning filing (2014 Filing), Docket No. E002/M-14-761 until a decision is reached in the 2019 IRP; and (3) allowing the Company to file its next decommissioning petition shortly following a decision in the 2019 IRP. This will allow the Company, Commission, and stakeholders to make decisions regarding the future of our nuclear fleet first (and with the benefit of updated decommissioning data provided in this filing) and then turn to a discussion regarding decommission planning and accrual setting in light of decisions made in the 2019 IRP.

To that end and in compliance with the Commission's Order in the 2014 Filing, we have analyzed a number of decommissioning scenarios and calculated a number of different accruals as part of this filing. The resulting accrual calculations range from negative $16.0 million (meaning we are over-funded today) for scenarios involving life extensions of our plants to positive $115.9 million (meaning we are under-funded today) for scenarios involving the early retirement of our plants by five years. In general, when compared to the 2014 Filing and using of the same assumptions regarding decommissioning alternatives and operating lives, accrual calculations have risen. For example, if we assume that immediate decommissioning will occur following the end of each plant license (consistent with our 2014 Filing), the accrual for 2019 would be approximately $45 million.

These increases in some of the accrual calculations are driven almost entirely by forward-looking expected returns, which in turn are largely driven by the lower current treasury interest rate relative to the interest rate expected from the 2014 Filing valuation. In other words, because the long-term treasury rate is a fundamental building block for our forward-looking return forecast and because that rate is lower today than it was in 2014, we now anticipate lower long-term investment growth in the future than we did in the 2014 Filing. This change in our projections is consistent with the investment industry as a whole. And given the very long duration of the Nuclear Decommissioning Trust (NDT) and decommissioning, even modest changes in forward looking expected return assumptions can have a substantial effect on the accrual. More detail can be found in Schedule D.

That said, some accrual calculations provided in this filing are substantially lower than $45 million. Changing from immediate decommissioning to SAFSTOR alone cuts the accrual nearly in half, resulting in an accrual of $24.9 million. And as already discussed, if we were to extend one or more of the plant licenses, the accruals decrease considerably and become negative in scenarios involving extensions at both plants. In light of this, our recommendation is to hold the accrual at the present $14.0 million until our 2019 IRP is resolved.

We recognize that this request deviates from the normal triennial procedure, but we believe it will allow for a complete and thorough review of this Petition while also ensuring that the 2019 accrual year remains consistent with what was included in the currently effective 2015 Multi Year Rate Plan (MYRP) filed under Docket No. E002/GR-15-826. In addition, it will provide an opportunity to reassess the accrual on the basis of updated assumptions from the 2019 IRP.

To be sure, if our previous assumption of running the plants through the end of their licensed lives is affirmed in the 2019 IRP, the decision to hold the accrual constant in this docket will result in a greater increase in the accrual post-2019 IRP. To mitigate these effects, we propose that Department of Energy (DOE) settlement funds be held for potential allocation to the NDT, which is consistent with some previous applications of these funds and is consistent with the Commission's Order in Docket No. E002/M-11-939, dated December 4, 2012. In combination with the current $14.0 million accrual, we believe these funds would allow the Commission to see the 2019 IRP process through before finalizing plans with respect to decommissioning and changing the accrual to reflect those plans.

For these reasons, the Company respectfully requests the Commission:

- Approve our decommissioning study and assumptions as compliant with the Company's obligations under Minnesota statutes, Commission rules, and prior precedent;
- Continue the current approved annual accrual of $14.0 million, to meet the needs of the Company's 60-year spent fuel scenario with no re-casking of the fuel, continuing for 2019 through 2021 while strategic decisions about the future of our nuclear units are decided in our 2019 IRP;
- Approve an annual accrual of $2.0 million for end-of-life (EOL) nuclear fuel for the calendar year 2019 through 2021; and
- Permit the Company to hold settlement payments received from the DOE in an interest-bearing account until the 2019 IRP is resolved, at which time the Commission can decide whether to apply those funds to the NDT or refund them to customers.

Additionally, and consistent with prior triennial filings, the Company is requesting Commission approval of changes in investment assumptions and targets. Specifically, the Company requests Commission approval of the following two changes in order to improve the expected earnings of the investment portfolio and ensure that decommissioning funding needs are met without excess costs to customers:

- Transitioning investments to bonds five years before decommissioning cash flows rather than the six years as previously assumed; and
- Changing the investment mix to reduce allocations to certain alternative asset classes and increase allocations to fixed income investments, as described later in this Petition.

I. SUMMARY OF FILING

A one-paragraph summary of the filing accompanies this Petition pursuant to Minn. R. 7829.1300, subp. 1.

II. SERVICE ON OTHER PARTIES

Pursuant to Minn. Stat. § 216.17, subd.3, Xcel Energy has electronically filed this document. A summary of the filing has been served on all parties on the attached service list

III. GENERAL FILING INFORMATION

Pursuant to Minn. R. 7825.3200, 7825.3500, and 7829.1300, subp. 3. Xcel Energy provides the following required information:

A. Name, Address, and Telephone Number of Utility

Northern States Power Company
Xcel Energy
414 Nicollet Mall
Minneapolis, MN 55401
(612) 330-5500

B. Name, Address, and Telephone Number of Utility Attorney

Ryan J. Long
Principal Attorney

Xcel Energy
414 Nicollet Mall, 401 – 8th Floor
Minneapolis, MN 55401
(612) 215-4659

C. Date of Filing

This Petition is being filed December 1, 2017.

D. Statute Controlling Schedule for Processing the Filing

Under Minn. R. 7829.0100, subp. 11, this request for approval of decommissioning accrual is a "miscellaneous" filing because no determination of the Xcel Energy general revenue requirements is necessary. There is no specific statute that prescribes the amount of time the Commission has to rule on this Petition.

E. Utility Employee Responsible for the Filing

Aakash H. Chandarana
Regional V. P., Rates and Regulatory Affairs
Xcel Energy
414 Nicollet Mall, 401 – 7th Floor
Minneapolis, MN 55401
(612) 215-4663

IV. COMPANY PROPOSAL

As already discussed, this filing differs from past triennial dockets in a couple of significant ways. First, it comes shortly before our 2019 IRP, in which we and our stakeholders will consider the long-term future of our nuclear fleet because all three of our nuclear units will reach the end of their respective license life during the fifteen-year IRP planning period. Moreover, the Commission specifically ordered that the Company describe in its next IRP "its plans and possible scenarios for cost-effective and orderly retirement of its aging baseload fleet, including Sherco, King, Monticello, and Prairie Island."[2]

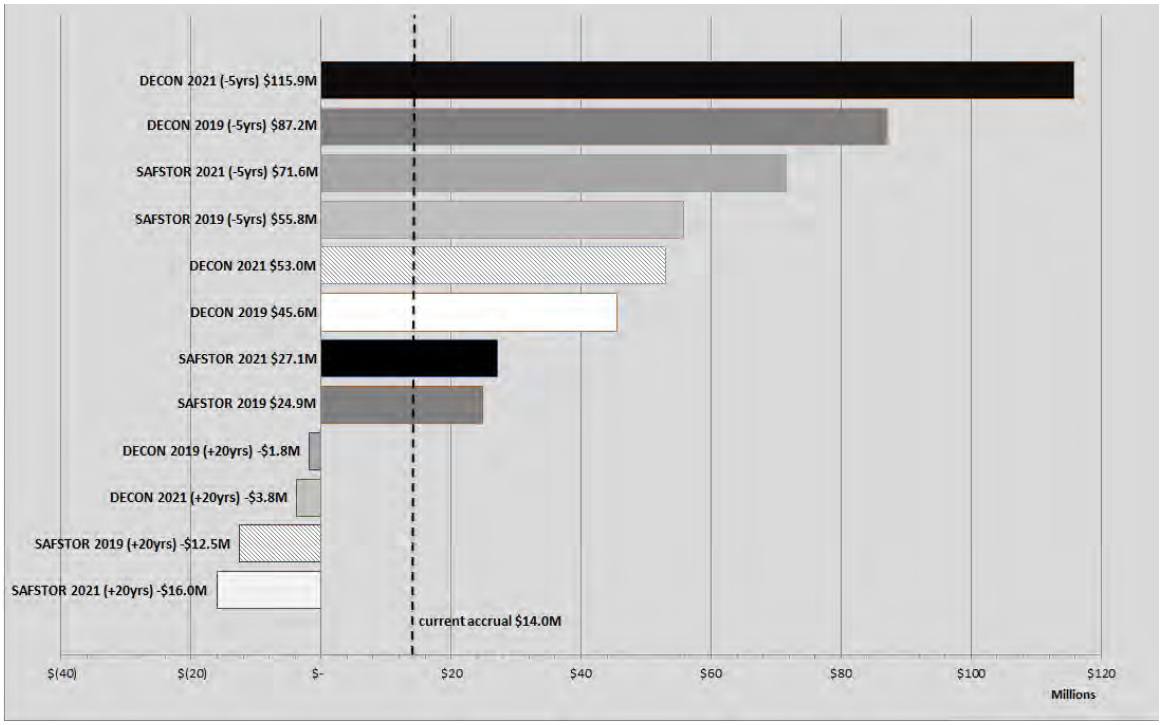
We therefore anticipate discussions in the upcoming 2019 IRP related to several alternatives for our nuclear fleet, including the continued operation of the units through the end of their licensed lives, possible early retirements of one or more units,

[2] Dkt. No. E002/RP-15-21 (January 11, 2017 Order at 12.)

and/or possible life extensions. In connection with these scenarios, we also expect to discuss alternative decommissioning scenarios, including both immediate decommissioning (DECON[3]) as well as the SAFSTOR[4] alternative. In fact, the Department raised SAFSTOR as an alternative in our 2015 IRP, noting that it would allow the decommissioning funds to accrue interest following retirement of the plants.[5]

These two decision points—how long to run the plants and how to decommission them—could have a dramatic impact on the accrual calculation for the NDT. The following table shows the potential 60-year accrual calculations using a variety of assumptions related to operating lives and decommissioning alternatives. It also shows accrual calculations for changes occurring in 2019 versus 2021 to reflect the potential impact of waiting to change the accrual until after the 2019 IRP.

Table 1 – Nuclear Decommissioning Triennial Accrual Alternatives (60 Year, No Recasking)



[3] DECON is defined by the NRC as, "[a] method of decommissioning in which the equipment, structures, and portions of a facility and site containing radioactive contaminants are removed and safely buried in a low-level radioactive waste landfill or decontaminated to a level that permits the property to be released for unrestricted use shortly after cessation of operations."
[4] SAFSTOR is defined by the NRC as, "[a] method of decommissioning in which a nuclear facility is placed and maintained in a condition that allows the facility to be safely stored and subsequently decontaminated (deferred decontamination) to levels that permit release for unrestricted use."
[5] Dkt. No. E002/RP-15-21 (Department's July 8, 2016 Comments at 37-38).

This table shows the wide range of potential accrual outcomes that could result from decisions that will need to be made in the 2019 IRP. The accrual could range from negative $16 million to positive $115 million depending on decisions about possible life extensions and/or early retirements. This is not inconsistent with the previous life extensions for our nuclear plants, which also had a significant impact on the accrual. Looking back to 2005, the accrual was approximately $61 million; then from 2006-2008, it was approximately $32 million; and once the licenses were extended, it dropped to $0 from 2009-2012.

This triennial is also unique because it is the first one to have been made during the term of the MYRP. Typically in the past, triennial filings and rate cases proceeded either in tandem or in quick succession so that base rates could be modified to reflect any changes that are necessary to the accrual to fully fund the NDT. Here, by contrast, the Company recently entered into a four-year MYRP that prevents it from filing another case until 2019, which would then not affect rates until 2020. As a result, any changes made to the accrual in this docket could not be reflected in base rates in 2019 consistent with past practice.

The overall goal of the decommissioning accrual schedule is designed to ensure that the customers who benefit from nuclear power pay the costs associated with that power at the time it is generated. We believe our proposal to maintain the current accrual level while the future of our nuclear units is decided in the 2019 IRP is reasonable due to the wide range of scenarios (and therefore, accrual levels) that could result from the 2019 IRP. Our proposal is also in the public interest as it does not collect speculative costs from customers in advance of a 2019 IRP decision, nor does it penalize the Company for the timing of the 2019 IRP by changing the accrual during the MYRP. Once the 2019 IRP is resolved, we propose to file an updated decommissioning petition, so that an accrual could be set based on the decisions that were made in the 2019 IRP as well as updated cost, inflation, escalation, and investment growth assumptions.[6]

Although we do not recommend a change to the accrual in this petition, we do want the Commission and our stakeholders to be fully informed with respect to our current assumptions related to our decommissioning cost estimate, inflation, escalation, and investment growth. We believe this information is important both for purposes of evaluating this petition and also to inform discussions in the upcoming 2019 IRP. We

[6] While these financial assumptions will not necessarily change as a result of any decision made in the 2019 IRP, they may change due to the passage of time and changes in market conditions.

have therefore analyzed a number of decommissioning scenarios and calculated a number of different accruals for the Commission. We also walk through all of the information that is required by the relevant statutes, Commission rules, and past Commission Orders in Section V below.

To be clear, if the 2019 IRP does not lead to any changes with respect to operational lives or decommissioning plans for the nuclear units, the decision to hold the accrual constant in this docket will result in a greater increase in the accrual after the 2019 IRP. That is why we are proposing to hold the DOE settlement funds in order to potentially mitigate these effects. More specifically, we propose to hold the DOE funds in an interest bearing account until the 2019 IRP is resolved, at which time the Commission can decide whether to add the funds to the NDT or refund them to customers in light of the 2019 IRP outcome in our next triennial filing with updated decommissioning assumptions. And while we cannot be certain as to the amounts we will receive as part of our settlement with the DOE in future years, we note that our 2017 payment was approximately $15 million (on a total company basis) and will continue to be significant over the coming years.[7] This use of the DOE funds is also consistent with some previous applications of these funds and with the Commission's Order in Docket No. E002/M-11-939, dated December 4, 2012.

We believe this proposal is reasonable and represents the best path forward in light of the unique circumstances at play in this triennial for all of the reasons discussed above. In the balance of this Petition, we present the information and analyses that are required by statute, Commission rules, and past Commission Orders for triennial filings.

V. REQUIRED DECOMMISSIONING INFORMATION

A. Scenarios Evaluated

Consistent with previous filings, the Company examines the impact of assumptions in (1) the engineering cost estimate; (2) costs associated with spent fuel storage following plant shutdown; (3) inflation and escalation; (4) earnings rates; (5) fund investment structure; and (6) recovery period.

As required by Minn. Stat. § 216B.2445, the Company provides scenarios assuming spent fuel will be stored in the State for 60 years, 100 years, and 200 years following cessation of operations at the plant. We include a 60-year scenario without recasking of the dry cask storage units as our base case because the Nuclear Regulatory

[7] We will soon make a filing with the Commission addressing the 2017 payment.

Commission (NRC) assumes that casks can be used for 100 years. We discuss this assumption further in Part C.1.b.iii below. However, pursuant to the Commission's Order in our previous Triennial Nuclear Decommissioning Accrual filing, we have also provided 60-year, 100-year, and 200-year scenarios that include the cost of switching out the dry cask storage units every 50 years.[8] In addition, we are including a scenario that assumes spent fuel will be stored in the state for only 32 years. This scenario is based on the Blue Ribbon Commission on America's Nuclear Future (BRC) report recommendations for the prompt development of centralized interim storage. The scenarios discussed above have been provided using the prompt removal and dismantling (*i.e.*, DECON) scenario for decommissioning, which is consistent with what was provided in the 2014 Filing. In addition to these five DECON scenarios, the Company has provided 32-year and 60-year (with no recasking) delayed removal and dismantling (*i.e.*, SAFSTOR) scenarios. These two alternatives are discussed in Schedule A, which lays out the annual cash flows, as well as the cost estimate report provided by TLG Services, Inc. (TLG) in Schedule L for Monticello and Schedule M for Prairie Island.

The decommissioning accrual is an annuity calculation based on the yearly expenditures, in nominal dollars, provided for each cost estimate scenario. The cost estimate is jurisdictionalized for Minnesota retail customers using 73.4886 percent as presented in the current Minnesota rate case.[9] The escalation rate is used to inflate the jurisdictional cost estimate to future years and the earnings rate is used to present value those future dollars back to the start of decommissioning. Then an annuity payment is calculated such that when added to the current fund balance and grown at the forward looking after tax expected return, will result in this present value required at decommissioning.

In total, the Company has presented 20 accrual scenarios. Fourteen are based on the DECON assumption. Six are based on the SAFSTOR assumption. They include various scenarios for a 32-year, 60-year (with and without re-casking), 100-year, and 200-year dry cask storage operational period. Some of the scenarios assume the accrual change starts in 2019 and the remaining scenarios assume a change in 2021. While most scenarios assume the current license shutdown, several alter the license termination date to be either 5 years before the current license date or 20 years after. The accrual scenarios are presented in Schedule F.

[8] *In the Matter of Northern States Power Company's for Approval of the 2016-2018 Triennial Nuclear Plant Decommissioning Accrual*, Docket No. E002/M-14-761, ORDER APPROVING NUCLEAR DECOMMISSIONING STUDY, ASSUMPTIONS, AND ANNUAL ACCRUAL, AND SETTING FILING REQUIREMENTS (October 5, 2015).
[9] Minnesota Electric Retail Rate Case, filed November 4, 2013, Docket No. E002/GR-15-826.

B. Primary Factors Changed Since 2014 Filing

The decommissioning analysis is comprised of three discrete steps. The first is to determine a decommissioning cost estimate for a chosen scenario.[10] The second is to determine the forward looking expected return estimate for the Nuclear Decommissioning Trust based on the investment mix over the relevant period of time. This includes an analysis of the expected returns on various asset classes and changing investment strategies based on when liquidity would be needed to cover decommissioning costs. The third step is to calculate an annual accrual necessary to fully fund the costs of decommissioning for each site based on the earnings estimates developed for the chosen scenario.

This Section of the Petition examines the three primary drivers that contribute to changes in the amounts needed for decommissioning at the expiration of the plants' current operating licenses:

- *Changes to the engineering and other cost estimates.* We revised the engineering cost estimates, using multiple dismantling and fuel storage duration scenarios. The DECON decommissioning scenario was prepared with five fuel storage scenarios. Two of the fuel storage scenarios assume no re-casking of the fuel and three fuel storage scenarios assume replacement of spent fuel storage dry casks every 50 years. The SAFSTOR scenario was prepared with two fuel storage scenarios with no re-casking assumed for either scenario.
- *Changes in assumptions about escalation/inflation of costs over time.* We utilized two escalation/inflation rates: one for the labor cash flows and one for the non-labor cash flows;
- *Revisions to the forward looking expected returns.* We applied multiple earnings rates. For each scenario, we applied one earnings rate for the operation period and another for the post shutdown period.

A detailed discussion of each of these primary drivers is provided below.

1. Engineering and Other Cost Estimates

Our consultant, TLG Services, Inc. (TLG), performed site-specific cost estimates for the 20 scenarios noted above (14 fuel scenarios for DECON and six fuel scenarios for SAFSTOR for each of the two sites). Schedules A.1-A14 show TLG's schedules of annual expenditures for each of the scenarios individually. A more complete

[10] In all scenarios, it is assumed that the site is fully dismantled, radiologically decontaminated, and restored.

comparison between the cost estimates from the previous filing to this one is provided in Schedule A.

In addition to the cost estimates from TLG, the Company also has provided a calculation of the NRC minimum funding amount applicable to Xcel Energy's facilities in Schedule A. The NRC minimum is a calculation of a generic cost to decommission based on the output of a unit and is calculated using a formula specified by the NRC. It is not intended to be a site-specific estimate of decommissioning, as it does not address specific site issues. The NRC uses this as a gauge of the minimum level of funding a licensee must have to meet the NRC's funding assurance requirements of future decommissioning. Consistent with prior filings, the Company does not use the NRC minimum when analyzing the need for future decommissioning funding, but it provides it as an additional data point for analysis. All the cost estimates from TLG in total are greater than the NRC minimum calculations, thus we are funding for more than the NRC minimum.

The decommissioning cost estimate is driven by two primary factors: the choice of decommissioning alternative for the radiological removal of the plant and the duration of fuel storage on site after operations. We discuss each in turn below.

a. Decommissioning Alternatives for Radiological Removal

The alternative chosen for the removal and decontamination of the radiological components of the nuclear plant can vary the timing of when the costs are incurred from early in the decommissioning timeframe for DECON to almost 50 years after operations cease for SAFSTOR. The annual costs associated with the radiological decommissioning alternative are similar across all the different spent fuel storage scenarios that are provided. For example, with the DECON method, the radiological removal costs are the same for the 32-year, the two 60-year, the 100-year, and the 200-year spent fuel storage scenarios. Thus, the duration for storing spent fuel remaining on site does not affect the annual costs for the radiological decommissioning.

The Company has decided to evaluate and provide SAFSTOR scenarios—in addition to DECON scenarios—in light of a growing number of plants using this method. Indeed, the industry is currently in the midst of change with respect to decommissioning, as a majority of plants shutting down in recent years are electing to use SAFSTOR. Of the 20 nuclear plants currently in decommissioning across the United States, 14 are utilizing SAFSTOR. Many of these plants have stated, however, they do not intend to take the full 60 years, but will finish decommissioning when economically viable.

The primary driver of this shift to SAFSTOR is the increased earnings in the fund when a large majority of the expenditures are pushed further out into the future. This allows for smaller annual accruals during operation. That is, to the extent that the after-tax return of the fund outpaces the sum of the annual escalation and costs to maintain the facility during dormancy, the required contributions by customers will decrease relative to a DECON method.

Regardless of decommissioning option, we anticipate the plant will put all of the used fuel into dry storage containers and move it to the Independent Spent Fuel Storage Installation (ISFSI) within the first five years following shutdown. This could occur even faster as technology continues to evolve, and we note that the Kewaunee plant recently completed moving all fuel to ISFSI within two years of shut down.

With either method, once the fuel has been moved to dry casks, the spent fuel pool and supporting systems can be dismantled, meaning that that the pool can be drained and supporting equipment can be de-energized and secured. For SAFSTOR, the plant is then left intact during the dormancy period. During this time, there is a 24-hour security force, and maintenance of security systems along with lighting, building maintenance, ventilation and radiation monitoring programs. This dormancy period allows for an eventual reduction in worker dose rates during decommissioning as systems are allowed to decay before full dismantlement. It also results in a reduction in radioactive waste volumes at time of full dismantlement, which results in cost savings.

b. Period that Spent Fuel Could Potentially Remain On Site

The second issue that influences the overall cost estimate is the duration of fuel storage after shutdown and the procedures in place for the handling of spent fuel. These include the period spent fuel remains in the pool, the period the fuel is stored onsite, and whether the fuel has to be moved to a second cask while stored onsite.[11]

As with all decommissioning cost estimates, the dismantlement and removal of contaminated structures cannot be completed until all spent fuel has been removed from the reactors and storage pools and placed in dry storage containers in the ISFSI. Final release of the site from all licenses will occur once all the fuel is removed from

[11] In our last triennial nuclear decommissioning filing, the Commission ordered that the Company provide a more detailed break out of "spent fuel management" costs in future decommissioning filings. In reference to this request the Company first notes that the engineering cost estimate provided in this filing contains tables 3.1-3.7 containing the costs assigned to spent fuel management by cost category and year for all seven scenarios. The cost estimates also provide a narrative discussion regarding what these costs include in section 2.1.4.

the onsite storage facility and the storage facility itself has been removed. The differences between the 32-year, the two 60-year, the 100-year, and the 200-year scenarios are all related to the storage facility operational period and whether the fuel storage scenario included costs to replace spent fuel dry storage casks every 50 years (*i.e.*, recasking). In our spent fuel scenarios, the 32-year and one of the 60-year scenarios do not include recasking. The second 60-year scenario as well as the 100-year and 200-year scenarios include recasking every 50 years.[12] Our recasking assumptions are discussed further in Part c below.

As part of the engineering cost estimate in the 2014 Filing, it was assumed that a federal off-site storage or disposal facility would be available in 2025 allowing spent fuel to be removed from Xcel Energy's nuclear plant sites by 2065 at Prairie Island and 2066 at Monticello. It was also assumed that all spent fuel would be removed from the storage pools at both plants after approximately 15 years to meet cool down requirements before being placed in dry storage. In the current engineering cost study, the assumptions for the removal of the fuel from the storage pools were changed to account for emerging cask technology that will allow spent fuel to be removed from the storage pools within the first five years of decommissioning. However, while the fuel can be placed into the ISFSI much earlier in the decommissioning timeframe compared to the 2014 engineering cost estimate, the ISFSI operating durations were not altered by this change.

Consistent with our 2014 Filing, we have evaluated a scenario that assumes a centralized interim storage facility will begin operation in 2025, allowing shipments from the Prairie Island and Monticello sites to begin in 2027 with all spent fuel being removed from Minnesota by 2064. [13] Based on the current status support for centralized interim storage (discussed further below), we believe this 32-year scenario may represent a realistic length of time for all spent fuel to be shipped off-site to a federal facility following the shutdown of Monticello and Prairie Island, assuming that

[12] The Commission's Order from the 2014 Filing directed the Company to "develop a 60, 100 and 200-year plan for the City of Red Wing to enable Xcel to build, improve, communicate, and share an understanding of the long-term safety-related costs of spent fuel storage on host communities." We provide this information in Schedule B.

[13] The NRC has resumed work on its review of the proposed Yucca Mountain repository as directed by the U.S. Court of Appeals. In October 2014, the NRC issued its Safety Evaluation Report Related to Disposal of High-Level Radioactive Wastes in a Geologic Repository at Yucca Mountain, Nevada: Repository Safety after Permanent Closure (NUREG-1949, Volume 3). Since the last filing, the Yucca Mountain supplemental Environmental Impact Statement (EIS) was issued in May, 2016. A final licensing decision could come after hearings, and full NRC adjudicatory review of contentions filed by project opponents.

the federal facility will be capable of receiving 3,000 metric-tons heavy metal each year from all nuclear power plants nationwide.[14]

In developing the strategy for spent fuel shipping for the 60-year, 100-year, and 200-year scenarios, a key assumption is that all fuel would be shipped from one site first (Prairie Island) followed by the second site (Monticello). Allocations of space for shipping to a federal facility are provided on a company-wide basis, and Xcel Energy has the discretion to ship spent fuel from either site first, or both sites at the same time. If spent fuel were shipped from both sites at the same time, both ISFSIs would have to operate for the entire time period following shutdown, *i.e.* 60 years, 100 years, or 200 years. By completing shipping from one site first, overall costs would be lowered because the costs of operating and securing the first site's ISFSI are eliminated approximately 13 years earlier.

However, the 32-year scenario assumes shipping from both sites simultaneously, resulting in the Prairie Island ISFSI operating until 2064 (31 years after plant shutdown) and the Monticello ISFSI operating until 2062 (32 years after plant shutdown). This is due to a need to cool the spent fuel following discharge from the reactor for a minimum of 30 years prior to shipping. Table 1 below depicts the years that spent fuel shipping will begin and finish for the 32-year, 60-year, 100-year, and 200-year scenarios. The fuel shipping commencement and completion dates do not change because of the decommissioning alternative chosen or whether recasking is performed.

[14] For more information pertaining to the DOE's progress toward its removal of spent nuclear fuel from Minnesota's nuclear plants, see the Company's most recent Annual Nuclear Waste Management Report at Docket No. E002/CN-09-36 filed on August 10, 2017.

Table 2 – Spent Fuel Shipping Schedules

Plant	Year Shipping Begins	Year Shipping Finishes
32-year Scenario		
Prairie Island	2027	2064
Monticello	2042	2062
60-year Scenario (recasking or no recasking)		
Prairie Island	2053	2077
Monticello	2078	2090
100-year Scenario		
Prairie Island	2093	2117
Monticello	2118	2130
200-year Scenario		
Prairie Island	2193	2217
Monticello	2218	2230

These shipping schedules are informed by two sets of activities that are occurring at the national level. The first is the DOE's Strategy for the Management and Disposal of Used Nuclear Fuel and High-Level Radioactive Waste published in January 2013, and the second is the NRC's Continued Storage of Spent Nuclear Fuel rule which went into effect on October 20, 2014.[15] Each is discussed in greater detail below.

i. BRC Report and DOE's Implementation Strategy

The BRC issued its report, entitled "Report to the Secretary of Energy" on January 26, 2012.[16] The report recommended, "Prompt efforts to develop a New Geologic Disposal Facility," in order to provide the needed facilities to safely dispose of spent fuel permanently.[17] In tandem with the development of a geologic disposal facility, the report also recommended, "Prompt efforts to develop one or more consolidated storage facilities," which, "would allow the federal government to begin the orderly transfer of spent fuel from reactor sites to safe and secure centralized facilities independent of the schedule for operating a permanent repository."[18]

On January 11, 2013, in response to the BRC report, then-Secretary Chu issued the DOE's "Strategy for the Management and Disposal of Used Nuclear Fuel and High-

[15] A copy of the Federal Register Notice which published the final NRC rule entitled, "Continued Storage of Spent Nuclear Fuel" dated September 19, 2014 can be found at the following web location: http://www.gpo.gov/fdsys/pkg/FR-2014-09-19/pdf/2014-22215.pdf

[16] "Blue Ribbon Commission on America's Nuclear Future, Report to the Secretary of Energy", http://cybercemetery.unt.edu/archive/brc/20120620220235/http://brc.gov/sites/default/files/documents/brc_finalreport_jan2012.pdf, January 26, 2012

[17] Ibid, Pg. xi

[18] Ibid, Pg. xii

Level Radioactive Waste."[19] The Strategy is intended to serve as a statement of Administration policy on nuclear waste and represents an initial basis for discussions among the Administration, Congress and other stakeholders. As the DOE report summarizes, "The Administration currently plans to implement a program over the next 10 years that:

- Sites, designs and licenses, constructs and begins operations of a pilot interim storage facility by 2021 with an initial focus on accepting used nuclear fuel from shut-down reactor sites;
- Advances toward the siting and licensing of a larger interim storage facility to be available by 2025 that will have sufficient capacity to provide flexibility in the waste management system and allows for acceptance of enough used nuclear fuel to reduce expected government liabilities; and
- Makes demonstrable progress on the siting and characterization of repository sites to facilitate the availability of a geologic repository by 2048."[20]

Full implementation of this program will require legislation to enable the timely deployment of the system elements noted above. In the meantime, the DOE is undertaking activities within its existing authorization to plan for the eventual transportation, storage, and disposal of used nuclear fuel. Activities range from examining waste management system design concepts, to developing plans for consent-based siting processes, to conducting research and development on the suitability of various geologies for a repository.

Based on these two reports, it is feasible that some facility, whether a centralized interim storage facility or permanent geologic disposal facility, could reasonably be sited, constructed and begin receiving fuel by 2025. The projected 2025 timeframe allows time for Congress to enact any required legislative changes, and for the facility to be sited, licensed and constructed. Transportation planning to the centralized interim facility would be accomplished in parallel with the siting and construction activities. The year 2025 is the earliest that spent fuel might be moved from Minnesota nuclear power plants.

Below we provide further details regarding the status of federal storage initiatives.

[20] Ibid, Pg. 2

ii. Status of Federal Storage Initiatives, Permanent or Temporary.

Licensing of Yucca Mountain. Public hearings before the NRC Atomic Safety and Licensing Boards were underway in May 2010 when the DOE sought to withdraw the Yucca Mountain application. An Atomic Safety and Licensing Board denied DOE's motion in June 2010 and the NRC Commission ruled that it was evenly divided on whether to overturn or uphold the Licensing Board decision.

In August 2013, the U.S. Court of Appeals for the District of Columbia Circuit ordered the NRC to continue with the licensing process unless or until Congress ruled otherwise or the NRC exhausted its appropriated funds. Subsequent to that decision, the NRC Staff completed its technical and environmental reviews of the Yucca Mountain application. As of May, 2016, the NRC has completed both the technical and environmental reviews of DOE's application for the proposed Yucca Mountain facility. The public hearings have not, however, been restarted

In March 2017, the Administration's Office of Management and Budget published its Budget Blueprint for Fiscal Year 2018 which proposed $120 million in appropriations "to restart licensing activities for the Yucca Mountain nuclear waste repository and initiate a robust interim storage program." The DOE budget request submitted to Congress on May 23, 2017, included $120 million for Yucca Mountain and interim storage. The NRC budget request, also submitted on May 23, 2017, sought $30 million for Yucca Mountain licensing. The House on July 27, 2017 passed the Fiscal Year 2018 appropriations for DOE and NRC, providing $120 million intended for DOE's Yucca Mountain licensing, and $30 million for NRC Yucca Mountain licensing costs. On August 8, 2017, the NRC announced that it would use $110,000 in existing Nuclear Waste Fund appropriations for information gathering activities relating to potential venues for a restarted Yucca Mountain hearing and the Yucca Mountain electronic database.

Consolidated Interim Storage. There are currently two private initiatives to develop away-from-reactor dry storage facilities. One project, Waste Control Specialists (WCS), is a proposed Consolidated Interim Storage Facility (CISF) at a site in Andrews County, Texas, adjacent to WCS's existing low-level radioactive waste and hazardous waste storage and disposal facilities. In April 2016, WCS filed an application with the NRC for the CISF. In April 2017, WCS asked the NRC to suspend the review of this application. Since that time, a federal judge ruled against the EnergySolutions $367 million acquisition of WCS, saying it would create a monopoly in nuclear waste disposal. It is unknown if another company will purchase WCS or if WCS will choose to move forward with licensing. Holtec

International has proposed a similar facility for a site in Eddy and Lea Counties in southeastern New Mexico. Holtec filed an application with the NRC for this facility on March 30, 2017. Both companies are reportedly considering how their projects could be used to meet the DOE obligation to accept spent nuclear fuel under the Standard Contracts.

It is feasible that some facility, whether it is a centralized interim storage facility or permanent geologic disposal facility, could reasonably be sited, constructed, and begins receiving fuel by 2025. The projected 2025 timeframe allows time for Congress to enact any required legislative changes, and for the facility to be sited, licensed and constructed. The year 2025 is the earliest that spent fuel might be moved from Minnesota nuclear power plants.

iii. Continued Storage of Spent Nuclear Fuel Rule

Historically, Waste Confidence has been the NRC's generic determination regarding the environmental impacts of storing spent nuclear fuel beyond the licensed life for operation of a nuclear power plant. This generic analysis has been incorporated into the NRC's reviews under the National Environmental Policy Act for new reactor licenses, license renewals, and ISFSI licenses through the Waste Confidence Rule. On June 8, 2012, the U.S. Court of Appeals for the DC Circuit found that some aspects of the Waste Confidence Rule did not satisfy the NRC's National Environmental Policy Act obligations and vacated the rulemaking.[21] The court indicated that in making either a Finding of No Significant Impact based on an Environmental Assessment or in an Environmental Impact Statement, the NRC needed to add additional discussions concerning the impacts of failing to secure permanent disposal for spent nuclear fuel, and concerning the impacts of certain aspects of potential spent fuel pool leaks and spent fuel pool fires.

In response to the court's decision, the NRC suspended final licensing decisions on new reactors, reactor license renewals, and spent fuel storage facility renewals. The NRC subsequently directed its staff to develop a new rule within 24 months.

On Sept. 6, 2012, the NRC Commission directed NRC staff to proceed with a Generic Environmental Impact Statement (GEIS) to analyze the environmental impacts of continued storage, address the issues raised in the Court's decision, and update the rule in accordance with the analysis in the GEIS. The final rule and GEIS was renamed from "waste confidence" to "continued storage of spent nuclear fuel" in response to public comment to more accurately reflect the nature and content of the

[21] *New York v. NRC,* 681 F.3d 471 (D.C. Cir. 2012)

rule. The GEIS and final rule effective October 20, 2014, implemented the Commission's direction.

The rule does not authorize, license or otherwise permit nuclear power plant licensees to store spent fuel for any length of time. Rather, the continued storage rule adopts the findings of the GEIS regarding the environmental impacts of storing spent fuel at any reactor site after the reactor's licensed period of operations. As a result, those generic impacts do not need to be re-analyzed in the environmental reviews for individual licenses. The GEIS analyzes the environmental impact of storing spent fuel beyond the licensed operating life of reactors over three timeframes: for 60 years (short-term), 100 years after the short-term scenario (long-term) and indefinitely. However, availability of a deep geologic repository within 60 years is commented on by the NRC in the Federal Register Notice of the Rule where it states on page 56254:

> *The United States national policy remains disposal of spent fuel in a geologic repository, and, as stated in the GEIS, the NRC believes that the most likely scenario is that a repository will become available by the end of the short-term timeframe (60 years beyond the licensed life for operation of a reactor).*

The possibility of even longer service times is supported by the evaluations performed in the NRCs NUREG-2157, Generic Environmental Impact Statement for Continued Storage of Spent Nuclear Fuel. Under the renewed ISFSI licenses, cask monitoring and maintenance activities are reviewed and approved by the NRC and provide reasonable assurance the casks will continue to store used nuclear fuel safely for a minimum of 60 years.

In NUREG- 2157, "The NRC assumes the replacement of dry casks after 100 years of service life, however, replacement times will depend on actual degradation observed during continued regulatory oversight for maintain safety during continued storage."

c. Recasking Assumptions

The Commission Order in the 2014 Filing required the Company to "re-examine its 50-year model recasking cost assumption and analysis, by providing two scenarios—one based on the same recasking assumptions used in this filing, and one assuming the need to replace all casks prior to being turned over to the custody of the federal government."[22] In compliance with that Order, the Company is providing two 60-

[22] Order Point 12(e). Additionally, we note that Order Point 12(g) directed the Company to "provide a detailed discussion of the status of Nuclear Regulatory Commission relicensing of casks, on the anticipated

year fuel storage scenarios—one that includes recasking after 50 years and one that does not. Additionally, both the 100-year and 200-year scenarios include recasking costs. Under all recasking scenarios, the first spent fuel canister would be replaced in 2045 at Prairie Island and 2058 at Monticello.

We believe it is reasonable and appropriate to assume that no recasking will be necessary for either the 32-year or 60-year scenarios. Recent activities by the NRC indicate that cask life is at least 60 years and might be 100 years, or longer. This is supported by the NRC's recent actions to process the renewal of the licenses of multiple ISFSIs,[23] including for Prairie Island, a total operation period of 60 years (a 20-year initial license plus a 40-year renewal) of operation. Under the renewed ISFSI licenses, cask monitoring and maintenance activities are reviewed and approved by the NRC and provide reasonable assurance that the casks will continue to store used nuclear fuel safely for a minimum of 60 years.

In addition, in the Generic Environmental Impact Statement for Continued Storage of Spent Fuel published in NUREG-2157 in September 2014, the NRC states, "The NRC assumes replacement of dry casks after 100 years of service life; however, replacement times will depend on actual degradation observed during continued regulatory oversight for maintaining safety during continued storage." Taken together, we believe these findings support our assumption that no recasking will be necessary under the 60-year scenario. We further note that the large step up in the accrual for any scenarios with recasking is primarily due to the recasking assumption that is included in the cost estimate.

The Prairie Island site specific ISFSI license (SNM-2506), which permits storage of the TN-40 casks, was issued in 1993 for a 20-year period. The associated Safety Analysis Report (SAR) described a minimum design life of 25 years. Xcel Energy subsequently applied for, and the NRC granted, a renewal of license SNM-2506 for an additional 40 years through 2053. As part of the license renewal process, a review of Time-Limited Aging Analyses (TLAA) and the Aging Management Review (AMR) of the ISFSI systems, structures, and components were conducted. TLAA reviews identified analyses that were required to be performed to demonstrate intended functions would be maintained during the period of extended operation. AMRs identified aging effects/mechanisms that could adversely affect the ability of the systems, structures, and components to perform their safety functions during the

---

life of the casks used by Xcel, manufacturer and contractor warranties and liability obligations for the casks, the technical and regulatory barriers associated with transporting the casks used and the status of any federal storage initiatives whether permanent or temporary.

period of extended operation and the application identifies an acceptable aging management program to be implemented prior to the period of extended operation at the site. The NRC Staff reviewed the AMRs and the Aging Management Programs proposed by Xcel Energy and added additional license conditions reflecting the Aging Management Programs.

The Monticello ISFSI casks are authorized by Certificate of Compliance 72-1004 which permits the use of each cask for 20 years from the date it is placed into service. The associated SAR described a service life of 50 years. The general license holder (TN Americas LLC) has subsequently applied for a renewal of Certificate of Compliance 1004 for an additional 40 years. This application is pending NRC approval. As part of the license renewal process, a review of Time-Limited Aging Analyses (TLAA) and the AMR of the ISFSI systems, structures, and components was conducted. TLAA reviews identified analyses that were required to be performed to demonstrate intended functions would be maintained during the period of extend operation. AMRs identified aging effects/mechanisms that could adversely affect the ability of the systems, structures, and components to perform their safety functions during the period of extended operation and the application identifies an acceptable aging management program to be implemented prior to the period of extended operation at the site. The application included SAR markups to modify the service life to 60 years.[24]

Based on TLAA and AMRs that have been performed, experience to date and continuation of approved aging management programs to ensure that monitoring and maintenance are adequately performed, Xcel Energy believes it is reasonable to assume the licenses and Certificates of Compliance may eventually be renewed for an additional 40 years, or longer.

d. Technical and Regulatory Barriers to Transporting Spent Fuel

There are no technical or regulatory barriers to transporting spent fuel. The NRC regulates the transportation of commercial spent nuclear fuel in accordance with 10 CFR Part 71 – Packaging and Transport of Radioactive Material. Over the past 30 years, the DOE, NRC and the nuclear industry have safely completed approximately 3,000 shipments of spent nuclear fuel and high-level waste. There is also extensive worldwide experience with spent nuclear fuel transportation: more than 70,000 metric tons of uranium of spent nuclear fuel has been safely shipped in the past 25 years.

[24] The manufacture warranty states the design of the casks shall conform and comply with the applicable NRC requirements for 20 years. The warranty on the material and services typically applies for 2- 5 years from the date of services or material delivery.

This is equal to the amount the DOE will ship to a permanent repository as authorized in the Nuclear Waste Policy Act. Barriers at this time are largely political and at a state level along the proposed transportation routes. DOE continues to provide funding to work on the potential transportation barriers such as public education and emergency planning along the transportation routes.

Under contract with DOE, nuclear plant operators are required to prepare spent fuel for shipment to DOE. To ship spent fuel the nuclear plant operators are required to place the fuel in NRC approved containers for transportation. The casks used for storage at Monticello and Prairie Island also will be used for transportation and there will not be a need to move spent fuel from their current storage container prior to transport. The actual transportation will be the responsibility of DOE. To accomplish this title and liability for the spent fuel will be transferred to DOE when the spent fuel transportation container crosses the nuclear plant site boundary and is in the possession of DOE.

2. Escalation/Inflation Rate

The second primary driver of the decommissioning estimate is an updated set of assumptions regarding escalation and inflation. Goldman Sachs Asset Management (GSAM), our investment advisor for the NDT, provided the forecast analysis for the escalation/inflation rates used in this filing's accrual calculations. A more comprehensive narrative of this analysis and accompanying graphs are included in Schedule C, which includes a discussion of the economic and inflation factors, including gross national product growth, labor productivity, and other considerations utilized in estimating long-term inflation rates.

The Company recommends a 4.05 percent escalation rate for the labor component of decommissioning and a 2.85 percent escalation rate for the non-labor components. The 1.2 percent difference in this escalation rate for non-labor reflects the fact that increases in labor productivity will not have an impact on escalation of non-labor costs. These two rates were factored into the calculation of the future costs of nuclear decommissioning. However, the Prairie Island Indian Community payments were not escalated as they remain constant each year until the fuel is removed from the site.

3. Forecast Earnings Rate

GSAM also provided the analysis for the forecasted earnings rate, which was reviewed internally for reasonableness. A more comprehensive narrative of this analysis and accompanying graphs are included in Schedule D, which includes a discussion of the analytical framework used by GSAM to arrive at the forward looking expected

returns. It also includes a discussion regarding our investment strategy, investment and economic assumptions, and the expected returns for the various classes of investments that are currently a part of the fund.

While there is inherent uncertainty in any forward looking expected return and escalation/inflation forecasts, the longer it takes to complete the decommissioning, the more time the fund has to compound earnings on the amounts contributed. At the same time, however, a longer decommissioning period also subjects the fund to more risk that the estimated earnings will not be realized as expected.

Consistent with our past triennial filings, the Company recommends a stratification of the earnings rate between the operational period and the decommissioning period. We also recommend two earnings rates for each facility to better match the earnings rates with the individual cost estimates and to better replicate the separation in the Qualified Trusts within the NDT. Each unit has its own set of earnings rates due to the difference in the timing of cash flows and different decommissioning start dates. Table 2 below shows the expected after-tax returns that are representative of the analysis detailed in Schedule D.

Table 3 – Earnings Rates Forecast

	60-Year Scenario			
	2014 Rates		2017 Rates	
Nuclear Unit	Operations	Decom.	Operations	Decom.
Monticello	6.20%	5.51%	5.00%	4.43%
Prairie Island Unit 1	6.24%	5.35%	4.99%	4.15%
Prairie Island Unit 2	6.30%	5.23%	5.04%	4.09%

The decrease in the expected after-tax returns is largely the result of lower forward looking expected returns for multiple asset classes.

C. Trust Structure & Investment Strategy

Per the Commission's October 5th, 2015 Order in Docket E002/M-14-761, the NDT investments are contained in three Qualified Trusts, which are a standard decommissioning fund that cannot be refunded to customers until all decommissioning activities are completed. The Company has established an individual Qualified Trust for each nuclear operating unit to hold the decommissioning funds required by the NRC.

Below we discuss our investment strategy for the NDT as well as changes to our liquidity assumptions for the trust.

1. Investment Strategy

As discussed in previous triennial dockets, the Company's NDT Committee routinely evaluates both the NDT's performance and the overall investment strategy for the fund (including its asset allocation), and it revises both the strategy and allocation as necessary. Following a hearing on the Company's 2016 Annual Informational Report, the Commission issued an order in February 2017 requiring Xcel Energy to re-evaluate the investment mix for the NDT with the purpose of reducing the NDT's investment management fees and increasing the annual return on its investment portfolio.

As part of this Triennial Nuclear Decommissioning Accrual filing, the Company undertook a comprehensive review of our investment allocations to evaluate portfolio changes that would be effective over the next triennial period. The process of determining the portfolio's asset mix is called asset allocation optimization. Different mixes of assets can produce hundreds, or even thousands, of alternative combinations of risk and returns. As a result, asset allocation techniques are used in practice to evaluate the various possible asset mixes and determine those combinations that are likely to deliver optimal performance in terms of risk and return.

We have used this process to perform a long-term optimization of the asset allocation for the NDT's investments. With any investment, there is always a trade-off between risk and the expected rate of return on that investment. Typically, strategies with higher expected returns also come with higher risk and vice versa. The goal is to optimize the trade-off between risk and return over the long term. If on one hand too little risk is taken, then there is a significant chance that the trust remains underfunded, necessitating very large contributions into the trust in later years. If on the other hand too much risk is taken, there is a risk of significant underfunding of the trust in the future, or of overfunding of the trust, which because of the difficulty of removing assets from the Qualified Trust is also undesirable.

In addition to this analysis, the Company also considered portfolio options that shifted fund objectives slightly from liability matching characteristics such as inflation sensitivity to instead focus on lower cost, more traditional investments. To that end, the NDT's investment in commodities was removed from the portfolio. The Company also re-evaluated the diversifying assets included in the portfolio, such as the hedge fund investments. Consistent with the objective of reducing investment manager fees and simplifying the portfolio, hedge funds were also removed.

Following the Company's full analysis of multiple investment portfolios, we recommend the following investment mix shown in Table 3 below. We note that the

development of this recommendation followed a process deemed prudent by the independent investment review required by the Commission's February 27, 2017 Order in Docket No. E002/M-14-761. That review also concluded that the Company "has found an appropriate balance to achieving a reasonable risk adjusted return" and that its asset allocation is "properly diversified amongst a reasonable amount of non-correlated assets classes."

Table 4 – Recommended Investment Mix

Portfolio Line Item	2016 Target	Updated 2017 Target
Total Equity	60.0%	60.0%
Private Equity	10.0%	10.0%
Public Equity	50.0%	50.0%
US All Cap Equity	26.0%	25.8%
Non-US Developed Equity	14.0%	14.1%
Emerging Markets Equity	10.0%	10.1%
Fixed Income	17.5%	30.0%
Investment Grade Fixed Income	5.0%	12.1%
High Yield Fixed Income	8.5%	10.0%
Emerging Market Debt	4.0%	7.9%
Hedge Funds	7.5%	0.0%
Private Real Estate	10.0%	10.0%
Real Assets (Commodities)	5.0%	0.0%
Cash	0.0%	0.0%
Total	**100.0%**	**100.0%**

Consistent with prior triennial filings, we request that the Commission approve this asset allocation, which we believe results in an optimized trade-off between risk and return over the long term on a forward looking basis. That said, the Company will continue to analyze the portfolio asset mix and make updates and changes as necessary. In other words, the portfolio mix identified in this filing is a snapshot of a point in time and could change between now and the next triennial filing.

A more detailed discussion of the recommended target asset mix for the decommissioning fund, along with an analysis of the forward looking expected returns is included in Schedule D.

a. Change in Liquidity Assumptions

The Company's 2014 analysis of forward looking expected returns assumed a reallocation of investments equivalent to the respective cash outflow to bonds six

years before that cash flow was needed for decommissioning. This was done to follow a principal called "the Two-Fund Separation Theorem," which states that an efficient portfolio can be constructed of both a growth portfolio and efficient low-risk portfolio. For 2017, the Company's analysis is continuing to use this Two-Fund Separation Theorem as a guide when making future investment assumptions. However, the Company is proposing a change from reallocation six years before cash flows to five years before cash flows.

Our analysis assumes that the funds are invested in bonds as a cash outlay is approached. For each expected annual outgoing cash flow, assets are converted to bonds ahead of time to give more certainty to the ability to make the payment. Not all funds are converted to bonds – only enough to cover each annual cash outflow. For example, if the conversion is at a five year period, the first outflows expected in 2030 are converted to bonds in 2025; then in 2026, enough cash is converted to bonds to match the 2031 expected outflow.

Since expected bond returns are lower than the expected growth portfolio returns, the earlier the transition to bonds, the greater the certainty (lower the risk) but also the lower expected return. And because a later conversion to bonds for each cash flow increases the overall expected return, the assumed conversion period has been reduced from six years to five years as indicated above. We believe any risk of the shorter period is mitigated by the transfer to bonds each year for the associated cash flow (rather than all at once), so cycles have a chance to 'average out."

In short, the Company believes that making this change will provide greater returns without adding significant additional risk. Additional details regarding this change are provided in Schedule D.

D. Current Fund Balances

Annually, the Company reports the balances in the various funds in either this petition or a separate letter. The balances for both the Qualified Trust for the MN Jurisdiction are discussed below. The Escrow Fund was transferred to the Qualified Trust after the last decommissioning filing and thus, Escrow Fund no longer exists.

1. Qualified Trust

As of June 30, 2017, the Qualified Trust book value balance for all three operating units was a total of $1,151 million for the MN Jurisdiction, with a total market value of $1,467 million. The difference between the book value and the market value is the

unrealized gains and losses. Table 4 below shows the book and market values by unit. A detailed presentation of each unit's balances is presented in Schedule E.

Table 5 – Qualified Trust Balance as of June 30, 2017

Unit	Book Value	Market Value
Monticello	$514,771,426	$641,884,228
Prairie Island Unit 1	298,347,569	388,313,263
Prairie Island Unit 2	337,452,778	436,807,122
Total	$1,150,571,773	$1,467,004,613

The Qualified Trust is maintained by retail and wholesale jurisdictions. The retail jurisdictions are Minnesota, North Dakota, South Dakota, and Wisconsin. The wholesale jurisdictions are Minnesota and Wisconsin. Since 2014, there are no longer any full requirements wholesale customers; the Company contacted the FERC for the possibility of redistributing the two wholesale jurisdictional balances to the four retail jurisdictions. Before we can do this transfer within the Qualified Trust, we must first file with the FERC for their approval.

While we cannot physically transfer the funds with in the Qualified Trust, and regardless of whether the FERC grants us approval to do so, the amount of funds assigned to these two wholesale jurisdictions need to be factored into the Minnesota retail accrual calculation. The reason we believe that we have to factor a portion of the wholesale balance into the accrual calculation relates to the allocation of the cost estimate to each jurisdiction. One hundred percent of the cost estimate is allocated to the retail jurisdictions as these customers carry the burden of funding the remaining amount for decommissioning. If we did not include a portion of the wholesale balance in the accrual calculation, the accrual calculations for each retail jurisdiction will over recover the amount needed by the wholesale balance. Thus, for the accrual calculation we must account for the Minnesota jurisdictional amount of the Minnesota and Wisconsin wholesale balance when calculating the accrual.

The book value balance for the Minnesota and Wisconsin wholesale jurisdictions in total was $45.3 million and for the market value is was $56.7 million at June 30, 2017. The proposed distribution of these balances using the rate case demand allocators, assigned 73.4886 percent of the total to the Minnesota Retail jurisdiction, or $33.3 million additional book value balance and $41.7 million in market value balance. The allocation of the wholesale jurisdiction balances is included in Schedule E. Including the Minnesota Retail portion of the wholesale jurisdiction balances to the June 30, 2017 balances, results in the adjusted balances used in this filing as follows in Table 5:

Table 6 – Adjusted Qualified Trust Balance as of June 30, 2017

Unit	Book Value	Market Value
Monticello	$529,148,381	$660,140,345
Prairie Island Unit 1	308,078,761	399,941,696
Prairie Island Unit 2	346,627,064	448,597,551
Total	$1,183,854,206	$1,508,679,592

2. Beginning Fund Balance for Annuity Calculation

The 2014 Filing was submitted using the fund's market values, per the Commission order, and the 2017 filing continues to use the market value as a basis for the accrual. Using the adjusted market value is consistent with forward looking market conditions and will provide the most justifiable and proper accrual estimate at this time. The adjusted funds currently have a $324.8 million unrealized net gain. However, not all of this unrealized gain is available to fund decommissioning costs because taxes will have to be paid on the gains when they are realized. Therefore, the June 30, 2017 adjusted market value was dampened by $90.4 million for the estimated tax that can be expected be paid when the unrealized gain is realized. The Company calculated the tax effect on the June 30, 2017 adjusted market value based on the unrealized gains and losses in the portfolio. This tax effect calculation is shown with each accrual calculation in Schedule F.

3. Escrow Fund

In the 2014 Filing, the Commission approved the discontinuance of the Escrow Fund and approved the transfer (pour-over) to the Qualified Trust. The Company completed this pour-over in 2016 and reported a zero balance in the Escrow Fund with the 2017 compliance filing to 2014 Filing.

VI. EFFECT OF CHANGE UPON XCEL ENERGY REVENUE

Subdivision 1 (b) of Minn. Stat. §216B.2445 requires the inclusion of an estimated customer impact for each of the assumed periods. For this petition we calculated the rate impact to each of the customer classes on a $/kWh increase. This was done by allocating the estimated accruals for the various scenarios presented in Schedule F to the customer classes using the most recent Class Cost of Service Study.

The class allocation process used the same stratification methodology approved by the Commission in Docket No. E002/M-11-807 to return the DOE Settlement dollars to customers. This included an approximate 19.3 percent weight to capacity and an 80.7

percent weight to energy usage from Docket No E002/GR-15-826. The accrual was then divided by the energy each class forecasted to be used over a 12-month period ending December 31, 2017, also from Docket No. E002/GR-15-826, to determine a $/kWh that would be required for that class to collect its portion of the accrual. Schedule G provides the result of this calculation for all accruals provided in Schedule F.

VII. EOL NUCLEAR FUEL

At the time each nuclear unit is shutdown, there will be nuclear fuel remaining in the reactor that has not been fully utilized. We refer to this unused fuel as end-of-life (EOL) nuclear fuel. The unused fuel cannot be transferred to another facility, and the amortization expense for said fuel would have to be taken at the end of operations at each unit. To avoid this spike in amortization at the end of the useful life of each unit, the Company estimates the expected cost of unused fuel at the end of operations and amortizes the expense over the remaining life of each unit. This is done using a sinking fund method.

The Company recommends a decrease to the annual internal accrual for EOL nuclear fuel for this triennial filing. The Company is proposing to change the 2019 accrual based on the new EOL nuclear fuel factors discussed in Schedule H. The Minnesota jurisdictional annual accrual for 2019 is requested to be $2,040,887. This is a decrease of $372,402 over the accrual based on the factors approved in the 2014 Filing.

This recommended decrease stems mainly from an update in the estimates of the cost of the final fuel at shutdown. The estimated amount to be recovered decreased approximately $4 million from the estimate used in the 2014 Filing. The decrease was primarily the result of lower projected nuclear fuel commodity prices in the future, and the enrichment assumptions used in the estimate for Monticello. The 2021 accrual worksheet detailing the calculation is included in Schedule H. We have included the 2019 and 2020 data as well, for comparison purposes. The internal rate of return has been revised for the 2021 accrual to coincide with the new authorized rate of return from the MYRP.

VIII. PREMATURE RISK INVESTIGATION

In previous Orders, the Commission has directed that the Company to provide an investigation of premature risk in its Triennial Nuclear Decommissioning Accrual

filings.[25] Consistent with the Commission's prior orders, our investigation included the following aspects of the risks of premature decommissioning:

- The availability of commercial insurance.
- The availability of electric industry co-insurance.
- Any programs, which may be proposed, mandated, or administered by the NRC or any other United States Government agency.
- Specific detailed information pertaining to any steps Xcel Energy has taken to minimize any possible loss, which may occur as a result of premature decommissioning.
- Xcel Energy's ability to withstand possible economic and financial trauma, which may be associated with premature decommissioning.

Schedule I contains the regular response to that request. It addresses accident and non-accident related premature decommissioning of nuclear generating facilities. Presently, insurance is unavailable for non-accident related premature decommissioning such as those caused by regulatory directives. Therefore, the insurance analysis deals with accidents.

Xcel Energy property insurance coverage of $2.25 billion would largely offset the potential impact of an accident-related decommissioning. Although accident-related decommissioning expenses are significant, the length of time involved in a clean-up process, insurance payments, tax deductibility of expenses, and related rate relief would affect the yearly expense. Although accident related premature decommissioning would affect both the Company and its customers, it is anticipated that, with acceptable regulatory decisions, the financial integrity of the Company would be maintained.

IX. ASSET RETIREMENT OBLIGATION

The implementation of the Statement of Financial Accounting Standards No. 143 (SFAS 143), *Accounting for Asset Retirement Obligations* (ARO) in January of 2003 brought some changes to the accrual accounting for decommissioning. Financial Accounting Standards Board (FASB) Interpretation No. 47 (FIN 47), *Accounting for Conditional Asset Retirement Obligations* was released in March 2005. These statements are both included within the FASB Accounting Standards Codification (ASC) 410 *Asset Retirement and Environmental Obligations*. This Interpretation of the conditionality of an ARO has resulted in some additional accounting analysis for many of the fixed assets

[25] *In the Matter of the Petition of Northern States Power Company d/b/a Xcel Energy for Approval of the 2012-2014 Triennial Nuclear Plant Decommissioning Accrual,* Docket No. E002/M-11-939, Order Approving Decommissioning Plan and Modifying Refund Plan, (Dec. 4, 2012).

at Xcel Energy. Nuclear decommissioning was never assumed to be conditional in nature, thus the ARO accounting for nuclear decommissioning established in 2003 is unaffected by this Interpretation. Nonetheless, a summary of the ARO accounting for nuclear decommissioning is included in Schedule J for reference. This section is provided in response to the Commission's Order Point 12.a. from the 2014 Filing.

X. COMPLIANCE MATRIX AND REQUESTED AUTHORIZATION

The Company has provided Schedule K, a Compliance Matrix, to assist in referencing specific order points from the Commission Order from the 2014 Filing to the discussion in this petition.

XI. MISCELLANEOUS INFORMATION

Pursuant to Minn. R. 7829.0700, subpt. 2, Xcel Energy requests that the following persons be placed on the Commission's official service list for this matter:

Ryan J. Long
Principal Attorney
Xcel Energy
414 Nicollet Mall, 401 - 8th Floor
Minneapolis, MN 55401
ryan.j.long@xcelenergy.com

Carl Cronin
Regulatory Administrator
Xcel Energy
414 Nicollet Mall, 401 - 7th Floor
Minneapolis, MN 55401
regulatory.records@xcelenergy.com

Any information requests in this proceeding should be submitted to Mr. Cronin at the Regulatory Records email address above.

XII. SUPPORTING DOCUMENTS

The following supporting schedules and studies have been included for filing requirement purposes and consistent with past practice:

Supporting Schedules

A	Cost Estimate Summary
B	Red Wing Plan
C	Escalation Analysis
D	Portfolio Analysis
E	Qualified Trust Statements

Supporting Schedules

F	Decommissioning Accrual Analysis
G	Customer Rate Impact Calculation
H	EOL Accrual
I	Premature Risk Investigation
J	Asset Retirement Obligation
K	Compliance Matrix
L	Decommissioning Cost Analysis for the Monticello Nuclear Generating Plant
M	Decommissioning Cost Analysis for the Prairie Island Nuclear Generating Plant

CONCLUSION

Xcel Energy respectfully requests the Commission approve our Petition for Approval of the 2019-2021 Nuclear Decommissioning Accrual. As described in this filing, we specifically request Commission approval of:

- Approve our decommissioning study and assumptions as compliant with the Company's obligations under Minnesota statutes, Commission rules, and prior precedent;
- Continue the current approved annual accrual of $14.0 million, to meet the needs of the Company's 60-year spent fuel scenario with no re-casking of the fuel, continuing for 2019 through 2021 while strategic decisions about the future of our nuclear units are decided in our 2019 IRP;
- Approve an annual accrual of $2.0 million for EOL nuclear fuel for the calendar year 2019 through 2021; and
- Permit the Company to hold settlement payments received from the DOE in an interest-bearing account until the 2019 IRP is resolved, at which time the Commission can decide whether to apply those funds to the NDT or refund them to customers.

Additionally, and consistent with prior triennial filings, the Company is requesting Commission approval of changes in investment transition assumption and investment mix targets. Specifically, the Company requests Commission approval of the following two changes in order to improve the expected earnings of the investment portfolio and ensure that decommissioning funding needs are met without excess costs to customers:

- Transitioning investments to bonds five years before decommissioning cash flows rather than the six years as previously assumed; and
- Changing the investment mix to reduce allocations to certain alternative asset classes and increase allocations to fixed income investments, thereby reducing the expected fees and increasing the forward looking expected return.

The next decommissioning filing would be for the calendar years 2022 through 2024 with the submittal due December 1, 2020.

IN THE MATTER OF THE PETITION OF NORTHERN STATES POWER COMPANY FOR APPROVAL OF THE 2019-2021 TRIENNIAL NUCLEAR DECOMMISSIONING STUDY & ASSUMPTIONS

DOCKET NO. E002/M-17-828

SUMMARY

SUMMARY OF FILING

Please take notice that on December 1, 2017, Northern States Power Company, doing business as Xcel Energy, filed with the Minnesota Public Utilities Commission its Petition for approval of its Triennial Nuclear Decommissioning Study and Assumptions. In this Petition the Company analyzed a number of decommissioning scenarios and calculated a number of different accruals The resulting accrual calculations range from negative $16.0 million (meaning we are over-funded today) for scenarios involving life extensions of our plants to positive $115.9 million (meaning we are under-funded today) for scenarios involving the early retirement of our plants by five years.

The full version of this filing can be found via the Commission's website at http://mn.gov/puc/. Select "Search eDockets," enter the year (17) and the docket number (828), then select "Search."

The cost estimates developed and presented in this decommissioning filing are based on numerous fundamental assumptions, including regulatory requirements, project contingencies, low-level radioactive waste disposal practices, high-level radioactive waste management options, and site restoration requirements. Thus, there are seven cost estimates for each facility provided with this filing. There are five fuel storage options and two dismantiling options presented.

As required by Minnesota statutes, a variety of cost studies were created, in order to address the possibility of delays in the DOE acceptance of spent fuel. The Company is required by statute to submit at least three cost scenarios, 60-year, 100-year, and 200-year scenarios. The length of these scenarios is the longest period of time measured from the start of shutdown until all spent fuel is removed from the locations, for all scenarios that is for the Monticello plant. The 60-year, scenario has been provided with a no-re-casking assumption as well as one that assumes that spent fuel storage dry casks will be replaced every 50 years. The 100-year and the 200-year dry cask operational period scenarios assume that the fuel will be re-casked every 50-years. The Company has provided Schedule P in order to clarify its position and the basis for disagreement with the need to recask the spent fuel every 50 years.

In the 2014 Filing, the Company provided all scenarios using the DECON decommissioning alternative. This alternative is discussed below, and also elaborated on in TLG's executive summary to the cost estimate. In addition to the standard DECON scenarios presented, this filing also provides two SAFSTOR alternative scenarios for consideration. Over the last several years SAFSTOR has become a more popular decommissioning alternative as nuclear facilities have begun shutting down. The Company last presented a SAFSTOR its 2002 filing, as well as the 2003 update to reflect license extention at Priarie Island. Both of these decommissioning alternatives are discussed below.

For this filing, the Company assumed approximately five years of wet storage based on a conservative estimate of the capabilitieis of casks currently on the market. For the remainder of this period, the fuel will be stored in dry storage and the pool will no longer be required. This results in a significant decrease in the amount of security staff required at the site.

As a basis for these cost estimates, TLG uses a systems and structural inventory database, which in 1999, was revised for both nuclear facilities. The Company has reviewed and made minor changes to this inventory in the current filing. Other items provided as input are property and sales tax assumptions, insurance levels, burial rates, recycling practices, license termination dates, department budgets,

purchased power and oil costs, incidental costs and meteorological data. These are all input to a process that will estimate the total dollar amount for decontaminating, removing, packaging, shipping, and disposing of the two nuclear sites. These cost estimates include labor rates for both salaried staff and union craft people. All labor is provided with loadings such as pension, unemployment, workers compensation, and medical where applicable. An estimate for employee retention costs also was included in the estimate to account for the additional expense the Company expects to incur in order to insure it retains the staffing required for the plant in the early post shutdown stage while fuel remains in the pool. Xcel Energy also reviewed the organizational structure and numbers of employees for the salaried staff input.

Briefly, the decommissioning process is broken down into several main categories of work that are performed in various periods throughout the decommissioning depending on the dismantling method and the fuel storage assumptions, as follows:

Preparation – Site preparation, engineering and planning of detailed procedures, performing various surveys, implementing the staffing transition plan, organizing the staff required to manage the intended decommissioning activities from available plant staff and outside resources, and submitting filings to regulatory entities.

Fuel Storage – Packaging the fuel in dry cask canisters, loading the canisters to the storage pad, building a fuel transfer facility, re-casking every 50 years for some cost estimates

Dormancy – For SAFSTOR only, this is the period following unit shutdown where structures and systems not necessary for the operation or support of spent fuel pool and site security and surveilience are drained, de-energized, and securired. Minimal maintenance, sanitation, and sealing is performed to allow the facility to be maintained in an inactive state until delayed decommissioning activities commence. Only inspection, maintenance and security/surveilience activities are occurring during this period.

Decommissioning operations – a constructing additional facilities for cask storage, transferring all spent fuel to dry casks, modifications to site structures and facilities, decontamination, removal, packaging, shipping, and burial of all contaminated and activated components and structures. By the end of this work all radioactive or

contaminated material from the plant has been removed, but the fuel may still be onsite.

Site Restoration – The demolition of remaining structures, site restoration, and license termination.

All cost estimate numbers are provided in instant dollars, which means that costs for the same activity from one year to the next do not increase due to inflation. For example, the salary for an engineer is the same in the first year and all subsequent years. The time value impact of inflation is brought into the equation in the accrual calculation worksheet.

In Summary, the Company has computed variousdecommissioning accruals using the DECON scenario assuming a 32-year, 60-year (no re-casking), 60-year (recasking), 100-year (with re-casking), and 200-year (with re-casking) dry cask storage operational period. Additional decommissioning accruals have been computed using the SAFSTOR scenario with the 32-year and 60-year (no re-casking) dry cask storage operational period.

SAFSTOR Method of Decommissioning

SAFSTOR is defined in the U.S. Code of Federal Regulations, Title 10, Parts 30, 40, 50, 51, 70, and 72, as "the alternative in which the nuclear facility is placed and maintained in a condition that allows the nuclear facility to be safely stored and subsequently decontaminated (deferred decontamination) to levels that permit release for unrestricted use." Under this cost estimate decommissioning activities will commence about 50 years after the cessation of operations and will be completed within 60 years. Many plants entering SAFSTOR have stated they do not intend to take the full 60 years but will finish decommissioning when economically viable.

SAFSTOR has begun to be pursued by a number of plant operators as they have entered shutdown. The primary reason for this shift is the increased earnings in the fund when a large majority of the expenditures are pushed further out into the future, which allows for smaller annual accruals during operation. To the extent that the after-tax return of the fund out paces the sum of the annual escalation and costs to tend the facility during dormancy, the required contributions by rate payers will be decreased over a DECON method. Over a 50 year dormancy period, this impact becomes substantial based upon current estimates.

The salaried staff presented in the cost estimate is not necessarily assumed to be the staff of Xcel Energy. This assumption is due to the length of the wait period, now being 50 years, and the fact that the employees with nuclear experience currently employed within Xcel Energy will be enjoying retirement and not available for decommissioning work. Thus, the cost estimate assumes a Decommissioning Operations Contractor (DOC), which is an independent entity that oversees the decommissioning work and provides the required salaried employees.

A more detailed description of the cost estimation process is included in the accompanying two volumes. TLG has provided a written outline of the procedures as well as worksheets that delineate the costs per activity, per period. The 2017 cost estimate results from TLG for SAFSTOR are provided for the 32 year and 60 year no-recasking scenarios.

DECON Method of Decommissioning

DECON is defined in the U.S. Code of Federal Regulations, Title 10, Parts 30, 40, 50, 51, 70, and 72, as "the alternative in which the equipment, structures, and portions of a facility and site containing radioactive contaminants are removed or decontaminated to a level that permits the property to be released for unrestricted use shortly after cessation of operations."

Under this cost estimate decommissioning activities will commence as soon as possible after the cessation of operations. The last fuel assemblies will be sufficiently cooled and can be removed from the spent fuel pool and placed in dry casks after about five years.

DECON has been the preferred method of decommissioning for most situations. It is generally favorable because it eliminates the costs for caretaking, other than those related to the ISFSI. The cost estimate places most of the major expenditures more towards the front end of the decommissioning schedule. This is a major advantage because the individuals familiar with the operation of the facility are available to support the dismantling effort, plant systems and services are fully functional, structural integrity is intact, and licensee has a comprehensive management organization available to oversee and conduct the orderly decommissioning and decontamination.

The 2017 cost estimate results from TLG Services for DECON are provided for the 32-year, 60-year (no re-casking), 60-year (recasking), 100-year, and 200-year

spent fuel removal scenarios. The 100-year and the 200-year spent fuel scenarios also assume a 50 year recasking schedule.

Comparison to 2014 Filing

An extended time period of spent fuel management has multiple impacts including a significant increase in labor costs and extends the period of cost escalation, which creates a higher risk over time. The Company has escalated the 60-year cost estimate from the 2014 Filing in the Table 1 below and compared it to the 2017 cost estimate simply to show that the cost estimates were similar and in line with the changes expected from inflaltion. The comparison table inflates the 2014 Filing cost estimate using the last approved escalation rate for radiological activities of 4.36 percent along with the 3.36 percent approved for the ISFSI operating periods.

Table 1
Comparison of Current No-Recasking Cost Estimate to Previous Filing
60-Year Scenario

	2014 Study in 2017 Dollars	2017 Cost Estimate
Monticello	$1,478,122,368	$1,515,849,676
Prairie Island Unit 1	891,516,617	997,041,305
Prairie Island Unit 2	1,038,396,636	998,642,807
	$3,408,035,641	$3,511,533,789

There have been a number of differences in the cost estimate assumptions that factor into the comparison of the cash flows. One of the largest increases was in the security staffing levels for the plants. This is the first filing where the Company has provided a detailed site specific estimate of security staffing levels rather than using generic estimates that did not fully incorporate current NRC requirements of 10CFR73.55. This was substantially offset by a decrease in the amount of time the Company anticipates needing to operate the spent fuel pool after shutdown from15 years to 5 years. This was driven by the emergence of new cask technology capable of storing hotter fuel, which allows the Company to empty the pool somewhat faster than prior estimates. This results in decreased operating and security costs for the plant. Also new to this cost estimate was the inclusion of certain retention payments, removal of all structures below grade in compliance

with Minnesota Pollution Control Agency (MPCA) rules[1], and the continuation of PIIC payments throughout the decommissioning period as long as fuel remains on the Prairie Island site. Given the increases and decreases, the current estimate is slightly increased, but remains approximately in line with the inflated 2014 Filing cost estimate.

Table 2 shows the attachments that provide the yearly cost estimate detail for the seven cost estimates for each facility. Theses summaries show the costs for the radiological decommissioning, the spent fuel management costs, site restoration, and the ISFSI decommissioning. The entire TLG cost estimate documentation is provided in Schedule L for Monticello and Schedule M for Prairie Island.

NRC Minimum

The NRC minimum required funding amounts, based upon the new information from NUREG-1307, Revision 16, and the most recent statistics for comparison to the new cost estimates have been calculated. Under the NRC minimum calculation requirements, the Company must show that it will meet the minimum cost calculated under at least one of the two burial options allowed: Direct Burial and Blended Burial. Both of the NRC minimum calculations are less than all scenarios of our 2017 cost estimates in total. Table 3 shows lists the support schedules for the information for the calculation of the NRC minimum.

Table 3
NRC Minimum Calculation Supporting Schedules

A.15	NRC Minimum Historical Escalation
A.16	NRC Minimum Calculation

Property Taxes Included in Cost Estimates

Taxation of utility property is fundamentally different than taxation of the property owned by any other business. Like other businesses, we pay property taxes on the value of the land we own, the buildings attached thereto, and rights-of-way. This property is all assessed at the local level. Unlike other businesses, however, we are also assessed property taxes on personal property. Specifically, we are required to pay property taxes on Operating Property, which is defined as "any tangible property that is owned or leased, except land, which is directly associated with the generation, transmission, or distribution of electricity [or] natural gas…." Minn. R. 8100.0100, subp. 11.

In Minnesota, the Department of Revenue (DOR) values all of the Company's operating property in Minnesota, as well as its gas and electric operating property that extends into North Dakota and South Dakota. Each type of property is valued as one integrated system, or unit. When the system value for each type (electric or natural gas) is determined, an allocation is then made to reflect how much of the system value is attributable to Minnesota. Allocation is based on a combination of original cost of the property in Minnesota to total system cost, as well as gross revenue in Minnesota to total system revenue.

Deductions are then made to subtract property locally assessed (land and some buildings) and exemptions (e.g., sliding scale exemption for generation efficiency, pollution control, etc.). The resulting value is then apportioned to the various taxing districts based on the original cost of the property located in those districts.

Local taxing districts then combine the market value apportioned to them with the value of the Company's locally assessed property to arrive at our tax base within the taxing district's jurisdiction. Finally, each jurisdiction then applies its own individual property tax rate to our tax base to determine our property tax liability in that jurisdiction.

As we make new investments in personal property throughout our integrated system, the market value upon which property taxes are assessed increases. This increased market value is then apportioned to the local jurisdictions that host our Monticello and Prairie Island plants. In 2012, the Company paid $8.9 million in real and personal property taxes related to Monticello and $11.9 million for Prairie Island. In 2013, the Company paid $13.1 million in property taxes related to Monticello and $13.9 million for Prairie Island. When operations at these nuclear plants cease, the operating property will be removed from the sites and will no longer be included in the DOR's market valuation. This will result in a reduction

in property taxes paid when operations cease, but the property for the ISFSI will continue to be locally assessed. For the decommissioning cost estimates, the land, structures, and the dry cask portion of the operating property taxes were assumed to continue with the structures component lasting until the structures are decommissioned and removed.

The property tax amounts for Monticello and Prairie Island provided in the decommissioning cost estimate were based on the actual liabilities for 2014 paid in 2016. The Company's consultant developed the future property tax estimates for after plant shut down based on the actual 2014 accruals for the Prairie Island ($21.4 million) and Monticello ($17.5 million) locations as reflected on the property tax statements received and paid in 2016. Table 3 shows the change in property taxes from operations to decommissioning.

Table 4
Property Tax Estimates

	During Operations	Plant Shutdown	Plant Structures Removed
Prairie Island			
Land	$212,258	$212,258	$212,258
Structure	4,552,444	4,552,444	0
Substation	345,235	0	0
ISFSI	1,885,006	1,885,006	1,885,006
Generation Machinery	14,378,986	0	0
Total	$21,373,930	$6,649,708	$2,097,264
Monticello			
Land	$535,724	$535,724	$535,724
Structure	2,524,272	2,524,272	0
Substation	287,654	0	0
ISFSI	149,311	149,311	149,311
Generation Machinery	13,959,453	0	0
Total	$17,456,414	$3,209,307	$685,035

The process used in the current property tax cost estimates is the same as the method used in our 2014 Filing. In addition, we note that there is no double recovery of property taxes between the decommissioning accrual and those included in current rates. The collection of funds from customers today for the payment of future tax obligations does not relate to the current year property tax expense.

Cost Estimate Summary

Docket No. E002/M-17-828
Schedule A.0
Page 10 of 10

Spent Fuel Management Costs

The cost estimates include the operating and maintenance of the ISFSI from shutdown through when all the fuel has been removed from the site. Schedules A.1 through A.14 show the annual costs in total spent fuel management costs by unit. Schedule A.17 breaks the spent fuel management costs down into its cost components such as utility staff, property taxes, and operating costs.

	$841,851,473	$308,519,969	$69,088,586	$4,490,764	$1,223,950,792

Xcel Energy **Docket No. E002/M-17-828**
NRC Minimum Historical Escalation **Schedule A.15**
Page 1 of 1

January 1986 to June 2014

1. Determine Most Recent Escalation Component

	Base Conversion 1986	Value (2005 base)	4Q - 16 (Dec '05 Base)	Base Labor Adjustment Factor	Current Labor Adjustment Factor
	(1)	(2)	(3)	(4)	(5)
Labor (L)	48.1	100.00	125.7	2.08	2.61

Dept of Labor, Bureau of Labor Statistics, Employment Cost Index (NAICS), 4th Qtr 2016 (Retrieved July 2017), Private industry, Midwest region

Industrial Power (P)	114.2			211.7	1.854
Light Fuel Oil (F)	82.0			153.3	1.870

Department of Labor, Bureau of Labor Statistics, Producer Price Index Data for December 2016 (Retrieved July 2017); Industrial Power from Commodity code 0543, 500 kw demand, Midwest Region; Light Fuel Oils from Commodity code 0573

Burial (B)	
PWR - Blended	10.971
PWR - Direct	30.061
BWR - Blended	12.111
BWR - Direct	26.329

NUREG 1307, Report on Waste Burial, Revision 16 (Table 2.1 in November 2016)

2. Calculate Energy Component (E)

	Equation	Industrial Power	Light Fuel Oil	Energy Component
Energy (PWR)	= .58(P) + .42(F)	1.854	1.870	1.860
Energy (BWR)	= .54(P) + .46(F)	1.854	1.870	1.861

3. Calculate NRC Escalation Factor as of June 2017

	Labor	Energy	Burial	NRC Escalation Factor
	(L)	(E)	(B)	(6)
PWR - Blended	2.613	1.860	10.971	4.3541
PWR - Direct	2.613	1.860	30.061	8.5539
BWR - Blended	2.613	1.861	12.111	4.6050
BWR - Direct	2.613	1.861	26.329	7.7330

Notes:

(1) = Base values from NRC Proposed Guidelines
(2) = Conversion factor to convert from 1986 base to 2005 base.
(3) = The most recent published value:
(4) = (3) / (1), Labor only
(5) = (4) * (3) for Labor, Industrial Power, and Light Fuel Oil
(6) = (.65 x L) + (.13 x E) + (.22 x B)

Xcel Energy **Docket No. E002/M-17-828**
NRC Minimum Historical Escalation **Schedule A.16**
Page 1 of 1

January 1986 to June 2014

1. NRC Minimum Calculation in 1986 Dollars

	Equation	MWt	1986 Minimum Calculation
Monticello (BWR)	= $104 million + (0.009 * MWt)	2004	122,036,000
Prairie Island (PWR), Unit 1	= $75 million + (0.0088 * MWt)	1677	89,757,600
Prairie Island (PWR), Unit 2	= $75 million + (0.0088 * MWt)	1677	89,757,600

2. NRC Minimum Calculation in 2017 Dollars - Combination of Facilities

	1986 Minimum Calculation	Escalation Rate	2017 Minimum Calculation (Blended)
Monticello (BWR)	122,036,000	4.6050	561,975,756
Prairie Island (PWR), Unit 1	89,757,600	4.3541	390,815,175
Prairie Island (PWR), Unit 2	89,757,600	4.3541	390,815,175

3. NRC Minimum Calculation in 2017 Dollars - Compact-Affiliated Facilities Only

	1986 Minimum Calculation	Escalation Rate	2017 Minimum Calculation (Direct)
Monticello (BWR)	122,036,000	7.7330	943,699,483
Prairie Island (PWR), Unit 1	89,757,600	8.5539	767,779,143
Prairie Island (PWR), Unit 2	89,757,600	8.5539	767,779,143

Xcel Energy Docket No. E002/M-17-828
Red Wing Plan Schedule B
Page 1 of 2

The Commission's Order from the last triennial directed the Company to "develop a 60, 100 and 200-year plan for the City of Red Wing to enable Xcel to build, improve, communicate, and share an understanding of the long-term safety-related costs of spent fuel storage on host communities."

We value our relationship with our host communities and meet with a subset of the city council each quarter to keep them informed of operations as well as long term plans including eventual decommissioning. Consistent with our past practice, we have continued to have discussions with our host communities regarding potential costs and other concerns arising from the storage of used nuclear fuel following the cessation of operations at our nuclear facilities. We understand from these discussions and from the City of Red Wing's comments in our last triennial that it continues to have concerns regarding the need for public safety services in connection with the long-term storage of spent fuel after the plant's retirement. As discussed in our last triennial, we will continue to have appropriate on-site radiological emergency plans in place during the ISFSI management and decommissioning period. And while we certainly appreciate the emergency response support we receive from our local communities during plant operations, current NRC guidance indicates that off-site radiological emergency support will not be required after the plants cease operations and nuclear fuel is moved to dry storage.[1]

Additionally—with the exception of radiological issues—the Prairie Island Plant and ISFSI are no different from any other industrial facility when it comes to public and emergency services. Nearly all special costs incurred by the City for radiological emergency preparedness—such as costs for emergency planning, training, and equipment—are reimbursed by the state under the Minnesota Emergency Management Act (MEMA). Under MEMA, Xcel Energy pays quarterly assessments

[1] In late 2014, the NRC granted Kewaunee Nuclear Plant an exemption from the emergency planning requirements for an operating nuclear facility. As part of that exemption, Kewaunee will no longer be required to maintain offsite radiological emergency preparedness plans for the 10-mile emergency planning zone. The exemption package for Kewaunee was issued October 27, 2014 and is available in the NRC's ADAMS database under accession number ML14261A223. In addition, the NRC held a meeting on April 23, 2015 with members of the NEI Emergency Preparedness Decommissioning Task Force to discuss issues related to potential changes to a licensee's emergency plan, based on the requirements of Section 50.47(b) of Title 10 of the Code of Federal Regulations and Appendix E to Part 50, following a decision to permanently cease operation and permanently remove fuel from the reactor vessel in accordance with 10 CFR 50.82(a).

to the Minnesota Division of Emergency Management to cover emergency response preparedness costs in the event of a radiological incident for the Prairie Island and Monticello nuclear facilities. Thus, Red Wing receives—and will continue to receive—funding for radiological emergency preparedness, including expenses for planning, training, drills/exercises, and equipment. The ISFSI will continue to be monitored and regulated per federal and state requirements.

That said, we do want to foster a shared understanding between the Company and Red Wing regarding any long-term safety-related issues in connection with the ISFSI following closure of the plant. Under current federal rules, after permanent shut down, the plant must submit written certification of permanent cessation of operations to NRC within 30 days. Within 2 years after certification of permanent closure, Xcel Energy will submit a post shut down decommissioning activities report (PSDAR) including things that describe activities and schedules during decommissioning. That report is available for public review and comments along with public hearings. As part of that process, three years prior to plant shutdown, we propose to work with the city to develop a safety plan that would outline responsibilities and coordinated efforts for response once we get to ISFSI only.

We believe we can learn best practices and insight from the plants and host communities currently going through decommissioning. To that end, we are proposing to facilitate an ongoing dialogue between the City of Red Wing and host communities in other parts of the country to assist the City in developing a better understanding of the issues faceting communities near standalone ISFSI's after plant shutdown and decommissioning. We have discussed this plan with the City of Red Wing and provided contacts to other city officials who host shut down plants.

We look forward to continued dialogue with our host communities throughout plant operations and into decommissioning.

Xcel Energy Docket No. E002-M-17-828
Escalation Analysis Schedule C
Page 1 of 5

Introduction

The escalation rate for decommissioning costs is an important element in determining the appropriate investment strategy, funding contributions, and the computation of the annual nuclear decommissioning external sinking fund accrual. This rate is used to inflate the 2017 decommissioning cost estimate out to the time that expenditures are predicted to occur. Since the decommissioning costs were provided by TLG in 2017 dollars (i.e., they are real costs), the escalation rate considers only the projected increases in costs from 2017 out to the estimated years of the final decommissioning expenditures. To arrive at these projections, long-range inflation and escalation assumptions are independently provided by Goldman Sachs Asset Management (GSAM).

Economic Forecast

The trend projection used for escalation is a baseline scenario based on a steady long-term real Gross Domestic Product (GDP) growth of 2.0 percent. The projection assumes that the economy suffers no major long-term mishaps, but grows smoothly, in the sense that actual output follows potential output relatively closely. This projection is best described as depicting the assumed mean of all possible paths that the economy could follow in the absence of major long-term disruptions. Such disruptions include large oil price shocks, untoward and persistent swings in macroeconomic policy, or excessively rapid increases in demand. The trend projection can be considered an unbiased reflection of the future performance of the economy. The real GDP forecast of 2.0 percent is slightly below the 3.2 percent average since 1947.

For the 60-Year Scenario, the 2017 decommissioning cost for Monticello and Prairie Island generating plants depict an overall expenditure period from 2033 to 2078 for the Prairie Island plant and from 2030 to 2091 for the Monticello plant. The expenditure pattern for this scenario requires the estimation of an escalation rate to 2091.

Inflation Factors

Inflation is the decrease in the purchasing power of money or the increase in the prices of goods and services. However, decommissioning is a unique combination of functions with many operations that are not performed often in

industry, and it may be more consistent to use a decommissioning-specific inflation factor rather than a general rate of inflation.

GSAM has refined the analysis surrounding the calculation of the escalation rate and believes its methodology provides an appropriate estimate. TLG provides a detailed decommissioning cost estimate that is site specific for the units at Monticello and Prairie Island. These site-specific decommissioning cost components need only be linked with appropriate escalation.

Escalation is broken down into two components: inflation and non-inflation escalation. Non-inflation escalation reflects idiosyncratic costs for decommissioning nuclear power plants, above and beyond the escalation associated with inflation.

The long-term escalation rates used in this analysis are as follows

Escalation Component	**Trend Projection**
Inflation	1.85%
Non-inflation escalation (Non-labor costs)	1.00%
Total escalation (Non-labor costs)	**2.85%**
Non-inflation escalation (Labor costs)	2.20%
Total escalation (Labor costs)	**4.05%**

Long-term expected inflation is assumed to be 1.85 percent, which is estimated from the expected inflation implied in long-term US treasury rates. The long-term risk-free (treasury) rate is observed to be 2.84 percent and the observed long-term Treasury Inflation Protected Securities (TIPS) yield (proxy for assuming the long-term real rate of interest) is 0.99 percent. This implies expected inflation of 1.85 percent. Non-inflation escalation is assumed to be 1.00 percent for non-labor costs, but 2.20% for labor costs.

The overall escalation rates in the above table should be compared with the 4.36 percent escalation rate in the 2014 analysis, 3.63 percent escalation rate in the 2011 analysis and the escalation rate of 2.89 percent from the 2008 analysis.

Decommissioning Cost Breakdown and Escalation

GSAM related the calculation of the escalation rate to the detailed cost categories provided by TLG. The TLG cost estimates are divided into five components or categories: labor, equipment & materials, energy, LLRW

disposal, and other. GSAM began its forecast by separating labor from the other four categories of costs.

Inflation is the general increase in all prices across the economy. If all costs in every industry were analyzed, in aggregate they must increase by inflation. Therefore, an assumption of costs growing by more than inflation requires that other costs somewhere are growing less. We assume that the non-labor parts of the costs grow at one percent more than inflation. In general, this increase would constitute a conservative assumption. However, given regulatory uncertainty and the complexities of forecasting technical change, the assumption that other costs grow faster than inflation seems reasonable. Historically, the escalation of nuclear decommissioning costs based on NRC filings and on engineer reports as reported in the Callan study[1] appears to have been substantially greater than inflation, by perhaps 4% - 5%.

According to economic theory, labor costs increase by inflation plus productivity (merit). We have assumed merit increases are 1.2 percent per year, consistent with a 2.00 percent long-term real GDP growth and an assumption that labor productivity accounts for 60 percent of GDP growth. Labor productivity has varied since 1950 between 60 and 66 percent.

In the 2014 triennial filing, an average escalation rate was calculated and used to escalate all costs based on the percentage of costs coming from labor. In the 2017 triennial filing, the two different escalation rates are being applied to labor and non-labor costs separately, which should be more precise than the previous approach. The 2017 triennial filing contains an additional third category for the Prairie Island Indian Community (PIIC) payments because they are determined by a settlement agreement that does not contain a provision for escalation beyond their current nominal amounts. These Labor, Non-Labor, and PIIC groups of cash flows are shown separately on Schedule F for the 2017 filing based upon the respective escalation rate applied.

Application of the Escalation Rate

A critical aspect of the valuation procedure is to ensure that assumptions are consistent between asset and liability growth. The analysis assumes that:

Expected cost (liability) growth = inflation + non-inflation escalation

[1] Callan 2017 Nuclear Decommissioning Funding Study

Expected pre-tax asset returns = inflation + real interest rate + risk premium

Note that inflation increases both pre-tax asset returns and decommissioning costs (i.e., the liability) equally. Thus, in the absence of taxes, inflation would be neutral to the valuation, which is consistent with economic theory based on real liability cash flows. The introduction of taxes, however, changes the analysis somewhat. Taxation means that lower inflation helps improve funded status, as the reduction in liability escalation will exceed the reduction in the after-tax asset return.

The other variables, however, have major implications for the analysis, since they are not offset in the same way as inflation. In general, the most important variables are non-inflation escalation, the real rate of interest, and the risk premium associated with the growth portfolio assets.

Historical Real GDP and Labor Productivity

In order to provide some context for the escalation assumptions presented above, below we present charts of historical real GDP and labor productivity for the US economy.

Analysis indicates that the real GDP growth assumption of 2.0 percent and labor productivity assumption of 60% are reasonable long-term forecasts.

Source: St. Louis Fed

Xcel Energy Docket No. E002/M-17-828
Portfolio Analysis Schedule D
Page 1 of 14

Background

Per Commission Orders, beginning with Docket No. E002/D-86-604 and through subsequent dockets, the Company is required to review the financial parameters, the funding methodology, and cost estimate every three years. In between triennial filings, the Company submits an Informational Letter annually discussing NDT performance.

Since the nuclear power plants deliver power across state lines, each state is responsible for its share of the plants' ownership/use, and as such, its share of decommissioning cost. Based upon the demand of Minnesota Retail customers, Xcel Energy estimates that Minnesota's usage of the plants is 73.4886 percent. However, the engineering reports and asset-liability analysis, which use the engineering reports, do not distinguish between jurisdictions. Likewise, the analyses referred to in this schedule are performed on a total plant basis, and the figures (assets, liabilities, funded status, and expected contributions) are allocated to Minnesota by multiplying figures by 73.4886 percent.

There are references in this schedule to both the total across all jurisdictions (Total Company) and the MN Jurisdiction for various figures. References to the MN jurisdiction generally correspond to the Total Company multiplied by 73.4886 percent.

Recent Portfolio Updates

As discussed in previous triennial dockets, the Company's NDT Committee routinely evaluates both the NDT's performance and the overall investment strategy for the NDT (including its asset allocation), and it revises both the strategy and allocation as necessary. Following a hearing on the Company's 2016 Annual Informational Report, the Commission's issued an order in February 2017 requiring Xcel Energy to re-evaluate the investment mix for the NDT with the purpose of reducing the NDT's investment management fees and increasing the annual return on its investment portfolio.

With this Order in mind, the NDT Committee's most recent investment strategy review focused on the following objectives:

1. The desire for higher expected portfolio returns
2. The desire for lower investment manager fees
3. The desire for a simplified portfolio with fewer asset classes

As part of the investment strategy review, the company considered portfolio options that shifted NDT objectives slightly from liability matching characteristics such as inflation sensitivity to instead focus on lower cost, more traditional investments. To this end, the NDT's investment in commodities was removed from the portfolio.

The company also re-evaluated the diversifying assets included in the portfolio, such as the hedge fund investments. Consistent with the objective of reducing investment manager fees and simplifying the portfolio, hedge funds were removed.

We believe these updates to the asset mix achieve the objectives established by the Commission. The expected portfolio return increases; expected manager fees decline; and there are two fewer line items in the portfolio, all at a similar risk profile. The tradeoff is that the portfolio has a larger allocation to fixed income investments, and will likely be more closely tied to movements in interest rates. That said, we believe this tradeoff is reasonable and in the best interests of our customers.

The 2016 and updated 2017 target asset allocations are included below for comparison:

Portfolio Line Item	2016 Target	Updated 2017 Target
Total Equity	60.0%	60.0%
Private Equity	10.0%	10.0%
Public Equity	50.0%	50.0%
US All Cap Equity	26.0%	25.8%
Non-US Developed Equity	14.0%	14.1%
Emerging Markets Equity	10.0%	10.1%
Fixed Income	17.5%	30.0%
Investment Grade Fixed Income	5.0%	12.1%
High Yield Fixed Income	8.5%	10.0%
Emerging Market Debt	4.0%	7.9%
Hedge Funds	7.5%	0.0%
Private Real Estate	10.0%	10.0%
Real Assets (Commodities)	5.0%	0.0%
Cash	0.0%	0.0%
Total	**100.0%**	**100.0%**

Trustee

BNY Mellon is the trustee for Xcel Energy's three external nuclear decommissioning Qualified Trusts (in aggregate the NDT). The primary duty of the trustee is the safe custody of its assets including handling the settlement of all purchases and sales, whether placed by the trustee or by an independent investment manager. The trustee has limited investment duties other than the responsibility for keeping cash balances temporarily invested. Other duties include paying income taxes on the earnings of the Qualified Trusts, paying invoices for services for the trust and investment managers, conducting investment performance reporting, and keeping accurate records of all of its activities with respect to the Qualified Trusts.

Investment Managers

Following regulatory approval of the life extension of the Monticello and Prairie Island nuclear generating plants, the Xcel Energy's NDT portfolio was updated to reflect a longer time horizon and a more diversified, higher risk, long-term investment strategy.

Following the investment strategy review conducted ahead of the 2017 triennial filing, three investment managers were selected for removal from the portfolio by 2017 year-end, at which point the target allocation will include eight investment managers covering eight asset categories. Those asset managers and mandates include:

1. StepStone Group manages the private equity component of the portfolio.
2. Parametric Portfolio Advisors, a subsidiary of Eaton Vance Management, manages the U.S. equity component of the portfolio, a portion of the non-U.S. developed market equity component of the portfolio, and the emerging markets equity component of the portfolio (distributed through Eaton Vance Management). Parametric utilizes tax-efficient strategies with respect to the whole trust.
3. Marathon International manages a portion of the non-U.S. developed market equity component of the portfolio
4. First Principles Capital Management manages the domestic investment grade fixed income component of the portfolio.
5. Eaton Vance Management manages the high yield fixed income component of the portfolio.

6. Wellington Management Company manages a portion of the emerging markets fixed income component of the portfolio.
7. Marathon Asset Management manages a portion of the emerging markets fixed income component of the portfolio.
8. The Townsend Group manages the private real estate component of the portfolio.

Although the trusts are not subject to the Employee Retirement Income Security Act (ERISA), the company uses fiduciary standards similar to those imposed by ERISA for the management of the Trusts. A fiduciary as defined by the ERISA is any person who:

1. Exercises any discretionary control over the management of a plan or the management or disposition of its assets;
2. Renders investment advice for a fee with respect to the funds or property of a plan or has the authority to do so; or
3. Has any discretionary authority or responsibility in the administration of a plan.

Although Xcel Energy has established the general guidelines in the investment advisory contracts, the Company does not direct the purchase of individual investments. The investment managers, however, being fiduciaries to the NDT, must act in the best interests of the NDT.

Earnings Evaluation

When making comparisons between market value and book value (original cost), the current market value of the Qualified Trusts less an allowance for assumed taxes is used because it represents the value of the securities if they were sold today. For accounting purposes, Xcel Energy records the actual purchase price of the investments. Quarterly, a market value adjustment journal entry is made to book any unrealized gains or losses to special regulatory accounts per SFAS No. 115, Accounting for Certain Investments in Debt and Equity Securities (ASC 320 *Investments-Debt and Equity Securities*). The difference between market and book values represents the unrealized gains or losses. In addition it should be noted that trustee fees, investment management fees, and income taxes also are paid from the Qualified Trusts, thereby impacting overall fund performance.

The trustee statements for the Qualified Trusts are a part of Schedule E and show the current holdings for the Qualified Trusts by operating unit and investment manager.

Benchmark Portfolio Performance

It is standard practice in the investment industry to measure the performance of a diversified portfolio, like the NDT, by identifying benchmarks that are representative of each asset class comprising the portfolio, and then to benchmark the total portfolio to the weighted sum of the individual benchmarks.

The updated 2017 target asset allocation and associated benchmarks are included below:

Portfolio Line Item	Updated 2017 Target	Benchmark (BM)
Total Equity	60.0%	Weighted average of equity BMs:
Private Equity	10.0%	Cambridge PE (1Q lagged)
US All Cap Equity	25.8%	Russell 3000
Non-US Developed Equity	14.1%	MSCI EAFE ND
Emerging Markets Equity	10.1%	MSCI EM ND
Fixed Income	30.0%	Weighted average of fixed income BMs:
Investment Grade Fixed Income	12.1%	75% Barclays Investment Grade Corporate Index, 25% Barclays U.S. TIPS 10+ year Index, 50% Bloomberg 20yr ZC Inflation Swap Overlay
High Yield Fixed Income	10.0%	BofA ML US High Yield
Emerging Market Debt	7.9%	JPM EM Bond Index GD
Private Real Estate	10.0%	NCREIF - ODCE (1Q lagged)
Cash	0.0%	Fed funds effective
Overall fund benchmark:	**100.0%**	**Weighted average of all portfolio BMs**

The focus of performance evaluation for the NDT should be at the overall fund benchmark level, given the portfolio is composed of several investment managers and assets classes that are designed to work together on the whole. The overall fund benchmark is comprised of the actual weights of each individual asset class benchmark as shown in the table above.

Both the performance of Xcel Energy's NDT asset portfolio and the performance of the weighted average overall fund benchmark are calculated by the trustee - an independent third party. Since benchmarks will be changed or updated over time,

Xcel Energy will update the Commission with respect to future modifications as they become necessary.

Analytical Method

There are two principal components to determining the overall strategy for the NDT:

1. Investment strategy (*i.e.,* the composition of the investment portfolio); and
2. Contributions strategy, (*i.e.,* the annual annuity payment amount required to fund the decommissioning costs).

First, the liability is calculated based on the projected decommissioning costs and the projected escalation of these costs through time. The valuation of the liability involves the following steps:

i. obtaining the current decommissioning costs from TLG in real dollars;
ii. escalation of the real decommissioning cash flows to account for realized and expected future inflation and non-inflation escalation; and
iii. calculation of the present value of the escalated cash flows back to the valuation date, using the expected return on assets as the discount rate. For this analysis, the valuation date is June 30, 2017.

Second, the projected liability is compared to the projected value of the assets (investments) net of an allowance for taxes of the NDT.

Method – Determining Investment Strategy

In light of the benefits of the Energy Policy Act of 1992 for nuclear decommissioning trust investment management, the Company has established a nuclear decommissioning investment policy with the goal to maximize after-tax portfolio returns and minimize aggregate portfolio risk for external fund investing. This policy was approved in the 1993 filing. Accomplishing this goal requires finding the combination of assets that optimizes the after-tax risk/return characteristics of the fund which leads to full funding in the expected case without an increase in contributions.

GSAM was engaged by the Company to recommend an appropriate investment strategy for trust assets intended for the eventual decommissioning of the Prairie Island and Monticello nuclear generating plants.

This process is called asset allocation optimization. Different mixes of assets can produce hundreds, or even thousands, of alternative combinations of risk and returns. As a result, asset allocation techniques have been developed to evaluate the various possible asset mixes and determine those combinations that are likely to deliver optimal performance in terms of risk and return.

This process has been used to perform a long-term optimization of the asset allocation for the Company's investments. In any investment there is always a trade-off between risk and the expected rate of return on that investment. Typically, strategies with higher expected returns also come with higher risk and vice versa. The goal is to optimize the trade-off between risk and return over the long term. If on the one hand too little risk is taken, then there is a significant chance that the trust remains underfunded, necessitating very large contributions into the trust in later years. If on the other hand too much risk is taken, there is a risk of significant underfunding of the NDT in the future, or of overfunding of the NDT, which because of the difficulty of removing assets from the Qualified Trust is also undesirable.

Method – Determining Contributions

Contributions are calculated in terms of the annual annuity payment amounts required to fund the difference between liabilities (the present value of decommissioning cash flows) and the projected asset level at the start of decommissioning.

The projected asset level in the future is calculated by applying the expected asset returns at any point in time to the pool of assets.

In the analysis, the liabilities are calculated as the present value of all the decommissioning costs. The present value is calculated in a two-stage process by:

1. Escalating the real decommissioning cash flows by the escalation factors discussed in Schedule C.

2. Discounting the escalated cash flows using the expected after-tax return on the asset portfolio.

As a result, the present value of the liabilities will depend on the escalation of the decommissioning costs and the expected return of the chosen investment portfolio. Because inflation impacts both the escalation of cash flows and the pre-tax discount rate, it only has a small impact on the value of the liabilities from the tax effects of changed inflation assumptions.

A measure of the degree to which assets will be able to meet the decommissioning cost liabilities is the funded status which is the ratio of the value of assets net of assumed taxes to the value of liabilities, expressed as a percentage.

Assumptions – Overview

The assumption set that goes into the process involves three different types of assumptions which are developed in a consistent manner:

- *Investment assumptions.* These include long-term expected returns, volatilities (standard deviations of returns) and correlations for different types of assets.
- *Other economic assumptions.* These include assumptions for the long-term inflation rate and the long-term escalation of decommissioning costs.
- *Tax assumptions.* These include assumptions for state and federal tax rates and deductibility.

Investment and Economic Assumptions

The development of consistent investment assumptions goes hand-in-hand with the development of other economic assumptions about inflation, interest rates, GDP growth, etc.

The return assumptions for each type of asset represent expected market returns for that asset class on a forward-looking basis. The assumptions reflect a blend of rigorous analysis of historical performance and the forward looking views of the financial markets, as revealed through the yields on long term bonds, the price-earnings ratios of the major stock market indices, implied inflation expectations in TIPS, etc.

This methodology will produce more conservative expected rates of return than an analysis that looks simply at historical averages. The important distinction is that, in using this methodology, the expected asset return is tied to the inflation rate and overall risk-free rates, so at lower inflation and interest rates investors require lower rates of return. Current markets indicate much lower expected inflation over even long-term horizons than historical averages.

The inflation rate used for expected returns is matched to the inflation rate used for liability growth, enforcing the consistency of asset and liability assumptions.

Expected asset returns (on a pre-tax basis) are developed via a building-block approach that starts with the expected long-term real interest rate and expected long-term inflation. Together these two define the expected long-term nominal risk-free interest rate. Expected returns for different assets are then determined by adding appropriate risk premiums to this. In other words, we have the following relationship:

Expected net-of-fee, pre-tax asset return	=	inflation + real interest rate + risk premium - fees

The next step in the assumption setting process involves an analysis of historical risks and correlations of asset class returns to which subjective judgment is applied. The result of this analysis is incorporated into a risk matrix from which expected long-term risk premiums are estimated for each asset class.

The long-term nominal return expectations are then determined by combining the asset class risk premiums with expected inflation and real risk-free rate assumptions. As a final consideration, the nominal return assumptions are blended with current market conditions to develop long-term equilibrium expectations. The return and risk expectations for each asset class incorporate assumptions about historical return relationships, current financial market conditions and the degree of global capital market integration.

The assumptions pertaining to the volatility of investment returns are based on observed experience and calculated in terms of the standard deviation of historical asset returns.

Portfolio Analysis

Docket No. E002/M-17-828
Schedule D
Page 10 of 14

The following table shows the expected return and volatility assumption inputs:

Long-term Investment Assumptions for 2017

	Expected pre-tax		Expected after-tax	
Asset class	**Arithmetic return**	**Volatility**	**Arithmetic return**	**Volatility**
US Large Cap Equity (Passive)	7.23%	14.62%	5.22%	10.55%
US Small Cap Equity (Passive)	8.53%	18.64%	6.16%	13.45%
EAFE Equity (Passive)	8.06%	15.90%	5.82%	11.47%
EAFE Equity (Active)	8.24%	16.27%	5.94%	11.74%
EM Equity	11.90%	21.38%	8.59%	15.43%
IG Fixed Income (10+ yr TIPS constant maturity)	5.32%	10.62%	4.25%	8.49%
High Yield Debt	6.13%	8.85%	4.43%	6.38%
EM Debt	6.21%	9.64%	4.48%	6.96%
Private Equity	10.03%	20.99%	7.24%	15.15%
Private Real Estate	6.44%	11.71%	4.65%	8.45%

These expected return assumptions are based on an assumed long-term risk-free rate of 2.84 percent, consisting of a 0.99 percent real asset return and expected inflation of 1.85 percent, based on market bond rates.

The correlations between the investment returns of different asset classes are important characteristics, in addition to the expected returns and the volatility of returns. Recent and long-term histories are used as a guide to setting these parameters. The table below shows the correlations between asset returns used in the analysis.

Long-Term Investment Return Correlations for 2017

	Asset class	1	2	3	4	5	6	7	8	9	10
1	US Large Cap Equity (Passive)	1.00	0.89	0.85	0.83	0.73	0.42	0.65	0.44	0.65	0.06
2	US Small Cap Equity (Passive)	0.89	1.00	0.75	0.73	0.67	0.36	0.61	0.46	0.61	0.01
3	EAFE Equity (Passive)	0.85	0.75	1.00	0.98	0.82	0.48	0.67	0.43	0.56	0.13
4	EAFE Equity (Active)	0.83	0.73	0.98	1.00	0.81	0.47	0.66	0.42	0.54	0.13
5	EM Equity	0.73	0.67	0.82	0.81	1.00	0.50	0.65	0.40	0.49	0.20
6	IG Fixed Income (10+ yr TIPS constant maturity)	0.42	0.36	0.48	0.47	0.50	1.00	0.65	0.33	0.30	0.49
7	High Yield Debt	0.65	0.61	0.67	0.66	0.65	0.65	1.00	0.48	0.36	0.26
8	EM Debt	0.44	0.46	0.43	0.42	0.40	0.33	0.48	1.00	0.35	0.25
9	Private Equity	0.65	0.61	0.56	0.54	0.49	0.30	0.36	0.35	1.00	0.12
10	Private Real Estate	0.06	0.01	0.13	0.13	0.20	0.49	0.26	0.25	0.12	1.00

Taxation Assumptions

The taxation assumptions, along with the investment and other economic assumptions are important inputs for both the asset allocation portion, and the overall analysis performed. The following table shows the applicable tax rates for the Qualified Trust.

Municipal bonds are assumed to be free of federal taxes. Therefore, only state taxes are imposed. In practice, some municipal bonds will be exempt from state taxes also, specifically municipal bonds issued by Minnesota, but these are assumed to be a small percentage of the portfolio.

Treasury bonds are exempt from state taxes. Therefore, treasuries are taxed only at the federal rate and not at the state tax rate.

The Company's view is that US stocks in the Qualified Trust do not earn a dividends' received deduction, therefore stock returns are assumed to be fully taxed.

Tax Element	Tax Rate
Federal tax rate for the qualified trust	20%
State tax on both the qualified trust and escrow account *Note: State taxes are deductible from federal taxes.*	9.8%

As a result, the total tax rates are (assuming that investments are fully taxed – this is modified for municipal bonds and treasuries):

Portfolio	Composite Tax Rate
Qualified Trust	27.84%*

*Calculation: 20% + 9.8% (1-20%)

These tax assumptions are incorporated into the after-tax expected returns in the table of investment assumptions above.

Results – Investment Strategy

The investment strategy is based on the use of an efficient risk-seeking portfolio (Growth Portfolio) for the majority of the investment period before decommissioning, and an efficient low-risk portfolio for the period just before decommissioning. The mix is determined by the following rule:

Five years prior to each decommissioning cash flow, the portion of the growth assets that are required to make that payment is reallocated into bonds.

This strategy is efficient from an asset-liability management perspective in order to reduce the risk that market volatility significantly reduces the value of this portion of the assets just when they are needed to make payments.

A period of five years is needed for assets to earn their long-term rate of return with some degree of confidence. As discussed above, year to year variation can be very large for high returning assets, and five years is needed to justify long-term assumptions. Therefore, as decommissioning payments come due at less than five years, the assumption is that the funds are switched to bonds. Further details related to the selection of a five year bond conversion period are described below.

Analysis of Bond Holding Period

Our analysis assumes that the funds are invested in bonds as a cash outlay is approached. For each expected annual outflow cash flow, assets are converted to bonds ahead of time to give more certainty to the ability to make the payment. It is important to recognize that not all funds are converted to bonds – only enough to cover each annual cash outflow. For example, if the conversion is at a 5 year period, the first outflows expected in 2030 are converted to bonds in 2025; then in 2026, enough cash is converted to bonds to match the 2031 expected outflow.

In the 2014 Filing, we assumed that funds would be converted to bonds six years ahead of each annual cash outflow. This is roughly consistent with converting to bonds in time to cover the length of a business cycle, which helps to ensure the appropriateness of our long-term growth assumptions. That said, we have modified our assumption in this Triennial to convert funds to bonds five years ahead of each annual cash outflow. Since expected bond returns are lower than the expected Growth Portfolio returns, a later transition to bonds results in higher expected returns, and therefore a lower accrual. And while a later conversion can lead to additional risk, we believe any additional risk of the shorter period is mitigated by the iterative transfer to bonds each year rather than converting the entire portfolio simultaneously. That is because even if a single year conversion does not match the business cycle and growth assumptions exactly, it is reasonable to expect that—over the multi-year conversion—average returns will be achieved.

Portfolio Analysis

Docket No. E002/M-17-828
Schedule D
Page 13 of 14

Rates of Return

Note that the portion of the portfolio assigned to growth assets changes over time based on how large expected decommissioning payments will be over the next five years. The updated target asset allocation for the growth assets are shown in the table below:

Portfolio Line Item	Updated 2017 Target	Benchmark (BM)
Total Equity	60.0%	Weighted average of equity BMs:
Private Equity	10.0%	Cambridge PE (1Q lagged)
US All Cap Equity	25.8%	Russell 3000
Non-US Developed Equity	14.1%	MSCI EAFE ND
Emerging Markets Equity	10.1%	MSCI EM ND
Fixed Income	30.0%	Weighted average of fixed income BMs:
Investment Grade Fixed Income	12.1%	75% Barclays Investment Grade Corporate Index, 25% Barclays U.S. TIPS 10+ year Index, 50% Bloomberg 20yr ZC Inflation Swap Overlay
High Yield Fixed Income	10.0%	BofA ML US High Yield
Emerging Market Debt	7.9%	JPM EM Bond Index GD
Private Real Estate	10.0%	NCREIF - ODCE (1Q lagged)
Cash	0.0%	Fed funds effective
Overall fund benchmark:	**100.0%**	**Weighted average of all portfolio BMs**

Potential Growth Portfolios are the portfolios of assets that earn an expected rate of return with the lowest risk and the actual choice of the growth portfolio is based on setting the level of risk or return desired. Please note even the growth portion of the portfolio includes some bonds to provide diversification and efficiency. The 'growth portion' is not the same as the investment in equities.

The overall expected portfolio returns and volatilities for each plant's Qualified Trust are given in the table below:

Expected Returns for the Updated Strategy

	60-Year Scenario	
Nuclear Unit	**Operations**	**Decom.**
Monticello	5.00%	4.43%
Prairie Island Unit 1	4.99%	4.15%
Prairie Island Unit 2	5.04%	4.09%

To arrive at the rates of return listed in the table above, the analysis uses different rates of return for bonds and the NDT Growth Portfolio; and the weights assigned to these portfolios change through time. Therefore, expected combined rates of return vary through time; the expected rates included are Single Effective Rates, which are weighted average rates. This expected rate leads to the same final funding level if applied to each of these components that would be obtained by using the actual expected rates.

Conclusion

The analysis presented in this Schedule addresses the decisions relating to investment strategy, and contribution strategy.

In terms of investment strategy, GSAM's analysis has led to a recommended asset allocation for the growth portion of the assets that involves equities, fixed income and alternative assets. The portion of the assets required to meet each decommissioning payment is switched from growth assets into bonds five years prior to that payment.

Xcel Energy Docket No. E002/M-17-828
Qualified Trust Statements Schedule E
Page 1 of 1

Schedule E contains the documents required by the Commission to be filed with every submittal. Annually, the Company submits a compliance filing in April. These compliance filings include the Qualified Trust fund activity for the prior year. For example the 2017 compliance filing made under the docket number for the 2014 Filing included the Qualified Trust fund activity for 2016. Therefore, this filing only includes the activity for the Qualified Trust since the last compliance filing. The 2017 activity documents the roll forward of the Qualified Trust balances from January 1, 2017 through June 30, 2017.

The June 30, 2017 Qualified Trust balances for the two wholesale jurisdictions have been included in Schedule E.8 as these balances were used to assign 73.4886 percent to the beginning balance used in the accrual calculations. In addition, the Escrow Fund had a zero balance in 2016, thus no activity is shown for the Escrow Fund. Below is a list of the schedules included.

Qualified Trust Analysis, Statements and Balances Supporting Schedules

E.1	Analysis of Qualified Trust Balances –January - June 2017
E.2	Trustee Statements – Qualified Trust, Monticello (All Managers, MN Jurisdiction)
E.3	Trustee Statements – Qualified Trust, Monticello (By Manager, Total Company)
E.4	Trustee Statements – Qualified Trust, Prairie Island Unit 1 (All Managers, MN Jurisdiction)
E.5	Trustee Statements – Qualified Trust, Prairie Island Unit 1 (By Manager, Total Company)
E.6	Trustee Statements – Qualified Trust, Prairie Island Unit 2 (All Managers, MN Jurisdiction)
E.7	Trustee Statements – Qualified Trust, Prairie Island Unit 2 (By Manager, Total Company)
E.8	June 30, 2017 Trustee Statements – Qualified Trust, MN and WI Wholesale, All Units
