St. Paul, MN 55101

RE: 2024-2040 UPPER MIDWEST INTEGRATED RESOURCE PLAN
DOCKET NO. E002/RP-24-67

Dear Mr. Seuffert:

Northern States Power Company, doing business as Xcel Energy, is pleased to submit this 2024-2040 Upper Midwest Integrated Resource Plan (2024 Plan) to the Minnesota Public Utilities Commission. The 2024 Plan identifies the resources we will need to reliably serve our customers over the next 15 years and charts a path toward achieving Minnesota's newly enacted "100 by 2040" law.

The Company's Preferred Plan is designed to build upon the substantial progress already made through prior resource plans, and we are grateful to all of our stakeholders and the Commission for their input, leadership, and collaboration as we continue to transition to a cleaner—and ultimately carbon-free—energy future. In our 2019 Plan, the Commission approved a number of key decisions in what promises to be an historic transformation of our energy system to one that will be dramatically cleaner, while remaining safe, affordable, and reliable for our customers. As the Commission directed in that proceeding, we will retire all of our baseload coal units in the coming years, replacing them with thousands of megawatts (MWs) of new renewable resources, supported by firm dispatchable resources to ensure reliability.

It's worth pausing to reflect on the progress we have already made together. Among other things, it includes the construction of multiple gigawatts of new wind resources across our region; the ongoing construction of the largest solar farm in the Midwest at our Sherco site; and the recent decommissioning of our Sherco 2 coal plant, which is the first in the series of carefully planned coal retirements that will occur throughout the 2020s. As a result of these and other achievements, our total energy mix in 2023 was 63 percent carbon-free.

In this 2024 Plan, we are proposing a Preferred Plan that will allow us to take the next step in decarbonizing our system while maintaining critical reliability and affordability for our customers at less than a one percent average annual increase in rates—less than half the national average. Key elements of that plan include:

- Extending the lives of both our nuclear plants—over 1,700 MWs of carbon-free baseload generation—into the 2050s;
- Adding nearly 10,000 MWs of renewable resources and over 2,100 MWs of energy storage to our system by 2040;
- Supporting the integration of nearly 6,000 MWs of demand-side resources, including energy efficiency, demand response, and distributed solar, on our distribution system by 2040; and
- Adding the necessary firm dispatchable resources to ensure reliability and facilitate renewable integration while generating less than 5 percent of the energy on our system.

The State of Minnesota and Xcel Energy have led the clean energy transition for decades, and this plan continues that leadership. We share the state's vision to deliver 100 percent clean energy in Minnesota by 2040, and we are well-positioned and steadfast in our commitment to achieving that target.

We look forward to discussing our 2024 Plan with the Commission, stakeholders, and the community.

Request for Protection of Confidential Information

The Company recognizes and supports the need for transparency in review of our 2024 Plan. We also take seriously our responsibility to maintain the security of the information and systems involved in the delivery of safe, reliable energy to our customers.

Appendix D1: 2023 Inertial Floor Study Report

Appendix D1 is marked as "Not-Public" and is provided with Critical Energy Infrastructure Information (CEII) redacted. The appendix contains contingency information related to or proposed to critical electric infrastructure, the incapacity or destruction of which would negatively affect national security, economic security, public health or safety, or any combination of such matters. Xcel Energy protects CEII as confidential Security Information as defined by Minn. Stat. § 13.37(1)(a),

as its disclosure would be likely to substantially jeopardize the security of vital system information, and property against trespass, or physical injury or otherwise cause financial harm from its disclosure. Xcel Energy maintains this information as a confidential pursuant to Minn. Rule 7829.0500, subp 2.

Appendix E: Load and Distributed Energy Resource Forecasting

Appendix E is marked "Not-Public" as a portion of Section VI.E. contains information designated as Trade Secret data pursuant to Minn. Stat. § 13.37(1)(b). The information contains sensitive forecasted production and load location data that derives an independent economic value from not being generally known or readily ascertainable by others who could obtain a financial advantage from their use. Thus, Xcel Energy maintains this information as a trade secret pursuant to Minn. Rule 7829.0500, subp 2.

Appendix F: EnCompass Modeling Assumptions and Inputs

Appendix F is marked "Not-Public" as Table F-14: Nuclear Leave Behind Costs contains information designated as Trade Secret pursuant to Minn. Stat. § 13.37, subd. 1(b). Table F-14 includes cost data that could provide an unfair economic advantage to other persons considering constructing projects or performing upgrades in the vicinity of the Company's nuclear plants. This information derives independent economic value, actual or potential, from not being generally known to, and not being readily ascertainable by proper means by, other persons who can obtain economic value from its disclosure or use. Thus, Xcel Energy maintains this information as a trade secret pursuant to Minn. Rule 7829.0500, subp 2.

Appendix M1: Nuclear Leave Behind Study Report

Appendix M1 is marked as "Not-Public" and is provided with Critical Energy Infrastructure Information (CEII) redacted. The appendix contains contingency information related to or proposed to critical electric infrastructure, the incapacity or destruction of which would negatively affect national security, economic security, public health or safety, or any combination of such matters. Xcel Energy protects CEII as confidential Security Information as defined by Minn. Stat. § 13.37(1)(a), as its disclosure would be likely to substantially jeopardize the security of vital system information, and property against trespass, or physical injury or otherwise cause financial harm from its disclosure. Xcel Energy maintains this information as a confidential pursuant to Minn. Rule 7829.0500, subp 2.

Appendix N1: 2021 REO-RES-SES Report
Appendix N2: 2022 REO-RES-SES Report

Appendices N1 and N2 are marked as "Not-Public" as certain portions of Attachment A to the reports are designated as Trade Secret information pursuant

to Minn. Stat. § 13.37, subd. 1(b). In particular, the information pertains to specific Commission-approved Purchase Power Agreements (PPAs), the terms of which require the information be protected as not-public. Other information marked as Trade Secret relates to specific production from specific customer facilities. Xcel Energy protects this information as private customer data pursuant to the Minnesota Data Practices Act and a trade secret pursuant to Minn. Stat. § 13.37, subd. 1(b), as it derives independent economic value, actual or potential, from not being generally known to, and not being readily ascertainable by proper means by other persons who can obtain economic value from its disclosure or use. Thus, Xcel Energy maintains this information as a trade secret pursuant to Minn. Rule 7829.0500, subp 2.

Appendix T: MISO Grid Congestion

Attachment T is marked "Not-Public" as portions of the appendix contain data designated as Trade Secret pursuant to Minn. Stat. §13.37(1)(b). The information includes wind facility curtailment and congestion costs Xcel Energy treats as confidential pursuant to purchase power agreements with facility owners. This information has independent economic value from not being generally known to, and not being readily ascertainable by, other parties who could obtain economic value from its disclosure or use. Thus, Xcel Energy maintains this information as a trade secret pursuant to Minn. Rule 7829.0500, subp 2.

Copies of the filing will be served on Commission staff, the Department of Commerce, and the Office of the Attorney General – Residential Utilities Division. We will also provide a copy to the Minnesota Environmental Quality Board. Interested parties will be able to obtain copies from our web site at xcelenergy.com/UpperMidwestEnergyPlan.

Please contact Bria Shea at (612) 330-6064 or bria.e.shea@xcelenergy.com if you have any questions regarding this filing.

Sincerely,

/s/

RYAN LONG
PRESIDENT
NORTHERN STATES POWER COMPANY

Enclosures
c: Service Lists

REQUIRED INFORMATION

I. SUMMARY OF FILING

A one-paragraph summary is attached to this filing pursuant to Minn. R. 7829.1300, subp. 1.

II. SERVICE ON OTHER PARTIES

Pursuant to Minn. Stat. § 216.17, subd. 3, we have electronically filed this document with the Commission. Pursuant to Minn. Rule 7843.0300, subp. 5, we have served copies of this filing on the Department of Commerce, Office of the Attorney General, Minnesota Environmental Quality Board and parties on the enclosed service lists.

III. GENERAL FILING INFORMATION

Pursuant to Minn. R. 7829.1300, subp. 3, the Company provides the following information.

A. Name, Address, and Telephone Number of Utility

Northern States Power Company doing business as:
Xcel Energy
414 Nicollet Mall
Minneapolis, MN 55401
(612) 330-5500

B. Name, Address, and Telephone Number of Utility Attorney

Ian M. Dobson
Lead Assistant General Counsel
Xcel Energy
414 Nicollet Mall, 401 – 8th Floor
Minneapolis, MN 55401
(612) 330-7641

C. Date of Filing and Proposed Effective Date of Rate Factors

The date of this filing is February 1, 2024. The Company is not proposing rate factors in this filing.

D. Statute Controlling Schedule for Processing the Filing

Minn. Stat. § 216B.2422 governs the Company's submission of a resource plan periodically in accordance with rules adopted by the Commission.

E. Utility Employee Responsible for Filing

Bria E. Shea
Regional Vice President, Regulatory Policy
Xcel Energy
414 Nicollet Mall, 401 – 7th Floor
Minneapolis, MN 55401
(612) 330-6064

IV. MISCELLANEOUS INFORMATION

Pursuant to Minn. R. 7829.0700, the Company requests that the following persons be placed on the Commission's official service list for this proceeding:

Ian M. Dobson
Lead Assistant General Counsel
Xcel Energy
414 Nicollet Mall, 401 – 8th Floor
Minneapolis, MN 55401
ian.m.dobson@xcelenergy.commailto:

Christine Schwartz
Regulatory Administrator
Xcel Energy
414 Nicollet Mall, 401 – 7th Floor
Minneapolis, MN 55401
regulatory.records@xcelenergy.com

Any information requests in this proceeding should be submitted to Christine Schwartz at the Regulatory Records email address above.

IN THE MATTER OF XCEL ENERGY'S 2024-2040 UPPER MIDWEST INTEGRATED RESOURCE PLAN	Docket No. E002/RP-24-67

XCEL ENERGY'S INTEGRATED RESOURCE PLAN SUMMARY OF PROPOSAL

SUMMARY

On February 1, 2024, Northern States Power Company, doing business as Xcel Energy, submitted to the Minnesota Public Utilities Commission its 2024-2040 Upper Midwest Integrated Resource Plan (2024 Plan).

The 2024 Plan builds on the strong foundation of cost-effective carbon reduction that we have been working toward since the Commission approved our 2019 Plan. The 2024 Plan identifies the resources we will need to reliably serve our customers over the next 15 years and charts a path toward achieving Minnesota's newly enacted "100 by 2040" law. It is comprised of a portfolio of forward-looking projects and resources designed to continue providing safe, reliable, and affordable service to our customers while continuing our ambitious carbon-reduction strategy, even as we forecast significant increases in customer load from electrification and other sources.

Copies of the filing will be served on Commission staff, the Department of Commerce, and the Office of the Attorney General – Residential Utilities Division. We will also provide a copy to the Minnesota Environmental Quality Board. Interested parties will be able to obtain copies from our web site at xcelenergy.com/UpperMidwestEnergyPlan.

CHAPTER 1: EXECUTIVE SUMMARY

I. INTRODUCTION 1
II. 2024-2040 UPPER MIDWEST RESOURCE PLAN 6
A. Planning Priorities and Characteristics 6
B. Proposed Resource Mix 12
III. CONCLUSION 15

CHAPTER 2: PLANNING LANDSCAPE

I. INTRODUCTION 1
II. MARKET CONSTRUCTS AND RENEWABLE INTEGRATION 2
A. New Resource Adequacy Construct 2
B. MISO Reforms on the Horizon 3
C. Renewable Integration Challenges 4
III. JURISDICTIONAL UPDATES 5
A. New Carbon-Free Energy Requirements 5
B. Minnesota 6
C. Wisconsin 8
D. Michigan 8
E. South Dakota 9
F. North Dakota 9
IV. FEDERAL INCENTIVES AND ENVIRONMENTAL REGULATIONS 11
A. Inflation Reduction Act 11
B. EPA New Source Performance Standards (NSPS) 111(b) &(d) 12
C. Good Neighbor Plan 12
V. COMMUNITY & EMPLOYEE CONSIDERATIONS 13
A. Equity Considerations 13
B. Employee Considerations 14
VI. CUSTOMER PREFERENCES 16
A. Municipal Customers 16
B. Commercial and Industrial Customers 17
C. Residential Customers 18
VII. SUPPLY & TECHNOLOGY TRENDS 18
VIII. CONCLUSION 20

CHAPTER 3: MINIMUM SYSTEM NEEDS

I. INTRODUCTION 1
II. MEETING CUSTOMER NEEDS 1

A. Customer Needs Forecast 2
III. MISO RESOURCE ADEQUACY REQUIREMENTS 7
A. MISO Footprint Capacity Obligation 8
B. Zonal Capacity Obligation 9
C. Capacity Obligations Derived from Forecasted Demands 10
D. Capacity Accreditation of Resources 11
IV. DEMAND SIDE MANAGEMENT 13
V. EXISTING AND APPROVED RESOURCES 14
A. Renewable Resources 14
B. Nuclear 14
C. Coal 15
D. Natural Gas (and Oil-Fired) Fleet 15
VI. NET RESOURCE SURPLUS/DEFICIT 15
VII. MEETING RENEWABLE ENERGY REQUIREMENTS AND GOALS 20
A. Minimum Compliance Requirements 20
B. RES and SES Compliance 21
C. Carbon Free Standards 22
VIII. ENERGY POLICY AND COMPANY GOALS 22
IX. REFERENCE CASE 23
X. CONCLUSION 29

CHAPTER 4: THE PREFERRED PLAN

I. INTRODUCTION 1
II. PREFERRED PLAN 1
A. Coal Resources 5
B. Renewable Resources 5
C. Firm and Dispatchable Resources 6
D. Battery Energy Storage Systems 6
E. Nuclear Resources 7
III. ACTION PLANS 7
A. Five-Year Plan (2024-30) 7
B. Long-Term Plan 11
IV. PUBLIC INTEREST ANALYSIS 11
A. Reliability 12
B. Impact to Customer Bills 13
C. Environmental Effects 14
D. Socioeconomic Impacts 14
E. Flexibility to Respond to Change 14
F. Limiting Risks 15

V. CONCLUSION 15

CHAPTER 5: ECONOMIC MODELING FRAMEWORK

I. INTRODUCTION 1
II. BASE ASSUMPTIONS IN THE REFERENCE CASE 1
III. SCENARIOS 6
A. Reference Case Scenario 7
B. Prairie Island Extension Scenario 8
C. Extend All Nuclear Scenario 8
IV. MARKET ACCESS AND RELIABILITY 8
V. SENSITIVITIES 12
VI. ENCOMPASS ANALYSIS RESULTS AND SELECTING THE PREFERRED PLAN 20
A. EnCompass Model Optimization & Challenges 20
B. Modeling Results and Conclusions 23
VII. PREFERRED PLAN SELECTION AND ASSESSMENT 25
A. Extend All Nuclear 25
B. Sensitivity Results 26
C. Preferred Plan and Future Load Uncertainty 30
D. Preferred Plan Benefits 34
VIII. SPECIAL STUDIES ON THE PREFERRED PLAN 35
A. 50 Percent/75 Percent Renewables 35
B. Remodels- DG Solar Bundles, New Technology (Hydrogen, SMRs, Long Duration Storage) 36
IX. CONCLUSION 47

CHAPTER 6: CUSTOMER RATE AND COST IMPACTS

I. INTRODUCTION 1
A. Preferred Plan Average Nominal Cost Comparison to National Average 1
II. REVENUE REQUIREMENTS FORECAST METHODOLOGY 4
III. KEY DRIVERS 8
IV. ESTIMATED ANNUAL RATE IMPACTS 8
V. ESTIMATED NEAR -TERM RATE IMPACTS 12

2024-2040 UPPER MIDWEST INTEGRATED RESOURCE PLAN

CHAPTER 1 - EXECUTIVE SUMMARY

I. INTRODUCTION

Northern States Power Company, a Minnesota Corporation, doing business as Xcel Energy (the Company), is pleased to present this 2024-2040 Upper Midwest Integrated Resource Plan. Our plan will allow the Company to continue providing safe, reliable, and affordable service to our customers while further accelerating our ambitious carbon-reduction strategy, even as we forecast significant increases in customer load from electrification and other sources. Specifically, the Company's Preferred Plan (the 2024 Plan or Preferred Plan) in this proceeding is designed to achieve the following:

- Greater carbon emissions reductions by 2030 than projected in our last plan, and compliance with Minnesota's new "100 x 2040" law;
- $464 million in Present Value of Revenue Requirements (PVRR) savings by 2040;
- $785 million in Present Value of Societal Cost (PVSC) savings by 2040 and over $1 billion by 2050;
- Sufficient firm dispatchable resource additions to ensure reliability; and
- Less than a one percent average annual increase in rates based on generic market pricing of new generation.

These benefits build off the progress made in our last resource plan (2019 Plan). In that proceeding, the Commission approved a number of key decisions in what promises to be a historic transformation of our energy system to one that will be dramatically cleaner, while remaining affordable and reliable for our customers. As the Commission directed, we are working to close all of our baseload coal units in the coming years, replacing them with thousands of megawatts (MWs) of new renewable resources, supported by firm dispatchable resources to ensure reliability. Toward that end, we have already made great progress on our carbon emission reduction efforts to date thanks to the support from and alignment with the Commission, the Legislature, and Governor Walz and his administration.

Following Commission approval of the 2019 Plan, the Company has taken a number of steps needed to transform our energy system into one that will provide cleaner energy to our customers, while remaining safe, reliable, and affordable. Several notable accomplishments since approval of the 2019 Plan include the following:

- The closure of Sherco Unit 2 at the end of 2023, the first of our four remaining coal units that we intend to close by the end of 2030;
- Commission approval of our Certificate of Need for additional dry cask storage at our Monticello Nuclear Generating Plant, which will allow that facility to continue providing carbon-free, reliable baseload power through 2040;
- Commission approval and the start of construction for Sherco Solar, which will add 710 MWs of solar generation to our system and fill the valuable interconnection rights made available by the closure of Sherco Unit 2; and
- Commission approval of a first of its kind long-duration energy storage pilot project that will test a new 10 MW iron-air storage technology that will provide up to 100 hours of storage capability.

The Company has also initiated proceedings to construct transmission lines for replacement generation at both Sherco (the Minnesota Energy Connection) and King (the King Gen-Tie), which will allow for the cost-effective integration of thousands of megawatts of additional renewable resources on our existing system. We have also initiated a bidding process to obtain the first 1,200 MWs of new wind energy that will utilize the Minnesota Energy Connection and preserve our valuable interconnection rights when Sherco Units 1 and 3 permanently close.

The 2024 Plan builds on these achievements and actions and increases the pace of our carbon-reduction efforts even further, while continuing to ensure our system maintains robust reliability. Under our 2024 Plan, our modeling in this IRP shows potential reduction of carbon emissions by 88 percent by 2030, as compared to 2005 levels—up from a goal of 80 percent emissions reduction in our 2019 Plan.[1] In addition, our 2024 Plan positions the Company to comply with Minnesota's newly enacted "100 x 2040" law,[2] which requires utilities to generate an amount of carbon-free electricity equivalent to their Minnesota retail sales by 2040. Finally, we continue to plan on generating 100 percent carbon-free energy by 2050, consistent with the industry-leading commitment we made in 2018.

[1] We note these are only modeled results and that our actual emissions reductions over time likely will differ from the modeling. One notable example is that, consistent with prior IRPs, this carbon reduction forecast is based on modeling that dispatches units to optimize PVSC. While we have not historically applied a carbon cost adder across our generation fleet when offering our units in the MISO market (which would mimic such modeling results), we are open to further consideration of our dispatch strategy as we manage the transition of our resources.
[2] Codified as Minn. Stat. § 216B.1691 Subd. 2g.

While some of the resources included in our near-term and long-term plan have naturally changed from our 2019 Plan given the passage of time, the overall direction is the same. Our five-year action plan is expected to see 3,200 MWs of wind resources added to our system and over 1,000 MWs of distributed solar and community solar gardens, consistent with newly-passed state law. We will have new opportunities to maximize the value of these and other intermittent resources as we project adding 600 MWs of stand-alone storage during this time. Also, we plan to achieve an average annual level of 780 gigawatt hours (GWh) of energy efficiency as ordered at the conclusion of the 2019 Plan, using a combination of utility-sponsored programs and growth of "naturally occurring" savings.

As we add these clean and low-cost intermittent and short-duration resources to replace our retiring baseload coal, we are increasingly focused on ensuring that our system remains reliable, so that we can deliver the power our customers' demand at all times and responsibly meet the State's carbon reduction goals. Our focus on reliability is particularly important because, at the same time we are planning to retire our entire coal fleet (over 2,000 MWs of baseload generation), we also have nearly 1,700 MWs of power purchase agreements (PPAs) with other capacity resources set to expire between 2025 and 2028. This need to ensure an adequate low-carbon power supply during this transition drives several of the additions we are proposing. First, we plan to extend the lives of existing facilities. We plan to extend the lives of both of our nuclear plants into the early 2050s to match 20-year life-extensions we are working to obtain from the Nuclear Regulatory Commission. This will ensure that the Company continues to have available more than 1,700 MWs of carbon-free baseload power into the foreseeable future. We are also planning to extend the lives of our Company owned Refuse Derived Fuel (RDF) waste to energy generating facilities. Second, to ensure our system remains reliable through this transition, our modeling analysis shows that we need to add over 2,200 MWs of firm peaking capacity—emergency resources intended to operate only at times of peak demand, some of which could be extensions of existing PPAs—during our five-year action plan.

Collectively, these changes will result in a resource mix that continues to be diverse but that will rely much more heavily on carbon-free resources going forward, as shown in Figures 1-1 and 1-2 below.

Figure 1-1: NSP System 2024 and 2040 Preferred Plan Capacity Mix

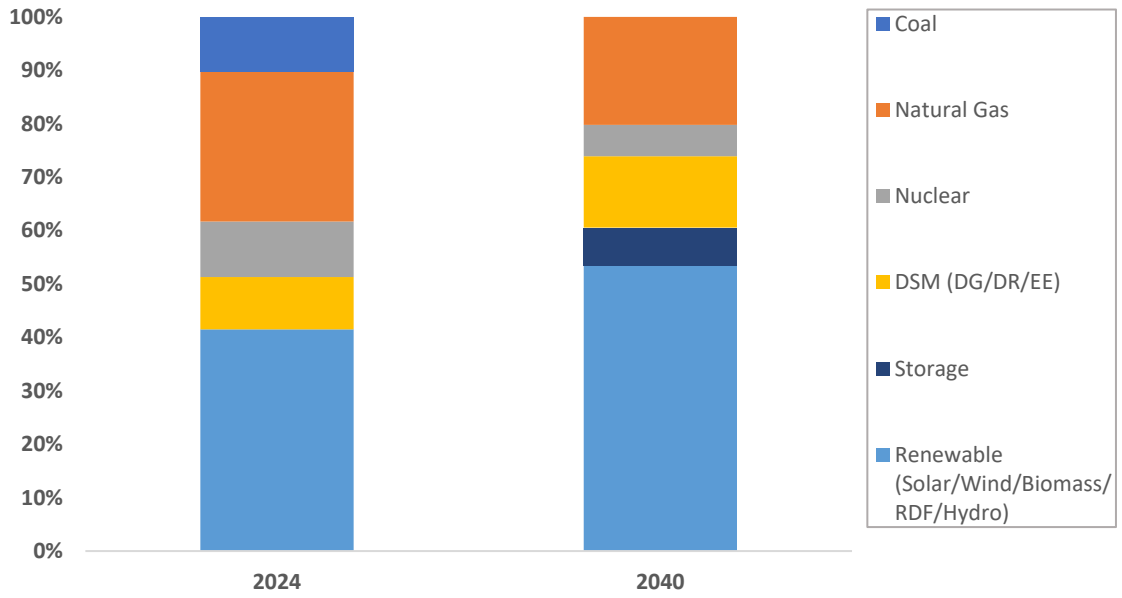

Figure 1-2: NSP System 2024 and 2040 Preferred Plan Energy Mix[3]

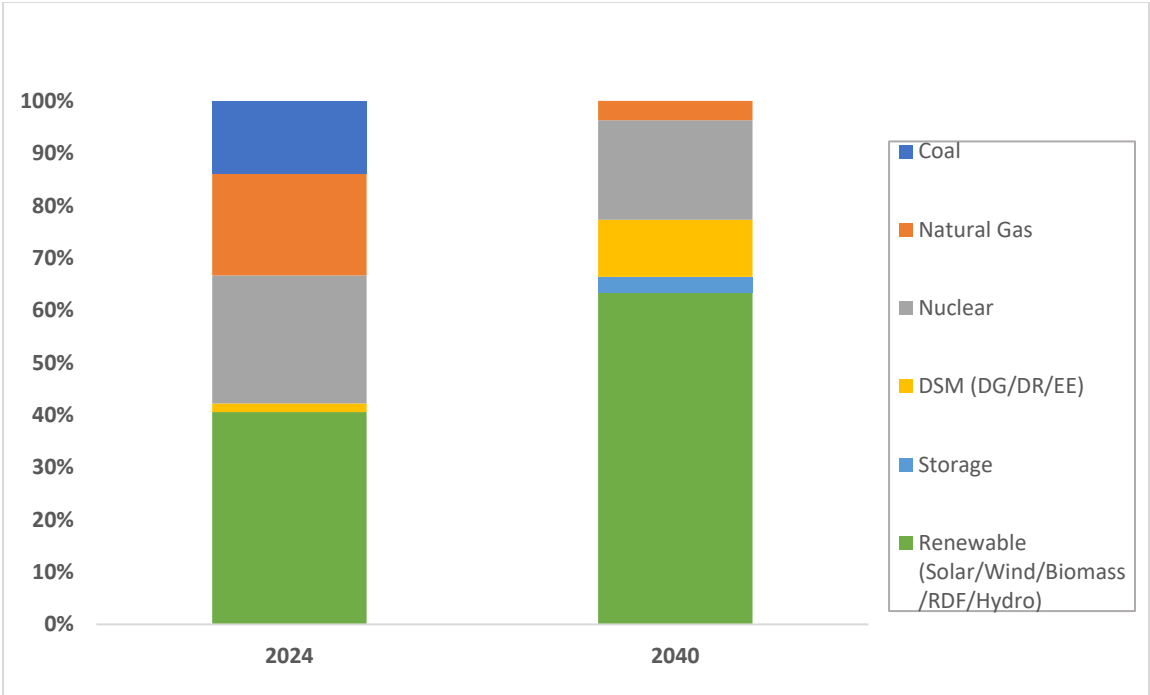


[3] These results are based on the modeled dispatch of resources added pursuant to our Preferred Plan. We note that the market dispatch of resources will ultimately determine the energy mix of the Preferred Plan.

Our 2024 Plan is also impacted by and consistent with state and federal energy policy, which are increasingly incentivizing utilities to accelerate their carbon-reduction strategies. As referred to above, this past year, the State of Minnesota passed the groundbreaking "100 x 2040" law, which requires that, by 2040, utilities generate or procure an amount of carbon-free energy equivalent to their Minnesota load. Likewise, the State also passed a new law requiring that at least three percent of the Company's retail sales be generated by new distributed solar generating systems. As discussed in greater detail below, we developed our 2024 Plan to ensure compliance with these and other applicable laws.

Changes in federal policy also make increasing investments in renewable resources more cost effective, and our 2024 Plan reflects this change. The Inflation Reduction Act (IRA) provides for enhanced tax incentives for new clean energy projects, making our planned renewable additions more affordable for our customers. In addition, the EPA's proposed "Good Neighbor Plan" would increase the per mega-watt hour (MWh) cost of operating carbon-emitting resources. The combination of these policies, in addition to the new State statutes reflected above, support a more rapid transition of our system to a clean energy future, consistent with the plan we lay out here.

Our 2024 Plan provides substantial economic benefits for our customers and communities. As noted above, our 2024 Plan results in $464 million in PVRR savings by 2040; $785 million in PVSC savings by 2040 and over $1 billion in PVSC by 2050. Our 2024 Plan leverages $5.7 billion in IRA tax credits through incremental renewable additions over the course of the planning period. Finally, our 2024 Plan is designed to exceed 80 percent reduction in carbon emissions (with actual results up to 88 percent by 2030) leading to continued carbon reductions while leading to less than a one percent average annual increase in rates.

Our 2024 Plan reflects a careful balancing of State and Federal policy, Commission guidance, and stakeholder input. Although there is still significant work to do to fully decarbonize our system, including developing and integrating new technologies such as standalone storage, this plan represents another critical step in that direction. We are examining advanced technologies such as new battery chemistries, advanced nuclear reactors and hydrogen, which may contribute further to our clean energy objectives. As new technologies mature, we will include them in our resource planning analyses. We are charting a path to decrease our carbon emissions even more than we had planned just a few years ago, in a responsible way that ensures our customers will have the power they need, when they need it, at an affordable cost.

II. 2024-2040 UPPER MIDWEST RESOURCE PLAN

Our 2019 Plan set us on an ambitious path to decarbonize our energy system, primarily by retiring all of our coal units in the next six years and replacing the bulk of the energy those plants provide with renewable resources. In bringing forward the 2024 Plan, we are accelerating our path toward decarbonization while remaining focused on ensuring that the core needs of our customers and stakeholders are met during this dynamic period of transition and growth. Our customers demand and deserve reliable electric service at affordable rates, and they—along with our regulators, stakeholders, and communities—have increasingly demanded that this service be provided by clean resources. In addition, our customers are beginning to use the electric service we provide to meet different needs. The growth of transportation and other beneficial electrification, along with other potential electric load increases, presents new challenges and opportunities as we plan to meet our customers' needs.

We believe that the robust planning process we have used to develop our 2024 Plan results in a portfolio that can serve the accelerating growth in energy demand in a way that is sustainable, reliable, and cost-effective. Our 2024 Plan relies on longstanding technologies with which we are deeply familiar, while integrating new and emerging technologies such as energy storage that can enhance the benefits of our system resources. We also continue our strategy of implementing a phased-in transition to a cleaner future, in which renewables and renewable-supporting resources are added over time—albeit on an ambitious but achievable timeline. This allows us to maintain the reliability of our system during this transition, while providing us with the flexibility to respond to changing market dynamics, technology advancements, and evolving regulatory policies.

Below, we discuss the major priorities and considerations we faced in developing our 2024 Plan and the overall resource mix we propose.

A. Planning Priorities and Characteristics

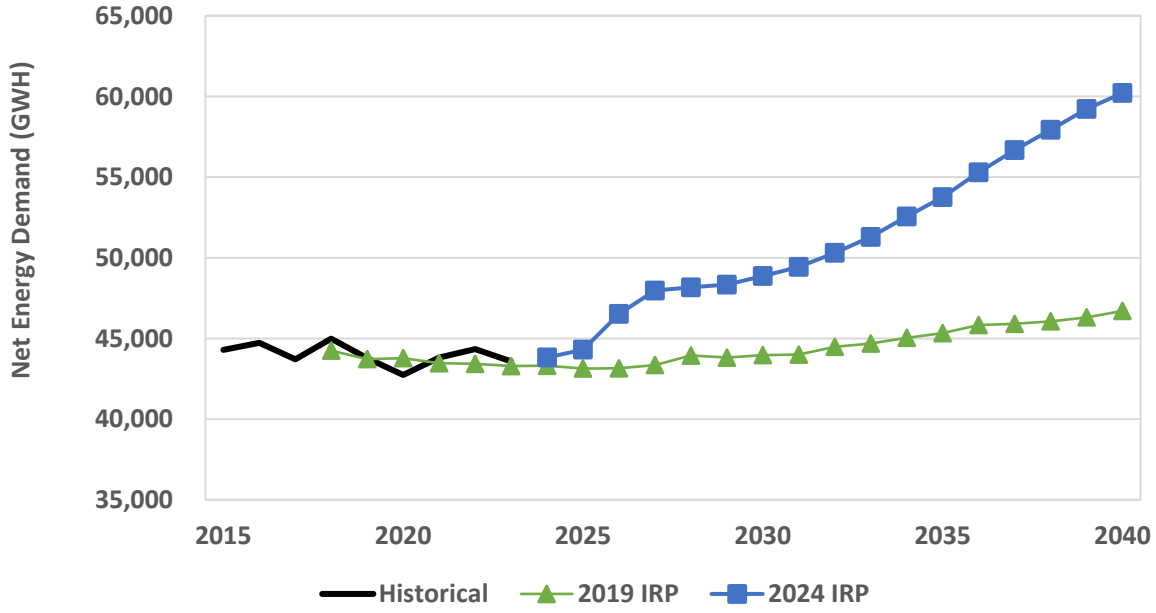
1. Load Growth

The last several decades of our industry can be characterized as a period of relatively flat annual growth for electric consumption. Conservation programs offered by utilities, coupled with efficiency gains in appliances and other naturally occurring energy savings from our customers, provided a significant offset to the energy growth attributable to new customer additions. For instance, after adjusting for weather,

electric energy requirements of our system increased at an average of only 0.2 percent from 2019 to 2022. As a result, while utilities have needed to plan for some growth, the amount of that growth was quite small.

We now, however, anticipate that this period of ultra-slow consumption growth is ending, and we expect to see the demand for our service increase at a greater pace. While further improvements in energy efficiency and demand response capabilities will continue to provide substantial value to our customers, we anticipate that emerging uses of electricity will result in greater consumption growth than we have needed to plan for in the recent past. Specifically, our base case forecasts now anticipate average annual growth rates of 1.8 percent in our peak demand, and 2 percent for our energy forecast over the 2024-2040 planning period. This is a marked divergence from what we have anticipated in the past, as demonstrated in the Figure 1-3 below:

Figure 1-3: Forecasted Net Energy Requirements After Energy Efficiency Adjustments (GWh)



The primary factors leading to this increased growth in our forecast are new anticipated load coming from large new data centers and accelerating adoption of electric vehicles. Other forms of beneficial electrification, such as the emerging transition in space and water heating from fossil sources to electricity, will provide additional sources of new growth.

Despite our projections for accelerating growth, we anticipate decarbonizing our energy system even faster than we thought just a few years ago. This means that we can better support the decarbonization of the other industries, such as transportation and space and water heating, that we project will drive our growing sales through electrification.

2. Reliability

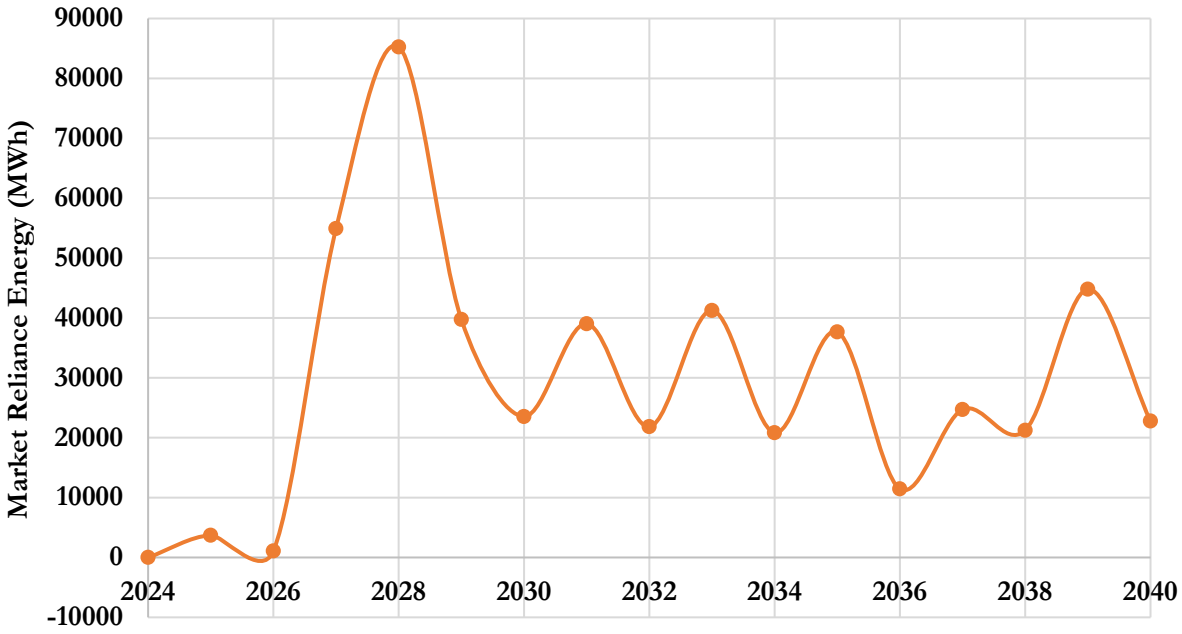
The anticipated increase in the growth of electricity consumption discussed above comes amid renewed attention to the reliability of the electric system. The foundational service we provide to our customers is safe and reliable electricity, and we must be prepared to meet our customers' energy demands twenty-four hours a day, 365 days a year. The closing of our (and other utilities') baseload coal units and the substantial additions of intermittent renewable resources has and will continue to provide many benefits to our customers and communities. At the same time, however, it also means that we must develop our plans thoughtfully to ensure that we continue to have the resources to meet our customers' needs at all times.

As the resource mix in the region has changed, there is also less excess capacity in the MISO footprint. In fact, MISO's 2022-23 Planning Resource Auction (PRA) resulted in a capacity shortfall for the MISO North/Central Regions, leading to the price of capacity clearing at the Cost of New Entry (CONE). As a result of these developments, among other things, MISO has changed its reliability construct to a seasonal Resource Adequacy (RA) construct with capacity requirements for each season. This new seasonal RA construct establishes planning reserve margin (PRM) and resource capacity contributions for each season (spring, summer, fall, winter). Additional changes to the RA construct are also under consideration and will impact the resources needed in the MISO region to meet reliability requirements. These changes are intended to ensure that MISO's members maintain adequate supplies of generation at all times. This is especially important for us, since our Upper Midwest system constitutes approximately half of the load in MISO Zone 1 and approximately seven percent of the load in the entire MISO footprint from Manitoba to Louisiana, making our system a major part of the broader MISO market.

The planning process we used to develop our 2024 Plan reflects and responds to these changes and the need for additional focus on ensuring an adequate resource mix. In past resource plans, our modeling analysis allowed a portion of our resource needs to be fulfilled by the MISO market. When we performed the same analysis for the 2024 Plan, however, the models produced an expansion plan that would be unable to serve our load during a significant number of hours each year. This reflects the

changing resource mix on our system. To illustrate this point, the orange line in the Figure 1-4 below shows the expected market reliance , which represents the total MWh in each year in which the Market Access Optimization expansion plan resources are unable to serve our load and must rely on the market purchases.

Figure 1-4: Market Access Optimization
Expected Market Reliance



This analysis demonstrates that an overreliance on the market creates substantial risk of high prices and, possibly, that sufficient resources simply will not be available when they are needed.

To address this risk while continuing to optimize the cost-effectiveness of our fleet, we used a modified analysis to develop our 2024 Plan, and we did not allow our model to rely on the MISO market when optimizing our capacity expansion plan. We did, however, set those capacity obligations using MISO's coincident peak and PRM, and we allowed the model to benefit from access to the MISO market to dispatch of resources to serve our customers. This two-step analysis results in an expansion plan that takes advantage of the potential cost savings of participating in the MISO market, while not being reliant on the MISO market to meet our resource needs. In addition, by continuing to plan to MISO's coincident peak and PRM, our analytical approach ensures that we are not adding resources that are not necessary to meet our customers' needs.

In addition to planning our resource additions to limit reliance on MISO market purchases, we have taken steps to further refine our energy adequacy analysis. We conducted an energy adequacy back casting analysis to ensure our system has the reliable energy it needs to serve all customers at every hour of every day. We used historical data on scenarios, including our Preferred Plan and Market Access Optimization sensitivity discussed above, which was developed assuming 2,300 MW of hourly market access.[4] The analysis allowed us to assess the capacity and energy adequacy of our plans. We evaluated these plans on six different measures:

1. Native Capacity Shortfall: Hours of insufficient system capacity in each year.
2. Average Shortfall Intensity: Average Shortfall in MW during the shortfall events in each year.
3. Longest Shortfall Event: Longest duration in hours of the shortfall events in each year.
4. Peak Capacity Shortfall: Peak capacity shortfall in MW of the capacity shortfall events in each year.
5. MISO Market Reliance Hours: Total number of hours the plan is reliant on the market to serve load.
6. MISO Market Reliance Energy: Total amount of MWh the plan is reliant on the market to serve load.

The Preferred Plan performs well across all of these energy adequacy metrics. There are only two hours of native capacity shortfall in 2030 across the seven historic years tested and applied to our Preferred Plan, resulting in limited dependence on the market. There are also only four hours across the seven historical test years where the Preferred Plan requires market purchases in order to meet load serving needs. In contrast, the Market Access Optimization sensitivity showed significant vulnerabilities across the energy adequacy metrics, supporting our approach in the Preferred Plan to ensuring reliability.

3. Cost-Effectiveness

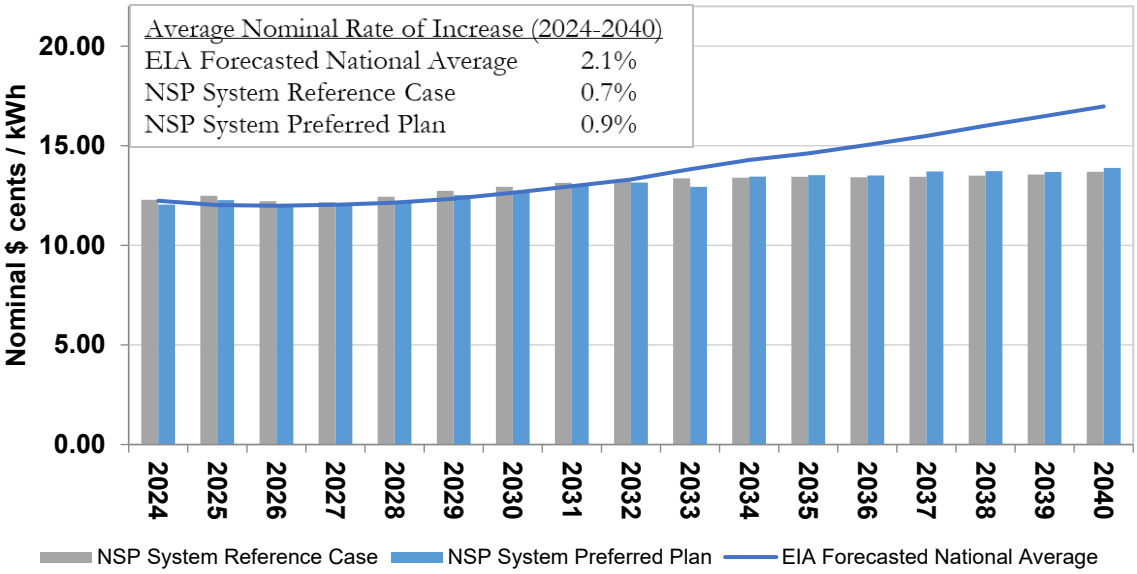
We understand the importance of keeping the cost of our service reasonable for our customers. Some of our customers truly struggle to afford their energy bills. We have developed and continue to improve upon a variety of programs designed to target and

[4] As discussed in Appendix D: Energy Adequacy Analysis, which also analyzed the Reference Case and Low Load Scenario.

assist those individuals. But regardless of whether our service is affordable for an individual or business, all of our customers rightfully expect that their energy bills will not be more than is necessary to meet their needs and public policy goals.

Our average residential customer's electricity bill has remained below the national average, and our goal continues to be that our customers will experience average annual bill increases that are below the rate of inflation. Our Preferred Plan remains broadly in line with these goals. In fact, our Preferred Plan achieves a higher level of carbon reductions than the approved 2019 Plan for a customer cost of less than one percent compound annual growth rate over the planning period. Figure 1-5 below shows the relative cost growth of our Preferred Plan in comparison to the national average:

Figure 1-5: Preferred Plan Average Rate Impact for the NSP System



* *Notes: National energy cost forecast from Energy Information Administration (EIA) Annual Energy Outlook 2023, Table Energy Supply, Disposition, Prices and Emissions – Reference Case. End use prices, all sector average.*[5] The Preferred Plan and Reference Plan lines include the costs of Solar Rewards*Community.

The low cost forecast to implement our Preferred Plan is aided by additional policy incentives that will benefit our customers. In particular, the passage of the Inflation Reduction Act (IRA) unlocked a projected $5.7 billion in additional federal tax incentives for our Preferred Plan's utility-scale renewable and storage resource

[5] *See* U.S. Energy Information Administration - EIA - Independent Statistics and Analysis The EIA's Annual Energy Outlook was published in 2023.

additions. We recognize additional cost savings from the IRA for our existing renewable and nuclear resources. The value of these tax benefits were incorporated in our modeling, lowering the levelized cost of these resources significantly. These tax benefits will have a meaningful impact for our customers, since our Preferred Plan includes additions of 3,200 MWs of additional wind generation, 400 MWs of additional utility-scale solar generation, and 600 MWs of standalone storage through 2030.

B. Proposed Resource Mix

Our Preferred Plan continues our strategy of transitioning our resource fleet to more sustainable energy sources while preserving our fundamental commitment to maintaining safe, reliable, and affordable service. Our proposed resource mix maintains the path approved in our 2019 Plan to retire all of our remaining coal generators by the end of 2030 – a reduction of approximately 2,400 MWs of baseload units. In that same time, 1,700 MWs of PPAs, the majority of which are for natural gas generation, are set to expire between 2025 and 2028.

To replace these resources and meet our customers' needs, we developed a diverse generation portfolio that relies predominantly on renewable and carbon-free resources, supported by necessary firm dispatchable resources, which are designed to operate only 5-10 percent of the year, to ensure reliability. By the end of 2030, we will add approximately 4,300 MWs of new wind and solar facilities—including the additions from community solar gardens and distributed solar, along with 600 MWs of standalone storage to optimize our system. The limited amount of carbon generation that remains on our system will largely be seldom-used peaking units that are needed to support the substantial increase in intermittent renewables.

Our Preferred Plan is set forth below in Figures 1-6 and 1-7 below:

Figure 1-6: 2024-2040 Preferred Plan Resource Additions (MW)

	2025	2026	2027	2028	2029	2030	2031	2032	2033	2034	2035	2036	2037	2038	2039	2040

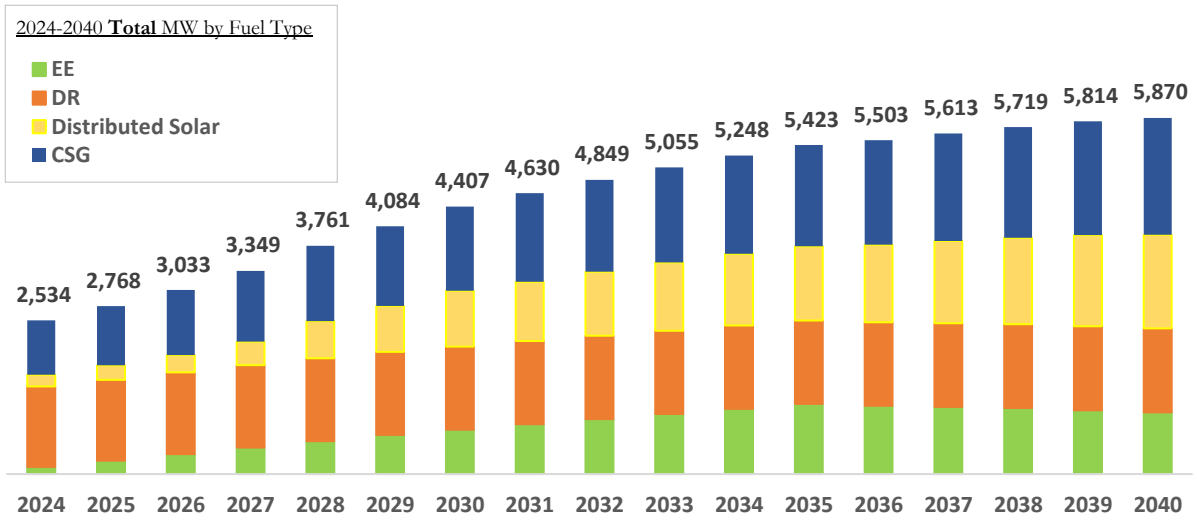
Figure 1-7 Preferred Plan Cumulative Capacity for Demand Side Resources and Community Solar Gardens (MW)



Our Preferred Plan is consistent with the path the Commission ordered in our last case. Specifically, we continue to plan to retire all of our coal units by 2030, with Sherco Unit 1 retiring in 2026, King retiring in 2028, and Sherco Unit 3 retiring in 2030. The closing of these facilities will open valuable interconnection rights, which we will use to add thousands of MWs of wind, solar, and standalone storage. We will also add substantial amounts of new wind generation and standalone storage that do not reuse these interconnection rights. In total, we envision adding nearly 10,000 MWs of utility-scale renewable energy and over 2,000 MWs of standalone storage during the entire planning period. In addition, we anticipate the capacity of community solar gardens and standalone distributed solar on our system will more than triple over the course of our planning period—growing from under 1,100 MWs of capacity in 2024 to nearly 3,500 MWs by 2040. The majority of this growth is the result of new legislation that requires at least three percent of the Company's total retail electric sales to be generated from distributed solar.

Our modeling shows that replacing these baseload coal units with this level of renewable additions will also require supporting resources that can operate for long durations. Our analysis demonstrates two steps that we must take to cost-effectively maintain a reliable system during this transition. First, our modeling shows that we will need to add a substantial amount of firm dispatchable capacity over the life of our plan. In addition to integrating our new renewables, these resources are needed to replace the 1,700 MWs of firm dispatchable PPAs that we will lose over the next few years. We have modeled these firm dispatchable additions as combustion turbine

resources that are relatively low-cost to build, do not operate for much of the year, and in the future, could run at least partially on clean fuels like hydrogen. Second, we plan to extend the lives of our nuclear and RDF generating facilities. Specifically, we will extend operation of the two Prairie Island Generating Plant units for 20 years past the current license expirations, to 2053/2054, and extend operation of the Monticello Nuclear Generating Plant to 2050, which aligns with our Subsequent License Renewal application pending at the Nuclear Regulatory Commission. Additionally, we are extending the lives of our RDF plants, recognizing the value they provide to their local communities. Extending these resources are vital for our system because, with the loss of our coal fleet, our nuclear and RDF facilities constitute the only remaining baseload units on our system. If we did not extend these resources, our EnCompass modeling results show that we would need to build or acquire more than 4,600 MWs of incremental generation and storage capacity, including almost 900 MWs of additional peaking resources for the planning period.

III. CONCLUSION

We are pleased to present this 2024 Plan, which capitalizes on recent federal and state policy changes to reduce our carbon emissions more aggressively than we had previously planned. We will continue to eliminate coal, add renewables, and expand our EE and DR programs. By also adding stand-alone storage and firm dispatchable resources, we will continue to maintain a diverse fleet of resources that is cost-effective for our customers and continuing to ensure that our system is reliable. For these reasons, and those discussed throughout this filing, we believe our Preferred Plan is in the public interest and should be approved by the Commission.

CHAPTER 2 – PLANNING LANDSCAPE

I. INTRODUCTION

The Company's Preferred Plan (the 2024 Plan or Preferred Plan) continues to chart the path toward achieving some of the most ambitious carbon reduction goals of any utility in the United States by focusing on reliable, responsible decarbonization of our system. The 2024 Plan digs deeper than previous plans in the impacts and challenges of carbon-reduction on the reliability of our system, analyzing numerous assumptions to identify the plan that best meets our obligations and goals, while still ensuring that we can meet customer needs at all times.

In this Chapter, we discuss some of the key internal and external market contexts that affect how we have developed, and plan to execute on, our 2024 Plan. Specifically in this section we examine:

- Market Constructs & Renewable Integration
- Jurisdictional Updates
- Federal Incentives & Environmental Regulations
- Community & Employee Considerations
- Customer Preferences
- Supply & Technology Trends

Each of these factors affected how we developed our 2024 Plan. However, a few factors stand out above others as being particularly influential in this 2024 Plan cycle: namely, market constructs and state and federal policy. Our regional system operator's new seasonal construct allows for more precise planning and resource allocation based on each season. It also introduces new levels of complexity and concern about reliability that our 2024 Plan is tailored to address. State and federal policy has also changed significantly since 2019. In Minnesota in particular, the cost of carbon, the distributed solar and renewable energy standards, and the new carbon-free energy standard each influenced our 2024 Plan's design. The same is true of federal law, which created both significant financial incentives for renewables along with new areas of uncertainty related to the Clean Air Act.

These and other factors all affect how we developed the 2024 Plan presented in this filing—and the issues we anticipate encountering as we pursue our goals to lead the clean energy transition while ensuring reliable and affordable grid services.

II. MARKET CONSTRUCTS AND RENEWABLE INTEGRATION

The Company's Upper Midwest system is part of the Midcontinent Independent System Operator (MISO) market. MISO's primary responsibilities are overseeing wholesale energy markets in the member region and planning for bulk system reliability (i.e. transmission planning, generator interconnection, and ensuring sufficient reserve margins). MISO's operations thus affect how we conduct resource planning. Here we focus on system reliability constructs and renewable integration challenges that impact how we designed our 2024 Plan.

A. New Resource Adequacy Construct

MISO's resource adequacy construct has historically been centered on an annual planning reserve margin (PRM) based on a summer peak. This approach was based on the assumption that resource needs and availability were relatively stable throughout the year, and consistently peaking in the early evening in summer months when air conditioning use is highest. However, recognizing the increasing variability in reliability needs and resource availability throughout the year, the Federal Energy Regulatory Commission (FERC) approved MISO's proposal to move to seasonal resource adequacy requirements. This new MISO construct began with the 2023 – 2024 planning year, which spans from June 1, 2023, through May 31, 2024, and will also be in place for subsequent planning years. The planned seasons are: (1) Summer: June through August; (2) Fall: September through November; (3) Winter: December through February; and (4) Spring: March through May.

This new construct is designed to address increases in emergency events that occur year-round, driven by factors including generation retirements, reliance on intermittent resources, seasonal variations, outages resulting from extreme weather events, and declining excess reserve margins. By planning for resource adequacy on a seasonal basis, utilities can better prepare for seasonal variations in demand and supply, leading to improved reliability of the power system.

Our 2024 Plan has incorporated the seasonal construct into the planning process and modeling, allowing for more precise planning and resource allocation based on the specific needs and resource availability of each season. Modeling tools have been adjusted, and our models have become more complex because they now have to ensure sufficient capacity across all four seasons as opposed to a single year. We have also adjusted our long-term planning assumptions because our models use trends or averages from several years of data in order to accurately predict what will happen in the future. However, we only have one year of data for existing generation assets

under the seasonal construct to use when figuring out how much capacity we will need for each season. Appendix F: EnCompass Modeling Assumptions and Inputs discusses our short- and long-term capacity accreditation assumptions in more detail.

Overall, MISO's seasonal resource adequacy construct adds complexity to resource modeling but also provides a more detailed and potentially more reliable approach to ensuring grid reliability throughout the year.

B. MISO Reforms on the Horizon

MISO is actively engaged in developing and refining additional reforms to improve resource adequacy and reliability of the electric power grid. Two reforms of note—Reliability-Based Demand Curve (RBDC) and Direct Loss of Load (DLOL)—aim to better align the value of reliability, provide investment signals for future resource needs and ensure stability in resource adequacy modeling, while considering the impacts on load serving entities and various resource classes.

Due to the growth of variable, energy-limited resources in the MISO footprint, along with changing weather impacts and operational practices, MISO determined that its existing accreditation methods for resources require further evaluation to ensure that the accredited capacity value reflects the capability and availability of the resource during periods of highest reliability risk. In response, MISO has developed a proposal that contains a new two-step process for accreditation. At a high level, MISO's proposal calculates accreditation based on modeled and historical performance of resources during tight margin hours. More specifically, the first step in the process determines how resources receive capacity credit at a class level and the second step contains a process for class-level megawatts to be allocated amongst specific resources. The class-level step utilizes a DLOL method which averages the availability of each resource during loss-of-load hours within the Loss-of-Load Expectation model and aggregates by resource class. The second step of the proposed process allocates each resource class level megawatts (determined by the DLOL method) among the individual resources in the class using the individual resources' performance during tight margin hours based on the prior three years of operational experience.

MISO's proposal would add significant complexity to the resource adequacy construct. Based on initial information provided by MISO, the proposed approach is likely to decrease the accreditation granted to resources but may also decrease the reserve margin in certain seasons due to the increased focus on tight margin hours which can occur outside peak demand periods.

MISO and stakeholders have continued to discuss in the Resource Adequacy Subcommittee details related to MISO's proposal as well as information that will be needed to integrate MISO's proposed changes into member resource planning processes. MISO is planning to file the proposal with FERC in the first quarter of 2024. MISO has proposed implementation in the 2028/2029 Planning Year.

The RBDC is a proposed design for MISO's Planning Resource Auction (PRA). It aims to reflect the reliability value of capacity and produce more efficient and stable capacity prices. Historically, the MISO region has maintained reserves significantly exceeding the required reserve margins. However, as experienced in the 2022-23 PRA, excess reserves can no longer be expected. MISO's proposed RBDC endeavors to address the limitations associated with the use of a vertical demand curve to clear the PRA. The RBDC proposal is currently under consideration by FERC. Pending FERC approval, the RBDC reform is expected to be implemented in PY 2025-2026.

The RBDC has not been approved by FERC and the proposed DLOL accreditation reform has not been filed with FERC. Chapter 5: Economic Modeling Framework, discusses a special reliability study evaluating a higher PRM as an RBDC opt-out proxy and Appendix D: Energy Adequacy Analysis includes the assumptions used in our analysis for future capacity accreditation.

C. Renewable Integration Challenges

The challenges of integrating new clean generation into the system continue due to delayed interconnection studies and limited open transmission availability. The MISO Generator Interconnection Process is designed to allow generators reliable, non-discriminatory access to the electric transmission system, in a timely manner, while maintaining transmission system reliability. Recently, as the number of proposed projects in MISO has expanded significantly, this process has seen significant delays.

Delay impacts are particularly evident in the Definitive Planning Process, where MISO undertakes generation interconnection studies. Current studies are several months to years behind due to the considerable number of projects in the queue, and due to a generator interconnection process, that allows late withdrawals from the queue. With the intention of addressing some limitations in processing generation interconnection queues, FERC issued Order 2023 in July of 2023,[1] which is discussed in more detail in Appendix L: System Planning Integration.

[1] https://www.ferc.gov/news-events/news/fact-sheet-improvements-generator-interconnection-procedures-and-agreements.

In response to direction from FERC and in recognition of the challenges described above, MISO is beginning to undertake several actions that could serve to mitigate challenges to bringing new, clean resources online. Appendix L discusses these potentially helpful initiatives in more detail, which could allow generation owners to leverage existing interconnection agreements to maximize utilization and fit renewable additions into the existing open spaces on the grid. As such, the Company is engaging in Long Range Transmission Projects and looking for ways to preserve and reutilize interconnection rights we already have, which influenced the location, size, and type of resources proposed in our 2024 Plan.

III. JURISDICTIONAL UPDATES

Our integrated Upper Midwest system provides service on a multi-jurisdictional basis to 1.8 million customers across five states, and we have historically planned this system as an integrated whole. Each resource on the Upper Midwest bulk energy system—whether generation or transmission—is developed in consideration of the whole system, to take advantage of the economies of scale available through integrated system planning. In the next section, we explain how differing policies in our multi state service territories is impacting our resource planning process.

A. New Carbon-Free Energy Requirements

In December 2018, the Company announced our goal to reduce carbon dioxide (CO_2) emissions 80 percent by 2030 below 2005 levels companywide, and to serve customers with 100 percent carbon-free electricity by 2050. Since the Company made this announcement, we have seen multiple states across our Upper Midwest service territory adopt similar carbon free goals.

In particular, in 2023, the Minnesota Legislature amended the requirements set forth in Minn. Stat. § 216B.1691 to include additional milestones for renewable energy as well as creating new carbon-free energy standards (see Minn. Laws 2023, chp. 7). The new legislation requires utilities to generate or procure carbon-free energy equivalent to 100 percent of their Minnesota retail sales by 2040. The law also requires utilities to achieve interim carbon-free energy standards of 80 percent by 2030 and 90 percent by 2035, and a renewable energy standard of 55 percent by 2035. Based on our current understanding of the law, our 2024 Plan is modeled to meet the requirements of this new legislation, as set forth in more detail in Appendix N: Standard Obligations. The details of how the carbon-free standards are calculated will be important in informing the implementation of these state policies. To that end, the Minnesota

Commission has opened an Investigation docket[2] into the Carbon-Free Standard. Parties and the Commission will weigh in on a number of topics in that docket over the next couple of years, including clarification of new and amended terms such as carbon-free, partial compliance, and environmental justice areas. Determining the appropriate calculation methodology will help ensure that utilities are on track to meet their targets and that progress can be accurately measured and reported. The Company's current compliance efforts, including how we are applying those terms to its system in this 2024 Plan, are also documented in Appendix N.

Further, as discussed below, this move towards carbon-free energy requirements is not exclusive to Minnesota; other states we serve are moving towards similar goals. We will continue to track those developments.

B. Minnesota

In addition to the new carbon-free goal, Minnesota has seen other significant legislative developments since our 2019 Plan that impact how we conduct our resource planning, such as the updated cost of carbon and how Distributed Energy Resources (DER) are addressed.

1. Cost of Carbon

A recent Commission Order Addressing Environmental and Regulatory Costs (Environmental and Regulatory Costs Order)[3] requires utilities to continue to analyze potential resources under a range of assumptions about environmental values and future regulatory costs, including the five modeling scenarios previously outlined in 2020, and altered the cost range utilities must apply to any fossil generation resource. Additionally, pursuant to Minn. Stat. § 216B.2422, Subd. 3, the Commission provisionally adopted and applied the cost of greenhouse gas emissions valuations presented in the United States Environmental Protection Agency's (EPA) November 2023 Report on the Social Cost of Greenhouse Gases: Estimates Incorporating Recent Scientific Advance.[4] Consistent with the Commission's Order, our 2024 Plan includes sensitivities addressing these valuations, which is discussed in detail in Appendix K: Environmental Regulations Review and Appendix F.

[2] Docket No. E999/CI-23-151.
[3] Order in Docket Nos. E-999CI-07-1199, E-999/DI-22-236, E-999/CI-14-463, December 19, 2023, Order Point 2.
[4] Available at: https://www.epa.gov/system/files/documents/2023-12/epa_scghg_2023_report_final.pdf.

2. Distributed Energy Resources

In another recent development, Minnesota's distributed solar energy standard was amended at subdivision 2h of Minn. Stat. § 216B.1691. This amendment mandates that at least three percent of the Company's retail electric sales in Minnesota be generated from qualifying solar energy generating systems. To be counted towards this standard, the solar generating system must have a capacity of 10 megawatts or less, be connected to the distribution system, be located in our Minnesota service territory, and be constructed or procured after August 1, 2023. Additionally, subdivision 7 now sets an annual capacity limit on community solar gardens, which decreases over time, from 100 megawatts in 2024, 2025, and 2026, to 60 megawatts in 2031 and each year thereafter. To-date, community solar gardens still make up the clear majority of the DER on our system in the Upper Midwest. DERs are also coming onto our grid, in the form of electric transportation options—enabling not only flexible load opportunities but also broader economy-wide emissions reduction.

Minnesota's Energy Conservation and Optimization Act (ECO Act) has also impacted how we approach DER in the 2024 Plan. The ECO Act changed how we approach demand side management by broadening the approaches a utility may take in achieving energy efficiency (EE) and demand response (DR). In particular, it allows for inclusion of both traditional DR efforts aiming to reduce peak reduction during hot summer days as well as non-traditional efforts to shift load based on the time of day. These efforts are part of our 2024 Plan, as set forth in Appendix J: Distributed Energy Resources.

Our 2024 Plan is substantially dependent on forecasted customer load, which incorporates our best estimates about customer adoption of DER and robust statistical forecasting methods. Our Integrated Distribution Plan and grid modernization efforts help us leverage DER and new load to enable more flexible demand management, improve reliability and enable better decision-making about large-scale investments. That said, it is difficult to predict new technologies, the pace of their adoption, and thus how the DER landscape could affect our generation needs in the future. Our 2024 Plan modeling includes various sensitivities to account for these uncertainties related to the impact of DER, as set forth in Appendix J. However, we still often do not have visibility into which technologies, and at what pace, customers will adopt and thus, how that changing load will affect our grid needs in the future.

C. Wisconsin

In Wisconsin, the Company is subject to a Renewable Portfolio Standard (RPS) equal to 12.89 percent of its three-year average in-state retail energy sales. In 2022, excluding renewable energy used for voluntary renewable programs, NSPW provided 44.05 percent of its retail energy sales from RPS-eligible renewable-based energy sources, therefore exceeding the state's 2022 RPS requirements.[5]

In May 2023, the State's Governor issued a Clean Energy Plan that includes a 100 percent carbon reduction goal for the state's electric sector that is broadly consistent with our objectives to reduce emissions 80 percent from 2005 levels by 2030, and 100 percent by 2050. Therefore, the Clean Energy Plan should not impact our 2024 Plan. The Governor's climate goals have not yet resulted in additional mandates for the electric sector. Similarly, the Company continues to engage with Public Service Commission of Wisconsin (PSCW) staff and interested stakeholder as several investigatory proceedings move forward. For instance, the PSCW has opened investigation to evaluate the impact of MISO's proposed reliability-based demand curve and capacity accreditation reforms (Docket 5-EI-161), a Roadmap to Zero Carbon (Docket 5-EI-158), and an evaluation of net energy metering programs (Docket 5-EI-157). None of these proceedings have resulted in Commission orders requiring utility action as of January 2024.

D. Michigan

In Michigan, the Company is subject to a Renewable Energy Standard (RES) equal to 15 percent of retail sales through 2029, pursuant to Michigan Public Act 235 of 2023.[6] The new legislation increased the RES to 50 percent for the period 2030-2034 and 60 percent for 2035 and beyond. In addition, the legislation establishes a Clean Energy Standard (CES) requiring 80 percent of retail electricity from qualifying resources during the period 2035-2039 and 100 percent in 2040 and beyond. We do not yet know the details of how compliance with the legislation will be calculated, but based on our current calculations, our Preferred Plan is modeled to be ahead of schedule on both RES and CES requirements through 2040 by nature of our 80 percent by 2030 carbon reduction plan.

[5] *See* Docket 5-RF-*NSPW Renewable Portfolio Compliance Plan for CY 2022. Northern States Power Company, a Wisconsin Corporation*.
[6] Act No. 235. Public Acts of 2023. Enrolled Senate Bill No. 271. 2023-PA-0235.pdf (mi.gov)

E. South Dakota

In South Dakota, the Company faces challenges to its decarbonization goals. For example, it has historically faced challenges in cost recovery for certain resources. The South Dakota Public Utilities Commission suspended the fuel clause adjustment in 2016 to investigate disputed resource costs. A Settlement Stipulation approved in 2017 resolved the recovery of cost associated with the Aurora solar resource and several biomass resources. The Settlement required proxy prices for the remaining disputed resources, including the Marshall and North Star solar Power Purchase Agreements (PPAs),C-BED PPAs, and Renewable Development Fund PPAs. The Company currently recovers costs associated with these resources based on a proxy price.[7]

More recently, the South Dakota Commission disagreed with the Company's plans to retire the King and Sherco 3 units in 2028 and 2030, respectively. In June of 2023, the South Dakota Commission approved a rate case settlement that assumes the current depreciable lives of King and Sherco 3 in June 2037 and December 2034. In opposing the Company's request for accelerated depreciation of those units, Commission Staff specifically cited the impact those retirements would have on MISO's seasonal resource adequacy construct and the Company's ability to provide reliable electricity.[8] The South Dakota Commission reiterated its reliability concerns over early plant closures in a January 4, 2024 letter to the Company.

F. North Dakota

As part of the 2021 North Dakota legislative session, the North Dakota Legislature enacted Senate Bill (SB) No. 2313, which added new sections regarding integrated resource planning to Chapter 49-05 of the North Dakota Century Code (NDCC). To further guide the process of resource planning and provide clarification on the implementation of SB 2313, Section 69-09-12 of the North Dakota Administrative Code was enacted effective January 1, 2023. With this new legislation and administrative rules, the North Dakota Commission has new oversight into utility resource planning; historically, the Commission did not have a formal vehicle to review resource acquisitions outside an advance determination of prudence proceeding.

The new resource planning legislation and rules re-emphasizes that a North Dakota preferred resource plan may not select resources based on externalities representing

[7] Docket EL18-004. https://puc.sd.gov/Dockets/Electric/2018/EL18-004.aspx.
[8] Docket EL22-017. https://puc.sd.gov/Dockets/Electric/2022/EL22-017.aspx.

environmental costs or future environmental laws or regulations that have not yet been enacted. The preferred plan must instead describe and select resources representing the least-cost plan for providing reliable service to ratepayers, consistent with North Dakota energy policy. Additional rules regarding resource plan filings are found at 69-09-12 of the North Dakota Administrative Code, which requires that:

- The resource plan must provide a North Dakota preferred plan,
- Except as otherwise required by law or by order of the commission, the North Dakota preferred plan may not select resources based on a carbon cost, greenhouse gas reduction goals, renewable energy standards, emissions goal, or other externalities,
- The resource plan must include reliability and resource adequacy assessments using quantitative metrics, and
- The resource plan must include information on how the electric public utility intends to reconcile potential jurisdictional differences in resource selection.

As noted in our comments in Case No. PU-22-163 via a June 16, 2022 letter to the North Dakota Commission, the new planning process should be beneficial for all parties:

> Xcel Energy plans and operates an integrated Upper Midwest system that serves customers in five states. While we believe the integrated system provides benefits to our customers across the states we serve, in some instances we have procured resources that have not been accepted in all jurisdictions. We are hopeful that a North Dakota resource planning process will not only provide the Commission with information about our future plans, but also provide a forum to better identify and address Commission concerns in advance of resource acquisition decisions. Our resource plans provide a critical guide to achieving Company goals, procuring resources, and meeting our customers' needs safely and reliably.

We plan on filing our North Dakota Resource Plan with the Minnesota Commission and providing updates on how that proceeding progresses. The resource planning process in North Dakota may identify jurisdictional differences that could pose a challenge to the implementation of our Preferred Plan. We will engage with both the North Dakota and Minnesota Commissions to address these differences.

IV. FEDERAL INCENTIVES AND ENVIRONMENTAL REGULATIONS

In addition to state policy, federal incentives, such as the Inflation Reduction Act (IRA), and environmental regulations, such as the EPA's New Source Performance Standards 111(b) and (d) and Good Neighbor Plan, are impacting utility resource planning by incentivizing clean energy and increasing the cost of emitting resources. As described below, the IRA, with its substantial funding for clean energy, is accelerating the transition towards renewable power generation and advancing policy goals such as decreasing energy burdens for low-income consumers. EPA 111(b) and (d), and the Good Neighbor Plan, on the other hand will potentially increase the cost of operating emitting resources, thereby incentivizing the shift towards cleaner energy sources.

A. Inflation Reduction Act

The IRA was signed into law on August 16, 2022, and includes an estimated $369 billion in energy and climate spending. The IRA puts the United States on track to reduce emissions 32-42 percent below 2005 levels by 2030 through grant and loan programs, tax credits and emissions fees that touch nearly every corner of the economy. Of particular interest for this 2024 Plan, the IRA contains roughly $161 billion in clean electricity tax credits, $37 billion in clean fuel and vehicle tax credits, and $27 billion in building efficiency, electrification, transmission, and Department of Energy (DOE) grants and loans.

The IRA provides the opportunity to transfer production tax credits (PTCs) and investment tax credits (ITCs) to unrelated taxpayers for cash. Eligible credits include clean energy PTCs and ITCs earned after 2022, including PTCs from projects placed in service before 2022. However, tax credits carrying forward from years prior to 2022 are not eligible for transferability. Consideration paid in exchange for transferred tax credits cannot be included in gross income and is not deductible by the transferee. In addition to transferability, the IRA expands the availability of tax incentives across a wider variety of technologies.

The IRA presents significant opportunity to accelerate the growth of renewable and carbon-free power generation and the reduction of greenhouse-gas emissions while mitigating rate impacts. For example, for this 2024 Plan, we project anticipated benefits totaling over $5.7 billion stemming from the IRA tax credits for new renewable additions in the Preferred Plan over the course of the planning period. We will also recognize additional savings from our existing renewable and nuclear

generation. In addition to these incentives, the IRA provides significant opportunities to advance policy goals such as decreasing energy burdens for low-income consumers; supporting communities affected by the energy transition; promoting environmental justice; increasing diversity, equity, and inclusion in the energy sector; and fostering workforce development.

More detail concerning the IRA can be found in Appendix U: Inflation Reduction Act, including a discussion of how our 2024 Plan leverages the IRA's significant incentives and resulted in significant estimated savings for our customers in our 2024 Plan.

B. EPA New Source Performance Standards (NSPS) 111(b) and (d)

On May 11, 2023 the EPA released a four-part proposal under their Clean Air Act authorities to regulate CO2 emissions from the power sector. The proposal included:

1) Repeal of the Affordable Clean Energy rule;
2) Regulations for new natural gas generating units pursuant to Clean Air Act section 111(b), hereafter referred to as 111(b);
3) Regulations for existing natural gas generation pursuant to Clean Air Act section 111(d), hereafter referred to as 111(d); and
4) Regulations for existing coal generation pursuant to section 111(d).

Since the rule is in a proposed state and has not yet been finalized, it is uncertain how the rule will ultimately impact operation of our facilities. We have taken into consideration the potential impacts of this rule for our 2024 Plan through a sensitivity analysis, recognizing potential impacts on existing gas Combined Cycle units and PPAs, as detailed in Appendix K.

C. Good Neighbor Plan

The "Good Neighbor" provision of the Clean Air Act for the 2015 Ozone National Ambient Air Quality Standards (NAAQS) addresses the interstate transport of air pollution, ensuring that one state's pollution does not interfere with the air quality in other, downwind states.

On February 13, 2023, the EPA finalized a rule that partially approved and partially disapproved the State Implementation (SIP) submissions from Minnesota and Wisconsin. This led to the creation of a Federal Implementation Plan (FIP), which included Minnesota and Wisconsin in the Group 3 ozone nitrogen oxides (NOx) allowance trading program, starting with the 2023 Ozone NOx season (May-September 2023). On April 14, 2023, an industry coalition, including Northern States Power-MN, filed

a petition for review of the partial disapproval of Minnesota's SIP. On July 5, 2023, the 8th Circuit granted a Stay of the SIP Disapproval for Minnesota, which effectively stayed the Good Neighbor Plan requirements. This means that the Good Neighbor Plan is not in effect for Minnesota during the litigation and its future depends on the outcome.

In Wisconsin, the Good Neighbor Plan applied to sources from August 4 – September 30, 2023, and will apply in future ozone seasons. NSPW will comply through operational changes and the potential purchase of allowances.

How these regulations have been incorporated into our 2024 Plan modeling based upon estimated allowance allocations through 2029, and how market dynamics could impact costs are further discussed in Appendix F and Appendix K.

V. COMMUNITY & EMPLOYEE CONSIDERATIONS

We know that our planning and decarbonization goals impact the communities we work in and serve. The Company has made significant efforts to engage and elicit community and stakeholder feedback and incorporate that feedback into how we do business. We are also committed to transitioning our system while proactively working with the communities where plants are located and the employees who work in those plants.

A. Equity Considerations

The Company has taken a number of interrelated actions to enhance equitable outcomes and broaden participation in energy decision-making by the communities we serve. We recognize voices of minority, low-income, and protected populations are often not present in conversations regarding grid planning and resource allocation and that marginalized groups need to access, participate in, and benefit from energy markets regardless of ability, race, or socioeconomic status. To that end, we have established an Equity Stakeholder Advisory Group (ESAG), engaged in community outreach, and plan to form an Environmental Justice Advisory Board (EJAB) to advise the Company on incorporating equity into our core business efforts. Although our equity work does not directly impact the size, timing, and type of generation resources that are the focus of our 2024 Plan, our community engagement more broadly impacts and informs how we provide service to our customers. This community engagement has included, for example, outreach to ESAG; interested stakeholders including state and local governmental representatives, the Clean Energy Organizations, developers, and business representatives, among others, the Prairie

Island Indian Community; and communities regarding remediation efforts at the Allen S. King and Sherburne County Generating Plants. More information on this outreach can be found in Appendix P and P1: 2023 Sherco Remediation Report, Appendix Q and Q1: 2023 King Remediation Report, Appendix R: Equity, and Appendix S: Stakeholder Engagement Summary.

Ultimately, we remain committed to considering environmental justice (EJ) in our energy, climate, and environmental initiatives, and to providing meaningful opportunities for impacted communities to participate in the process. As further detailed in Appendix R, we have incorporated EJ into our work through: our efforts with ESAG and the future formation of EJAB, the development of a Workforce Diversification Plan, our Request for Proposals process, the development of supplier diversity goals, our corporate giving and community involvement efforts, Electric Vehicle programs, our Energy Conservation and Optimization plans, our Natural Gas Innovation Act programs, federal initiatives such as the IRA and Investment and Infrastructure Jobs Act, our Resilient Minneapolis Project, and Tribal outreach efforts. We continue to evaluate and look for other ways we can incorporate equity into our efforts.

B. Employee Considerations

As we move forward with our carbon reduction goals, we are cognizant that phasing out our legacy generation assets has a significant impact not only on our energy mix, but on the economies of communities where those plants are located and the employees who work in those plants. For our coal facilities, the plants are prominent places of employment and contributors to the property tax base in the community. This is why we have and continue to make efforts to spur economic development in locations where our current units will eventually be phased out.

For example, since we proposed to retire the Sherco coal units in Becker, Minnesota, we have worked extensively with local units of government, community stakeholders, and the State to draw new development to the site to support the local economy. This includes working with the City of Becker and Sherburne County to attract new economic development to the Becker area that meets the needs of both the community and the Company. This effort led to the approval of the sale of 348 acres of land at Sherco to Elk River Technologies for the development of a data center, on April 6, 2023. The Company expects that similar outcomes in 2024, will bring more economic opportunities and tax revenues to the community.

Relatedly, we participated in a study overseen by Center for Energy and Environment (CEE) that examined the impacts of the large baseload generation plants in Minnesota on host communities. The other participants in the study included the Coalition of Utility Cities, Minnesota Power, and the Prairie Island Indian Community. The study resulted in four main findings:

1) Power plant closures will undoubtedly have a strong economic and financial impact on the communities that host them, and potentially, other Minnesota communities as well.
2) Host communities are currently pursuing a variety of strategies to plan and prepare for power plant closures and the economic transition that they will require. None of those preparation strategies are expected to fully offset the economic impact of a plant closure, but they may help mitigate the negative effects.
3) Workers, labor unions, and host communities may benefit from close coordination and communication in plant closure transition planning and preparation efforts.
4) Not all of Minnesota's host communities receive benefits from the power plant they host.

Overall, the study reinforced that host communities are not a monolith, and that preparing for plant closures and the corresponding economic transition takes significant time, planning, and communication and outreach efforts. The Company is engaged with our host communities and our workers, as detailed in Appendix O and O1: 2023 Workforce Transition Plan, Appendix P and P1, and Appendix Q and Q1.

In addition to community impacts, we are also aware that these plant closures impact our employees and their families. With this in mind, and consistent with our past practices, we are working with these impacted employees to transition them to other Xcel Energy plants or areas of the Company. In the past, when plants have been closed or converted (and impacted headcount) we have provided resume writing services, support for interview practice, job training, and job shadowing opportunities. Through natural attrition and job relocations, we have been able to successfully "re-home" nearly all impacted employees from plant closures and conversions to-date. More details about our efforts to help our workers transition to new positions within the Company can be found in Appendix O1, which was also filed in Docket No. E002/M-22-265.

Going forward, we continue to be dedicated to working with employees, communities, and stakeholders to manage community impacts throughout our clean energy transition.

VI. CUSTOMER PREFERENCES

Our Upper Midwest system continues to serve a diverse mix of customers with varied interests and preferences. While most customers continue to prioritize affordability, we have seen increasing interest in customer choice around how and from where they consume energy, sustainability, carbon reduction, and other clean energy objectives. We have taken these interests into consideration in planning our resource mix for the future. Below, we outline the energy preferences our municipal, commercial and industrial, and residential customers have expressed, as well as overall interest in DER, and what the Company is doing to help them achieve their goals through partnerships and programs. Although customer interests and preferences do not ultimately impact the type, timing, or size of resources in our resource plan, they do influence our overall program development so that we can create programs and services that best serve all of our customers' needs.

A. Municipal Customers

Cities and municipalities are increasingly setting and developing strategies around sustainability and climate goals. In fact, there are at least 32 cities in our Upper Midwest jurisdiction that have set carbon reduction or renewable energy goals, according to our Community Energy Goals Survey. We work with many of these communities through our Partners in Energy programs to support achievement of these goals. Minneapolis is the most prominent example, as evidenced by the Clean Energy Partnership that had just started when we filed our 2015 Plan. Since then, the partnership has flourished and advanced, helping to achieve progress toward the city's sustainability goals.

Other municipalities and communities are also developing goals and action plans around renewable energy and climate goals. The Company has a long history of supporting the communities we serve, and we always want to work with our customers and our communities in support of their energy goals. In addition to our Partners in Energy Program, the Company offers the following partnerships and programs:

- Community Relations Managers and Account Managers;
- Community Energy Reports;

- Renewable Energy Programs;
- Electric Vehicle Programs;
- Certified Renewable Percentage; and
- Customized Support for Sustainability Initiatives.

More can be read about these programs and our Community Energy Goals Survey in Appendix V: Community Goals.

B. Commercial and Industrial Customers

Our commercial and industrial customers place a high priority on keeping costs low to remain competitive in their own markets. This is particularly true of large industrial customers, where energy costs can make up a substantial portion of their operating expenses. However, corporate efforts to achieve sustainability goals are also increasing, both in the US broadly and within our system. As the cost of renewable energy declines, affordability and sustainability goals increasingly go hand in hand. Within our system, several of our corporate customers are co-members of the Minnesota Sustainable Growth Coalition, which is a business-led public-private partnership working to advance clean energy and other sustainability and circular economy objectives. We hear from these and other corporate customers across our Upper Midwest system that sustainability and clean energy are important to them, and they want us to offer products that meet these needs. Renewable*Connect is one such product.

In 2015, we worked with customers to develop Renewable*Connect. The program achieved full subscription in its first year. In January 2019, we filed for an expansion of this program, and included an option for high load factor customers (i.e. those that operate continuously during the day) to be served primarily with competitively priced wind and a smaller portion of solar.[9] In 2023, the Commission approved the Company's proposed expansion of this program.[10] The expansion of Renewable*Connect advances the sustainability goals of the participating companies without creating additional costs that must be carried by other, non-participating customers. We are continually evaluating the need for potential expansion of Renewable*Connect. Should there be sufficient customer interest, the Company would look to solicit the necessary resources through an RFP process.

[9] In the Matter of the Petition of Northern States Power Company d/b/a Xcel Energy for the Approval of a Renewable*Connect Program. Docket No. E002/M-19-33.
[10] In the Matter of the Petition of Northern States Power Company d/b/a Xcel Energy for the Approval of a Renewable*Connect Program Modification, Order, May 18, 2023.

In 2019, we also developed a new program called Certified Renewable Percentage (CRP), which is ongoing. The CRP is Renewable Energy Certificate (REC)-based accounting methodology that clarifies the percentage of our system energy delivered to customers that is renewable. The CRP is not a subscription service or program customers need to enroll in. Instead, the Company calculates, certifies, and annually reports a CRP for Minnesota.[11] With the CRP, we retire sufficient RECs on behalf of all our retail customers, such that the total RECs retired annually reflects the portion of delivered energy that is renewable. This allows all retail customers to claim the percentage of renewable energy on the system as the starting point towards their sustainability goals.

C. Residential Customers

Residential customers likewise tell us that they value both opportunities to save energy and to have access to clean, affordable and reliable energy. In response, we have developed programs that offer more convenient payment options, rebates for energy efficiency upgrades, and the chance to reduce the environmental impact of their consumption by choosing renewable energy. Customers are taking advantage of these programs in large numbers—and they have expressed strong satisfaction with their ability to select programs that best meet their individual energy needs. In fact, customers who participate in these programs tend to be more satisfied than customers who are not enrolled in a program.

Programs that we account for in our modeling include EE programs and Beneficial Electrification (BE) of space and water heating. The 2024 Plan marks the first time the Company has included BE assumptions in our electrical sales forecast. More information about how EE and BE impact our modeling can be found in Appendix E: Load and Distributed Energy Resource Forecasting.

VII. SUPPLY & TECHNOLOGY TRENDS

Trends around the supply of equipment for generation and energy storage needed to fulfill our 2024 Plan had a significant impact on the mix and timing of our resource proposals.

Wind, solar, and battery energy storage systems technology costs are expected to continue to improve. While photovoltaic (PV) module costs did increase as a result of

[11] Our most recent report was submitted on June 1, 2023 in Docket No. E999/PR-23-12. The report is filed on June 1 of each year in a reserved docket, which is xx-12, where "xx" is the last two digits of the year.

the AD/CVD and UFLPA policies that were put in place in 2021 and 2022 among other factors, they are trending downward again.[12] Overall, however, commercial solar in particular has experienced significant cost declines, with median installed costs falling over 78 percent since 2010.[13] Consistent with past years, our 2024 Plan assumes that wind and solar capital costs will continue to decline, although at perhaps a slower pace as these technologies advance on their respective maturity curves and as the industry continues to be challenged with supply chain constraints. We also expect technological advancements to continue to improve capacity factors, as tracking and PV module technologies have continued to improve and inverter loading ratios have increased with falling capital costs. These factors continue to improve the cost competitiveness of wind and solar resources in real terms–changes to incentive policies notwithstanding—relative to the other resource options we considered.

We also continue to examine the role energy storage can play in meeting our system needs. Technologically, we expect grid-scale energy storage will support our clean energy goals in the future, by helping us maintain grid stability and supporting peak management while integrating the higher quantities of intermittent renewable generation we envision on our system. From a cost perspective, battery energy storage systems have experienced significant improvements over the last few years, and we expect costs to further decline going forward. We are committed to pursuing this technology, recognizing that challenges remain to our ability to manage seasonal renewable energy variability and longer duration demand-shifting needs. More discussion of our consideration of this technology can be found in Appendix I: Minnesota Energy Storage Systems Assessment

Finally, as we have noted, achieving our corporate decarbonization goals will require further development of technologies that have not yet been identified and commercialized, as discussed in Appendix X: Advanced Technologies. We continue to monitor industry activity around other emerging technologies that may contribute to achievement of our goals. In addition to potential new battery chemistries, potential emerging clean energy technologies include advanced nuclear reactors, hydrogen, types of energy storage technologies beyond batteries, and others. We will continue to evaluate new technologies and take advantage of advancements that will meet our goal and benefit our customers.

---

[12] Domestic PV supply is constrained into 2027, but many suppliers have indicated plans to pursue US based production. The AD/CVD and UFLPA policies have resulted in greater risk of modules not being admitted into the US, resulting in the need to take great care in completing detailed due diligence of module suppliers supply chain to understand risk profiles.

VIII. CONCLUSION

As we continue to chart the path toward achieving some of the most ambitious carbon reduction goals of any utility in the United States, we will continue to take into account key internal and external market conditions. This 2024 Plan focuses on reliable, responsible, and cost-effective decarbonization of our system, while accounting for state and federal legislation, equity for our communities and our employees, the wants and needs of our customers, and trends in the industry.

CHAPTER 3 – MINIMUM SYSTEM NEEDS

I. INTRODUCTION

Our resource planning process focuses on deep carbon reductions while serving our Upper Midwest customers reliably and affordably. In this chapter, we describe in more detail how we arrived at the minimum number of resources our system will need through the planning period. The system needs and existing resources evaluated here formulate the baseline upon which we have developed the Reference Case, our modeling scenarios, and ultimately our Preferred Plan.

We have made the following changes to aspects of our Minimum System Needs approach with this Resource Plan:

- *MISO Seasonal Resource Adequacy Requirements.* In the 2024 Plan, we are incorporating a seasonal Planning Reserve Margin to align with the approach recently adopted by MISO. Further, we are applying seasonal accredited capacity (SAC) values for each resource option. These adjustments align with MISO's ongoing effort to address the increasing variability in reliability needs and resource availability across all four seasons.
- *Market Reliance Risk.* We have optimized resource additions in the EnCompass model to ensure that the portfolio of resources developed can serve customer load across all hours by limiting access to the MISO market. The limited access is only applied to the resource optimization to avoid over reliance on MISO market purchases for reliability. We allow the model to access the MISO market to dispatch resource and take advantage of the access to economic resource in the larger MISO market.

II. MEETING CUSTOMER NEEDS

Forecasting customers' needs for electricity is a key component of any resource plan and provides the foundation for determining the type and amount of resources that will be needed over the 15 year planning period. The first step is forecasting the amount of electricity our customers will need over the planning period. To do this, we add a reserve margin that is prescribed by MISO for each season. We then subtract the resources we already have or expect to have (with some adjustments), to determine our net surplus or need.

We illustrate this concept in Figure 3-1 and discuss each of the components below.

Figure 3-1: Seasonal Net Resource Need/Surplus Calculation

Customer Needs Forecast
Plus MISO Reserve Margin
Equals **Total Capacity Obligation**
Minus Demand Response Capability
Minus Generation Capacity (measured by seasonal accredited capacity)
Minus Generation Adjustments
Equals **Net Resource Need/Surplus**

A. Customer Needs Forecast

Forecasting our customers' energy needs starts with a capacity, or peak demand, assessment, which informs the total amount of generating capacity (in megawatts, or MW) needed to meet our customers' needs in the highest demand hour (i.e. peak-hour) in each year of the planning period. In previous resource plans, planning centered on meeting the highest demand hour of a given year, which for NSP occurs in the summer. The introduction of MISO's seasonal construct shifts the focus to planning for the highest demand hour in each season.

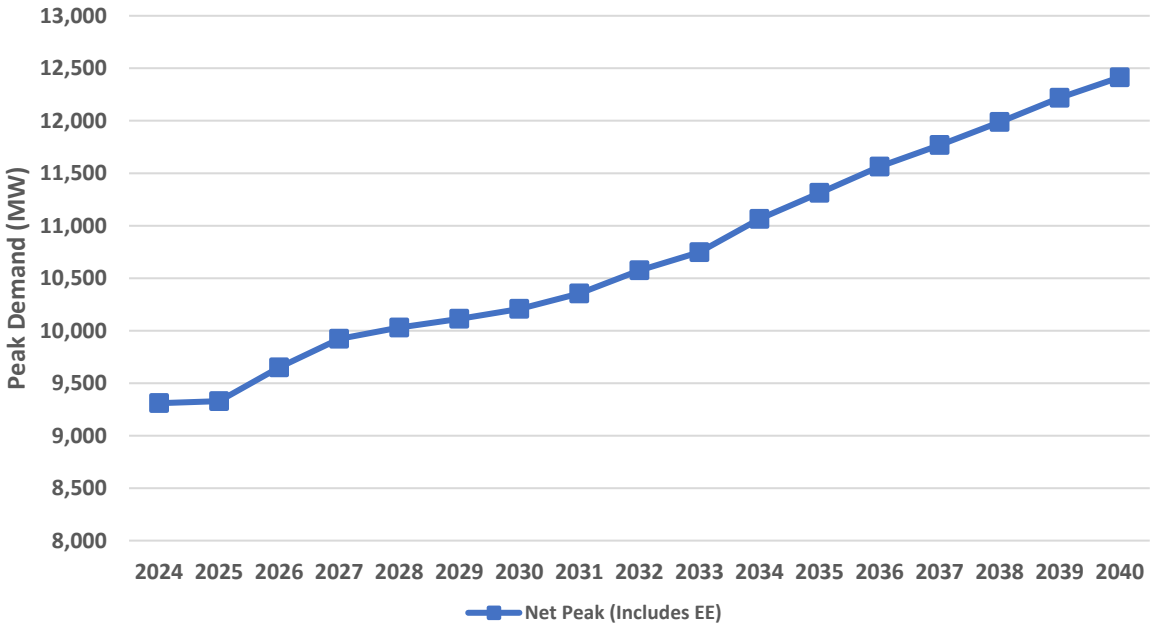
We also assess the amount of total energy (measured in megawatt hours or MWh) we expect customers to consume in each year of the planning period. Together, the peak demand and total energy needs inform the type of generating resources that will best meet customer needs.

1. Peak Demand Requirements

We use econometric analysis and historical actual coincident net peak demand data to determine system capacity requirements for each year. We provide a detailed discussion about our peak demand forecasting methodology in Appendix E: Load and Distributed Energy Resource Forecasting.

During the 2024 – 2040 planning period, the base case peak forecast increases at an average annual growth rate of 1.8 percent. As demonstrated in Figure 3-2 below, annual peak demand increases at an average of 194 MW each year, starting with 9,309 MWs in 2024 to 12,414 MWs in 2040.

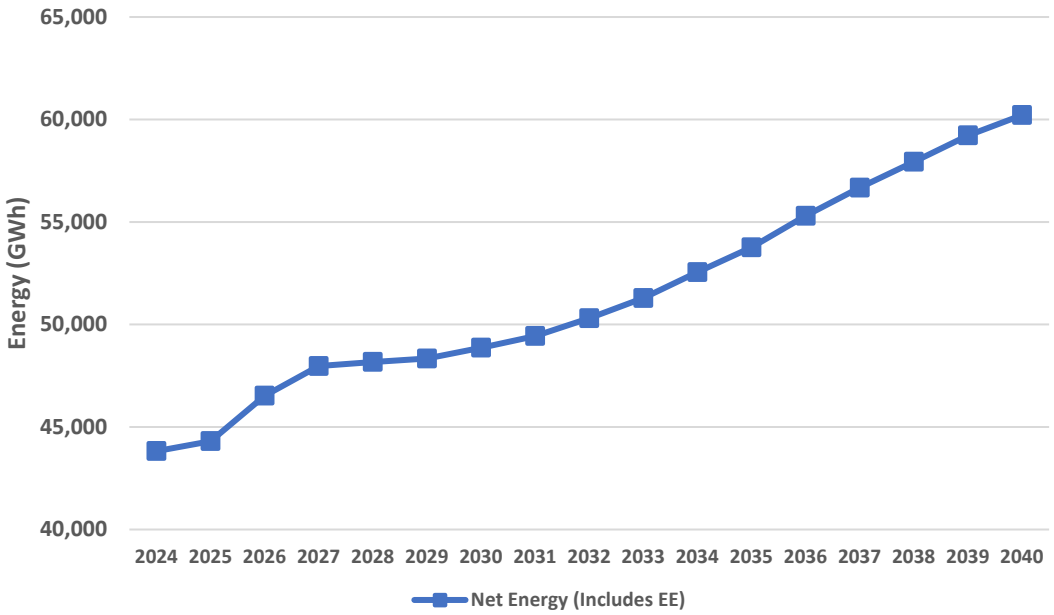
Figure 3-2: NSP System Median Base Summer Peak Demand (MW)
(Includes modeled EE Adjustment)



Additionally, the base energy forecast increases at an average annual growth rate of two percent over the 2024 – 2040 planning period, net of modeled energy savings, forecasted distributed solar, and electric vehicle charging projections. Electric energy requirements[1] are expected to increase at an annual average of 1,025 gigawatt-hours (GWh), starting with 43,823 GWhs in 2024 to 60,215 GWhs in 2040. See Figure 3-3 below.

[1] Gross of rooftop solar generation. Solar generation was modeled as a resource instead of netting against energy requirements.

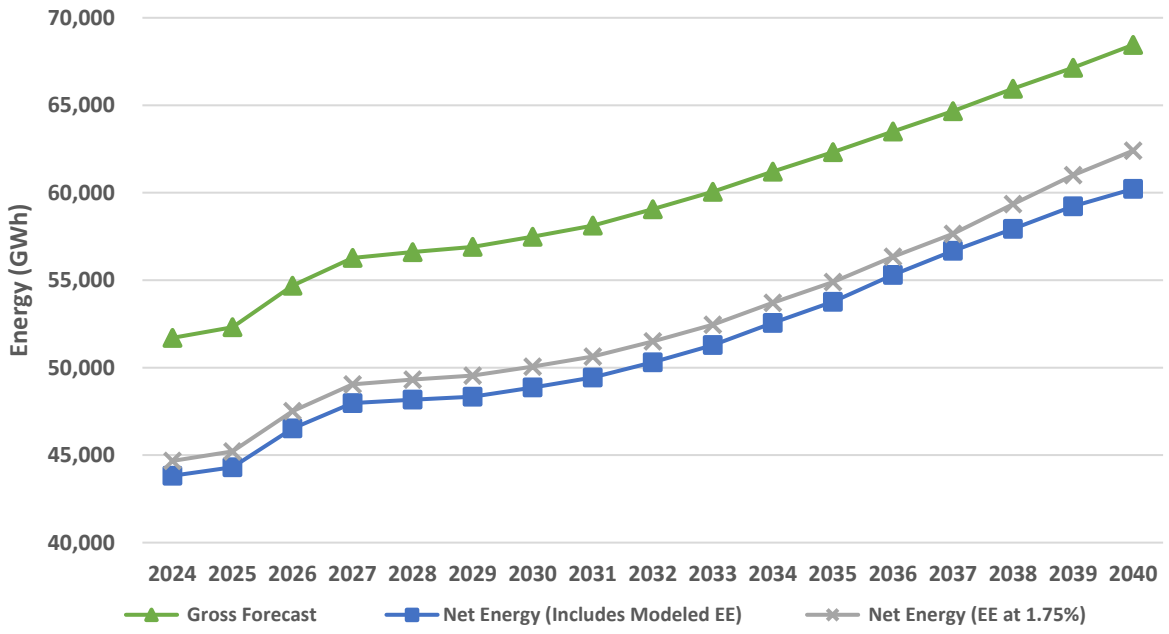
Figure 3-3: NSP System Total Median Net Energy (GWh)
(Includes modeled EE Adjustment)



The projected two percent average annual growth in electric energy requirements is stronger than the actual growth seen over the past few years due, primarily, to forecasted large new data center loads and acceleration in adoption of Electric Vehicles. After adjusting for unusual weather, electric energy requirements increased at an average annual rate of 0.2 percent from 2019 to 2022.

To be consistent with the modeling approach for Energy Efficiency (EE) in our approved 2019 Plan, we continue to model EE as a supply-side resource. In a separate process, we formulated annual EE savings amounts into "Bundles" that we made available in the EnCompass model along with other supply-side resources. This required that we adjust the base energy forecast to remove the embedded EE adjustment that projects the effects of energy savings to the end of the planning period. This resulted in an NSP System Gross Energy Requirements forecast. These adjustments are shown in Figure 3-4 below.

Figure 3-4: Gross Energy Requirements Forecast Compared to Net Energy Requirements Forecast

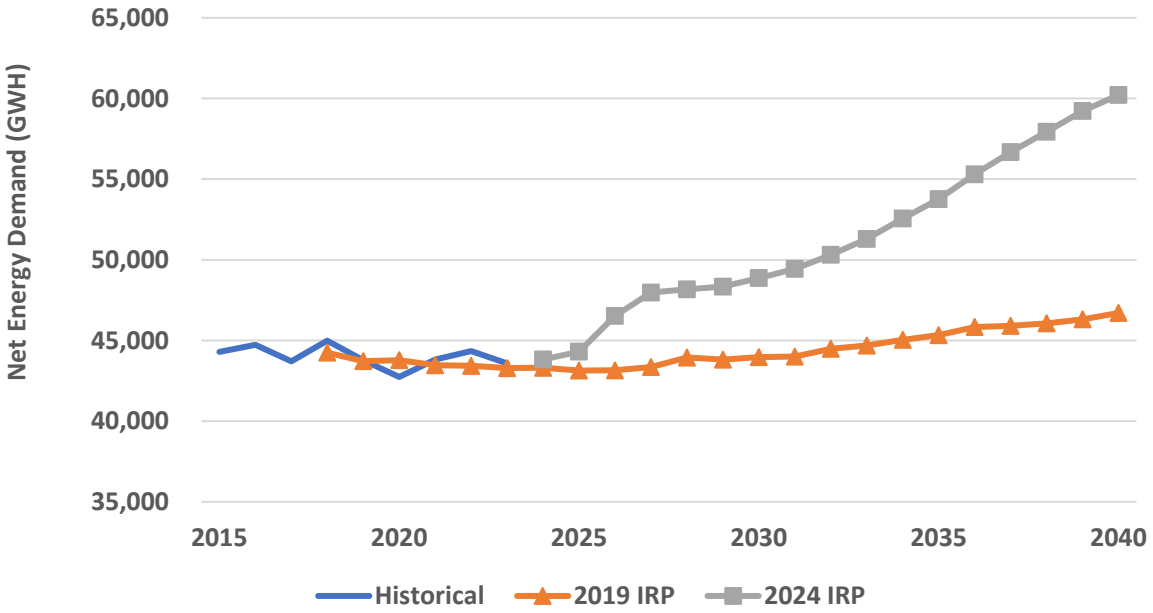


We discuss the EE Bundle modeling further in Appendix E:, Appendix F: EnCompass Modeling Assumptions and Inputs, Appendix H: Resource Options. Appendix J: Distributed Energy Resources contains detail on how the EE bundles were developed.

2. Energy Requirements

We forecast an approximate 35 percent increase in energy requirements over the 2024-2040 planning period, after accounting for EE included in the Base Case. As discussed above, the inclusion of two incremental EE Bundles reflects achievement of approximately 2.2 percent EE, which leaves our Net Demand substantially higher than forecast in our last Resource Plan. Figure 3-5 below compares our estimated net energy demand adjusted by the two EE Bundles, to the energy forecast in our approved 2019 Plan.

Figure 3-5: Forecasted Net Energy Requirements, After Energy Efficiency Adjustments[2] (GWh)



3. Forecast Adjustments

After determining the base peak capacity and energy demand forecasts, we make certain forecast adjustments to account for the impact of events or trends we reasonably expect to occur in the planning period. We summarize our key adjustments below:

DSM. Prior to our 2019 Plan, the load forecasts used in our modeling were adjusted for the expected effects of existing DSM programs. As with our 2019 Plan, in this 2024 Plan, incremental EE beyond that classified as naturally-occurring is no longer embedded in the load forecast; rather, EE is treated as a potential supply-side resource in our modeling, like Demand Response (DR). We further discuss the EE and DR (collectively, DSM) in the context of our resource planning process in Appendix J.

Rooftop solar. Projected rooftop solar is handled similarly to Energy Efficiency and is modeled as a supply-side resource in EnCompass, and is not netted from energy and peak forecasts.

[2] Although we modeled EE bundles as supply-side resources in this Resource Plan, we show the estimated resulting EE as a demand reduction from gross demand for purposes of the chart above.

Expected Customer Changes. We make adjustments to account for known and expected changes in load on our system. These typically reflect expected changes in specific large customers' electricity usage, either because of increased behind the meter energy generation, increased production activities by existing customers, or additional demand from new customers. This adjustment only applies to the Large Commercial/Industrial (CI) class.

Electric Vehicle Adoption. We adjust our energy and peak demand forecasts to account for increasing use of plug-in electric vehicle charging. These forecasts are based on estimates of current EV usage and future adoption (including the effect of financial incentives to facilitate adoption), and the expected electricity consumption per vehicle.

Beneficial Electrification. Residential and Commercial/Industrial energy as well as our peak demand outlooks are adjusted to account for growth in beneficial electrification from converted space and water heating.

We discuss our forecasting process, inputs, assumptions, adjustments, and results in more detail in Appendix E.

III. MISO RESOURCE ADEQUACY REQUIREMENTS

MISO prescribes Resource Adequacy (RA) requirements that are intended to help ensure adequate reliability of the bulk electric supply system. MISO's RA process requires load serving entities (LSE) like the Company to maintain resources or secure capacity to cover their level of demand by a specific margin (planning reserve margin or PRM) to cover potential uncertainty in the availability of resources or level of demand.[3] The RA requirements are fundamental to the resource planning process and inform the level of capacity we need in our portfolio to adequately serve customers.

MISO's resource adequacy construct has historically been centered on an annual PRM. However, recognizing the increasing variability in reliability needs and resource availability throughout the year, MISO has implemented a seasonal RA construct beginning with the 2023 – 2024 planning year (PY), which spans June 1, 2023 through May 31, 2024 (and will be in place for subsequent PYs). The planning seasons are delineated as follows:

Summer: June through August
Fall: September through November
Winter: December through February
Spring: March through May

[3] The factors affecting availability and demand include: planned maintenance, unplanned or forced outages of generating facilities, deratings in resource capabilities, variations in weather, and load forecasting uncertainty.

We describe the various aspects of the seasonal PRM calculation and note that the seasonal MISO PRM and average NSP Coincidence Factor[4] in Table 3-1 below.

Table 3-1: MISO Seasonal Planning Reserve Margin and Average NSP Coincidence Factor[5]

	Summer	Fall	Winter	Spring
MISO Planning Reserve Margin (PRM) PY 2024/2025	9.00%	14.20%	27.40%	26.70%
Average NSP Coincidence Factor	92.24%	92.67%	97.09%	95.61%

Prior to each planning year, MISO determines two different sets of capacity obligations for each LSE; one for the entire MISO footprint as a whole, and one for the Local Resource Zone (LRZ or Zone) where the LSE has load.[6]

A. MISO Footprint Capacity Obligation

By November 1 prior to a planning period, MISO issues the finalized seasonal PRM applicable to all LSEs within its footprint. MISO determines the PRM by performing a technical probabilistic analysis to determine the minimum PRM for each season needed to achieve a Loss of Load Expectation (LOLE) of 0.1 day per year, expressed as a percentage. For example, for the planning year covering June 1, 2024 through May 31, 2025 the overall MISO seasonal PRM on an installed capacity (ICAP)[7] basis and on an unforced capacity rating (UCAP) basis[8] are shown in Table 3-2.

[4] NSP Coincidence Factor refers to the NSP demand at the time of the MISO footprint peak demand.
[5] The values in Table 4-1 are not static and represent a snapshot in time.
[6] Almost all of the NSP system load is located within LRZ 1, which includes almost all of Minnesota, western Wisconsin, and the Dakotas. Approximately 7 MW of load along the Minnesota-Iowa border is located in LRZ 3.
[7] ICAP refers to units' Installed Capacity Rating, which is a capacity accreditation measure based on annual or historical tested generating. The ICAP is the lesser of the generator verification testing capacity or the interconnection service capacity.
[8] UCAP refers to units' Unforced Capacity Rating, which is a function of the unit's installed capacity and its anticipated forced outage rate. A generator's anticipated forced outage rate is typically based on the individual unit's historical performance. UCAP = ICAP x (1 – Forced Outage Rate). *See* "MISO Planning Year 2024-2025 Loss of Load Expectation Study Report". Available at: https://cdn.misoenergy.org/LOLE%20Study%20Report%20PY%202024-2025631112.pdf.

Table 3-2: MISO Footprint PY 2024-2025 Seasonal Planning Reserve Margin

	Summer	Fall	Winter	Spring
MISO PRM ICAP	17.7%	25.2%	49.4%	40.8%
MISO PRM UCAP	9.0%	14.2%	27.4%	26.7%

Over the planning period MISO examined in the 2023-2024 LOLE study,[9] the summer UCAP PRM increased from 7.4 percent in 2023 to 11.2 percent in 2032. The fall UCAP PRM remained relatively constant between 14.9-16.3 percent. The winter and spring UCAP PRMs also remained relatively constant between 23.7 and 25.5 percent between 2024-2033.[10,11]

Each LSE is required to have resources sufficient to meet the forecasted demand at the time of MISO's peak demand, plus its PRM. MISO's tariff acknowledges a state regulatory body's authority to establish a PRM for LSEs within its jurisdiction, which would override the PRM otherwise determined by MISO. None of the NSP System states have established a PRM that would override the MISO PRM.

B. Zonal Capacity Obligation

Additionally, MISO makes an annual determination regarding the amount of capacity required within each of MISO's Zones, called the Local Clearing Requirement (LCR) for each season. The LCR is determined as a function of each Zone's Local Reliability Requirement (LRR) and its Capacity Import Limit (CIL) for each season. The LRR represents the necessary resource requirement in order for a Zone to achieve a LOLE of 0.1 day per year, without relying on resources outside of the Zone. Each Zone, having a smaller footprint than the overall MISO footprint does not benefit from the same level of peak load diversity as does the larger, more diverse MISO footprint. If a Zone within which the Company operates has import capacity, however, the resulting LCR is reduced from the LRR to recognize the transmission system's ability to deliver outside resources into that Zone. Accordingly, the Company plans its minimum system needs based on the MISO-wide PRM while also ensuring zonal requirement are satisfied.

---

[9] *See* "MISO Planning Year 2023-2024 Loss of Load Expectation Study Report." Available at: https://cdn.misoenergy.org/PY%202023-2024%20LOLE%20Study%20Report626798.pdf.

[10] We note these values vary slightly from the those presented in Table 4-2, which originate from the MISO PY 2024-2025 LOLE Study. This study has not yet been updated to incorporate the analyses of outyear PRMs.

[11] These PRMs were formulated without the assumption of a Direct Loss of Load methodology, which MISO intends to file in 2024. This change will impact the PRM.

For the 2024-2025 planning year, Zone 1 was determined to require an LRR of 18.9 GW to achieve the LOLE reliability requirement of 0.1 days per year. After accounting for Zone 1's summer CIL of 5.3 GW, Zone 1's summer LCR is reduced to 13.6 GW. Among the several LSEs in LRZ 1, the Company must meet its load share of LRZ 1's LCR as identified in Table 3-3 below.

Table 3-3: MISO PY 2024-2025 Seasonal Local Reliability Requirement

Local Resource Zone 1	Summer	Fall	Winter	Spring	Formula Key
LRZ 1 LRR (GW)	18.9	15.6	22.1	19.1	[A]
LRZ 1 Capacity Import Limit (CIL) (GW)	5.3	6.5	4.9	6.2	[B]
LRZ 1 LCR (GW)	13.6	9.1	17.2	12.9	[A] - [B]
NSP's Share of LRZ 1 LCR (GW)	6.7325	5.8556	7.1288	6.3785	

C. Capacity Obligations Derived from Forecasted Demands

After MISO determines seasonal PRM and zonal LRRs, each LSE's MISO-wide and zonal capacity obligation are derived for each season from its forecast of peak demand (peak load). While LSEs typically forecast the peak demand for their individual system, the resource adequacy process requires the LSE to also forecast:

- The LSE's demand at the time of the MISO footprint's peak demand (MISO Coincident Peak Demand, or MISO CPD); and
- The LSE's demand at the time of the LRZ's peak demand (Zonal Coincident Peak Demand, or Zonal CPD).

Because each LRZ footprint is smaller than the MISO footprint, the LRZ's load diversity is lower than the load diversity of the MISO system, and an LSE's Zonal CPD is typically greater than its MISO CPD.

The NSP System CPD factor measures how closely our system peak matches the MISO system peak. A coincidence factor of 95 percent indicates that we expect to experience load levels that are approximately 95 percent of our peak load during times when the total MISO system load is peaking. In other words, the timing of our peak and the MISO peak does not match exactly, so we are able to reduce the amount of reserves we are required to carry.

Our estimated obligation for all planning period years can be found in the Load and Resources table in Section VI below.

D. Capacity Accreditation of Resources

After these obligation levels have been determined, we consider the type of resources suitable to meet that requirement. MISO's tariff and business practices set forth procedures to enable various types of resources to be used to achieve our RA requirements. MISO has recently made changes to its resource accreditation process, moving from an annual accreditation to a seasonal accreditation capacity (SAC). This change is intended to align resource accreditation with availability in the highest risk periods. Under the new system, MISO accredits resources on their SAC, which is determined by the resource's availability during seasonal RA hours and non-RA hours. MISO conducts independent auctions for all seasons in the spring to clear capacity for LSEs that are short of meeting their seasonal resource adequacy requirements.

Resources used to achieve MISO's RA requirements are referred to as "Planning Resources." Planning Resources include the following sub-types:

- *Capacity Resources*: Physical Generation Resources (i.e., physical assets and purchase agreements), External Resources if located outside of MISO's footprint, and DR Resources participating in MISO's energy and operating reserves market, available during emergencies.
- *Load Modifying Resources*: Behind-the-Meter Generation and DR available during emergencies, which reduces the demand for energy supplies coming from the LSE.
- *Energy Efficiency Resources*: Installed measures on retail customer facilities designed and tested to achieve a permanent reduction in electric energy usage while maintaining a comparable quality of service.

MISO's resource accreditation represents a measure of a resource's reliable contribution to the system's resource adequacy needs. MISO's SAC value for each resource, in megawatts, accounts for various factors such as plant availability and outages during tight system margins and performance during peak hours. Therefore, instead of using installed or nameplate capacity (i.e. ICAP), MISO calculates the SAC value for each resource to determine its expected contribution to RA. These are calculated differently depending on the resource's dispatchability or variability:

- *Dispatchable thermal resources* – MISO determines the SAC value for dispatchable thermal resources pursuant to Schedule 53. The SAC calculation for these

resources is primarily based on the availability of offered resources, mostly during RA hours.

- *DR and EE resources* – MISO assigns capacity accreditation for DR and EE resources based on modeled forecasts.
- *Intermittent Generation and Dispatchable Intermittent resources* – The SAC value for intermittent generation resources or dispatchable intermittent resources is determined by MISO based on historical performance, availability, and type and volume of interconnection service. For wind resources, MISO determines SAC values based on interconnection service volumes and their respective wind capacity credit established through a seasonal Effective Load Carrying Capacity (ELCC) study. Wind capacity credits are determined for individual wind resources based on their average capacity factor during MISO's top eight coincident peaks that occurred during the season for the previous three years.

  The SAC value for non-wind intermittent generation and dispatchable intermittent resources (e.g., run-of-river hydro, solar) is a function of the individual unit's historical performance during the peak hours for each season of the planning period. Specifically, these units are measured on historical performance during the operating hours of 1500 to 1700 during the Summer, Fall and Springs seasons; and the hours of 0800, 0900, 1900 and 2000 in the Winter season over the three-year most recent period.
- *Energy storage resources* – The SAC value for energy storage resources is determined by MISO based on the total net energy during a test of at least one hour, deliverability, and the historical forced outage rate of the resource.

Our modeling selects resources based on their SAC values from MISO PY 2023/2024 with a long-term trend to ELCC values for wind and solar resources, to ensure we maintain adequate capacity on our system over the planning period.

IV. DEMAND SIDE MANAGEMENT

DSM programs offer our customers opportunities to lower their energy use and manage their peak demand, in particular through EE and DR programs included in our Energy Conservation and Optimization (ECO) Triennial Plan. We base our forecasts and potential incremental additions on historic achievements through our programs, as well as external studies about expected and potentially achievable adoption rates.

As previously discussed, we adjusted the customer capacity and energy forecasts in the 2024 Plan to distinguish incremental EE from the load forecast. We modeled incremental DR and EE achievements as "Bundles" to be evaluated alongside other resource options. Each Bundle represents a combination of program achievements expected to lead to a certain amount of avoided load or energy per year, at an estimated blended cost.

For EE, these Bundles include measures that work to reduce a customer's overall energy usage throughout the year. The Commission's Order in Docket No. 19-368, on June 14, 2022, requires the Company to save, on average, at least 780 gigawatt-hours via energy efficiency each year through 2034. To demonstrate compliance with that target in this Resource Plan, the Company has bifurcated naturally occurring EE[12] from energy savings claimed through our ECO programs. We included three EE Bundles in our modeling for both the Reference Case and Preferred Plan. The Company developed the EE bundles based on the filed 2024-2026 ECO Triennial.[13]

The DR Bundles, on the other hand, reflect a customer's commitment to discrete reductions in demand (e.g., on a day when peak load is expected to be high otherwise). These actions are expected to reduce the anticipated annual system peak demand, as well as smooth demand on specific days when weather or other conditions lead to high demand at a certain point in time. In the Order approving our 2019 Plan,[14] the Commission directed that the Company "shall continue to acquire no less than 400 MWs of incremental demand response by 2023 as ordered in the Company's last Resource Plan." In this 2024 Plan, we included six DR Bundles in our modeling for both the Reference Case and Preferred Plan.

---

[12] Naturally Occurring energy efficiency includes customers who take action without participating in energy efficiency programs and instances of equipment that currently may be influenced by energy efficiency programs, but in the future world would not be part of an energy efficiency program because an efficient technology is required to meet code or has become common practice.
[13] 2024-2026 ECO Triennial Plan, as filed, Docket No. G,E002/CIP-23-92, June 29, 2023.
[14] *See* E002/RP-19-368 Order Approving Plan with Modifications and Establishing Requirements for Future Filings (April 15, 2022), Order Point 2.A.2.

We discuss the development of the bundles, our expected EE and DR levels, our analysis, and the changing DSM landscape in more detail in Appendix J.

V. EXISTING AND APPROVED RESOURCES

Our current generating resources[15] comprise a diverse portfolio including nuclear, coal, wind, biomass, solar, hydro, natural gas, and oil-fueled facilities. Physical generating assets owned by the Company have a net capacity of approximately 9,500 MWs, including about 2,300 MWs of wind. In addition to these assets, we purchase power from additional physical generating assets representing a capacity of approximately 5,600 MWs.[16] Together, these provide approximately 15,000 MWs of generation resources, of which approximately 7,700 MWs[17] is supplied by renewables. In addition to the physical assets above, customer-owned distributed solar, demand response, and energy efficiency provide additional portfolio diversity. Counting these additional customer-facing resource types, as well as the Company's nuclear units, more than 11,400 MWs of resources[18] supply carbon-free energy for our system.

A. Renewable Resources

In total, we currently have approximately 7,700 MWs of renewable capacity serving the NSP System, including:[19]

- 4,500 MWs of wind resources;
- 2,300 MWs of solar, including community solar programs and grid-scale solar;[20]
- 800 MWs of hydroelectric power;[21] and
- 130 MWs of biomass and landfill gas.

B. Nuclear

Our Monticello and Prairie Island nuclear plants provide a total net capacity of approximately 1,650 MWs of clean energy. These units operate at high-capacity factors and provide nearly 30 percent of the total electric energy and approximately 40 percent of the carbon-free energy our customers consume. Between 2019 and 2023, we have consistently maintained production costs at approximately $31.25 per

[15] Includes approved resources: Sherco Solar 1, 2, and 3; Louise, Fillmore and Apple River solar.
[16] This total excludes the Company's current diversity exchange contract with Manitoba Hydro.
[17] *Id.*
[18] *Id.*
[19] Note: these values are approximate.
[20] Includes solar projects anticipated to be operational in 2024.
[21] Excluding capacity associated with diversity agreement contracts with Manitoba Hydro.

megawatt-hour (MWh) or less, which is a decrease of more than 20 percent when compared to 2013 production costs.

C. Coal

Our coal fleet includes our Sherburne County Generating Station (Sherco) Units 1 and 3 in Becker, Minnesota, and the Allen S. King plant[22] in Oak Park Heights, Minnesota. This coal fleet provides almost 1,700 MW of baseload and cycling generating capacity and supports system reliability. The Commission approved our proposal to retire Sherco Coal Units 1 and 2 in 2026 and 2023, respectively, in its Order in Docket No. E-002/RP-15-21(January 11, 2017). Sherco Unit 2 was retired on December 31, 2023, resulting in a loss of 682 MW of firm dispatchable generation from the NSP system. In the last Resource Plan, the Commission approved our proposal to retire the Allen S. King Generating Station in 2028 and Sherco Unit 3 in 2030.[23] These retirements are reflected in our Reference Case.

D. Natural Gas (and Oil-Fired) Fleet

Our natural gas fleet consists of both intermediate and peaking generation. We have five owned or contracted intermediate-type generating assets that provide over 2,000 MWs of capacity. We have peaking-type resources located at seven sites, providing nearly another 2,000 MWs of capacity. Combined, these facilities provide valuable load following capabilities for our system, cycling as necessary to provide important flexibility to our generation operations and support to our growing renewable resources.

VI. NET RESOURCE SURPLUS/DEFICIT

As described above, our forecast of customers' peak demand and MISO RA requirements are used to determine our overall total generating capacity obligation. From this we deduct our expected load management achievements and accredited capacity of the various resources we have included in our Reference Case to determine our net generation capacity surplus or deficit. We anticipate a net surplus through 2026 and a deficit thereafter, starting first in the spring and summer of 2027. Reference Case Load and Resources tables for each season are in Tables 3-4 through 3-7 below.

[22] Asset is in seasonal operation. The identified capacity represents its maximum capacity offered during the winter season.
[23] *In the Matter of the 2020-2034 Upper Midwest Integrated Resource Plan of Northern States Power Company d/b/a Xcel Energy,* Docket No. E-001/RP-19-368, Order (April 15, 2022), at Order Point 2.A.4.

VII. MEETING RENEWABLE ENERGY REQUIREMENTS AND GOALS

A. Minimum Compliance Requirements

Each of the states in the NSP System has a different public policy with respect to renewable energy requirements or objectives. Table 3-8 below illustrates each state's renewable energy standard (RES).

Table 3-8: Renewable Energy Requirements and Objectives by State – NSP System

State	Renewable & Recycled	Renewable	Carbon-free	Solar	Distributed Solar
Minnesota		30% by 2020* 55% by 2035	80% by 2030 90% by 2035 100% by 2040	1.5% by 2020*	3% by 2030
North Dakota	10% by 2015**				
South Dakota	10% by 2015**				
Wisconsin	12.9% by 2015*				
Michigan	50% by 2030 60% by 2035		100% by 2040		

*Goal Met
**Voluntary objective met

Of our states that have renewable standards expressed as a percentage of electric retail sales from qualifying resources by a certain date, Minnesota's RES is the highest, requiring that 30 percent of the Company's energy come from renewables, with at least 24 percent of the electricity we provide to retail customers coming from wind energy by 2020.[28] Legislation passed in the 2013 session also established a Solar Energy Standard (SES) for Minnesota that requires that investor-owned utilities in the state generate 1.5 percent of 2020 retail sales, net of customer exclusions, from solar energy resources. Of that 1.5 percent, 10 percent must come from systems with

[28] This requirement is included in the total 30 percent RES, and we are authorized to count a limited amount of solar energy towards an overall 25 percent wind and solar requirement (amounting to 1 percent of total sales). The SES is assessed separately. Large hydro does not count as a renewable energy source for purpose of the Minnesota RES. Minn. Stat. § 216B.1691.

capacity less than 40 kW.[29] Additionally, the Distributed Solar Energy Standard requires that three percent of solar power come from distributed energy by 2030, and the Carbon Free Standard (CFS) requires 80 percent of retail sales to come from carbon-free energy by 2030,[30] 90 percent by 2035, and 100 percent by 2040.

North Dakota and South Dakota each have a voluntary objective that includes renewable or recycled energy.[31] Further, our North Dakota regulators have indicated that compliance with the North Dakota Renewable Energy Objective should be accomplished with competitively-priced energy.

To-date we have implemented plans that result in the entire NSP System complying with, at the very least, the highest of renewable energy requirements across our jurisdictions, in this case, the Minnesota RES. This strategy also places us in compliance with the specific requirements in each of our other jurisdictions. As a result, we have been planning for renewable energy additions, and allocating their benefits, to all our jurisdictions (with certain exceptions as discussed in Chapter 2, Planning Landscape). As state energy policies continue to evolve, however, we will continue to examine whether this requires a strategy change going forward, and engage our Commissions as needed on that topic.

B. RES and SES Compliance

We project continued compliance with the renewable energy goals and standards in each of our NSP states under our Preferred Plan. The Company currently maintains a set of banked Renewable Energy Credits (RECs) for future compliance.[32] In the past, we have leveraged our REC bank to manage the size, type, and timing of renewable energy additions on our system, to ensure that we identify and acquire the renewable generation resources that provide our customers with the greatest value at the lowest

[29] The original legislation set a threshold of 20 kW, but was increased to 40 kW in 2018, per HF3232. *See* "Minnesota Renewable energy Standard: Utility Compliance." Minnesota Department of Commerce (January 2019) at 7. Available at: https://www.leg.state.mn.us/docs/2019/mandated/190330.pdf.

[30] Minn. Stat. § 216B.1691 Subd. 2h states that projects must comply with eligibility requirements to count toward the DSES. Eligibility requirements stipulate that the project must be: 10 MW or less; connected to our distribution system; located in our Minnesota service territory; and constructed/procured after August 1, 2023 using a Commission-approved competitive bidding process; etc.

[31] As defined in North Dakota Century Code, 49-02-25, recycled energy means "systems producing electricity from currently unused waste heat resulting from combustion or other processes into electricity and which do not use an additional combustion process. The term does not include any system whose primary purpose is the generation of electricity unless the generation system consumes wellhead gas that would otherwise be flared, vented, or wasted." South Dakota Codified Law 49-34A-94 contains a similar definition.

[32] A REC is an accounting device designed to reflect the renewable energy attributes of a particular MWh of renewable energy generation. RECs are the currency for compliance with state renewable targets.

cost. The Company currently expects to generate a sufficient number of RECs throughout the planning period to satisfy our renewable obligations. Additional information on our compliance with RES and SES is provided in Appendix N: Standard Obligations.

C. Carbon Free Standards

In 2023, the Minnesota Legislature amended the requirements set forth in Minn. Stat. § 216B.1691 to create new carbon-free energy standards (see Minn. Laws 2023, chp. 7). The new legislation requires Xcel Energy to generate or procure carbon-free energy equivalent to 100 percent of its Minnesota retail sales by 2040. The law, Minn. Stat. § 216B.1691, also requires Xcel Energy to achieve interim carbon-free standards of 80 percent by 2030, and 90 percent by 2035.

Further, both Wisconsin and Michigan's Governors recently put forward 100 percent by 2040 carbon reduction goals for their respective states' electric sector. Proceedings by those states' Public Utilities Commissions are still in the early stages and have not produced any final compliance requirements for electric utilities. Additional information regarding our compliance with the newly enacted carbon-free energy standard is provided in Appendix N.

VIII. ENERGY POLICY AND COMPANY GOALS

As discussed above, we believe that we are well positioned to meet minimum system needs. At least through 2026, we expect that we will be able to meet those needs with existing and already-approved resources. In December 2018, the Company announced its goals to reduce carbon dioxide (CO_2) emissions 80 percent by 2030 below 2005 levels company-wide, and to serve customers with 100 percent carbon-free electricity by 2050. Our 2024 Plan is informed by these internal policies, as well as the renewable energy milestones set forth in Minn. Stat. § 216B.1691, and demonstrates our commitment to a cost-effective, renewable, and carbon-free future. Additionally, our Preferred Plan will result in significant carbon reductions and keeps us on track to provide 100 percent carbon-free electricity by 2050.

IX. REFERENCE CASE

We incorporate all the aforementioned elements into the EnCompass modeling tool, which allows us to explore how we best meet our customer and policy requirements under a variety of conditions and at a reasonable cost. We work with internal and external subject matter experts to develop starting assumptions that reflect their expert opinion of likely future conditions. We then test the robustness of the plan through sensitivity analysis and special studies by individually changing key assumptions and re-running the plans under these changed assumptions. Our analysis resulted in the following Reference Case Expansion Plan, depicted in Tables 3-9 through 3-13 below.

Table 3-9: Reference Case Annual Expansion Plan, Summer Season UCAP[33]

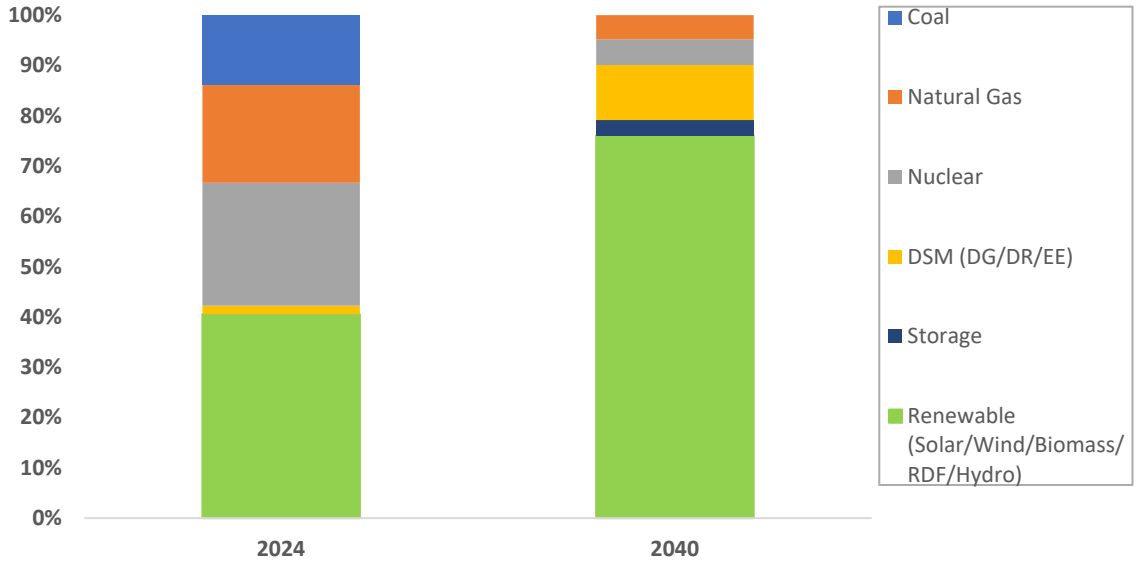
The Reference Case presented here would result in the following energy mix depicted in Figure 3-6 below.

Figure 3-6: NSP System Reference Case Energy Mix in 2024 and 2040



In Chapter 4, we detail our Preferred Plan. In Chapter 5: Economic Modeling Framework, we outline and discuss the starting assumptions, scenarios, and sensitivities that formed our EnCompass modeling analysis, and resulted in our Preferred Plan.

X. CONCLUSION

Our 2024 Plan focuses on reducing carbon emissions while ensuring reliable and affordable service to our customers. The minimum number of resources required for the planning period is determined based on system needs and existing resources. The Reference Case, modeling scenarios, and Preferred Plan are developed based on this baseline. In our 2024 Plan, our minimum system needs are informed by the seasonal resource adequacy construct recently implemented by MISO and our energy adequacy analysis. These changes are intended to address the increasing variability in reliability needs and resource availability throughout the year and align resource accreditation with availability.

CHAPTER 4 - THE PREFERRED PLAN

I. INTRODUCTION

The Preferred Plan we propose here continues to deliver on our obligations to provide safe, reliable, and affordable service to our customers while further accelerating our ambitious carbon-reduction strategy. It increases the pace of the carbon-reduction efforts approved in our 2019 Plan, while continuing to ensure our system maintains robust reliability.

Building on our ongoing efforts to transform our energy system, and based on extensive collaboration with our stakeholders, the key components of our Preferred Plan include:

- Adding thousands of megawatts of additional renewable resources to our system, including customer-sited DERs;
- Integrating and investing in energy storage systems, including adding short-duration storage systems to our fleet;
- Extending the life of our nuclear fleet;
- Ensuring reliability through additional firm dispatchable generation; and
- Continuing to increase Energy Efficiency and Demand Response resources to help reduce overall system demand.

Our Preferred Plan leverages existing grid connections and proven technologies, while using emerging technologies like battery storage to provide a balanced mix of resources, at an estimated average annual increase in retail rates of less than one percent, all while preserving our fundamental commitment to reliability.

Our planning objectives center on addressing generation decarbonization and load growth while maintaining reliability, and the cost effectiveness of our Preferred Plan. Importantly, we understand and have considered the impact that our Preferred Plan will have on our customers and have engaged with stakeholders and the community to help inform and further refine our Preferred Plan. Our strategy reflects our commitment to providing clean, reliable, and affordable energy to our customers, while also leading the charge in the clean energy transition.

II. PREFERRED PLAN

Our Preferred Plan is designed to accelerate our carbon-reduction efforts while maintaining a safe, reliable, and affordable system for our customers and

communities. Figures 4-1 and 4-2 below outline our Preferred Plan's modeled resource additions over the 2024 – 2040 planning period. Resource additions in 2025 include the approved Sherco Solar resources expected to achieve commercial operations in 2025, the approved Apple River solar resource, and the investments at our Wheaton and Blue Lake facilities approved in 2019 Plan.[1]

Figure 4-1: Preferred Plan Resource Additions (MW)

	2025	2026	2027	2028	2029	2030	2031	2032	2033	2034	2035	2036	2037	2038	2039	2040

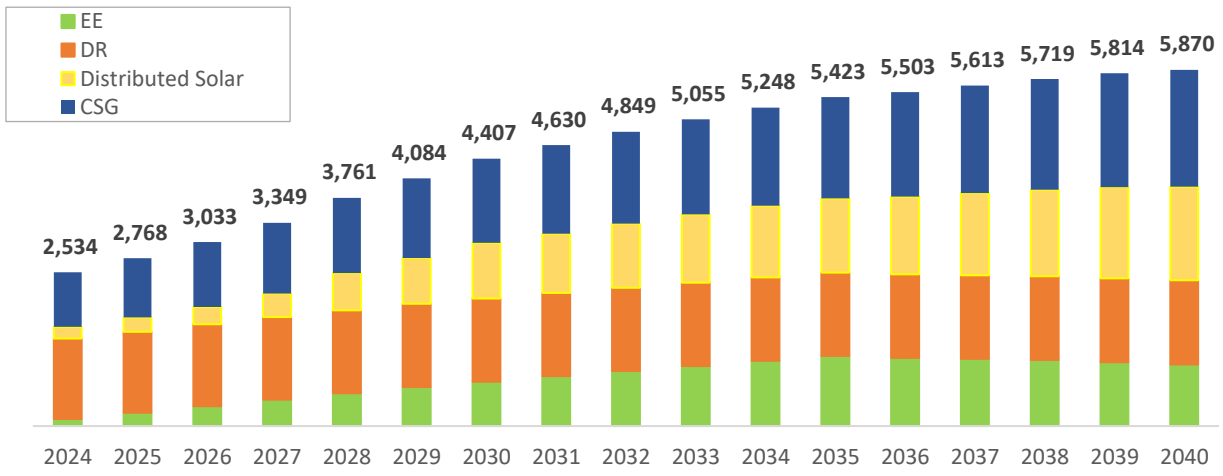
[1] The Wheaton repowering is currently under review by the Wisconsin Public Service Commission.

Figure 4-2: Preferred Plan Cumulative Capacity
Demand Side Resources and Community Solar Gardens (MW)



The figures illustrate our Preferred Plan's aim to maximize cost-effective renewable resources. This is in addition to the significant distributed resources projected, which align with state law and policy. The Preferred Plan is supported by firm dispatchable generation, enhancing renewable integration and system reliability, in an effort to reduce market exposure and risk.

With this diverse mix of resources, our system will not be overly reliant on any one fuel source, and we will continue to ensure reliability, while retaining the flexibility to consider the economics of new resources as our baseload plants retire. Our projected capacity and energy mix for 2040 under our Preferred Plan can be seen in Figures 4-3 and 4-4 below.

Figure 4-3: NSP System 2024 and 2040 Preferred Plan Capacity Mix

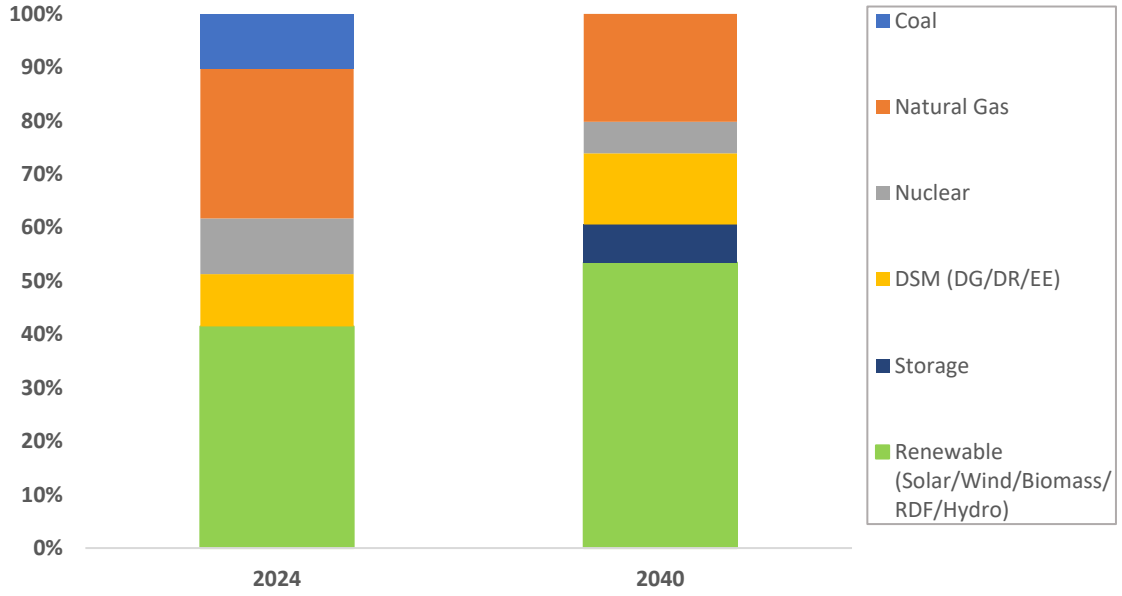


Figure 4-4: NSP System 2024 and 2040 Preferred Plan Energy Mix

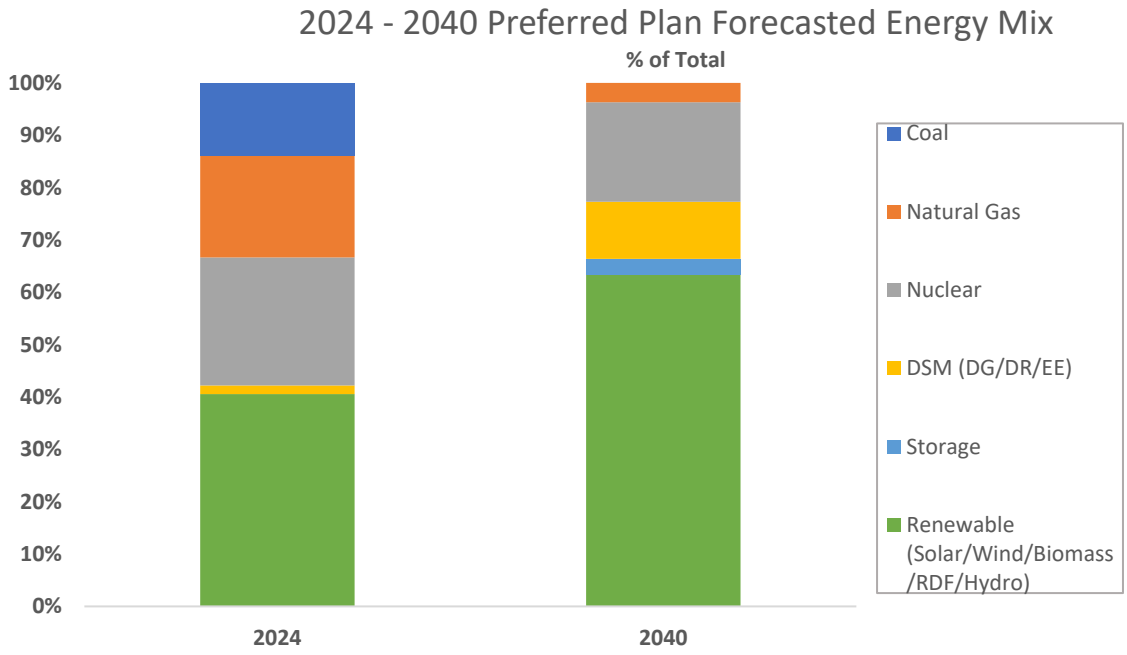


Below, we discuss our Preferred Plan's anticipated resource mix in more detail.

A. Coal Resources

Our Preferred Plan continues along the path that the Commission set in our 2019 Plan when it approved our proposal to close all of our coal units by 2030. We retired Sherco Unit 2 at the end of 2023, removing approximately 700 MWs of baseload coal from our fleet. We continue to plan for retiring Sherco Unit 1 in 2026, King in 2028, and Sherco Unit 3 in 2030, bringing our total coal reductions to 2,400 MWs.

Closing our coal units aligns with our sustainability goals and makes economic sense due to changes in federal policy that makes replacing coal generation with cleaner energy sources more cost-effective. Regardless, these coal units have been a cornerstone of our fleet for decades, operating at high load-factors to provide reliable power to our customers. We therefore need to retire these resources responsibly by giving ourselves sufficient time to build the necessary replacement resources, help transition our workforce, and maintain a reliable system. Our Preferred Plan is designed to allow us to do just that.

B. Renewable Resources

As part of our Preferred Plan, we plan to add significant wind and solar resources. Robust renewable additions continue to be a critical component of our vision to achieving our clean energy commitments. In addition to helping to achieve our renewable energy goals, wind and solar do not have any fuel costs and act to insulate the Company against rising fuel prices. Our Preferred Plan reflects a modeled expansion need of nearly 9,900 MWs of utility-scale renewable resources by 2040, with new resource additions beginning in 2027.

We have long been one of the nation's leading providers of wind energy and expect this to continue. Our Preferred Plan reflects the need for an incremental 8,400 MWs of wind capacity through 2040. We note that the MISO accreditation for wind is higher than the assumption used in our 2019 Plan, and the assumption coupled with the lower levelized cost of energy from IRA production tax credits is driving the wind additions.

In addition to this substantial increase in wind generation, our Preferred Plan reflects a modeled expansion need for 1,500 MWs of solar through 2040. Further, our Preferred Plan includes nearly 2,000 MWs of Community Solar Gardens and nearly 1,600 MWs of distributed solar resources in compliance with state law.

C. Firm and Dispatchable Resources

We plan to add essential firm dispatchable capacity to our resource mix. As we transition from a system built off of baseload coal to one that is made up primarily of clean, intermittent, and short duration resources, we remain committed to ensuring that we can still meet our customers' energy demands at all times. This reliability is a fundamental obligation of our service and one that our customers expect. Unlike intermittent renewable resources, firm dispatchable resources can be relied on to deliver power on-demand for extended periods of time due to their primary characteristics: dispatchability and consistent fuel supply. Our focus on reliability is particularly important because at the same time we are planning to retire our entire coal fleet (approximately 2,400 MWs of baseload generation), we also have nearly 1,700 MWs of power purchase agreements (PPAs) with other capacity resources set to expire between 2025 and 2028.

As shown in our energy adequacy analysis in Appendix D: Energy Adequacy Analysis, additional firm dispatchable resources help maintain reliability amid retiring base load generation. Our 2024 Plan therefore includes the addition of approximately 3500 MW of cumulative firm dispatchable between 2027 and 2040 to ensure long-duration, affordable energy when our intermittent renewables are not able to fully meet our customers' needs.

D. Battery Energy Storage Systems

We plan to add Battery Energy Storage Systems (BESS) to help meet some of our dispatchable needs. In addition to firm dispatchable resources, our modeling shows an incremental need for approximately 2,100 MW of storage between 2027 and 2040. The BESS modeled as part of our 2024 Plan are short-duration storage systems. Although valuable, short-duration BESS cannot currently meet the longer duration dispatch needed from firm dispatchable resources.[2] Instead, the primary value to our system that short-duration BESS provides is in aiding renewable integration, providing grid support, deferring some, but not all, traditional grid investments, and improving power quality. We provide additional information on the uses of BESS, and its limitations, as part of the Appendix I: Minnesota Energy Storage Systems Assessment.

[2] Recently, we partnered with Form Energy to deploy and test a multi-day, iron-air battery system at the Sherco site, but the project is a pilot, to allow for further study. We anticipate that advancements in long-duration storage and grid-forming technologies will continue, and that long-duration storage, together with other grid investments to ensure system stability, will have the potential to address firm dispatchable needs in the future.

E. Nuclear Resources

We plan to extend operations at both of our nuclear plants. Combined, this will provide approximately 1,650 MW of net dispatchable generation. We propose to extend operation of the two Prairie Island Nuclear Generating Plant units for 20 years past the current license expirations, to 2053/2054, and to extend operation of the Monticello Nuclear Generating Plant by 10 years to 2050, which aligns with our Subsequent License Renewal application for Monticello pending review by the Nuclear Regulatory Commission.

To accommodate more intermittent renewable resources on the grid, we work with the MISO Day-Ahead market to allow for flexible power operations capabilities at all three nuclear units. Our nuclear plants can safely and efficiently accommodate power changes of approximately 280 MW—or over 15 percent—of our nuclear capacity in response to the market. Our nuclear fleet is also a critical component of our reliability and stability strategy, particularly during the winter months, when MISO's seasonal resource adequacy construct reduces the accredited capacity of renewables. We discuss the benefits of nuclear, as well as the performance of our nuclear fleet, in greater detail in Appendix M: Nuclear.

By continuing the operation of these plants to at least 2050, customers will continue to benefit from the carbon-free, baseload power that our nuclear fleet provides, while helping to keep costs low as we leverage existing, reliable resources on our system. Nuclear is central to achieving our carbon reduction goals and maintain reliability.

III. ACTION PLANS

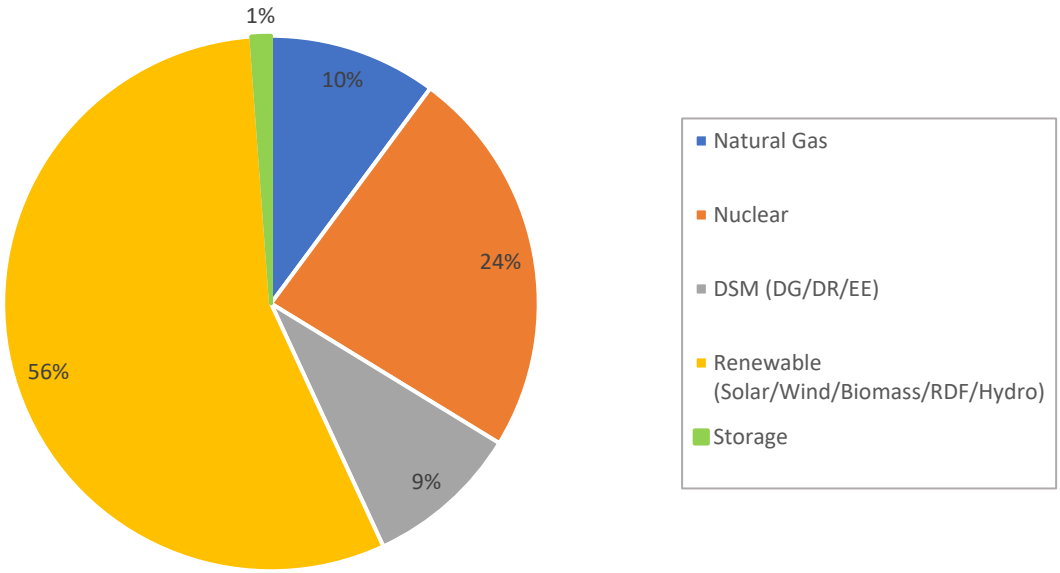
A. Five-Year Plan (2024-2030)

Our 2024 Plan does not identify any incremental capacity needs until 2027. However, from 2027 through 2030, our Preferred Plan contemplates adding over 6,000 MWs of incremental generation. Below, we discuss the near-term actions by resource type that underly our long-term plan, recognizing that the resource additions may need to be smoothed during the implementation process to create a portfolio of projects that can be constructed effectively within the constraints of the market for equipment and labor.

With our 2024 Plan, we are taking steps to transform our energy resource portfolio to include a robust mix of renewable resources, supported by firm dispatchable resources. We anticipate that by 2030, our forecasted energy mix, would match that

displayed in Figure 4-5, and models a nearly 88 percent reduction in CO_2 emissions from 2005 levels by 2030.

Figure 4-5: NSP System 2030 Preferred Plan Energy Mix



The details of this near-term resource mix and related action plan are provided below.

1. Wind

Our 2024 Plan proposes to add 3,200 MWs of wind additions through 2030. 2,800 MWs of the 3,200 MWs near-term wind total is assumed to utilize the MN Energy Connection Sherco Generation tie line. The remaining 400 MWs of generation is generic and non-location specific. We are pursuing 1,200 MWs of this wind through the recently approved MN Development Transfer Resource Acquisition Process to utilize the MN Energy Connection tie line. We would expect to begin further procurement activities and the proceedings for regulatory approval in the next year to ensure we have the necessary wind generation online before the capacity is needed through a Commission approved bidding process. To the extent we encounter opportunities to economically repower existing resources or if specific customer programs require specific procurements, we expect to pursue them and submit the plans for approval in separate proceedings.

2. Solar

Our 2024 Plan adds 400 MWs of solar using the King Interconnection in 2030. Beyond these additions, we do not include any new utility scale solar projects between 2024 through 2030, other than those already approved by the Commission and included in our Base Case.

One of the key components of our 2019 Plan was the Sherco Solar project. We are currently working on completing the Sherco Solar project, which will be constructed in two separate 230 MW AC blocks. The first block is scheduled to be completed in October 2024, and the second block in October 2025.

On the distributed solar side, we have incorporated forecasted growth into our 2024 Plan. We recognize the potential of distributed solar capacity and are committed to harnessing this potential to further our clean energy objectives. As measures of this, we have used as model assumptions the maximum possible level of non-legacy community solar gardens and levels of 3 percent distributed solar energy standard (DSES) solar that attain full compliance with the DSES by the 2030 requirement. Additionally, we also understand that the actual additions to customer-owned, behind the meter distributed solar capacity may exceed the forecasted amount included in our Preferred Plan and have thus included additional modeling examining higher levels of this resource.

3. Firm Dispatchable

Our 2024 Plan calls for 2,244 MWs of firm dispatchable resources by 2030. These resources are split between 748 MWs in 2027, 748 MWs in 2028, and 748 MWs in 2030. Approximately 374 MWs of the 2028 need is located on our re-optimized Sherco Generation tie line and is pending regulatory approvals from the Commission. The rest of the firm dispatchable additions are not location specific.

We have already opened a proceeding before the Minnesota Commission to consider up to 800 MWs of firm dispatchable resources.[3] The 800 MWs are included in the 2,244 MWs proposed in our Plan. However, our modeling for our 2024 Plan confirms a need exceeding 800 MWs of firm dispatchable resources. As part of the 800 MW proceeding, the Company has submitted three proposals totaling in excess of 800 MWs. Third party providers have also submitted their own proposals.

[3] Docket No. E002/CN-23-212

4. Battery Energy Storage Systems

We plan to add approximately 600 MWs of BESS by 2030. The 600 MWs of BESS is comprised of a modeled 480 MWs of generic storage in 2027, and 120 MWs as part of our re-optimized Sherco Generation tie line in 2029. We expect to solicit these resources as part of a request for proposals under a commission approved bidding process.

5. Nuclear Extension

In order to support our nuclear extensions to at least 2050, steps will need to be taken in the near future. We plan on filing a Certificate of Need with the Commission on February 7, 2024, for additional dry fuel storage to support continued operation of Prairie Island through 2053/2054. The concrete pad construction would occur over a 9–12-month period between 2027 and 2029 to support license extension and future dry fuel storage needs. By the end of 2026, we anticipate submitting our application for license renewal with the Nuclear Regulatory Commission to extend the Prairie Island Nuclear Generating Plant operating license from 2033/2034 to 2053/2054.

With respect to Monticello, the Commission recently approved, in August 2023, dry fuel storage expansion in support of a Subsequent License Renewal, which is currently pending review by the Nuclear Regulatory Commission. The concrete pad construction at Monticello would occur in 2026 over a 9-12-month duration with spent fuel loading occurring in 2028 to support license extension and future dry fuel storage needs. Shortly after a Commission decision on this 2024 Plan, we will also seek another Certificate of Need to support the additional 10-year life extension.

Throughout the planning process, we continue to collaborate with the Prairie Island Indian Community, the City of Red Wing, the City of Monticello, Goodhue County, Wright County, and other community interests to ensure transparency and continuous partnership.

6. Refuse Derived Fuel Waste to Energy Extension

Finally, all three of our renewable Refuse Derived Fuel (RDF) waste to energy generating plants are slated for retirement in 2027 and we plan to extend the life and operations of our Red Wing, Mankato, and French Island RDF plants to 2037, 2037, and 2040 respectively. These plants not only add significant value to our system and help us achieve our renewable energy goals with reliable power, but also provide value to the local communities they serve. We plan to address the extension of these plants

in our upcoming annual remaining lives filings. More about these plants, and the value they provide to their community is included in Appendix W: RDF Plants.

B. Long-Term Plan

In addition to our immediate five-year action plan, our long-term 2024 Plan relies on model-selected resources in the 2031-2040 planning period that we envision could be part of our energy future including:

- Adding an additional 1,100 MWs of incremental utility-scale solar;
- Adding an additional 5,200 MWs of incremental wind and repowering existing wind resources when economical;
- Adding an additional 1,500 MWs of incremental Battery Energy Storage Systems;
- Adding approximately 1,347 MWs of incremental firm dispatchable resources;
- Developing additional regional transmission infrastructure;
- Growing our DR portfolio to approximately 1,385 MW by 2040; and
- Continuing plans to achieve average annual energy savings, through our energy efficiency programs between 2031-2040.

Our 2024 Plan presents a pathway to 2040 to meet Minnesota's 100 percent carbon free by 2040 law. While these modeled additions project what our system would look like in 2040, we note that ingenuity, new technologies, and transmission will be necessary in order to ensure we can achieve our longer-term goals of 100 percent carbon-free electricity across the NSP system by 2050.

While our 2024 Plan examines the generation side of the equation, the Company is working on creating a long-term Vision study to examine the 2040 and 2050 timeframes to determine what transmission investments might be needed to achieve a 100 percent carbon-free energy plan. The study will include a comprehensive look at load growth, including varying electrification and adoption rates, generation profiles and locational data, and finally transmission needed to accommodate the future carbon goals. We look forward to leveraging these studies to inform our planning as they become available.

IV. PUBLIC INTEREST ANALYSIS

Based on our detailed analysis, we conclude that the 2024 Plan is in the public interest. We believe it best balances our goals to ensure reliability, achieve significant carbon reduction, and maintain reasonable costs to customers.

The Commission's rules identify the factors that the Commission must consider when determining if the 2024 Plan is in the public interest.[4] Specifically, these rules require that resource options and resource plans are to be evaluated on their ability to:

- Maintain or improve the adequacy and reliability of utility service;
- Keep the customers' bills and the utility rates as low as practicable, given regulatory and other constraints;
- Minimize adverse socioeconomic effects and adverse effects upon the environment;
- Enhance the utility's ability to respond to changes in the financial, social, and technological factors affecting its operations; and
- Limit the risk of adverse effects on the utility and its customers from financial, social, and technological factors that the utility cannot control.

By planning ahead and charting an orderly, gradual transition of our generation fleet, we believe our 2024 Plan achieves all of these goals while managing the impacts to our communities and employees, preserving the reliability and stability of our system, and maintaining affordability for our customers. As set forth in more detail below, we believe our 2024 Plan is in the public interest and merits Commission approval.

A. Reliability

The 2024 Plan aims to provide safe and reliable service amidst the retirement of baseload units and the addition of variable renewable generation capacity. Challenges in planning for reliability are presented by the new seasonal MISO Resource Adequacy construct, the increase in intermittent resources, and the uncertainty in future capacity accreditation and Planning Reserve Margins. The future accreditation of resources, crucial for investments in solar and storage resources, is particularly challenging due to its dependence on the installed capacity of all resource types across the MISO system.

In this 2024 Plan, we used an updated analytical approach to design a plan that addresses these challenges. It both ensures we have sufficient resources to meet our customers' needs and positions us to be able to comply with future changes to the MISO Resource Adequacy construct. We plan to meet customer needs with very limited reliance on neighboring systems and the broader MISO market. At the same time, we benefit from participation in the MISO market by incorporating the current planning assumptions and allowing for the economic dispatch of our resources within

[4] Minn. R. 7843.0500, subp. 3.

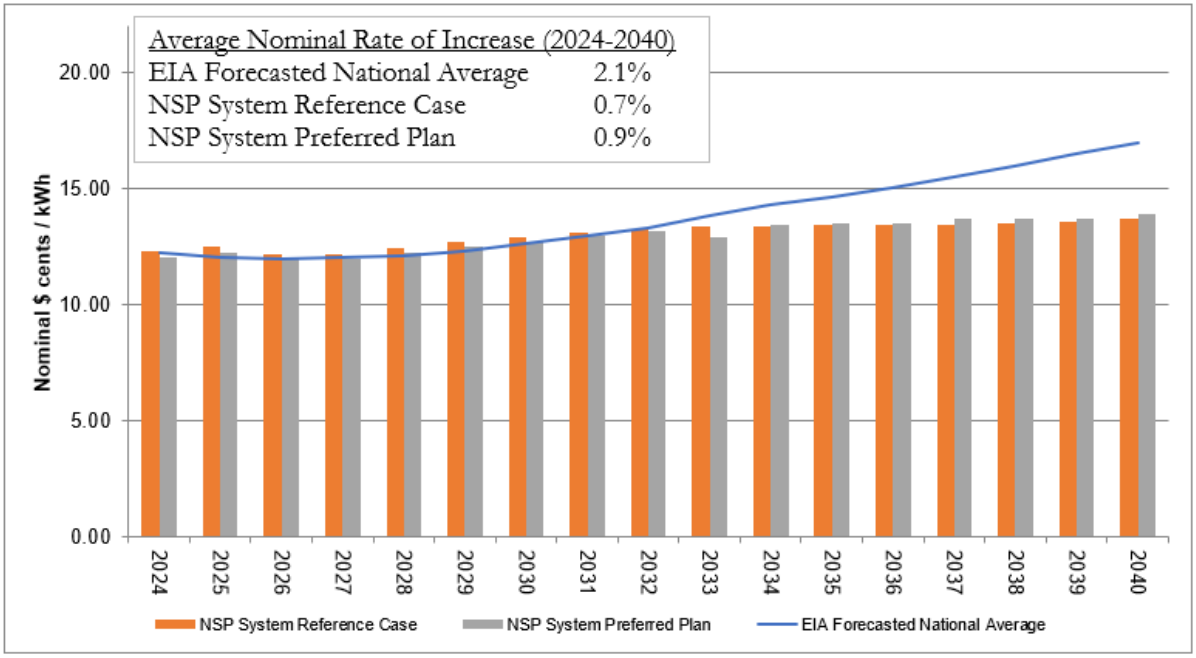
the broader region. As a result, our 2024 Plan is robust under changing assumptions and provides a path to transition our system while maintaining the reliable system our customers expect. For further detail on our reliability stress tests, see Appendix D: Energy Adequacy Analysis.

B. Impact to Customer Bills

The opportunity to achieve significant reductions in our carbon emissions for a nominal increase in cost is one of the principal benefits of our 2024 Plan. By leveraging technological advancements and financial savings from recent policies such as the IRA, we are able to present a 2024 Plan that achieves significant carbon reductions at a nominal customer cost of less than one percent annual increase in retail rates compared to the EIA forecasted national average electricity rate increase of over two percent. In other words, we can achieve significant CO_2 emissions reductions, with cost impacts that are less than half of the expected national average increase in electricity prices.

Figure 4-6 shows the relative cost growth of our 2024 Plan in comparison to the national average.

Figure 4-6: Preferred Plan Average Rate Impact for the NSP System



While there is a cost to add the resources the Company needs over the next 15 years to continue providing safe and reliable service, to comply with state energy

requirements, and to address plant retirements and PPA expirations, the cost is modest and appropriate in light of the benefits. For further details about the rate impact analysis, please see Chapter 6: Customer Rate and Cost Impacts.

C. Environmental Effects

Minimizing and addressing environmental effects is foundational to our 2024 Plan. In particular, our 2024 Plan increases the share of clean generating resources which can significantly and cost-effectively reduce the negative impacts like air and water pollution, land use, and associated environmental compliance cost. All NSP coal units are scheduled to cease operation by December 31, 2030, and we are replacing those resources primarily with new renewable resources and extended nuclear generation resources. This will lead to an increased share of clean energy supply, including utility-scale renewables and energy storage, and clean DERs, resulting in environmental and health benefits for the communities in which we work and that we serve. Our 2024 Plan also charts a path to meet Minnesota's 100 x 2040 law, to meet our own aggressive decarbonization goals, and to comply with EPA standards. A full discussion of the environmental regulations impacting planning can be found in Appendix K: Environmental Regulations Review.

D. Socioeconomic Impacts

We acknowledge that phasing out some of our legacy generation assets has a significant impact on the economies of the communities where those plants are located and the employees who work in those facilities. We will continue to make efforts to draw new development to locations where our current units have been or will be retired and to support our employees, consistent with our past practices, by working with those impacted to transition to new positions. Additional details of these efforts can be found in Appendix O and O1: 2023 Workforce Transition Plan.

Our plan to promote clean and distributed resources generates socioeconomic benefits, by preserving jobs with our nuclear fleet and creating jobs throughout renewable development and construction. We are also committed to working with our communities and stakeholders to ensure meaningful opportunities for them to participate in the process. Additional details can be found in Appendix R: Equity.

E. Flexibility to Respond to Change

Our 2024 Plan positions the Company to meet near-term needs and create flexibility for the future. Planning constructs, federal and state policy changes, and technology

development, cost, and adoption all create uncertainty, which led us to prioritize strategic flexibility in our 2024 Plan. With this diverse mix of resources, our system will not be overly reliant on any one fuel source, and we will continue to ensure reliability, while retaining the flexibility to consider the economics of new resources as our baseload plants retire. For example, we have left open our firm and dispatchable capacity needs in our long-term plan, recognizing that the technology landscape is rapidly changing, and new options may be more economically favorable than natural gas at that time. This flexibility enhances our ability to respond to changes in our planning landscape that could affect our operations during the planning period and preserves some agility for us to respond and adapt.

F. Limiting Risks

The Preferred Plan addresses major risks by maintaining portfolio diversity, retaining optionality and effectively managing market exposure. The Plan incorporates significant capacity additions to replace retiring resources and expiring PPAs, consisting of a diverse portfolio of DSM, nuclear and RDF extension, solar, wind, and firm dispatchable resource additions. Further, ensuring we do not become too dependent on a single fuel source mitigates risk.

We also have evaluated factors such as energy market exposure and portfolio length. All of our baseload scenarios show high levels of market interaction but are not overly reliant on the market to serve customer load.

V. CONCLUSION

Our Preferred Plan builds upon the efforts approved in our 2019 Plan and aligns with state and federal energy policies. The plan includes significant additions of renewable resources, investments in energy storage systems, extension of our nuclear fleet's life, and an increase in Energy Efficiency and Demand Response resources. It also includes the necessary firm dispatchable resources—modeled to provide less than 5 percent of our system's energy by 2040—necessary to maintain reliability as we continue to pursue the clean energy transition. By leveraging existing grid connections, proven technologies, and emerging technologies like battery storage, we aim to provide a balanced mix of resources.

We have considered the average annual rate impact on our customers and engaged with stakeholders and the community to refine our Plan. Our planning objectives are centered on balancing service reliability, affordability, environmental impacts, and equitable community investment. This strategy reflects our commitment to leading the

charge in the clean energy transition while ensuring that our energy remains clean, reliable, and affordable for our customers. Our 2024 Plan presents the best path forward for the Company, our customers, and the energy future of our Upper Midwest system, and is thus in the public interest. We look forward to the implementation of the 2024 Plan and the positive impacts it will have on our energy system and the broader community.

CHAPTER 5 - ECONOMIC MODELING FRAMEWORK

I. INTRODUCTION

We have used the EnCompass Resource Planning model to perform our economic analysis since 2020. We use EnCompass as our primary resource planning software to estimate the costs of various resource expansion plan options, evaluate specific capacity alternatives, and measure the potential risks of new environmental legislation and other policy scenarios. EnCompass results are a decision support tool to guide development and selection of a Preferred Plan and test the robustness of the plan under a variety of assumptions and sensitivities.

To ultimately identify and refine our Preferred Plan presented in Chapter 4, we created three scenarios that examined different combinations and timing of baseload nuclear unit retirements, and the resulting size, type, and timing of new resources we would need to add in order to continue meeting customers' needs and achieve our 2030 carbon reduction goals. We refer to these scenarios as "baseload study scenarios." After this analysis was completed, we used the outcomes and sensitivity tests to select and refine a Preferred Plan. Finally, we conducted special studies on the Preferred Plan for a more thorough examination of specific issues not fully covered in the plan.

We discuss our assumptions, scenarios, sensitivities and how these inputs guided selection of our Preferred Plan in more detail below. This comprehensive analysis ultimately aligns with and reinforces our Preferred Plan.

II. BASE ASSUMPTIONS IN THE REFERENCE CASE

There are several assumptions included in our baseline data inputs that are common across all scenarios studied. These factors may, in some cases, be varied within sensitivities, but are largely kept constant across the default study of each scenario.

As discussed in Chapter 2: Planning Landscape, in 2023, the Minnesota Legislature amended the requirements set forth in Minn. Stat. § 216B.1691 to include additional milestones for renewable energy as well as creating new carbon-free energy standards (see Minn. Laws 2023, Ch. 7). Further, Minnesota's distributed solar energy standard (DSES) was amended at subdivision 2h of Minn. Stat. § 216B.1691. This amendment mandates that at least three percent of the Company's retail electric sales in Minnesota be generated from solar energy generating systems that meet certain eligibility criteria by 2030. While we did not include constraints to meet the required renewable energy

standard, solar energy standard, or carbon-free standard, we did include a modeling constraint to comply with the three percent DSES by 2030.[1]

Other important starting assumptions in our analysis include:

Load Forecast. The Company used discrete changes in assumptions for electric vehicles, large commercial and industrial customers, beneficial electrification, and rooftop solar to determine our load and energy forecasts under two alternatives to the base forecast, which is our most probable forecast of future load changes: the High and Low load sensitivities. We provide detailed descriptions of our load forecasting methodology and assumptions under each of our sensitivities in Appendix E: Load and Distributed Energy Resource Forecasting.

We also incorporated a seasonal planning reserve margin, per MISO requirements, as shown in Table 5-1. The modeled Planning Reserve Margin is based on the MISO Planning Year 2024-2025 assumptions, adjusted for the average coincidence factors in MISO Planning Year 2024-2025 and Planning Year 2023-2024. EnCompass determines an effective reserve margin based on our MISO coincident factor assumption. For summer 2024, the coincidence factor results in a reduction to net load of 730 MW.

Table 5-1: Seasonal Planning Reserve Margin

	Summer	Fall	Winter	Spring
MISO Planning Reserve Margin (PRM) PY24/25	9.00%	14.20%	27.40%	26.70%
Average Coincidence Factor	92.24%	92.67%	97.09%	95.61%

Existing Fleet. We develop forecasts to model our existing fleet's cost and performance assumptions (such as variable O&M, heat rate, forced outage rate, maintenance requirements, etc.) based on historical data, with adjustments for known future changes where applicable. Additional operational and performance assumptions include:

- Retirements of Sherburne County Generating Station (Sherco) Units 1 and 3 in 2026 and 2030, respectively, and retirement of the Allen S. King plant in 2028, as approved in our 2019 Plan;[2]

[1] Our plan complies with the renewable standards and the carbon-free standard as shown in Appendix N: Standard Obligations.
[2] Sherco Unit 2 was retired on December 31, 2023.

- Sherco Units 1 and King are dispatched economically through their respective retirement dates. Sherco 3 is jointly owned with Southern Municipal Power Agency (SMMPA). We are currently offering Sherco 3 as a must-run under our operating agreement with SMMPA. We will continue to work with SMMPA to identify opportunities to operate Sherco 3 more flexibly as the plant nears its end of life. Therefore, in the modeling, we have assumed Sherco 3 is offered as must-run through 2029 and offered on an economic basis in 2030.
- Retirement of all other facilities at their current expected end of life, if that is planned to occur within the resource planning period, unless we have specifically included costs of life extension (e.g. for nuclear units in scenarios that include life extension);
- Short-term PPA extensions for Mankato Energy Center and Cannon Falls, consistent with recently-executed agreements;
- Sherco and King generation tie lines reoptimized with a Combustion Turbine (CT) allowed for selection on the Sherco generation tie-line; and
- Continued operation of the Company's owned hydroelectric resources based on historical performance.

Major PPA expirations include:

- Manitoba Hydro: 835 MW in 2025
- Cottage Grove: 226 MW in 2027
- Mankato Energy Center: 314 MW in 2028
- Cannon Falls: 317 MW in 2028

Additional cost–related assumptions include:

- Costs are escalated based on corporate estimates of expected inflation rates,
- Costs associated with re-licensing the nuclear plants were developed for use in the Baseload Study modeling.

Renewable Energy. The addition of Sherco Solar 1, 2, and 3, Apple River Solar, and the Louise and Fillmore solar projects are included in our baseline assumptions. We also included small solar resources in our baseline assumptions.

In addition, we have assumed:

- Accreditation of wind, solar and battery resources based on the 2023-2024 MISO Planning Year seasonal accredited capacity. For years beyond 2024, the seasonal accredited capacity trends over multiple years to meet the assumptions in MISO's November 2022 Regional Resource Assessment (RRA).
- The costs used for wind, solar, and storage assets fully incorporate the Production Tax Credit (PTC) or Investment Tax Credit (ITC) in the Inflation Reduction Act (IRA). The IRA allows the transferability of tax credits, allows utilities to elect out from normalization for storage facilities, and allows owners of solar facilities to claim a PTC in lieu of the ITC, which is subject to normalization.
- The resources on the generation tie-lines to Sherco and King were allowed to re-optimize—meaning the model selected from an updated resource mix based on updated assumptions to maximize customer and system benefits. Wind, Solar, and a firm dispatchable resource were available for selection on the Sherco tie-line. Solar additions were available for selection on the King tie-line.

Markets. We have optimized resource additions in the EnCompass model to ensure that the portfolio of resources developed is capable of serving customer load across all hours by limiting access to the MISO market. The limited access is only applied to the resource optimization to avoid over reliance on MISO market purchases for reliability or sales for wholesale revenues. We allow the model to access the MISO market to dispatch resources and take advantage of the access to economic resources in the larger MISO market.

Wholesale electricity price forecasts. To derive the forecast of monthly On and Off-peak electricity prices, the Company uses a simple average of On and Off-peak power price forecasts provided by external analysts Wood Mackenzie and S&P Global. To generate hourly market prices, the Company uses the hourly energy price forecast from the Horizons Energy EnCompass National Database, specifically the energy prices at the MISO-ND-MN node and scales it to match the monthly On and Off-peak price forecasts.

Purchase and sales limits. In our EnCompass model, when we allow access to the MISO market, we include a limit on the amount of energy that we can either purchase from or sell to the MISO market. This limit was established in our 2019 Plan based on PROMOD modeling and historical transfer data. For 2024-2029, we have continued to assume a market interaction limit of 2,300 MWs. Further, we include a cap on

market sales of no more than 25 percent of retail sales consistent with the assumption used in our 2019 Plan. While significant transmission expansion projects are at various stages of development, as discussed in Appendix T: MISO Grid Congestion, we believe it is prudent to limit market exposure during this period of rapid energy transition as further discussed below.

Emissions rates and costs. Emission rates for existing and planned resources are consistent with historical and expected performance. We assume the following costs and apply them to emitting resources as relevant:

- For the regulatory cost of carbon, we use the regulatory cost range of $5-$75 per ton starting in 2028 and escalating at inflation. Our base assumption uses the mid-point of the regulatory cost of carbon range. The regulatory cost of carbon impacts the dispatch of resources in the Encompass modeling. The modeling optimizes the dispatch based on cost, and therefore the dispatch of emitting resources is reduced relative to a scenario where the regulatory cost is not included. Our projected carbon reduction of 88 percent by 2030 is based on modeling that includes the mid-point of the regulatory cost of carbon range.
- Externality costs are included based on United States Environmental Protection Agency's (EPA) September 2022 *External Review Draft of Report on the Social Cost of Greenhouse Gases*[3] (EPA SC-GHG) consistent with the Commission's Order,[4] for purposes of measuring environmental and socioeconomic costs under Minn. Stat. § 216B.2422, Subd. 3, with the base assumption using the mid-range values. To avoid double counting, we adjusted the EPA SC-GHG values for modeling purposes by subtracting the Regulatory Cost of Carbon from the EPA SC-GHG value starting in 2028. Additional combinations of externality and regulatory costs were included as sensitivity cases.

Generic Resources. EnCompass uses generically defined resources to meet future demand when our already existing and approved resources are not sufficient in a given year. Generic resources are modeled as incremental units of a certain installed capacity size. The ICAP values are provided below, and the UCAP, representing the MISO seasonal accredited capacity value the units would yield, is factored into the Encompass modeling process. For example, although the generic unit size for solar is 100 MW installed capacity, the resource adequacy or MISO capacity credit value we would expect to receive for a plant of that size is as little as 6.3 MWs in the winter for

[3] We understand the EPA finalized the draft SC-GHG values in November 2023.
[4] Order in Docket Nos. E-999CI-07-1199, E-999/DI-22-236, E-999/CI-14-463. December 19, 2023.

Planning Year 2023-2024.

Generic units ICAP values included in modeling are as follows:[5]

- 374 MW gas-fired CT unit,
- 225 MW gas-fired CT unit,
- 108 MW reciprocating engine peaking unit (RICE),
- 60 MW utility scale battery,
- 200 MW wind project,
- 100 MWdc utility scale solar, and
- 130 MWdc solar + 60 MWac battery, 100 MWac inverter.

Appendix F: EnCompass Modeling Assumptions & Inputs, provides more detail on modeling assumptions. Please see Appendix H: Resource Options, for additional discussion on supply-side resource options included in the analysis.

Customer Programs. Incremental customer programs for Demand Response (DR) and Energy Efficiency (EE) were included as potential resources in the EnCompass model. The derivation of these six DR and three EE "Bundles" is described in Appendix J: Distributed Energy Resources. It is important to note that these Bundles represent generic Demand-Side Management (DSM) additions and therefore may not perfectly align with the size and timing of actual DR or EE additions to the system in the future.

III. SCENARIOS

We created three scenarios to examine combinations and timing of baseload nuclear unit retirements (our only remaining baseload units after Sherco and King retire by the end of this decade), and the resulting size, type, and timing of new resources we would need to add to continue meeting customers' needs and achieve our 2030 carbon reduction goals. We describe key parameters of these scenarios below.

[5] The cost and performance data for these units are based on consultant's estimates, publicly available third-party data, and internal company data. Availability dates are selected based on our estimates of the lead time needed for regulatory approvals, financing, permitting and construction.

A. Reference Case Scenario

We describe the development of our Reference Case in Chapter 3: Minimum System Needs. The Reference Case (Scenario 1) is an extension of our approved 2019 Plan,[6] in that all of the baseload units retire at their currently scheduled retirement dates, and it serves as our starting point. The Reference Case includes the following underlying assumptions:

- Approved resources, including: Sherco Solar 1, 2, and 3; Apple River, Louise and Fillmore solar projects; Wheaton Repower.[7]
- Extension of our Refuse Derived Fuel Waste to Energy Generating Plants.
- Short-term PPA extensions include: Mankato Energy Center and Cannon Falls.
- Sherco and King Tie-Line reoptimized.
- CT allowed for selection on Sherco Tie-Line.
- Optimized without market purchases/sales.
- Dispatched with access to MISO market.

Additional resource options are evaluated and optimized in the modeling and added when economic. These resource options include wind, solar, storage, combustion turbines, and reciprocating engines, as described in Appendix F: EnCompass Modeling Assumptions & Inputs.

To determine the optimal strategy regarding the future of the baseload nuclear fleet, we developed two additional scenarios with varying combinations of nuclear retirement dates. The resulting system needs were then met with an EnCompass model-optimized portfolio of new resources. Internal finance, energy supply, and nuclear subject matter experts worked to develop a robust set of assumptions and potential retirement dates for the nuclear retirements. These input assumptions include: ongoing capital expenditures, O&M expenses, and decommissioning and/or life extension costs. We also incorporated planning level estimates from a "leave behind" study conducted by the Company to determine the transmission system impacts of the nuclear plants' retirement to inform our Preferred Plan.

[6] July 25, 2021 Reply Comments, Docket No. E002/RP-19-368.
[7] Wheaton Repower is subject to approval by the Public Service Commission of Wisconsin.

B. Prairie Island Extension Scenario

For the Prairie Island extension scenario (Scenario 2), the Prairie Island 1 and 2 retirement date extends from 2033/2034 to 2053/2054. The Monticello retirement date is unchanged. This scenario is designed to test the economics of re-licensing Prairie Island and extending the operational life by 20 years.

C. Extend All Nuclear Scenario

For the "extend all nuclear" scenario (Scenario 3), the Prairie Island 1 and 2 retirement date extends from 2033/2034 to 2053/2054, and the Monticello retirement date extends from 2040 to 2050. This scenario is designed to test the economics of re-licensing both Prairie Island 1 and 2 and Monticello, extending the operational life of Prairie Island by 20 years and Monticello by 10 years.

IV. MARKET ACCESS AND RELIABILITY

While reliability has always been a critical objective of resource planning, there has been increased focus on regional reliability in the past several years as utilities and other generation owners across the country retire significant dispatchable capacity, replacing it with significant amounts of variable renewable generation. In 2022, the North American Reliability Corporation (NERC) concluded that the MISO region was at risk of insufficient electricity supplies during peak winter conditions.[8] MISO's 2022-2023 Planning Resource Auction (PRA) resulted in a capacity shortfall for the MISO North/Central Regions resulting in the price of capacity clearing at the Cost of New Entry (CONE). More recently, NERC concluded that the supply of electricity in the MISO region "is more likely to be insufficient in the forecast period and that more firm resources are needed."[9]

Recognizing the evolving reliability challenges, MISO has proposed changes to its resource adequacy (RA) construct. The seasonal RA construct was implemented last year and provided reserve margin and resource capacity contributions tailored to each season (spring, summer, fall, winter). Additional changes to the RA construct are also under consideration and will impact the resources needed in the MISO region to meet reliability requirements.

[8] 2022-2023 NERC Winter Reliability Assessment (November 2022) at p. 4. Available at: https://www.nerc.com/pa/RAPA/ra/Reliability%20Assessments%20DL/NERC_WRA_2022.pdf.
[9] 2023 NERC Long-Term Reliability Assessment (Dec. 2023) at p. 7. Available at: https://www.nerc.com/pa/RAPA/ra/Reliability%20Assessments%20DL/NERC_LTRA_2023.pdf

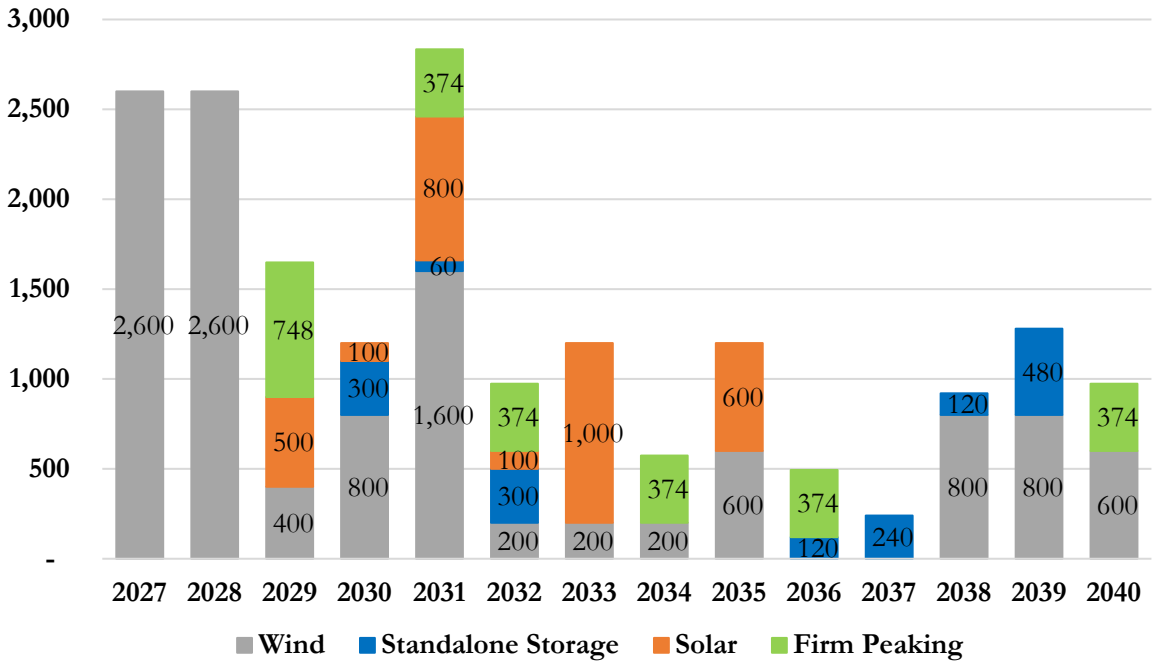
The evolving MISO RA construct creates a challenge to resource planning. Ensuring resource and energy adequacy to all our customers across our Upper Midwest System is a foundational duty of our business. The challenges facing resource planning include the change to a seasonal RA construct, a transition to a higher percentage of intermittent resources across the region, and uncertainty in accredited capacity and future Planning Reserve Margins (PRM). The future accreditation of resources presents a particularly difficult challenge for planners. Investments in solar and storage resources, like other resources, depend on the capacity value of the resources over the life of the assets, which is dependent upon the installed capacity of all resource types in the MISO system.

In this 2024 Plan, the Company used an analytical approach to develop a plan that ensures we have sufficient resources to meet our customers' needs at all times and positions us to be able to comply with future changes to the MISO RA construct, while retaining the economic benefits of the MISO market. Our 2024 Plan adds resources to be able to meet customer needs with very limited reliance on neighboring systems and the broader MISO market. At the same time, our 2024 Plan retains the benefits of participation in the MISO market by incorporating the current planning assumptions and allowing for the economic dispatch of our resources within the broader region. We have tested our Preferred Plan using historical data to analyze variations in load and renewable production. Our 2024 Plan is robust under changing assumptions and provides a path to transition our system while maintaining the reliable system our customers expect.

In our 2019 Plan, we allowed access to the MISO market, subject to an hourly limit on the amount of energy that we could buy or sell to the MISO market. This limit was developed for our 2019 Plan based on PROMOD modeling and historical transfers. We also imposed a limit on market sales of no more than 25 percent of retail sales, consistent with the assumption used in our last 2019 Plan. Given the scale and pace of change in the market at that time, this approach was reasonable for that plan.

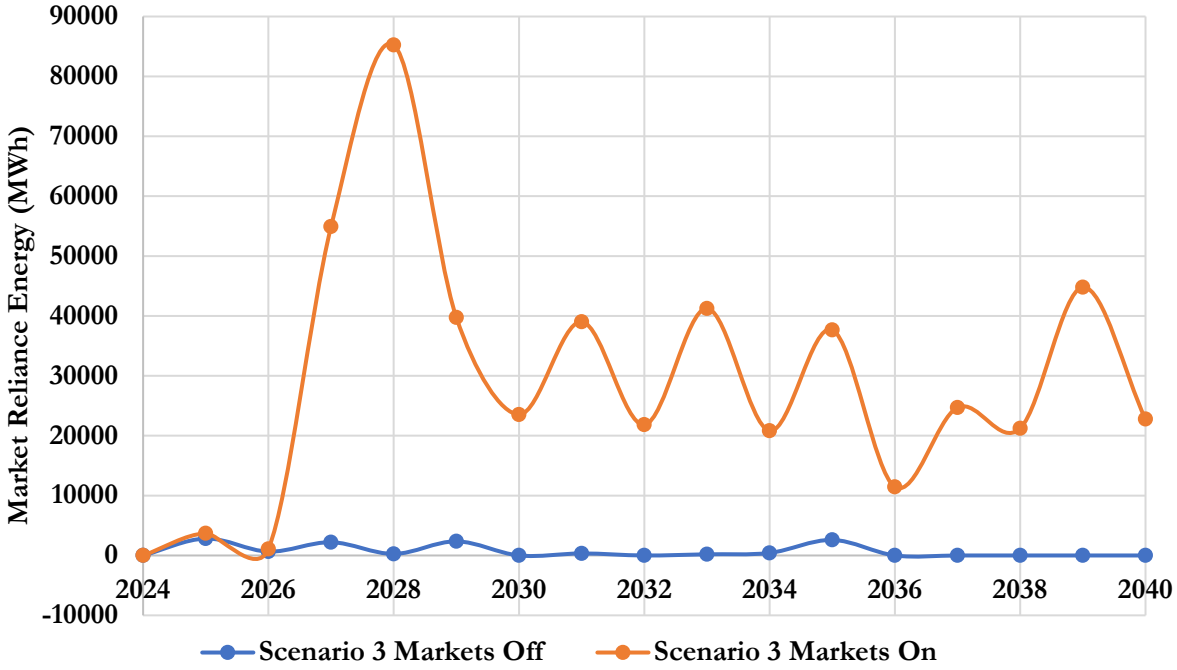
Using the same market access assumptions as those applied in the 2019 Plan now, however, results in a plan with substantial market exposure. In other words, when we allow EnCompass to optimize the resource expansion with the ability to rely on the market, the resources included in the expansion plan are unable to serve our load in a significant number of hours. The Market Access Optimization expansion plan, which represents Scenario 3 with 2,300 MW of hourly market access, is shown below in Figure 5-1.

Figure 5-1: Market Access Optimization Expansion Plan (MW)



The model makes large wind resources additions in 2027, 2028, and beyond (adding over 10,000 MW of wind alone during the planning period) to fulfill capacity needs based on accreditation assumptions and current market conditions. The model assumes excess energy is sold into the market, and the resulting wholesale revenue would make these significant wind resource additions cost-effective. The model does not select firm dispatchable resources until 2029. To assess the market exposure of this plan, we modeled a dispatch run on the expansion plan without market access. This dispatch run provides the number of hours our system relies on market purchases to serve load. The expected market reliance energy shown in Figure 5-2 below is the total megawatt-hours (MWh) in each year in which the expansion plan resources are unable to serve our load and must rely on market purchases.

Figure 5-2: Market Access Optimization - Expected Market Reliance



The significant amount of market reliance results when the plan is optimized with market access. Such a plan's market exposure would be risky for multiple reasons. During the times when the plan is reliant on the market for purchases, Locational Marginal Prices (LMPs) may be unreasonable, or worse, resources may simply not be available. During times when the plan is selling into the market, if LMPs are low, the substantial amount of resources added may not be cost-effective as anticipated by the model. In addition, the resources may not be able to comply with future changes to the MISO reliability construct, if, for instance, there are significant changes to capacity accreditation in the future.

Moreover, historically, we have planned to have enough resources to meet our load serving needs. In the past, when our system relied on fewer renewable resources, this meant ensuring we had sufficient resources to meet our annual planning reserve margin. In general, having sufficient capacity to meet our annual peak resulted in sufficient capacity to meet our needs year-round. As more variable resources have been added to our system, it has become necessary to consider more hours of the year. The change to a seasonal RA construct and the use of the chronological hourly modeling tool, EnCompass, were both motivated by the changing resource mix.

While we have optimized our portfolio without access to the market, we will continue to benefit from the access to the MISO market as we have in the past. We will continue to dispatch our resources on an economic basis. We will purchase from the market when market purchases are lower cost than using our own resources, and we will sell excess generation into the market to benefit our customers. While we optimized the capacity expansion additions without market reliance, we conduct a dispatch run in the Encompass model with market access to reflect these market interaction benefits. Furthermore, as noted above, we plan for our peak needs coincident with the MISO peak. The coincidence factor allows us to procure less capacity than we would otherwise need. In addition, we plan to the MISO PRM, which is developed considering the broader MISO footprint.

By optimizing the resource expansion plan without access to the market, we ensure that our 2024 Plan can serve our customers' needs across all hours of the year and positions us to be able to comply with future changes to the MISO RA construct. Our 2024 Plan adds resources to be able to meet customer needs with very limited reliance on neighboring systems and the broader MISO market for reliability. At the same time, our 2024 Plan retains the benefits of participation in the MISO market by incorporating the current planning assumptions and allowing for the economic dispatch of our resources within the broader region. We have tested our Preferred Plan using historical data to analyze variations in load and renewable production. Our 2024 Plan is robust under changing assumptions as further described in Appendix D: Energy Adequacy Analysis and provides a path to transition our system while maintaining the reliable system our customers expect.

V. SENSITIVITIES

To determine how changes in our assumptions impact the costs or characteristics of the baseload study plans, we examine them under a number of sensitivities. This testing provides insights on potential plan performance and helps us assess the "robustness" of each scenario in the face of future uncertainty, meaning that we want to test how resilient the scenario is to changes in one or more key assumptions. Generally, if a given plan is extremely sensitive to changes in assumptions, it would not represent a prudent course of action for the Company to pursue, because it would subject our customers to excessive risk. Compared to our 2019 Plan, this 2024 Plan includes fewer scenarios, but more sensitivities to address key resource robustness and policy uncertainties as described throughout this section. A summary of sensitivities is presented in Table 5-2 with additional discussion below.

Table 5-2: Sensitivities and Special Studies

Category	Scenario Descriptions
Standard	PVSC – Base, i.e., with Mid Reg Cost ($40) >2028 + Mid Draft EPA <2028 + (Draft EPA - Reg Cost) starting in 2028
	PVRR – Base, i.e., no carbon cost and environmental externality
Sensitivities on All Three Nuclear Scenarios	
Fuel prices	High Fuel/Market Price
	Low Fuel/Market Price
Load	High Load
	Low Load
Technology cost	High Technology Cost
	Low Technology Cost
	Edison MISO Market Prices for wind and solar
Cost of carbon	High Reg Cost ($75) >2028 + High Draft EPA <2028 + (Draft EPA - Reg Cost) starting in 2028
	Low Reg Cost ($5) >2028 + Low Draft EPA <2028 + (Draft EPA - Reg Cost) starting in 2028
	Draft EPA - High ($0 Reg Cost)
	Draft EPA - Mid ($0 Reg Cost)
	Draft EPA - Low ($0 Reg Cost)
Market Access	Market access off in dispatch runs
Environmental Policy	Good Neighbor Rule applied in both Minnesota and Wisconsin + EPA Rule 111
Combination	High technology cost + high load
	Low technology cost + low load
Carbon Free 100x50	Carbon constraint to reach 100x50 carbon free goal
Special Studies on the Preferred Plan	
DG Solar Bundles	Selectable DG bundles
Advanced Technologies	Hydrogen Only
	SMRs Only
	Long-Duration Storage Only
	All three advanced technology options available for selection
Data Center Load	Data Center Load

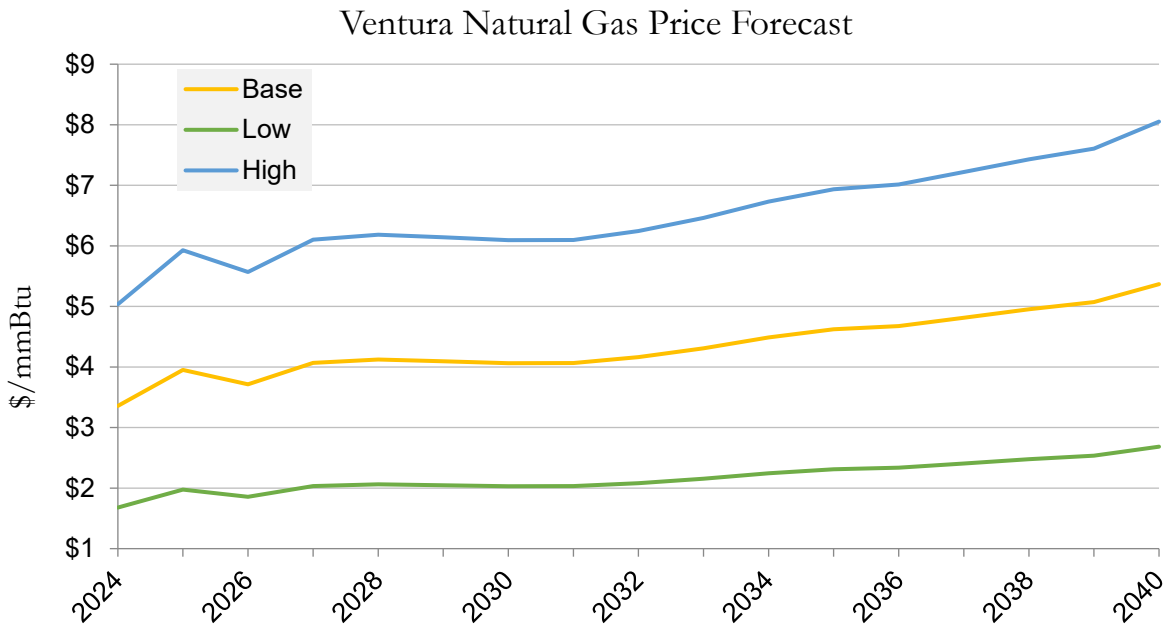
Resource Adequacy	Higher PRM (RBDC opt-out proxy)
	25% Battery ELCC
	Market Access 2,300 MW
	Wind Fleet Variability
Energy Adequacy Analysis	Scenario 3 with market access off
	Scenario 1 with market access off
	Market access 2,300 MW re-optimization for Scenario 3
	Low load scenario for Scenario 3 with market off

*Note: shaded scenarios require re-optimization of the expansion plans and redispatch of the resulting expansion plans.

Special studies on the Preferred Plan are discussed in Section VIII. A summary of the PVRR and PVSC for each sensitivity can be found in Appendix G: Scenario Sensitivity Analysis, and below we discuss additional detail for these sensitivities.

Fuel Price/Market Costs. High and low-price sensitivities were performed by adjusting the growth rate up and down, respectively, by 50 percent from the base forecast. Fuel price assumptions by base, low, and high sensitivities are depicted below in Figure 5-3.

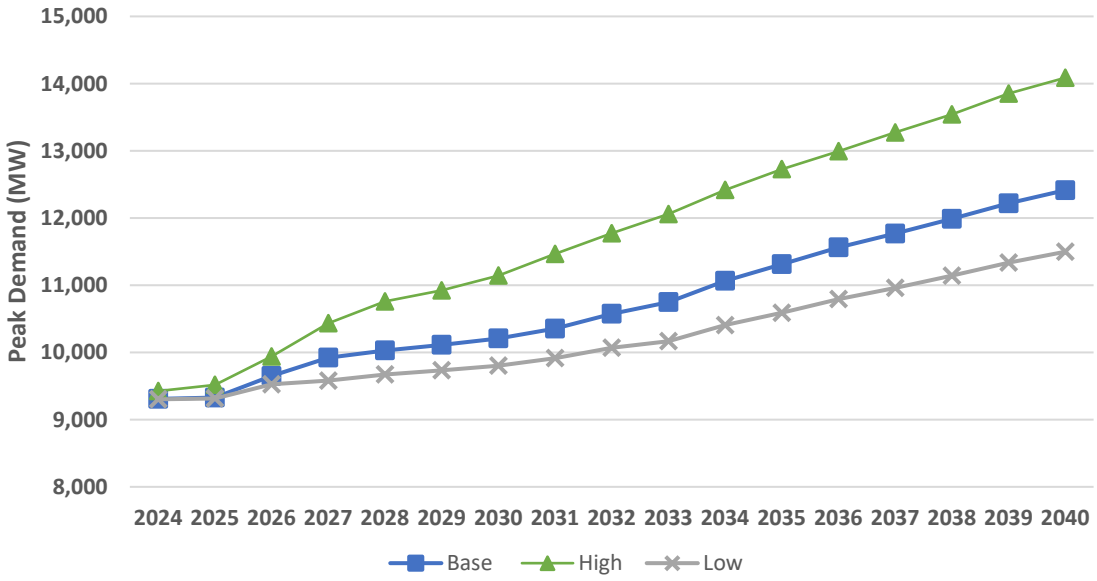
Figure 5-3: Fuel Price Assumptions, by Base, Low, High Sensitivities



Load. The low load sensitivity includes high customer adoption-based Distributed Energy Resource (DER) growth, no beneficial electrification, slower adoption of

electric vehicles (EV), and less new load from data centers. The high load sensitivity includes increased beneficial electrification, full achievement of Minnesota's "20 percent by 2030" goal for EV penetration with similar increases in EV adoption in other states served by NSP, and additional large data center loads located in Minnesota. Peak Demand, net of EE impacts, by Base, Low, and High sensitivity is shown in Figure 5-4 below.

Figure 5-4: Peak Demand, Net of EE Impacts, by Base, Low, High Sensitivities (MW)



Technology Costs. Wind, solar and battery costs, as well as battery operational characteristics such as cycle limit and Round-Trip Efficiency (RTE), are from National Renewable Energy Laboratory (NREL) 2023 *Annual Technology Baseline* (ATB) data. High and low technology cost sensitivities are created based on NREL ATB "Conservative" and "Advanced" forecasts. We also have a sensitivity where the wind, solar and solar + battery hybrid LCOEs prior to 2030 are adjusted to match the 2023 Q1-Q3 actual PPA prices in MISO, reported in the Edison Energy Global Renewable Market Update quarterly reports to align pricing with most recent market trends in MISO. We did not include any sensitivities adjusting capital costs for thermal resources such as the generic CTs or Reciprocating Engines, so all sensitivities include our base cost assumptions for those resources. New wind and solar resource cost assumptions and sensitivities with and without transmission costs are shown below in Figure 5-5 and 5-6, and new battery resource costs assumptions and sensitivities are shown below in Figure 5-7.

Figure 5-5: New Wind and Solar Resource Cost Assumptions with Transmission Cost
($/MWh)

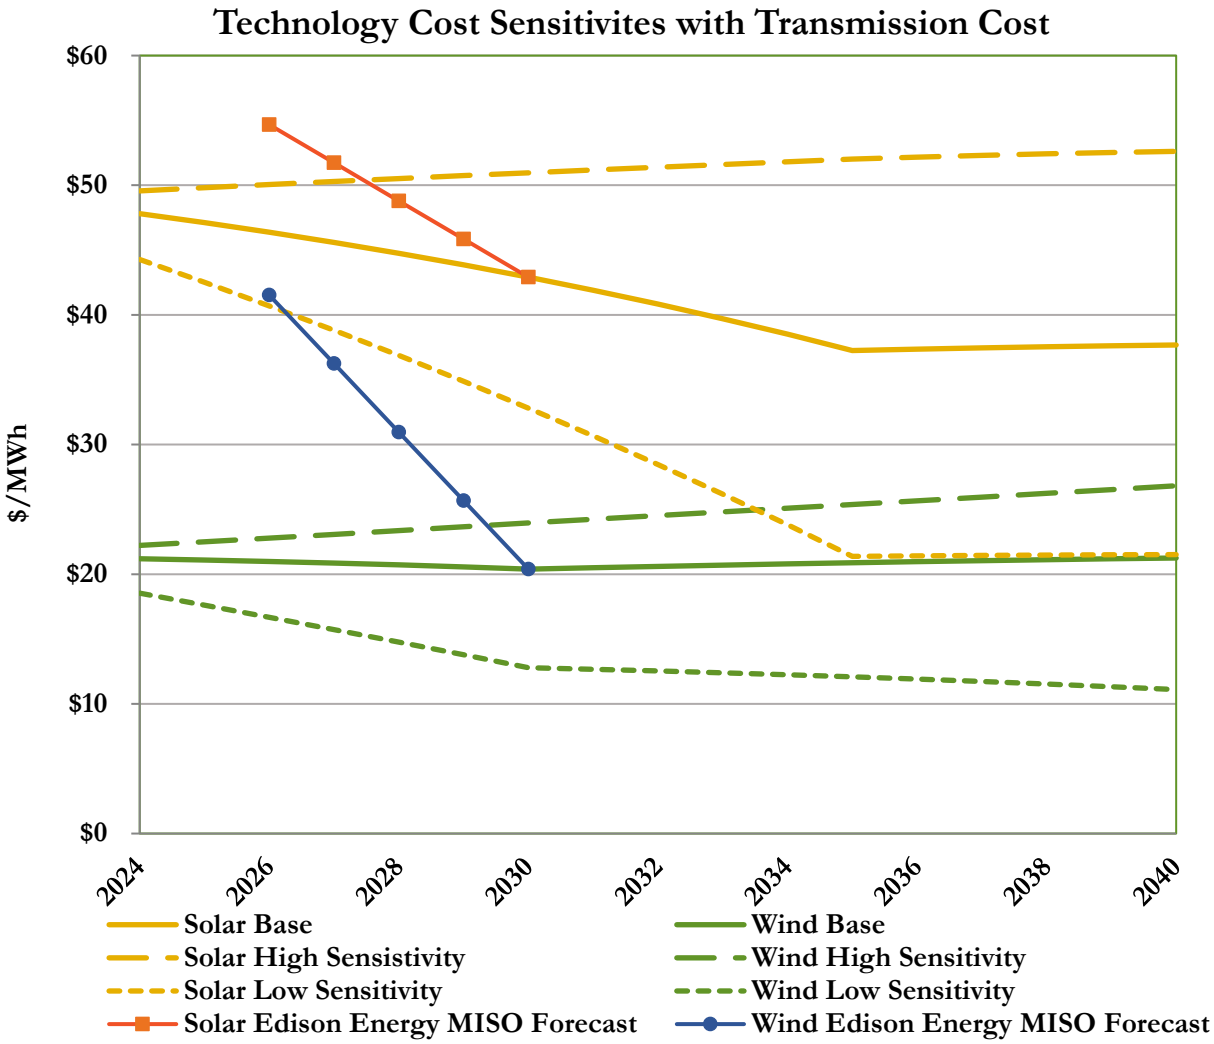


Figure 5-6: New Wind and Solar Resource Cost Assumptions without Transmission Cost($/MWh)

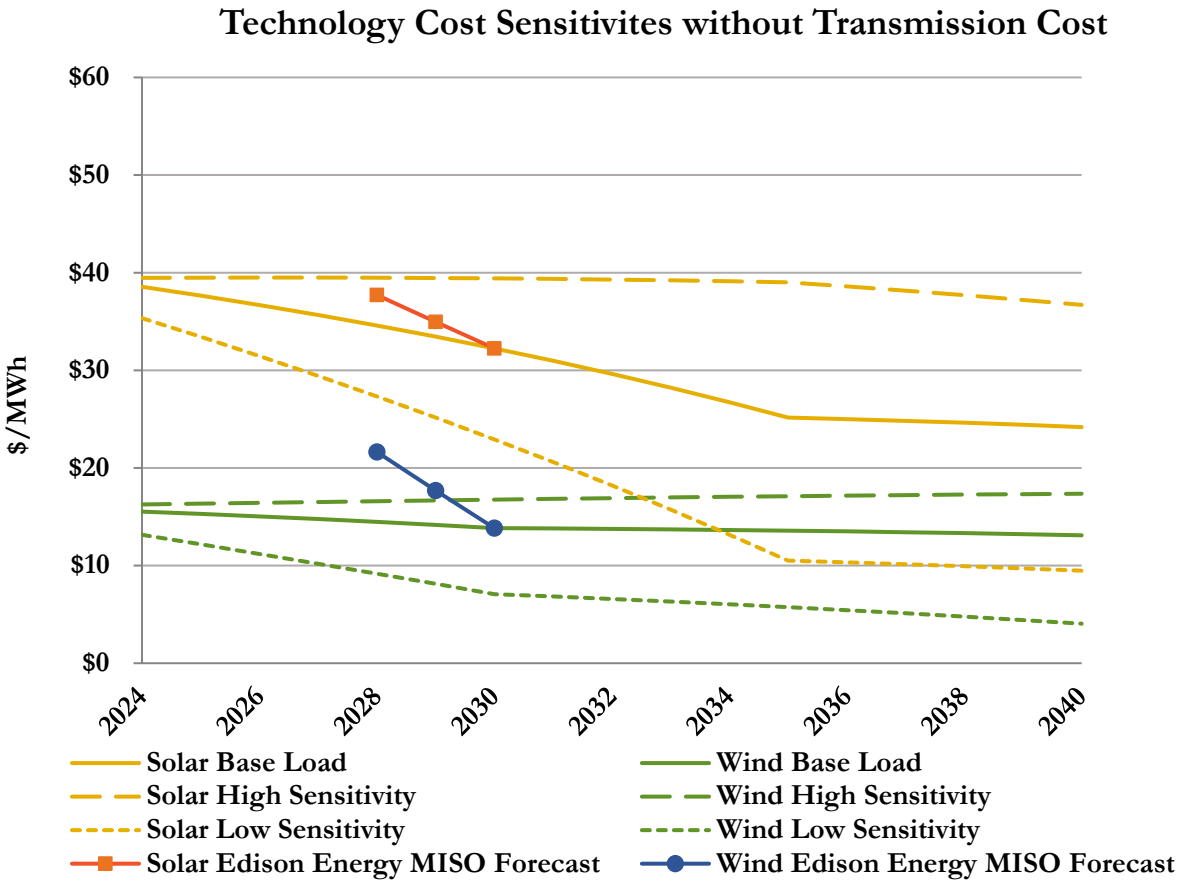

Figure 5-7: New Battery Resource Cost Assumptions with Transmission Cost (nominal $/kW)

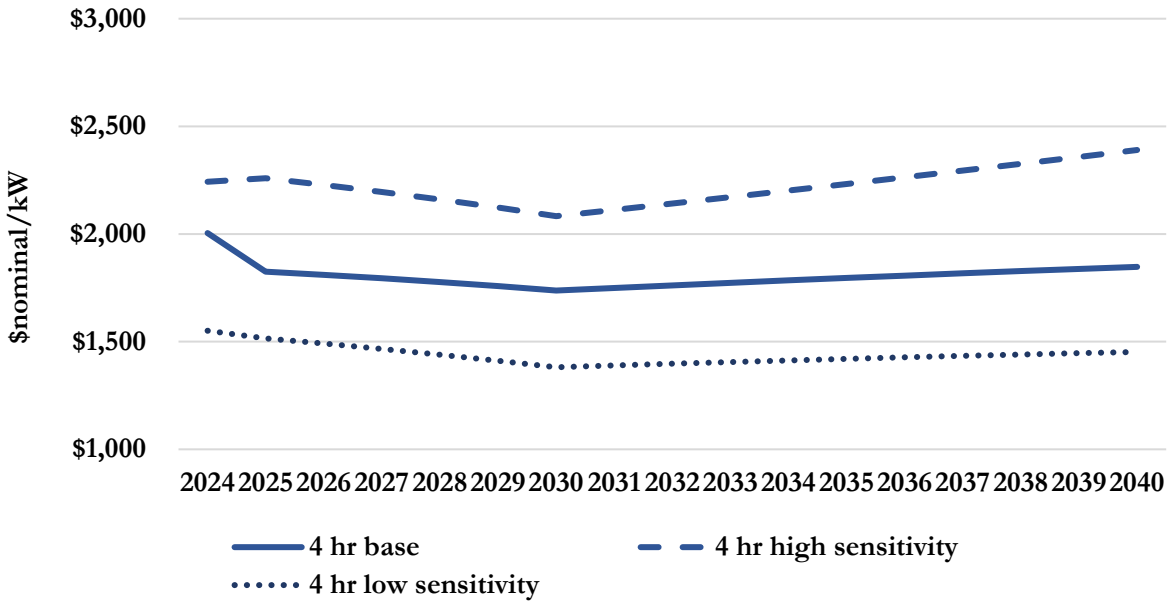


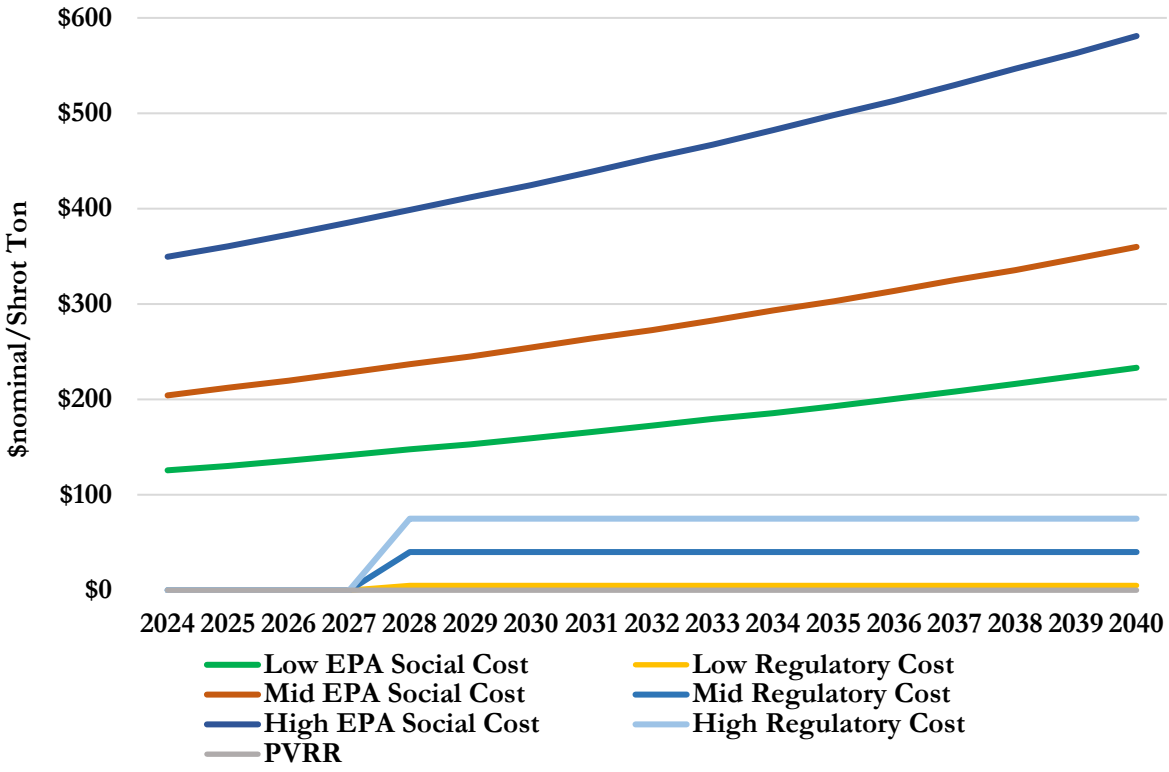
Greenhouse Gas (GHG) Costs. We applied six sensitivities to the model in compliance with the Commission's December 19, 2023 Order in Docket No. E-999/DI-22-236. In the Order, the Commission established a range of regulatory costs of carbon dioxide emissions from $5 to $75 per short ton, effective in 2028 and thereafter. The Commission also provisionally adopted and applied the draft measures of costs related to the emissions of greenhouse gasses as set forth in the EPA's External Review Draft of Report on the Social Cost of Greenhouse Gases (EPA's SC-GHG), released in September 2022,[10] and its successors, for purposes of measuring environmental and socioeconomic costs under Minn. Stat. § 216B.2422, Subd. 3. As noted above, the PVSC base value used the midpoint of the regulatory cost range of $5-$75 and the mid-range of the EPA's SC-GHG. The additional carbon sensitivities are:

High Externality, High Regulatory Cost of Carbon
Low Externality, Low Regulatory Cost of Carbon
High Externality
Mid Externality
Low Externality
PVRR, or No Externality or Regulatory Cost of Carbon

[10] We understand the EPA finalized the draft SC-GHG values in November 2023.

Both the externality and regulatory costs are applied in the regulatory cost sensitivities. To avoid double counting, in the regulatory cost sensitivity, we adjusted the EPA SC-GHG values for modeling purposes by subtracting the Regulatory Cost of Carbon from the EPA SC-GHG value (beginning in 2028). Carbon cost assumptions are depicted in Figure 5-8 below.

Figure 5-8: Carbon Cost Assumptions
($ nominal/Short Ton)



Market Access. The "all markets off" sensitivity represents a view in which we cannot access the market to sell energy outside our system.

Policy (Good Neighbor and proposed EPA Rule 111). This sensitivity requires our fleet to comply with the stayed Good Neighbor Rules and EPA Rule 111 as proposed. To address the Good Neighbor Rules implementation in both Minnesota and Wisconsin, we impose NOx allowances to all existing fossil fuel unit operations. For EPA Rule 111, we limit the annual capacity factor of existing combined cycle units to under 50 percent and any new CT annual capacity factor to under 20 percent.

Combination. For this sensitivity, we combined two different futures: (1) high technology cost and high load and (2) low technology and low load. The high/low technology and high/low load assumptions are described above.

100 Percent Carbon-Free by 2050 (100x50). For this sensitivity, we included a carbon constraint in the model to reach our 100x50 carbon free goal.

It is important to note that these sensitivities are designed to test the performance of our baseload nuclear retirement decisions under plausible future conditions. These sensitivities are not, however, intended to test which future is overall least cost for our system. We do not have full control over the level of distributed solar or electrification growth on our system and have no control over variables such as fuel prices and new resource capital costs. However, as shown in Appendix G: Scenario Sensitivity Analysis: PVRR & PVSC Summary, our Preferred Plan provides benefits under nearly all sensitivities. As demonstrated in the next section, the sensitivities analysis shows that our Preferred Plan baseload nuclear decisions to extend Prairie Island 1 and 2 and Monticello are likely to yield customer benefits relative to the Reference Case, even in a future where multiple key assumptions change.

VI. ENCOMPASS ANALYSIS RESULTS AND SELECTING THE PREFERRED PLAN

After identifying the scenarios and sensitivities for analysis, we used EnCompass to identify the expansion plans for each of the three primary scenarios, and their resulting cost and emissions impacts.

A. EnCompass Model Optimization & Challenges

In the initial round of modeling, all generic technology alternatives (wind, solar, 4-hour and 10-hour batteries, solar + battery hybrid, CTs) were made available to the model, and we developed fully-optimized expansion plans using a typical on and off-peak day per month for the optimization horizon 2027-2055. However, due to the substantial number of these alternatives, initial runs took a significant amount of time to complete (or fail completely). Furthermore, the limited dispatch duration of the 4-hour generic batteries was not evaluated due to the typical on and off-peak setting in the expansion plan. As a result, the model yielded unreliable plans with prominent levels of unserved energy. This unserved energy occurs due to the production cost runs, which are used for more granular dispatch and system cost estimates and simulate the electric system on an hourly time basis, versus the simplified time periods used during capacity expansion modeling used to determine the best mix of resources

to arrive at a least-cost portfolio for a planning period. If the production cost runs associated with certain portfolio yield unserved energy, it demonstrates that resource adequacy captured in the EnCompass modeling has not been achieved due to the disconnect between modeling steps. In this case, due to this set of initial runs reflecting unserved energy and therefore deemed unreliable, we needed to address several refinements in our modeling methodology.

1. Reduced Time Block Granularity

On average, initial runs took over 24 hours to process, and in several instances, EnCompass ran into memory issues and was unable to "solve" the problem. This is defined as the mixed integer programming ("MIP") Stop Basis tolerance defined within EnCompass never being reached and a portfolio never being presented in the modeling output. In order to address the solve time/feasibility issue, the number of daily intervals modeled was reduced to 11 total time blocks per day versus the 24 per day (i.e., every hour) initially used for the on-peak/off-peak optimization period. This additional aggregation of hours resulted in 264 (11*2*12) intervals being solved per year versus 576 (24*2*12) intervals. It should be noted that this aggregation of hours was only applied to capacity expansion modeling for selection of resources for the portfolios and not for the production costing used to estimate overall portfolio costs, which was done using the full 8,760 hours per year granularity. This aggregation was determined based on similar modeling run-time issues experienced in the Company's other jurisdictions and has been discussed/recommended by the software vendor for EnCompass, Anchor Power. They have confirmed that the aggregation proposed would not fundamentally alter the validity of the analysis results. The reason the capacity expansion process, versus production costing, requires this additional aggregation of hours is because of the much larger problem size EnCompass must solve when determining capacity selections.

2. Addressing Battery Storage

In addition to the time granularity issues discussed previously, modeling the different battery storage duration options (for example, 10-hour versus 4-hour) created additional complexities that were a challenge for the model to solve. To develop reliable portfolios which did not result in the modeling reflecting unserved energy, we first removed the 10-hour batteries and solar + battery hybrid resource options to reduce the problem size in the initial step of the capacity expansion plan optimization. We specifically removed these options because doing so was expected to have a minimal impact on any resulting expansion plan for two different reasons, namely MISO's current capacity accreditation methodology for Energy Storage Resources

(ESRs) does not differentiate between ESRs of different durations. For instance, 10-hour batteries receive the same amount of capacity accreditation as 4-hour batteries. Should MISO provide updated guidance for ESR accreditation, we will incorporate it into our model to distinguish between short-duration and long-duration resources.

Second, since the battery portion of a solar + battery hybrid resource can only be charged by the paired solar instead of the grid, the solar + battery hybrid resources do not generate the same energy benefits to the system as standalone batteries. Therefore, they are unlikely to be selected over standalone solar resources or standalone batteries. Furthermore, the IRA allows standalone batteries to receive full ITC without pairing with solar, thereby removing most of the cost advantages of solar + battery hybrid. Moreover, to verify that this simplifying assumption did not result in the elimination of any 10-hour ESR or solar + storage additions, we conducted a special study to allow the Encompass model to consider these resource options. The special study confirmed that 10-hour ESR and solar + storage resources are not selected in the planning period when included as resource options. In the special study where we allow 10-hour batteries and hybrid options in the expansion plan, the 10-hour batteries are only selected in 2052 and the hybrid resource was not selected.

3. Second step expansion plan

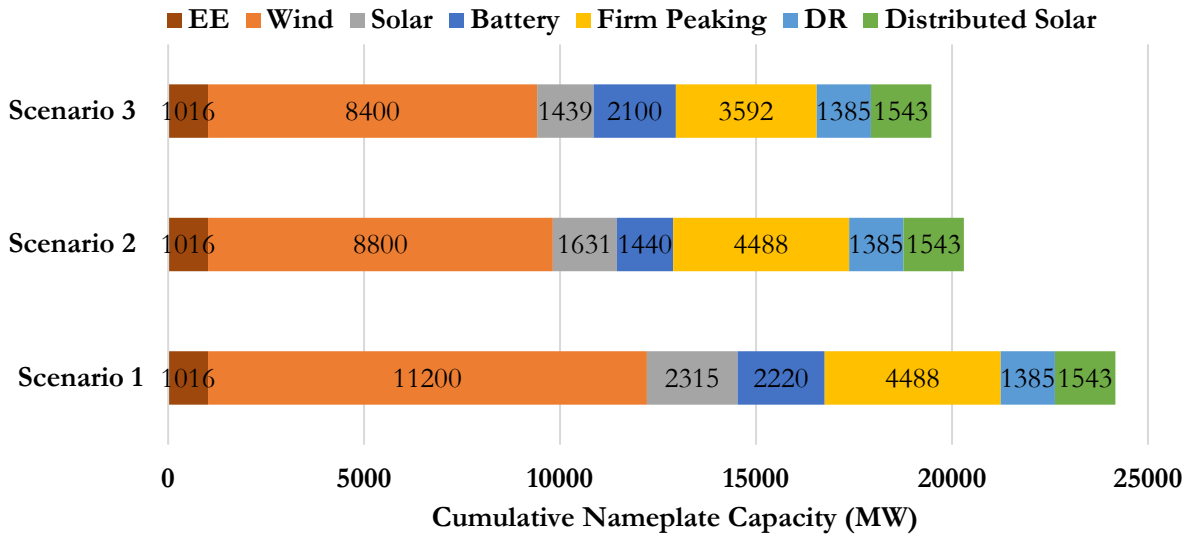
In order to address the unserved energy issue, we created a second expansion plan optimization with more granular time periods, which allowed EnCompass to better evaluate the energy adequacy of dispatchable resources (i.e. 4-hour batteries and CTs). Specifically, we used all calendar days instead of typical on- and off-peak days per month. With this increased optimization granularity, the problem size increased significantly. To allow the model to solve within a reasonable amount of time, we reduced the optimization horizon from 2024-2055 in the initial expansion plan to every four years. Further, we used the wind and solar capacity additions selected in the initial capacity expansion plan as a floor for the minimum wind and solar capacity needs. Additions of wind and solar above the floor are considered in the expansion plan developed in the second step. This second step expansion plan allows EnCompass to capture most of the hourly granularity when evaluating resource options.

B. Modeling Results and Conclusions

Completing baseload scenario runs, as described above, allows us to examine scenario outcomes side-by-side, to evaluate their benefits and drawbacks. Among other factors, we examine the resource expansion profile and carbon emissions outcomes, present value costs, and several indicators of risk for each scenario.

The cumulative expansion plan additions through the planning period for the three scenarios are shown below in Figure 5-9.

Figure 5-9: Expansion Plans by Scenario (MW, Cumulative Nameplate Capacity Resource Additions by Resource Type, 2024-2040)



As shown above in Figure 5-9, Scenario 3 results in fewer additions of firm peaking and wind capacity relative to both Scenarios 1 and 2. The extension of the nuclear units offset additions of other resources need for capacity and energy. While Scenario 2 includes the same amount of cumulative firm peaking resources through 2040, those additions are delayed by the extension of Prairie Island, and few firm peaking resources are needed over the 20-year life extension. Moreover, the nuclear extensions provide a certain and stable source of energy to our system as we transition our generation fleet.

The cost impact of the three scenarios is shown below in Table 5-3. The table shows the net present value (NPV) delta of modeled costs compared to Scenario 1 (the

Reference Scenario), with negative values representing customer savings relative to the Reference Scenario.[11]

Table 5-3: Scenario PVSC/PVRR Deltas from Reference Case ($2024 millions)

PVSC Production Cost	Delta in NPV ($m) 2024-2040	NPV ($m) 2024-2040	Delta in NPV ($m) 2024-2047	NPV ($m) 2024-2047	Delta in NPV ($m) 2024-2050	NPV ($m) 2024-2050
Scenario 1 PVSC	$0	**$51,037**	$0	**$63,635**	$0	**$68,788**
Scenario 2 PVSC	($413)	**$50,624**	($437)	**$63,198**	($513)	**$68,275**
Scenario 3 PVSC	($785)	**$50,252**	($941)	**$62,695**	($1,025)	**$67,762**
PVRR Production Cost	**Delta in NPV ($m) 2024-2040**	**NPV ($m) 2024-2040**	**Delta in NPV ($m) 2024-2047**	**NPV ($m) 2024-2047**	**Delta in NPV ($m) 2024-2050**	**NPV ($m) 2024-2050**
Scenario 1 PVRR	$0	**$34,678**	$0	**$44,948**	$0	**$48,927**
Scenario 2 PVRR	($97)	**$34,581**	$291	**$45,239**	$391	**$49,317**
Scenario 3 PVRR	($464)	**$34,215**	$46	**$44,994**	$239	**$49,166**

The Scenario 3 plan was the lowest cost plan in terms of PVSC in all time periods assessed. As our nuclear plants provide a source of carbon-free energy to our system, extension of these resource results in overwhelming benefits due to the avoidance of carbon emissions from other resources. It also is the lowest cost plan in terms of PVRR through 2040, and nearly breakeven through 2047 compared to the Reference Case. The only outlier is when PVRR is assessed through 2050, which shows Scenario 3 adds $239 million in NPV compared to the Reference Case. We note, however, that the replacement capacity added at the end of the expansion plan to replace Prairie Island in Scenario 2 and Prairie Island and Monticello in Scenario 3, significantly impacts overall cost.

Given current technologies, the model makes significant additions of firm dispatchable resources in the late 2040s in anticipation of the retirement of the nuclear fleet. Under the PVRR assumptions, no cost is included on the emissions from these resource additions. We expect technological advancements will provide resource options that are not currently available when the plants near the end of their extended lives. Therefore, the significant firm dispatchable additions in the late 2040s may not provide a reliable indication of the costs that far out in time. As a result, we provide cost comparisons over three different time horizons. The most relevant of these

[11] Note that these PVRR and PVSC deltas shown depict NPV for 2024-2040.

horizons—through 2040, when resource and cost assumptions are most known—shows the extension of our nuclear fleet provides significant economic benefits even when the benefits of avoided emission are not included.

VII. PREFERRED PLAN SELECTION AND ASSESSMENT

As described previously in this chapter and in Chapter 4: Preferred Plan, we evaluated the PVRR and PVSC results of our three baseload scenarios, and how effectively each potential plan would meet our planning objectives, to determine which Scenario should form the basis of the Preferred Plan. Based on these outcomes, we selected baseload Scenario 3. Our Preferred Plan continues on the path toward achieving ambitious carbon reduction goals and regulatory requirements, reflects substantial stakeholder input and consensus, and ensures reliability and affordability for our customers on both a PVRR and PVSC basis. The baseload aspects of this Preferred Plan include extension of our Monticello nuclear facility to 2050 and Prairie Island to 2053/2054. We discuss more detail regarding how we selected and evaluated our Preferred Plan below.

A. Extend All Nuclear

From a modeling perspective, the PVSC and PVRR results are primary indicators of the various scenarios' economic favorability. Table 5-3 shown above indicates that the Prairie Island and Monticello nuclear extension scenario, Scenario 3, yields the most attractive customer value relative to the Reference Case. Further, Scenario 3 provides the best fit for our carbon goals and helps mitigate the potential for regulatory or legislative action around carbon costs or carbon reduction levels. Maintaining nuclear generation in our resource portfolio provides fuel diversity and an ongoing source of carbon-free baseload generation. From a reliability risk perspective, baseload nuclear adds value as we transition our generation fleet away from coal assets to more intermittent, renewable resources. While all of our scenarios meet the carbon goal we established, we believe cost and risk considerations elevate Scenario 3 above the rest as an appropriate path forward.

As demonstrated in our modeling analysis, the Preferred Plan achieves customer value, not only under a PVSC basis through the mid-2040s but also nearly break-even on a PVRR basis when the cost of Scenario 3 is considered through 2047.

In addition to the beneficial cost outcomes discussed above, the Preferred Plan addresses major risks by maintaining portfolio diversity, retaining optionality, and effectively managing market exposure, as shown in the sensitivity analysis below. The

Preferred Plan incorporates significant capacity additions to replace retiring resources, consisting of a diverse portfolio of DSM, nuclear extension, solar, wind, and firm dispatchable resource additions. This approach mitigates the risk of becoming too dependent on a single fuel source.

B. Sensitivity Results

As previously discussed, a final step in our analysis process evaluated the performance of the baseload study plans under different sensitivities. As shown in Appendix G: Scenario Sensitivity Analysis: PVRR & PVSC Summary, the summary of the PVRR and PVSC for each sensitivity consistently shows the Preferred Plan, Scenario 3, as yielding the most customer benefits on a PVSC basis across nearly all sensitivities. We address key sensitivity assumptions and insights below.

1. Fuel Prices

The Preferred Plan produces savings under both High and Low Fuel Price sensitivities. Our nuclear fleet provides an effective hedge against fuel price volatility.

2. Load

Table 5-4 below provides a summary of the load sensitivity results under different planning periods. The Preferred Plan provides savings under both the high and low load sensitivities relative to the Reference Case, which suggests that the Preferred Plan is robust under a range of potential future conditions.

Table 5-4: Preferred Plan NPV Savings under Different Load Scenarios and Planning Periods ($2024 millions)

	Base PVSC	Base PVRR	High Load PVSC	Low Load PVSC
2024-2040 NPV Delta	($785)	($464)	($837)	($534)
2024-2047 NPV Delta	($941)	$46	($953)	($560)
2024-2050 NPV Delta	($1,025)	$239	($1,013)	($627)

3. Technology Cost

The Preferred Plan provides savings under the High Tech, Low Tech, Edison MISO Market Prices sensitivities conducted. While the savings are reduced under the Low

Technology cost sensitivity, the overall saving of $514 are still considerable as shown in Appendix G.

4. Cost of Carbon

As discussed above, the Preferred Plan was analyzed using six different cost of carbon assumptions. A summary of the results is shown below in Table 5-5.

Table 5-5: Preferred Plan NPV Savings under Different Environmental Regulatory Costs and Planning Periods ($2024 millions)

	PVSC	PVRR	High Reg, High SC-GHG	Low Reg Low SC-GHG	No Reg, High SC-GHG	No Reg, Mid SC-GHG	No Reg, Low SC-GHG
NPV ($m) 2024-2040							
Scenario 1	$0	$0	$0	$0	$0	$0	$0
Scenario 2	($413)	($97)	($707)	($343)	($607)	($428)	($301)
Scenario 3	($785)	($464)	($1,160)	($739)	($974)	($800)	($667)
NPV ($m) 2024-2047							
Scenario 1	$0	$0	$0	$0	$0	$0	$0
Scenario 2	($437)	$291	($1,006)	($224)	($894)	($463)	($192)
Scenario 3	($941)	$46	($1,754)	($790)	($1,565)	($982)	($612)
NPV ($m) 2024-2050							
Scenario 1	$0	$0	$0	$0	$0	$0	$0
Scenario 2	($513)	$391	($1,239)	($248)	($1,067)	($544)	($209)
Scenario 3	($1,025)	$239	($2,058)	($823)	($1,814)	($1,074)	($607)

The Preferred Plan produces the greatest level of savings under all sensitivities that consider a cost of carbon. As discussed above, costs are shown in the 2040s when a carbon cost is not considered, but even when carbon cost are not included, the Preferred Plan results in savings through 2040.

5. Market Access

As discussed above, for the Encompass dispatch runs, we allow for purchases of

market energy and energy sales to market. When market interactions are not allowed, the Preferred Plan continues to show significant benefits as shown in Appendix G.

6. Environmental Policy

The Preferred Plan provides an effective hedge against potential environmental regulations, including the Good Neighbor Rule and draft EPA 111 Rule as shown in Appendix G.

7. Combination

Under the High Technology cost + high load combination sensitivity the Preferred Plan generally results in increased benefits as shown in Appendix G. The extension of the nuclear fleet avoids cost associated with replacement resources and provides a steady source of baseload power for our system. The benefits are reduced or offset under a Low Technology cost + low load sensitivity due to the lower cost of replacement resources and lower load serving needs.

8. 100 Percent Carbon-Free by 2050 (100x50)

The Company has set a goal to generate 100 percent carbon-free energy by 2050 (100x50). Advances in technology will be critical to achieving this goal reliably and cost-effectively. To assess the benefits of our Preferred Plan compared to existing technologies, we conducted a sensitivity that reoptimizes our expansion plan to achieve a 100 percent carbon-free generation fleet by 2050. The results of the analysis are shown below.

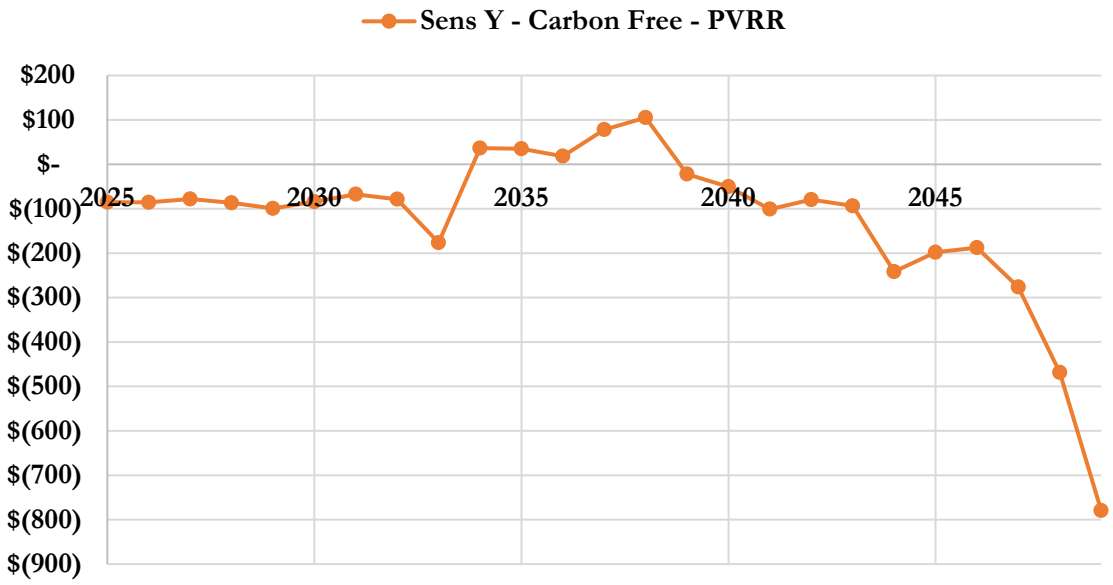
Table 5-6: NPV Savings under 100 Percent Carbon-Free by 2050 Constraint ($2024 millions)

PVSC Production Cost	Delta in NPV ($m) 2024-2040	NPV ($m) 2024-2040	Delta in NPV ($m) 2024-2047	NPV ($m) 2024-2047	Delta in NPV ($m) 2024-2050	NPV ($m) 2024-2050
Scenario 1 - Carbon Free - PVSC	**$0**	$50,703	**$0**	$62,974	**$0**	$70,930
Scenario 2 - Carbon Free - PVSC	**($298)**	$50,406	**($385)**	$62,589	**($1,003)**	$69,927

Scenario 3 - Carbon Free - PVSC	**($662)**	$50,041	**($931)**	$62,042	**($1,850)**	$69,080
PVRR Production Cost	**Delta ($m)**	**NPV ($m) 2024-2040**	**Delta ($m)**	**NPV ($m) 2024-2047**	**Delta in NPV ($m) 2024-2050**	**NPV ($m) 2024-2050**
Scenario 1 - Carbon Free - PVRR	**$0**	$34,819	**$0**	$46,314	**$0**	$54,273
Scenario 2 - Carbon Free - PVRR	**($200)**	$34,619	**($323)**	$45,991	**($947)**	$53,326
Scenario 3 - Carbon Free - PVRR	**($612)**	$34,207	**($941)**	$45,373	**($1,865)**	$52,407

As shown in the Table 5-6 above, the Preferred Plan results in dramatic savings of nearly $2 billion on both a PVSC and PVRR basis. Compared to existing technologies, the extension of our nuclear fleet provides an overwhelmingly cost-effective source of carbon-free energy. Figure 5-10 below shows the PVRR savings over time.

Figure 5-10: Preferred Plan Annual Costs or Savings Compared to the Reference Case, 100x50 Sensitivity ($ millions)



As shown above, significant savings are achieved in the late 2040s under this analysis. Further, as noted above, we expect advancements in technology will reduce the cost of reaching our 100 percent carbon-free goal. As discussed further below, long-duration storage, hydrogen, and small-module reactors could play a role in our energy future as technology evolves. The technologies and costs of alternatives that will be available in the 2040s are very uncertain today. As a result, caution should be taken when considering expect impacts twenty years from now. However, it is clear that our nuclear fleet can play a critical role in providing a source of carbon-free generation well into the future.

C. Preferred Plan and Future Load Uncertainty

We anticipate a change in the slow load growth we have experienced over the past several years. As discussed further in Appendix E: Load Forecasting, we expect to see the demand for electricity to increase at a greater pace. While further improvements in energy efficiency and demand response capabilities will continue to provide substantial value to our customers, we anticipate that emerging uses of electricity will result in greater consumption growth than we have needed to plan for in the recent past. Specifically, our base case forecasts now anticipate average annual growth rates of 1.8 percent in our peak demand, and 2 percent for our energy forecast over the 2024-2040 planning period. As discussed above, given that there is uncertainty in any long-term forecast, primarily around the potential for data center loads and their timing, accelerated EV and DG adoption, etc., we developed High and Low load sensitivities that adjusted the base outlook using discrete adjustments for these forecast components. As shown in Table 5-7 below, under all load sensitivities, Scenario 3 – the Preferred Plan, is the most economic.

Table 5-7: NPV Savings under Base, High, and Low Loads ($2024 millions)

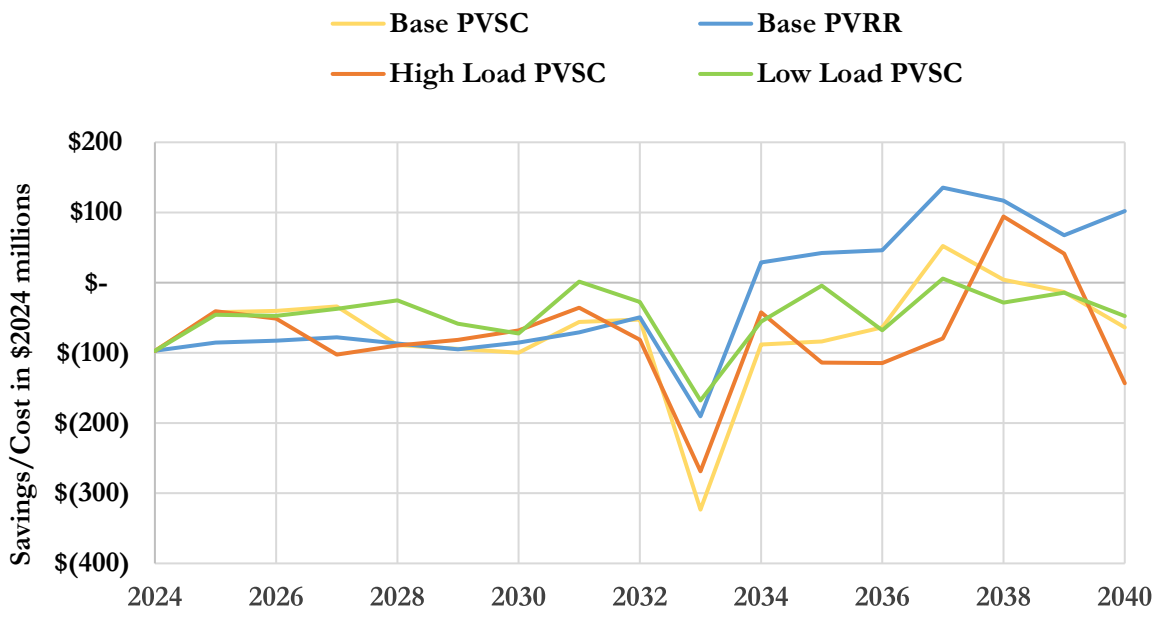
	Scenario 1	Scenario 2	Scenario 3
Delta in NPV ($m) 2024-2040 Base Load PVSC	$0	($437)	($941)
Delta in NPV ($m) 2024-2040 High Load PVSC	$0	($567)	($837)
Delta in NPV ($m) 2024-2040 Low Load PVSC	$0	($298)	($534)

	Scenario 1	Scenario 2	Scenario 3
Delta in NPV ($m) 2024-2047 Base Load PVSC	$0	($437)	($941)
Delta in NPV ($m) 2024-2047 High Load PVSC	$0	($548)	($953)
Delta in NPV ($m) 2024-2047 Low Load PVSC	$0	($143)	($560)
Delta in NPV ($m) 2024-2050 Base Load PVSC	$0	($513)	($1,025)
Delta in NPV ($m) 2024-2050 High Load PVSC	$0	($596)	($1,013)
Delta in NPV ($m) 2024-2050 Low Load PVSC	$0	($128)	($627)

As demonstrated above, the Preferred Plan offers benefits across a range of potential future scenarios. Additional analysis focused on the Preferred Plan is discussed below.

Figure 5-11 below, provides further detail on the expected savings of the Preferred Plan relative to the Reference Case through 2040. As shown, the Preferred Plan achieves customer savings through 2040 under the variations in expected load growth. In other words, load growth that is higher or lower than expected will not significantly change the benefits expected under the Preferred Plan. This demonstrates that the Preferred Plan is robust and beneficial to customers, yielding savings under a host of potential future conditions.

Figure 5-11: Preferred Plan Annual Costs or Savings Compared to the Reference Case, by Scenario ($ millions)



The detailed expansion plan for the 2027-2030 Preferred Plan is provided below.

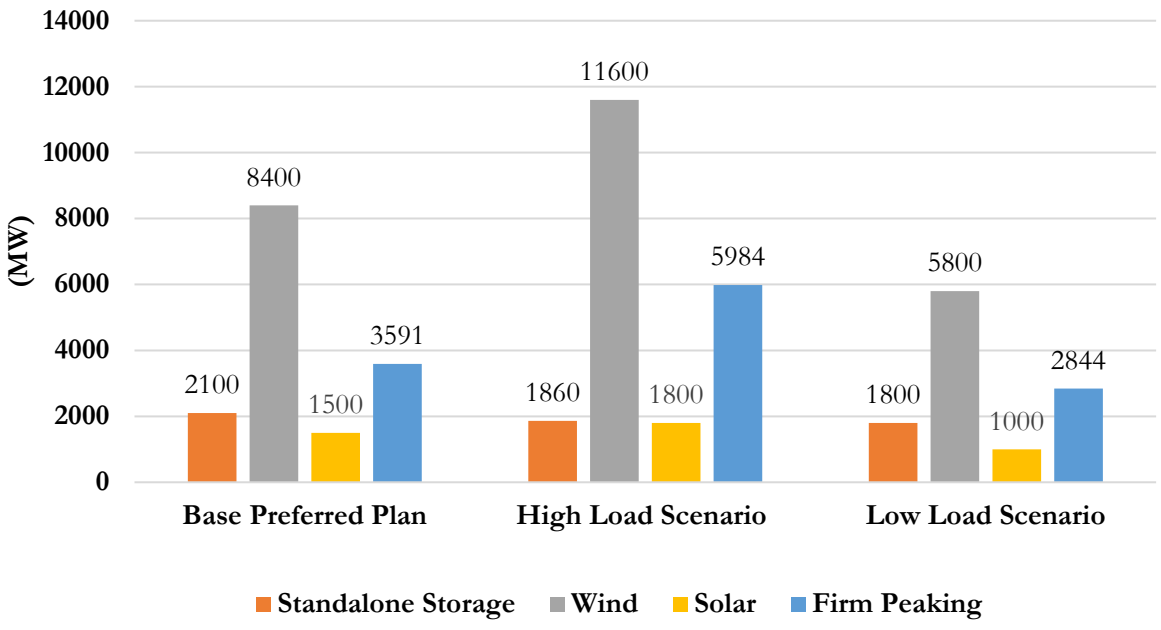
Table 5-8: Preferred Plan Expansion Plan (2027-2030) (MW)

	2027	2028	2029	2030
Standalone Storage	480	-	120	-
Wind	400	2,000	800	-
Solar	-	-	-	400
Firm Peaking	748	748	-	748
Total	**1,628**	**2,748**	**920**	**1,148**

Relative to the Preferred Plan the High Load sensitivity has the same amount of firm dispatchable added by 2030, while the Low Load sensitivity has 374 MW less. The High Load sensitivity also include more storage and wind additions in the near-term, while the Low Load sensitivity, which captures a high distributed solar assumption, includes less wind and solar in the near-term. In other words, across load sensitivities, our plans call for significant additions of renewables and firm dispatchable resources as we continue to retire units and transitions our system.

For simplicity, Figure 5-12 below shows cumulative expansion plan additions by resource type. It is important to note that while DR and EE are not reflected as separate categories, they would be considered to fill any firm dispatchable needs identified in the expansion plans. Similarly, evolving economics and value could also shift the mix of resource additions.

Figure 5-12: Cumulative 2024-2040 Additions by Resource Type and Sensitivity (MW)



D. Preferred Plan Benefits

We believe our analysis supports selection of Scenario 3, extension of Prairie Island to 2053/2054 and Monticello nuclear facility to 2050, as our Preferred Plan. While all of our scenarios meet the 2030 carbon goal we established and achieve compliance with the new 100 percent carbon-free energy by 2040 legislation, we believe cost and risk considerations elevate Scenario 3 above the rest as an appropriate path forward.

1. Cost

As demonstrated in our modeling analysis, the Preferred Plan achieves customer value under a wide variety of future conditions. The Preferred Plan achieves savings under all PVSC analysis and through the planning period on a PVRR analysis. When carbon impacts are considered, either through incorporation of a cost or an emissions constraint, our Preferred Plan results in significant savings. Further, from a customer rate impact perspective, the Preferred Plan, as modeled, results in annual rate increases of under one (1) percent, which is below the rate of inflation.[12] Altogether, we believe the Preferred Plan delivers tangible customer savings while taking industry-leading steps towards a carbon free future.

2. Risk

In addition to beneficial cost outcomes, the Preferred Plan addresses major risks by maintaining portfolio diversity, retaining optionality and effectively managing market exposure. The 2024 Plan incorporates significant capacity additions to replace retiring resources and expiring PPAs, consisting of a diverse portfolio of DSM, nuclear extension, solar, wind, storage, and firm dispatchable resource additions. Further, ensuring we do not become too dependent on a single fuel source mitigates risk.

We also evaluate factors such as energy market exposure and portfolio length. Our Preferred Plan limits our exposure to market risk and ensures we have the resources needed to serve our customers. As discussed below, we conducted extensive analysis to confirm the energy adequacy of our plan. Further, our Preferred Plan results in a portfolio length of at least 230 MWs through the planning period. We believe our Preferred Plan's portfolio length is warranted at this time, and creates an effective hedge for our customers against two key risk factors:

Capital Investment Wind Down at Retiring Plants. The retirement of our remaining coal

[12] As noted in Chapter 4: Preferred Plan and discussed further in Chapter 6: Customer Rate and Cost Impacts

assets, in addition to the expiration of other resources by 2030 exposes our customers to some risk as we wind down operations and reduce capital spend at these plants. In the event of an early outage, excess capacity will give us the option to adjust resource procurements as needed if we find that a capital investment needed to continue operation of a retiring plant is not in our customers' best interests at that time.

Capacity Accreditation. We expect further changes to the accreditation of resources in MISO as discussed Chapter 2: Planning Landscape. MISO's Direct Loss of Load (DLOL) proposal calculates accreditation based on modeled and historical performance of resources during tight margin hours. Our Preferred Plan additions position us to be able to manage the uncertainty of further changes to resource accreditation.

VIII. SPECIAL STUDIES ON THE PREFERRED PLAN

Special studies in resource planning allow for a more thorough examination of specific issues not fully covered in the general resource plan. In this 2024 Plan, we evaluated community energy goals and meeting renewable statute requirements as described below. We also conducted remodels to assess how distributed generation (DG) solar bundles and potential new technology options could impact the Preferred Plan as described below.

A. 50 Percent/75 Percent Renewables

Minn. Stat. § 216B.2422, subd. 2(c) requires that we "include the least cost plan for meeting 50 and 75 percent of all energy needs from both new and refurbished generating facilities through a combination of conservation and renewable energy resources." The Preferred Plan (Scenario 3) satisfies the statute's first requirement (50 percent of energy needs from conservation or renewables) because it is economically optimized and meets approximately 81 percent of energy needs with renewables and conservation. Our baseload scenario analysis satisfies this statute's second requirement (75 percent of energy needs from conservation or renewables), as Scenario 3 yields the least cost plan for meeting at least 75 percent of all energy needs from both new and refurbished generating facilities through a combination of conservation and renewable energy resources.

B. Remodels – DG Solar Bundles, New Technology (Hydrogen, SMRs, Long Duration Storage)

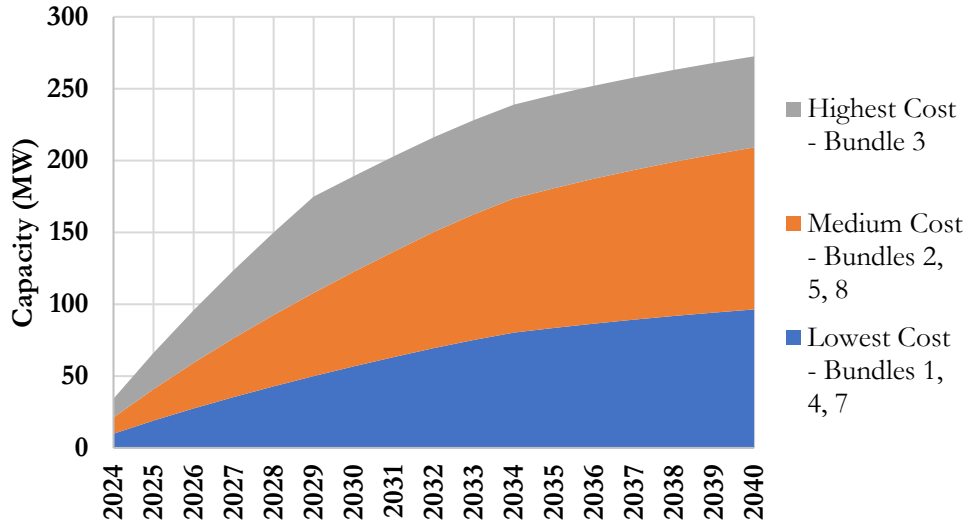
We conducted a special study on the Preferred Plan to assess the impacts of additional DG solar bundles as required by 2019 Plan, Order Point 15. Further, we conducted special studies of advanced technologies (hydrogen, SMRs, long duration storage, and a combination of the three advanced technologies), data center load, resource adequacy (higher PRM/RBDC opt-out, 25 percent battery ELCC, 2,300 MW market access, wind fleet variability), and an energy adequacy analysis—on the Preferred Plan. For each of these studies, the additional resource options are evaluated and optimized in the modeling and added when economic. The study assumptions and findings are described below. A cost analysis for these studies is not included below because the assumptions are insufficiently developed, and the current costs are too high relative to the resource options modeled in this 2024 Plan. Further, the commercial viability of some of these technologies hinders the ability to provide a detailed and reliable cost analysis.

1. DG Solar Bundles

For this special study, we created nine solar bundles as additional resource options for EnCompass to select. Appendix J: Distributed Energy Resources, contains detail on how the solar bundles were developed and about what they represent: estimates of generic customer-owned distributed solar that are economically possible, absent any 1) technical and market barriers for customers and 2) specific details about how the Company would acquire these resources.

Figure 5-13 below shows the selected DG bundle capacity by year, and the resulting cumulative capacity expansion plan is shown in Table 5-9.

Figure 5-13: Selected DG Bundles (MW)



As shown in Figure 5-13 above, solar bundle resource selection increases each year and peaks at 272 MW in 2040. Notably, half of the capacity is installed by the late 2020s. The majority of the added DG solar capacity is derived from the two lowest incentive payment bundles. As shown in Table 5-9 below, the addition of the DG solar bundle resource option results in a reduction of 900 MW of utility-scale generic solar, a slight increase in the amount of storage, and an additional 800 MW of wind. Please see Appendix J: Distributed Energy Resources, for discussion about next steps upon acceptance of each bundle.

Table 5-9: Cumulative Capacity Expansion Plan with Solar Bundle Resource Option (MW)

Resource Type	Base Preferred Plan	Selectable DG Bundles
Standalone Storage	2,100	2,160
Wind	8,400	9,200
Utility-Scale Solar (Non-Bundle)	1,500	600
Firm Peaking	3,592	3,592
Total Without Bundles	15,592	15,552
Additional DG Solar (Bundles)	0	273

Resource Type	Base Preferred Plan	Selectable DG Bundles
Total Added Capacity	15,592	15,775

2. Advanced Technology

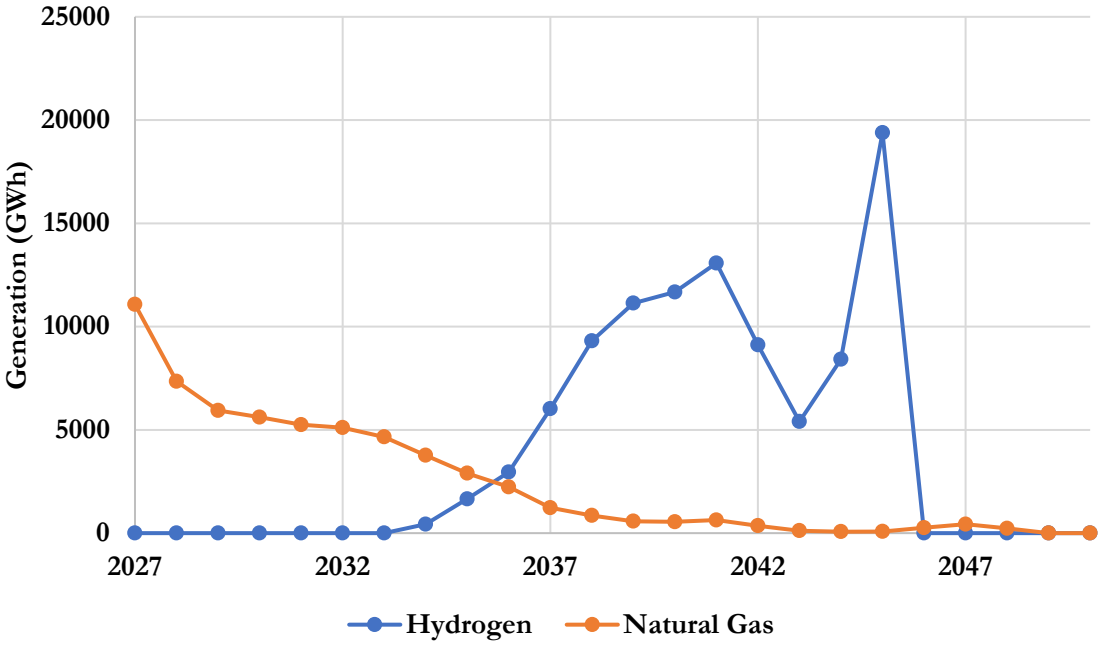
As discussed in Appendix X: Advanced Technologies, advanced and evolving technologies will play a critical role in helping us eliminate the remaining carbon emissions from our system while maintaining safe, affordable, and reliable electric service at times when renewable energy output is low. To further analyze the potential of advanced technologies to achieve our 2050 carbon-free vision, we used Encompass to perform special studies on three advanced technologies. We first study each technology—hydrogen, small modular reactors (SMRs), long duration energy storage (LDES)—individually. Finally, we conducted another study to allow EnCompass select from all three advanced technology options. For each special study, we impose a 100 percent carbon reduction by 2050 (100x50) constraint in EnCompass. We discuss our assumptions and study findings below. Additional model inputs and assumptions are included in Appendix F: EnCompass Modeling Assumptions & Inputs.

a. Hydrogen

For this study, hydrogen is the only advanced technology option available for EnCompass to select. The model allows hydrogen blending with natural gas in firm dispatchable resources (modeled as generic CTs) up to 100 percent starting in 2030 based on economic signals and the carbon constraint. The generic CT depreciation life remains at the default of 40 years due to its hydrogen blending capability.

As shown on Figure 5-14, hydrogen generation rises starting in 2034, reaching its peak in 2045, as the declining production cost and the hydrogen PTC make it a cost-effective, clean alternative to natural gas. However, the expiration of the hydrogen PTC in 2045 reduces its cost-effectiveness and the model does not rely on hydrogen after the PTC expiration based on these assumptions. Further, the use of natural gas gradually diminishes over this period.

Figure 5-14. Generation by Fuel Type in the Hydrogen Only Study (PVSC)



b. Small Modular Reactors (SMRs)

For this study, SMRs are the only available advanced technology resource option for EnCompass to select starting in 2035. The depreciation life of generic CTs is shortened to be fully depreciated in 2050.

As shown below in Table 5-10, the first SMR is selected in 2047 in anticipation of nuclear retirement and zero carbon target in 2050.

Table 5-10: Cumulative Capacity Expansion Plan in the SMR Only Study (MW)

Resource Type	2027-2035	2036-2040	2041-2045	2046-2050	2051-2055
Standalone Storage (4-hr)	1,620	900	2,040	5,640	(900)
SMRs	-	-	-	4,200	3,000
Wind	5,800	3,800	8,400	3,200	2,000
Solar	1,800	300	2,000	5,800	2,900

Resource Type	2027-2035	2036-2040	2041-2045	2046-2050	2051-2055
Firm Peaking	2,244	1,122	-	(3,366)[13]	-
Total	11,464	6,122	12,440	15,474	7,000

c. Long Duration Energy Storage (LDES)

For this study, LDES is the only advanced technology resource for EnCompass to select starting in 2035. The depreciation life of generic CTs is shortened to be fully depreciated in 2050.

The battery seasonal accreditation starts with the MISO October 2023 Resource Adequacy BPM section 4.2.9.4, which provides the five percent forced outage (95 percent accredited capacity assumptions) for new energy storage resources. The accreditation trends over several years from the 95 percent capacity accreditation to the long-term assumptions for battery storage resources in the MISO November 2022 RRA. The MISO battery accreditation is based on a four-hour battery. In the case of a 10-hour battery, we conservatively apply the same value since MISO does not provide an ELCC for a 10-hour duration.

As shown below in Table 5-11, the first LDES is selected in 2036. With significant further additions through 2050. The analysis relies on renewable additions and LDES to achieve the 100x50 goal. As shown in the table below, the model relies on LDES rather than the shorter duration standalone storage.

Table 5-11: Cumulative Capacity Expansion Plan in the LDES Only Study (MW)

Resource Type	2027-2035	2036-2040	2041-2045	2046-2050	2051-2055
Standalone Storage	1,680	-	(840)	840	-
LDES	-	3,000	1,700	7,600	5,500
Wind	6,000	2,400	8,600	-	3,000
Solar	1,800	-	-	3,700	2,100
Firm Peaking	2,244	-	-	(2,244)	-

[13] All firm peaking resources are retired by 2050 in this study.

Resource Type	2027-2035	2036-2040	2041-2045	2046-2050	2051-2055
Total	11,724	5,400	9,460	9,896	10,600

d. Three Advanced Technology Resource Options

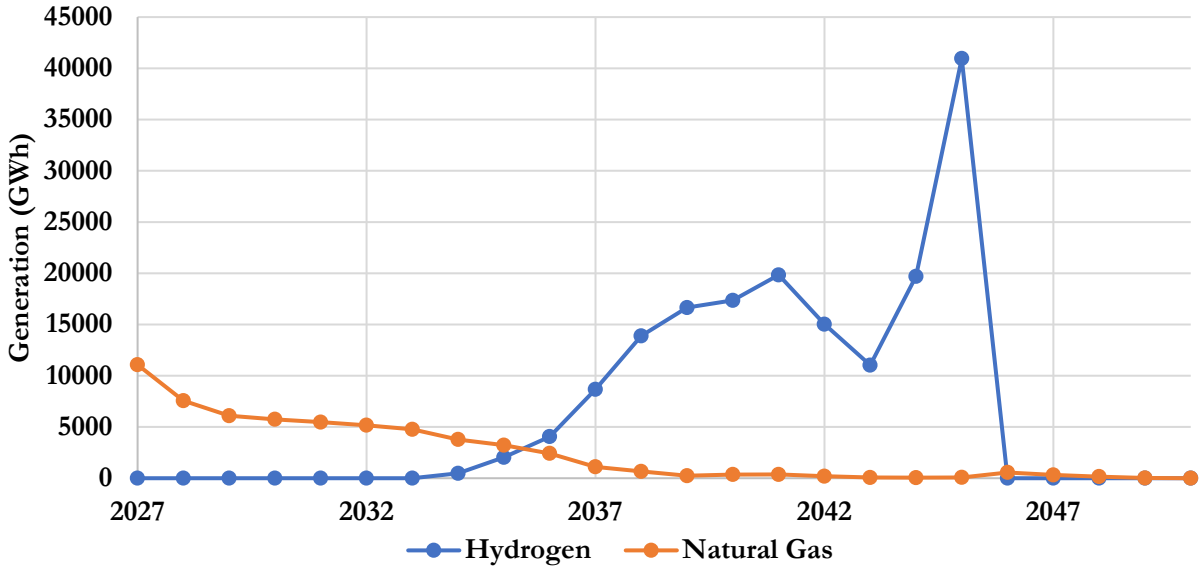
For this study, all three advanced technology resource options—hydrogen, small modular reactors (SMRs), and long duration energy storage (LDES)—were available for EnCompass to select. The SMRs and LDES resources could be selected starting in 2035. The model allows hydrogen blending with natural gas up to 100 percent in firm dispatchable resources (modeled as a CT) starting in 2030 based on economic signals and the carbon constraint. The generic CT depreciation life remains at the default of 40 years, due to its blending capability.

As shown below in Table 5-12, the first LDES resource is selected in 2036, and no SMR is selected throughout the planning period. Hydrogen blending starts in 2034 in the PVSC scenario.

Table 5-12: Cumulative Capacity Expansion Plan in the Study with Three Advanced Technology Resource Options (MW)

Resource Type	2027-2035	2036-2040	2041-2045	2046-2050	2051-2055
Standalone Storage	1,320	-	(600)	(720)	-
LDES	-	2,500	1,900	6,200	5,200
SMRs	-	-	-	-	-
Wind	6,400	800	10,000	-	3,600
Solar	1,500	-	-	3,900	2,300
Firm Peaking	2,470	-	-	-	-
Total	11,690	3,300	11,300	9,380	11,100

Figure 5-15. Generation by Fuel Type in the Scenario with Three Advanced Technology Resource Options (PVSC)



The integration of hydrogen, SMRs, and LDES onto our system has the potential to provide our customers with safe, reliable, and cost-effective benefits while helping the Company and the State of Minnesota achieve decarbonization goals. Our Preferred Plan strategically positions us to explore and integrate advanced technologies in a practical and timely manner to accelerate the clean energy transition.

3. Data Center Load

For the data center load special study, we have assumed load growth surpassing the traditional high load sensitivity to accommodate the accelerated load growth stemming from data centers. The demand for data centers has recently surged notably due to the expansion of machine learning/artificial intelligence technologies, which are more energy-intensive than traditional data processing methods. Xcel Energy's achievements in renewable energy, along with state initiatives and robust fiber connectivity, are contributing to this increased demand for data centers in our service territory. The Company is actively engaged with several hyperscale and colocation data centers, with transmission interconnection studies underway for several requests. These entities are largely seeking renewable/carbon-free energy options and are interested in forming partnerships.

The results in Table 5-13 show the impact of an increased data center load on the capacity expansion plan.

Table 5-13: Cumulative 2024-2040 Additions by Resource Type Comparison

Resource Type	Base Preferred Plan	Data Center Load
Standalone Storage	2,100	2,220
Wind	8,400	12,800
Solar	1,500	3,200
Firm Peaking	3,592	5,462
Total	15,592	23,682

4. Resource Adequacy

To assess resource adequacy, we conducted four special studies as further described below: (1) higher planning reserve margin (RBDC Opt-Out), (2) 25 percent battery ELCC, (3) 2,300 MW Market Access and (4) Wind Fleet Variability. The resulting capacity expansion plan for each resource adequacy study is shown in Table 5-14 and discussed below.

Table 5-14: Cumulative 2024-2040 Additions by Resource Type for Each Resource Adequacy Study

Resource Type	Base Preferred Plan	RBDC Opt-Out	25% Battery ELCC	2,300 MW Market Access	Wind Fleet Variability
Standalone Storage	2,100	2,100	1,320	1,620	2,160
Wind	8,400	8,400	9,200	11,400	8,000
Solar	1,500	1,400	1,700	3,100	1,600
Firm Peaking	3,592	3,592	4,488	2,618	3,592
Total	15,592	15,492	16,708	18,738	15,352

a. Higher Planning Reserve Margin (RBDC Opt-Out)

As discussed in Chapter 2: Planning Landscape, the Reliability Based Demand Curve (RBDC) is a proposed design for MISO's Planning Resource Auction that aims to reflect the value of capacity in excess of the MISO PRM and produce more efficient and stable capacity prices. The RBDC opt-out proxy represents the additional capacity necessary to opt-out of the RBDC. By opting out of the RBDC, we can avoid costs

that would otherwise be assessed to compensate other generators in MISO. This sensitivity assesses the cost of securing the excess generation needed to opt-out. As shown in Table 5-14 above, this study results indicate that the Preferred Plan capacity additions are sufficient to meet the higher planning reserve margin in most years.

b. 25 Percent Battery Effective Load Carrying Capability (ELCC)

The 25 percent battery ELCC special study evaluates the impact of a lower ELCC for battery storage, instead of the 95 percent accreditation battery storage received in the current planning year. As shown in Table 5-14 above, in this study, standalone storage resources additions are reduced by 780 MW while over 1,000 MW of capacity is added from the other resource options. In the near term, by 2030, there is no change in firm peaking capacity additions, and battery capacity additions are reduced by 60 MW relative to the Preferred Plan.

c. 2,300 MW Market Access

For this study, we allow hourly market access of 2,300 MW. As thoroughly discussed in Section IV, the model adds over 10,000 MW of wind alone during this planning period and results in a significant market exposure.

d. Wind Fleet Variability

In the 2019 Plan, the Commission ordered that the Company analyze our likely firm dispatchable need using "corrected modeling of wind fleet variability."[14] We clarify that our generic wind profile uses the average hourly wind generation from our existing wind fleet, which inherently reflect variability of the wind generation profiles. However, to address the order point, this sensitivity uses a blended profile from three representative wind profiles in Minnesota, North Dakota and South Dakota, then allows the model to re-optimize any additions of firm dispatchable resources. We note that our existing wind facilities are modeled using resource-specific wind profiles.

The results in Table 5-14 above show that the cumulative firm peaking capacity additions by 2040 in this study is the same as the Reference Case, indicating changing the generic wind profile does not reduce the need for firm dispatchable resources. However, we intend to conduct this analysis as part of evaluation of resource options in Docket No. E-002/CN-23-212.

[14] *In the Matter of the 2020-2034 Upper Midwest Integrated Resource Plan of Northern States Power Company d/b/a Xcel Energy*, Docket No. E-002/RP-19-368, Order (April 15, 2022), at p.32.

5. 10-hour battery and hybrid resource options

In this study, a 10-hour battery is first selected in 2052 and the hybrid resource is not selected in the modeling period. This validates our decision to remove these two resource options in the base runs to speed up the run time.

6. Energy Adequacy Analysis

We conducted a special study to test the energy adequacy of our plans. As discussed in Appendix D: Energy Adequacy Analysis, we used historical data on four plans including our Preferred Plan and Market Access Optimization, which was developed assuming 2,300 MW of hourly market access.[15] This analysis allows us to assess the capacity and energy adequacy of our plans. We evaluated these four plans on six different measures:

1. Native Capacity Shortfall: Hours of insufficient system capacity in each year.
2. Average Shortfall Intensity: Average Shortfall in MW during the shortfall events in each year.
3. Longest Shortfall Event: Longest duration in hours of the shortfall events in each year.
4. Peak Capacity Shortfall: Peak capacity shortfall in MW of the capacity shortfall events in each year.
5. MISO Market Reliance Hours: Total number of hours the plan is reliant on the market to serve load.
6. MISO Market Reliance Energy: Total amount of MWh the plan is reliant on the market to serve load.

A summary of the results for each scenario in 2030 and 2040 is shown in Table 5-15 below. The highest values in each category are in bold.

[15] As discussed in Appendix D, which also analyzed the Reference Case and Low Load Scenario.

Table 5-15: Summary of 2030 Energy Adequacy Special Study Scenario

		Capacity Adequacy Metrics				Energy Adequacy Metrics**	
Plan	**Historical Year - Hourly Conditions in 2030**	**Native Capacity Shortfall (Hrs.)**	**Average Shortfall Intensity (MW)**	**Longest Shortfall Event (Hrs.)**	**Peak Capacity Shortfall (MW)**	**MISO Market Reliance Hours**	**MISO Market Reliance (MWh)**

	**** LOLH is higher than capacity shortfall due to batteries having available capacity, but no stored energy (MWh)**						

As shown in Table 5-15 above, the Preferred Plan performs well across energy adequacy metrics. There are only two hours of native capacity shortfall in 2030 across the seven historic years tested and applied to our Preferred Plan, resulting in limited dependence on the market. There are only four hours across the seven historical test

years where the Preferred Plan requires market purchases in order to meet load serving needs.

In contrast, under the Market Access Optimization, assumes market access of 2,300 MW in all hours of the year, the results plan exposes our customers to excessive risk. There are 405 hours across the seven historic years where the plan has insufficient capacity to meet needs. This results in 509 hours where the plan cannot meet load serving needs and must rely on market purchases of nearly 250,000 MWh of energy.

IX. CONCLUSION

Considering the above, we believe our modeling and analysis fully supports selection of the Preferred Plan and strikes a strong balance in meeting our planning objectives, in service of our customers' needs. The Preferred Plan sets us on a path to meet both our 2030 carbon reduction objectives and longer-term carbon-free goals and achieve compliance with the new 100 percent carbon-free energy by 2040 legislation, all while providing affordable and reliable service. Further, the Preferred Plan is bolstered by comprehensive reliability and sensitivity analysis, which scrutinize a wide variety of factors and contingencies. This thorough examination provides confidence in the plan's resilience to uncertainties and its ability to meet future energy demands reliably. The combination of robust sensitivity analysis and the multifaceted advantages of nuclear plant extensions underscore the soundness of the Preferred Plan.

CHAPTER 6 – CUSTOMER RATE AND COST IMPACTS

I. INTRODUCTION

Minn. R. 7843.0500, subp. 3, requires that the Minnesota Public Utilities Commission evaluate resource plans on, among other things, their ability to "keep the customers' bills and the utility's rates as low as practicable, given regulatory and other constraints." In this chapter we present rate and bill impacts of our Preferred Plan for our Residential, Commercial, and Industrial customer classes.[1] Overall, our Preferred Plan results in an estimated annual rate increase of 0.5 percent for Minnesota customers, which is less than the expected national average increase of 2.1 percent for electricity prices.

Producing a detailed analysis of rate impacts in a resource planning process with long time horizons is challenging due to the potential changes in our rates and resource needs over time. Factors that can impact the estimated rate impacts in the planning period include generation ownership structure, tax treatment, regulatory decisions, large customer load additions, changes in customer class allocations, and others. The simplifying assumptions made in both the calculation methodology and the input variables mean that these estimated impacts may not align with the actual rates set by the Commission for various customer classes in the future. We caution that this information should not be interpreted as directly comparable to the customer rate impact information we would provide as part of a rate case filing.

Our customer cost impact analysis shows that the Preferred Plan does not materially increase costs for our customers. The Preferred Plan results in an estimated average annual increase in retail rates of 0.9 percent across our system, compared to the Reference Case results of 0.7 percent and the EIA forecasted national average electricity rate increase of 2.1 percent. In other words, we can achieve significant CO_2 emissions reductions, with cost impacts that are less than half of the expected national average increase in electricity prices. Both the Reference Case and the Preferred Plan are designed to meet the Company's clean energy goals, and state policy objectives. As shown below, our Preferred Plan maintains affordability and reliability while continuing our trend of carbon reduction benefits relative to our Reference Case.

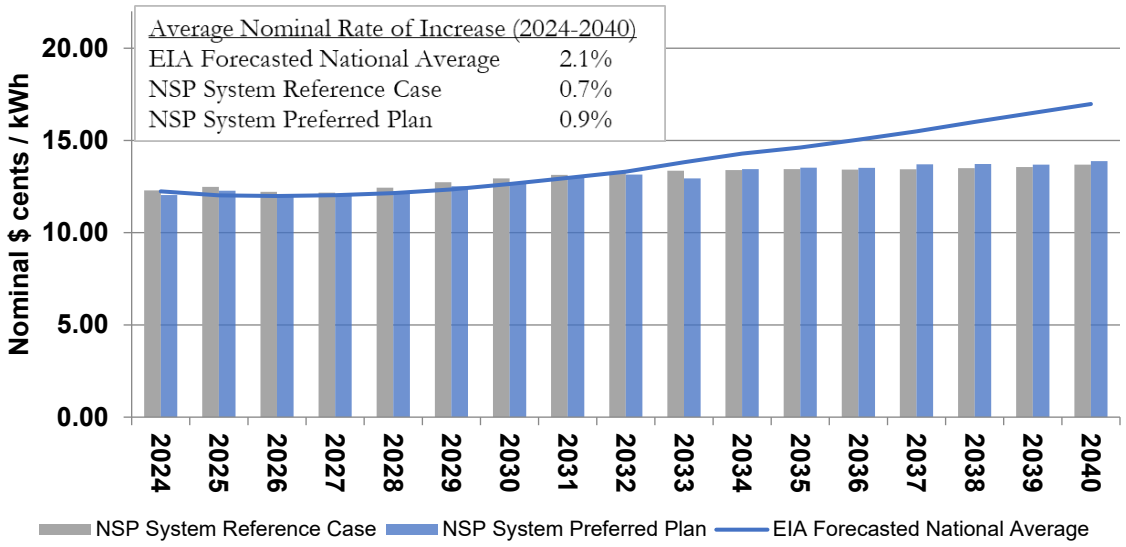
A. Preferred Plan Average Nominal Cost Comparison to National Average

We begin by showing our Reference Case and Preferred Plan's average nominal cost as compared to the national average as forecasted by the Energy Information

[1] See *In the Matter of the 2020–2034 Upper Midwest Integrated Resource Plan of Northern States Power Company d/b/a Xcel Energy*, Order Approving Plan with Modifications and Establishing Requirements for Future Filings, MN PUC Docket No. E-002/RP-19-368, Order Point 18 (April 15, 2022).

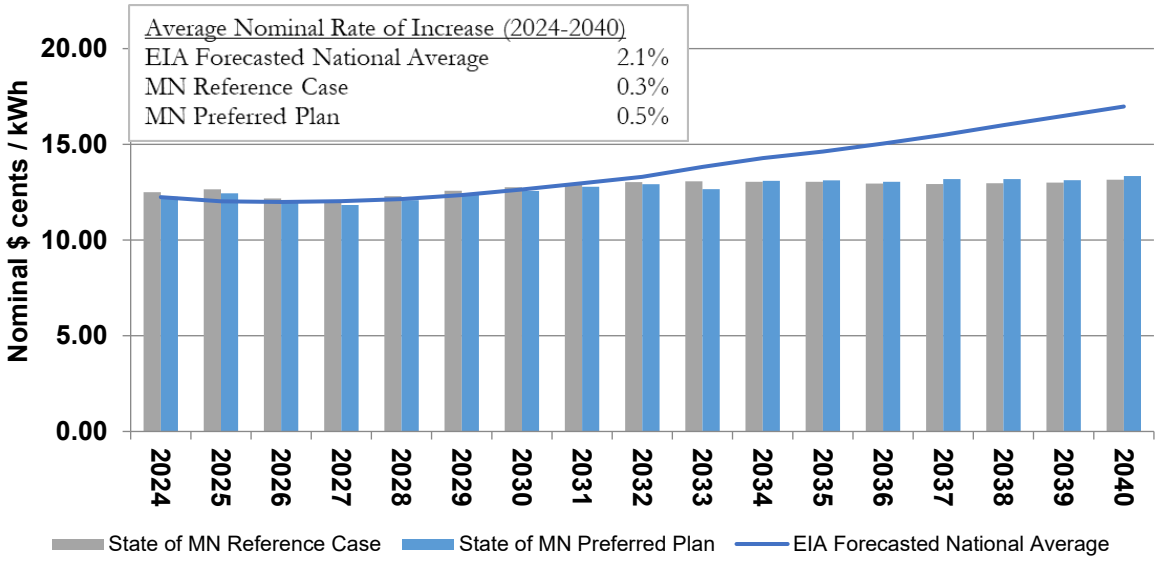
Administration. To show the cost impact of our proposal over the long-term, we provide a compound average growth rate (CAGR) comparison of our Preferred Plan compared to the national average nominal cost CAGR for the NSP System in Figure 6-1, and Minnesota in Figure 6-2, below. As can be seen in these figures, our Preferred Plan remains lower than the national average.

Figure 6-1: Average Nominal Cost Comparison
NSP System



** Notes: National energy cost forecast from Energy Information Administration (EIA) Annual Energy Outlook 2023, Table Energy Supply, Disposition, Prices and Emissions – Reference Case. End use prices, all sector average.*[2] The Preferred Plan and Reference Plan lines include the costs of Solar Rewards*Community.

Figure 6-2: Average Nominal Cost Comparison
State of Minnesota



The results above indicate that the CAGR for average rates is higher for the Preferred Plan than for the Reference Case. To be clear, however, this should not be interpreted to mean that the Reference Case is more beneficial to customers than the Preferred

Plan. The CAGR simply measures the growth rate from one end point to another, in this case the average rate in 2024 versus the average rate in 2040. The Preferred Plan average rate in 2024 begins at a slightly lower point than in the Reference Case, and ends slightly higher in 2040, resulting in a higher growth rate. In contrast, the PVRR analysis takes into account each year of the annual revenue requirement stream, and not just the end points in 2024 and 2040. As discussed earlier in this filing, the Preferred Plan results in a lower PVRR than the Reference Case, making the Preferred Plan the overall least cost option for our customers.

The results in Figures 6-1 and 6-2 also show that the Minnesota CAGR is lower than the NSP system average CAGR for the time period of 2024 through 2040. This is due to the way each CAGR is calculated. The annual NSP system average rates are calculated as the annual revenue requirement for the entire NSP system divided by NSP system sales. The annual Minnesota rates are calculated the same way using the jurisdictional revenue requirement and the jurisdictional annual sales forecast. Since Minnesota sales are forecasted to grow more quickly than the NSP average, they make up a larger portion of the total NSP sales mix in 2040 than they do in 2024. Therefore, the average rates in 2040 (and thereby the CAGR to reach those rates) for Minnesota are lower than for the NSP system as a whole.

II. REVENUE REQUIREMENTS FORECAST METHODOLOGY

To calculate the long-term rate impacts of the Preferred Plan as compared to the Reference Case, we first developed a forecast of revenue requirements for the Reference Case. This forecast leverages retail revenue requirements from the Company's most recent rate case test years approved by each Commission in our five jurisdictions: Minnesota,[3] North Dakota,[4] South Dakota,[5] Wisconsin,[6] and Michigan[7] to create an NSP System revenue requirement for 2024. We identified annual costs through the end of the planning period (2040) using the CAGR of generation and fuel costs from the EnCompass model Reference Case. This approach avoids speculation

[2] *See* U.S. Energy Information Administration - EIA - Independent Statistics and Analysis The EIA's Annual Energy Outlook was published in 2023.
[3] *In the Matter of the Application of Northern States Power Company, dba Xcel Energy, for Authority to Increase Rates for Electric Service in the State of Minnesota*, Findings of Fact, Conclusions, and Order, MN PUC Docket No. E-002/GR-21-630 (July 17, 2023).

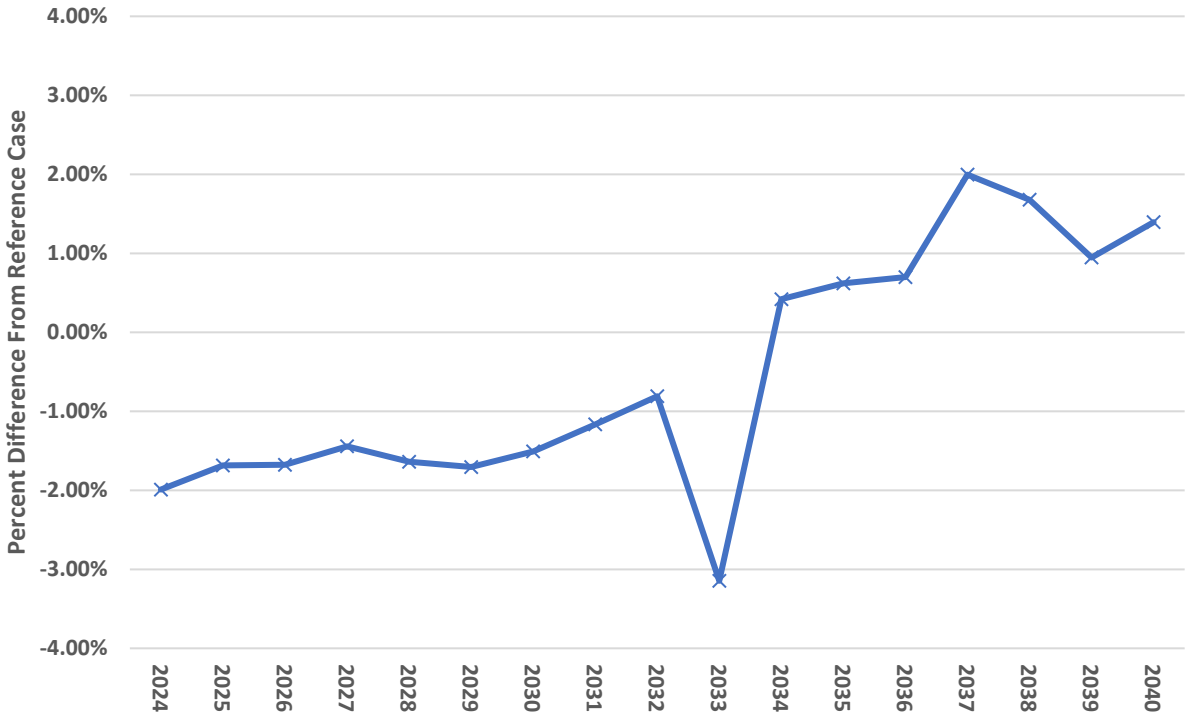
[5] *In the Matter of the Application of Northern States Power DBA Xcel Energy for Authority to Increase Its Electric Rates*, Order Granting Joint Motion for Approval of Settlement Stipulation; Order Approving Refund Plan, Docket No. EL22-017 (June 8, 2023).
[6] *Application of Northern States Power Company-Wisconsin for Authority to Adjust Electric and Natural Gas Rates,* Final Decision, 4220-UR-126 (December 20, 2023).
[7] *Id.*

on areas of the business not related to resource planning and modeling, while still using the detailed generation-related information from the EnCompass model to create a "business as usual" long term rate projection.

To determine the revenue requirement impact of the Preferred Plan, we identified the differential in annual expenses and capital spend of the Preferred Plan compared to the Reference Case Encompass model results. This annual differential was added to the annual Reference Case revenue requirements to create the Preferred Plan annual revenue requirements.

Figure 6-3 below illustrates the estimated revenue requirement impacts of the Preferred Plan compared to the Reference Case over the planning period, while Figure 6-4 localizes the impacts to Minnesota.

Figure 6-3: Annual Percent Change in Revenue Requirements (2024-2040)
Preferred Plan Compared to Reference Case
NSP System

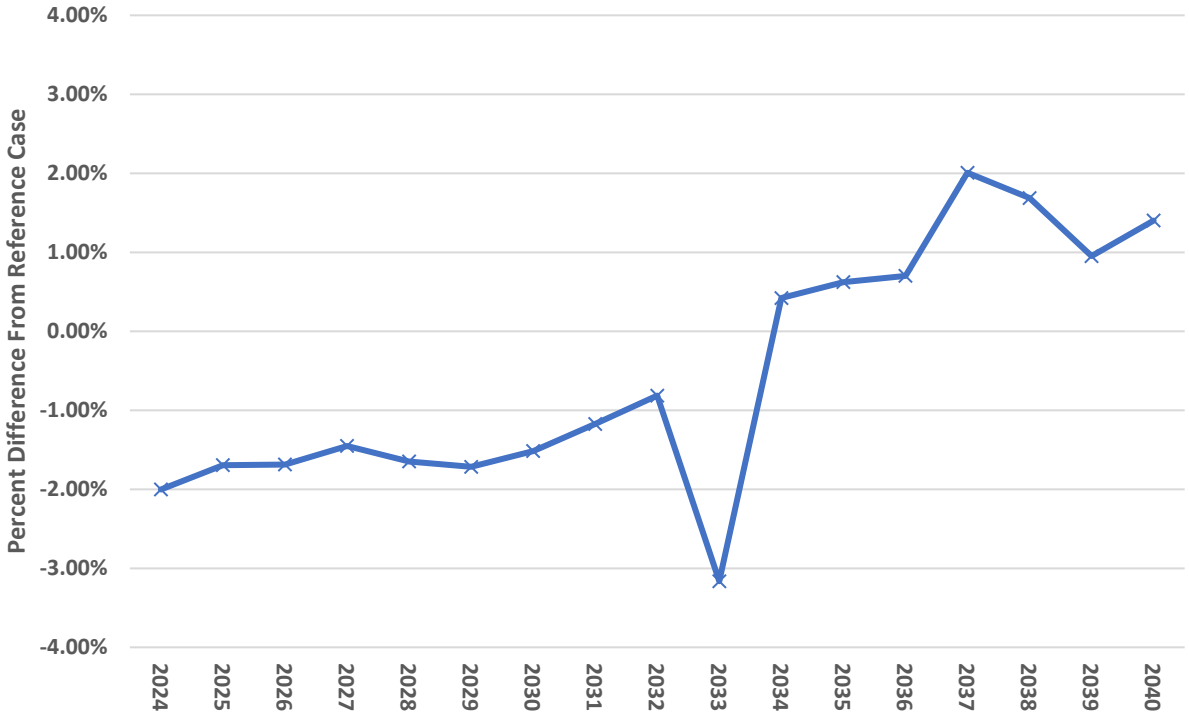


The annual revenue requirements for the Reference Case and Preferred Plan were jurisdictionalized using allocators from the Company's 2022-2024 Minnesota Electric Rate Case (Docket No. E-002/GR-21-630). Table 6-1 and Figure 6-4 below provide the estimated impact of the Preferred Plan for Minnesota.

Table 6-1: Estimated Incremental Impact of Preferred Plan State of Minnesota – All Customers

Year	Reference Case Revenue Req ($000)	Incremental Impact of Preferred Plan ($000)	Preferred Plan Revenue Req ($000)	Incremental Impact (%)
2024	$3,537,894	-$70,821	$3,467,074	-2.00%
2025	$3,628,567	-$61,488	$3,567,079	-1.69%
2026	$3,721,563	-$62,756	$3,658,808	-1.69%
2027	$3,816,943	-$55,396	$3,761,547	-1.45%
2028	$3,914,768	-$64,499	$3,850,268	-1.65%
2029	$4,015,099	-$68,867	$3,946,232	-1.72%
2030	$4,118,002	-$62,422	$4,055,580	-1.52%
2031	$4,223,542	-$49,503	$4,174,039	-1.17%
2032	$4,331,788	-$35,259	$4,296,529	-0.81%
2033	$4,442,807	-$140,536	$4,302,271	-3.16%
2034	$4,556,672	$19,193	$4,575,865	0.42%
2035	$4,673,454	$29,110	$4,702,565	0.62%
2036	$4,793,230	$33,664	$4,826,895	0.70%
2037	$4,916,076	$98,679	$5,014,755	2.01%
2038	$5,042,070	$85,061	$5,127,131	1.69%
2039	$5,171,293	$49,226	$5,220,520	0.95%
2040	$5,303,828	$74,393	$5,378,222	1.40%

Figure 6-4: Annual Percent Change in Revenue Requirements (2024-2040)
Preferred Plan Compared to Reference Case
State of Minnesota



III. KEY DRIVERS

The major inflection points in the delta of revenue requirements (and rates) are driven by the differences in the set of resources that comprise the Preferred Plan and Reference Case; these points coincide with differences in the retirement dates for Prairie Island. Compared to the Reference Case, the Preferred Plan results in lower cost through 2033 due to the extension of Prairie Island and corresponding reduction in depreciation expense. The Prairie Island extension results in fewer resources added in 2033, including the offset of a firm dispatchable addition, compared to the Reference Case, and therefore lower costs reflected in the downward spike in 2033 reflected in Figures 6-3 and 6-4 above. The slightly higher costs in 2034 and beyond reflect the relative costs associated with the Prairie Island extension and the costs of resources added in the Reference Case after Prairie Island retires based on our assumptions for generic resource additions. The generic resource additions are modeled assuming a levelized cost over the life of the asset.

IV. ESTIMATED ANNUAL RATE IMPACTS

After determining the revenue requirement of the Reference Case and the incremental impacts from the Preferred Plan, we determined customer class revenue requirement impacts using cost allocation principles described below. We calculated rate impacts in $ per kWh by dividing each customer class's revenue requirement in each year by the annual forecasted sales.

Figure 6-5 and 6-6 provide the incremental rate impacts of the Preferred Plan for retail customers and by customer class, respectively.

Figure 6-5: Incremental Rate Impact of Preferred Plan
State of Minnesota – All Customers

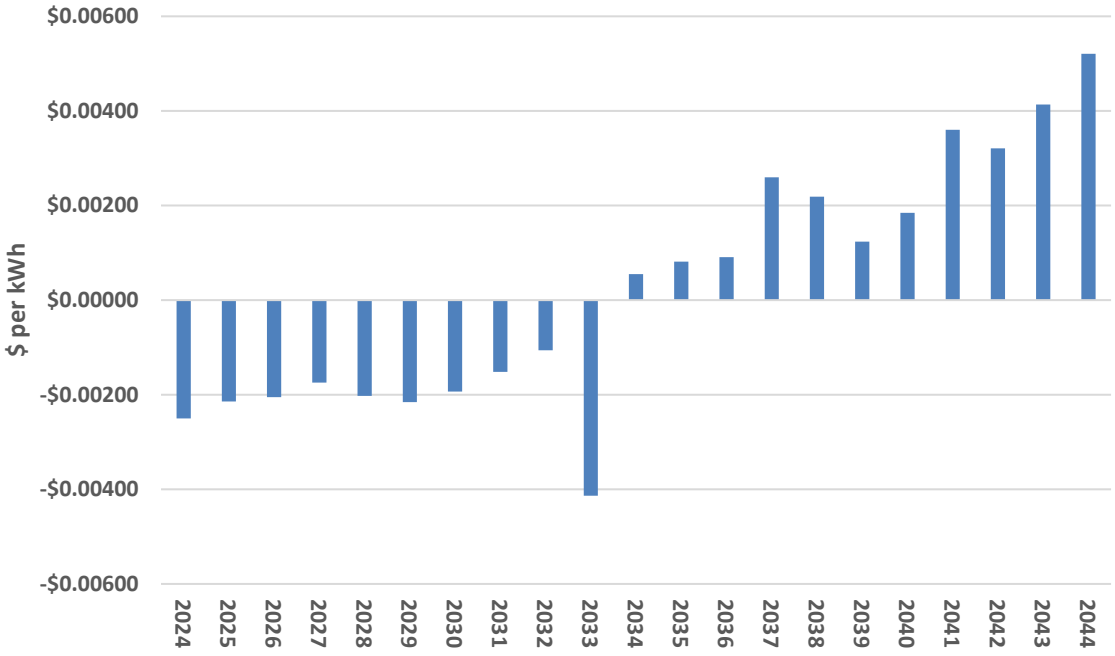


Figure 6-6: Incremental Rate Impact of Preferred Plan
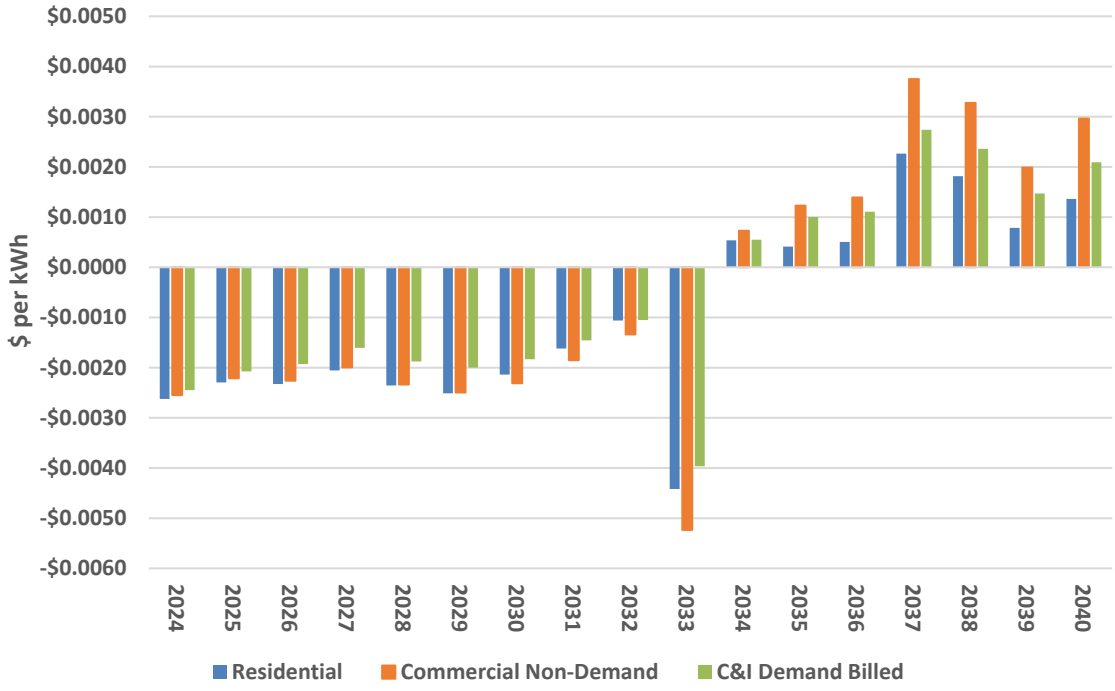
by Customer Class – State of Minnesota



As noted above, we determine customer class revenue requirement impacts of the Preferred Plan by allocating incremental costs to customer classes for each year in the planning period (2024-2040). To do this, we apply ratemaking treatments to expense items for each generation resource type that is impacted by the 2024 Plan. Items include fuel costs and purchased energy, fixed O&M, variable O&M, and the revenue requirement associated with capital investments.

Costs for fuel, purchased energy, and variable O&M are allocated to customer classes using the E8760 energy allocator approved in our most recent Minnesota rate case, as provided below:[8]

Table 6-2: E8760 Energy Allocator

MN	Residential	Commercial Non-Demand	C&I Demand	Lighting
100.00%	31.69%	2.94%	65.03%	0.35%

The E8760 allocator is calculated by taking the forecast hourly load for each of the 8,760 hours of the test year for each customer class, then weighting the hourly load by the forecasted hourly marginal energy cost in each respective hour.

Fixed O&M and the revenue requirement related to capital investments are split into energy-related and capacity/demand-related components using the Company's plant stratification analysis approved in our most recent Minnesota rate case.[9] We provide the plant stratification analysis for each plant type below:

[8] See Docket No. E002/GR-21-630, *In the Matter of the Application of Northern States Power Company for Authority to Increase Rates for Electric Service in the State of Minnesota*, Findings of Fact, Conclusions, and Order , (July 17, 2023).
[9] *Id.*

Table 6-3: Stratification Analysis by Plant Type

Plant Type	Replacement Value $/kW	Capacity Ratio	Capacity/Demand Percentage	Energy Percentage
Combustion Turbine	$1,026	$1,026 / $1,026	100.0%	0.0%
Fossil	$2,458	$1,026 / $2,458	41.8%	58.2%
Nuclear	$5,109	$1,026 / $5,109	20.1%	79.9%
Wind	$11,262	$1,026 / $11,262	9.1%	90.9%
Solar	$3,736	$1,026 / $3,736	27.5%	72.5%

The plant stratification approach begins by comparing the replacement cost of each type of generation plant (fossil, nuclear, etc.) to the replacement cost of a Combustion Turbine (CT). CTs are 100 percent capacity/demand-related since they are the generation source with the lowest capital cost and the highest operating cost. For each generation type, the percent of total generation costs that exceeds the cost of a CT peaking plant are classified as being energy related. These costs are in excess of the capacity/demand-related portion, and as such, were not incurred to obtain capacity, but rather to obtain lower cost energy.

After fixed O&M costs and the capital-related revenue requirement originating from each type of generation plant are split into capacity-related and energy-related components based on the percentages shown in Table 6-3 above, those costs that have been classified as being energy-related are allocated to customer class using the E8760 energy allocator provided in *part 1* above.

The capital costs that have been classified as being capacity- or demand-related are allocated to customer class using the D10S capacity allocator utilized in our most recent rate case.[10] The D10S allocator is simply each customer class's load that is coincident with the NSP system peak load. We provide the D10S customer class allocator percentages below:

Table 6-4: D10S Capacity Allocator

MN	Residential	Commercial Non-Demand	C&I Demand	Lighting
100.00%	39.55%	2.77%	57.68%	0.00%

[10] *Id.*

V. ESTIMATED NEAR-TERM RATE IMPACTS

Table 6-5 below provides a more detailed view of near-term estimated rate impacts for Minnesota customer classes.

Table 6-5: Preferred Plan Minnesota Estimated Rate Impacts by Customer Class per Year

Rate Class Impacts	2024	2025	2026	2027	2028	2029	2030	Comp'd Incr/Yr
Residential (avg rate, ¢/kWh)	15.467¢	15.248¢	15.607¢	15.961¢	16.192¢	16.456¢	15.911¢	N/A

Cumulative Increase (%)		-1.42%	0.90%	3.19%	4.69%	6.39%	2.87%	0.47%
$ Impact/Month, @ 650 kWh		($1.42)	$0.91	$3.21	$4.71	$6.43	$2.89	N/A
Sm Non-Dmd (avg rate, ¢/kWh)	14.501¢	14.301¢	14.672¢	15.122¢	15.522¢	15.949¢	16.743¢	N/A
Cumul Increase (¢/kWh)		-0.200	0.171	0.621	1.021	1.448	2.242	N/A
Cumulative Increase (%)		-1.38%	1.18%	4.28%	7.04%	9.99%	15.46%	2.43%
$ Impact/Month, @ 1,000 kWh		($2.00)	$1.71	$6.21	$10.21	$14.48	$22.42	N/A
Demand (avg rate, ¢/kWh)	10.879¢	10.447¢	9.739¢	9.477¢	9.706¢	9.953¢	10.331¢	N/A
Cumul Increase (¢/kWh)		-0.432	-1.141	-1.403	-1.173	-0.927	-0.548	N/A
Cumulative Increase (%)		-3.97%	-10.48%	-12.89%	-10.79%	-8.52%	-5.04%	-0.86%
$ Impact/Month, @ 37,500 kWh		($162.01)	($427.72)	($526.04)	($440.02)	($347.47)	($205.45)	N/A
Street Ltg (avg rate, ¢/kWh)	26.983¢	26.673¢	27.082¢	27.690¢	28.200¢	28.681¢	29.236¢	N/A
Cumul Increase (¢/kWh)		-0.310	0.099	0.708	1.217	1.698	2.254	N/A
Cumulative Increase (%)		-1.15%	0.37%	2.62%	4.51%	6.29%	8.35%	1.35%
$ Impact/Month, @ 60 kWh		($0.19)	$0.06	$0.42	$0.73	$1.02	$1.35	N/A

Using the methodologies described above, the incremental costs in the last year of the period (2030) for the Preferred Plan would be expected to have the following impacts:

- Residential rate increases by about 0.47 percent on a compounded annual basis through 2030, equivalent to a total increase of $2.89 per month above the current rate level;
- Commercial rate increases by about 2.43 percent on a compounded annual basis through 2030, equivalent to a total increase of $22.42 per month above the current rate level; and
- Industrial rate decreases by about 0.86 percent on a compounded annual basis through 2030, equivalent to a total decrease of $205.45 per month below the current rate level.

As noted above, this is not intended to be a prediction of what rate or bill increases will actually be over this time (which will be impacted by numerous factors, including,

among other things, the specific costs of actual generation additions rather than generic assumptions used here, non-generation related costs, actual sales growth, and cost allocation decisions). Instead, this is intended to serve as an indicative look at the incremental rate and monthly bill impacts of the modeling results for the Preferred Plan.

VI. RATE IMPACTS OF STANDARD OBLIGATIONS

Each electric utility must submit to the Commission a report containing an estimation of the rate impact of activities necessary to comply with Minn. Stat. § 216B.1691, subd. 2e. The report must be updated and submitted as part of each integrated resource plan or plan modification filed under section Minn. Stat.§ 216B.2422.

We have been adding cost-effective renewable resources to our system to reduce emissions consistent with the analysis in our resource plans and acquisitions. Our analysis in the 2024 Plan considers the costs and impacts of the renewable additions but does not require any additions to meet our standard obligations. Therefore, our standard obligations do not impact our rates. For further details please see Appendix N: Standard Obligations.

VII. CONCLUSION

Based on the totality of these metrics, we believe that our Preferred Plan keeps customers' bills and rates as lows as practicable while continuing our transition to a carbon-free system. As we continue our transition to a carbon-free system, we remain committed to being the energy provider of choice for our customers, and keeping rates low is a key part of that commitment.

APPENDIX A: COMPLIANCE MATRIX

Xcel Energy is committed to complying fully with all applicable statutes, rules and orders. We believe our 2024-2040 Upper Midwest Integrated Resource Plan reflects appropriate implementation of all related requirements. The matrix below reflects our inventory of requirements to be met in the 2024-2040 Upper Midwest Integrated Resource Plan and cross-references to the portion of the IRP that fulfills each compliance item.

Rules, Statutes, and Orders			
Statute, Rule or Order	**Subdivision or Order Point**	**Information Required by Statute, Rule or Order**	**2024-2040 IRP Location of Required Content**
Minn. Stat. § 216B.1691 Renewable Energy Objectives	Subdivision 2a	**Eligible energy technology standard**. Each electric utility shall generate or procure sufficient electricity generated by an eligible energy technology to provide its retail customers in Minnesota, or the retail customers of a distribution utility to which the electric utility provides wholesale electric service, so that the electric utility generates or procures an amount of electricity from an eligible energy technology that is equivalent to at least the following standard percentages of the electric utility's total retail electric sales to retail customers in Minnesota are generated by eligible energy technologies by the end of the year indicated: (1) 2012 12 percent (2) 2016 17 percent (3) 2020 20 percent (4) 2025 25 percent (5) 2035 55 percent	Appendix N: Standard Obligations
Minn. Stat. § 216B.1691 Renewable Energy Objectives	Subdivision 2e	**Rate impact of standard compliance; report**. Each electric utility must submit to the commission and the legislative committees with primary jurisdiction over energy policy a report containing an estimation of the rate impact of activities of the electric utility necessary to comply with this section. In consultation with the Department of Commerce, the commission shall determine a uniform reporting system to ensure that individual utility reports are consistent and comparable, and shall, by order, require each electric utility subject to this section to use that reporting system. The rate impact estimate must be for wholesale rates and, if the electric utility makes retail sales, the estimate shall also be for the impact on the electric utility's retail rates. Those activities include, without limitation, energy purchases, generation facility acquisition and construction, and transmission improvements. A report must be updated and submitted as part of each integrated resource plan or plan modification filed by the electric utility under section 216B.2422. The reporting obligation of an electric utility under this subdivision expires December 31, 2040.	Chapter 6: Customer Rate and Cost Impacts
Minn. Stat. § 216B.1691 Renewable Energy Objectives	Subdivision 2g	**Carbon-free standard.** In addition to the requirements under subdivisions 2a and 2f, each electric utility must generate or procure sufficient electricity generated from a carbon-free energy technology to provide the electric utility's retail customers in Minnesota, or the retail customers of a distribution utility to which the electric utility provides wholesale electric service, so that the electric utility generates or procures an amount of electricity from carbon-free energy technologies that is equivalent to at least the following standard percentages of the electric utility's total retail electric sales to retail customers in Minnesota by the end of the year indicated: (1) 2030 - 80 percent for public utilities; 60 percent for *other* electric utilities (2) 2035 - 90 percent for all electric utilities (3) 2040 -100 percent for all electric utilities.	Appendix N: Standard Obligations
Minn. Stat. § 216B.1691 Renewable Energy Objectives	Subdivision 3a	**Utility plans filed with commission**. (a) Each electric utility shall report on its plans, activities, and progress with regard to the standard obligations under this section in its filings under section 216B.2422, or in a separate report submitted to the commission every two years, whichever is more frequent, demonstrating to the commission the utility's effort to comply with this section. In its resource plan or a separate report, each electric utility shall provide a description of: (1) the status of the utility's renewable energy mix relative to the standard obligations; (2) efforts taken to meet the objective and standard obligations; (3) any obstacles encountered or anticipated in meeting the standard obligations; and (4) potential solutions to the obstacles. (5) the number of Minnesotans employed to construct facilities designed to meet the utility's standard obligations under this section; (6) efforts taken to retain and retrain workers employed at electric generating facilities that the utility has ceased operating or designated to cease operating for new positions constructing or operating facilities used to meet a utility's standard obligation; (7) the impacts of facilities designed to meet the utility's standard obligations under this section on environmental justice areas; (8) efforts made to increase the diversity of both the utility's workforce and vendors; and (9) for an electric utility utilizing renewable energy credits to satisfy any portion of its obligations under this section, the following information: (i) the name and location of energy facilities that generated the energy associated with the credits; (ii) the dates when the energy associated with the credits was generated; (iii) the type of fuel that generated the energy associated with the credits; and (iv) whether the energy associated with the credits was purchased by the utility purchasing the credits.	Appendix N: Standard Obligations

Rules, Statutes, and Orders			
Statute, Rule or Order	**Subdivision or Order Point**	**Information Required by Statute, Rule or Order**	**2024-2040 IRP Location of Required Content**
Minn. Stat. § 216B.1691 Renewable Energy Objectives	Subdivision 10	A competitive resource acquisition process established by the commission prior to June 1, 2007, shall not apply to a utility for the construction, ownership, and operation of generation facilities used to satisfy the requirements of this section unless, upon a finding that it is in the public interest, the commission issues an order on or after June 1, 2007, that requires compliance by a utility with a competitive resource acquisition process. A utility that owns a nuclear generation facility and intends to construct, own, or operate facilities under this section shall file with the commission as part of the utility's filing under section 216B.2422 a renewable energy plan setting forth the manner in which the utility proposes to meet the requirements of this section	N/A - we are not proposing any specific resource acquisitions in this Resource Plan
Minn. Stat. § 216B.2422 Resource Planning; Renewable Energy	Subdivision 2	(c) As a part of its resource plan filing, a utility shall include the least cost plan for meeting 50 and 75 percent of all energy needs from both new and refurbished generating facilities through a combination of conservation and renewable energy resources.	Chapter 5: Economic Modeling Framework
Minn. Stat. § 216B.2422 Resource Planning; Renewable Energy	Subdivision 2a	**Historical data and Advance Forecast.** Each utility required to file a resource plan under this section shall include in the filing all applicable annual information required by section 216C.17, subdivision 2, and the rules adopted under that section. To the extent that a utility complies with this subdivision, it is not required to file annual advance forecasts with the department under section 216C.17, subdivision 2.	Appendix AA: 2022 Electric Utility Annual Report
Minn. Stat. § 216B.2422 Resource Planning; Renewable Energy	Subdivision 2c	**Long-range emission reduction planning.** Each utility required to file a resource plan under subdivision 2 shall include in the filing a narrative identifying and describing the costs, opportunities, and technical barriers to the utility continuing to make progress on its system toward achieving the state greenhouse gas emission reduction goals established in section 216H.02, subdivision 1, and the technologies, alternatives, and steps the utility is considering to address those opportunities and barriers.	Chapter 2: Planning Landscape Chapter 4: Preferred Plan Appendix K: Environmental Regulations Review Appendix T: MISO Grid Congestion
Minn. Stat. § 216B.2422 Resource Planning; Renewable Energy	Subdivision 3	**Environmental Costs**. (a) A utility shall use the values established by the commission in conjunction with other external factors, including socioeconomic costs, when evaluating and selecting resource options in all proceedings before the commission, including resource plan and certificate of need proceedings.	Chapter 5: Economic Modeling Framework Appendix F: EnCompass Modeling Assumptions & Inputs
Minn. Stat. § 216B.2422 Resource Planning; Renewable Energy	Subdivision 3(a)	**Environmental costs.**(a) The commission shall, to the extent practicable, quantify and establish a range of environmental costs associated with each method of electricity generation. A utility shall use the values established by the commission in conjunction with other external factors, including socioeconomic costs, when evaluating and selecting resource options in all proceedings before the commission, including resource plan and certificate of need proceedings.	Chapter 5: Economic Modeling Framework Appendix F: EnCompass Modeling Assumptions & Inputs Appendix K: Environmental Regulations Review
Minn. Stat. § 216B.2422 Resource Planning; Renewable Energy	Subdivision 4	**Preference for renewable energy facility.** The commission shall not approve a new or refurbished nonrenewable energy facility in an integrated resource plan or a certificate of need, pursuant to section 216B.243, nor shall the commission allow rate recovery pursuant to section 216B.16 for such a nonrenewable energy facility, unless the utility has demonstrated that a renewable energy facility is not in the public interest. When making the public interest determination, the commission must consider: (1) whether the resource plan helps the utility achieve the greenhouse gas reduction goals under section 216H.02, the renewable energy standard under section 216B.1691, or the solar energy standard under section 216B.1691, subdivision 2f.; (2) impacts on local and regional grid reliability; (3) utility and ratepayer impacts resulting from the intermittent nature of renewable energy facilities, including but not limited to the costs of purchasing wholesale electricity in the market and the costs of providing ancillary services; and (4) utility and ratepayer impacts resulting from reduced exposure to fuel price volatility, changes in transmission costs, portfolio diversification, and environmental compliance costs.	Chapter 4: Preferred Plan Chapter 5: Economic Modeling Framework Appendix F: EnCompass Modeling Assumptions & Inputs
Minn. Stat. § 216B.2422 Resource Planning; Renewable Energy	Subdivision 4a	**Preference for local job creation**. As part of a resource plan filing, a utility must report on associated local job impacts and the steps the utility and the utility's energy suppliers and contractors are taking to maximize the availability of construction employment opportunities for local workers. The commission must	Appendix O: 2023 Workforce Transition Plan Summary Appendix O1: 2023 Workforce Transition Plan Appendix R: Equity
Minn. Stat. § 216B.2422 Resource Planning; Renewable Energy	Subdivision 7	**Energy storage systems assessment.** (a) Each public utility required to file a resource plan under subdivision 2 must include in the filing an assessment of energy storage systems that analyzes how the deployment of energy storage systems contributes to: (1) meeting identified generation and capacity needs; and (2) evaluating ancillary services. (b) The assessment must employ appropriate modeling methods to enable the analysis required in paragraph (a).	Appendix F: EnCompass Modeling Assumptions & Inputs Appendix H: Resource Options Appendix I: Minnesota Energy Storage Systems Assessments Appendix L: System Planning Integration
Minn. Stat. § 216B.2426 Opportunities for Distributed Generation		The commission shall ensure that opportunities for the installation of distributed generation, as that term is defined in section 216B.169, subdivision 1, paragraph (c), are considered in any proceeding under section 216B.2422, 216B.2425, or 216B.243.	Chapter 5: Economic Modeling Framework
Minn. Stat. § 3.8851 Legislative Energy Commission	Subdivision 4	**Nuclear reports**. The public utility that owns the Prairie Island and Monticello nuclear generation facilities shall update the reports required under section 116C.772, subdivisions 3 to 5, and shall submit those updates periodically to the Public Utilities Commission with the utility's resource plan filing under section 216B.2422 and to the Legislative Energy Commission.	Appendix M: Nuclear Appendix BB: 2022-2024 Triennial Nuclear Plant Decommissioning Study and Assumptions

Rules, Statutes, and Orders			
Statute, Rule or Order	**Subdivision or Order Point**	**Information Required by Statute, Rule or Order**	**2024-2040 IRP Location of Required Content**
Minn. Rule 7843.0300 Filing Requirements and Procedures	Subpart 3	**Completeness of filing.** The resource plan must contain the information required by part 7843.0400, unless an exemption has been granted under subpart 4.	See below:
Minn. Rule 7843.0400 Contents of Resource Plan Filings	Subpart 1	**Advance forecasts.** A utility shall include in the filing identified in Subpart 2 its most recent annual submission to the Minnesota Department of Commerce and the Minnesota Environmental Quality Board under Minnesota Statutes, sections 216B.2422, subdivision 2a, and 216C.17, and parts 7610.0000 to 7610.0600.	Appendix AA: 2022 Electric Utility Annual Report
Minn. Rule 7843.0400 Contents of Resource Plan Filings	Subpart 2	**Resource Plan.** A utility shall file a proposed plan for meeting the service needs of its customers over the forecast period. The plan must show the resource options the utility believes it might use to meet those needs. The plan must also specify how the implementation and use of those resource options would vary with changes in supply and demand circumstances. Utility is only required to identify a resource option generically, unless a commitment to a specific resource exists at the time of the filing. Utility shall also discuss plans to reduce existing resources through sales, leases, deratings, or retirements.	Chapter 4: Preferred Plan Chapter 5: Economic Modeling Framework Appendix G: Scenario Sensitivity Analysis--PVRR & PVSC
Minn. Rule 7843.0400 Contents of Resource Plan Filings	Subpart 3	**Supporting Information.** A utility shall include in its resource plan filing information supporting selection of the proposed resource plan.	Entire IRP
Minn. Rule 7843.0400 Contents of Resource Plan Filings	Subpart 3A	A) When a utility's existing resources are inadequate to meet the projected level of resource needs, the supporting information must contain a complete list of resource options considered for addition to the existing resources. At a minimum, the list must include new generating facility of various types and sizes and with various fuel types, cogeneration, new transmission facilities of various types and sizes, upgrading of existing generation and transmission equipment, life extensions of existing generation and transmission equipment, load-control equipment, utility-sponsored conservation programs, purchases from non-utilities, and purchases from other utilities. The utility may seek additional input from the commission regarding the resource options to be included in the list. For a resource option that could meet a significant part of the need identified by the forecast, the supporting information must include a general evaluation of the option, including its availability, reliability, cost, socioeconomic effects, and environmental effects.	Chapter 4: Preferred Plan Chapter 5: Economic Modeling Framework Appendix H: Resource Option
Minn. Rule 7843.0400 Contents of Resource Plan Filings	Subpart 3B	B) The supporting information must include descriptions of the overall process and of the analytical technique used by the utility to create its proposed resource plan from the available options.	Chapter 5: Economic Modeling Framework
Minn. Rule 7843.0400 Contents of Resource Plan Filings	Subpart 3C	C) The supporting information must include an action plan, a description of the activities the utility intends to undertake to develop or obtain noncurrent resources identified in its proposed plan. Action plan must cover a five-year period beginning with the filing date. Action plan must include a schedule of key activities, including construction and regulatory filings.	Chapter 4: Preferred Plan
Minn. Rule 7843.0400 Contents of Resource Plan Filings	Subpart 3D	D) For the proposed resource plan as a whole, the supporting information must include a narrative and quantitative discussion of why the plan would be in the public interest, considering the factors listed in part 7843.0500, subpart 3.	Chapter 4: Preferred Plan
Minn. Rule 7843.0400 Contents of Resource Plan Filings	Subpart 4	**Nontechnical summary.** A utility shall include in its resource plan filing a non-technical summary, not exceeding 25 pages in length and describing the utility's resource needs, the resource plan created by the utility to meet those needs, the process and analytical techniques used to create the plan, activities required over the next five years to implement the plan, and the likely effect of plan implementation on electric rates and bills. Minn. Stat. §216B.1612,	Appendix Z: Non-Technical Summary
Docket No. E999/CI-06-159 In the Matter of Commission Investigation and Determination under the Electricity Title, Section XII, of the Federal Energy Policy Act of 2005 **August 10, 2007 Order**	Order Point 2	**(Fossil Fuel Efficiency Standard)** Investor-owned utilities shall include information in their Resource Plans generically describing how the utility is planning to address fossil fuel efficiency to meet the goals of this standard.	Chapter 5: Economic Modeling Framework Appendix F: Encompass Modeling Assumptions & Inputs
Docket No. E999/CI-06-159 In the Matter of Commission Investigation and Determination under the Electricity Title, Section XII, of the Federal Energy Policy Act of 2005 **August 10, 2007 Order**	Order Point 3	Investor-owned utilities shall include information in their Resource Plans with respect to: a. The heat rates of existing plants; b. Their efforts to maintain or improve heat rates over time; and c. Modeling runs(s) of ways to improve the heat rates of either the largest existing or the lowest heat rate generation plants.	Appendix F: EnCompass Modeling Assumptions & Inputs
Docket No. E002/RP-10-825 In the Matter of Northern States Power Company d/b/a/Xcel Energy's Application for Approval of its 2011-2025 Resource Plan **August 5, 2013 Notice**	Page 1	The public interest determination must include whether the resource plan helps the utility achieve the greenhouse gas reduction goals under section 216H.02, the renewable energy standard under section 216B.1691, or the solar energy standard under section 216B.1691, 2f.	Chapter 4: Preferred Plan Appendix N: Standard Obligation
Docket No. E002/RP-10-825 In the Matter of Northern States Power Company d/b/a/Xcel Energy's Application for Approval of its 2011-2025 Resource Plan August 5, 2013 Notice	Page 2, Para 1	The Commission expects utilities to include in their resource plans filed after August 1, 2013 an explanation how the resource plan helps the utility achieve the greenhouse gas reduction goals, renewable energy standard, and solar energy standard.	Chapter 4: Preferred Plan Appendix N: Standard Obligations

Rules, Statutes, and Orders			
Statute, Rule or Order	**Subdivision or Order Point**	**Information Required by Statute, Rule or Order**	**2024-2040 IRP Location of Required Content**
Docket No. E002/RP-10-825 In the Matter of Northern States Power Company d/b/a/Xcel Energy's Application for Approval of its 2011-2025 Resource Plan **August 5, 2013 Notice**	Page 2, Para 3	Utilities shall consider convening a stakeholder meeting prior to filing their initial IRPs to answer questions about assumptions used in the filing, for the purpose of responding to questions which could enhance parties' understanding of the filing and reducing the number of information requests parties may need to file.	Appendix S: Stakeholder Engagement Summary
Docket No. E002/RP-15-21 In the Matter of Northern States Power Company d/b/a/Xcel Energy's Application for Approval of its 2016-2030 Resource Plan **January 11, 2017 Order**	Order Point 10	10. Xcel shall acquire no less than 400 MW of additional demand response by 2023.	Appendix J: Distributed Energy Resources
Docket No. E002/RP-15-21 In the Matter of Northern States Power Company d/b/a/Xcel Energy's Application for Approval of its 2016-2030 Resource Plan **January 11, 2017 Order**	Order Point 12	12. Xcel shall investigate the potential for an energy-efficiency competitive bidding process for customers that have opted out of the statewide Conservation Improvement Program (CIP) under Minn. Stat. § 216B.241, subd. 1a(b).	Appendix J: Distributed Energy Resources
Docket No. E002/RP-15-21 In the Matter of Northern States Power Company d/b/a/Xcel Energy's Application for Approval of its 2016-2030 Resource Plan **January 11, 2017 Order**	Order Point 15	15. In future resource plan filings, analysis and inputs must, to the extent possible, be consistent with Xcel's distribution system planning.	Chapter 5: Economic Modeling Framework Appendix F: EnCompass Modeling Assumptions & Inputs
Docket No. E999/CI-07-1199 and E999/DI-17-53 In the Matter of Establishing an Estimate of the Costs of Future Carbon Dioxide Regulation on Electricity Generation Under Minnesota Statutes § 216H.06 & In the Matter of Establishing an Updated 2016 Estimate of the Costs of Future Carbon Dioxide Regulation on Electricity Generation Under Minn. Stat. § 216H.06 **June 11, 2018 Order**	Order Point 1	The Commission hereby quantifies and establishes the range of regulatory costs of carbon dioxide emissions as $5 to $25 per short ton effective 2025 and thereafter.	Chapter 5: Economic Modeling Framework Appendix F: EnCompass Modeling Assumptions & Inputs Appendix G: Scenario Sensitivity Analysis--PVRR & PVSC
Docket No. E002/RP-19-368 In the Matter of the 2020–2034 Upper Midwest Integrated Resource Plan of Northern States Power Company d/b/a Xcel Energy **April 15, 2022 Order**	Order Point 2A2.	2) Xcel shall continue to acquire 400 megawatts of incremental demand response by 2023 as ordered in the company's last resource plan.	Appendix J: Distributed Energy Resources
Docket No. E002/RP-19-368 In the Matter of the 2020–2034 Upper Midwest Integrated Resource Plan of Northern States Power Company d/b/a Xcel Energy **April 15, 2022 Order**	Order Point 5	5. Xcel shall consider opportunities to deploy renewable resources, storage technologies, and resources powered by hydrogen or clean fuel alternatives on a schedule faster than in its Alternate Plan. If deployment would be cost-effective, maintain reliability, and aid in achieving compliance with decarbonization policies, Xcel shall pursue them.	Chapter 4: Preferred Plan
Docket No. E002/RP-19-368 In the Matter of the 2020–2034 Upper Midwest Integrated Resource Plan of Northern States Power Company d/b/a Xcel Energy **April 15, 2022 Order**	Order Point 9A	9. Xcel shall take steps to better align distribution and resource planning, including: A. Set the forecasts for distributed energy resources consistently in its resource plan and its Integrated Distribution Plan.	Appendix E: Load and DER Forecasting Appendix L: System Planning Integration
Docket No. E002/RP-19-368 In the Matter of the 2020–2034 Upper Midwest Integrated Resource Plan of Northern States Power Company d/b/a Xcel Energy **April 15, 2022 Order**	Order Point 9B	B. Conduct advanced forecasting to better project the levels of distributed energy resource deployment at a feeder level, using Xcel's advanced planning tool.	Appendix E: Load and DER Forecasting Appendix L: System Planning Integration Appendix S: Stakeholder Engagement Summary
Docket No. E002/RP-19-368 In the Matter of the 2020–2034 Upper Midwest Integrated Resource Plan of Northern States Power Company d/b/a Xcel Energy **April 15, 2022 Order**	Order Point 9C	C. Proactively plan investments in hosting capacity and other necessary system capacity to allow distributed generation and electric vehicle additions consistent with the forecast for distributed energy resources.	Appendix E: Load and DER Forecasting Appendix L: System Planning Integration
Docket No. E002/RP-19-368 In the Matter of the 2020–2034 Upper Midwest Integrated Resource Plan of Northern States Power Company d/b/a Xcel Energy **April 15, 2022 Order**	Order Point 9D	D. Improve non-wires alternatives analysis, including market solicitations for deferral opportunities to make sure Xcel can take advantage of distributed energy resources to address discrete distribution system costs.	Appendix L: System Planning Integration
Docket No. E002/RP-19-368 In the Matter of the 2020–2034 Upper Midwest Integrated Resource Plan of Northern States Power Company d/b/a Xcel Energy **April 15, 2022 Order**	Order Point 9E	E. Plan for aggregated distributed energy resources to provide system value including energy/capacity during peak hours.	Appendix L: System Planning Integration

Rules, Statutes, and Orders			
Statute, Rule or Order	**Subdivision or Order Point**	**Information Required by Statute, Rule or Order**	**2024-2040 IRP Location of Required Content**
Docket No. E002/RP-19-368 In the Matter of the 2020–2034 Upper Midwest Integrated Resource Plan of Northern States Power Company d/b/a Xcel Energy **April 15, 2022 Order**	Order Point 10	10. In its next resource plan Xcel shall, either through its Integrated Distribution System Plan proceedings or through another stakeholder process, develop and/or improve its forecasts of the adoption rate for the following technologies, to be used in Xcel's base case scenario and its overall demand forecast. A. Adoption of light-, medium-, and heavy-duty electric vehicles. B. Adoption of electric space heating. C. Adoption of electric water heating. D. Electrification of other end uses. E. Increased potential for demand response and load flexibility from an increase in electrification of the technologies in A–D. F. Adoption of distributed solar-powered generators—including generators sited by customers, community solar gardens organized under Minn. Stat. § 216B.1641, and generators that are neither sited by customers nor related to community solar gardens.	Appendix E: Load and DER Forecasting Appendix S: Stakeholder Engagement Summary
Docket No. E002/RP-19-368 In the Matter of the 2020–2034 Upper Midwest Integrated Resource Plan of Northern States Power Company d/b/a Xcel Energy **April 15, 2022 Order**	Order Point 12	12. Xcel shall include in its next resource plan a deeper analysis of (1) storage options, including options combining solar generation and battery storage, and (2) the role of hydrogen and clean fuel alternatives in Xcel's resource mix. In preparation, Xcel shall work with stakeholders to develop a fair basis for comparing the full supply-chain and life-cycle carbon impacts of the generation and storage resource options under consideration to help the Commission evaluate the "adverse socioeconomic effects and adverse effects upon the environment" of each option, pursuant to Minn. R. 7843.0500, subp. 3.C. Docket No. E002/RP-19-368 In the Matter of the 2020–2034 Upper Midwest Integrated Resource Plan of Northern States Power Company d/b/a Xcel Energy **April 15, 2022 Order**	Order Point 20C6	6) An update to the Commission on the status of efforts to support the city's and region's economic development efforts, including—to the extent possible—specific projects and investments the company is assisting the city and region in attracting.	E002/M-22-263 Appendix P: 2023 Sherco Remediation Report Summary Appendix P1: 2023 Sherco Remediation Report
Docket No. E002/RP-19-368 In the Matter of the 2020–2034 Upper Midwest Integrated Resource Plan of Northern States Power Company d/b/a Xcel Energy **April 15, 2022 Order**	Order Point 20C7	7) A description of the company's efforts to work with local governments and other stakeholders to assess and account for local land use and planning impacts. Before starting any additional regulatory process to determine the final length and route of the Sherco gen-tie line, Xcel shall consult with stakeholders to discuss the plans.	E002/M-22-263 Appendix P: 2023 Sherco Remediation Report Summary Appendix P1: 2023 Sherco Remediation Report
Docket No. E002/RP-19-368 In the Matter of the 2020–2034 Upper Midwest Integrated Resource Plan of Northern States Power Company d/b/a Xcel Energy **April 15, 2022 Order**	Order Point 20C8	8) Any other items the Commission or the company sees fit to include.	E002/M-22-263 Appendix P: 2023 Sherco Remediation Report Summary Appendix P1: 2023 Sherco Remediation Report
Docket No. E002/RP-19-368 In the Matter of the 2020–2034 Upper Midwest Integrated Resource Plan of Northern States Power Company d/b/a Xcel Energy **April 15, 2022 Order**	Order Point 20C	If Xcel cannot obtain the necessary information at the time of each filing, the company shall submit a detailed timeline on which it anticipates it will be able to provide the city and stakeholders with additional information.	E002/M-22-263 Appendix P: 2023 Sherco Remediation Report Summary Appendix P1: 2023 Sherco Remediation Report
Docket No. E002/RP-19-368 In the Matter of the 2020–2034 Upper Midwest Integrated Resource Plan of Northern States Power Company d/b/a Xcel Energy **April 15, 2022 Order**	Order Point 21A	21. Regarding remediation plans for the King site: A. The Commission authorizes its Executive Secretary to open a new docket on this topic.	E002/M-22-264 Appendix Q: 2023 King Remediation Report Summary Appendix Q1: 2023 King Remediation Report
Docket No. E002/RP-19-368 In the Matter of the 2020–2034 Upper Midwest Integrated Resource Plan of Northern States Power Company d/b/a Xcel Energy **April 15, 2022 Order**	Order Point 21B	B. Xcel shall conduct quarterly stakeholder meetings regarding the King site with interested parties including the city of Oak Park Heights, Washington County, the Department, DNR, the Energy Transition Office, PCA, the National Park Service, CEOs, CEE, the Wild Rivers Conservancy, and labor unions. Xcel shall file in the new docket by January 1, 2023, details describing the stakeholder outreach and updates for the efficient demolition of the King plant and remediation of the site and impacted land.	E002/M-22-264 Appendix Q: 2023 King Remediation Report Summary Appendix Q1: 2023 King Remediation Report
Docket No. E002/RP-19-368 In the Matter of the 2020–2034 Upper Midwest Integrated Resource Plan of Northern States Power Company d/b/a Xcel Energy **April 15, 2022 Order**	Order Point 21C1	C. Following these stakeholder meetings, by December 31, 2023, or in its next resource plan if earlier—and annually thereafter—Xcel shall submit to the Commission, the city of Oak Park Heights, and interested stakeholders a detailed report describing the company's plans for the disposition of the King site, equipment, and buffer property. This report should include the following: 1) The company's plans, estimated costs, and a detailed timeline to decommission and demolish the electric generation facility.	E002/M-22-264 Appendix Q: 2023 King Remediation Report Summary Appendix Q1: 2023 King Remediation Report

Docket No. E002/RP-19-368 In the Matter of the 2020–2034 Upper Midwest Integrated Resource Plan of Northern States Power Company d/b/a Xcel Energy **April 15, 2022 Order**	Order Point 21C	If Xcel cannot obtain the necessary information at the time of each filing, the company shall submit a detailed timeline on which it anticipates it will be able to provide the city and stakeholders with additional information.	E002/M-22-264 Appendix Q: 2023 King Remediation Report Summary Appendix Q1: 2023 King Remediation Report
Docket No. E002/RP-19-368 In the Matter of the 2020–2034 Upper Midwest Integrated Resource Plan of Northern States Power Company d/b/a Xcel Energy **April 15, 2022 Order**	Order Point 22	22. Xcel shall immediately begin stakeholder discussions exploring the future of the Prairie Island Nuclear Generating Plant.	Appendix M: Nuclear Appendix S: Stakeholder Engagement Summary
Docket No. E002/RP-19-368 In the Matter of the 2020–2034 Upper Midwest Integrated Resource Plan of Northern States Power Company d/b/a Xcel Energy **April 15, 2022 Order**	Order Point 23A	23. In its next resource plan, Xcel shall file a report explaining the following: A. Planned investments at the Prairie Island and Monticello, and future plans for Prairie Island.	Appendix M: Nuclear
Docket No. E002/RP-19-368 In the Matter of the 2020–2034 Upper Midwest Integrated Resource Plan of Northern States Power Company d/b/a Xcel Energy **April 15, 2022 Order**	Order Point 23B	B. Any aging management issues that may arise from continued operation.	Appendix M: Nuclear
Docket No. E002/RP-19-368 In the Matter of the 2020–2034 Upper Midwest Integrated Resource Plan of Northern States Power Company d/b/a Xcel Energy **April 15, 2022 Order**	Order Point 23C	C. Expectations regarding future nuclear workforce.	Appendix M: Nuclear
Docket No. E002/RP-19-368 In the Matter of the 2020–2034 Upper Midwest Integrated Resource Plan of Northern States Power Company d/b/a Xcel Energy **April 15, 2022 Order**	Order Point 23D	D. Cyber-security issues or concerns as plants move from analog to digital systems.	Appendix M: Nuclear
Docket No. E002/RP-19-368 In the Matter of the 2020–2034 Upper Midwest Integrated Resource Plan of Northern States Power Company d/b/a Xcel Energy **April 15, 2022 Order**	Order Point 23E	E. True comprehensive cost-benefit analysis, which includes potential environmental and economic impacts to the neighboring communities—in particular, the Prairie Island Indian Community and its Treasure Island Resort & Casino.	Appendix M: Nuclear
Docket No. E002/RP-19-368 In the Matter of the 2020–2034 Upper Midwest Integrated Resource Plan of Northern States Power Company d/b/a Xcel Energy **April 15, 2022 Order**	Order Point 23F	F. Additional spent nuclear fuel generated over a 10- or 20-year period.	Appendix M: Nuclear
Docket No. E002/RP-19-368 In the Matter of the 2020–2034 Upper Midwest Integrated Resource Plan of Northern States Power Company d/b/a Xcel Energy **April 15, 2022 Order**	Order Point 23G	G. How fuel stored on-site will be removed during the next integrated resource plan period.	Appendix M: Nuclear

Rules, Statutes, and Orders			
Statute, Rule or Order	**Subdivision or Order Point**	**Information Required by Statute, Rule or Order**	**2024-2040 IRP Location of Required Content**
Docket No. E002/RP-19-368 In the Matter of the 2020–2034 Upper Midwest Integrated Resource Plan of Northern States Power Company d/b/a Xcel Energy **April 15, 2022 Order**	Order Point 23H	H. Which additional state permits, Certificates of Need, or federal licenses will be required.	Appendix M: Nuclear
Docket No. E002/RP-19-368 In the Matter of the 2020–2034 Upper Midwest Integrated Resource Plan of Northern States Power Company d/b/a Xcel Energy **April 15, 2022 Order**	Order Point 23I	I. The full supply chain and life-cycle carbon impacts of the ongoing nuclear generation and storage at each of the facilities.	Appendix Y: Life Cycle Emissions Impacts
Docket No. E002/RP-19-368 In the Matter of the 2020–2034 Upper Midwest Integrated Resource Plan of Northern States Power Company d/b/a Xcel Energy **April 15, 2022 Order**	Order Point 24	24. The Commission authorizes the Executive Secretary to open a new docket regarding workers at retiring generating facilities in Minnesota, including Sherco and King.	E002/M-22-265 Appendix O: 2023 Workforce Transition Plan Summary Appendix O1: 2023 Workforce Transition Plan
Docket No. E002/RP-19-368 In the Matter of the 2020–2034 Upper Midwest Integrated Resource Plan of Northern States Power Company d/b/a Xcel Energy **April 15, 2022 Order**	Order Point 24A	A. Xcel—working with the Minnesota Department of Employment and Economic Development and the Energy Transition Office; the International Brotherhood of Electrical Workers, Locals 23, 160, and 949; the Minnesota Building Trades; and the Center for Energy and Environment—shall develop a comprehensive plan for supporting transitioning workers. The plan shall consider the measures outlined in the IBEW comments dated March 17, 2020, and March 21, 2021, including skills inventories, training and education, worker placement and potential early retirement buy-out scenarios. Xcel shall file the plan with the Commission no later than December 31, 2022. The plan shall include an estimated budget for each measure, timeline for implementation, and a description of additional funding needed by DEED or the Energy Transition Office, if applicable, to implement the plan.	E002/M-22-265 Appendix O: 2023 Workforce Transition Plan Summary Appendix O1: 2023 Workforce Transition Plan
Docket No. E002/RP-19-368 In the Matter of the 2020–2034 Upper Midwest Integrated Resource Plan of Northern States Power Company d/b/a Xcel Energy **April 15, 2022 Order**	Order Point 24B	B. Beginning on December 31, 2023, and annually thereafter, Xcel shall file a detailed update on its efforts to implement the plan in coordination with CEE, DEED and the Energy Transition Office, and IBEW.	E002/M-22-265 Appendix O: 2023 Workforce Transition Plan Summary Appendix O1: 2023 Workforce Transition Plan
Docket No. E002/RP-19-368 In the Matter of the 2020–2034 Upper Midwest Integrated Resource Plan of Northern States Power Company d/b/a Xcel Energy **April 15, 2022 Order**	Order Point 25A	25. Xcel shall engage in community outreach and establish a stakeholder group to do the following: A. Design for the equitable delivery of electricity services and programs for energy burdened customers in the company's next resource plan.	E002/M-22-266 Appendix R: Equity Appendix S: Stakeholder Engagement Summary
Docket No. E002/RP-19-368 In the Matter of the 2020–2034 Upper Midwest Integrated Resource Plan of Northern States Power Company d/b/a Xcel Energy **April 15, 2022 Order**	Order Point 25B	B. Create new options to improve customer access to energy efficiency and renewable energy.	E002/M-22-266 Appendix R: Equity Appendix S: Stakeholder Engagement Summary
Docket No. E002/RP-19-368 In the Matter of the 2020–2034 Upper Midwest Integrated Resource Plan of Northern States Power Company d/b/a Xcel Energy **April 15, 2022 Order**	Order Point 25C	C. Draft a plan to be submitted in Xcel's next resource plan to bring the racial and gender diversity of the company's workforce in line with the utility's stated goals.	E002/M-22-266 Appendix R: Equity Appendix R1: Workforce Diversification Plan Appendix S: Stakeholder Engagement Summary
Docket No. E002/RP-19-368 In the Matter of the 2020–2034 Upper Midwest Integrated Resource Plan of Northern States Power Company d/b/a Xcel Energy **April 15, 2022 Order**	Order Point 25D	D. Design incentives to ensure that communities of low-income, Black, Indigenous, and People of Color that have disproportionately borne costs of unjust and inequitable energy decisions have equitable access to programs promoting distributed generation.	E002/M-22-266 Appendix R: Equity Appendix S: Stakeholder Engagement Summary
Docket No. E002/RP-19-368 In the Matter of the 2020–2034 Upper Midwest Integrated Resource Plan of Northern States Power Company d/b/a Xcel Energy **April 15, 2022 Order**	Order Point 25E	E. Adopt practices in furtherance of procedural justice—including deeper engagement with renters; affordable rental property owners; communities of Black, Indigenous, and People of Color; and under-resourced individuals—providing resources for engagement and participation, and providing financial support for impacted individuals to participate in dockets and decision-making processes.	E002/M-22-266 Appendix R: Equity Appendix S: Stakeholder Engagement Summary
Docket No. E002/RP-19-368 In the Matter of the 2020–2034 Upper Midwest Integrated Resource Plan of Northern States Power Company d/b/a Xcel Energy **April 15, 2022 Order**	Order Point 25F	F. Form an environmental justice accountability board which shall develop environmental justice-focused initiatives to be incorporated throughout the utility.	E002/M-22-266 Appendix R: Equity Appendix S: Stakeholder Engagement Summary
Docket No. E002/RP-19-368 In the Matter of the 2020–2034 Upper Midwest Integrated Resource Plan of Northern States Power Company d/b/a Xcel Energy **April 15, 2022 Order**	Order Point 25	By January 1, 2023, and annually thereafter, Xcel shall file details describing stakeholder outreach and progress in its next resource planning docket, and in a separate docket to be established by the Executive Secretary.	E002/M-22-266 Appendix R: Equity Appendix S: Stakeholder Engagement Summary

Rules, Statutes, and Orders			
Statute, Rule or Order	**Subdivision or Order Point**	**Information Required by Statute, Rule or Order**	**2024-2040 IRP Location of Required Content**
Docket No. E002/M-21-694 In the Matter of Xcel Energy's 2021 Integrated Distribution System Plan and Request for Certification of Distributed Intelligence and the Resilient Minneapolis Project **July 26, 2022 Order**	Order Point 6	Xcel shall hold a series of stakeholder meetings to collaborate with interested parties, obtain input, and generate new ideas around a shared vision of the distribution grid of the future. This stakeholder series is intended to provide transparency into the Company's distribution planning process and explore how Minnesota's public policy goals will be realized on the distribution system and impact the Company's future plans. This stakeholder series should be timed such that stakeholder input can be incorporated into the Company's next IDP filing and next IRP filing and include at least four meetings. The topics will include, but not be limited to, the following: a. Integrated Distribution Planning 101 b. Identify the public policy goals that are changing the expectations of the distribution grid and how each public policy is expected to be realized on the grid in the near- and long-term. [For example, examine transportation, building and industrial electrification forecasts and the effects on load profiles in the near-term and long-term.] c. How energy efficiency, demand response, and other DER might impact Xcel's planning processes. d. How Xcel should consider and incorporate local clean energy goals in its planning processes. e. What investments are necessary to achieve the distribution grid of the future, and the criteria Xcel should use to plan and prioritize those investments. f. Prioritizing the use of "net load" in its load forecasts and system planning, including developing a methodology for incorporating the load reducing impact of distributed generation into its load forecasts and system planning processes. g. Develop a methodology for valuing the load-modifying impacts of demand response in load forecasts and present a load forecast that includes demand response contributions. h. Identify appropriate transportation, building, and industrial end use electrification scenarios for inclusion in the 2023 IDP load forecasts. i. How Xcel anticipates proactively planning for grid investments to allow distributed generation and EV additions consistent with the DER forecast. j. Estimate the potential synergies between interconnection upgrades and planned distribution capital investments, and discuss the anticipated overlap between planned investments and capacity constrained locations on Xcel's distribution system. Xcel shall make a compliance filing with a summary of the stakeholder process and a list of next steps by August 1, 2023. Xcel shall include a summary of the stakeholder series in its next IDP and relevant summary in its next IRP, including how it considered and incorporated stakeholder input.	Appendix S: Stakeholder Engagement Summary November 1, 2023 Integrated Distribution Plan E002/M-23-452
E999/CI-14-643 In the Matter of the Further Investigation into Environmental and Socioeconomic Costs Under Minnesota Statutes Section 216B.2422, Subdivision 3 **1/3/2018 Order**	Order Point 1	1. The Commission hereby quantifies and establishes the range of environmental cost of carbon dioxide emissions associated with electricity generation as follows: •The low end of the range shall reflect the global damage of the last (marginal) short ton emitted, calculated through the year 2100, with a 5.0% discount rate. •The high end of the range shall reflect the global damage of the last (marginal) short ton emitted, calculated through the year 2300, with a 3.0% discount rate.	Chapter 5: Economic Modeling Framework Appendix F: EnCompass Modeling Assumptions & Inputs
E999/CI-14-643 In the Matter of the Further Investigation into Environmental and Socioeconomic Costs Under Minnesota Statutes Section 216B.2422, Subdivision 3 **1/3/2018 Order**	Order Point 3	3. In resource-selection proceedings, utilities shall continue to analyze potential resources under a range of assumptions about environmental values—including at least one scenario that excludes consideration of environmental externalities.	Appendix G: Scenario Sensitivity Analysis--PVRR & PVSC
Docket No. E999/CI-22-624 In the Matter of a Joint Investigation into the Impacts of the Federal Inflation Reduction Act **September 12, 2023 Order**	Order Point 1	The utilities shall maximize the benefits of the Inflation Reduction Act in future resource acquisitions and requests for proposals in the planning phase, petitions for cost recovery through riders and rate cases, resource plans, gas resource plans, integrated distribution plans, and Natural Gas Innovation Act innovation plans. In such filings, utilities shall discuss how they plan to capture and maximize the benefits from the Act, and how the Act has impacted planning assumptions including (but not limited to) the predicted cost of assets and projects and the adoption rates of electric vehicles, distributed energy resources, and other electrification measures. Reporting shall continue until 2032.	Appendix U: Inflation Reduction Act
Docket No. E002/M-19-33 In the Matter of Northern States Power Company's, d/b/a Xcel Energy, Petition to Expand its Renewable*Connect Program **August 12, 2019 Order**	Order Point 3	In current and future resource plans, Xcel must identify the resources dedicated to the Renewable*Connect program and must provide a thorough discussion of the present and forecasted resources that are necessary to meet its present and future demand for the program.	Chapter 2: Planning Landscape Chapter 3: Minimum System Needs

APPENDIX B – ACRONYMS AND TERMS

ACRONYM / TERM	DEFINITION
AABE	American Association of Blacks in Energy
AAPI	Asian American and Pacific Islander
ABLE	Accessibility, Be an Ally, Lead, and Empower
AC	Alternating Current
ACE	Affordable Clean Energy rule
ACEEE	American Council for Energy Efficient Economy
ACI	Activated Carbon Injection
ADMS	Advanced Distribution Management System
ADP	Advanced Determination of Prudence
AEO	Annual Energy Outlook
AFC	Accelerated Fleet Change
AIOIC	American Indian Opportunities Industrialization Center
ALJ	Administrative Law Judge
AMI	Advanced Metering Infrastructure
AMP	Aging Management Program
ANL	Argonne National Laboratory
APC	Adjusted Production Costs
ARDP	Advanced Reactor Demonstration Program
ARR	Avoided Revenue Requirements
A.S. King	Allen S. King Generating Plant
ASHP	Air-Source Heat Pumps
ATB	Annual Technology Baseline
AUAR	Alternative Urban Areawide Review
AWEA	American Wind Energy Association
BA	Balancing Authority
BACT	Best Available Control Technology
BART	Best Available Retrofit Technology
BLAX	Black Employees at Xcel Energy
BE	Beneficial Electrification
BESS	Battery Energy Storage System
BGEPA	Bald and Golden Eagle Protection Act
BIL	Bipartisan Infrastructure Law
BIPOC	Black, Indigenous, and People of Color
BO	Buildout Scenario
BPM	Business Practice Manual
BRD	Business Research Division
BRG	Business Resource Groups
BSER	Best System of Emission Reduction
BWCA	Boundary Waters Canoe Area
C&I	Commercial and Industrial (Customers)
CAA	Clean Air Act
CAGR	Compound Annual Growth Rate

ACRONYM / TERM	DEFINITION
CAIDI	Net capacity factor of power plant, typically expressed as percentage, is ratio of its actual output over period of time to its potential output if it were possible for it to operate at full nameplate capacity indefinitely.
CAIR	Clean Air Interstate Rule
CAP	Competitive Acquisition Process
Capacity Factor	Measure of how often an electric generator runs for a specific period of time. Indicates how much electricity a generator actually produces relative to the maximum it could produce at continuous full power operation during the same period.
CapX2020	Coordinated transmission development effort by group of 11 regional utilities (the CapX2020 Utilities) in MN, ND, SD and WI.
CARB	California Air Resources Board
CBA	Cost-Benefit Analysis
C-BED	Community-Based Energy Development
CBECS	Commercial Buildings Energy Consumption Survey
CBP	Community Benefits Plan
CC	Combined Cycle
CCGT	Combined Cycle Gas Turbine
CCOSS	Class Cost of Service Study
CCRs	Coal Combustion Residuals (often referred to as coal ash)
CCS	Carbon Capture and Sequestration
CDL	Commercial Driver's License
CEE	Center for Energy and Environment
CEI	Center for Economic Inclusion
CEL	Capacity Export Limit
CEMS	Continuous Emissions Monitoring Systems
CEO	Clean Energy Organizations
CER	Capital Project Module
CERA	Cambridge Energy Research Associates
CERCLA	Comprehensive Environmental Response Compensation and Liability Act
CEWD	Center for Energy Workforce Development
CF	Coincidence Factor
CF2050	Carbon-Free 2050
CFC	Continued Fleet Change
CFPP	NuScale Power's Carbon Free Power Project
CFS	Carbon-Free Standard
CFTI	Carbo-Free Technology Institute
CH_4	Methane
CHP	Combined Heat and Power
CI or C&I	Commercial/Industrial

ACRONYM / TERM	DEFINITION
CIL	Capacity Import Limit
CIP	Conservation Improvement Program
Circuit Breaker	An electromechanical device used to configure the flow of electricity on the distribution grid. A circuit breaker is designed to open or close while electricity is flowing through the circuit. When a circuit breaker is open, no electricity is flowing through the circuit.
CISF	Consolidated Interim Storage Facility
CO	Carbon Monoxide
CO_2	Carbon Dioxide
CO_{2e}	Carbon Dioxide Equivalents
CON	Certificate of Need
CONE	Cost of New Entry
CPD	Coincident Peak Demand
CP Node	Commercial Pricing Node
CRP	Certified Renewable Percentage
CSAPR	Cross-State Air Pollution Rule
CSG	Community Solar Garden
CT	Combustion Turbine
CWA	Clean Water Act
CWIP	Construction Work in Progress
DA	Day Ahead
DAV	Disabled American Veterans
DEED	Department of Employment and Economic Development
DEI	Diversity, Equity , ad Inclusion
DEM	Drive Electric Minnesota
DER	Distributed Energy Resources
DERMS	Distributed Energy Resource Management Systems
DG	Distributed Generation
DIC	Disproportionately Impacted Communities
DIGT	Digester
DIR	Dispatch Intermittent Resource Protocol
DLOL	Direct Loss of Load
DNR	Department of Natural Resources
DOC	Department of Commerce
DOE	U.S. Department of Energy
DOI	Department of the Interior
DPP	Definitive Planning Process
DR	Demand Response
DSD	Minnesota Deemed Savings Database
DSM	Demand Side Management
DSP	Distributed Solar Parties
DSES	Distributed Solar Energy Standard
EAW	Environmental Assessment Worksheet

ACRONYM / TERM	DEFINITION
E3	Energy and Environmental Economics, Inc.
ECC	Economic Carrying Charge
ECN	Employee Connection Network
ECO	Energy Conservation and Optimization
EE	Energy Efficiency
EERC	Energy & Environmental Research Center
EERE	Office of Energy Efficiency and Renewable Energy
eGRID	Emissions and Generation Resource Integrated Database
EGU	Electric Generating Unit
EJ	Environmental Justice
EJAB	Environmental Justice Advisory Board
EIA	Energy Information Administration
ELCC	Effective Load Carrying Capability
ELGs	Effluent Limitation Guidelines
EPA	Environmental Protection Agency
EPA Clean Air Act 111d Rule	Draft regulation to reduce carbon dioxide gas emissions from existing power plants that burn coal and other fossil fuels.
EPA SC-GHG	Environmental Protection Agency Social Cost of Greenhouse Gases
EPE	Energy Production Estimate
EPRI	Electric Power Research Institute
EQB	Environmental Quality Board
ERIS	Energy Resource Interconnection Service
ESA	Endangered Species Act
ESAG	Equity Stakeholder Advisory Group
ETAC	Energy Transition Advisory Committee
EVs	Electric Vehicles
Externality Values	Range of environmental costs.
FAN	Field Area Networks
Fault	Abnormal condition on electric system, such as short circuit, broken wire or intermittent connection.
Feeder	Lines connecting distribution substations to taps.
FERC	Federal Energy Regulatory Commission
FERC Order 1000	Rule mandating how public utility transmission providers plan for and allocate costs of new projects on regional and interregional basis.
FGD	Flue-Gas Desulfurization
FIPs	Federal Implementation Plans
FTE	Full-Time Equivalent
FL&U	Fuel Lost and Unaccounted
FLISR	Fault Location, Isolation, and Service Restoration

ACRONYM / TERM	DEFINITION
FOM	Fixed Operation & Maintenance Costs
FTR	Financial Transmission Right
FWS	U.S. Fish and Wildlife Service
Gas Burn	Energy from New Natural Gas Generation
GAF	Generation Module
GALL-SLR	Generic Aging Lessons Learned for Subsequent License Renewal
GHG	Greenhouse Gas
GREET	Greenhouse Gases, Regulated Emissions, and Energy Use in Transportation
GRIP	Grid Resilience and Innovation Partnership
GROW	Growth and Retention of Women
GW	Gigawatt
GWh	Gigawatt Hour
GWP	Global Warming Potential
HAP	Hazardous Air Pollutant
HDVs	Heavy-Duty Vehicles
HI	Hazardous Index
HFPO-DA	Hexafluoropropylene Oxide Dimer Acid
HVAC	High-Voltage Alternating Current
HVDC	High-Voltage Direct Current
IB MACT	Hazardous Air Pollutants from Industrial Boilers
IBEW	International Brotherhood of Electrical Workers
ICAP	Installed Capacity Value
ICE	Internal Combustion Engine
IDP	Integrated Distribution Plan
IDS	Interdepartmental Sales
IGCC	Integrated Gasification Combined Cycle
IIJA	Infrastructure Investment Jobs Act
ILR	Inverter Loading Ratios
ILSR	Institute for Local Self-Reliance
ILTF	Indian Land Tenure Foundation
INPO	Institute of Nuclear Power Operations
IPaC	Information for Planning and Consultation
IPCC	Intergovernmental Panel on Climate Change
IPPs	Independent Power Producers
IRA	Inflation Reduction Act
IRP	Integrated Resource Plan
ISFSI	Independent Spent Fuel Storage Installations
ISO	Independent System Operators
ISP	Integrated System Planning
ISP	Interim Storage Partners
ITC	Investment Tax Credit
ISOs	Independent System Operators
JCOSS	Jurisdictional Cost of Service Study

ACRONYM / TERM	DEFINITION
JTIQ	Joint Targeted Interconnection Queue
kV	Kilovolt
kVA	Kilovolt Amps: 1,000 Volt-Amps. Volt is measure of force of electricity. Amp (Ampere) is measure of flow of electricity.
kWh	Kilowatt
LAF	Load Module
LBA	Load Balancing Authorities
LCA	Life Cycle Assessments
LCM	Life Cycle Management

LRZ	Local Resource Zone or Zone
LSE	Load Serving Entities
LTRA	Long Term Reliability Assessment
MATS	National Emission Standards for Hazardous Air Pollutants for Coal- and Oil-Fired Power Plants. This rule is often referred to as the Mercury and Air Toxics Standard.
MBTA	Migratory Bird Treaty Act
MCLG	Maximum Containment Level Goal
MCPS	Market Congestion Planning Study
MDVs	Medium-Duty Vehicles
MEC	Mankato Energy Center
MEFF	Minnesota Energy Future Framework
MGP	Manufactured Gas Plants

ACRONYM / TERM	DEFINITION
MISO	Midcontinent Independent System Operator, Inc.: Non-profit organization providing reliable coordination and regional planning services including: regional planning, generation interconnection, maintenance coordination, market monitoring and dispute resolution.
MLBO	Mille Lacs Band of Ojibwe
MMBTU	Million British Thermal Units
MMERA	Minnesota Mercury Emissions Reduction Act
MNDNR	Minnesota Department of Natural Resources
MNEC	Minnesota Energy Connection
MNGP	Monticello Nuclear Generating Plant
MPCA	Minnesota Pollution Control Agency
MPUC	Minnesota Public Utilities Commission
M-RETS	Midwest Renewable Energy Tracking System
MSW	Municipal Solid Waste
MTEP	MISO Transmission Expansion Plan
MTO	Minnesota Transmission Owners
MW	Megawatt
MWh	Megawatt Hour
MVA	Mega Volt Amps: 1,000,000 amps or 1,000 kVA
MVP	Multi Value Project: Regional transmission solutions that meet one or more of three goals: reliably and economically enable regional public policy needs, provide multiple types of regional economic value, and provide a combination of regional reliability and economic value.
N_2O	Nitrous Oxide
NAAQS	National Ambient Air Quality Standards
NaVOBA	National Veteran-Owned Business Association
NAYGN	North American Young Generation in Nuclear
NCP	Non-MISO Coincident Peak
NDPSC	North Dakota Public Service Commission
NEEP	Northeast Energy Efficiency Partnerships
NEI	Nuclear Energy Institute
NERC	North American Electric Reliability Corporation
NESHAP	National Emission Standards for Hazardous Air Pollutants
NGEA	Minnesota's Next Generation Energy Act
NGIA	Natural Gas Innovation Act
NGLCC	National Gay & Lesbian Chamber of Commerce
NHRG	Nuclear Human Resource Group

ACRONYM / TERM	DEFINITION
NMFS	National Marine Fisheries Service
NMSDC	National Minority Supplier Development Council
NO_2	Nitrogen Dioxide
NO_x	Nitrogen Oxide
NOAA	National Oceanic and Atmospheric Administration
NPDES	National Pollutant Discharge Elimination System
NPS	National Park Service
NPV	Net Present Value
NRC	Nuclear Regulatory Commission
NREL	National Renewable Energy Laboratory
NRIS	Network Resource Interconnection System
NSPM	Northern States Power Company-Minnesota
NSPW	Northern States Power Company-Wisconsin

NWA	Non-Wires Alternatives
NYMEX	New York Mercantile Exchange
O&M	Operating and Maintenance
O_3	Ozone
OCED	Office of Clean Energy Demonstrations
OFA	Over-Fire Air
OSPA	Sales to Public Authorities
Pb	Lead
PCBs	Polychlorinated Biphenyls
PCOR	U.S. Department of Energy's Plains Carbon Dioxide Reduction Partnership
PFAS	Polyfluoroalkyl Substances
PFBA	Perfluorobutanoic Acid
PFBS	Perfluorobutanesulfonic Acid
PFDA	Perfluorodecanoic Acid
PFHxA	Perfluorohexanoic Acid
PFHxS	Perfluorohexanesulfonic Acid
PFNA	Perfluorononanoic Acid
PFOA	Perfluorooctanoic Acid
PFOS	Perfluorooctanesulfonic Acid
PI	Prairie Island
PiE	Partners in Energy
PINGP	Prairie Island Generating Plant
PIIC	Prairie Island Indian Community
PINGP	Prairie Island Nuclear Generation Plant
PIRA	Petroleum Industry Research Associates

ACRONYM / TERM	DEFINITION
Plume Blight	Smoke, dust, colored gas plumes, or layered haze emitted from stacks which obscure the sky or horizon and are relatable to a single source or small group of sources.
PM	Particulate Matter
$PM_{2.5}$	Fine Particulate Matter under 2.5 micrometers
PM_{10}	Coarse Particulate Matter under 10 micrometers
POI	Point of Interconnection
POTW	Publicly-Owned Treatment Works
PP	Park Potential
PPA	Power Purchase Agreement
PPB	Parts Per Billion
PPM	Parts Per Million
PPT	Parts Per Trillion
PRA	Planning Resource Auction
Prairie Island	Prairie Island Nuclear Generating Plant
PRC	Planning Resource Credits
PRPs	Potentially Responsible Parties
PRM	Planning Reserve Margin
PRMR	Planning Reserve Margin Requirement
Proview	Expansion Planning Module
PSD	Prevention of Significant Deterioration Section of the Clean Air Act
PSHL	Public Street and Highway Lighting
PTC	Production Tax Credit
PV	Photovoltaic
PVRR	Present Value Revenue Requirement
PVSC	Present Value of Societal Costs
PY	Planning Year
RA	Resource Adequacy
RAC	Reliability Assessment Commitment
RAVI	Reasonably Attributable Visibility Impairment
RBDC	Reliability-Based Demand Curve
RCC	Regulatory Cost of Carbon
RCR	Reconnect Rondo
RCRA	Resource Conservation and Recovery Act
RDF	Refuse Derived Fuel or Renewable Development Fund
RDF	Renewable Development Fund
Recloser	Circuit breaker that includes mechanism to automatically close (reconnect) after set period of time. Reclosers are used to restore service after momentary fault.
RECAP	E3's Renewable Energy Capacity model

ACRONYM / TERM	DEFINITION
RECs	Renewable Energy Credits: A certificate representing all of the environmental attributes of one MWh of generation from a renewable resource.
Reference Case	Baseline scenario identifying necessary resource additions.
REMI	Regional Economic Models, Inc.
REO	Renewable Energy Objective
REPI	Renewable Energy Production Incentive
RES	Renewable Energy Standard
RESOLVE	E3's Renewable Energy Solutions model
Retrofill	Remove contaminated oil and replace with clean oil.
RFP	Request For Proposal
RGGI	United States' Regional Greenhouse Gas Initiative
RGU	Responsible Government Units
RHR	Regional Haze Rule
RICE	Reciprocating Internal Combustion Engines
RIIA	Renewable Integration Impact Assessment
RIM	Rate Impact Measure
RLB	Rondo Land Bridge
RMP	Resilient Minneapolis Project
ROE	Return on Equity
RPS	Renewable Portfolio Standard
RRA	Regional Resource Assessment
RSG	Revenue Sufficiency Guarantee (Charges): Direct result of production shortfalls relative to earlier forecasts.
RTE	Round-Trip Efficiency
RTF	Resource Treatment Framework
RTO	Regional Transmission Organization
RTR	Risk and Technology Review
S*R	Solar Rewards (Company's Program)
S*RC	Solar Rewards Community (Company's Community Solar Gardens Program)
SAC	Seasonal Accredited Capacity
SAIDI	System Average Interruption Frequency Index: Measures average number of times customer is interrupted over given period (usually monthly or annually). Lower values are better.
SAIFI	System Average Interruption Frequency Index: Measures average number of times customer is interrupted over given period (usually monthly or annually). Lower values are better.
SB	Senate Bill
SCADA	Supervisory Control and Data Acquisition

ACRONYM / TERM	DEFINITION
SCC	Social Cost of Carbon
SC-GHG	Social Cost of Greenhouse Gases
SCORE	Select Committee on Recycling and Environment
SCR	Selective Catalytic Reduction
SDPUC	South Dakota Public Utilities Commission
SEA	Strategic Energy Assessment
SEPA	Solar Electric Power Association
SES	Minnesota Solar Energy Standard: Minn. Stat. § 216B.1691, subd. 2f, which requires 1.5% of retail sales to be sourced from new solar resources. SES is incremental to the Renewable Energy Standard (RES).
SFH	Single Family Housing
SHAW	Shoulder Average Winds
SIP	State Implementation Plan
SLR	Subsequent License Renewal
SMR	Small Module Nuclear Reactor
SO_2	Sulfur Dioxide
SO_x	Sulfur Oxide
SolarTAC	Solar Technology Acceleration Center
SPP	Southwest Power Pool
SQ	Status Quo
S-RECs or SREC	Solar Renewable Energy Credits: Created from a solar resource installed after August 1, 2013 and eligible to be used for compliance with the MN Solar Energy Standard.
SRO	Senior Reactor Operator
SRREN	Special Report on Renewable Energy Sources and Climate Change Mitigation
STEM	Science, Technology, Engineering, and Mathematics
Switch	Electromechanical devise used to configure the flow of electricity on distribution grid. A switch is designed to be opened or closed when electricity is not flowing through circuit. When switch is open, no electricity is flowing through circuit.
Tap	Final leg of distribution system before connecting to customer premises.
TCCRI	Twin Cities Climate Resiliency Initiative
TDEC	Tennessee Department of Environment and Conservation
TEP	Transportation Electrification Plan
TES	Thermal Energy Storage
THI	Temperature Humidity Index
TIR&C	Treasure Island Resort & Casino
TO	Transmission Owners

ACRONYM / TERM	DEFINITION
TOU	Time-of-Use
TPS	Technical Planning Study
Transcos	Transmission-only entities designed to respond to the FERC Order 1000.
Transformer	Electromechanical devise that converts alternating current to higher or lower voltage.
Transmission Inadequacies	Identified deficiencies in the transmission system that need to be upgraded to keep the transmission system within its defined limits.
TRC	Total Resource Cost
TSD	Technical Support Document
UAMPS	Utah Associated Municipal Power Systems
UCAP	Production Capability Value
UDEQ	Utah Department of Environmental Quality
USACE	U.S. Army Corps of Engineers
USGS	United States Geological Survey
V2G	Vehicle-To-Grid
VAR	Voltage and Reactive Power
VETS	Veterans and Employees Together in Service
VMT	Vehicle Miles Traveled

WTP	Worker Transition Plan
XE WiN	Women in Nuclear
YPN	Young Professionals Network
ZRC	Zonal Resource Credit

APPENDIX C – ABOUT XCEL ENERGY

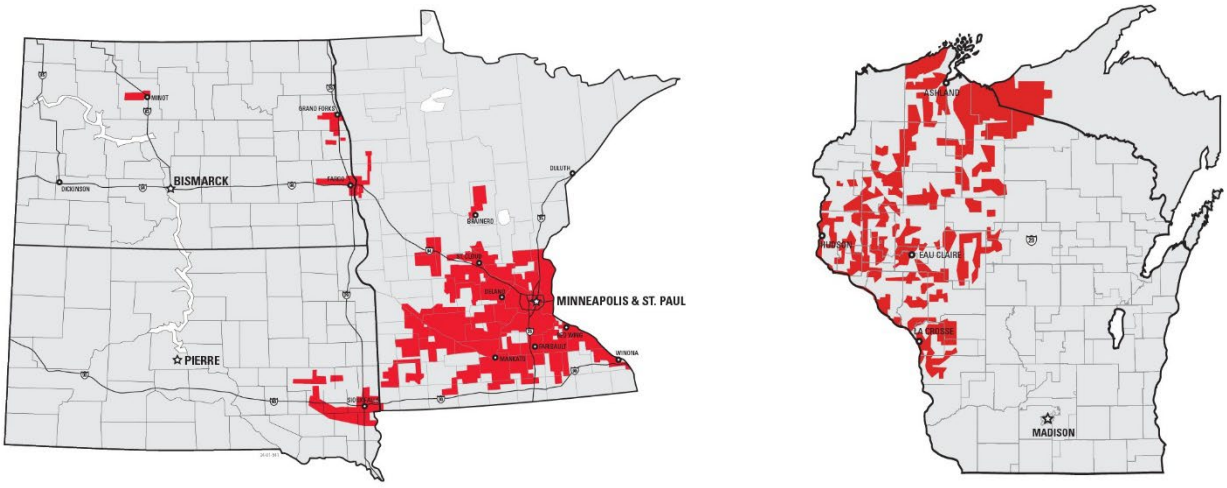
Based in Minneapolis, Xcel Energy serves 3.8 million electricity and 2.1 million natural gas customers through four regulated operating companies that generate electrical power, and transmits, distributes, and sells it to residential and business customers within service territories assigned by state regulators:

- Public Service Company of Colorado
- Northern States Power Company-Minnesota
- Northern States Power Company-Wisconsin
- Southwestern Public Service Company

Northern States Power Company-Minnesota (NSPM), and Northern States Power Company-Wisconsin (NSPW), collectively the NSP Companies, are public utilities organized under the laws of the state of Minnesota, and Wisconsin. The NSP Companies own and operate the five-state integrated NSP System pursuant to the terms of the Federal Energy Regulatory Commission (FERC) approved Interchange Agreement. The NSP Companies have about 1.8 million electricity customers in the upper Midwest.

Figure C-1 shows the Company's upper Midwest service territories in the states of Minnesota, Wisconsin, Michigan, North Dakota, and South Dakota.

Figure C-1: NSP Companies' Upper Midwest Service Territory

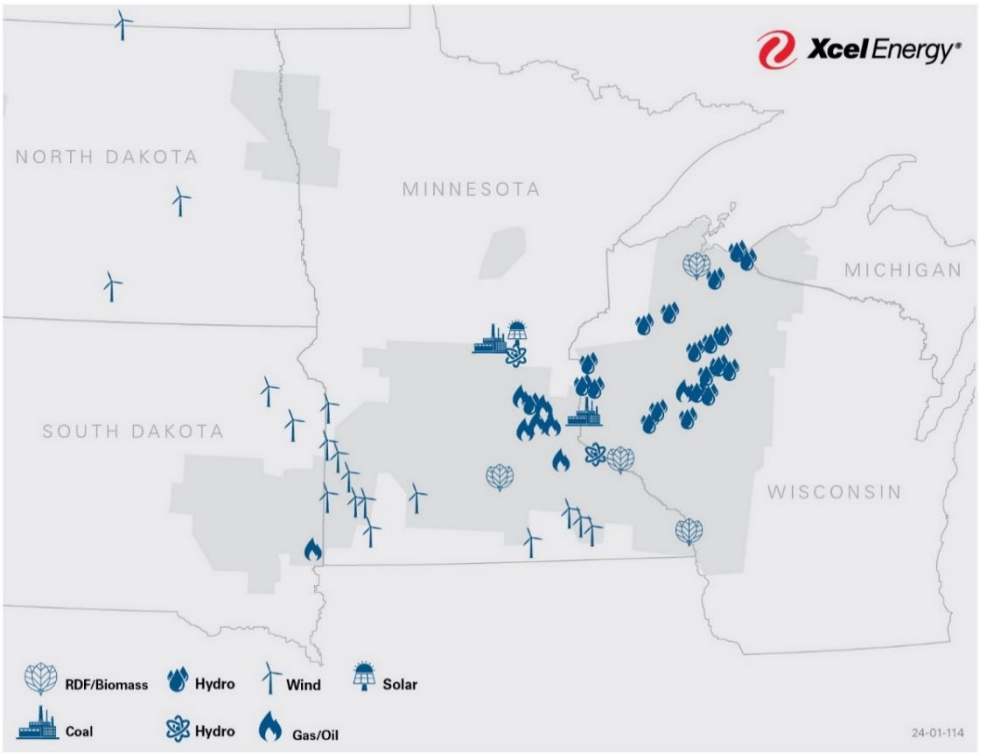


Approximately 89 percent of our NSP customers are residential, with commercial and industrial customers comprising most of the remaining 11 percent. The distribution of electricity sales by type of customer, however, is significantly different. Residential customers make up approximately 23 percent of electricity sales, with commercial, industrial, and other customers making up most of the remaining 77 percent.

NSP currently provides jobs to about 6,500 people[1] in the Upper Midwest. In 2023, we initiated 18 economic development projects for our local communities, which are projected to create more than $2.4 billion in capital investments and 1,400 new jobs in those communities. Our Vision is to be the preferred and trusted provider of the energy our customers need and with a mission to provide our customers with the safe, clean, reliable energy services they want and value at a competitive price.

The Company owns and operates multiple electric generation facilities serving this area using a variety of technologies and fuels including, coal, natural gas, wind, solar, hydro, refuse derived fuel, and nuclear. The map in Figure C-2 illustrates this fleet of generation resources.

Figure C-2: NSP System Generation Resources



[1] Includes employees and contract workers.

The NSP System includes power plants with a net maximum capacity of approximately 9,500 MW, 45,000 conductor miles of transmission lines, and approximately 558 transmission and distribution substations. We also have over 3,700 MW of Purchase Power Agreements (PPAs).

APPENDIX D – ENERGY ADEQUACY ANALYSIS

I. INTRODUCTION

The electric grid is undergoing a significant transformation, moving away from traditional thermal baseload sources to more variable energy sources like wind, solar, and battery energy storage. This shift brings new challenges and complexities in maintaining grid resilience and reliability.

We are increasingly focused on ensuring that our system remains reliable, so that we can continue to deliver the power our customers demand, while responsibly meeting the State's carbon reduction goals. Our focus on reliability is particularly important because, as we are planning to retire our entire coal fleet (over 2,000 MW of baseload generation), we have nearly 1,700 MW of power purchase agreements (PPAs) set to expire between 2025 and 2028. At the same time, our neighbors are also retiring firm capacity, which makes relying on the market more difficult. Given these challenges, traditional reserve margins and capacity-based estimates are no longer sufficient to ensure our system is prepared for the challenges of extreme weather and changing grid dynamics. To ensure reliability, enhanced planning and energy adequacy assessments are necessary.

In addition to planning to meet our planning obligations without reliance on MISO, we have taken steps to further refine our energy adequacy analysis. We conducted energy adequacy back casting analysis to ensure our system has the reliable energy it needs to serve all customers at every hour of every day. We also examined the inertial floor of our system to assess how the grid would perform in the absence of traditional baseload generation. Our studies go beyond traditional EnCompass modeling to verify the need for firm dispatchable resources and inertia to ensure reliable service for our customers.

II. UTILITY PLANNING FOR SYSTEM NEEDS

Minnesota law requires that we demonstrate that we have sufficient capacity to meet our obligations for a five-year period consistent with Minn. Stat. § 216B.2422. Historically, we planned to have enough resources to meet our load serving needs. Though MISO plays a critical role in ensuring the reliable and efficient operation of the electric grid in the Midwest region of the United States by managing the grid and determining the availability and need for capacity, energy, and ancillary services, we cannot simply rely on MISO to address our capacity needs and ensure the reliability of our system.

MISO's Resource Adequacy (RA) construct will not necessarily ensure there is sufficient firm capacity online to cover the needs of load serving entities. The MISO region relies on Load Serving Entities (LSEs) and market participants to supply the generation resources needed to serve load. MISO also oversees a market to ensure the resources that are available are used efficiently to serve load across the MISO footprint. While MISO can manage the distribution of resources, it cannot ensure that there is enough power generation to meet demand and does not guarantee that there will be enough firm capacity to meet the needs of LSEs.

MISO's role in generation planning is limited. Generation planning is reserved for the states (except in IL). MISO has the ability to set a reserve margin but not the ability to determine what resources will be procured to meet it. While we utilize MISO market energy purchases when they are more cost-effective than our own resources, these purchases are non-firm and do not contribute to our capacity for meeting our seasonal Planning Reserve Margin Requirements (PRMR) obligations as a MISO market participant. Compliance with PRMR obligations is for single-year periods, and the acquisition of new generation capacity often spans multiple years. Our most cost-effective and responsible strategy is to plan for the acquisition of generation capacity several years in advance.

Relying on the MISO Planning Resource Auction (PRA) for securing capacity for single-year periods is not a viable resource planning option. Therefore, it is crucial that we continue to plan for a system with sufficient capacity to meet our customer's energy needs.

A. Navigating the Challenges of Changing Energy Landscapes and Extreme Weather Conditions

The challenges and considerations for maintaining reliability in the face of changing energy landscapes and extreme weather conditions underscores the importance of long-term planning and the integration of new technologies and resources into the grid. Utilities are facing mounting pressure to keep pace with accelerating electricity demand, energy needs, and transmission system adequacy as the resource mix transitions.[1] Extreme weather events continue to pose the greatest risk to its reliability and stability. The North American Reliability Corporation (NERC) concluded that much of North America is again at an elevated risk of having insufficient energy supplies to meet

[1] 2023 Long-Term Reliability Assessment (LTRA): North American Electric Reliability Corporation, 2023 Long-Term Reliability Assessment (2023). https://www.nerc.com/pa/RAPA/ra/Reliability%20Assessments%20DL/NERC_LTRA_Infographic_2023.pdf.

demand in extreme operating conditions.[2] As the resource mix on the grid continues to evolve, the risk associated with continuity of energy supply must be managed.

For many years, the regional energy supply has relied on large generators located near large load centers. However, in recent years, there has been a marked shift toward renewable and distributed resources that may be distant from major load centers or may provide variable production profiles. This transition toward more variable resources located far away from load has only increased in recent years.

Consistent with our 2019 Plan, we recently retired Sherco Unit 2, and will retire Sherco Unit 1 in 2026, King in 2028, and Sherco 3 in 2030. Ultimately, the retirements of all the Sherco and King units will remove a total of 2,400 MWs of from our system by 2030. Others are also removing base load from their system. For example, according to the most recent MISO Regional Resource Assessment (RRA)[3] in LRZ1, coal generation is expected to decline by more than 3,200 MWs from 2027 to 2037. This generation is being replaced by less than 1.5 GWs of dispatchable generation. While a substantial amount of non-dispatchable resources is also replacing this retiring generation, MISO is still forecasting a 1 GWs reduction in accredited capacity from 2027-2032 for LRZ1. These forecasted replacements create a systemic risk that the market for capacity and energy in MISO LRZ1 will not be enough to serve the load in LRZ1—including that of Xcel Energy—under certain weather conditions. This situation could lead to an energy shortfall, disrupting the supply to consumers and potentially causing widespread outages. Moreover, similar risk extends to areas immediately adjacent to LRZ1 – LRZ2 and LRZ3 – as shown in Figure D-1 below.

[2] 2023–2024 Winter Reliability Assessment: North American Electric Reliability Corporation, 2023-2024 Winter Energy Market and Electric Reliability Assessment (2023), https://www.nerc.com/news/Pages/Generator-Fuel-Supplies,-Power-Plant-Winterization,-Load-Forecasting-Complexity-Increase-Reliability-Risk-in-North-America-.aspx

[3] 2023 Regional Resource Assessment, MISO. (November 2023). RAN Reliability Requirements and Sub-annual Construct (misoenergy.org)

Figure D-1: Local Resource Zones[4]

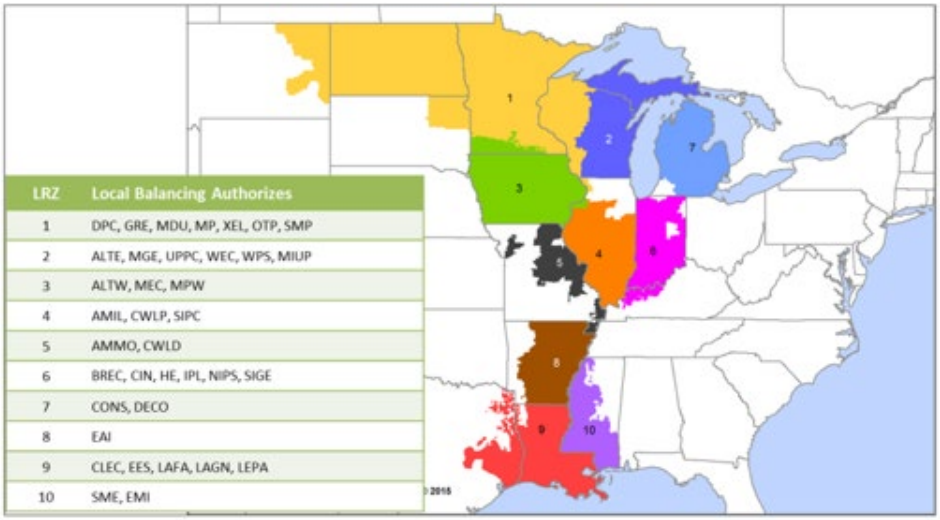


Table D-1 shows RRA projections of no excess capacity in LRZ3 and an even larger capacity shortfall than LRZ1 in the same period. These adjacent LRZs are critical for the Company's market interactions and reduction of available capacity in these locations further threatens the reliability of the energy supply for LRZ1, as it suggests they may not always be able to provide support to LRZ1 if needed. This scenario underscores the need for strategic planning and robust risk management measures to ensure the uninterrupted operation of the energy market.

Table D-1: Estimated Net Change in Resource Type for Surrounding Load Balancing Authorities

	2027 GW Surplus or (Gap) in Accredited Capacity	2032 GW Surplus or (Gap)
LRZ 1 (Company's LRZ)	**1.0**	**(1.0)**
LRZ 2	**(1.0)**	**(3.0)**
LRZ 3	**1.0**	**0.0**

In the face of these challenges, it is imperative that we explore and implement solutions that can effectively mitigate these risks. The amount of dispatchable capacity that is scheduled to retire from our system in the next several years requires that we earnestly analyze the reliability of our system to ensure that we can continue to be resilient and that our customers continue to experience the high levels of reliability they expect. It is

[4] Source, MTEP18 Book 2 Resource Adequacy264875.pdf (misoenergy.org)

important that we plan to meet our energy and capacity obligations without overreliance on the market or exposing our customers to excessive risk.

III. ENERGY ADEQUACY ANALYSIS

To ensure we would have sufficient capacity on our system to meet our customers' needs across hours of the year, we stress tested our Preferred Plan against historical hourly load and renewable production data using Encompass modeling software. The Encompass modeling reflects actual system and market conditions and hourly production cost analysis. We use the model's full chronological modeling capabilities to run dispatch and cost analyses for the years 2027 to 2030, 2033, 2034 and 2040.

Using each historical year from 2016 to 2022, we developed an 8,760-hour historical demand shape, along with monthly peak and energy forecasts, to calculate the future system level demand and shape to use in the Encompass model. All existing wind and solar resources were dispatched based on their actual historical 8,760-hour production profiles or an 8,760-hour profile from a nearby facility. Generic facilities were given a random 8,760-hour profile. Using this historical data, we conducted a special study on four plans to ensure we would have sufficient capacity on our system to meet our customers' needs under varying weather conditions:

(1) Reference Case (Scenario 1),
(2) Preferred Plan (Scenario 3),
(3) Low Load (Scenario 3), and
(4) Market Access Optimization (Scenario 3 optimized with 2,300 MW of hourly market access).

This analysis allows us to assess the capacity and energy adequacy of our plans. We evaluated these plans on six different measures:

1. Native Capacity Shortfall: Hours of insufficient system capacity in each year.
2. Average Shortfall Intensity: Average Shortfall in MW during the shortfall events in each year.
3. Longest Shortfall Event: Longest duration in hours of the shortfall events in each year.
4. Peak Capacity Shortfall: Peak capacity shortfall in MW of the capacity shortfall events in each year.
5. MISO Market Reliance Hours: Total number of hours the plan is reliant on the market to serve load.
6. MISO Market Reliance Energy: Total amount of MWh the plan is reliant on the market to serve load.

The results for each scenario in 2030 and 2040 are shown below in Table D-2:

Table D-2: Summary of 2030 Energy Adequacy Special Study Scenario

		Capacity Adequacy Metrics				Energy Adequacy Metrics**	
Plan	**Historical Year - Hourly Conditions in 2030**	**Native Capacity Shortfall (Hrs.)**	**Average Shortfall Intensity (MW)**	**Longest Shortfall Event (Hrs.)**	**Peak Capacity Shortfall (MW)**	**MISO Market Reliance Hours**	**MISO Market Reliance (MWh)**

	2022 Historical	**20**	**290**	**3**	**1,144**	**24**	**7,254**
	**** LOLH is higher than capacity shortfall due to batteries having available capacity, but no stored energy (MWh)**						

As shown in the table above, the Preferred Plan performs well across energy adequacy metrics. There are only two hours of native capacity shortfall across the seven historic years tested, resulting in limited dependence on the market. There are only four hours across the seven historical test years where the Preferred Plan requires market purchases in order to meet load serving needs. The Reference Case and Low Load scenarios also result in limited market dependence.

In contrast, under the Market Access Optimization, which allows the capacity expansion to optimize assuming market access of 2300 MWs in all hours of the year, the results show that the plan exposes our customers to excessive risk. There are 405 hours across the seven historic years where the plan has insufficient capacity to meet needs. This results in 509 hours where the plan cannot meet load serving needs and must rely on market purchases of nearly 250,000 MWhs of energy.

Our analysis of 2040, below, shows similar results as displayed in Table D-3 below:

Table D-3: Summary of 2040 Energy Adequacy Special Study Scenario

	** LOLH is higher than capacity shortfall due to batteries having available capacity, but no stored energy (MWh)						

Similar to the results for 2030, the Preferred Plan performs well across energy adequacy metrics in 2040. There are only 8 hours of native capacity shortfall across the seven historic years tested, resulting in limited dependence on the market. There are 36 hours across the seven historical test years where the Preferred Plan requires market purchases in order to meet load serving needs. The Reference Case and Low Load scenarios also result in limited market dependence.

In contrast, under the Market Access Optimization, which allows the capacity expansion to optimize assuming market access of 2300 MWs in all hours of the year, the results exposes our customers to excessive risk. There are 200 hours across the seven historic years where the plan has insufficient capacity to meet needs. This results in 501 hours where the plan cannot meet load serving needs and must rely on market purchases of over 300,000 MWhs of energy.

Limiting market dependence is important for both cost and reliability. During hours when system resources cannot meet load serving needs, purchases from the market are the only option to meet needs. During these hours, we are exposed to the prevailing Locational Marginal Energy Prices (LMPs) at load. If LMPs are high, those high cost will increase customer bills. If LMPs are high over multiple hours, those impact could be significant. More importantly, if resources are not available in the market, customers may be subjected to reliability impacts. As one of the largest utilities in MISO Zone 1, the potential for reliability impacts in the region are greater if we have insufficient resources to meet our load serving needs.

Figures D-2 through D-5 below provide additional insight into the energy adequacy of the four plans analyzed.

Figure D-2: Reference Case (Scenario 1)

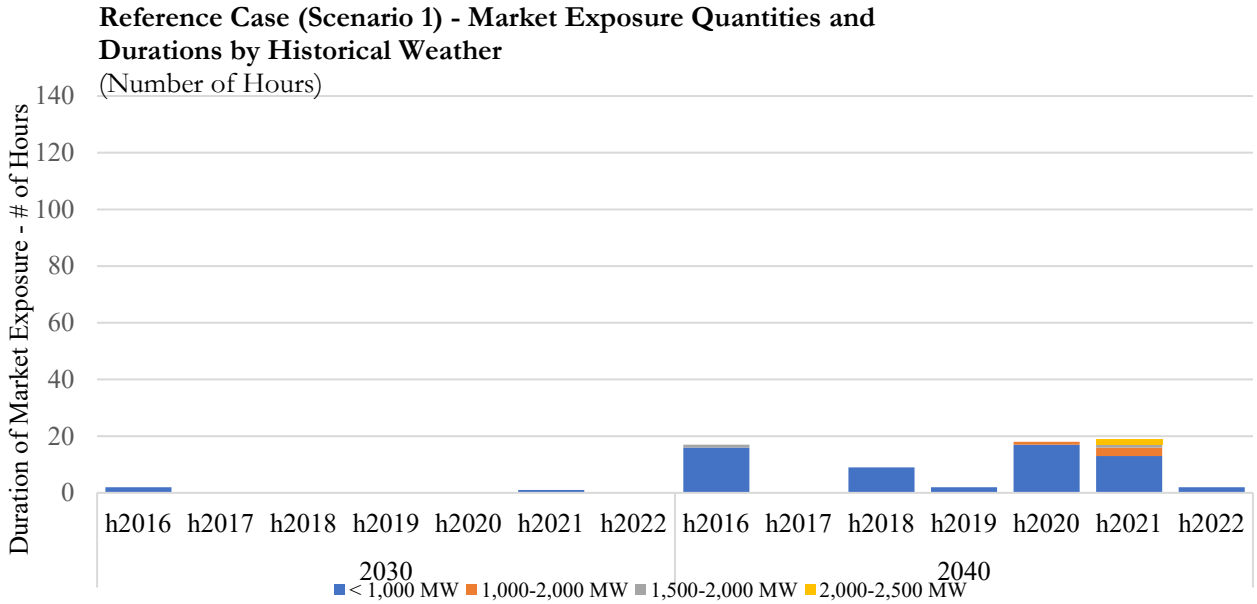

Figure D-3: Preferred Plan (Scenario 3)

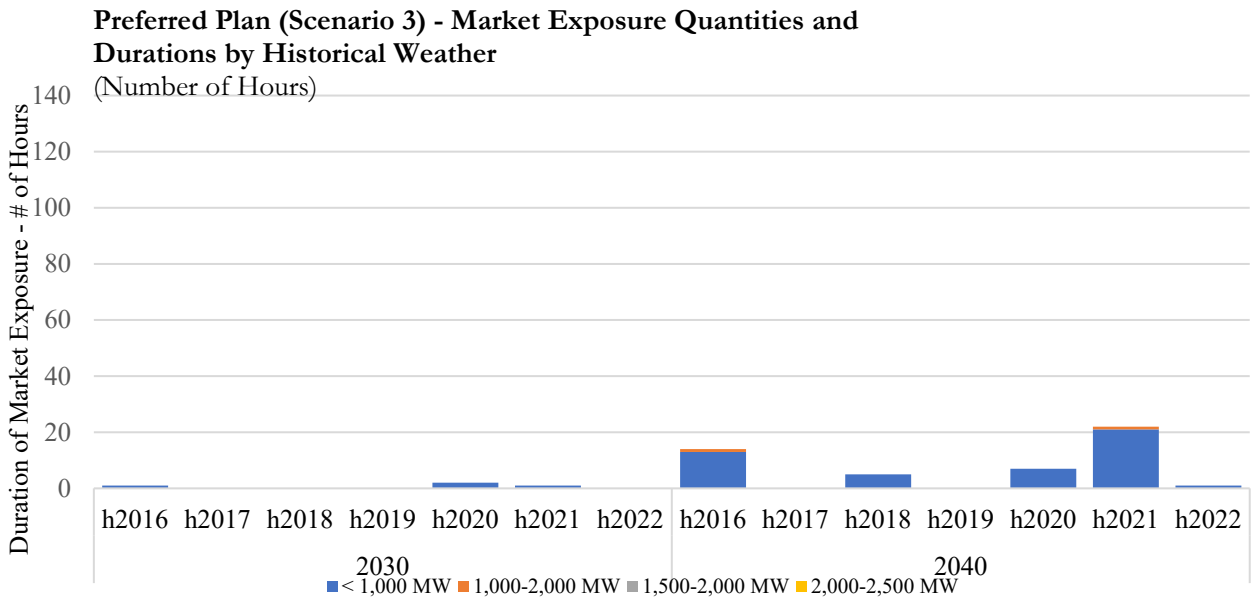

Figure D-4: Low Load (Scenario 3)

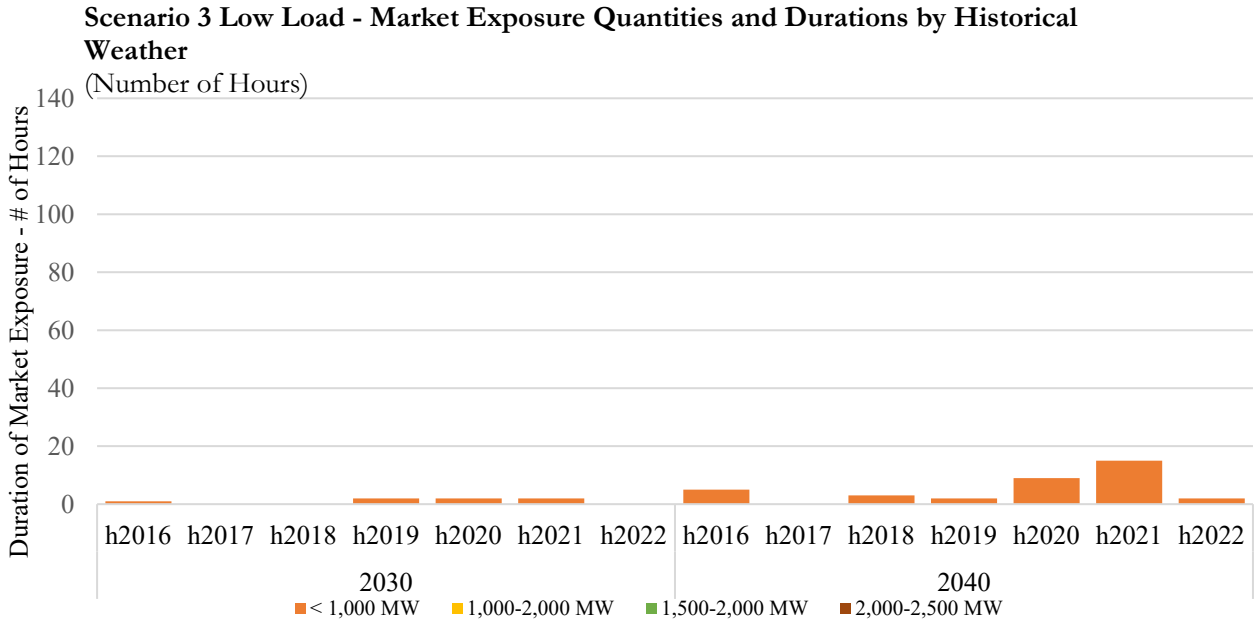

Figure D-5: Market Access Optimization (Scenario 3 optimized with 2,300 MW of hourly market access).

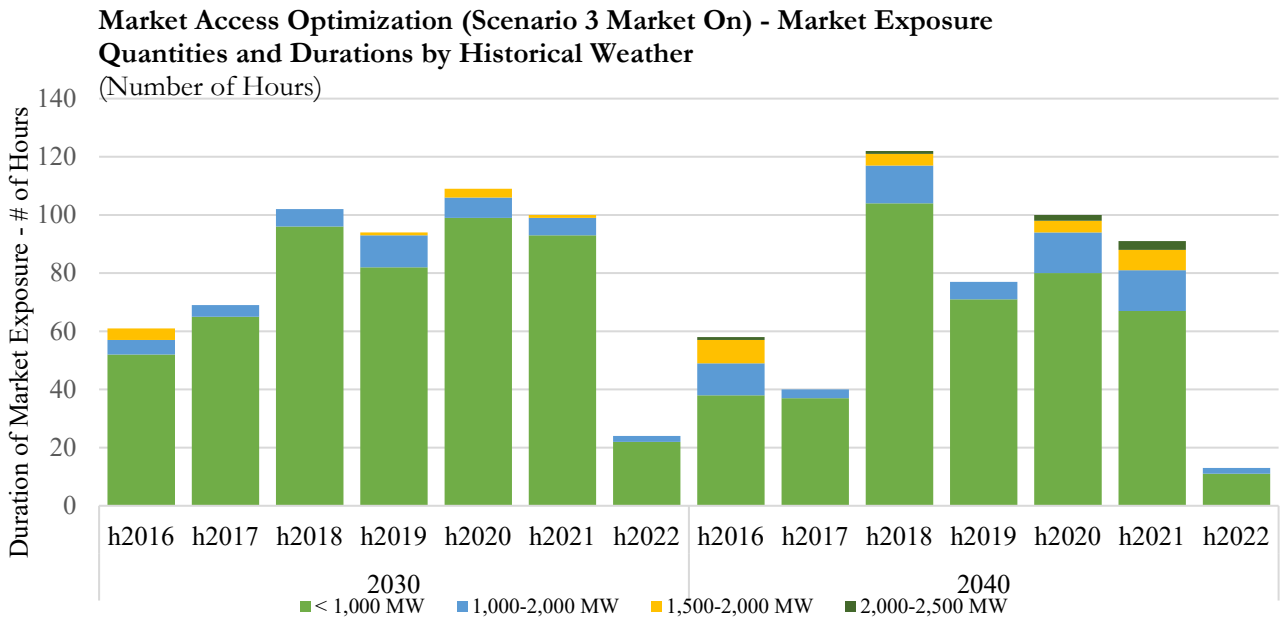

The figures above show the market dependence of each scenario analyzed. The bar for each historic year shows the impact in 2030 in 2040 both in terms of the number of hours of market dependence and the magnitude of those hours. The darkest green

shows hours where over the system must rely on the market for over 2,000 MWs of purchases in order to serve load. Consistent with the results above, the Preferred Plan, Reference Case and Low Load scenarios also result in limited market dependence. In contrast, the Market Optimization analysis shows significant market dependence.

The tests and metrics above focus on limiting market dependence. There are many reasons market exposure can occur, including fluctuations in pricing, weather, load, or generation that last for a few acute hours or for 1–2-day periods. However, in addition to limiting market dependence across all events, different plans can also differ starkly in terms of how they weather a longer period – 4 days – of lower than expected solar and wind generation.

The need for our resources to be able to cover energy needs over an elongated period of time is important because we have seen historical, and projected instances of low renewable output that could create havoc for reliability were there not a sufficient amount of firm capacity to cover energy needs. For instance, recently customers in Oahu were asked to reduce use of electricity to avoid rolling blackouts across Oahu due to a shortage of reserve generation capacity.[5] Two large generating units at Waiau Power Plant went offline, and repairs were not expected to be completed by the end of the day. Heavy cloud cover and rainy conditions reduced the production from solar energy systems and prevented battery energy storage systems from charging to full capacity. As a result, Hawaiian Electric began load shedding in various areas around the island to avoid a more widespread outage or damage to the electric system from an imbalance of demand versus available generation.

Further, the Moon Shoot study[6] by GridLab, emphasized the importance of firm dispatchable generation to support a clean energy policy. The study noted that short storage duration batteries (typically 4 to 10 hours) can provide a significant amount of capacity for reliability, but they cannot be the only capacity resource on the system (unless systems are upsized in terms of solar and wind resources, or capacity expansions are planned through a regional optimization approach). There may be long periods—potentially spanning multiple days—where solar and wind are unavailable, requiring other resources (such as hydrogen capacity) to be available in these times. During this time, even relatively long, 10-hour duration battery storage does not bridge the gap between periods of renewable production and demand.

Assessing the tradeoffs among clean portfolios with a PNM case study, Grid Lab
https://gridlab.org/moonshot-study/.

In conclusion, energy adequacy analysis is a critical tool in resource planning. It helps ensure that we have a diverse and resilient energy portfolio capable of meeting demand. This not only ensures the continuous supply of power but also contributes to the broader goals of affordability, carbon reduction and job creation.

IV. THE IMPORTANCE OF FIRM DISPATCHABLE RESOURCES IN OUR PREFERRED PLAN

As we work to decarbonize our system, our models indicate the need for the addition of approximately 3,600 MWs of cumulative firm dispatchable resources between 2027 and 2040 to ensure long-duration, affordable energy when our intermittent renewables are not able to fully meet our customers' needs. Of this modeled need, 2,244 MWs of firm dispatchable resources are needed by 2030. These resources are split between 748 MWs in 2027, 748 MWs in 2028, and 748 MWs in 2030. Approximately 374 MWs of the 2028 need is located on our re-optimized Sherco Generation tie line.

We note that the Commission is considering firm dispatchable resources additions in Docket No. E002/CN-23-212. Additional firm dispatchable resources above 800 MWs have bid into the acquisition proceeding to serve our up to 800 MW need identified in our 2019 Plan. As noted here, firm dispatchable resources provide numerous benefits, including near-instant availability, making them ideal for peak power supply and when intermittent wind and solar generation are not producing energy.

The value of firm dispatchable resources and fuel diversity becomes evident during periods of extreme weather. During the 2019 Plan, it was observed that firm dispatchable resources were crucial during severe cold spells when wind resources underperformed. Even with a hypothetical doubling of wind output, there were periods of low renewable output. Hence, having diverse resources is essential to meet customer needs during such events. A diverse mix of firm dispatchable resources ensures our ability to provide reliable electric service under all conditions. With the increasing frequency of extreme weather events, it is crucial to manage the transformation of our generation portfolio while preserving system reliability and stability. Though our nuclear units remain a major source of reliable, carbon-free generation for our system, our modeling shows a need for additional firm dispatchable generation.

Extreme events can span all or nearly all of MISO's footprint, limiting the ability to rely on the broader MISO system in times of need. To meet the shortfall in the output of variable resources; at such times, we may have to rely on our resource diversity and our dispatchable generation, including units fueled by natural gas and fuel oil. With the increasing frequency of extreme weather events, such as the 2019 polar vortex and

Winter Storm Uri in 2021, it is crucial to manage the transformation of our generation portfolio while preserving system reliability and stability. Any disruption in electric service during similar future events could have serious impacts on our customers, public safety and to overall grid operations.

In sum, from a high-level capacity and reliability standpoint, the importance of firm, dispatchable resources in our energy strategy is undeniable. As we transition towards a more sustainable energy future, these resources provide the reliability and stability necessary to ensure uninterrupted service under all conditions. While advancements in transmission technologies, renewable energy sources, and energy storage resources are promising, they cannot at this time fully replace the need for firm dispatchable resources due to their current technological maturity, regulatory complexities, and the challenges in large-scale deployment. Therefore, a balanced approach that includes a diverse mix of firm, dispatchable resources, is crucial in meeting the growing energy demand while also progressing towards decarbonization.

VI. INERTIAL FLOOR STUDY

In addition to considering the value of various resources from a high-level capacity and reliability view, the Company is assessing the electrical engineering impacts of moving from a system built around large, centrally located baseload units to one based more on remotely located renewable generators. Studies that the Company and others have conducted show that the inertia historically provided by these baseload units is crucial to help the system oscillations dampen out. To help inform decisions for future generation transformation from traditional coal-based generation, the Company's Transmission Planning engineers performed a study to evaluate the NSP system's transient stability response with all of the baseload coal generation in the region offline and replaced by renewable generation (wind and solar) and other thermal generation. Unlike traditional MISO generator replacement studies, this study considers not only what happens to our system as we retire Company-owned coal generation but also potential retirements of neighboring coal generation. At this time, MISO only studies system impacts of unit retirements based on unit-specific requests made by the owners of such units. However, we understand that the vast majority of utilities within MISO are considering similar renewable initiatives to the Company. Therefore, while MISO's studies currently reflect the transmission system as being reliable and stable, they do not provide a forward-looking regional assessment of stability as coal retirements continue.

We include as an attachment to this appendix, our NSP Power System Inertial Floor Study Report, showing how the grid would perform in the absence of traditional baseload generation, mainly coal and nuclear. This Inertial Floor study is run annually to

update the analysis and evaluate the impacts to our system reliability, system stability, angular stability and inertia. This analysis allows us to determine the necessary levels of spinning mass and/or dispatchable generation necessary to keep the system stable and reliable to serve our customers.

Our study shows that inertia is crucial to help the system remain stable, and as we and other owners of baseload generation in the region retire those units, we begin to see regional stability issues. This demonstrates that it will be critical that we acquire resources capable of providing inertia as we retire our coal-fleet.

VI. CONCLUSION

Preparation and planning are key to delivering reliable power to our customers. As a Company, we take this responsibility seriously. Recent events have shown that it is important to plan for how we can provide electricity to our customers under all conditions. In addition to planning to meet our planning obligations without reliance on MISO, we have taken steps to further refine our energy adequacy analysis. We conducted energy adequacy back casting analysis to ensure our system has the reliable energy it needs to serve all customers at every hour of every day. We also examined the inertial floor of our system to assess how the grid would perform in the absence of traditional baseload generation. Our studies go beyond traditional EnCompass modeling to verify the need for firm dispatchable resources and inertia to ensure reliable service for our customers. Our Preferred Plan satisfies these concerns and will provide for the reliability our system needs to adequately ensure continued service to our customers.

Executive Summary

This analysis was performed to determine how the grid would perform in the absence of traditional baseload generation, mainly coal and nuclear. Baseload generators are units online or operating most hours of the year. To help inform decisions for future generation transformation from traditional coal based, Transmission Planning engineers performed a study to evaluate the NSP system transient stability response with all of the baseload coal generation offline. Renewable generation (wind and solar) and natural gas Combined Cycles (CC) and Combustion Turbines (CT) generation are used to replace the baseload generation that has been turned offline. This study is a stability only look – system transfer capability and resource capacity analyses are out of the work scope of this study. However, all the problems shown in the power flow models are documented.

This study examines grid performance in the absence of traditional baseload generation. The following Table 1 shows theses baseload generators and the amount of power that needs to be replaced by another type of generation.

Table 1

Baseload Generator	2027 SHAW	2027SUM
SherCo #1 (Coal)	730 MW	730 MW
SherCo #2 (Coal)	730 MW	730 MW
SherCo #3 (Coal)	928 MW	928 MW
King (Coal)	197 MW	560 MW

Based on the analysis results performed in this study, there are several potential system issues observed. The observations are listed below:

- Inertia is crucial to help the system oscillations dampen out
- Existing and proposed CCs do help stabilize the power system but are not enough to hold the system stable during all potential future generation retirement or during low renewable power situations when wind and solar are not available (i.e. night time with no wind).

Scenarios Analyzed

Summer Shoulder Average Wind, and Summer Peak scenarios are analyzed in this study. Renewables in the NSP system are modeled at seasonal generation levels; Solar at 50% for Summer Peak, 50% for Summer Shoulder Average Wind, Wind at 14.8% for Summer Peak, 48% for Summer Shoulder Average Wind.. CCs in the study area are turned on to full capacity as required to provide system stability. NERC requires Transmission Planners to evaluate the grid including under prior outage conditions. Key generation outages are assessed in the study:

- Scenario 1: Turn OFF MP Boswell Unit 3 and 4 coal plant
- Scenario 2: Turn OFF GRE Coal Creek Unit 1 and 2 coal plant
- Scenario 3: Turn OFF OTP Bigstone Unit coal plant
- Scenario 4: Turn OFF Nextera Duane Arnold nuclear plant

- Scenario 5: Turn OFF MEC Ottumwa coal plant
- Scenario 6: Turn OFF MEC George Neal Unit 3 and 4 coal plant
- Scenario 7: Turn OFF MEC Council Bluffs Unit 3 and 4 coal plant

NSP load information is shown in following Table 2.

Table 2
NSP Load Level and Thermal Generation

Introduction

This analysis was performed to determine how the grid would perform in the absence of traditional baseload coal generation. Baseload generators are units online or operating most hours of the year. To help inform decisions for future generation transformation from traditional coal based, Transmission Planning engineers performed a study to evaluate the NSP system transient stability response with all of the baseload coal generation offline. Renewable generation (wind and solar) and natural gas Combined Cycles (CC) and Combustion Turbines (CT) generation are used to replace the baseload generation that has been turned offline. This study is a stability only look – system transfer capability and resource capacity analyses are out of the work scope of this study. However, all the problems shown in the power flow models are documented.

Assumptions

This study is performed utilizing Powertech TSAT version 21.0, and based on the MISO MTEP 2022 dynamics package. MISO MTEP 2022 series, year 2027 models are selected as the starting models; no substantial load growth is assumed in this study. Renewables listed on the MISO Renewable Sitting Location list are selected based on the Tier 1 and Tier 2 order. Only Renewables located in Iowa, South Dakota, North Dakota, Minnesota, and Wisconsin are selected. All generations are modeled as lumped generator, and all wind generators are modeled as type 3 models, and all solar generations are modeled as type 4 models.

Potential Limitations

Software

Powertech TSAT version 21.0 is utilized to perform the study. The existing TSAT software version is designed and manipulated based on today's power system – strong inertial support and high reliability margin– which generates great steady state results and provides very useful information for voltage stability and transient stability studies. However, due to functional limitations and the lack of detailed load and DER modeling information, the existing TSAT program can't predict precisely where the stability issue will start to occur in a high penetration, low inertia system.

Model

The study models originated from the MISO MTEP 2022 package models and are based on 2027 load levels. Existing dynamic load models included in the MTEP package are used in this study, but future, more detailed dynamic load modeling, could significantly change the system stability in a low inertia system. Utility size solar farms are included and modeled, but the smaller distributed solar farms (DER) are not modeled in the study. The DER modeling and coordination can play a very important role in future high penetration and low inertia system.

Unpredictable new technologies (Technology stabilize the system) and/or load (such as system wide loads, new policy making on Electric Vehicles, etc) are not analyzed in this study. However, these factors could change the system condition dramatically. The study is based on all facilities functioning correctly, and all protection schemes correctly coordinated. System coordination will be even more important and challenging in the future, than compared to the current system.

All the wind and solar farms are lumped as a single generator connecting directly to the point of interconnection (POI); detailed connector system is not modeled. The wind and solar farm connector system consumes reactive power which helps to deliver and transform the generated wind power to the rest of the power system; the lumped generator doesn't demonstrate the reactive power consumption in the connector system. Therefore, better reactive capacity is shown in the lump generator modeling.

1 Models and Assumptions

2.1.1 Models Utilized

This study is performed utilizing Powertech TSAT version 21.0 and based on the MISO MTEP 2022 dynamics package. MTEP 2022, year 2027 models are selected as the starting models. No substantial load growth is assumed in this study.

2.1.2 Model Development

MTEP 2022, year 2027 models are selected as the starting models. No substantial load growth is assumed in this study. Renewables listed on the MISO Renewable Sitting Location list are selected based on the Tier 1 and Tier 2 order and IRP filing. All renewables added to the model are listed in Table-3.

Summer Shoulder Average Wind, and Summer Peak scenarios are analyzed in this study. Renewables in the NSP system are modeled at seasonal generational levels in both models; Solar at 50% for Summer Peak, 31% for Summer Shoulder Average Wind, Wind at 14.9% for Summer Peak, 50% for Summer Shoulder Average Wind. For No renewable cases, Wind and Solar were reduced to 0MW and 70% MVAR availability to simulate the Wind Free and Q at night functionality of the new inverter types. CCs in the study area are turned on to full capacity as needed to provide stability in each scenario. NSP load information is shown in Table-4.

Table-4 NSP Load Level and Thermal Generation Level

Year	Season	Load Level
2027	Summer Shoulder Average Wind	6517 MW
2027	Summer Peak	9309 MW

Baseload generators turned off are listed in Table-5.

2.1.3 Modeling Assumption

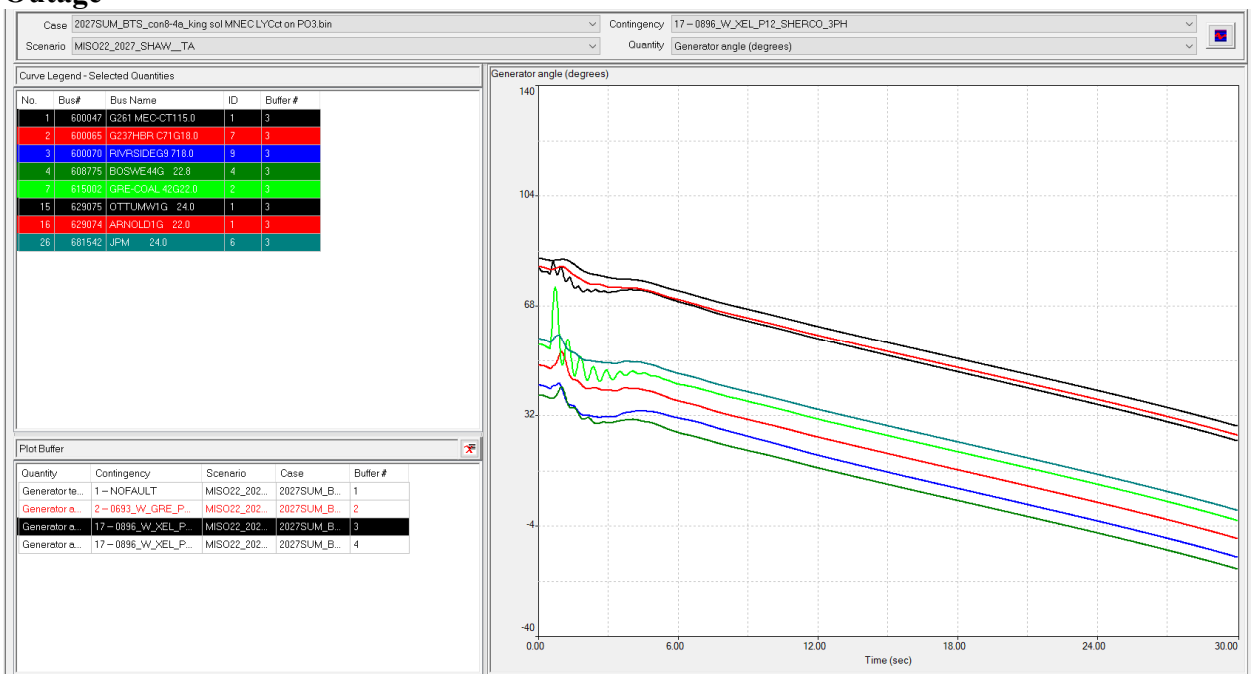
Only Renewables located in Iowa, South Dakota, North Dakota, Minnesota, and Wisconsin are selected. All wind generations are model as type 3 models, and all solar generations are modeled as type 4 models. Solar at 50% for Summer Peak, 31% for Summer Shoulder Average Wind, Wind at 14.9% for Summer Peak, 50% for Summer Shoulder Average Wind. For No renewable cases, Wind and Solar were reduced to 0MW and 70% MVAR availability to simulate the Wind Free and Q at night functionality of the new inverter types.

2.1.4 Issues Shown in Power Flow Models

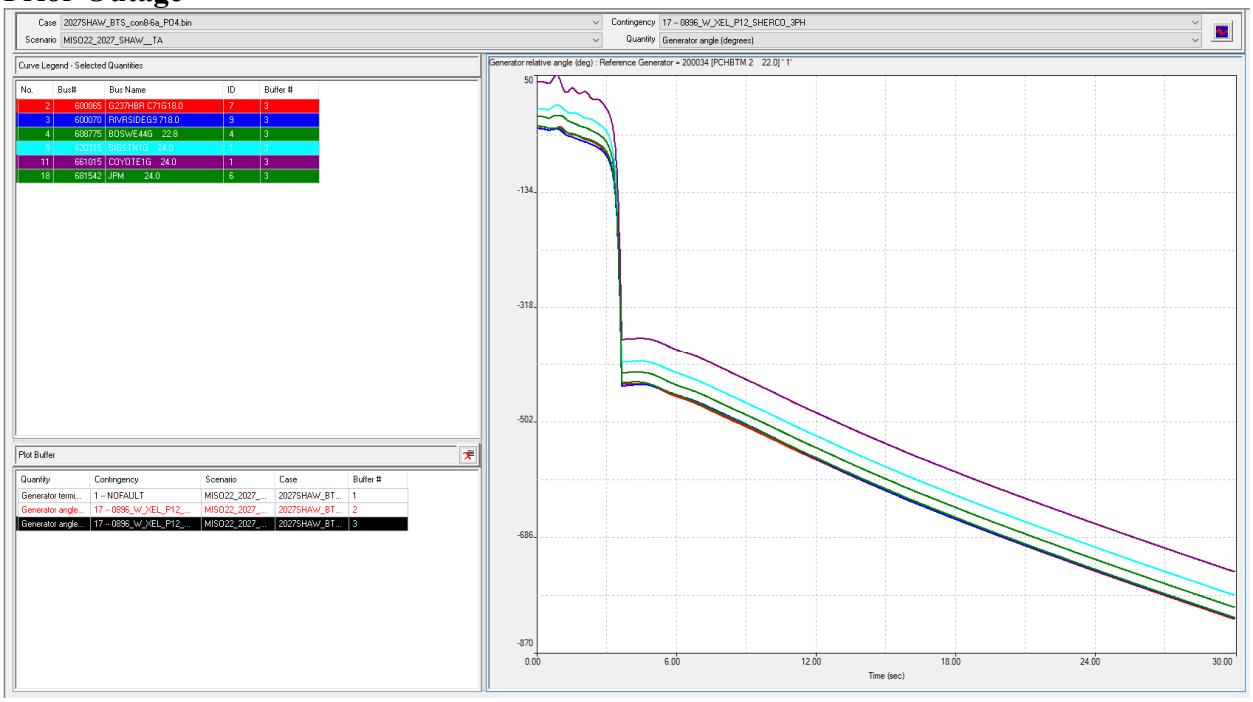
Potential generation stability issues were identified in SHAW, no renewable prior outage cases and SUM prior outage and no renewable cases. The instability is indicated by the generator rotor

angles exceeding 300 degrees, which is indication of angular separation from the grid, which would lead to generator tripping and likely islanding of the system where small pockets of the system are isolated by protection tripping. The SUM prior outage cases did not exceed 300 degrees in the 30 second analysis duration, but did showed degrading angle and no indication of recovery. Plots E3 and E4 show examples of the generator angle instability.

Plot E-3 Generator Angular Instability Summer with Synchronous Condenser Prior Outage



Plot E-4 Generator Angular Instability Shoulder Average Wind No Renewable Prior Outage



2.1.5 Prior Outages

Three prior outages are selected to test more stressed system conditions. The selected prior outages are tested for each season, and listed below:

- Scenario 1: Turn OFF MP Boswell Unit 3 and 4 coal plant
- Scenario 2: Turn OFF GRE Coal Creek Unit 1 and 2 coal plant
- Scenario 3: Turn OFF OTP Bigstone Unit coal plant (Summer Only, Unit Off in Shoulder Base Case)
- Scenario 4: Turn OFF Nextera Duane Arnold nuclear plant
- Scenario 5: Turn OFF MEC Ottumwa coal plant
- Scenario 6: Turn OFF MEC George Neal Unit 3 and 4 coal plant
- Scenario 7: Turn OFF MEC Council Bluffs Unit 3 and 4 coal plant

2 Stability Analysis

MISO MTEP 2022 Transient Dynamic package is used to conduct the transient stability analysis. Three phase faults with normal clearance time and single line to ground faults with a stuck breaker are tested for major 345 kV substations, transmission lines in Twin Cities and neighboring areas. Selected 345 kV bus voltages and transmission line power flow in Twin Cities and neighboring areas are monitored and plotted. The disturbances studied are listed in Table-7:

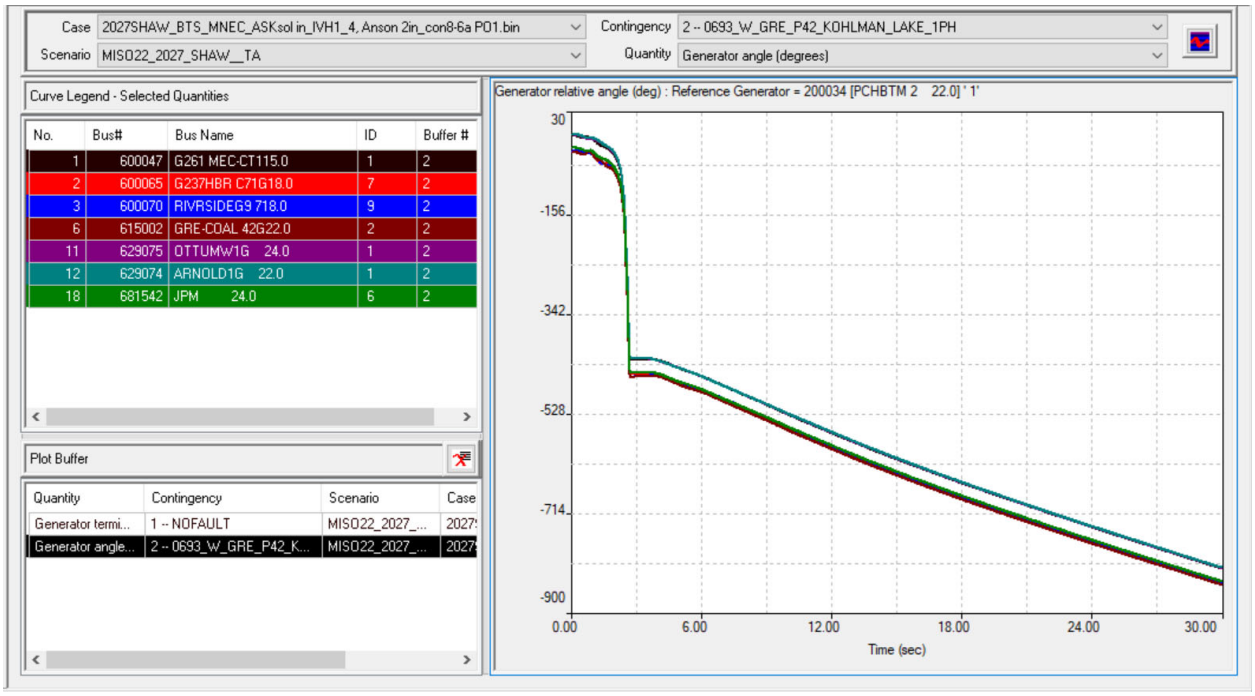
5 Analysis Results Discussion

2027 Shoulder Average Wind Case:

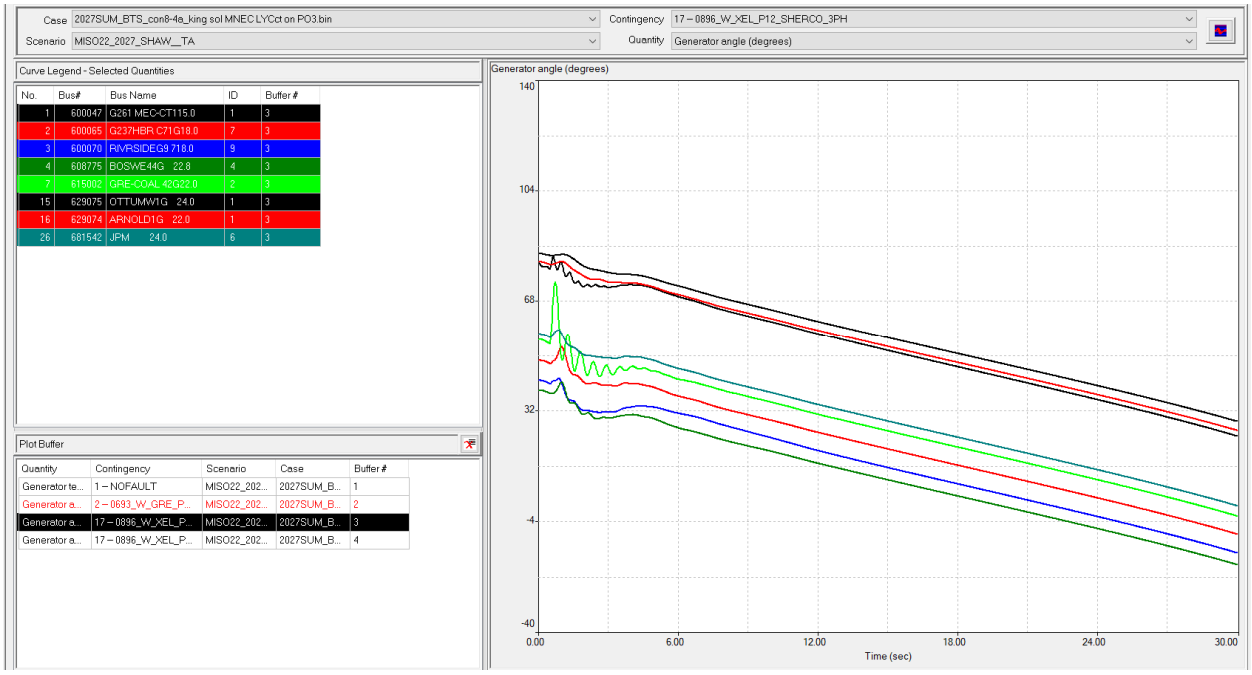
System generator angular stability issues are shown in the no renewable scenario on generators in the study area in all disturbances tested.



Summer Peak Case:

System generator angular stability issues are shown in the prior outage and no renewable scenario on generators in the study area in all disturbances tested.

.



6 Observation

Based on the analysis results performed in this study, there are several potential system issues that have been observed. These observations are listed below:

- Inertia is crucial to help the system oscillations dampen out, but does not help angular stability.
    - Inertia can be provided by synchronous machines.
    - Angular stability can only be solved by using real power on the other side of the power transfer to reduce the angle.

Existing and proposed CCs do help stabilize the power system but are not enough to hold the system stable during all potential future generation retirement or during low renewable power situations.

APPENDIX E – LOAD AND DISTRIBUTED ENERGY RESOURCE FORECASTING

I. SUMMARY LOAD FORECAST DESCRIPTION

This appendix discusses the methodology we used in conjunction with this resource plan to forecast customer need, including the requirements specified in Minn. R. 7610.0320. This appendix documents our load and energy demand forecasting process. In addition, we have taken additional steps in this resource plan to model energy efficiency (EE) as a supply-side resource. Where relevant, we include explanations of these steps to provide transparency and explain how this base forecast correlates to the load and energy demand forecasting discussed in Chapter 3: Minimum System Needs, and Appendix F: EnCompass Modeling Assumptions and Inputs.

The Company relies on econometric models and other statistical techniques to develop the sales forecast. The econometric models relate our historical electric sales to demographic, economic, and weather variables. We develop our sales forecasts for each major customer class in each state of our service area. The individual class forecasts for each state are summed to derive a total system sales forecast.

We convert the sales forecast into energy requirements at the generator level by adding energy losses. The forecasted losses are based on forecasted loss factors, which are developed by modeling actual historical losses. We develop a preliminary peak demand forecast using a regression model that relates historical monthly base peak demand to energy requirements and weather, and then develop a final peak forecast by adjusting for electric vehicles, changes in large customer loads, and beneficial electrification. We provide a detailed discussion of the forecast methodology later in this appendix.

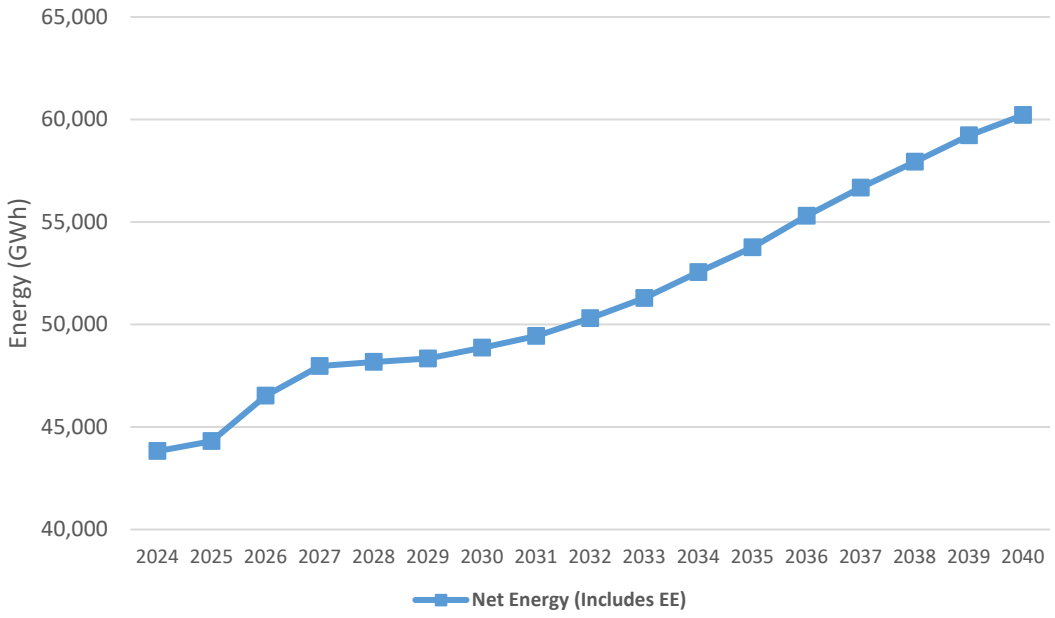
The forecasts themselves are based on projections of economic activity for our various service areas provided by IHS Global Insight, Inc. (Global Insight). Global Insight expects continued growth in key economic indicators. For example, for the Minneapolis-St. Paul metropolitan area, households are expected to increase at an average annual rate of 0.8 percent during the 2024-2040 planning period. Real per-capita personal income is expected to increase 1.9 percent per year on average, and employment is expected to gain an average of 0.4 percent per year. Minnesota real gross state product is expected to increase at an average annual rate of 1.8 percent.

A. Energy Forecast

1. Base Forecast

The base energy forecast increases at an average annual growth rate of 2 percent over the 2024 – 2040 planning period, net of modeled energy savings, forecasted distributed solar, and electric vehicle charging projections. Electric energy requirements[1] are expected to increase at an annual average of 1,025 gigawatt-hours (GWh), starting with 43,823 GWh in 2024 to 60,215GWh in 2040. See Figure E-1 below.

Figure E-1: NSP System Total Median Net Energy (GWh)
(Includes Adjustment for EE)



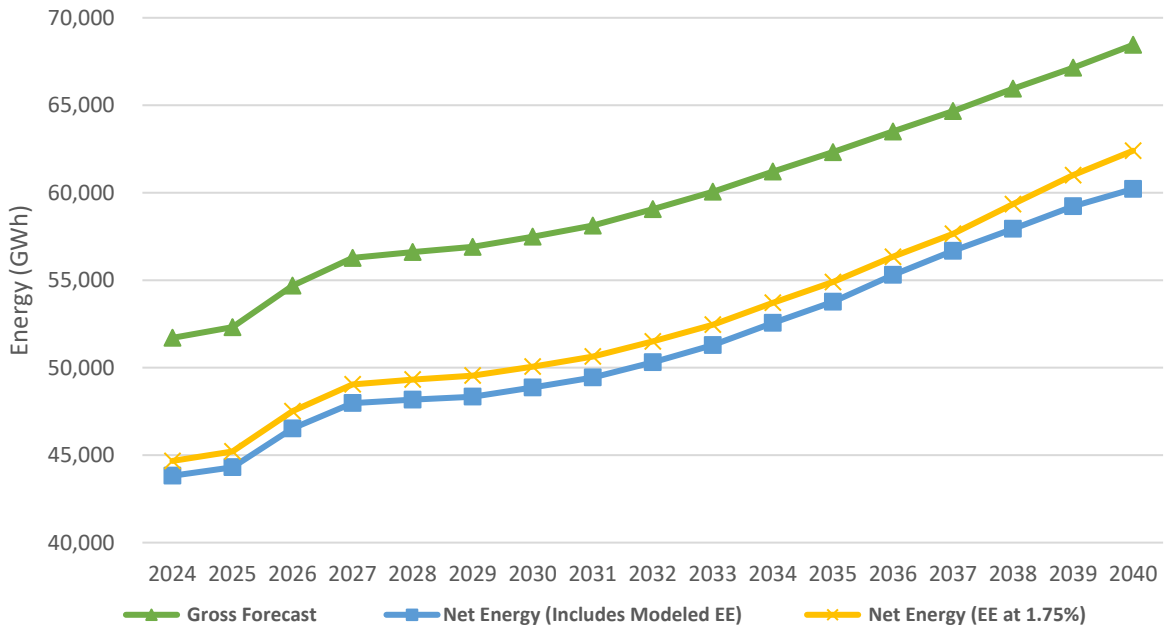
The projected 2 percent average annual growth in electric energy requirements is stronger than the actual growth seen over the past few years due, primarily, to large new data center loads and acceleration in the adoption of Electric Vehicles. After adjusting for unusual weather, electric energy requirements increased at an average annual rate of 0.2 percent from 2019 to 2022.[2]

[1] Gross of rooftop solar generation. Solar generation was modeled as a resource instead of netting against energy requirements.
[2] This data comes from the Company's EFF database, which is our system of record for sales and customer accounts.

2. Modifications for Use in EnCompass

To be consistent with the modeling approach for EE in the last IRP, we continue to model energy efficiency as a supply-side resource. This required that we adjust the base energy forecast (discussed in Part 1 above) to remove the embedded EE adjustment that projects the effects of energy savings to the end of the Planning Period. This resulted in an NSP System Gross Energy Requirements forecast. In a separate process, we formulated annual EE savings amounts into "Bundles" that we made available in the EnCompass model along with other supply-side resources. These adjustments are shown in Figure E-2 below.

Figure E-2: Gross Energy Requirements Forecast Compared to Net Energy Requirements Forecast



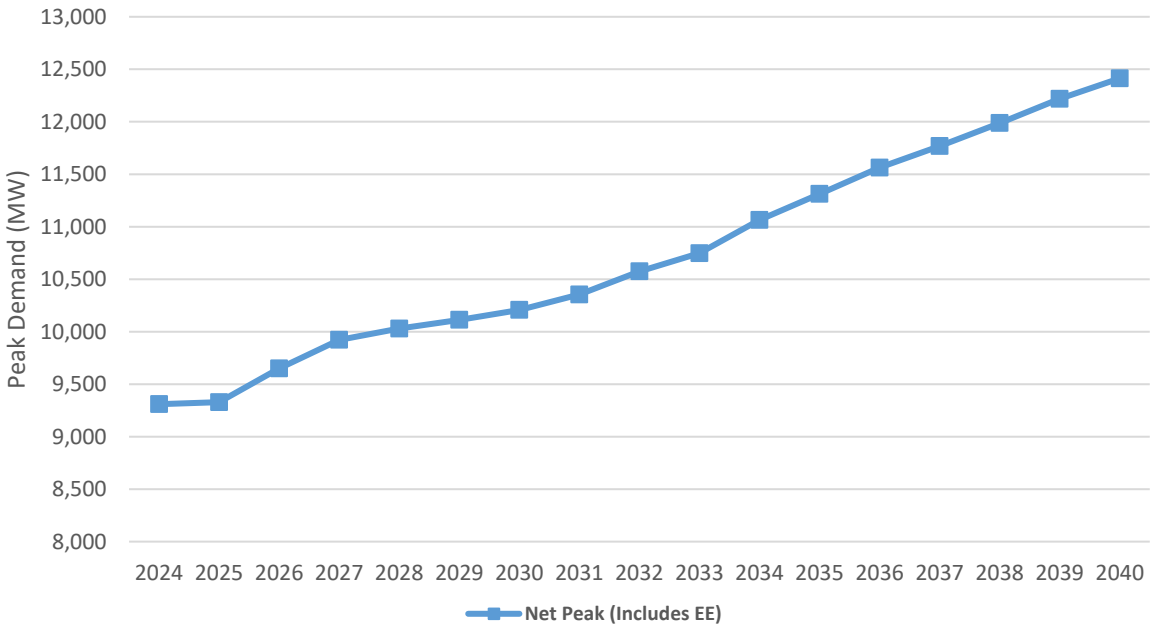
We discuss the EE Bundle modeling further later in this appendix, as well as in Appendix F: EnCompass Modeling Assumptions and Inputs, and Appendix H: Resource Options. Appendix J: Distributed Energy Resources contains detail on how the EE bundles were developed.

B. System Peak Demand Forecast

1. Base Forecast Methodology

During the 2024 – 2040 planning period, the base case peak forecast increases at an average annual growth rate of 1.8 percent. As demonstrated in Figure E-3 below, annual summer peak demand increases at an average of 194 MW each year, starting with 9,309 MW in 2024 to 12,414 MW in 2040.

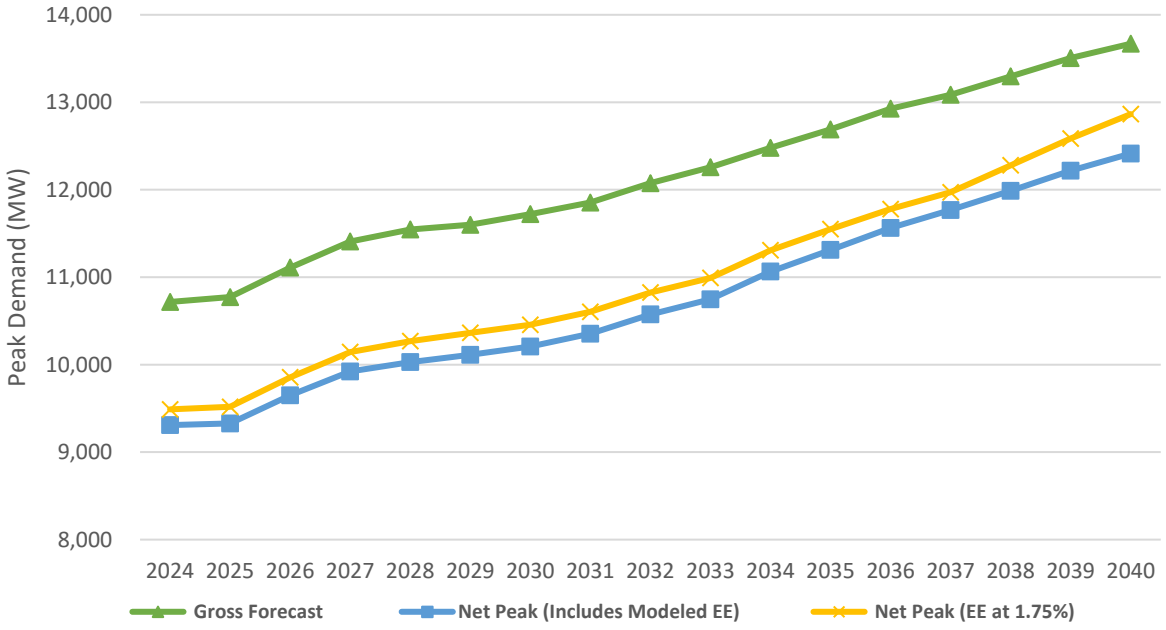
Figure E-3: NSP System Median Base Summer Peak Demand (MW) (Includes modeled EE Adjustment)



2. Modifications for Use in EnCompass

For modeling peak summer demand levels in EnCompass, we took the same approach as noted in reference to the energy forecasts. Again here, for EnCompass modeling purposes, we start with the base forecast and remove EE adjustments to reflect gross load. This process enables us to model the system considering EE as a supply-side resource.

Figure E-4: Gross Peak Demand Forecast Compared to Net Peak Demand Forecast



The remainder of this appendix discusses the energy and peak load forecasting methodologies, assumptions, analytics, adjustments, etc. to derive the System Energy Forecast presented in Part A.1 and Figure E-1 and the System Base Peak Demand Forecast presented in Part B.1 and Figure E-3.

C. Forecast Methodology

Xcel Energy serves customers in five jurisdictions in the upper Midwest: Minnesota, North Dakota, South Dakota, Wisconsin, and Michigan. We develop a forecast for each major customer class and jurisdiction using a variety of statistical techniques.

We first develop our system sales forecasts by using a set of econometric models at the jurisdictional level for the Residential, Small Commercial and Industrial sectors for all jurisdictions, Large Commercial and Industrial sector for all NSPM jurisdictions, and the Minnesota Public Street and Highway Lighting and Public Authority sectors. These models relate our historical electric sales to demographic, economic and weather variables as detailed in the prior section of this document.

For the remaining, more static customer classes – Large Commercial and Industrial (NSPW), Public Street and Highway Lighting, Public Authority, and Interdepartmental – in all states but Minnesota we use trend analysis or a simple historical average. We compile our system sales by summing the individual forecasts for each sector in each jurisdiction.

Since some energy is lost, mostly in the form of heat created in transmission and distribution conductors, we use loss factors to convert the sales forecasts into energy production requirements at the generator. The forecasted loss factors are developed by modeling actual historical loss factors and estimating losses for the first forecast year (2023). These factors are held constant over the forecast period.

We updated our peak forecast methodology to better account for the potential peak shifting due to future adoption of Distributed Solar Generation (DG Solar), managed and unmanaged Electric Vehicle (EV) charging, and Beneficial Electrification (BE). These technologies will, on net, shift load from typical summer peak hours (afternoon/early evening) into late evening or, in the case of managed EV's, early morning. The prior monthly peak modeling approach could not account for time shifting; therefore, the static assumption would be that NSP will continue to peak at the same time as the historical series being modeled.

The current "8760" peak modeling approach uses Metrix LT to scale unique hourly profiles for each hour in the year. Specifically, we perform modeling for Base energy,[3] EV, BE, DG Solar,[4] Large CI Data Centers, and Energy Efficiency using monthly energy assumptions for each specific component and on a state-by-state basis. The Base energy curve is also scaled to include a Base monthly peak demand outlook[5] that assumes no new technologies and no change in customer behavior from the present. All component curves are then aggregated, and the maximum hourly load by month is calculated. The resulting peaks largely align with the Company's old monthly modeling process for the first few years of the forecast timeframe. However, adoption of rooftop solar generation eventually pushes summer peaks later into the evening, and increased EV penetration with charge management programs moves peaks to 1:00 a.m. by the early 2040s.

[3] Base energy is an outlook for NSP consumption that assumes no change in customer behavior i.e. if consumer behavior remains unchanged from the present, and includes no forecast adjustments for EV, BE, DG Solar, new Large CI Data Centers, and Energy Efficiency.
[4] DG Solar does not include CSGs or solar that satisfies the 3 percent DSES legislation.
[5] Produced using a monthly regression model of NSP peak demand.

Once the NSP System peak demand forecast is complete,[6] a model is developed that relates the NSP System's non-MISO coincident peak (NCP) to the NSP System demand coincident with the Midcontinent Independent System Operator (MISO) system peak demand. In other words, the model was developed to calculate NSP's coincident peak (CP). The resulting relationship between the two series is referred to as the Coincidence Factor (CF), and is used to convert the NCP[7] to the CP forecasts used in Encompass modeling for this Resource Plan.

D. Forecast Adjustments

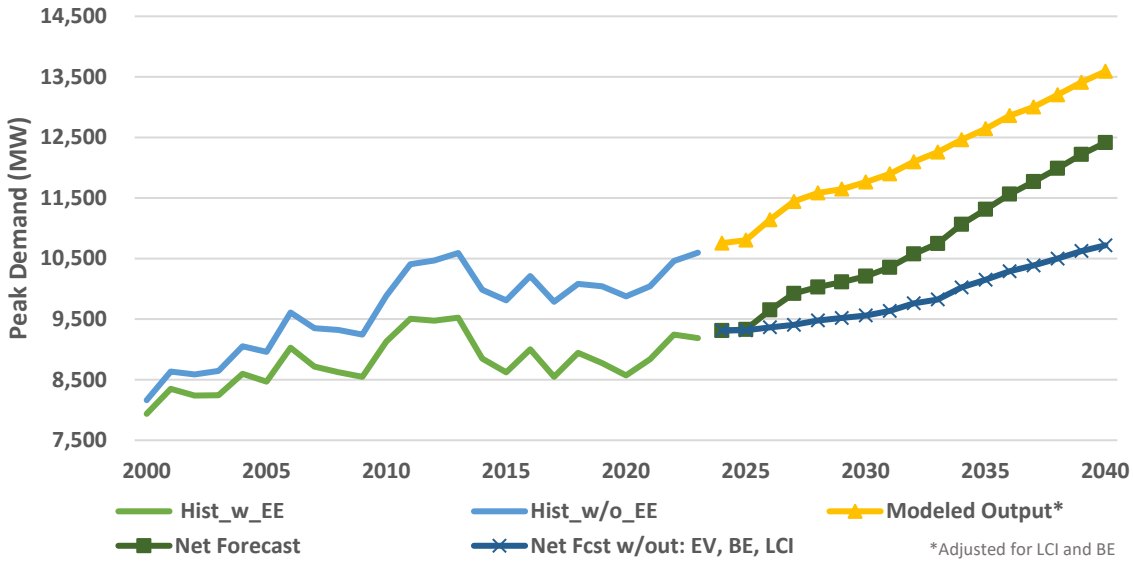
The demand and energy forecasts are developed using a number of assumptions described in this appendix, including Energy Efficiency (EE). NSP's methodology is unchanged from the 2019 and 2015 resource plans, and the process follows three distinct steps:

- Collect and calculate historical and current effects of EE on observed sales.
- Project the forecast using observed data with the impact of EE removed (i.e., increase historical sales to show hypothetical case without EE).
- Adjust the forecast to show the impact of all planned EE in future years and from continuing energy savings resulting from historical measures.

These EE adjustments are based on the Company's current Energy Conservation and Optimization (ECO) Triennial Plan goals, which were set using the savings level approved in the resource planning process. The Commission approved an average annual energy savings level of 780 GWh for all planning years in our 2019 Resource Plan.[8] Our most recent ECO Triennial filing[9] follows the approved level, and these EE impacts are shown below in Figure E-5.

[6] The Coincident Factor calculations were conducted using NSP's old monthly-frequency modeling process, and not the new 8760 process. This was partly due to timing of 8760 process development and partly because the Company could not determine a viable methodology for translating the 8760 process to a MISO CP forecast result.
[7] Produced by the 8760 modeling process.
[8] Docket No. E002/RP-19-368.
[9] Docket No. G002/CIP-23-92.

Figure E-5: Illustration of EE Adjustment – NSP System Demand (MW)



In response to the amendments to the Solar Energy Standard (SES) by the Minnesota Legislature in 2023,[10] an increased emphasis has been placed on distributed solar generation. We developed a forecast of the expected impact on demand and energy based on new programs designed to meet goals established for the SES. We adjusted the Minnesota class-level sales forecasts and the system peak demand forecast to account for the impacts of customer-sited behind-the-meter solar installations on the NSP System. We discuss the distributed solar forecast methodology below.

After determining the base forecast, we developed net forecasts that include all adjustments, including future EE, distributed solar generation, electric vehicle charging, and the effects of our EE programs over time.

E. Additional Forecast Adjustments

We made additional adjustments to the energy and demand forecasts to account for expected changes in specific large customers' electricity usage. These additional adjustments include:

[10] Sec. 16. Minnesota statutes 2022, section 216b.1691. Subd. 2h. Chapter 60 - mn laws (https://www.revisor.mn.gov/laws/2023/0/Session+Law/Chapter/60/).

- Customers adding self-generation combined heat and power capabilities, which reduce energy consumption and peak demand. This adjustment only applies to the Large CI class.
- Increases (or reductions) in usage due to customers moving into and out of our service territory, or planned expansions or reductions of load by existing customers. This adjustment also only applies to the Large CI class, and
- Increasing use of plug-in electric vehicle charging, which we discuss in Section VI.C. below.
- Increasing levels of Beneficial Electrification.
- Increasing adoption of rooftop solar.

F. Forecast Variability

As with any forecast, our projections of energy requirements and peak demand depend on other forecasts of key variables. Changes in these variables will affect our forecasts. For instance, if the number of households in our service territory is lower than Global Insight has predicted, electric consumption in the residential sector will be lower. The peak demand for electric power each year is very sensitive to weather conditions and can vary considerably as the result of abnormal weather conditions.

Other forecast uncertainties include potential increases in loads due to new customers and potential losses in loads due to changes in customers' operations. For example, the potential exists for large increases in Data Center loads early in the planning period. However, these loads may fail to materialize as assumed, and NSP may be responsible for serving a different amount of load than forecasted in the Base Case.

Given the uncertainty in any long-term forecast, primarily around the potential for data center loads and their timing, accelerated EV and DG adoption, etc., NSP developed High and Low load sensitivities that adjusted the base outlook using discrete adjustments for these forecast components. This discrete adjustment approach replaces the prior uncertainty modeling method involving Monte Carlo simulations, as a Monte Carlo approach would fail to account for the sizeable increases in load due to data center load or EV adoption. The resulting High and Low load sensitivities are shown below in Figure E-6.

Figure E-6: NSP System Total Net Energy (MWh)
(Includes EE adjustment)

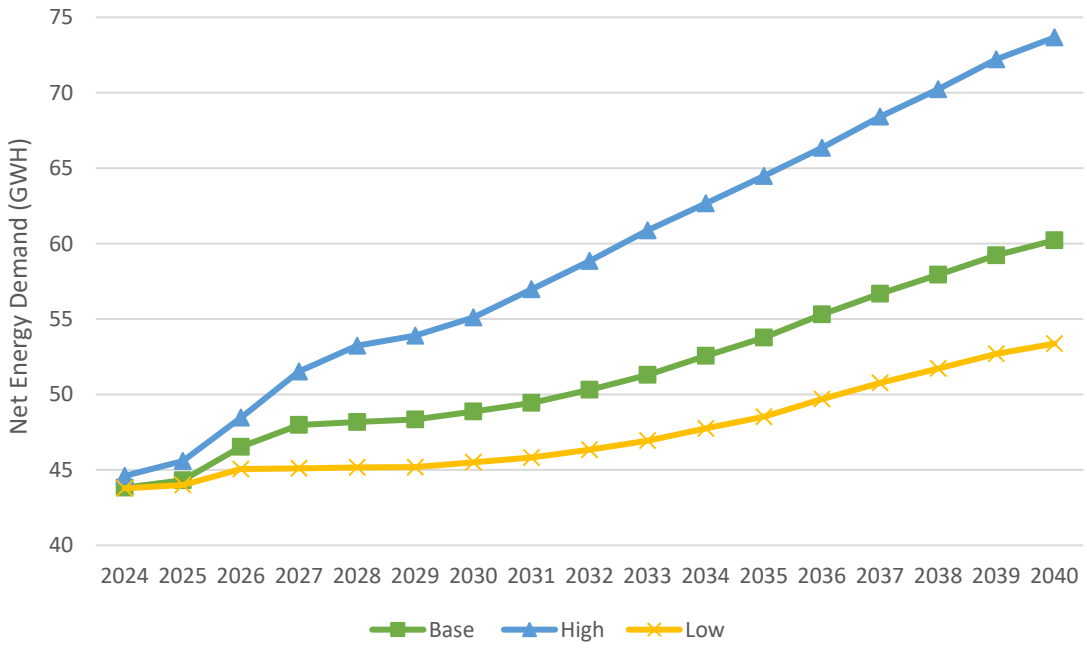


Figure E-7 below shows the high and low sensitivities for base peak demand.[11]

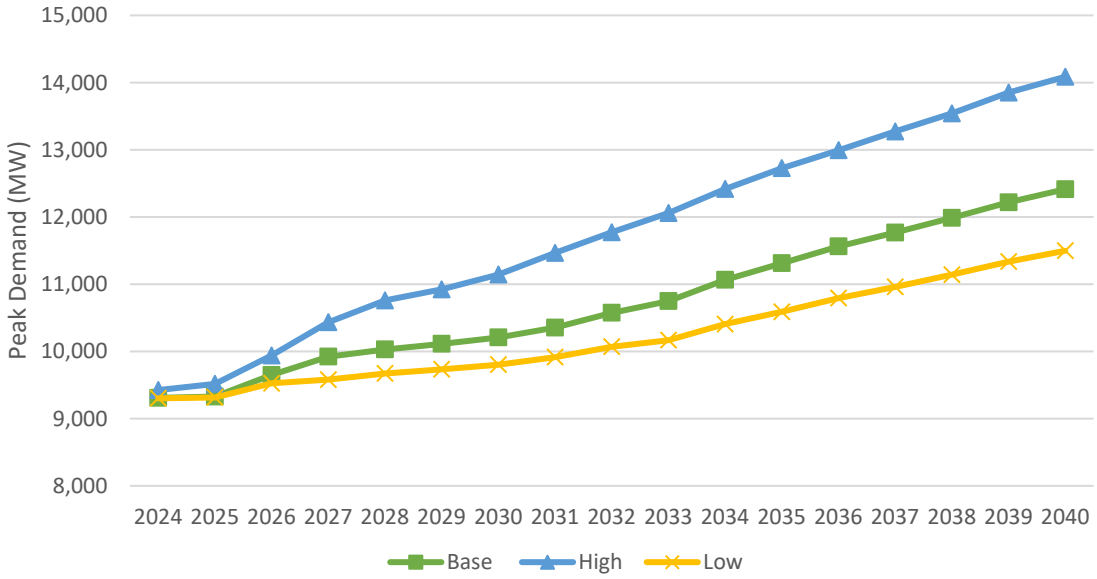
Figure E-7: NSP System Total Base Summer Peak Demand (MW)
(Includes EE Adjustment)



Tables E-1 and E-2 below provide the data underlying Figures E-6 and E-7 respectively.

Table E-1: Annual Net Energy (MWh)

Average Annual Growth	1.8%	2.5%	1.3%

G. Forecast Vintage Comparison

As described above, projections of energy and demand are fundamental to identifying the need for resources to meet expected customer needs. Thus, these forecasts are an important component in determining the size, type, and timing of new generation resources. As a result, ensuring robust forecasts with fully analyzed assumptions and variables is key to supporting a Resource Plan or resource acquisition.

Per the Commission's Order in the IDP,[12] Xcel Energy made efforts to maintain consistency of DER assumptions between our IDP and IRP by utilizing the same forecast vintages when possible. However, the IDP and IRP processes are fundamentally different, serve disparate functions, and are developed on different time horizons with differing planning cycle durations and cadences. This makes it difficult, if not impossible, to generate forecasts in them that will align perfectly. The IRP is a well-established, long-term resource planning process that indicates size, type, and timing of resource needs over a 15-year time horizon. In comparison, the nascent IDP shows a five-year budget of discrete projects and investments. The five-year budget used for the IDP is built every year on the forecast from the previous fall – for example, the 2023 IDP budget was based on forecast data from Fall 2022. This is significantly different in the IRP, where the modeling happens only three to six months in advance of the filing date every four years, meaning that the most recent and relevant forecast vintages are used.

Despite these differences, we made efforts when developing this IRP to set the forecasts for DER consistently between our IDP and IRP to align with the Commission's IRP Order. [13] Because of the modeling timeline for the IRP, finalization of the IRP models was not complete at the time of IDP submission on November 1, 2023. However, we were able to use some forecasts or updated versions of forecasts developed for the IDP in our IRP process.

Table E-3 below identifies the forecast vintages that were used for the various IDP and IRP forecasts that we provided in Appendix A1: System Planning of our November 1, 2023 IDP.

[12] July 26, 2022, Order, Docket No. 21-694, Ordering Paragraph 4.
[13] The Commission's latest IDP Order includes a parallel Order Point; *see* July 26, 2022 Order in Docket No. E002/M-21-694, at Order Point 4.

Table E-3: Forecast Vintage Comparison

Forecast	Vintage Reflected in Corporate-Level DER Scenario Modeling	Vintage Used in LoadSEER DER Scenario Modeling	Vintage Used in IRP Energy Forecast
Distributed Solar PV	June 2023	June 2023	June 2023
Community Solar Gardens	August 2023	August 2023[14]	August 2023
Distributed Energy Storage	September 2023	2021 IDP	Do not model in IRP
Energy Efficiency	September 2023	Embedded In 2022 Energy Sales & Demand Forecast	September 2023
Demand Response	2022	Embedded In 2022 Energy Sales & Demand Forecast	September 2023
Electric Vehicles	July 2023	2022	July 2023

We assume Distributed Energy storage will cause minimal overall increases in energy consumption since there are only small losses associated with consumer-level storage, which is why it was not modeled for this IRP. Energy storage will likely have a notable impact on peak demand in the distant future once adoption is widespread and a Time of Use (TOU) rate encourages customers to consume from the grid only at specific times. We expect to enhance our forecast with assumptions for consumer-level energy storage in the future, but we do not currently make assumptions for TOU adoption or its estimated impacts on customer usage.

The review process for a Resource Plan or a resource acquisition typically takes a significant amount of time and effort to complete. During this time, forecasts can change as economic conditions, business operations, and technology changes occur. The graphs below compare the peak demand and energy of the Company's current forecast with the forecasts filed in the 2019 Resource Plan.

Figures E-8 and E-9 below indicate that the Fall 2023 energy and load forecasts are higher than the Fall 2018 forecast used in our 2019 Resource Plan due, primarily, to the current Resource Plan's assumptions for large new data center loads and a more reasonable forecast for adoption of Electric Vehicles.

[14] This sensitivity includes a forecast for solar that will meet Distributed Solar Energy Standard (DSES), Minn. Stat. § 216B.1691, subd. 2h, as added by 2023 Session Laws Chapter 60, Article 12, Section 16, and is discussed in section II.C.7.

Figure E-8: Net Energy Requirements (MWh) – Comparison of Current and Previous Base Case Energy Forecasts

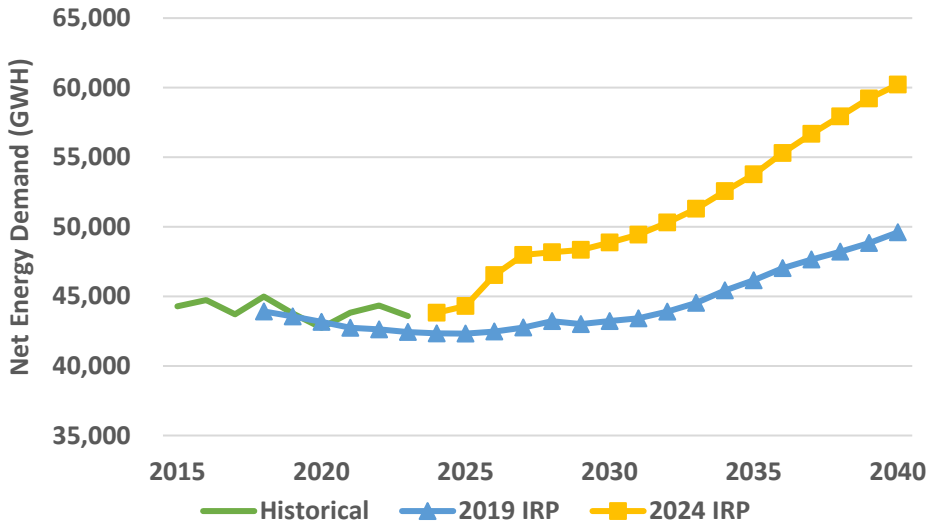

Figure E-9: Peak Demand (MW) – Comparison of Current and Previous Demand Base Case Forecasts

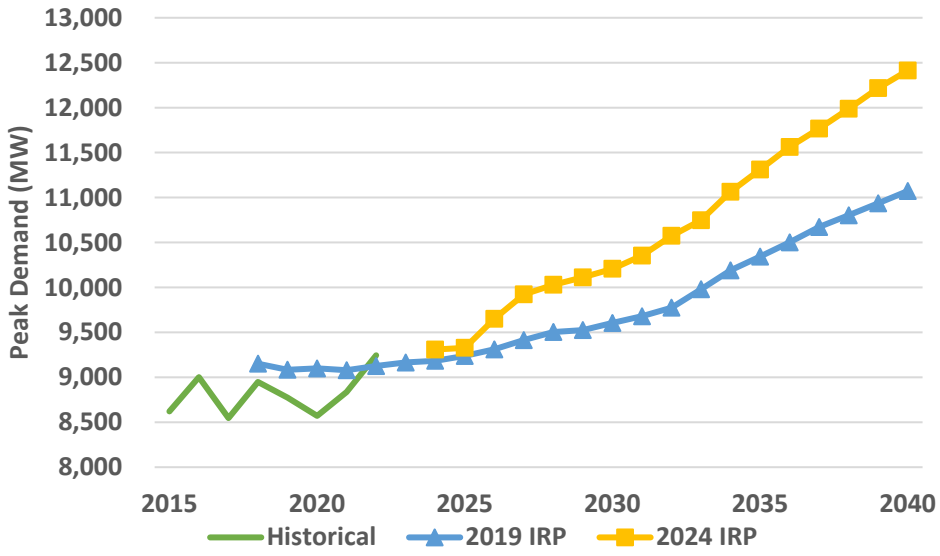


The 2019 Resource Plan assumed EV growth effectively stopped in 2024 at just 235,000 MWh in EV requirements per year; a level we are likely to surpass in the next year or two. EV assumptions in this Resource Plan are detailed in Section VI.C. of this appendix.

Further, projected economic growth is notably higher than forecast in the 2019 Resource Plan. For example, employment in the Minneapolis-St. Paul metropolitan area is expected to gain an average of 0.4 percent per year from 2024-2040, whereas the 2019 Resource Plan's employment outlook only grew at 0.2 percent.[15]

II. OVERALL LOAD FORECAST METHODOLOGICAL FRAMEWORK

Xcel Energy prepares its forecast by major customer class and jurisdiction, using a variety of statistical and econometric techniques. The NSP System serves five jurisdictions. Minnesota, North Dakota, and South Dakota are served by Northern States Power Company (NSPM). Wisconsin and Michigan are served by Northern States Power Company, a Wisconsin corporation (NSPW). The NSPM and NSPW Systems operate as an integrated system. The forecast is referred to as the 2023v2.0 Forecast (completed in July 2023).

A. Specific Analytical Techniques

1. Econometric Analysis. Xcel Energy used econometric analysis to develop jurisdictional MWh sales forecasts at the customer meter for the following sectors (exceptions to this are noted in bullet 2):

   a. Residential without Space Heating;
   b. Residential with Space Heating;
   c. Small Commercial and Industrial;
   d. Large Commercial and Industrial (NSPM only);
   e. Public Street and Highway Lighting (Minnesota only);
   f. Sales to Public Authorities (Minnesota only).

   Xcel Energy also used econometric analysis and the 8760 process to develop the total system MW peak demand forecast.

2. Trend analysis or simple historical averages were used for all other sectors, which includes Large Commercial and Industrial (in NSPW jurisdictions),

[15] IHS Global Insight, July 2018 vintage, 2020-2034 planning period.

Public Street and Highway Lighting, Other Sales to Public Authorities for all jurisdictions except Minnesota, and Interdepartmental sales for all jurisdictions.

3. Loss Factor Methodology. Loss factors by jurisdiction were used to convert the sales forecasts into system energy requirements (at the generator).
4. Judgment. Judgment is inherent to the development of any forecast. Whenever possible, Xcel Energy used quantitative models to structure its judgment in the forecasting process.

The sales forecasts are estimates of MWh levels measured at the customer meter. They do not include line or other losses. The various jurisdictional class forecasts were summed to yield the total system sales forecast. Native energy requirements are measured at the generator and include line and other losses. Xcel Energy created the native energy requirements based on the sales forecasts. A system loss factor for each jurisdiction, developed based on modeled historical losses, is applied to the sales forecast to calculate total losses. The sum of the MWh sales and the MWh losses equals the native energy requirements. The native energy requirements, along with peak producing weather and binary variables, then were used as independent variables within an econometric model to forecast MW peak demand for the Xcel Energy North System.

B. Models Used

1. ***Residential Econometric Models.*** Sales to Residential customers represent 31.5 percent of NSP System electric sales in 2022. Residential sales are divided into two sub-classes for each NSPM jurisdiction: space heating and without space heating. NSPW jurisdictions only have a total Residential customer class. Regression models using historical data are developed for each Residential sector. A variety of independent variables were used in the models, including:

    - Real Personal Income or Real Personal Income per Capita for the respective jurisdiction;
    - Average price (reported revenues/reported sales) for the respective jurisdiction;
    - Gross Metro Product for the respective jurisdiction;
    - Total population for the respective jurisdiction;

- Average price of West Texas Intermediate crude oil;
- Actual heating (HDD) and temperature humidity index (THI) degree days;
- Number of customers;
- Number of monthly billing days;
- Month specific binary variables;
- Other binary and or trend variables.

2. *Small Commercial and Industrial Econometric Models.* The small commercial and industrial sector represents 42.75 percent of NSP System electric sales in 2022. The models are econometric regressions using historical data. The models include a combination of variables, including the following:

   - Number of small commercial and industrial customers;
   - Gross State/Metro Product for respective jurisdiction;
   - Employment for respective jurisdiction;
   - Actual heating (HDD) and temperature humidity index (THI) degree days;
   - Number of monthly billing days;
   - Month specific binary variables;
   - Other binary and or trend variables.

3. *Large Commercial and Industrial Econometric Model (NSPM).* Sales to the large commercial and industrial sector represent 25.2 percent of NSP System electric sales in 2022. The regression models used for NSPM jurisdiction LCI forecasts use historical data and the following explanatory variables:
   - Industrial Manufacturing Employment;
   - Number of monthly billing days;
   - Month specific binary variables;
   - Other binary variables.

4. *Others.* Sales to the "Others" sector represent 0.6 percent of NSP System electric sales in 2022. This sector includes Public Street and Highway Lighting (PSHL), Sales to Public Authorities (OSPA) and Interdepartmental (IDS) sales. Regression models are used to estimate sales for the PSHL and

OSPA classes (Minnesota only), using historical data and a combination of variables, including the following:

a. Population for the respective jurisdiction;
b. Gross Metro Product for the respective jurisdiction;
c. Number of monthly billing days;
d. Month specific binary variables;
e. Other binary and or trend variables.

5. ***Municipals.*** As of 2014 there are no longer any municipal customers for whom NSP or NSPW provides firm service.
6. ***Peak Demand. The peak demand forecast i***s the result of an updated, granular process referred to as the "8760" peak forecasting process. Section D "Forecast Methodology" summarizes this process.

C. Key Demand and Energy Forecast Variables

Below we discuss some of the key variables that are included in the 2024 Resource Plan forecasts.

1. Demographics

Demographic projections are essential to the development of the long-range forecasts. The consumption of electricity is closely correlated with demographic statistics. The number of residential customers, weather data, and economic indicators are key variables in the residential energy sales forecast. Over 99 percent of the variability in historical electric residential customer counts in our service territory can be explained through an econometric model that contains either population or households as key drivers. The forecasts for population and households are provided by Global Insight. We forecast an average annual growth rate for total residential customers on our system of 0.7 percent, with the addition of 12,153 residential customers on average per year from 2024 through 2040.

2. Economic Indicators

Xcel Energy uses estimates of key economic indicators to develop electric sales forecasts. These variables include gross state product, employment, and real personal income. The variables used are specific to the jurisdiction and are statistically significant in the sales models for the residential and commercial and industrial

customer classes. Growth in electric energy consumption in the residential and commercial and industrial sectors closely follows trends in economic activity. Global Insight provided the economic forecasts used in our regression models.

For the planning period, the economy is expected to continue to grow, resulting in growth in electric energy consumption.

3. Weather

The peak demand for electric power is heavily influenced by hot and humid weather. As the temperature and humidity rise, the demand for cooling rises steeply. Our approach to forecasting peak demand includes using a weather variable that consists of the mean of an index of heat and humidity referred to as the temperature humidity index (THI). Simply stated, the THI is an accurate measure of how hot it really feels when the effects of humidity are added to the high temperature.

We have tracked the THI at the time of the system peak demand over the past 20 years. Because of the 20 years of smoothing, the weather variable does not drastically affect our median forecasts; however, it becomes a key factor in assessing the potential peak demand if and when hot and humid weather extremes are encountered. Since Xcel Energy must have adequate generating resources available during hotter than normal circumstances, planning for the extreme is important.

III. FORECAST ADJUSTMENTS

The outputs of raw econometric modeling are adjusted to account for either: 1) components that cannot be modeled correctly using regression, such as the addition of a new customer in the forecast timeframe, or 2) components that are necessary because of our regression modeling process, such as "adding back" the effects of energy efficiency.

A. Energy Efficiency Programs

The sales outlooks for residential and commercial/industrial classes are initially modeled based on a history that excludes the effects of Energy Efficiency (EE), and the resulting forecasts also exclude the effects of EE. This approach is necessary to properly account for EE in the forecast timeframe as the gross outlook (the outlook excluding EE) can then be adjusted per any assumption of future EE.

The first step in this process involves collecting EE data for the historical period being modeled. In the Fall 2023 models, NSP collected monthly energy savings for any measure impacting customer usage for the time-period from 2008 to 2023. Since EE measures have a "life of measure" that is typically longer than just one year, EE data for several years prior to the Fall 2023 estimation timeframe (2008-2023) was collected.

A hypothetical "gross of EE impacts"[16] sales data set is created by subtracting historical EE impacts from historical sales. That "gross of EE impacts" series is then modeled and forecast using regression analysis. The resulting sales series is presumed to also be "gross of EE impacts," and must be adjusted per any future impacts of EE. Future EE impacts resulting from past measures are netted from the energy outlook, whereas EE resulting from future measures is modeled as a resource in Encompass.

B. Behind-the-Meter Distributed Solar Generation

In response to changes to the SES by the Minnesota Legislature, as discussed above, an increased emphasis has been placed on distributed solar generation. A forecast of the expected impact on demand and energy has been developed based on new programs designed to meet goals established for the SES. The process of incorporating behind-the-meter distributed solar generation into the forecast process is similar to how EE program savings are incorporated in the sales and peak demand forecasts. Historical behind-the-meter distributed solar generation is added-back to the historical sales and peak demand modeling data to create a "gross of historical distributed solar" sales series, which is then modeled. The resulting forecast output is presumed to be gross of distributed solar and must be reduced for the future impacts of behind-the-meter installations on the class level sales in Minnesota and South Dakota and the NSP System peak demand.

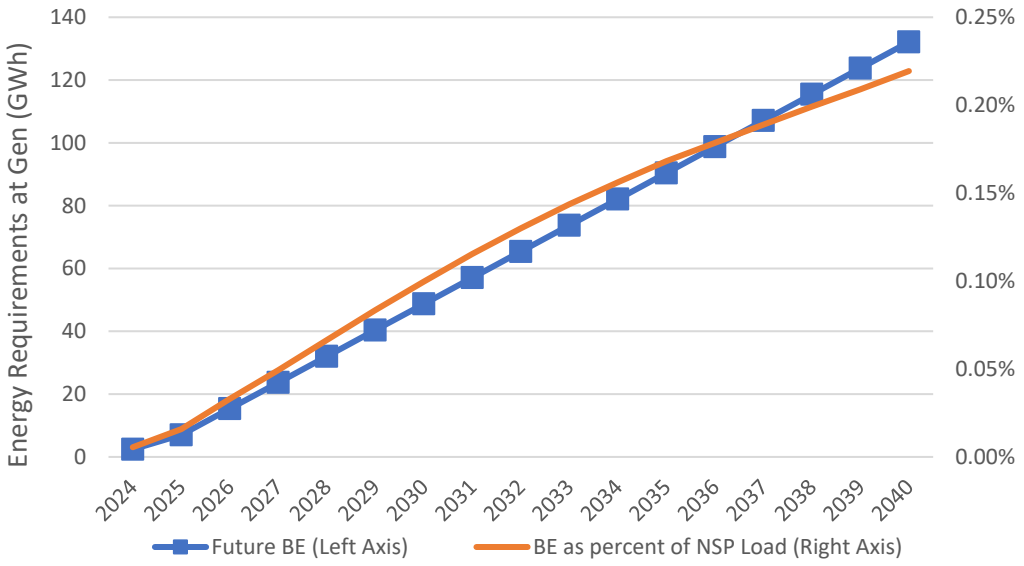
C. Beneficial Electrification

We made assumptions for Beneficial Electrification (BE) of space and water heating based on achievement of the annual goals filed in the Xcel Energy 2024-2026 Energy Conservation and Optimization Triennial Plan (Docket No. G, E002/CIP-23-92) for 2024-2026, and assumed achievement of the 2026 goal for all subsequent years. The goal assumptions included in this Plan are modest as the electrification technologies

[16] Would not include any naturally occurring/customer driven EE. The adjusted series only accounts for Company EE resulting from Conservation Improvement Programs (CIP).

and programs are just being introduced to the market and have significant barriers to adoption the next few years. This is the first time NSP has included BE assumptions in our electricity sales forecast,[17] and the Company will likely continue to keep its assumptions modest until observed trends or policy suggest higher levels of BE. The chart below shows the Company's assumption for BE in both GWh requirements and as a percent of overall NSP load.

Figure E-10 Base Case Beneficial Electrification Assumption



D. Large C&I Adjustments

Adjustments have been made to the forecast to account for planned changes in production levels for several large customers in Minnesota and Wisconsin. The most significant Large C&I adjustments concern the anticipated and expected addition of several large data centers in Minnesota. The assumptions for LCI adjustments under the Base, High, and Low sensitivities are discussed in section VI.F. of this Appendix.

[17] Displacement of natural gas consumption by this electrification was also reflected in NSP's forecast of gas sales forecast.

IV. METHODOLOGY

The strength of the process Xcel Energy used for this forecast is the richness of the information obtained during the analysis. Xcel Energy's econometric forecasting models are based on sound economic and statistical theory. Historical modeling and forecast drivers are based on economic and demographic variables that are easily measured and analyzed. The use of models by class and jurisdiction gives greater insight into how the NSP System is growing, thereby providing better information for decisions to be made in the areas of generation, transmission, marketing, conservation, and load management.

With respect to accuracy, forecasts of this duration are inherently uncertain. Planners and decision makers must be keenly aware of the inherent risk that accompanies long-term forecasts. They must also develop plans that are robust over a wide range of future outcomes, which is why we developed high and low load sensitivities.

V. DATA SOURCES

MWh sales and MW peak demand. Xcel Energy uses internal and external data to create its MWh sales and MW peak demand forecast.

Historical MWh sales and MW peak demand. Historical MWh sales are taken from Xcel Energy's internal company records, fed by its billing system. Historical coincident net peak demand data is obtained through company records. The load management estimate is added to the net peak demand to derive the base peak demand.

Weather data. Weather data (dry bulb temperature and dew points) were collected from www.weatherunderground.com and the National Oceanic and Atmospheric Administration for the Minneapolis/St. Paul, Fargo, Sioux Falls, and Eau Claire areas. The heating degree-days and THI degree-days are calculated internally based on this weather data.

Economic and demographic data. Economic and demographic data is obtained from the Bureau of Labor Statistics, U.S. Department of Commerce, and the Bureau of Economic Analysis. Typically, they are accessed from IHS Global Insight, Inc. data banks, and reflect the most recent values of those series at the time of modeling.

A. Input Data Adjustments and Assumptions

Weather Adjustments. Xcel Energy adjusts the monthly weather data to reflect billing schedules. Therefore, the monthly weather data corresponds proportionately with the billing month schedule.

Economic Adjustments. All economic series are deflated to 2012 constant dollars.

B. Assumptions and Special Information

The data used in Xcel Energy's forecasting process has already been discussed in a general way. Descriptions and citations of sources for the data sets have been mentioned within this documentation under different sections.

Xcel Energy believes that its process is a reasonable and workable one to use as a guide for its future energy and load requirements. The underlying assumptions used to prepare Xcel Energy's median forecast are as follows:

- *Demographic Assumption.* Population or household projections are essential in the development of the long-range forecast. The forecasts of customers are derived from population and household projections provided by IHS Global Insight, Inc., and reviewed by Xcel Energy staff. Xcel Energy customer growth mirrors demographic growth over the forecast period.

- *Weather Assumption.* Xcel Energy assumes "normal" weather in the forecast horizon. Normal weather is defined as the average weather pattern over the 20-year period from 2003-2022. The variability of weather is an important source of uncertainty. Xcel Energy's energy and peak demand forecasts are based on the assumption that the normal weather conditions will prevail in the forecast horizon. Weather-related demand uncertainties are not treated explicitly in this forecast.

- *Loss Factor Assumptions.* The loss factors are important to convert the sales forecast to energy requirements. Xcel Energy uses modeled historical losses for each jurisdiction for the first forecast calendar year, and assumes it will not change in the future.

C. MISO Coincident Peak Demand Forecast

The MISO coincident peak (CP) forecast is an estimate of NSP load at the time of MISO peak. The process involves scaling our overall NSP system peak, i.e. our non-coincident peak (NCP), by a coincidence factor (CF). The coincident factor is calculated using the methodology described below.

Historical monthly MISO-coincident peaks are queried using the historical peak date/times provided by MISO.[18] Peak-day weather conditions are also queried using these date/times. MISO coincident peaks and corresponding CF for the Planning Year 2024-2025 (PY 24-25) are modeled as a function of historical NSP NCP, weather, and monthly binaries. The peak-day weather forecast assumption is a simple monthly historical average of 2009-2023 CP weather data.

The resulting CF for the Planning Year 2024-2025 (PY 24-25) are averaged with last year's CF's (PY 23-24) to produce the seasonal peak coincident factors used in this Resource Plan. These factors are shown in Table E-4 below.

Table E-4: Coincident Factor Assumptions

	Summer	Fall	Winter	Spring
Average Coincident Factor (PY23-24 & PY24-25)	92.24%	92.67%	97.09%	95.61%

D. Forecast Coordination

Xcel Energy reports its energy and peak demand forecasts to MISO, who then combines the forecasts of all its member utilities. Xcel Energy also reports its forecast to the Public Service Commission of Wisconsin as part of its Strategic Energy Assessment (SEA) process. In this process, the Wisconsin portion of the total Xcel Energy system load is combined with other Wisconsin electric utilities to form a statewide Wisconsin forecast.

VI. SENSITIVITY ASSUMPTIONS

The Company's Fall 2023 load forecast is used as the base assumption in this Resource Plan. The forecast assumes adoption of electric vehicle (EV), new Large C&I customer additions, Beneficial Electrification (BE), and demographic/economic growth. Two alternative sensitivities were developed to model the range of potential outcomes for NSP energy requirements and load: the High and Low load sensitivities. The details of each sensitivity, by component assumptions are described in this section. Table E-5 below shows how component assumptions were adjusted from the base case by sensitivity. Base load (i.e. the modeled econometric outputs) were not adjusted in any of the sensitivities; instead, discrete adjustments for each component were developed to clearly define each sensitivity. This approach replaces the previous process involving Monte Carlo simulation.

Table E-5: High and Low Load Sensitivity Assumptions

Component	High Load Case	Low Load Case
Base Load	Base Case	Base Case
Solar	Base Case	High Solar
Demand-Side Management	Base Case	Base Case
Beneficial Electrification	High BE	No BE
Electric Vehicles	Full Achievement	Low Achievement
Large Commercial & Industrial Customers	High LCI	Low LCI

A. Distributed Solar

We offer several programs to customers interested in solar as a renewable energy opportunity, including our Solar*Rewards program and our Community solar program, which provides the opportunity to earn bill credits for Community Solar Gardens (CSGs). In addition, for larger systems, we offer a net-metering option. We have factored all these distributed solar PV options into our various distributed solar forecasts. As we will discuss further below, the rooftop solar forecast is from June 2023 and the CSG forecast is from August 2023.

In determining our Solar*Rewards forecast, we updated our goals to be consistent with legislative outcomes that increased and provided funding for Solar*Rewards incentives for 2023 to 2025. The Solar*Rewards installations for 2023 to 2026 were estimated based on historical trends of funding levels and project conversion rates.

For net metering and CSGs, we assume that customers who participate in solar programs would consider, in most cases, that these programs are substitutes for each other. Therefore, the incremental growth in one category is interchangeable with another category.

We used the average of a Bass Diffusion and an economic model to derive the base forecast of net metered solar. Bass Diffusion models are used to describe various technology adoptions that penetrate an existing market through an "S" shaped diffusion characteristic. Economic models use a simple payback to estimate potential adoption. The Bass Diffusion model is calibrated using state specific, historical solar installed capacity through December 2022. Additionally, we have incorporated into both the Bass diffusion and economic models, a factor for the percentage of customers unable to install solar on their roof, for various reasons (e.g., renters, shaded roof, inability to access the roof, etc.). The main variables impacting adoption in the economic payback model are installation and maintenance cost, hosting capacity, inverter replacement, investment tax credit, utility rates, and capacity factors. Models and estimates are updated as new data becomes available and estimates can vary significantly.

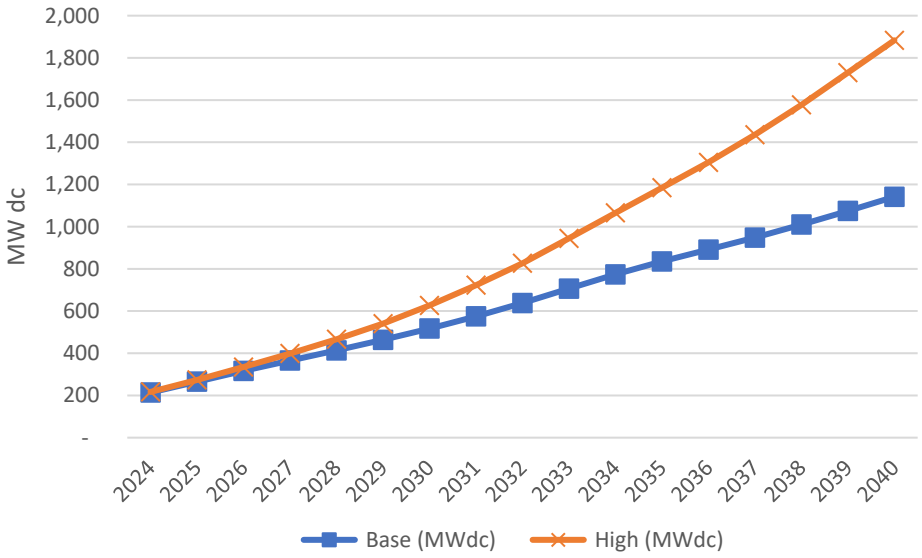
We created the High solar adoption sensitivity using a combination of lower installation cost and higher savings. The High sensitivity assumes the installation costs decrease at a faster rate than the Base outlook. The Bass Diffusion High sensitivity uses higher coefficients compared to the Base case. These coefficients were calibrated using a section of the historical curve that showed higher than average growth.

The Base and high load sensitivities use the base PV adoption scenario, the results of which indicate around 706 MWdc for the total installed rooftop distributed solar by 2033. The low load sensitivity assumes a high PV adoption outlook, the results of which show installed rooftop distributed solar around 944 MWdc by 2033. We provide a tabular and graphical view of the forecast in Table E-6 and Figure E-11.

Table E-6: Distributed Rooftop Solar Scenarios

	Base (MWdc)	High (MWdc)
2024	214	217
2025	265	274
2026	317	335
2027	365	399
2028	413	466
2029	463	540
2030	517	626
2031	575	723
2032	638	827
2033	706	944
2034	774	1,065
2035	835	1,184
2036	891	1,304
2037	948	1,436
2038	1,010	1,577
2039	1,074	1,730
2040	1,142	1,883

Figure E-11: Distributed Rooftop Solar Forecast



B. Distributed Wind

We presently have a small number of distributed wind projects on our system, with a total of 93 projects that comprise 12 MWdc. We believe distributed wind will continue to be a very small proportion of DER on our distribution system, largely due to the rapid development of solar and storage markets – and their relative ease of adoption, compared to wind. Additionally, there is little information available in the industry regarding the adoption of distributed wind. For these reasons, we are not providing a forecast in conjunction with this Resource Plan.

C. Electric Vehicles

With an increase of available models, EV adoption has increased, and there are approximately 38,000 light-duty EVs estimated to be in Xcel Energy's Minnesota service territory as of September 2023. The EV forecasts discussed below were updated in July 2023.

Light Duty Vehicles

We currently estimate light-duty EV adoption for the Base and Low forecast using two modeling techniques: (1) Bass Technology Diffusion, and (2) Economic models.

Our current approach for the Base forecast relies on state and Xcel Energy service area specific data. The Bass Diffusion model is calibrated using state specific historical EV sales. The economic model calculates the total cost of ownership for EV compared to traditional internal combustion engine (ICE) automobiles. An average of both the Bass Diffusion and total cost ownership models are used to estimate EV adoption. Additionally, we have incorporated into both the Bass Diffusion and economic models a factor for the percentage of vehicles in urban and rural areas. Presently, higher adoption is occurring in urban areas with the rural areas anticipated to ramp-up slowly. Our cumulative Base adoption estimate for 2030 is approximately 7.8 percent of all registered cars and light trucks in our Minnesota service territory.

We create the Low economic model sensitivity for Minnesota and the Dakotas using a combination of battery prices and gasoline prices. The Low sensitivity assumes battery prices are 20 percent higher than the Base Case outlook, and gasoline prices lower by one standard deviation. The Low sensitivities for the Bass Diffusion models are created using data from states that reflect low historical adoption rates.

The High sensitivity reflects the Minnesota state goal of EV's accounting for 20 percent of all light-duty vehicles by 2030 and also applies this goal to medium and heavy-duty vehicles as well. This results in 100 percent EV saturation by 2052. This same methodology is then applied to produce the estimates for North Dakota and South Dakota. The High sensitivity outlooks for Wisconsin and Michigan were developed by scaling the Base outlooks using the South Dakota's ratio of High to Base outlook[19].

We note that EV fuel efficiency could be impacted by advances in technology; we currently assume gasoline cars average 25 miles per gallon. Analysis indicates that battery costs are a significant factor for higher EV prices. The main variables impacting adoption are available tax incentives, price differential between EV and ICE vehicles, and gasoline prices. Models and estimates are updated annually with new relevant available data and estimates can vary significantly. Since we are in the early stages of EV adoption, we expect our future estimates will be increasingly robust with additional data available every year.

Our estimates show significant volatility between various sensitivities. The estimates are also sensitive to several externalities like policy changes (e.g., incentive changes, cybersecurity requirements, carbon requirements); technology changes (e.g., improvements in existing battery technologies and new disruptive battery or electric motor management technologies, autonomous vehicles, alternate technologies like fuel cell vehicles); geopolitical factors – such as trade and tariff issues; availability of raw materials such as lithium, cobalt, and nickel; and infrastructure availability.

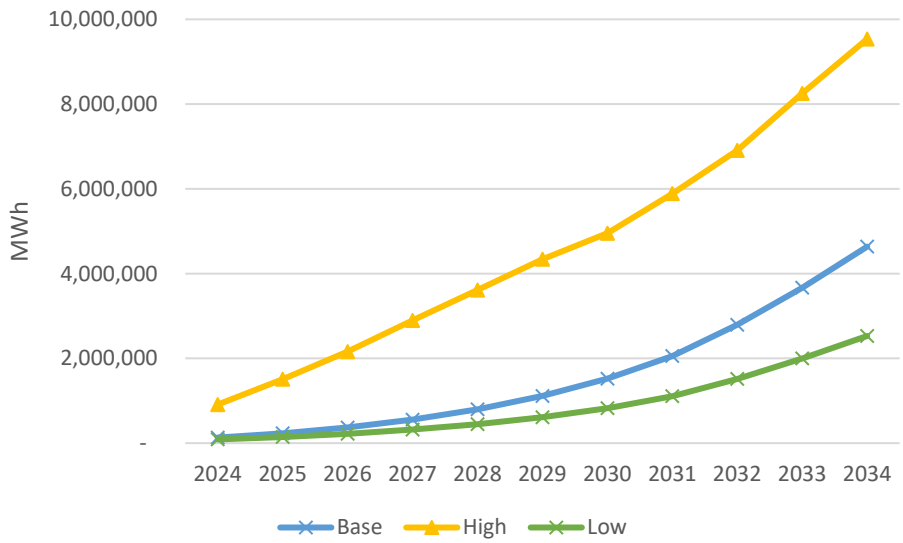
Additionally, many of the inputs change frequently and could produce significant swings in the model outputs.

Medium and Heavy-Duty Vehicles

We utilize estimates from a third-party consultant for medium and heavy-duty electric vehicle Base Case adoption in Xcel Energy's service territory.

[19] The same method was used to develop Wisconsin and Michigan's low sensitivity outlooks.

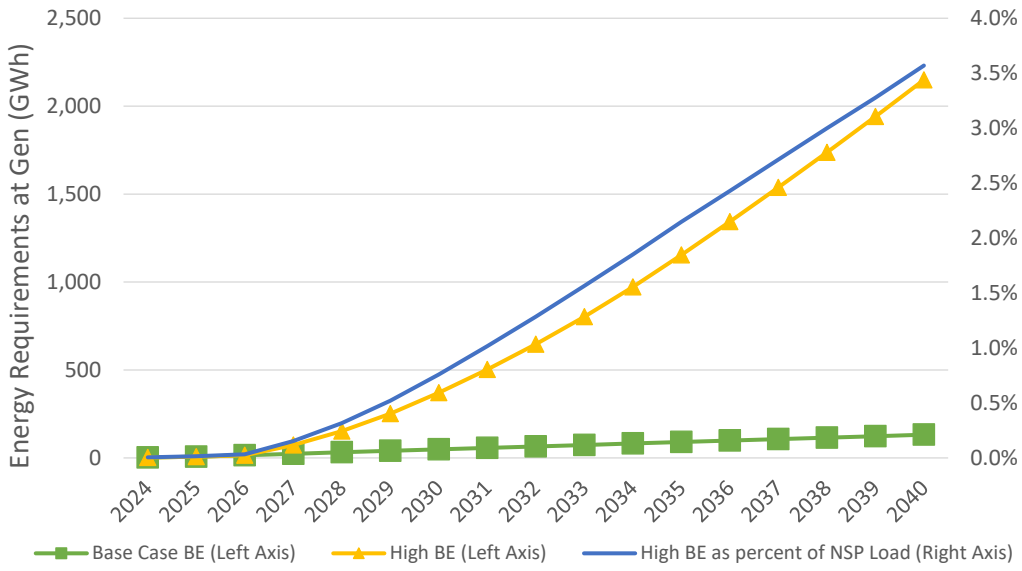
Figure E-12: NSP System Base, High, and Low EV Sensitivities



D. Beneficial Electrification

Assumptions for Beneficial Electrification (BE) were adjusted in both the High and Low sensitivities. The Low sensitivity simply assumed no added load from beneficial electrification, and the High sensitivity assumed substantial growth in BE over the Base Case assumptions. Under the High load sensitivity, new load from BE would comprise about 3.5 percent of total energy requirements.

Figure E-13: NSP System Base and High Beneficial Electrification Forecasts



E. LCI Assumptions

The NSP Base, High, and Low outlooks include some load for several prospective new large data center customers in the Minnesota jurisdiction, and the volume of load included in each sensitivity for these customers is dependent on the likelihood of each load tranche.

Under the Base sensitivity, we assume **[PROTECTED DATA BEGINS PROTECTED DATA ENDS]** of new load from data centers in the 2025-2026 timeframe. A location in **[PROTECTED DATA BEGINS PROTECTED DATA ENDS]** is especially promising location, and we expect that any of the above-mentioned companies would take advantage of the opportunity to locate there, but at this time it is unclear which project is most likely. We also assumed several smaller additions or expansions by new or existing customers that would add load in the 2023-2024 timeframe, but these are more than offset by expected new on-site generation by existing customers; the combined impact of non-data center load adjustments in the Base forecast is -4 MW.

Under the High sensitivity, we assume data centers add **[PROTECTED DATA BEGINS PROTECTED DATA ENDS]** due to expansions in the

2030-2033 timeframe. These expansions are added to the Base case assumptions bringing the total new data center load to **[PROTECTED DATA BEGINS PROTECTED DATA ENDS]** under the High sensitivity. This sensitivity also includes a **[PROTECTED DATA BEGINS PROTECTED DATA ENDS]** expansion by **[PROTECTED DATA BEGINS PROTECTED DATA ENDS].** However, this assumed expansion is not expected until **[PROTECTED DATA BEGINS PROTECTED DATA ENDS].**

Under the Low sensitivity, we assume **[PROTECTED DATA BEGINS PROTECTED DATA ENDS]** of new data center load growth**.** The timing of these load additions is the same as in the Base case (2025-2026), but the magnitude is more conservative.

APPENDIX F – ENCOMPASS MODELING ASSUMPTIONS AND INPUTS

A. Discount Rate and Capital Structure

The discount rate used for levelized cost calculations and determining the present value of modeled costs is 6.39 percent. The rates shown below were calculated by taking a weighted average of the most recent electric retail rate case in each NSP jurisdiction.

Discount Rate and Capital Structure				
	Capital Structure	Allowed Return	Before Tax Electric WACC	After Tax Electric WACC
Long-Term Debt	46.83%	4.34%	2.03%	1.47%
Common Equity	52.48%	9.35%	4.91%	4.91%
Short-Term Debt	0.68%	3.18%	0.02%	0.02%
Total			**6.96%**	**6.39%**

B. Inflation Rate

The inflation rate is applied to existing resources, generic resources, and other costs associated with general inflationary trends in the modeling. For long term capacity expansion planning purposes, we used the two percent long-term inflation rate inflation target established by the Federal Reserve.

C. Reserve Margin

The modeled Planning Reserve Margin is based on the MISO Planning Year 2024-2025 assumptions, adjusted for the average coincidence factors in MISO Planning Year 2024-2025 and Planning Year 2023-2024.

Table F-1: Seasonal Planning Reserve Margin

	Summer	Fall	Winter	Spring
MISO Planning Reserve Margin (PRM) PY24/25	9.00%	14.20%	27.40%	26.70%
Average Coincidence Factor	92.24%	92.67%	97.09%	95.61%

The higher Planning Reserve Margin or MISO Reliability Based Demand

Curve[1](RBDC) Opt-Out sensitivity represents the additional capacity necessary to opt out of the RBDC and assumes the effective reserve margin as shown in Table F-2.

Table F-2: Reliability-Based Demand Curve Sensitivity

	Summer	Fall	Winter	Spring
Reliability-Based Demand Curve Opt Out[2]	3.1%	3.4%	2.7%	1.7%

D. Greenhouse Gas Costs

The December 19, 2023 Commission Order in Docket Nos. E999/CI-07-1199, E999/DI-22-236, E-999/CI-14-643 Addressing Environmental and Regulatory Costs (Environmental and Regulatory Costs Order)[3] at Order Point 2 requires utilities to continue to analyze potential resources under a range of assumptions about environmental values and future regulatory costs, including five modeling scenarios as outlined in *In the Matter of Establishing an Estimate of the Costs of Future Carbon Dioxide Regulation on Electricity Generation Under Minnesota Statutes § 216H.06,* Docket No. E-999/CI-07-1199, Order Establishing 2020 and 2021 Estimate of Future Carbon Dioxide Regulation Costs (September 30, 2020), Ordering Paragraph 2, as modified.

Per the Environmental and Regulatory Costs Order, for purposes of measuring environmental and socioeconomic costs under Minn. Stat. § 216B.2422, Subd. 3, the PVSC Base Case Greenhouse Gas (GHG) values, inclusive of carbon dioxide, methane and nitrous oxide, are based on the United States Environmental Protection Agency's (EPA) September 2022 *External Review Draft of Report on the Social Cost of Greenhouse Gases*[4] (EPA SC-GHG), mid EPA SC-GHG values, with the high and low EPA SC-GHG values as sensitivities. The EPA SC-GHG costs are applied post processing and do not impact dispatch order. All prices are converted from metric ton to short ton and to nominal dollars using two percent escalation factor.

---

[1] The RBDC proposal, currently under consideration by FERC, is a proposed design for MISO's Planning Resource Auction that aims to reflect the reliability value of capacity and produce more efficient and stable capacity prices. Pending FERC approval, the RBDC reform is expected to be implemented in PY 2025-2026.
[2] Reliability Requirement Representations in the Planning Resource Auction: Consideration of a Reliability-Based Demand Curve (August 22, 2023). [3] Order in Docket Nos. E-999CI-07-1199, E-999/DI-22-236, E-999/CI-14-463. December 19, 2023.
[4] We understand the EPA finalized the draft SC-GHG values in November 2023.

Starting in 2028, the PVSC Base Case values also include the Regulatory Cost of Carbon (RCC), relying on the "mid" end of the range of regulated costs.[5,6] Although the cost range was amended in 2023, when the Commission modified the range to between $5 and $75, these values will still begin being applied in 2028, and still under the range of assumptions about environmental values and future regulatory costs (including the five modeling scenarios) outlined in the September 30, 2020 Order.[7] The low end and high end of the range are modeled in separate sensitivities. The regulatory costs are applied to all carbon emitting units as well as market energy purchases, hence affect dispatch order.

The following additional sensitivities have also been modeled: high RCC with high draft EPA SC-GHG, low RCC with low draft EPA SC-GHG costs, zero RCC with low, mid and high draft EPA SC-GHG. We have adjusted the EPA SC-GHG values for modeling purposes by subtracting the regulatory cost of carbon from the EPA SC-GHG value beginning in 2028 to avoid double counting of GHG costs. All prices escalate at general two percent inflation.

The values modeled in the PVSC Base Case and alternative scenarios are identified below in Table F-3 and F-4.

E. All Other Externality Costs

The values of the criteria pollutants are derived from the high and low values for each of the four locations, as determined in the Minnesota Commission Order Updating Environmental Cost Values in Docket No. E999/CI-14-643 issued January 3, 2018. The mid-point externality costs are the average of the low and high values. All prices

are escalated to 2023 real dollars using the 2022 GDP IPD. These costs are applied post processing and do not impact dispatch order.

Table F-5: Externality Costs

MPUC Low Externality Costs 2023 $ per short ton				
	Urban	Metro Fringe	Rural	<200mi
SO2	$6,976	$5,509	$4,156	$0
NOx	$3,347	$2,991	$2,407	$32
PM2.5	$12,202	$7,821	$4,168	$994
CO	$1.88	$1.34	$0.36	$0.36
Pb	$5,540	$2,923	$711	$711

MPUC High Externality Costs 2023 $ per short ton				
	Urban	Metro Fringe	Rural	<200mi
SO2	$17,439	$13,723	$10,128	$0
NOx	$9,571	$8,896	$7,724	$180
PM2.5	$30,481	$19,496	$10,235	$1,513
CO	$4.00	$2.37	$0.72	$0.72
Pb	$6,856	$3,530	$793	$793

MPUC Midpoint Externality Costs 2023 $ per short ton				
	Urban	Metro Fringe	Rural	<200mi
SO2	$12,208	$9,616	$7,142	$0
NOx	$6,459	$5,943	$5,066	$106
PM2.5	$21,341	$13,659	$7,202	$1,254
CO	$2.94	$1.85	$0.54	$0.54
Pb	$6,198	$3,226	$752	$752

F. Energy Efficiency (EE) Bundles

The Company based our EE bundles on our proposed 2024-2026 ECO Triennial Plan.[8] Three bundles of EE were developed: (1) a low-achievement bundle based on minimum statutory requirements in Minn. Stat. § 216B.241, (2) a mid-achievement bundle based on estimated savings derived from our 2024-2026 ECO Triennial, and (3) a high-achievement bundle based on the "Optimized Bundle" as part of the 2020-

[8] 2024-2026 ECO Triennial Plan, as filed, Docket No. G,E002/CIP-23-92, June 29, 2023.

2034 IRP which took into account the most recent state potential analysis.[9] Internal experts provided estimated costs, and energy and demand avoidance characteristics for the programs. Multiple sources were considered for the different bundles including the 2018 *Minnesota Energy Efficiency Potential Study* findings, the Company's ECO Triennial Plan, and IRA policies and funding. In addition to the bundles, naturally occurring EE is embedded in the load forecast.

Each bundle is modeled in Encompass in the same manner as a supply side resource. The first two bundles are forced into the model and are not selectable as they represent our planned program achievement for EE. The High Achievement Bundle (Bundle 3) was offered as a selectable resource by the EnCompass model as part of the optimization process. Bundle 3 was developed by the Company, drawing on the Optimal Bundle in the 2019 IRP.

G. Demand Response Forecast

Like the process for EE, the Company created six bundles for demand response based on level of achievement and technology so that DR could be modeled in Encompass in the same manner as a supply-side resource. These bundles included: (1) Base DR, Saver's Switch, (2) Base DR, Other DR, (3) Incremental DR, Saver's Switch, (4) Incremental DR, Other DR, (5) High Potential, Saver's Switch, and (6) High Potential, Other DR.

Consistent with past practice, the Company developed a Base DR Forecast from existing programs at historical growth rates, which was included in all baseline resource modeling as the first level of DR achievement. The Company then developed two levels of DR achievement incremental to the Base DR Forecast. The second level of DR achievement represents a higher level of growth rate necessary to achieve the required 400 MW of incremental DR by the end of 2023,[10] and a continuation of that level of achievement beyond 2023. This level of achievement, represented by bundles 1 through 4, is included in the Encompass model as required resources as ordered by the Commission. The third level of DR achievement, represented by bundles 5 and 6, is based on the Brattle DR Potential Study included in the 2019 IRP. This level of achievement exceeds the achievement of the ordered 400 MW by 2023 at a higher cost. These bundles are included in the Encompass model as selectable resources to determine the cost-effective level of future DR achievement.

Within each level of achievement, the costs and impacts of the Saver's Switch program and all other DR programs were modeled separately. This was done as the Saver's Switch program controls air-conditioning,[11] resulting in load reductions that differ significantly from the load reductions from all other DR programs which control a wide variety of loads. This results in a total of six bundles modeled bundles as described above (each level broken into specific technology and control characteristics). Similar to EE, each level of achievement represents an incremental amount of DR and is dependent on the preceding level of achievement being selected (i.e., third level of achievement for the Saver's Switch program cannot be selected unless the second level of achievement is selected).

[10] *See Order Approving Plan with Modifications and Establishing Requirements For Future Filings*, Docket No. E002/RP-19-368, April 15, 2022 at Order Point 2.A.2.
[11] Saver's Switch was used as a proxy for characterization of the resource, other programs such as AC Rewards also hold these characteristics.

Table F-7: Demand Response Forecast

H. Demand and Energy Forecast

The Company's Fall 2023 load forecast is used as the base assumption in this Resource Plan. The forecast assumes adoption of Electric Vehicle (EV), new Large Commercial & Industrial (C&I) customer additions, Beneficial Electrification (BE), and demographic/economic growth. These load increases are netted against reductions in consumption resulting from Energy Efficiency to result in an overall energy requirements outlook that increases two percent per year in the 2024-2040 timeframe.

The "Load Forecast with required MN EE Bundles" shown in Table F-8 below is the starting point for the load inputs. In all modeling sensitivities, the "EE" is removed; the removal of the impact of this future and historic EE achievement, each of which has a 14-year life, impacts the load forecast through the end of the modeling period. The EE impact was subsequently locked in all sensitivities. The resulting forecast, before the impacts of EE achievement are added, is shown below in Table F-8 as "Forecast without required MN EE Bundles." The forecasts shown do not include the impact of DG solar.

Table F-8: Demand and Energy Forecast

Seasonal Peak Demand and Energy Forecast										
Year	Peak Seasonal Demand (MW) without required MN EE Bundles				Peak Seasonal Demand (MW) with required MN EE Bundles				Energy (GWh)	
	Summer	Fall	Winter	Spring	Summer	Fall	Winter	Spring	Forecast without required MN EE Bundles	Forecast with required MN EE Bundles
2024	9,408	7,528	6,612	7,043	9,309	7,433	6,525	6,949	44,439	43,823

2055	14,916	13,949	15,125	14,265	14,907	13,929	15,107	14,246	73,717	73,528

*Winter peak does not include December because EnCompass model does not assume December as the peak month so that consecutive winter periods from one year to the next never occur.

High and low load sensitivity assumptions are summarized below in Table F-9. Our high load forecast sensitivity assumes increased BE, full achievement of Minnesota's "20% by 2030" goal for EV penetration with similar increases in EV adoption in other states served by NSP, and additional large data center loads locating in

Minnesota. All other assumptions are held the same as in the base case outlook. The resulting high load forecast is shown below in Table F-10. The low load sensitivity assumes increased adoption of rooftop solar generation, no beneficial electrification, slower adoption of EVs, and less new load from data centers than was assumed in the Base Case. The resulting low load forecast is show below in Table F-11.

Table F-9: High and Low Load Sensitivity Assumptions

Component	High Load Case	Low Load Case
Base Load	Base Case	Base Case
Solar	Base Case	High Solar
Demand-Side Management	Base Case	Base Case
Beneficial Electrification	High BE	No BE
Electric Vehicles	Full Achievement	Low Achievement
Large Commercial & Industrial Customers	High LCI	Low LCI

Table F-10: High Load Sensitivity

High Load Sensitivity					
	Peak Seasonal Demand (MW)				Energy (GWh)
Year	Summer	Fall	Winter	Spring	
2024	9,524	7,653	6,730	7,125	45,219
2025	9,716	7,844	6,884	7,282	46,739

2047	12,626	9,767	9,805	9,374	61,348
2048	12,650	9,752	9,751	9,521	61,693
2049	12,661	9,799	10,567	9,884	62,015
2050	12,711	10,048	10,891	10,156	62,422
2051	12,744	10,272	11,146	10,511	62,698
2052	12,803	10,533	10,906	10,779	63,056
2053	12,017	10,748	11,647	10,874	63,341
2054	12,059	10,977	11,899	11,155	63,820
2055	12,207	11,243	12,158	11,435	64,358

*Winter peak does not include December because EnCompass model does not assume December as the peak month so that consecutive winter periods from one year to the next never occur.

I. Fuel and Market Price Forecasts

To derive the forecast of monthly delivered gas prices at Ventura Hub, the Company uses a combination of market indicators such as New York Mercantile Exchange (NYMEX) and long-term price forecasts published by highly respected, industry-leading sources such as Wood Mackenzie and S&P Global. The forecast is NYMEX-based for the first few years, and then it transitions into blending the NYMEX curve with the vendor forecasts to develop a composite forecast. The Company used the following weightings for each component at various time intervals:

Period	NYMEX	S&P Global	Wood Mackenzie
Balance of the year + 2 years	100%	0%	0%
Years 3 and Beyond	25%	37.5%	37.5%
	10 yr trendline extension		

The final years of the forecasts vary between sources; Wood Mackenzie and S&P Global provide data through 2050, and NYMEX through 2035. The Company uses linear extrapolation to extend the data of each forecast out to 2050 and beyond. The Ventura Hub is later adjusted for specific delivery costs at each generating unit to develop the final model inputs.

Coal price forecasts at mine mouth are based on a combination of the short-term spot market forecast from Coaldesk, LLC in the near term and a simple average of long-term coal price forecasts provided by Wood Mackenzie and S&P Global. Added to the coal price forecast at mine mouth, which is just for the coal commodity, are: transportation charges (rail and diesel fuel), SO_2 costs, freeze control, and dust suppressant, as required. Coal price forecasts are shown below in Table F-12.

Table F-12: Coal Price Forecasts

Coal Price Forecast		
Year	AS King (Delivered) $/mmBtu	Sherco (Delivered) $/mmBTU
2024	$2.62	$2.37
2025	$2.71	$2.52
2026	$2.78	$2.57
2027	$2.81	$2.60
2028	$2.89	$2.67
2029	$2.95	$2.72
2030	$3.01	$2.78

In addition to resources that exist within the NSP System, the Company is a participant in the MISO Market. To derive the forecast of monthly On and Off-peak electricity prices, the Company uses a simple average of On and Off-peak power price forecasts provided by Wood Mackenzie and S&P Global. Table F-13 below shows the market prices under zero CO_2 cost assumptions. To generate the hourly market prices, the Company uses the hourly energy price forecasts from the Horizons Energy EnCompass National Database, specifically the energy prices at the MISO-ND-MN node and scales it to match the monthly On and Off-peak price forecasts in Table F-13.

High and low-price sensitivities were performed by adjusting the base forecast up and down by 50 percent.

Table F-13: Gas and Market Price Forecast

	Base Forecast			Low Forecast			High Forecast		
	Gas Price ($/mmBTu)	Market Price ($/MWh)		Gas Price ($/mmBTu)	Market Price ($/MWh)		Gas Price ($/mmBTu)	Market Price ($/MWh)	
Year	Ventura Hub	Minn Hub On-Peak	Minn Hub Off-Peak	Ventura Hub	Minn Hub On-Peak	Minn Hub Off-Peak	Ventura Hub	Minn Hub On-Peak	Minn Hub Off-Peak
2024	$3.36	$39.74	$30.58	$1.68	$19.87	$15.29	$5.04	$59.61	$45.88

J. Baseload Retirement "Leave Behind" Costs

The Company includes "leave behind" estimates, which reflect costs required to mitigate localized grid impacts of baseload resource retirements. For the retiring coal units, these costs are largely attributed to synchronous condensers that will likely be needed to maintain grid stability. For the nuclear units, the Company conducted a "leave behind" study to determine the transmission system impacts of the nuclear plants' retirement. The reinforcement costs are included as capital expenditure based on the timing of the resource retirement.

Specifically, we have included the following proxy leave behind costs related to our baseload resource retirements as estimated by the Company. We applied these costs in the modeling as soon as the resource is retired to reflect the estimated local transmission reinforcement costs assumed to be required upon retirement. All numbers below are in real dollar terms ($2023).

- King: $50 million
- Sherco 1: $50 million
- Sherco 2: $50 million
- Sherco 3: $50 million

K. Market Capacity Price

Surplus capacity up to 500 MW can receive surplus capacity credit and is priced at the avoided capacity cost of a generic greenfield H-Class combustion turbine on an economic carrying charge basis.

L. Seasonal Accredited Capacity Assumptions for Wind, Solar, and Battery Resources

The seasonal accredited capacity (SAC) values for wind, solar, and battery resources vary according to whether a resource is already in existence or is a new resource option for the model. The Effective Load Carrying Capability (ELCC) for existing NSP wind and solar resources is based on the 2023-2024 MISO planning year seasonal accreditation capacity[12] with an annual degradation assumption for solar resources.[13] For years beyond 2024, the seasonal accredited capacity of existing wind, solar, and battery resources trends over multiple years so it meets the assumptions used in MISO's November 2022 Regional Resource Assessment (RRA) as depicted in Figures F-1, F-2, and F-3 below. As outlined by MISO, there was an unexpected deviation from the anticipated declining trend in ELCC when more of a resource type is added to the system. Specifically, the average solar ELCC for the winter season increased from one percent in 2031 to 11 percent in 2041. This increase can be attributed to the hour in which risk emerged during the winter months. In 2041, the evening risk materialized two hours earlier than it did in 2031. This change, attributed to low wind output, resulted in a ten percent change to the solar ELCC outcome when using the average ELCC methodology as described further below.[14]

[12] MISO Planning Year 2023-2034 Wind and Solar Capacity Credit Report (March 2023). Available at https://cdn.misoenergy.org/2023%20Wind%20and%20Solar%20Capacity%20Credit%20Report628118.pdf.
[13] The seasonal accredited capacity percentages are applied to the installed capacity of each existing NSP resource. In the case of solar resources, the maximum capacity declines slightly each year, due to slight degradation in the installed solar modules. NSP incorporates a 0.5 percent decrease in existing solar resources' installed capacity to mimic this effect in addition to the ELCC assumptions described in this section.
[14] MISO Regional Resource Assessment (November 2022) at p. 45. Available at https://cdn.misoenergy.org/2022%20Regional%20Resource%20Assessment%20Report627163.pdf.

Figure F-1: Average seasonal ELCC for Existing Wind Resources[15]

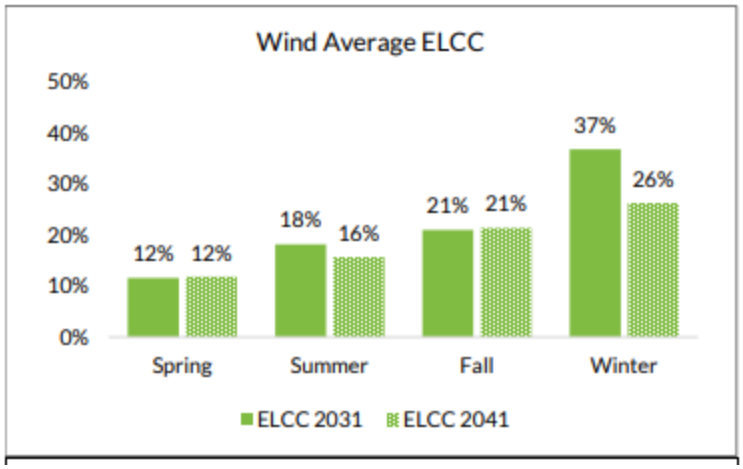

Figure F-2: Average seasonal ELCC for Existing Solar Resources[16]

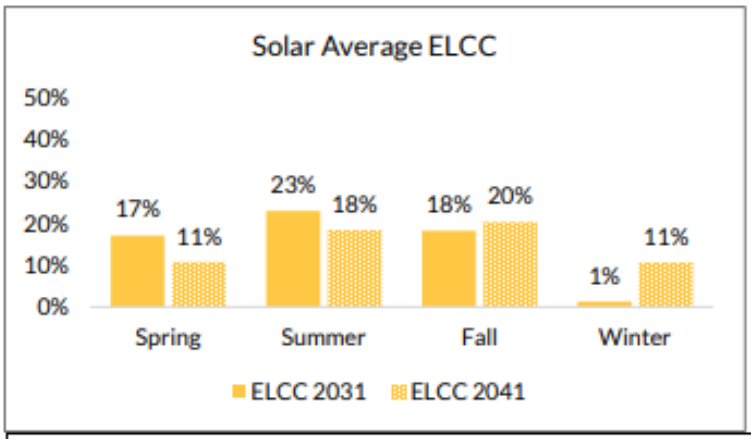
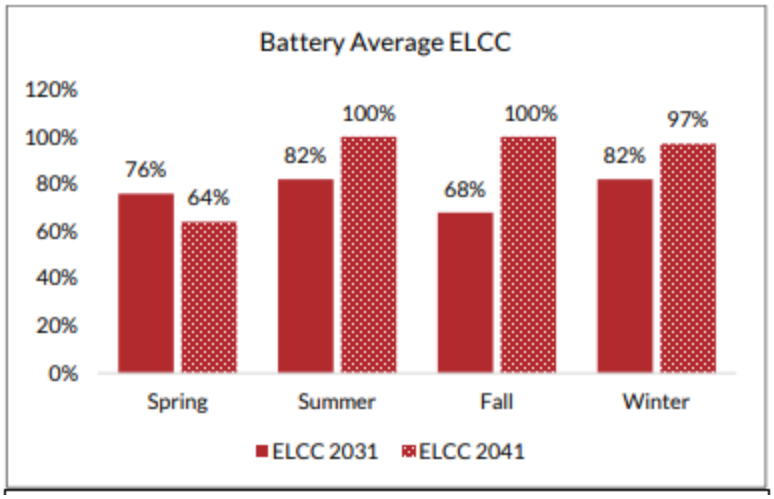


[15] *Id.* at p. 47.
[16] *Id.* at p. 45.

Figure F-3: Average seasonal ELCC for Battery Resources[17]



The seasonal accreditation assumptions for generic wind, solar, battery, and solar + battery hybrid resources are shown on Table F-16. The seasonal accreditation assumptions for generic wind resources are based on values used in MISO's 2022 and 2023 Regional Resource Assessment (RRA); and stem from MISO's March 2023 Planning Year 2023-2024 Wind and Solar Capacity Credit Report.

The seasonal accreditation for generic solar resources starts with the values in the MISO 2023/2024 PY Planning Reserve Margin and Local Reliability Requirements. These values then trend to the long-term ELCC assumptions in the MISO November 2022 RRA.

The battery seasonal accreditation starts with the MISO October 2023 Resource Adequacy Business Practice Manual (BPM) section 4.2.9.4, which provides the five percent forced outage (95% accredited capacity assumptions) for new energy storage resources. The accreditation trends over several years from the 95% capacity accreditation to the long-term assumptions for battery storage resources in the MISO November 2022 RRA. The MISO battery accreditation is based on a four-hour battery. In the case of a 10-hour battery, we conservatively apply the same value since MISO does not provide an ELCC for a 10-hour duration.

The solar plus battery hybrid accreditation value is calculated using the methodology in the MISO October 2023 Resource Adequacy Business Practice Manual BPM,

[17] *Id.* at p. 51.

Section 4.2.11. This section details the Phase I "sum of parts" method for hybrid systems, applying it to the assumed generic solar and storage units in our model. For each year within the modeling horizon, the "sum of parts" methodology from the current MISO BPM is replicated. However, in this case, the components combined are the standalone storage and solar generic units, each component part – solar and storage – with accreditation assumptions that trend over time to align with the long-term November 2022 MISO RRA values for standalone storage and standalone solar.[18]

A key trend over time here is that many of the seasonal values for different generic resource types trend down from the single year MISO PY 2023/2034 to MISO PY 2031/2032 and then back up again by MISO PY 2041/2042. This occurs in part because the studies for MISO PY 2023/2024 assumptions differ from those for the later years and also because of the methodology and assumptions being used for PY 2031/2032 and PY 2041/2041.

In the case of MISO PY 2031/2032 and MISO PY 2041/2042 variations, ELCC assumptions for intermittent resources are affected by the system-wide generation resource mixes MISO projects for those years. Additionally, the average ELCC method MISO uses for this study heavily depends on projected resource output for a few key Loss of Load Probability (LOLP) hours each season. While MISO notes that average ELCC methodology "may not be adequate for a system with large amounts of intermittent generation" and that "changes to the accreditation methodology applied to non-thermal technologies are currently being considered by MISO's Resource Adequacy Subcommittee (RASC) stakeholders," in the absence of other long-term data, the Company has adopted these ELCC values for its long-term modeling purposes.

[18] The total resource accreditation for hybrid units used this method instead of matching to MISO 2022 RRA values for hybrids because the sizes of the solar and storage components relative to total asset size that MISO had used in their analysis were unknown and may have differed from the hybrid generic unit configuration used by the Company in IRP modeling.

Table F-16. Generic Wind, Solar, Battery, and Solar + Battery Hybrid Resource ELCC

PY 2023/2024

Generic Resource Type	Summer	Fall	Winter	Spring
Wind[19]	18.1%	23.1%	40.3%	23.0%
Solar[20]	45.4%	25.3%	6.3%	15.0%
Battery	95.0%	95.0%	95.0%	95.0%
Solar + Battery Hybrid	52.6%	43.3%	33.3%	37.9%

PY 2031/2032

Generic Resource Type	Summer	Fall	Winter	Spring
Wind	18.0%	21.0%	37.0%	12.0%
Solar	23.0%	18.0%	1.0%	17.0%
Battery	82.0%	68.0%	82.0%	76.0%
Solar + Battery Hybrid	38.0%	30.9%	26.4%	32.9%

PY 2041/2042

Generic Resource Type	Summer	Fall	Winter	Spring
Wind	16.0%	21.0%	26.0%	12.0%
Solar	18.0%	20.0%	11.0%	11.0%
Battery	100.0%	100.0%	97.0%	64.0%
Solar + Battery Hybrid	41.1%	42.1%	36.4%	26.0%

M. Spinning Reserve Requirement

The total spinning requirement in the model consists of spinning reserve and supplemental reserve. Spinning reserve is the on-line reserve capacity that is synchronized to the grid to maintain system frequency stability during contingency events and unforeseen load swings. Supplemental reserve is the off-line capacity capable of quick start within 10 minutes. On an hourly basis, each ancillary type for NSP is calculated as the NSP load ratio of the published MISO System Wide Ancillary Requirements. The level of total spinning requirement modeled is 125.17 MW and is based on a 12-month historical average in 2022.

[20] MISO 2023/24 PY Planning Reserve Margin and Local Reliability Requirements – Final Results. October 3, 2022. Available at: https://cdn.misoenergy.org/20221003%20LOLEWG%20Item%2003%20PY%202023-24%20Final%20LOLE%20Study%20Results626468.pdf.

N. Emergency Energy

Emergency energy is used to cover events where there are not enough resources or market purchase energy available to meet system energy requirements. In EnCompass, we use the value of $1,000,000/MWh. Emergency energy is a "soft constraint" in EnCompass modeling that allows emergency energy to "dispatch" as a last resort resource, in order for the model to find a feasible solution. The EnCompass price is set to a high level to ensure that all other available resources – including those that may have a very high effective $/MWh cost resulting from startup costs spread over a very small, required run time – are utilized before emergency energy.

O. Cost Assumptions for Transmission Tie Lines and New Resource Interconnections

Interconnection costs of $250/kw[21] are included in addition to the capital costs and operating expenses for utility-scale generic resource options.[22] These interconnection costs represent "grid upgrades" to ensure deliverability of energy from these facilities to the overall bulk electric system and are the "behind the fence" costs associated with substation and representative gen-tie construction.

In this IRP, a new distribution-interconnected resource, solar used to comply with the 3% Distributed Solar Energy Storage (DSES) legislation, also includes an interconnection cost as part of its total modeled cost. Costs from our recently filed Integrated Distribution Plan (IDP) were used as shown in Table F-17.[23]

[21] The basis for this cost assumption is discussed in Appendix L: System Planning Integration.
[22] Generic resources interconnecting to the Sherco and King transmission tie-lines do not have this cost as part of their capital cost assumption since they will not need to have a new, dedicated Generator Interconnection Agreement (GIA) with MISO.
[23] *See* Integrated Distribution Plan, Appendix I: Distribution System Upgrades, November 1, 2023, Docket No. E002/M-23-452, for more information on the development of interconnection cost assumptions.

Table F-17: 3% DSES Interconnection Cost Assumptions

Years	3% Distributed Solar Energy Standard Interconnection Cost Assumption (Nominal $/kW)
2024-2029	$225
2030-2040	$184
2041-2055	$149

Regarding transmission tie-lines, in the Alternate Plan, we proposed to build transmission tie-lines from our Sherco and King sites that can interconnect incremental renewable and/or firm dispatchable resources. The total costs of the tie lines include capital costs plus VAR support, such as installing tie-line synchronous condensers and series compensation of the lines; while these are general cost estimates and subject to change during detailed project design, they are in line with the Company's experience on other projects. The total capacities of generator reuse are based on the existing interconnection rights at Sherco and King.

Table F-18: Sherco and King Gen-tie Assumptions

	Total Capital Costs (in 2023 Dollars)	Interconnection Rights
Sherco gen-tie	$1.139 billion	1996 MW
King gen-tie	$177 million	591 MW

Table F-19: Retiring Coal Units and Selection Windows for Gen-tie Resources[24]

Retiring Unit	Open Interconnection	Replacement Resource Window	Replacement Resources Allowed
Sherco 2	710 MW	2024-2026	Solar[25]
Sherco 1	720 MW	2027-2029	Solar, and Wind + ~400 MW of CTs (2028-2029)
Sherco 3	566 MW	2030-2032	Solar + Wind
AS King	591 MW	2028-2030	Solar only

[24] It was discovered that we inadvertently transposed the interconnection values for Sherco coal units 1 and 2 in the previous IRP. This has been corrected in this IRP model. The overall replacement MW indicated in the IRP Order for Units 1 and 2 together is correct and has not changed.
[25] Collectively, the Sherco Solar 1, 2, and 3 projects reutilize the interconnection capacity made available with the retirement of Sherco Coal Unit 2.

P. Distributed Generation and Community Solar Gardens

The distributed solar and Community Solar Gardens inputs are based on the most recent Company forecasts and an estimated ramp up of resources that comply with the Distributed Solar Energy Standard (DSES). Distributed Solar is modeled assuming a degradation of half a percent annually in generation. Community Solar Gardens are modeled assuming a degradation of half a percent annually in generation, and a 25-year service life.

Table F-20: Distributed Solar Nameplate capacity Forecast

Distributed Solar (Nameplate MWac)					
Year	CSG Legacy (2016-2024)	Non-Legacy CSGs	Customer Sited DG Solar	Distributed Solar Energy Standard (3%)	Total

[26] Costs for each resource are derived from the following data sources: (1) CSG: Value of Solar Bill Credit Rates, (2) Customer Sited DG Solar: Xcel Energy A50 Rate Code, and (3) Distributed Solar Energy Standard (3 percent): combination of NREL ATB Utility-Scale Solar and Distributed Commercial PV resource types.

Q. Owned Unit Modeled Operating Characteristics and Costs

Company owned units are modeled based upon their tested operating characteristics and projected costs. Below is a list of typical operating and cost inputs for each company owned resource.

a. Retirement Date
b. Maximum Capacity
c. Seasonal Accredited Capacity Ratings
d. Minimum Capacity Rating
e. Heat Rate Profiles
f. Variable O&M
g. Start up fuel usage and start up charge
h. Fixed O&M
i. Maintenance Schedule
j. Forced Outage Rate
k. Emission rates for SO_2, NO_x, CO_2, CO, CH_4, N_2O, Pb and particulate matter
l. Contribution to spinning reserve
m. Fuel prices
n. Fuel delivery charges

R. Thermal Power Purchase Agreement (PPA) Operating Characteristics and Costs

PPAs are modeled based upon their tested operating characteristics and contracted costs. Below is a list of typical operating and cost inputs for each thermal PPA.

a. Contract term
b. Maximum Capacity
c. Minimum Capacity Rating
d. Seasonal Accredited Capacity Ratings
e. Heat Rate Profiles
f. Energy Schedule
g. Capacity Payments
h. Energy Payments
i. Start up fuel usage and start up charge
j. Maintenance Schedule
k. Forced Outage Rate
o. Emission rates for SO_2, NO_x, CO_2, CO, CH_4, N_2O, Pb and particulate matter

l. Contribution to spinning reserve
m. Fuel prices
n. Fuel delivery charges

S. Renewable Energy (PPAs and Owned) Operating Characteristics and Costs

Below is a list of typical operating and cost inputs for each renewable energy unit.

a. Contract term
b. Name Plate Capacity
c. Seasonal Accredited Capacity
d. Annual Energy
e. Hourly Patterns
f. Capacity and Energy Payments
g. Whether curtailed energy is compensable or not

T. Park Potential profiles for modeling wind and solar generation on the NSP System

This section discusses the process used to create Park (i.e., wind or solar farm) Potential profiles of wind and solar generation for Xcel Energy's upper Midwest region.

1. Annual Expected Park Potential

The Company combined monthly generation and curtailment data to derive the monthly Park Potential for each renewable generation Commercial Pricing Node (CP Node) from January, 2018 through November, 2022. The monthly Park Potentials were summed on a rolling 12-month basis to derive 48 annual Park Potential values. The Company averaged the 48 annual values to determine the annual expected Park Potential value for each CP Node. For renewable generation without sufficient historic data, the most recent Energy Production Estimate (EPE) from pre-construction developer software or the Annual Committed Energy from the Purchase Power Agreement was used as the annual PP value.

2. Monthly Allocation of Annual Park Potential

For new wind plants, the pre-construction developer software uses 30 years' worth of

meteorological weather reanalysis data to determine the expected monthly generation expressed as a percentage of the annual EPE. The Company used the average of the monthly percentages from new wind plants to allocate the CP Node annual Park Potential values to each calendar month. For solar plants, the Company calculated the ratio of monthly Park Potential relative to annual Park Potential for each month from the years 2018-2022. Table F-22 shows the monthly allocations for wind and solar plants expressed as a percentage of the annual expected Park Potential.

Table F-22: Monthly Percentage of Annual Wind and Solar Plant Park Potential

Month	Wind Allocation (%)	Solar Allocation (%)
January	9.1	3.7
February	8.2	5.4
March	9.1	9.0
April	9.4	10.0
May	9.1	11.9
June	7.7	13.2
July	6.3	13.1
August	6.1	11.6
September	7.7	9.2
October	9.1	6.6
November	9.2	3.8
December	9.0	2.7

3. Hourly Allocation of Monthly Park Potential

For most wind plants, the Company has wind speed data measured at the turbine anemometers.[27] The Company gathered hourly averaged wind speed data from 2020 for each wind CP Node and used empirical power conversions specific to those CP Nodes to convert the hourly wind speed to hourly generation. The summed monthly generation for each CP Node was compared to the volume of generation derived from the monthly allocation of the annual Park Potential. A constant wind speed adjustment was made to each hour so that the sum of the hourly generation based on the hourly wind speed data matched the monthly allocation of the annual Park Potential.

[27] The Company has turbine wind speed data for approximately 91% of Company-controlled wind generation capacity.

For wind generation at CP Nodes without wind speed data, the Company generated a single empirical power conversion derived from the simple average of all wind speed data for each hour in 2021 and the paired sum-of-generation from all CP Nodes without wind speed data. For each of these CP Nodes, the Company calculated the pro rata ratio of the CP Node annual Park Potential relative to the sum of annual Park Potentials for all CP Nodes without wind speed data. A constant wind speed adjustment was applied to the system average wind speed profile for each month so that the resulting generation profile matched the monthly allocation of the sum of annual Park Potentials for all CP Nodes without wind speed data. Each CP Node without wind speed data was assigned their pro-rata share of this hourly generation profile for each month.

For solar generation, the Company used hourly irradiance and generation data from 2020 for each solar plant and used empirical power conversions to convert the hourly irradiance to hourly generation. The summed monthly generation for each plant was compared to the volume of generation derived from the monthly allocation of the annual Park Potential. An irradiance adjustment was made to each hour in a given month so that the sum of the hourly generation based on the hourly irradiance data matched the monthly allocation of the annual Park Potential.

For plants without historic irradiance or generation data, the Company used 2020 hourly irradiance data for each plant location sourced from the National Solar Radiation DataBase (NSRDB) maintained by the National Renewable Energy Laboratory (NREL). The same process was used to derive the hourly generation profiles for these solar plants as for the existing solar plants in the Company's portfolio of renewable generation.

U. Generic Assumptions

Generic resources are modeled based upon their expected operating characteristics and projected costs. Generic thermal assumptions are based on the Company's internal estimates informed by external consultants and original equipment manufacturers. Generic renewable and battery costs, as well as battery operational characteristics such as cycle limit and Round-Trip Efficiency (RTE) are from National Renewable Energy Laboratory (NREL) 2023 Annual Technology Baseline (ATB) data. High and low technology cost sensitivities are created based on NREL ATB "Conversative" and "Advanced" forecasts. We also have a sensitivity where the wind,

solar and solar + battery hybrid LCOEs prior to 2030 are adjusted to match the 2023 Q1-Q3 actual PPA prices in MISO, reported in the Edison Energy Global Renewable Market Update quarterly reports. Utility-scale wind, solar, solar plus battery hybrid and battery costs, with and without interconnection costs for the base case and all sensitivities, are shown in Tables F-24 – F-38.

The costs used for wind, solar, and storage assets fully incorporate the Production Tax Credit (PTC) or Investment Tax Credit (ITC) in the Inflation Reduction Act (IRA). The costs of wind and solar resources selected to replace the interconnection capacity of Sherco and King are calculated without incremental transmission costs (as the gen-tie costs are already accounted for elsewhere in the model). In addition, we do not make cost adjustments to the Company's owned units selected to replace the retired coal capacities. The IRA allows the transferability of tax credits, allows utilities to elect out from normalization for storage facilities, and allows owners of solar facilities to claim a PTC in lieu of the ITC, which is subject to normalization. All of these combine to create a more level playing field for utilities to build/own solar and storage assets.

Below is a list of typical operating and cost inputs for each generic resource.

<u>Thermal</u>

2030	13.84	32.25	79.78

V. Advanced Technology

The Company modeled three advanced technologies in this Resource Plan as discussed be below: small modular reactors, long-duration batteries, and hydrogen.

1. Small Modular Reactors

The small modular reactor (SMR) cost forecast uses the NREL 2023 ATB conservative projection and SMR operation parameter assumptions.

Table F-39: SMR Modeling Assumptions

SMR	
Representative Plan Size (MW)	600
Capacity Factor	92.7%
Book life (years)	60
PTC or ITC applied	ITC
Electric Transmission Delivery ($/kW)	250
Forced outage rate	7.3%

Table F-40: SMR LCOE with Transmission Cost

Levelized Costs by In-Service Year (30 year life) with Transmission Cost	
Year	**SMR**
2035	$105.26
2036	$107.36
2037	$109.51
2038	$111.70
2039	$113.93
2040	$116.21
2041	$118.53
2042	$120.90
2043	$123.32
2044	$133.16
2045	$142.50
2046	$157.12
2047	$160.26
2048	$163.46
2049	$166.73
2050	$170.06
2051	$173.46
2052	$176.93
2053	$180.47
2054	$184.08
2055	$187.76

2. Long Duration Batteries

Long duration batteries are modeled as those capable of discharging for 100 contiguous hours. Cost projections for long duration batteries are based on the 2030 cost projection detailed in the "Form Energy White Paper" in Great River Energy's 2023 - 2037 INTEGRATED RESOURCE PLAN, in Minnesota Public Utilities Commission Docket No. ET-2/RP-22-75 (March 31st, 2023) and assume a one percent cost decline trend. Operational parameters of the long duration batteries were developed based on information provided by Form Energy.

Table F-41: Long Duration Energy Storage Modeling Assumptions

Long Duration Energy Storage	
Representative Plan Size (MW)	100 MW
Battery Duration	100 hours
Capacity Factor	Subject to dispatch
Book life (years)	15
PTC or ITC applied	ITC
Electric Transmission Delivery ($/kW)	250

Table F-42: Long Duration 100 Hour Energy Storage Capital and Fixed O&M Cost Assumptions

Long Duration 100 hr Energy Storage		
Year	Capex with TRX ($nominal/kW)	Fixed Operation & Maintenance Cost (FOM) ($nominal/kW-yr)
2030	$2,698.77	$19.00
2031	$2,728.27	$19.38
2032	$2,758.11	$19.77
2033	$2,788.31	$20.16
2034	$2,818.87	$20.57
2035	$2,849.80	$20.98
2036	$2,881.09	$21.40
2037	$2,912.76	$21.83
2038	$2,944.80	$22.26
2039	$2,977.23	$22.71
2040	$3,010.05	$23.16
2041	$3,043.26	$23.62
2042	$3,076.88	$24.10
2043	$3,110.90	$24.58
2044	$3,145.32	$25.07
2045	$3,180.17	$25.57
2046	$3,215.44	$26.08
2047	$3,251.13	$26.60
2048	$3,287.26	$27.14
2049	$3,323.83	$27.68
2050	$3,360.84	$28.23
2051	$3,398.31	$28.80
2052	$3,436.23	$29.37
2053	$3,474.61	$29.96
2054	$3,513.47	$30.56
2055	$3,552.81	$31.17

3. Hydrogen

Modeling assumptions for hydrogen production come from the S&P Global green hydrogen production cost forecast released in June 2023. We apply the IRA PTC

($3/kg) to hydrogen production costs, with the phase-out period starting in 2032 and ending in 2036. The EPRI US-REGEN model assumption is used for estimating the hydrogen delivery cost. An estimate of the additional capital investment needed, and timeline required to enable hydrogen blending capabilities for generic CTs was provided by GE.

Table F-43: Hydrogen Production Cost Assumption

Year	H2 Production Cost ($/mmBTU)	H2 Delivery Cost ($/mmBTU)	H2 PTC ($/mmBTU)	Overall H2 Fuel Cost ($/mmBTU)
2024	$ 38.72	$ 6.12	$ 22.67	$ 22.17
2025	$ 37.07	$ 6.24	$ 23.12	$ 20.19
2026	$ 34.50	$ 6.37	$ 23.58	$ 17.28
2027	$ 32.57	$ 6.49	$ 24.05	$ 15.01
2028	$ 31.73	$ 6.62	$ 24.54	$ 13.82
2029	$ 30.98	$ 6.76	$ 25.03	$ 12.71
2030	$ 30.23	$ 6.89	$ 25.53	$ 11.60
2031	$ 29.56	$ 7.03	$ 26.04	$ 10.55
2032	$ 28.96	$ 7.17	$ 26.56	$ 9.57
2033	$ 28.41	$ 7.31	$ 27.09	$ 8.63
2034	$ 27.93	$ 7.46	$ 27.63	$ 7.76
2035	$ 27.49	$ 7.61	$ 28.18	$ 6.92
2036	$ 27.08	$ 7.76	$ 28.75	$ 6.10
2037	$ 26.66	$ 7.92	$ 29.32	$ 5.25
2038	$ 25.25	$ 8.08	$ 29.91	$ 3.42
2039	$ 24.98	$ 8.24	$ 30.51	$ 2.71
2040	$ 24.74	$ 8.40	$ 31.12	$ 2.02
2041	$ 24.61	$ 8.57	$ 31.74	$ 1.44
2042	$ 24.50	$ 8.74	$ 32.37	$ 0.87
2043	$ 24.47	$ 8.92	$ 33.02	$ 0.37
2044	$ 24.47	$ 9.09	$ 33.68	$ (0.12)
2045	$ 24.50	$ 9.28	$ 34.36	$ (0.58)
2046	$ 24.54	$ 9.46	$ -	$ 34.00
2047	$ 24.63	$ 9.65	$ -	$ 34.28
2048	$ 24.74	$ 9.84	$ -	$ 34.59
2049	$ 24.86	$ 10.04	$ -	$ 34.90
2050	$ 25.04	$ 10.24	$ -	$ 35.28
2051	$ 25.54	$ 10.45	$ -	$ 35.99
2052	$ 26.05	$ 10.66	$ -	$ 36.71
2053	$ 26.58	$ 10.87	$ -	$ 37.44
2054	$ 27.11	$ 11.09	$ -	$ 38.19
2055	$ 27.65	$ 11.31	$ -	$ 38.96

W. Market Purchases and Sales Import/Export Limits and Carbon Rate

In order to account for emissions rates associated with market purchases, the Company assumes an annual average carbon emissions pounds/MWh rate, as shown in the table below. These estimates were developed based on MISO's MTEP21 Future 2 modeling results. Market sales emissions rates reflect an average emissions rate for our system resources and vary according to each individual scenario and sensitivity capacity expansion portfolio.

Table F-44: Market Purchase Carbon Rate

Market Purchase CO2 Rate																
	2024	**2025**	**2026**	**2027**	**2028**	**2029**	**2030**	**2031**	**2032**	**2033**	**2034**	**2035**	**2036**	**2037**	**2038**	**2039**

ATTACHMENT A: HEAT RATE UPDATED

In Docket No. E999/CI-06-159 (In the Matter of Commission Investigation and Determination under the Electricity Title, Section XII, of the Federal Energy Policy Act of 2005), the Minnesota Commission required the Company to file information on the fossil fuel efficiency (heat rate) of our generation units, and actions we are taking to increase the fuel efficiency of those units.

Heat rate data for the Company's owned generating units is provided publicly in our annual Federal Energy Regulatory Commission (FERC) Financial Report, FERC Form No. 1. We include a copy of the pertinent unit heat rate data from FERC Form No. 1 for 2022 in Table F-45 below.

Table F-45: 2022 FERC Heat Rates

Unit	Heat Rate
A.S. King	15,223
Sherco	10,235
Monticello	10,244
Prairie Island	10,675
Black Dog (NG)	11,436
High Bridge	7,940
Riverside	7,116
French Island	24,327
Wilmarth	22,659

The Company's Performance Optimization department performs online heat rate and performance analysis. In addition, testing, assessments, and reporting on boilers, air heaters, cooling towers, and enthalpy drop tests on steam turbines are also conducted as needed. These tools factor into our assessment of the condition of these individual components, as well as how their respective performance levels will impact the overall efficiency of a given generating unit. Table F-46 below shows a summary of NSP System heat rate testing from 2016-2023.

Table F-46: Heat Rate Tests – 2016-2023

Plant/Unit	Type of Unit Test	Type of Test	Year Tested
Sherco U1	Coal Boiler	Performance	2019
King U1	Coal Boiler	Performance	2019
Sherco U2	Coal Boiler	Performance	2016
Black Dog U5/U2	Combined Cycle	Performance	2021
High Bridge CC	Combined Cycle	Heat Rate	2018
Sherco U3	Coal Boiler	Heat Rate	2017
Black Dog U6	Combustion Turbine	Heat Rate	2018
Riverside U7,U9,U10	Combined Cycle	Heat Rate	2018

As part of its heat rate testing and reporting protocol, the Performance Optimization group identifies potential heat rate improvement opportunities and validates actual performance enhancements. The Company does not look at heat rate improvements in isolation when considering plant improvement projects; rather, we perform a

collective assessment of potential safety, efficiency, and environmental performance improvements as well as overall economics in developing our generation asset management objectives. Looking forward, the Company plans to continue our proactive cycle of performance monitoring and testing, heat rate curve updates, and overall unit assessments at our generation units and implement improvements as opportunities arise.

ATTACHMENT B: WATER AND PLANT OPERATIONS

The Minnesota Commission's August 5, 2013 Notice of Information in Future Resource Plan Filings in Docket No. E002/RP-10-825 suggested utilities should consider adding to their initial resource plan filings the supplemental information listed at page 4 of the Commission's May 10, 2013 Order in Minnesota Power Docket No. E015/RP-13-53 (Order Point No. 4).

The Company's generating units are geographically positioned along major Minnesota waterways. The access to water accommodates the thermal needs of these generating units. As such, the Company's plant operations are governed by and comply with all applicable cooling water intake and discharge rules and regulations, which may indirectly affect EnCompass modeling as discussed below.

The Clean Water Act Section 316(a) sets thermal limitations for discharges and the criteria and processes for allowing thermal variances. The Company's power plant discharge temperature limits and allowances for thermal emergency provisions are outlined in the plants' National Pollutant Discharge Elimination System (NPDES) permits. Additionally, Xcel Energy has policies which outline the conditions and procedures to implement during periods of energy emergencies that provide a temporary pathway for enforcement discretion for thermal discharge compliance if Xcel Energy has taken the prescribed actions and coordinates with the Minnesota Pollution Control Agency before, during, and post an actual energy emergency. Xcel Energy is not granted authority to exceed our thermal discharge limits by our permit conditions at any time by our NPDES permit conditions.

Section 316(b) of the Clean Water Act governs the design and operation of intake structures in order to minimize adverse environmental impacts to aquatic life. EPA issued new rules in August 2014 that impacts all plants that withdraw water for cooling purposes. The rules require improvements to intake screening technology to minimize the number of aquatic organisms that are killed due to being stuck to the

screens (referred to as "impingement). The rules also created a process for the state permitting agency to evaluate and determine if additional improvements are required to minimize the number of smaller organisms that pass through the intake screens and enter the plant cooling water system (referred to as "entrainment"). While the costs associated with the impingement compliance requirements are definable, the costs associated with the entrainment compliance requirements are uncertain and are determined by the permitting agency just prior to any planned capital improvements to each plant.

Timing of the compliance requirements is site-specific and is determined by each site's NPDES permit renewal timeline.

While specific conditions, such as the effects of drought, are not directly modeled in EnCompass, the model reflects the impact of reducing plant output to comply with each site's NPDES permit thermal discharge limits. Modeling in EnCompass includes two methods to account for impacts due to changes in plant operations: each resource is modeled using a unit specific median accredited capacity rating, and the system needs are modeled with a planning reserve margin. By modeling the system needs with a planning reserve margin, the base level of required resources is assumed to be higher than those needed to meet the forecasted peak system demand. By modeling all units with an assumed level of forced outage, the base level of all available resources, modeled in aggregate, is assumed to be sufficient to represent resource availability due to emergency changes in plant operations. Thus, the impact of reducing plant output due to drought conditions and/or plant thermal discharge limitations is reflected through corrections to both obligation and resource adjustments.

ATTACHMENT C: ICAP LOAD AND RESOURCES TABLE

The following tables shows load and resources using Installed Capacity Rating (ICAP) for the planning period for each season, in compliance with the Minnesota Commission's August 5, 2013 Notice of Information in Future Resource Plan Filings.[28]

Table F-47: Load and Resources Tables, 2024-2040 Planning Period, Summer Season

APPENDIX H – RESOURCE OPTIONS

I. INTRODUCTION

Our planning horizon spans from 2024 to 2040, during which customer peak demand is projected to rise from 9,400 MW to over 13,200 MW, before Demand Side Management (DSM) adjustments. With our existing and approved resources, we face a capacity deficiency in the late-2020s due to resource retirements and contract expirations. We have identified a portfolio of resources that addresses not only our projected capacity shortfall but also aligns with our core principles of cost-effectiveness, reliability, environmental stewardship and risk mitigation.

The next section delves into our existing resources, offering a comprehensive look at our current system capacity and future system plans thus setting the stage for a deeper discussion on bridging the gap between current capabilities and future resource needs.

II. EXISTING RESOURCES

The Company currently owns and has under contract approximately 15,000 MW of capacity plus 211 MW of distributed solar, although as stated above, many of our current resources are slated to retire over the current planning period. Below, we include discussion of each resource type, and tables showing each generating unit, whether it is owned or contracted, the capacity we own or contract,[1] and the retirement year if known, as reflected in the EnCompass model. These numbers have been rounded to the nearest whole number for simplicity, where applicable.

A. Coal

The Company owns and operates three coal-fired generating units at two sites. The Sherburne County Generation Station (Sherco) previously had three operating units. On December 31, 2023, we reached an exciting milestone in the clean energy transition with the retirement of Sherco Unit 2. The closing of Sherco 2 resulted in a loss of 682 MW of firm dispatchable generation from the NSP system. We are planning to retire Sherco 1 and 3 by December 31, 2026 and 2030, respectively. We are planning to retire the Allen S. King plant in 2028. Retirements of these plants will result in the loss of an additional 1,705 MW of firm dispatchable generation from the NSP system.

[1] Expected as of January 2024.

Table H-1: Existing Coal Resources

Name of Unit or Contract	Type	Owned or Contracted (PPA)	Maximum Capacity (MW)	Existing Retirement/Contract Expiration
Allen S King[2]	Steam Turbine (ST)	Own	510	2028
Sherco 1	ST	Own	678	2026
Sherco 2	ST	Own	682	Closed as of 2023
Sherco 3[3]	ST	Own	517	2030

B. Nuclear

The Company owns and operates three nuclear units – two units at Prairie Island Nuclear Generating Plant and one at Monticello Nuclear Generating Plant – with a total net capacity of approximately 1,650 MW. These units operate at high-capacity factors and provide nearly 30 percent of the total electric energy and approximately 40 percent of the carbon-free energy our customers consume. Between 2019 and 2023, we have consistently maintained production costs at $31.25 per megawatt-hour (MWh) or less, which is a decrease of more than 20 percent when compared to 2013 production costs. In this plan, we are seeking to extend both nuclear facilities to meet future capacity needs beyond their existing retirement dates.

Table H-2: Existing Nuclear Resources

Name of Unit or Contract	Type	Owned or Contracted (PPA)	Capacity (MW)	Existing Retirement/Contract Expiration
Monticello	Boiling Water Reactor	Own	617	2040
Prairie Island 1	Pressurized Water Reactor (PWR)	Own	521	2033
Prairie Island 2	PWR	Own	519	2034

**Net summer capacity shown.*

[2] Asset is in seasonal operation now. Capacity represented above is maximum capacity offered during one of the seasons – winter – in which it operates.
[3] This represents the portion of Sherco 3 under our ownership.

C. Natural Gas and Oil

The Company owns or contracts for several natural gas and oil facilities. Our current natural gas and oil generators are configured as either simple-cycle Combustion Turbines (CTs), Combined Cycle Gas Turbine (CCs) or reciprocating internal combustion engines (RICE). The CTs are located at seven different sites and provide peaking capacity, meaning they are typically only dispatched a limited number of times a year during peak demand and/or net load conditions. The CCs are located at five sites and provide intermediate capacity, meaning they tend to operate at higher capacity factors due to better efficiencies and lower dispatch prices when compared to CTs. RICE units are located at existing CT sites. Our current natural gas and oil fleet provides nearly 4,726 MW of firm dispatchable capacity.

Table H-3: Existing Natural Gas and Oil Resources

Name of Unit(s)	Type	Owned or Contracted (PPA)	Maximum Capacity (MW)	Existing or Planned Retirement/Contract Expiration
Black Dog 5/2	CC	Own	298	2032
High Bridge	CC	Own	580	2048
Riverside	CC	Own	508	2049
Mankato Energy Center	CC	PPA	711	2028, 2039
Cottage Grove	CC	PPA	245	2027
Angus Anson 2-4	CT	Own	386	2041, 2045
Angus Anson RICE	IC	Own	28	2068
Black Dog 6	CT	Own	228	2058
Blue Lake 7,8	CT	Own	350	2045
Inver Hills 1-6	CT	Own	345	2030
Wheaton [4]	CT	Own	225	2065
Wheaton Recip	IC	Own	45	2065
Cannon Falls Energy Center	CT	PPA	356	2028
Blue Lake 1-4	CT (Oil)	Own	192	2025
French Island 3,4	CT (Oil)	Own	159	2030
Wheaton 6	CT (Oil)	Own	70	2024

D. Biomass

The company owns or contracts for various biomass facilities. Refuse-derived fuel (RDF), landfill (LND,) and digester (DIGT) resources are also generally considered biomass resources and therefore included in this category. These facilities total nearly 134 MW of capacity and are located at six sites on our system. More about the Company's RDF plants can be found in Appendix W: RDF Plants.

[4] Capacity and retirement date shown for repowered asset, pending approval before the Wisconsin Public Utilities Commission.

Table H-4: Existing Biomass Resources

Name of Unit or Contract	Type	Owned or Contracted (PPA)	Maximum Capacity (MW)	Retirement/Contract Expiration
Bayfront 5,6	Bio	Own	26	2035
French Island 1,2	Bio	Own	15	2027
Red Wing 1,2	Bio	Own	18	2027
Wilmarth 1,2	Bio	Own	17	2027
St. Paul Cogen	Bio	PPA	24	2024
Hennepin Energy Recovery Center	RDF	PPA	34	2024

E. Hydroelectric

The Company owns or contracts for hydropower resources with a number of different counterparties, totaling nearly 800 MW of capacity. The majority of our current hydro capacity is provided by our PPAs with Manitoba Hydro, which expire in 2025. While the Company is considering contract renewals with Manitoba Hydro, they are not included here as they are not finalized at the time of final modeling.[5] Further, the Company currently has a 350 MW Diversity Agreement with Manitoba Hydro, wherein we receive 350 MW of capacity in the summer and Manitoba Hydro receives 350 MW of capacity in the winter. Due to the unique nature of the agreement, it is not included in the list below or reflected in the total hydro capacity specified above.

[5] The Company considers its overall system needs as well as the reasonableness of the costs to customers when determining whether to pursue a PPA or an extension. In the case of the contract with Manitoba Hydro, it is a system capacity service contract and not a standard PPA, as it is not an actual facility resource and is not a dispatchable generation resource like a typical large-scale generator. However, it can provide the necessary baseload capacity and energy. A short-term renewal of the Manitoba Hydro System capacity contract would contribute to the baseload capacity available to meet our near-term capacity obligation while we continue to pursue longer-term resource options, including those that are firm and fully dispatchable on a real time basis. We are currently in negotiations with Manitoba Hydro to extend the system capacity contract, however, because Manitoba Hydro has to serve increasing needs of its own domestic customers, we anticipate any extension to be for a much smaller capacity amount over a shorter duration, likely 5 years or less. We will keep the Commission informed if negotiations are successful.

Table H-5: Existing Hydroelectric Resources

Name of Contract or Unit	Type	Owned or Contracted (PPA)	Capacity (MW)	Retirement/Contract Expiration
Hastings	Hydro	PPA	4	2033
St. Cloud	Hydro	PPA	9	2041
Dairyland	Hydro	PPA	1.2	2037
Eau Galle	Hydro	PPA	0.3	2026
DG Hydro	Hydro	PPA	0.4	-
SAF Hydro	Hydro	PPA	9	2031
WTC Angelo Dam	Hydro	PPA	0.2	2024
MN Grouped Hydro	Hydro	Own	14	-
WI Grouped Hydro	Hydro	Own	260	-
Manitoba Hydro	Large Hydro	PPA	500	2025

F. Wind

The Company owns or contracts for over 4,300MW of wind power. Over the next two to three years, the Company intends to add 2,800 MW of wind generation from recent acquisitions and Requests for Proposals (RFPs), as well as additional capacity to serve other customer programs.

Table H-6: Existing and Near-Term Wind Resources

Name of Contract or Unit(s)	Type	Owned or Contracted (PPA)	Maximum Capacity (MW)	Retirement/Contract Expiration
Big Blue	Wind	PPA	36	2032
Community Wind North	Wind	Own	26	2044
Fenton	Wind	PPA	206	2032
Garwin	Wind	PPA	37	2028
Jeffers	Wind	Own	44	2044
MinnDakota	Wind	PPA	150	2026
Moraine II	Wind	PPA	50	2029
Community Wind South (Zephyr)	Wind	PPA	31	2032
Lake Benton I	Wind	PPA	104	2028
Odell	Wind	PPA	200	2036
Prairie Rose	Wind	PPA	190	2032
Mower County	Wind	Own	99	2045
Ridgewind	Wind	PPA	25	2031
Border Winds*	Wind	Own	150	2051
Heartland Divide	Wind	PPA	200	2047
Deuel Harvest	Wind	PPA	100	2036
Courtenay	Wind	Own	200	2041
Fowke Wind Energy Center[6]	Wind	Own	100.5	2044
Nobles (Repowered)	Wind	Own	201	2035
Pleasant Valley*	Wind	Own	200	2051
Crowned Ridge (Owned)	Wind	Own	300	2045
Freeborn	Wind	Own	200	2045
Foxtail	Wind	Own	150	2044
Blazing Star I	Wind	Own	200	2045
Blazing Star II	Wind	Own	200	2045
Lake Benton Repower	Wind	Own	100	2044

Crowned Ridge (PPA)	Wind	PPA	300	2044

**Unit to be repowered*

[6] Formerly known Grand Meadows, the asset has been repowered and renamed.

G. Solar

By 2024 the Company anticipates it will maintain a total of 2,276 MW of solar capacity, via ownership or PPA, to serve our customers. This includes approximately 1,152 MW of large grid-scale solar, over 899 MW of Community Solar Gardens (interconnected by 2024), 3 MW of Solar*Connect Community in Wisconsin, and nearly 202 MW of small-scale distributed solar, and an additional 20 MWs small-scale distributed solar in Wisconsin.

Table H-7: Existing and Near-Term Solar Resources

Name of Contract or Unit	Type	Owned or Contracted (PPA)	Capacity (MW)	Retirement/Contract Expiration
Slayton	PV	PPA	2	2033
St. John's	PV	PPA	0.4	2030
School Sisters of Notre Dame	PV	PPA	0.7	2030

Community Solar Gardens	PV	PPA	899(2023)	Various

[7] Includes Solar*Rewards and Made in MN Solar.

III. GENERIC FUTURE RESOURCE OPTIONS

For this Resource Plan, we employed generically defined potential additions resources in our EnCompass modeling. We utilized EnCompass modeling to develop a set of generic resources, informed by project experience and expertise, stakeholder input, and third-party studies like the National Renewable Energy Laboratory's (NREL's) 2023 Annual Technology Baseline (ATB). These potential additions of non-specific resources are used to represent the size, type, and timing of future resource additions to our system. The performance and cost metrics for these generic resources are derived from third-party studies like NREL's 2023 ATB, consultant estimates, and/or our own internal data. Our analysis covers both supply-side and demand-side resources, as well as the transmission cost implications within the MISO network. See Appendix F: EnCompass Modeling Assumptions and Inputs for further details.

We have accounted for the impacts of the Inflation Reduction Act (IRA) financing within the stated cost assumptions. Costs to transfer credits are not specifically included. Generic resources are not tied to specific locations or ownership models for purposes of the IRA; instead, they guide the overall dimensions of future resource needs. In general, specific resources are acquired through a competitive resource acquisition process, following approval in a Resource Plan proceeding. For further discussion surrounding the impacts of the IRA, refer to Appendix U: Inflation Reduction Act.

A. Supply Side Resources

Centralized supply-side resources available for capacity expansion includes renewables such as battery, hybrid, and thermal generation facilities. Our modeling includes various resource types such as wind and solar, standalone battery and hybrid solar plus battery storage, combustion turbines, and reciprocating engines. Unlike previous resource plans, we have not included a combined cycle resource option. Within our modeling, the generic representative plant size is consistent with NREL ATB assumptions. We are not assuming any difference in costs between Company-owned assets, or those subject to PPAs. Detailed attributes for each resource are further elaborated, with cost and performance assumptions specified in Appendix F.

1. Wind

Wind generators designed to generate electricity by harnessing the kinetic energy of wind. These plants consist of multiple wind turbines strategically placed in areas with high wind speeds to maximize energy production. The turbines are equipped with

blades that rotate when exposed to wind, driving a generator that converts mechanical energy into electrical energy. The electricity generated is then fed into the electrical grid, contributing to overall energy supply. Our generic wind resource option is based on the 2023 NREL ATB study, and therefore reflects a 200 MW nameplate capacity and net capacity factor of approximately 44 percent. The forecasted wind costs in our modeling also reflect the 2023 NREL ATB study. IRA production tax credits (PTCs) are included in the NREL ATB "Market + Policies" case and converted to nominal dollar terms. A transmission cost adder is included in the levelized cost of energy (LCOE) calculation for generics not reusing existing interconnection.

2. Solar

Solar power plants generate electricity by capturing sunlight and converting it into electrical energy. These plants use photovoltaic panels or concentrating solar power systems to capture solar radiation. Our generic large-scale solar resource option based on the 2023 NREL ATB study, and therefore is sized at 100 MW on a nameplate capacity basis with a net capacity factor of is approximately 23 percent. We use forecasted solar costs from the publicly available LCOE data in the 2023 NREL ATB. Similar to the adjustments for wind resources, this cost has been adjusted for IRA PTCs in the NREL ATB "Market + Policies" case and converted to nominal dollar terms. Transmission cost adder is included in the LCOE calculation for generics not reusing existing interconnection.

For this Resource Plan, our modeling also includes a forecast of distributed solar bundles adoption, applied as a supply-side resource with an assumed adoption rate. See Section III.C.1 below.

3. Standalone Battery Energy Storage

A battery system is standalone energy storage designed to store electrical energy for later use, independent of any other energy generation source. The generic units are sized at 60 MW with either a four-hour or 10-hour configuration. An annual net capacity factor limit is applied to each generic battery to reflect the one cycle per day operational constraint and the model can economically dispatch batteries based on system needs. We use forecasted standalone battery capital and fixed O&M costs from the publicly available data in the 2023 NREL ATB. These costs are converted to nominal dollar terms and the IRA Investment Tax Credits (ITCs) are applied in the model; as the NREL ATB cost does not include ITCs for standalone storage. A transmission cost adder is included in the capital cost calculation for generics not

reusing existing interconnection. For more discussion on storage, see Appendix I: Minnesota Energy Storage Systems Assessment.

4. Solar-Plus-Storage Hybrid

Hybrid solar plus energy storage combines solar power generation with battery storage that integrates solar power generation capabilities with energy storage solutions to create a more reliable and efficient energy supply. In our planning, we developed a hybrid unit sized at 130 MW-DC solar plus 60 MW-AC four-hour battery with a 100 MW-AC Inverter. We use the forecasted LCOE from the publicly available data in 2023 NREL ATB. This cost was adjusted for IRA ITCs and converted to nominal dollar terms in the NREL ATB "Market + Policies" case. A transmission cost adder is included in the capital cost calculation for generics not reusing existing interconnection.

5. Natural Gas Combustion Turbines

Combustion Turbines (CTs) are a type of power-generating resource that utilize the combustion of fuel, often natural gas, to drive turbines and produce electricity. In our planning, we have developed two generic CT options with capacities of 232 MW and 374 MW. We identified generator cost and performance assumptions from external sources, original equipment manufacturers, and internal engineering assessments.

6. Reciprocating (RICE) Engines

Reciprocating engines operate on the principle of converting linear motion into rotational motion through the use of pistons and a crankshaft—like the internal combustion engines in most vehicles. They are highly flexible and can ramp up quickly, making them suitable for peaking and load-following applications. In our planning, we modeled reciprocating engines in modular increments of 6 × 18 MW engine configurations. The cost and performance assumptions for these engines are derived from a combination of industry data, original equipment manufacturers, and our internal engineering assessments.

B. Demand Side Resources

Demand-side resources continue to evolve as the efficiency of equipment grows, beneficial electrification is expanded, and we begin to address not only customer equipment but how energy is being used within a home or business. This evolution requires careful consideration of how best to model resources moving forward. In this

plan, the Company has updated energy efficiency based on our proposed 2024-2026 Energy Conservation and Optimization (ECO) Triennial Plan and has modeled the significant demand response portfolio available today against other resource alternatives in EnCompass modeling. We believe these modeling approaches will be modified further in future planning years as differing technologies are available, including streamlined customer-sited batteries, advanced metering technologies, and Distributed Energy Resource Management Systems, impacting the modeling approaches specific to customer energy usage and flexible load resulting from customer actions.

1. Energy Efficiency (EE)

The Company continues their commitment to aggressively pursuing EE as an alternative least cost resource. Three scenarios of achievement based on statutory requirements, our most recent 2024-2026 ECO Triennial filing[8], and the optimized scenario of high achievement (as identified in the 2019 IRP) were created to model EE. Each bundle is modeled in Encompass in the same manner as a supply side resource. In addition to bundles, naturally occurring EE is embedded in the load forecast.

2. Demand Response (DR)

Demand Response (DF) resources can offset the need for additional resources. The Company recently exceeded the Commission's 2019 requirements to secure an additional 400 MW of load[9] significantly increasing these resources. In this resource plan, the Company reviewed these changes and modeled various bundles to incorporate DR in the same manner as a supply-side resource.

Further detail regarding specific modeling scenarios for both EE and DR can be found in Appendix F. Detailed descriptions of these resources can be found in Appendix J: Distributed Energy Resources.

[8] 2024-2026 ECO Triennial Plan, as filed, Docket No. G,E002/CIP-23-92, June 29, 2023.
[9] *See Order Approving Plan with Modifications And Establishing Requirements for Future Filings,* Docket No. E002/RP-19-368, April 15, 2022 at Order Point 2.A.2

C. Resource Option Sensitivities

Sensitivities on the Preferred Plan were run on all baseload scenarios, and in discrete special cases to help us understand potential differential futures. Sensitivities help us assess risk for individual scenarios by isolating the effects of each sensitivity. We run through the impacts of each below.

1. DG Solar Special Study

Our modeling includes a forecast of distributed rooftop solar bundles adoption, applied as a supply-side resource with an assumed adoption rate. In addition to these static forecasts, we include an additional model sensitivity on the Preferred Plan involving amounts of distributed rooftop solar resources.[10] Unlike the forecasted distributed rooftop solar bundles adoption already included in the Preferred Plan, these rooftop solar projects incur an acquisition cost from the Company. Unlike nearly every other resource option considered in this resource plan, the only costs for this resource that are included in EnCompass are acquisition costs and mandatory tariff payments. While these costs are the only new costs borne by the NSP system, they do not represent the customer's (i.e., the solar owner's) full cost of the distributed rooftop solar system, nor do they represent the bill or rate impacts for all other customers from their implementation.[11] The assumptions used in modeling are discussed in more detail in Appendix J and Appendix S: Stakeholder Engagement

2. Emerging Technology

Achieving our Company-wide vision of a carbon-free electricity supply by 2050 will require significant technological developments that either do not yet exist or are not yet commercialized. In particular, our system will need stable baseload and dispatchable carbon-free generation, and energy storage technologies that can help us maintain reliability for every hour of every day, while simultaneously keeping electricity safe and affordable for customers. As such we have developed sensitivities to account for: (1) hydrogen, (2) long duration storage, and (3) advanced nuclear/small modular reactors in our special study on the Preferred Plan.

[10] DG solar forecasted by the Company includes base level (naturally occurring customer-owned solar, Solar*Rewards, small qualified facility (QF) solar, existing/approved NSP system solar resources & CSGs), and mandated (New CSGs & Large DERs (3% legislation, 0 – 10 MW)) solar.
[11] Given the way net metering is structured, although it does not create a revenue requirement impact on the resource side of the ledger, it artificially decreases sales, thereby increasing the revenue requirement to be recovered from all other customers.

For hydrogen, we modeled green hydrogen cost from the S&P Global forecast paired with renewable sources and blended the hydrogen with natural gas. Assumptions were sourced from vendors and industry research. For the long duration storage, we assumed 100-hour duration and sourced assumptions from vendors. For the advanced nuclear/small modular reactors, we took costs from 2023 NREL ATB conservative case assumption on costs and operating parameters. Discussion of these advanced emerging technologies is included in Appendix X: Advanced Technologies. We are continually assessing innovative technologies that may be viable options for future resource plans.

IV. POTENTIAL RESOURCES NOT CONSIDERED IN MODELING

We considered several additional technologies in initial screening that were not included in our modeling due to economic viability, technical limitations, operational complexity, or otherwise not aligning with the Company's strategic priorities. We will continue to monitor and screen these options for possible pilot programs or inclusion in future resource plans, pilot programs, and/or allow them to compete in competitive resource acquisitions so that we may gain additional information on their potential operating characteristics and costs. Although we are excluding such resources from our modeling for the reasons set forth below, that does not mean we will necessarily preclude participation of such resources from future acquisition proceedings. It is possible that as part of a future resource acquisition or contract extension, some of these resource types could potentially displace other generic resource options identified in this Plan. For example, a cost-effective biomass plant could potentially beat out a natural gas peaking plant, or a pumped-hydro facility could beat a battery energy storage system, in future resource acquisition proceedings.

A. Biomass

New biomass resources were excluded from consideration as generic options, primarily due to cost. Generic estimates for biomass resources from the U.S. Energy Information Administration (EIA), and other sources, indicate that the capital costs of new biomass resources are substantially higher than those associated with generic wind, solar, and natural gas resource options. As a result, we did not include a generic biomass resource for consideration in the modeling.

B. Combined Heat and Power (CHP)

Combined Heat and Power (CHP) was not included as a generic resource option, as studies indicate it will have limited economic potential during the planning period.

As part of a prior resource plan, the Company worked with Electric Power Research Institute (EPRI) and ICF International to evaluate the technical and economic potential for CHP applications in our Minnesota service area. The study estimated a total of 319 MW of technical potential from 239 sites and 145 MW of economic CHP potential inthe Company's Minnesota service territory. Under the base scenario, CHP adoption was estimated at 43 MW through 2039. The study was provided as Appendix S to our 2020-2034 Upper Midwest Integrated Resource Plan.

C. Pumped Hydro

Pumped hydro is a mature flexible-duration storage technology with a relatively long operational life; however, environmental challenges and resource economics have generally limited its growth. Further, pumped hydro unit configurations and costs are largely site specific, which makes it a difficult resource to represent generically. As a result, the Company did not include a generic pumped hydro resource for consideration in modeling.

D. Coal

New generic coal resources were eliminated from the list of resource options due to cost, environmental challenges, and non-alignment with the Company's strategic goals. Capital costs for generic coal resources are high relative to other resource types. With low natural gas prices, increased renewable penetration, policy and regulatory risk, new coal resources are not competitive and are faced with significant environmental challenges. Furthermore, adding coal resources with high carbon emission levels would not align with our commitment to a 100 percent carbon-free electric system.

E. Combined Cycle (CC)

New generic Combined Cycle (CC) resources were eliminated from the list of resource options primarily due to their cost and environmental impact. Studies and market data indicate that the capital and operational costs of new CCs are not competitive when compared to renewable energy options like wind and solar. Additionally, the emissions profile of CCs does not align with our Company vision and state policy objectives. As a result, the Company did not include a generic CC resource for consideration in modeling.

APPENDIX I – MINNESOTA ENERGY STORAGE SYSTEMS ASSESSMENT

I. INTRODUCTION

We are seeing a growing interest in the benefits and potential of energy storage systems as we transition to a cleaner, more renewable, future. Pilot programs are being implemented to evaluate the benefits of using energy storage to manage grid reliability, storage is being co-located along with generation, and we are witnessing the rise of hybrid storage plus assets to help utilities transition to a cleaner more renewable future. We expect adoption of energy storage technology to grow as costs decrease; renewable generation increases; and regulators, utilities, and the public across the country increasingly prioritize clean energy and decarbonization goals.

Xcel Energy has long taken a leading role in integrating energy storage into our operations in investing in energy storage projects across our system. Our continuing targeted initiatives and programs will assist us in prioritizing the cost-effective use cases for energy storage as we gain further experience and expertise in energy storage deployment. As we continue to develop operational experience and greater understanding of storage's strengths, and operational constraints, we will utilize this experience as we progress toward aggressive carbon reduction goals.

II. ENERGY STORAGE ASSESMENT

Minn. Stat. § 216B.2422 requires that utilities include an assessment of energy storage systems in their resource plan filing:

> Subd. 7. **Energy storage systems assessment.**(a) Each public utility required to file a resource plan under subdivision 2 must include in the filing an assessment of energy storage systems that analyzes how the deployment of energy storage systems contributes to:
>
> (1) meeting identified generation and capacity needs; and
>
> (2) evaluating ancillary services.
>
> (b) The assessment must employ appropriate modeling methods to enable the analysis required in paragraph (a).

Energy storage itself is nothing new and has existed for decades.[1] FERC defines energy storage as any energy asset that is:

[1] Krista Hughes, Stacey Simone Garfinkle*, Planning for A Rainy Day: The Future of Energy Storage and the Policies Driving Its Growth*, Nat. Resources & Env't, Spring 2018, at 31, 33.

> Interconnected to the electrical grid and is designed to receive electrical energy, to store such electrical energy as another energy form, and to convert such energy back to electricity and deliver such electricity for sale, or to use such energy to provide reliability or economic benefits to the grid.[2]

Energy storage encompasses a wide variety of technologies that store electrical energy directly (e.g., capacitors) or after converting to some other form of potential or kinetic energy. Energy storage can take the form of pumped hydro, compressed air, flywheels, various types of batteries, thermal technologies, and hydrogen. While we have deployed a number of these technologies across our system in the past, we will continue to gain experience with others in the future.

We envision four key areas in which energy storage can add value to our system: renewable integration, grid support, deferred investment, and power quality. First, energy storage can support integrating renewables generation into the grid by helping to shift renewable energy to time periods when it is needed, especially for short-term deviations of a few minutes to a few hours. Second, energy storage can help with grid reliability and resilience by providing voltage support, and various ancillary services such as frequency regulation, spinning reserves, operating reserves, energy arbitrage, readily available reserves, and black start capability. Third, energy storage has the potential to replace large traditional grid investments across our system, including investments in peaking generation, transmission and distribution upgrades, and reliability investments to maintain grid support.[3] Finally, energy storage can improve power quality by helping avoid momentary outages that interfere with the operation of sensitive electronic equipment. Because of these benefits, we are optimistic about the role of energy storage in our transition to a cleaner and more renewable future.

Storage has inherent limitations that policymakers and utilities must keep in mind as we invest in the energy system of the future. Energy storage for instance has a declining marginal capacity value; therefore, it is not technically or economically feasible to use storage to continue to shift energy from off-peak to on-peak periods. MISO does not provide accreditation based on storage duration. While energy storage can shave off and lower the top of peaks, it also widens them, thus requiring larger, more expensive storage systems to reduce system energy needs. This problem is

[2] *Third-Party Provision of Ancillary Services; Accounting & Fin. Reporting for New Elec. Storage Techs.*, 144 FERC ¶ 61056 (July 18, 2013).

[3] Though we note that storage has the potential to replace large amount of traditional grid investments in certain instances, we note that generation or transmission and distribution upgrades will continue to be necessary, and the most effective solution in certain applications and locations.

compounded during periods of low renewable production, when excess generation may not be available to re-charge batteries for the next peak. Further, while storage can stack multiple values together, not all benefits can be recognized simultaneously. For instance, a battery cannot simultaneously integrate renewables and provide black start capability. The value of storage must be determined based on the value streams storage provides, and the ability and efficiency of storage to meet our system needs. Finally additional reliability checks may be necessary to ensure that storage is the appropriate resource if it is selected in capacity expansion model runs based on its capacity credit. Given these challenges, a broader suite of resources will be necessary to help us reach our clean energy goals. For further information on storage's ability to provide ancillary services, please see Appendix D: Energy Adequacy Analysis, and for further information on regarding the capacity credit for modeled storage, see Appendix F: EnCompass Modeling Assumptions and Inputs.

Key to capturing the full spectrum of these benefits of storage is the recognition that storage is first and foremost a grid asset. As more and more energy storage is deployed on our system and across the country, it is important that the rules governing ownership and operation of energy storage assets are clear and aimed at maximizing the grid benefits of storage while encouraging its affordable, reliable, and safe deployment. Utilities are uniquely situated to understand the grid and its needs and should play an important role both in owning and operating grid-scale storage. However, at the same time, we are looking for ways to consider how to incorporate the benefits of customer-owned storage, such as working with their customers to aggregate these facilities into Virtual Power Plants (VPPs) or other resources that can provide utility benefits. For example, Xcel Energy's Colorado Subsidiary, Public Service Company's Residential Battery Connect Demand Response Pilot ran for 18 months and aimed to understand the performance and demand management capabilities of residential battery storage systems. Key findings included that batteries can be dispatched quickly during events, their performance is not diminished during back-to-back events, and most participants were highly satisfied with the pilot, citing various motivations for enrollment including grid reliability and environmental benefits. We are developing a similar program in Minnesota.[4] We have provided an analysis of these options, and how they may fit within our resource plan, in this matter in Appendix E: Load and Distributed Energy Resources Forecasting and Appendix H: Resource Options.

[4] The Company intends to propose this demand response battery program as part of our 2024-2026 Energy Conservation and Optimization (ECO) Triennial via a modification sometime in 2024. We proposed a related Energy Storage Incentive Program, pursuant to Minn. Stat. § 216C.379; *see* Docket No. E002/M-23-459.

III. ENERGY STORAGE ANALYSIS IN THE RESOURCE PLAN

On December 31, 2019, the Minnesota Department Commerce released its "Minnesota Energy Storage Cost-Benefit Analysis," which recommended energy storage become a regular part of the resource planning and competitive bidding processes and emphasized the importance of gaining experience in operating energy storage and understanding both its limits and benefits to the grid. Further, the Commission's April 15, 2022, Order approving the Company's last Resource Plan in Docket No. E002/RP-19-368, required that we "include a deeper analysis of (1) storage options, including options combining solar generation and battery storage...."

Xcel Energy is committed to incorporating energy storage in our resource planning activities. While we see storage as a growing part of our energy system, it must be part of a diverse clean energy portfolio. In this Resource Plan, we developed standalone storage, and solar plus storage hybrid modules for use in our EnCompass resource modeling. The standalone energy storage unit was given the opportunity to select between 4- and 10-hour configurations, while the solar plus storage unit assumed a 4-hour configuration. These energy storage configurations were allowed to compete with other resources to meet energy and capacity needs per the statutory requirement and were able to provide ancillary service to meet spinning reserve requirement of 125.17 MWs based on a 12-month rolling average of spinning reserves carried by the NSP System within MISO.

Our Preferred plan proposes to add 2,100 MWs of storage between 2027 and 2040, including 600 MWs by 2030. We expect battery storage to play an important role in our resource portfolio. Presently, the most cost-effective Lithium-ion batteries have a four-hour duration. This is not sufficient to meet our reliability needs in most cases, such as when we need added capacity for multi-day contiguous periods. Still, our modeling analysis finds value in the short-duration resources currently available for peak shaving and possibly extending the duration of solar resources into periods of high-load.

Our assumptions for standalone storage, and solar plus storage, were based on the National Renewable Energy Laboratory's (NREL's) 2023 Annual Technology Baseline (ATB). NREL's 2023 ATB was designed to (1) document transparent, normalized technology cost and performance assumptions using published sources; (2) document potential pathways for impacts of R&D on renewable energy technologies; (3) enable consistency in technology assumptions across analysis projects; (4) facilitate the tracking and sourcing of input assumptions; and (5) reduce the lead time required when conducting scenario analysis of 5- to 30-year futures. The NREL ATB is updated

each year to provide technology cost and performance assumptions. We have traditionally utilized the ATB to provide cost assumptions for different nonthermal resource types. The characteristics and cost assumptions for storage resources can be found in Appendix F.

We continue to consider new tools and processes to analyze the energy storage solutions including the evaluation of potential values storage assets might provide to the system. For instance, Appendix Y: Life Cycle Emissions Impacts provides a literature review to examine a comparison between different electricity generation and storage technologies. The goal was to examine the carbon impacts throughout the life cycle of different electric generation alternatives to provide a comprehensive assessment of the environmental footprint of a resource over the life of the asset. The literature review suggested that renewable energy sources and storage paired with renewable generation exhibit much lower life cycle emissions compared to fossil fuel-based technologies. We are also examining long duration storage as a sensitivity, as discussed in Appendix X: Advanced Technologies, though we note the long duration storage, such as our Form Energy Pilot, is in test phases, and not ready yet for commercial deployment.

IV. CONCLUSION

Our Preferred Plan adds storage, and we expect storage to be part of our resource portfolio as costs continue to decline and we add more renewables to our system. Like other resources, much of the value of storage is in its ability to provide capacity and energy (arbitrage). We expect these needs to help drive storage additions in the future as we continue to explore near-term storage opportunities that could provide value to our system.

APPENDIX J – DISTRIBUTED ENERGY RESOURCES

I. INTRODUCTION

For purposes of this Resource Plan, Distributed Energy Resource (DER) is defined as supply and demand side resources that can be used throughout an electric distribution system to meet energy and reliability needs of customers, whether installed on the customer or utility side of the electric meter. The definition further clarifies that for the IRP, DER may include, but is not limited to distributed generation, energy storage,[1] electric vehicles,[2] and demand side management. As discussed in our November 1, 2023, Integrated Distribution Plan,[3] future grid modernization investments will be necessary to integrate more DERs, keep pace with load growth, and ensure efficient and sound operations in an increasingly complex environment.

In the context of this IRP, DERs are an essential part of our path towards carbon reduction and often keep costs low to customers. In this appendix we describe in more detail the importance of these resources and how they have been addressed as part of our Preferred Plan.

II. DEMAND SIDE MANAGEMENT

Demand Side Management (DSM) is the modification of customer demand for energy through various customer changes including installing more efficient equipment, altering usage patterns of energy (such as washing laundry at a certain time of the day), or reducing overall energy consumption through energy conservation. The methods utilities use to influence these decisions are typically through education and financial incentives. DSM enhances our customers' experience with opportunities to reduce energy and ways to manage their energy differently. By empowering customers with insights and technology, we can provide tools for them to lower their overall energy bills. In addition, DSM, through these customer actions, will help avoid the need for future generation resources and enable CO_2 emissions reductions.

Xcel Energy is proud to contribute to Minnesota's status as a national leader in DSM. Minnesota has held this designation for more than a decade. In fact, the state's utility-sponsored energy efficiency programs are among the longest standing in the country, and Minnesota is the only Midwestern state that has consistently ranked in the top ten on the American Council for Energy Efficient Economy's (ACEEE) State Energy

[1] Energy storage is discussed in Appendices E, H, and I.
[2] Electric vehicles are discussed in Appendix E.
[3] Docket No. E002/M-23-452.

Efficiency Scorecard. Minnesota utilities' energy savings achievements through DSM have saved billions of dollars for customers and avoided millions of tons of greenhouse gas and other pollutants while creating and supporting jobs in the state.[4] In 2023, ACEEE's utility energy efficiency scorecard designated Xcel Energy Minnesota 10th out of 53 large electric utilities.[5]

The value of DSM continues to evolve from traditional energy efficiency (EE) measures that permanently reduce customer consumption and demand response (DR) efforts that reduce customer load during traditional system peak hours, to programs that leverage the additional benefits of reducing energy at certain times of the day, typically when energy supply costs are cleaner and/or less costly. These traditional EE and DR resources will continue to have a significant role in future DSM portfolios. As the future unfolds, however, the portfolio will need to explore new integrated technologies that optimize DSM solutions by location and time impacting energy usages versus demand. For example, new technologies (such as smart thermostats) also offer benefits beyond simply reducing overall and peak usage, including features that make it easier for customers to shift energy use to non-peak times when energy is less expensive. As we begin to shift our efforts towards optimization of energy use, the impacts of DSM as a resource will simultaneously evolve. Whereas energy savings targets were once focused on permanent reduction of load, we instead see benefit in focusing on the timing of energy use. This adjustment will be seen in resource planning as incremental demand reductions that grow smaller over time or even a slight reduction in the overall future demand reduction opportunity. This does not represent t a reduction in the Company's commitment to DSM.

The Company is pleased to be part of a broad bipartisan coalition who supported passage of the landmark Energy Conservation and Optimization (ECO) Act of 2021. ECO has modernized the framework for customer-funded utility programs and re-imagined the scope of what such programs can include as we begin to embrace new technologies and optimization efforts leading to the future of these portfolios as described above. In our first ECO Triennial Plan,[6] the Deputy Commissioner approved the Company's proposal to achieve electric savings of two percent of sales and 1.5 percent of natural gas sales, both of which exceed the statutory minimum.[7,8]

[5] 2023 Utility Energy Efficiency Score Card, ACEEE, August 2023
[6] Docket No. E002/CIP-23-92.
[7] Decision, *In the Matter of Xcel Energy's 2024-2026 Energy Conservation and Optimization Triennial Plan*, Department of Commerce, December 1, 2023.
[8] Minn. Stat. 216B.241.

Our Triennial Plan proposed programs and savings targets that continued our long-standing commitment to energy efficiency and recognized the value of customer programs does not stem solely from the reduction of energy consumption. The ECO Act opened the door for load management (demand response) programs that go beyond traditional peak-hour load shedding and seek to optimize the time at which customers use energy. With this change, the Company can work with customers to help them use electricity at low-cost and low-emission times of day, benefitting the grid, the climate and the customer simultaneously.

In perhaps the most transformational change enabled by ECO, the Triennial Plan also includes proposals to support customers who seek not only to use energy more efficiently, but to change the form of energy they use through efficient fuel-switching (EFS). The Company believes that the incentives and support for EFS included here will both support customers interested in fuel-switching and provide avenues to learn and develop enhancements that can help scale EFS activity in future years.

Our Preferred Plan complies with Commission orders and continues our commitment to energy efficiency and demand response, with total energy efficiency reductions (including both programmatic and naturally occurring energy efficiency) of 780 GWh on an average annual basis and demand response of 1,385 MW throughout our plan. We summarize DSM efforts in more detail below.

Energy Efficiency

The Company is committed to aggressively pursuing energy efficiency. The Preferred Plan will achieve between 2-2.5 percent annual energy savings at an annual energy savings level of 582 GWh for all planning years through programs we administer. As discussed below, when combined with naturally occurring energy efficiency, the Preferred Plan includes total energy efficiency that exceeds 780 GWh on an average annual basis. Specific details regarding how the Company will achieve energy efficiency will continue to be addressed in our Triennial Planning process.

The Company has also identified energy efficiency impacts that are naturally occurring as part of our energy demand forecast. These can be described as routine adoption of efficient measures outside of programs or progression of codes and standards that specify minimum performance levels. Where a major step change in codes and standards occurs (e.g. implementation of a federal 45 Lumen per watt efficacy requirement for general service lamps or an acceleration of required performance in non-residential buildings as required in a state law adopted in 2023), the Company can calculate these effects to demonstrate the effect of energy conservation that is not

accounted for in the programs we administer through ECO. As part of the Preferred Plan, we estimate this to account for an additional 40 percent savings on top of those estimated as part of administered programs under ECO.

Demand Response

At the end of 2023, the Company exceeded the Commission's 2019 requirement to secure an incremental 400 MW of load. Many of these resources focus on the reduction of load during summer peak days or test customer interest and access to shifting opportunities. For our demand response portfolio to continue to be successful, we need the flexibility to procure resources and modify load for localized events and timing across all months of the year.

Our Preferred Plan includes 1,365 MW (of demand response resources as part of our five-year planning period. Our Preferred Plan aims to maintain load reduction through traditional resources with a moderate increase in load. This moderation is a result of the significant increase of available load as ordered from previous resource plans.

The Company has also begun to look at load flexibility as a resource. However, rather than model it as a resource like energy efficiency and demand response, we have identified the system needs that could be addressed by load flexibility. This will allow us to design load flexibility programs that can effectively produce system benefits by optimizing location and timing of the programs to minimize the net cost to all customers. This is discussed further as part of Section III below.

A. Energy Efficiency (EE)

On December 1, 2023, the Deputy Commissioner approved Xcel Energy's first Triennial Plan under the 2021 Energy Conservation and Optimization (ECO) Act. This landmark filing continues the Company's commitment to energy efficiency and demand response, setting targets at over the statutory minimum requirements, increasing budgetary spending for income qualified customers and laying out specific programs and requirements for efficient fuel switching – now allowed by ECO. With over 40 energy efficiency programs, ranging from Home Energy Squad visits providing energy efficient equipment installed directly in customers' homes to Process Efficiency programs providing comprehensive whole-building energy efficiency analysis, the Company continues to provide emerging technologies and program models to our customers.

Below, we discuss the requirements related to energy efficiency, the historical performance of the Company's ECO program, how the planning outlook was determined in the Preferred Plan, and the results of our modeling. The Company does not provide a specific action plan for energy efficiency in this filing, as this was approved in Docket No. G,E002/CIP-23-92 on December 1, 2023.

1. Naturally Occurring Energy Efficiency

The energy savings resulting from naturally occurring energy efficiency includes: customers who take action without participating in energy efficiency programs and instances of equipment that currently may be influenced by EE programs, but in the future would not be part of an energy efficiency program because an efficient technology is required to meet code or has become common practice. The level of energy efficiency occurring as part of the utility's ECO programs depends on what is allowed to be counted towards state savings targets. As a result, the achievements claimed by the utilities represent only a portion of the savings realized. For example, the Department of Energy and the Environmental Protection Agency have had success in recent years through their ENERGY STAR efforts working with electronics manufacturers and retailers to produce and stock more efficient models. Energy efficiency is increasingly being driven by multiple influencers in the market, some of them benefiting from utility programs and others driven by the market.

The Company has taken this into consideration as we developed our modeling techniques for energy efficiency. The Company has analyzed historical load compared to future customer demand forecasting to determine that customers are becoming more efficient than can be explained by our DSM portfolio alone. Comparing our future ECO program portfolios and applying an estimated 40 percent increase (estimated based on historical trends) shows the Company meeting and, in the short-term, exceeding 780 GWh of energy efficiency as modeled in previous resource plans. The Company has bifurcated naturally occurring energy efficiency to show the true nature of "conservation" where not all energy savings can be claimed through demand-side management (or in this case our ECO programs).

2. Integrated Resource Planning Requirements for Energy Efficiency

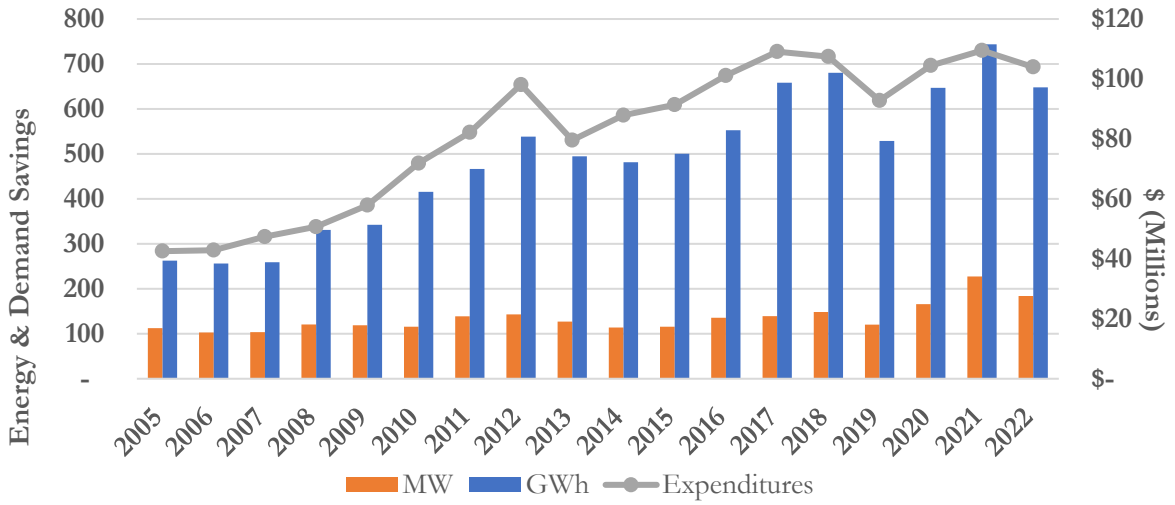
In connection with the Company's last IRP, the Commission's Order in Docket No. 19-368, issued on June 14, 2022, requires the Company, in Order Point 2.A.1, to "save, on average, at least 780 gigawatt-hours via energy efficiency." The Company's EE initiatives, reflected in the Preferred Plan meets this requirement. As discussed below, our Preferred Plan increases our projected EE savings in this planning period beyond

the requirements of Minn. Stat. § 216B.241, which requires the Company to save 1.75 percent of retail sales yearly. Rather, the Preferred Plan extends these savings between 2-2.5 percent at an annual energy savings level of 582 GWh for all planning years. Combined with naturally occurring energy savings, which is estimated to increase these savings by up to 40 percent, the Preferred Plan meets Commission's order.

3. Historical Performance of Programmatic Energy Efficiency

Xcel Energy has one of the longest-running and most successful DSM programs in the country. Between 1994-2022, the Company invested nearly $2.2 billion (nominal) resulting in 11,813 GWh of electric savings, 3,733 MW of electric demand savings. Our efforts continuously grow and modifications to our customer offerings prove worthwhile as we continue to meet and exceed statutory energy savings targets for electricity every year since 2011. Figure J-1 below highlights our historic electric achievement.

Figure J-1: Historical Electric ECO Achievements 2005-2022[9]



Our EE portfolio has had a significant impact on carbon reduction. Technologies and improvements implemented as part of EE programs, generally last for several years. Reductions in energy usage based on these programs have resulted in commensurate reductions in carbon emissions for the same period.

[9] Historical Achievement for ECO includes those demand response savings claimed as part of the portfolio.

4. Energy Efficiency Planning Outlook

The Company's projections for EE savings of over two percent of retail sales are critical to these goals and are based on a combination of two major types of energy efficiency: energy savings from ECO programs and naturally occurring energy savings as customer behavior impacts future load growth. In this section, we discuss the Company's current projections for efficiency savings from ECO programs, how we developed those projections, and the important contribution they make to the targets outlined in the Company's IRP. The Company created three bundles for EE of incremental increasing achievement at incremental increasing cost based on these projections so that EE could be modeled in Encompass in the same manner as a supply-side resource.

a. Energy Efficiency Scenarios

The Company began the development of energy efficiency bundles based on the filed 2024-2026 ECO Triennial.[10] Three bundles of EE were developed, based on (1) minimum statutory requirements, (2) estimated savings derived from our 2024-2026 ECO Triennial, and (3) high achievement.

First, a "Minimum Scenario" was set at the minimum statutory savings requirements set by Minnesota Statute § 216B.241; we reference this as Bundle 1. The resulting savings are set at 1.75 percent of weather normalized sales for the three prior years before a triennial is filed. The savings for 2024-2026 was set based on sales in 2020-2022, and the savings for 2027-2029 was set based on the sales forecast for 2023-2025. This trend continues every three years through the end of the modeling period.

Second, a "Programmatic Scenario" was created for Bundle 2 based on the Company's filed 2024-2026 ECO Triennial. The years 2024, 2025, and 2026 match the energy efficiency savings filed in our plan excluding the demand response segment (these are modeled separately as part of the IRP). The savings in 2027-2029 are included as the average of 2024-2026 since market conditions and codes and standards should remain consistent enough through this time. Starting in 2030 the programmatic savings drop to reflect the latest federal lighting efficiency standards.[11] This standard will essentially remove all savings from screw in bulbs, so these savings were removed from the 2024-2026 portfolio to calculate a percent reduction in programmatic savings.

[10] 2024-2026 ECO Triennial Plan, as filed, Docket No. G,E002/CIP-23-92, June 29, 2023.
[11] Federal legislation includes the 2007 Energy and Independence and Security Act (IESA) that adjusts baselines for lighting technologies.

Finally, a third bundle was provided as a selectable resource by the EnCompass model. This final bundle was created as a high-level scenario with a significant cost increase for program administration. This scenario was based on the high scenario of our 2020-2034 IRP which took into account the most recent state potential analysis for energy efficiency.[12]

Table J-1: Energy Efficiency Scenarios

	2024		2028	
	GWh	**Costs ($M)**	**GWh**	**Costs ($M)**
Bundle 1	477	$86	468	$82
Bundle 2	615	$134	623	$140
Bundle 3	774	$214	870	$264

Costs for these bundles were developed based upon the filed 2024-2026 ECO plan. For all bundles, the total cost is made up of two parts: an administrative cost and a cost of rebates to achieve these savings.

- Administrative Cost: Administrative cost is the total cost of the portfolio minus rebates. For the Programmatic bundles year 2024-2026 the filed costs were used. The Company assumed that administering energy savings programs varies directly with the size of said programs because of this the Company used a constant dollar-per-kWh metric from the filed programs to determine costs of all other years.
- Rebate Costs: The Company used the costs from the 2019 Potential Study to develop a cost curve to determine the costs of our high bundle and minimum bundle in relation to our Programmatic bundle which utilized specific rebate costs as filed in the 2024-2026 ECO Triennial.

All of the bundles use the same load shape, which is based on the filed 2024-2026 ECO Triennial plan. The shape was developed by combining the filed load shapes for each measure. To do this the total lifetime energy savings for each shape were used to determine weighting factors on which to combine the shapes. This results in alignment between the EE summer peaking shape and the Company's overall peak shape.

b. Modeling Results

The Company continues its commitment to Energy Efficiency as part of the 2024-2040 IRP. As part of the modeling process, both Bundle 1 and Bundle 2 were used as the

[12] Upper Midwest Integrated Resource Plan 2020-2034, Xcel Energy, Docket No. E002/RP-19-368, 2019.

baseline for the Encompass model. The first because of compliance requirements and the second as a result of the Company's commitment to energy efficiency through the 2024-2026 ECO Triennial and anticipated growth over time. Bundle 3 was not chosen as part of the modeling analysis due to the cost of additional energy efficiency.

The Preferred Plan includes lower energy efficiency levels as compared to our previous IRP planning process. However, this Plan has also captured natural occurring energy efficiency savings with a reduction of the energy forecast. This is an important aspect of our Preferred Plan, as the Company sees the reduction of lighting technologies available through ECO as LEDs become mainstream in the market and many newer technologies focus on the reduction of natural gas or shifting of load rather than permanent reductions.

B. Demand Response (DR)

Demand Response continues to be a critical part of our overall portfolio. Today, this DR portfolio comprises 14 percent of our total peak load. The growth of these resources has been maintained over several years by adjusting our programs, modifying control equipment and operational controls, and adding new innovative programs for customer participation.

Our Preferred Plan continues the growth of demand shedding resources, but that begins to level out, driven by our anticipation that customers will modify their level of commitment to these programs as they shift demand differently in a future where additional electrification technologies become more mainstream. The Company continues to explore opportunities to shift demand. We believe that, as newer technologies become active (e.g., residential batteries) in the market, systems and tools are put in place to better manage load control (e.g., DRMS), and the Company is able to complete several of their pilots (gaining important customer insights and usage data) we will be able to model these activities more accurately. Right now, this is not feasible because such technologies involve active shifting of resources that may reduce peak demand differently then we have historically seen. This likely will adjust the load that may be available for those programs that traditionally shed load at a specific time in the summer. The Company has included Appendix J1: Demand Management Portfolio Design Whitepaper as written by Opinion Dynamics, as an attachment to this appendix with further explanation of the history of demand response and where load flexibility will take us over time.

Below, we discuss the requirements related to DR, the historical performance of the Company's portfolio, the results of our modeling and DR as part of the Preferred Plan.

1. Integrated Resource Planning Requirements for Demand Response

In connection with the Company's last IRP, the Commission's Order in Docket No. 19-368, issued on June 14, 2022, Order Point 2.A.2 requires the Company to "acquire 400 megawatts of incremental demand response by 2023[.]" As provided in more detail in Docket No. E002/M-20-421 on February 1, 2024, the Company has grown its DR resources by 482 MWs over the last several years for a total of 1,333 MWs as required by Order Point 2.A.2. As described in more detail in our compliance filing, this requirement was met despite the loss of load resulting from the COVID pandemic and general load loss as a result of more efficient cooling systems. Several levers were applied to reach this level of savings including the addition of pilot programs, significant sign-on bonuses to customers, and one-to-one discussions with our largest customers. This unprecedented amount of savings exceeds the level of cost-effective demand response availability as found within past potential study analysis.[13]

In addition, Order Point 15 of the most recent IRP Order states in part:

> *Xcel shall include improved load flexibility and demand response modeling methodologies prospectively, including in its next resource plan.*

The Company has altered its modeling of DR resources by expanding our analysis to include additional load characteristics as described further in the modeling analysis of this chapter. Load Flexibility is addressed in Section III of this chapter.

2. Historical Performance of Demand Response

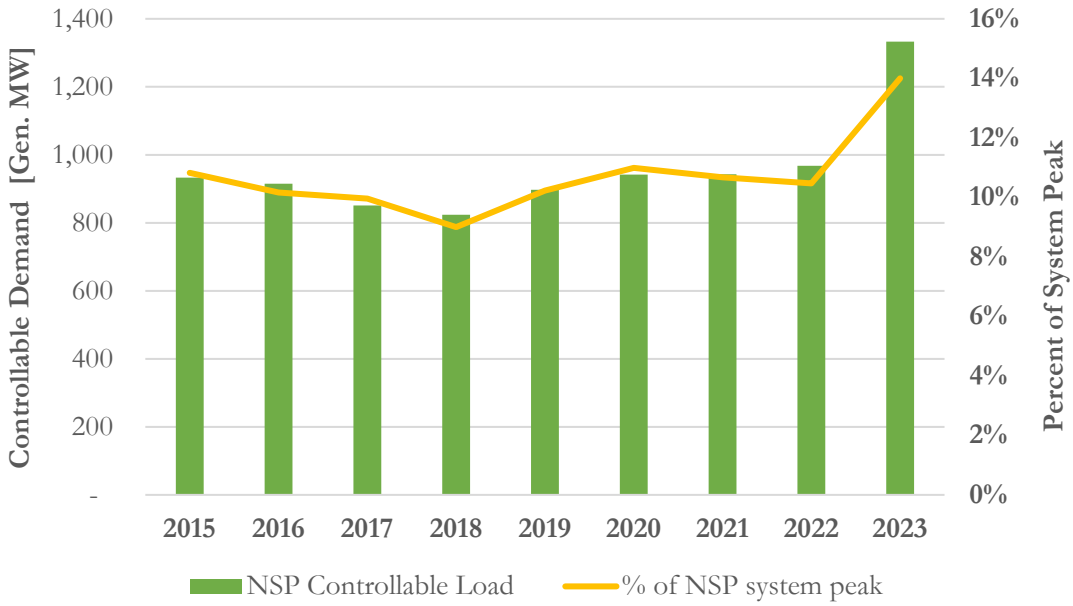
The Company has a large percent of peak load reduction from demand response, now approximately 14 percent of our system peak in the Midwest and remaining an outlier among utilities. In comparison, Otter Tail Power has a little over 10 percent, Baltimore Gas & Electric (BGE) has approximately 5 percent and Consolidated Edison, Nevada Energy and Arizona Public Service (APS) have less than four percent according to U.S. Energy Information Administration (EIA) data.[14] Below, the Company provides the historical details for the growth of demand response through 2023.

---

[13] Upper Midwest Integrated Resource Plan 2020-2034, Xcel Energy, Docket No. E002/RP-19-368, 2019, Appendix G.

[14] 2020 data set was used for analysis, available at: https://www.eia.gov/electricity/data/eia861/

Figure J-2: Historical Demand Response Achievements 2015-2023



3. Demand Response Planning Outlook

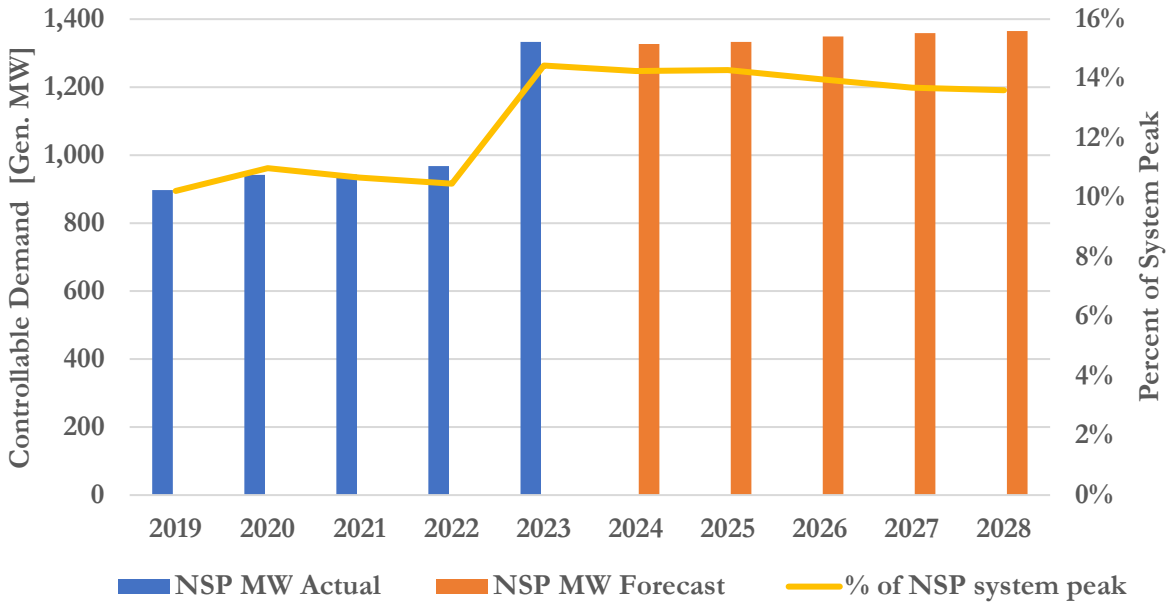
Our Preferred Plan includes 1,365 MW of DR resources as part of our five-year planning period. This is consistent with the achievement of an additional 400 MWs as required by previous Commission orders and our current resource availability.[15]

Our current available load for 2023 for demand response is 1,333 MWs or 14 percent of our peak load for NSP.[16] Our Preferred Plan estimates continued growth of demand response at a moderate pace, increasing load to 1,365 MW in the next five years. This moderate growth shows a slow increase as shedding DR resources have begun to saturate given recent growth efforts. In addition, we anticipate that some of our pilots currently unregistered with MISO may not continue and general load loss will continue as it has for the past five years due to customer attrition. We anticipate that these additional MWs in the five-year planning period will be a result of time-varying rates and load shifting opportunities of new technologies dependent on customer interest, customer behavior and the use of advanced metering technologies.

[15] Our Preferred Plan includes those resources available as a capacity resource, as part of MISO, therefore there may be a slight difference between total available capacity and total contracted load by our customers.
[16] Compliance Filing, Xcel Energy Demand Response, Docket No. E002/M-20-421, February 1, 2024

Figure J-3 below shows the demand response resources included in Encompass as part of our Preferred Plan.

Figure J-3: Controllable Demand (Gen. MW)



In this section, we discuss the Company's current projections for demand response, how we developed those projections, and the important contribution they make to the targets outlined in the Company's IRP.

a. Demand Response Scenarios

The Company created six bundles for demand response based on level of achievement and technology so that DR could be modeled in Encompass in the same manner as a supply-side resource. These bundles included: (1) Base DR, Saver's Switch, (2) Base DR, Other DR, (3) Incremental DR, Saver's Switch, (4) Incremental DR, Other DR, (5) High Potential, Saver's Switch, and (6) High Potential, Other DR.

Consistent with past practice, the Company developed a Base DR Forecast from existing programs, which was included in all baseline resource modeling as the first level of DR achievement. The Company then developed two levels of DR achievement incremental to the Base DR Forecast. The second level of DR achievement represents

achievement of the required 400 MW of incremental DR by the end of 2023,[17] and a continuation of that level of achievement beyond 2023. This level of achievement, represented by bundles 1 through 4, is included in the Encompass model as required resources as ordered by the Commission. The third level of DR achievement, represented by bundles 5 and 6, is based on the Brattle DR Potential Study included in the 2019 IRP. This level of achievement exceeds the achievement of the ordered 400 MW by 2023 at a higher cost. These bundles are included in the Encompass model as selectable resources to determine the cost-effective level of future DR achievement.

With each level of achievement, the costs and impacts were modeled separately to account for differing characteristics. These characteristics were defined through technology and control – including load shape and control hours – to create two categories of technologies: (1) Saver's Switch, and (2) Other DR programs.

Within each level of achievement, the costs and impacts of the Saver's Switch program and all other DR programs were modeled separately. This was done as the Saver's Switch program controls air-conditioning,[18] resulting in load reductions that differ significantly from the load reductions from all other DR programs which control a wide variety of loads. This results in a total of six modeled bundles as described above (each level broken into specific technology and control characteristics). Similar to EE, each level of achievement represents an incremental amount of DR and is dependent on the preceding level of achievement being selected (i.e., third level of achievement for the Saver's Switch program cannot be selected unless the second level of achievement is selected). Table J-2 provides the details of these scenarios.

Table J-2: Demand Response Scenarios

	2024		2028	
	MW	**Costs ($M)**	**MW**	**Costs ($M)**
Bundle 1	686	$29.5	692	$29.8
Bundle 2	339	$20.2	375	$22.4
Bundle 3	176	$13.8	178	$13.9
Bundle 4	56	$4.4	61	$4.8
Bundle 5[19]	24	$3.5	31	$4.5
Bundle 6	70	$10.1	59	$8.5

[17] *See Order Approving Plan with Modifications And Establishing Requirements For Future Filings*, Docket No. E002/RP-19-368, April 15, 2022 at Order Point 2.A.2.
[18] Saver's Switch was used as a proxy for characterization of the resource, other programs such as AC Rewards also hold these characteristics.
[19] Bundles 5 and 6 were not selected as cost-effective resources.

For each bundle, an estimate of the MW that varies by month was used and a maximum hour of annual control was also used. For the Bundles that include Saver's Switch (Bundles 1, 3 and 5) the monthly pattern of load relief potential was used to determine the MWs of load relief between May through September (all other months assumed 0 load relief), based on the historically observed air-conditioning load at system peaking conditions within those months. For the Bundles that include all other DR programs, the MWs of load relief across the entire year was based on the historically observed load relief potential each month at system peaking conditions.

Additionally, for all bundles, a maximum number of annual control hours was set, limiting the model to dispatch each bundle across each year in the future. For the Bundles that include Saver's Switch (Bundles 1, 3 and 5), this limit is 300 hours. For the Bundles that include all other DR programs, this limit is 80 hours.

b. Modeling Results

These bundles were optimized and tested as though they were competitive supply-side resources. Bundles 1-4 were set as non-selectable resources because they were already being procured through various demand response programs and therefore are already in existence (or assumed to be in the future). Bundles 5 and 6 were set as selectable resources, meaning they were compared to other supply side resources.

As noted, Bundles 1-4 were non-selectable and included in the Preferred Plan. In addition, Encompass ultimately chose Bundle 6 based on the load profile characteristics of programs that allows for control over several months rather than just peak summer days. This matches the future load profile of the Company and the MISO shift to a seasonal construct.

While the model shows a limited number of additional savings in outer years, the Company believes that as new technologies are developed, load profiles began to alter, and the utility is able to begin to initiate future demand resource management systems (DRMS) we will see additional efforts and opportunities for DR. In the short term, we estimate that these incremental steps will be smaller as programs are piloted and customer interest grows.

III. ADVANCED RATE DESIGN, DEMAND RESPONSE, AND ANY OTHER EFFORTS TO SHIFT CUSTOMER DEMAND

Order Point 13 of the Commission's April 15, 2022 Order in Docket No. E002/RP-19-368 requires the Company to account for anticipated effects of advanced rate design, demand response, and any other efforts to shift customer demand. We discuss demand response in Section II and the remaining efforts below.

A. Advanced Rate Design

On August 7, 2018, the Commission approved the Company's time-of-use (TOU) rate pilot, known as Flex Pricing Pilot.[20] The Pilot operated for two years, from November 2020 to October 2022, and included participants in two geographic areas: Minneapolis (Midtown substation) and Eden Prairie area (Westgate substation). Participants were selected from the eligible population to capture a diverse population base and provide insights into key customer types (income qualified, EV drivers, etc.).

The Pilot aimed to send adequate signals to reduce peak demand; evaluate effective customer engagement strategies; understand customer impacts by segment; support attainment of demand response goals; and understand integration of Pilot elements in our service territory. The findings indicated a modest reduction in demand during summer peak hours. Although usage patterns and their impact on customer bills were relatively minor, the average participant reduced their summer on-peak demand by 1.6 percent, with variations by location and year. The first year showed a consistent response in both regions. However, in the second year, the Eden Prairie area maintained its reduced usage patterns while the Minneapolis area did not result in a statistically valid difference between the treatment and control populations. In contrast, winter on-peak demand reductions in the second year indicated increased engagement from Minneapolis consumers, mirroring the efforts in Eden Prairie.

While the pilot data indicates a directional reduction, the task of deriving a quantitative adjustment to consider when modeling resource needs is complicated by the inconsistent results observed in the pilot. Further, the specific design of a TOU rate can significantly influence its effects. On December 22, 2023, the Company proposed a permanent residential TOU rate that closely mirrors the Flex Pricing Pilot rate.[21] However, as this proposed TOU rate framework includes customers that were excluded

[20] Docket No. E002/M-17-775.
[21] Docket No. E002/M-23-524.

customer classes from the pilot[22] and may evolve during the regulatory process, there remains uncertainty in forecasting its ultimate design and impact. Therefore, until we collect more data and receive Commission approval on a final TOU rate, the Company believes that the potential effects of a TOU rate can be best evaluated as one consideration that could result in the low load modeling sensitivity.

B. Shifting Resources

The Company did not specifically model the shifting of resources as part of this Resource Plan. While we have not modeled what can be considered "load flexibility" as a specific resource such as we would for energy efficiency or demand response, we have proposed a method to determine the generation system assets that can be avoided by these nascent technologies.

There are two reasons for moving forward such as we have. First, many of these resources are currently undefined. For example, an energy management system can be used to shift resources (or load) from one time to another based on a specific signal and/or programmatic scenario developed for the customer. Second, the Company does not have the capabilities to manage customer load at this level – however, we are testing holistic options for these types of custom approaches with customers as part of our 2024-2026 ECO Triennial. These current situations prevent the Company from making reasonable estimates of the potential impact of load flexibility, or when load flexibility can effectively be dispatched. Development of specifically defined bundles of load flexibility to model load flexibility resources in the same manner as EE, DR and supply-side resources is not possible at this time. Opinion Dynamics in their "Demand Management Portfolio Design Whitepaper" states that "many load flexibility value streams have not yet been established or quantified yet, though efforts are well underway, and opportunities abound. Most of the efforts across the country are nascent, with pilots showing promising results."

For this planning period, the Company has instead identified system needs that could be addressed by load flexibility. Batteries have similar characteristics to load flexibility in that they can both provide load relief that can be dispatched a high number of hours throughout the year but also produce an increase in load for other hours. By using the Encompass model to identify potential supply-side batteries as cost-effective resources,

[22] To achieve the goal of drawing conclusions about the entire population from the relatively small sample included in the pilot, certain customers were excluded. These exclusions were necessary either due to their small numbers or the difficulty in matching them with valid treatment-control pairings. Examples of such customers include those with electric space heating, those participating in net metering, and those with medically necessary equipment.

the Company can begin to design load flexibility programs. The charge and discharge hours, magnitude of load relief and the cost of those cost-effective batteries provide information to design load flexibility programs to provide similar load relief characteristics at costs below the supply-side options. Additionally, the design of the load flexibility programs will also consider impacts on the distribution system. This analysis occurring outside of the Encompass model is necessary to design load flexibility programs that can effectively produce system benefits by optimizing location and timing of the programs to minimize net cost to all customers.

Appendix J1: Demand Management Portfolio Design Whitepaper, provides further detail regarding how the Company can prepare for this adjustment from traditional DR resources to "load flexibility." As described in the appendix, several ongoing factors will help unlock the opportunities presented by load flexibility, including AMI deployment and further Grid Modernization.[23] In addition, the Company is currently piloting customer programs and will be focusing on a Virtual Power Plant (VPP) as described in Appendix X: Advanced Technologies and continuing several recently launched programs. As the Company continues to explore these options and learns further from our active pilots, we will incorporate these learnings into alternative forecasting and modeling options in future integrated resource plans.

IV. DISTRIBUTED GENERATION (DG) SOLAR BUNDLES

Order Point 15 of the Commission's April 15, 2022 Order in Docket No. E002/RP-19-368 requires the Company in its next Resource Plan to work with stakeholders to develop a modeling construct that enables the Company to model solar-powered generators connected to the Company's distribution system as a resource. Further, Order Point 15 directed the Company and stakeholders to address the following factors in developing the modeling construct:

A. Using a "bundled" approach as is used to model energy efficiency and demand response.
B. The costs borne by the utility and the costs borne by the customer.
C. Cost effectiveness tests.
D. Other topics as identified by stakeholders.

While we discuss this Order Point below, it is important to note that, since this Order was issued, the regulatory landscape for distributed solar has substantially changed. In 2023, the Minnesota Legislature amended the distributed solar energy standard (DSES)

[23] See Xcel Energy's Integrated Distribution Plan for further details regarding Grid Modernization, Docket No. E002/M-23-452.

set forth in Minn. Stat. § 216B.1691, subd. 2h, to mandate that at least three percent of the Company's retail electric sales in Minnesota must be generated from solar energy generating systems. To be counted towards this standard, the solar generating system must have a capacity of ten megawatts or less, be connected to the distribution system, be located in our Minnesota service territory, and be constructed or procured after August 1, 2023. As a result, our Preferred Plan includes nearly 2,000 MW of Community Solar Gardens and over 1,600 MW of distributed solar resources in compliance with state law.

As detailed in Appendix S: Stakeholder Engagement Summary, we discussed with the Clean Energy Organizations (CEOs) the potential effects of the DSES on the Order Point 15 distributed solar model construct. The CEOs' perspective in those meetings was that the DSES requirement will likely pertain to front-of-the-meter solar, while solar bundling is more likely to occur behind the meter. We agree with this interpretation; however, we anticipate that the DSES will have an impact on the capacity expansion model, and consequently, on the model selection of the solar bundle resource option. Further, we note that since the IRP Order, there are currently multiple dockets with pending decisions that will impact DG Solar development, inclusive of both behind the meter solar generation and distributed solar procured to comply with the DSES.[24]

A. DG Solar Bundle Approach

Below, we discuss the history of the solar bundle model construct within our resource planning process, as well as the development of the solar bundles included in this IRP model.

1. Background

As indicated in Appendix E: Load and Distributed Energy Resource Forecasting and Appendix F: EnCompass Modeling Assumptions and Inputs, the projected growth of behind-the-meter distributed solar on the NSP System by 2050 is expected to be substantial.[25] This surge in adoption can be attributed to a multitude of factors, including the declining cost of photovoltaics, the maturity of the solar installation industry in Minnesota, and tax credits. Given that these factors are not under the

[24] *In the Matter of Updating the Generic Standards for the Interconnection and Operation of Distributed Generation Facilities Established Under Minn. Stat. § 216B.1611,* Docket No. E999/CI-16-521.
[25] Residential solar growth is further discussed in the *In the Matter of Updating the Generic Standards for the Interconnection and Operation of Distributed Generation Facilities Established under Minn. Stat. § 216B.1611*, Docket No. E-999/CI-16-521.

Company's control and that the decision to install behind the meter distributed solar systems lies with the customers rather than the utility, the Company has traditionally included this resource in the NSP system model as a fixed forecasted amount, rather than treating it as a generic, selectable resource. As a result, during capacity expansion planning, EnCompass will optimize the combination of various generic renewable and other resource options, but maintain a constant level of DG solar.

In the last IRP, the Distributed Solar Parties (DSP) presented an alternative modeling construct for behind-the-meter distributed generation. Instead of relying on the Company's fixed forecasted amount of DG solar in the capacity expansion optimization, the DSP proposed creating selectable "bundles" of distributed solar resources with varying cost points and MW capacity levels. EnCompass could then choose from these bundles, similar to the modeling constructs for DR and EE discussed in this appendix.

While most selectable options in EnCompass are modeled based on their levelized cost of energy (LCOE), the DSP argued that this was inadequate for residential and commercial solar behind-the-meter DG solar resources. This was because the LCOE represents the costs incurred by the customers, not the Company, for purchasing and installing a DG solar system. Instead, they contended that the Company could directly influence the adoption of DG solar by:

1. providing an additional incentive to make these systems economically attractive to more customers, thereby fostering predictably increased adoption, and
2. including only the incentive payment to participating customers as the cost represented in EnCompass for rooftop DG solar resources instead of the LCOE.

The DSP used an adoption model to estimate the expected MW capacity that customers would adopt under different incentive scenarios. This adoption model was based on the economics of DG solar from the perspective of the participating customer.[26]

The Company raised a few concerns in response to these options. The primary concern was the predictability of the actual amount of distributed solar capacity that the Company could bring online at a specific incentive payment level. While the DSP

[26] DSP adopted a model proposed by Eric Williams, Rexon Carvalho, Eric Hittinger, and Matthew Ronnenberg in the journal Renewable Energy in December 2019. *See* Eric Williams et al., Empirical development of parsimonious model for international diffusion of residential solar, 150 Renewable Energy 570, 570- 577 (2020).

compared this construct to bundled approaches used for modeling EE and DR, it lacked any achievable potential analysis – an analysis of how much of an economically cost-effective demand-side resource can realistically be achieved given market and other barriers for customers and any utility resource limits. Achievable potential is an important and conventional component in implementing demand-side resources; indeed, the EE and DR resources modeled in this resource plan incorporate this aspect within their modeled resources.

We also raised concerns about whether this approach adequately accounts for potential rate and bill impacts, whether a significant portion of the payments might go to customers who would have installed such systems without a payment from the utility, and whether cost-effectiveness has been thoroughly evaluated from perspectives other than that of the participating customer when designing bundle levels.[27]

2. Current Iteration of Proposed Modeling Construct

For this IRP, we applied a "bundled approach" to demonstrate the modeling construct proposed by DSP. We discussed the proposed construct on three occasions with various interested parties. For additional information and recommendations, please see Appendix S: Stakeholder Engagement Summary, which contains more details on our correspondence and discussions on this matter.

3. Adoption Model and Inputs

Since this analysis involves working with multiple parties and examination of several assumptions, we used the same economic adoption model proposed by the DSP. This allows full transparency of the adoption model inputs used to create the bundles offered into EnCompass as well as transparency into key drivers, such as projected capital costs and the tax credits assumptions that impact the projected capacity of adopted solar.

The core principle of the adoption model brought forth by the DSP is that adoption can be modeled as a function of its economic viability for a participant. The model defined economic viability as the net present value (NPV) of the solar investment from the participant's perspective and forecasts the level. Essentially, a higher NPV makes the investment more attractive to customers. Fundamentally, the adoption model is designed to determine the appropriate "size" of the DG solar bundles that will be

[27] For example, a bundle with a very high incentive level, such as $90/MWH, would appear highly economic from the perspective of a participating customer but may not be cost-effective for the utility to implement.

offered in EnCompass as a selectable generation resource. As discussed below, the bundle sizes represent the amount of DG solar adoption that is economically viable at a given incentive level, pending a further assessment of achievable potential. Without a potential study to account for possible customer and implementation constraints, we do not have enough information to equate the amount of adoption projected by this model with the actual amount of solar that could be procured.

We used this same adoption model, with updated inputs as shown in Table J-3, to develop DG solar bundles for both commercial and residential customer classes.

Table J-3: Initial Year Input Assumptions for Economic Adoption Models[28]

Assumption	DSP's Residential Bundle in 2019 IRP	Residential Bundle	C & I Customer Bundle
Baseline Population	667,980 single family detached homes (7 county metropolitan area)	MSA is 15 counties MN and WI. 937,338 single-family detached homes	MSA is 15 counties MN and WI. 937,338 single-family detached homes
Size of typical installation	4 kWdc	7.2 kWdc	200 kWdc
Self-Consumption	100% (all consumed onsite)	100% (all consumed onsite)	100% on-site consumption
Gross Cost Per Watt	$3.50	$2.736	$2.049
Retail Price of Electricity	$0.12/kWh	$0.15/kWh	$0.13/kWh
Inflation Rate	2.00%	2.00%	2.00%
Lending Rate	5%	8%	8%
Capital Cost Subsidy (Federal)	Investment Tax Credit (ITC) expires in 2020	Inflation Reduction Act tax credits	Inflation Reduction Act tax credits
First Year Energy	5,000 kWh	8,311 kWh	236,528 kWh
Solar System Lifetime	25 years	30 years	30 years
Fixed Operations & Maintenance Costs	$0	$29.01/kW-yr	$18.08/kW-yr

[28] Many of the assumptions in Table J-3 change over the years. The assumptions for the initial year are provided in the table.

Assumption	DSP's Residential Bundle in 2019 IRP	Residential Bundle	C & I Customer Bundle
Additional Capital Cost Subsidy (Proposed Incentive Level Paid by Company)	$10/MWH, $20/MWH, $30/MWH, $35/MWH, $40/MWH	$10/MWH, $20/MWH, $30/MWH	$10/MWH, $20/MWH, $30/MWH

4. What the Adoption Model Outputs Represent, and How They Are Used to Create Bundle Sizes

Table J-3 above shows slight variations between input assumptions for the three different analyses conducted using the adoption model. In addition to differences in assumptions, there is a key difference in how the analysis in the last IRP and the analysis in this IRP would be implemented. Specifically, there is a difference in the assumptions about how the incentive levels analyzed in the adoption model would be used to acquire any DG solar bundles selected by EnCompass. In the 2019 IRP proceedings, the DSP proposed all incremental DG solar capacity receive the same incentive level as the highest bundle selected. In this Resource Plan, the amount of incremental solar receiving the incentive is capped at the amount of capacity projected in the solar adoption model. The capacity is targeted at DG solar that would not otherwise be installed without the incentive. This difference between the two IRPs, in which incentives are now assumed to be targeted at DG solar projects not already naturally occurring, was included in presentations to stakeholders on this construct and mitigates the Company's concern from the last IRP about the potential for substantial free ridership with this proposed modeling construct.

Once the adoption model provided by stakeholders produced the estimated MW levels for each of the proposed incentive levels, the residential and commercial adoption levels at a given incentive amount were bundled together. For example, for the year 2027, 3.8 MW of residential solar adoption and 4.4 MW commercial solar adoption were projected at an incentive of $10/MWH. Using the bundled approach, this means that EnCompass would be offered a single $10/MWH option for that year instead of separate residential and commercial DG solar bundles.

Finally, the bundles are composed of 5-6 year periods of acquisitions, instead of the 15 year periods that were proposed by the DSP in the last IRP. For example, Bundle 1 offers $10/MWH of incentive payments to customers installing new DG solar systems between 2024 and 2029, instead of the entire time period from 2024-2040. This was

done to allow for contiguous years of consistent incentive level, which encourages customer participation without being locked into a long term bundle. This approach ensures that the cost of acquiring new solar in the 2030s does not exceed the price of new utility-scale solar during the same time horizon. Due to the declining price of utility scale solar, bundles with higher acquisition costs can be a cost-effective alternative to utility-scale solar in the 2020s but exceed the projected price of utility-scale solar in the 2030s. Providing bundles in 5-6 year segments instead of 15 year segments allows EnCompass to minimize the number of years in which this phenomenon occurs.

5. Bundle Costs as Represented in EnCompass

While each DG solar bundle directly adopts the MW size estimates generated by the adoption model, the cost assumption provided to EnCompass for each bundle is adapted to reflect administrative costs necessary for the utility to acquire DG solar from customers via incentive payments. This step is another key difference from the analysis put forth by the DSP in the last IRP, which did not assume any cost to the utility for acquiring solar resources directly from customers. Since EnCompass modeling involves generic acquisition assumptions, generic administration costs were generated for each bundle by using as a proxy at the same level of adminstrative budget relative to the entire estimated annual cost as is used for the residential and business segments in the ECO Triennial 2024 plan.[29] As further discussed below, if bundles are selected in EnCompass modeling, the actual costs would need to be determined through a subsequent analysis to assess whether the modeled amounts of DG solar are achievable. Such an analysis can also incorporate more granular procurement details, such as potential locations, project types, or customer segments to target.

6. Bundles Provided in EnCompass Modeling

The cost and size information from the adoption model analysis was used to develop the nine solar bundles shown below in Table J-4. The costs presented in this table include the proposed incentive payments modeled in the adoption model plus the previously discussed administrative costs.

[29] Decision, *In the Matter of Xcel Energy's 2024-2026 Energy Conservation and Optimization Triennial Plan*, Department of Commerce, December 1, 2023.

Table J-4: Solar Bundle Selectable Bundles Offered in EnCompass

Year	Bundles 1, 4, and 7		Bundles 2, 5, and 8		Bundles 3, 6, and 9	
	Incremental MW*	Acquisition Cost ($/MWH)	Incremental MW*	Acquisition Cost ($/MWH)	Incremental MW*	Acquisition Cost ($/MWH)
2024	9.86	$12.69	11.38	$25.37	13.09	$38.06
2025	9.17	$12.69	10.60	$25.37	12.22	$38.06
2026	8.58	$12.69	9.94	$25.37	11.49	$38.06
2027	8.08	$12.69	9.38	$25.37	10.86	$38.06
2028	7.66	$12.69	8.91	$25.37	10.33	$38.06
2029	7.30	$12.69	8.51	$25.37	9.89	$38.06
2030	7.01	$12.69	8.18	$25.37	9.53	$38.06
2031	6.77	$12.69	7.92	$25.37	9.23	$38.06
2032	6.59	$12.69	7.71	$25.37	9.00	$38.06
2033	5.98	$12.69	7.02	$25.37	8.22	$38.06
2034	5.48	$12.69	6.46	$25.37	7.58	$38.06
2035	3.43	$12.69	4.09	$25.37	4.85	$38.06
2036	3.21	$12.69	3.83	$25.37	4.55	$38.06
2037	3.00	$12.69	3.59	$25.37	4.28	$38.06
2038	2.83	$12.69	3.38	$25.37	4.04	$38.06
2039	2.67	$12.69	3.20	$25.37	3.83	$38.06
2040	3.43	$12.69	4.09	$25.37	4.85	$38.06
Cumulative Total By 2040[30]	96.4		112.8		63.4	

B. DG Solar Bundle Cost Categories

Costs associated with DG solar bundles impact various parties differently (i.e., participating customers who install solar systems realize costs and benefits that differ from those realized by the utility and non-participating customers). To address Order Point 15, in part, Table J-5 identifies the cost categories borne from each party's perspective. Costs stated here were not necessarily used in cost-effectiveness tests discussed below. Instead, they are presented to enable a more comprehensive evaluation when analyzing the achievable potential of DG solar bundles accepted in EnCompass modeling, as impacts will vary with program design, regulatory framework,

[30] Amount shown is incremental (new) DG solar installed each year. As with other solar resources in the EnCompass model, in each subsequent model year for the solar installed, a 0.5 percent annual degradation is assumed. The cumulative totals at the bottom of the table represent the total amount of solar offered into EnCompass by all bundles using the same level of customer incentive - $10/MWH, $20/MWH, or $30/MWH – inclusive of 0.5 percent annual degradation.

and local market conditions. The costs listed below were compared with cost categories used by other recent cost-effectiveness analyses of distributed solar.[31]

Table J-5: DG Solar Cost Categories

Cost Component	Description
Participating Customers	
Upfront Costs: Initial Solar Plant	Costs associated with purchasing and installation of solar system
Upfront Costs: Additional Distribution Upgrades	Any necessary upgrades to the distribution system for integration.
Ongoing Costs	Ongoing operation and maintenance costs during life of solar asset, including inverter replacement
Utility Or Non-Participating Customers	
Administration Costs (Labor Costs)	Costs related to administrative tasks such as program management and customer support.
Incremental Payments to Participating Customers	Payments made to participating customers as incentives or direct compensation for installing DG solar
Participating Customer Bill Reductions	Reduced revenues from reduced utility bills of participating customers. As noted further in the narrative this is not a net new cost to the system but cost shifts from these reductions can impact rates and/or bills for other customers.
Grid Technology Additions[32]	Investments in distribution grid infrastructure or technology to accommodate procured DG solar bundles.

[31] References include Benefits and Costs of Net Energy Metering in Washington. *Energy + Environmental Economics (E3)*. December 2023. Available at: https://www.ethree.com/wp-content/uploads/2023/12/E3_Benefits-and-Costs-of-Net-Energy-Metering-in-Washington_2023-12-21.pdfand National Standard Practice Manual for Benefit Cost-Analysis of Distributed Energy Resources. August 2020. Available at: https://www.nationalenergyscreeningproject.org/national-standard-practice-manual/

[32] As noted in the Benefits and Costs of Net Energy Metering (December 2023), grid modernization investments, such as distributed energy resource management system (DERMS), are not generally associated with a specific increment of DERs such as DG solar and are instead made strategically to enable the utility to better manage both existing and anticipated DERs. As such, these costs may be incurred largely on behalf of resources such as DG solar but are typically recovered from all customers, thus resulting in a net cost to ratepayers.

Regarding the participating customer bill reductions listed in the table above, it is important to note that due to the structure of net metering, while not directly impacting the revenue requirement on the resource side of the ledger,[33] effectively reduces sales. This reduction in sales does not correspond with a proportional decrease in the costs that the Company continues to incur in serving the customer. Consequently, net metering leads to a disparity between sales revenue and ongoing service costs which can result in bill and/or rate impacts for other customers. While we have noted this cost in Table J-5, in accordance with the National Standard Practice Manual, we have not included it in the standard cost-effectiveness testing discussed below.[34] This is because it is more appropriately studied in more in-depth rate, bill, or participation analyses outside the scope of this generic IRP modeling.

C. DG Solar Bundle Cost Effectiveness Tests

The Company employed several cost-effectiveness tests to evaluate the DG solar bundles instead of relying upon the results of a single cost-effectiveness test. Tests included an analog to the Minnesota Cost Test, and as agreed upon by stakeholders, use of the standard cost-effectiveness tests used in many demand-side management cost-effectiveness analyses – the Participant Test, Ratepayer Impact Measure Test, Utility Cost Test, and the Societal Cost Test. All bundles passed the Minnesota Cost Test analog and were passed forward to EnCompass modeling.[35]

D. Other topics as identified by stakeholders to develop DG solar bundles modeling construct.

A comprehensive summary of stakeholder engagement is included in Appendix S. While no other topics were identified by stakeholders to develop the DG solar bundle modeling construct, stakeholder input informed the development of the solar bundles in this Resource Plan.

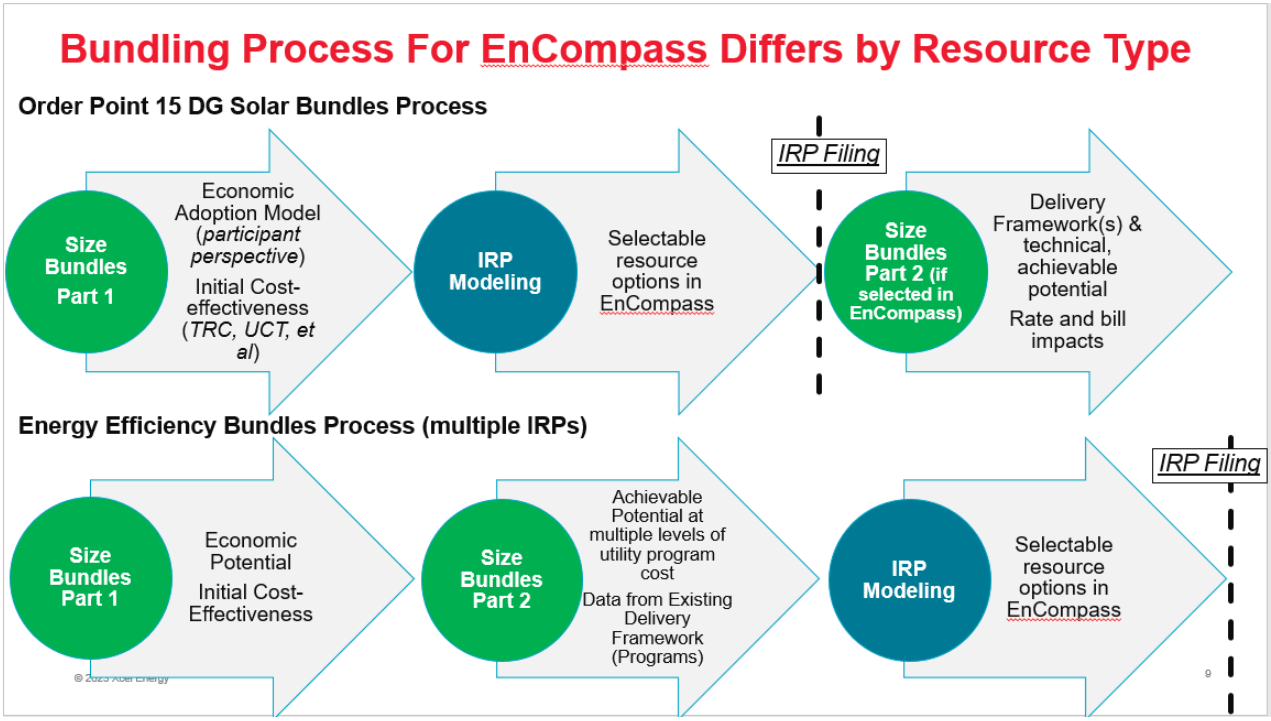
E. DG Solar Bundle Modeling Results and Next Steps

The results of this DG Solar Bundle modeling construct exercise are discussed in

[33] In the parlance of terminology regarding cost-effectiveness testing, this means that retail bill savings from customers installing DG solar systems are not a net new cost to the system (i.e., there is no revenue requirement or new financial transaction that is included in the rate base).
[34] The only exception is the Ratepayer Impact (RIM) Test.
[35] For more information regarding the Minnesota Cost Test, see Decision, *In the Matter of 2024-2026 Cost-Effectiveness Methodologies for Electric and Gas Investor-Owned Utilities*, Docket No. E,G999/CIP-23-46, March 31, 2023. (Further referred to as 2023 Cost-Effectiveness Decision).

Chapter 5: Economic Modeling Framework. As noted earlier, specific details on how these resources would be acquired, such as location, specific customers targeted, achievable potential, etc., fall outside the scope of this generic IRP modeling. These details would need to be identified, along with further cost-effectiveness testing updated with more granular inputs. Unlike EE and DR, the Company currently does not offer incentives for DG solar installations, outside of the Solar*Rewards program. Because of this different construct from EE and DR, additional analysis after bundle creation and EnCompass selection are necessary, as shown in the process comparison in Figure J-4 below.

Figure J-4: Summary of DG Solar and EE Bundle Processes



V. CONCLUSION

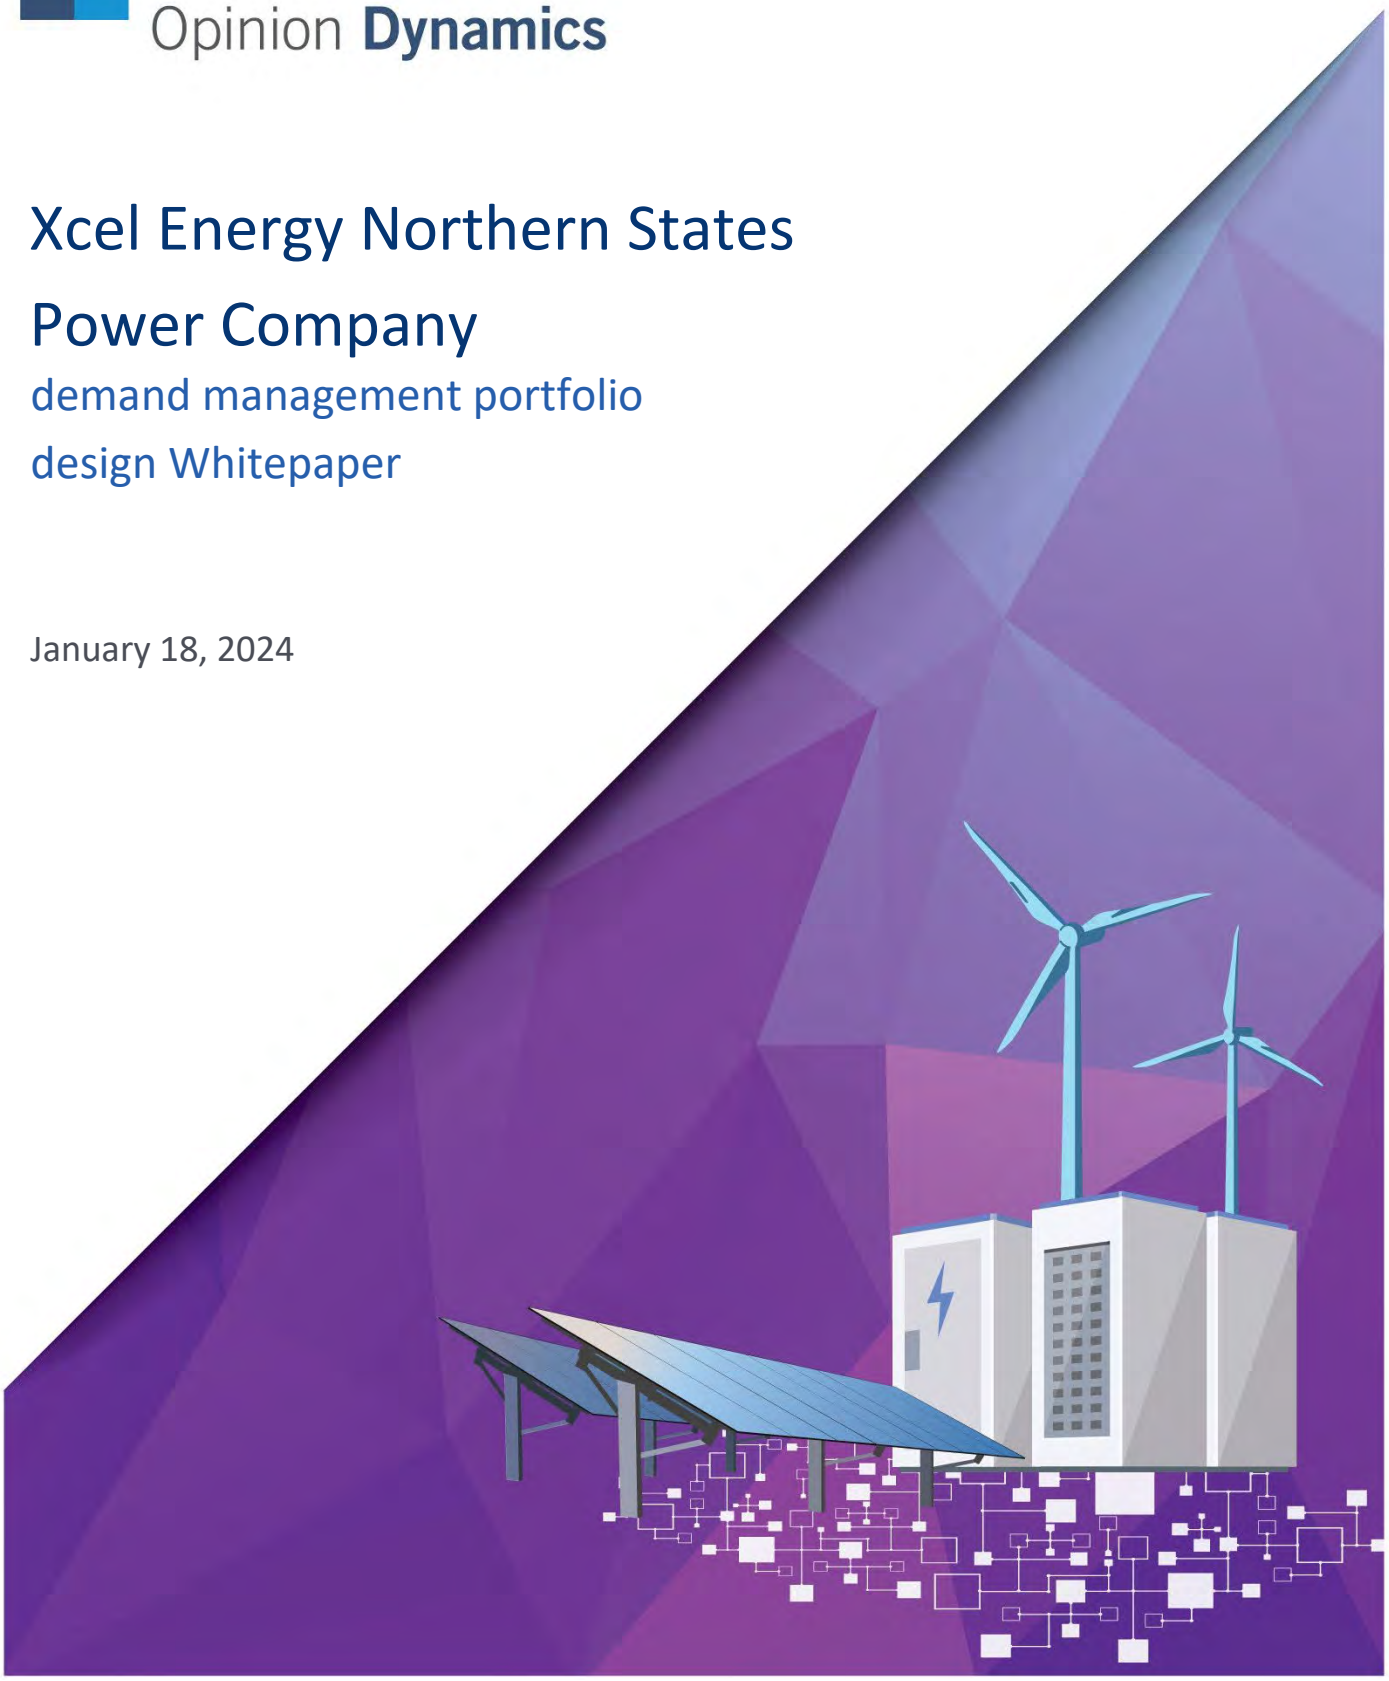
As noted above, DERs play an important role in our Resource Plan and are an essential part of our path towards carbon reduction. While the Company has a long history of integrating DERs into our system, advancements in technology will allow us to shift our efforts towards optimization of energy use, adding more value to the system.

Opinion Dynamics

Xcel Energy Northern States Power Company

demand management portfolio design Whitepaper

January 18, 2024



Introduction

Demand Response (DR) programs have been a part of energy planning for over 40 years. Over time, traditional DR has evolved in concert with the increasing availability of technologies unlocking breadth and depth of customer engagement, coupled with changing regulatory policies to address grid, customer, and climate needs. The last decade has marked an even more rapid evolution given the adoption of renewables, penetration of distributed energy resources (DERs), electrification policy objectives, and extreme weather events—creating a perfect environment to re-envision DR. As a result, new value streams have been unlocked, supplanting traditional DR with a more comprehensive approach: Load Flexibility.

This whitepaper explores the future opportunities and pathways to unlock the most value out of Load Flexibility in Xcel Energy's Northern States Power Company (NSP) service territory. To that end, the whitepaper addresses:

- The history of DR in the United States
- The state of DR programs and offerings in the Upper Midwest
- The evolution of Demand Response to Load Flexibility, including considerations to support NSP's future grid needs

Evolution of Demand Response in the United States

History of Demand Response in the United States

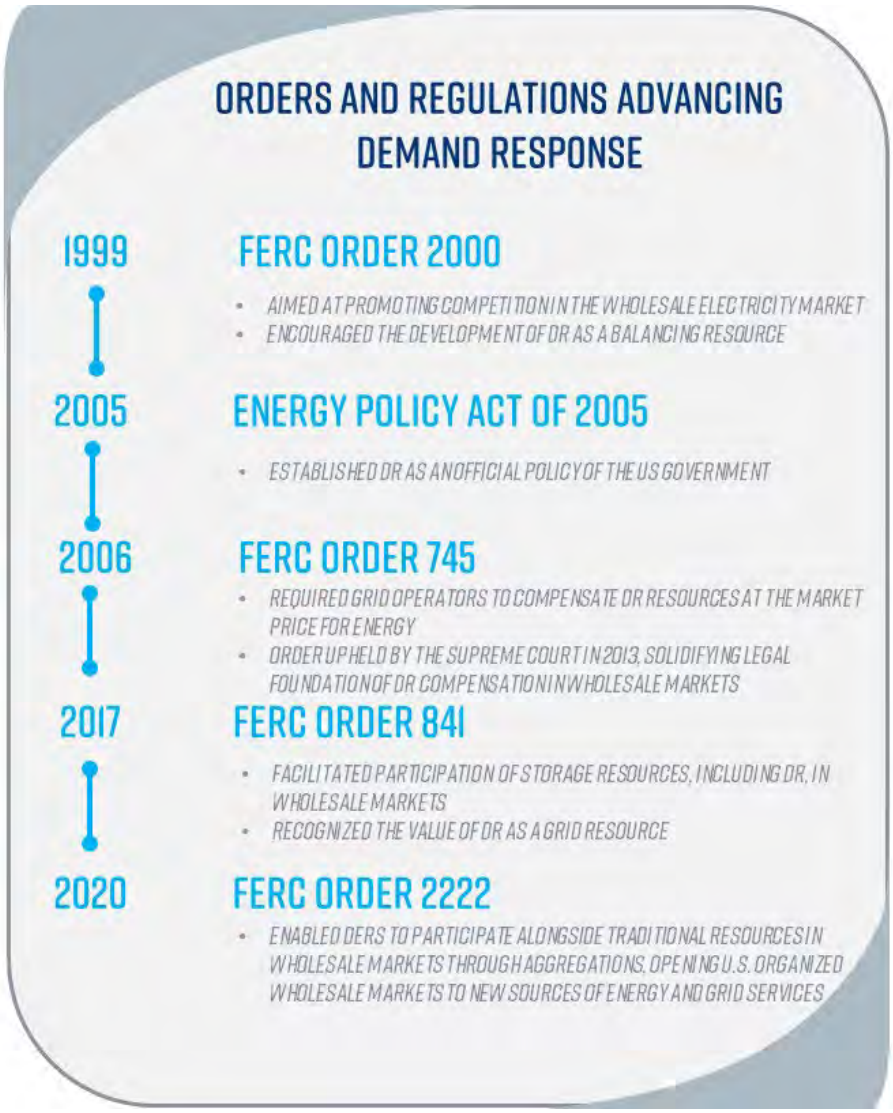
Demand Response is defined as "changes in electric usage by demand-side resources from their normal consumption patterns in response to changes in the price of electricity over time, or to incentive payments designed to induce lower electricity use at times of high wholesale market prices or when system reliability is jeopardized." – Federal Energy Regulatory Commission (FERC)

Demand response (DR) programs originated in the 1970s and 1980s as utilities began to experiment with demand-side management (DSM) initiatives to tackle concerns about energy efficiency and peak demand.

The Energy Policy Act of 1992 was a significant milestone in the development of DR in the United States. It encouraged utilities to invest in energy efficiency and DR programs by allowing them to recover costs associated with these initiatives.

Beginning in 1999, a series of federal rules and orders established DR as a recognized resource in the wholesale markets (see sidebar). In response to regulatory signals and grid needs, DR programs have evolved significantly over time.

The advent and development of smart grid technologies facilitated better communication between utilities and consumers, which paved the way for more sophisticated DR programs.



DR Value Streams

This whitepaper focuses on value streams that are cost-effective for utilities to implement within the Upper Midwest, drawing from NSP's 2019 Potential Study associated with system peak demand. We acknowledge that additional value streams, such as affordability and carbon reduction, are not included in this framework (Hledik et al. 2019).

Table 1. DR Value Streams by Typology

DR Typology	Value Stream	Description
Traditional DR	Avoided generation capacity costs	Reduced need for new peaking capacity
	Reduced peak energy costs	Reduced load during high-priced peak periods
	System-wide deferral of transmission and distribution	Reduced need for peak-driven upgrades in transmission and distribution capacity
Non-Traditional DR	Geotargeted distribution capacity investment deferral	Targeted DR investments where load reductions would defer localized needs for capacity upgrades
	Ancillary services	Real-time adjustments to load from some end-use applications to mitigate system imbalances
	Load building/valley filling	Shifting on-peak load to off-peak hours
	Facilitating better integration of non-dispatchable, intermittent renewable generation resources	Adjusting load (up or down) as non-dispatchable renewables come online or go offline

Since 1970, DR programs have been evolving, albeit at varying timescales based on geographic, regulatory, and grid features. This evolution is classified broadly into three phases: DR 1.0 – The Past, DR 2.0 – The Present, and DR 3.0 – The Future, which align with an increasing array of value streams.[1]

DR 1.0 – The Past

- The earliest DR programs were interruptible tariffs (manual dispatches for large commercial and industrial [C&I] customers and one-way communication load control devices for residential customers).
- DR was primarily used to provide energy and/or capacity when wholesale prices were unusually high, there was a shortfall in generation or transmission capacity, or during unexpected emergency grid operating situations. Notifications were manual, and there was little to no customer feedback on performance.[2]
- Activities focused on demand reductions during a limited peak window for a small number of hours per year with the following associated value streams: generation capacity avoidance, reduced peak energy costs, and system peak-related transmission and distribution deferral (Faruqui and Hledik 2018).

DR 2.0 – The Present

- DR became integral to most wholesale markets and grid operation systems in the US. DR provided more precise energy and capacity to support wholesale marketplace activities, as well as sophisticated and near real-time measurements, which were often used as the system of record for customer feedback and confirmation of customer performance.
- Program variety increased, alongside increasing automation and program sophistication (e.g., transition of air conditioning switch programs to smart thermostats, C&I programs that extend beyond simple interruptible tariffs [e.g., demand bidding, performance-based payments], exploration of DR potential among small businesses, EV-managed charging programs, etc.).

[1] The descriptions of DR 1.0, 2.0, and 3.0 are informed by the authors' industry experience as well as their role facilitating Peak Load Management Alliance's "The Evolution of DR to DER" training class.
[2] NSP's traditional event-based DR (DR 1.0) is dispatched in response to emergency events called by MISO and does *not* refer to participation in MISO's day-ahead or real-time energy markets.

- Communication signals improved, which contributed to DR program variations.
- Adoption of advanced metering infrastructure (AMI) created additional DR program options, such as behavioral DR, critical peak pricing, and peak time rebates.
- DR timing moved beyond event-window peak shaving to the potential for 24/7 continuous management, and existing programs increasingly focused on targeted distribution capacity deferral.

DR 3.0 – The Future

- DR will be characterized by greater complexity.
- DR (or the DR 3.0 paradigm of "Load Flexibility") will evolve to be a component of broader distributed energy resources (DERs), including distributed photovoltaic (PV), EV charging, and various forms of energy/thermal storage, both on a grid operating system scale as well as behind-the-meter (i.e., on the customer side of the meter).

Load Flexibility is defined by the California Energy Commission as "the practice of adjusting load (or energy usage) to match the supply of electricity."

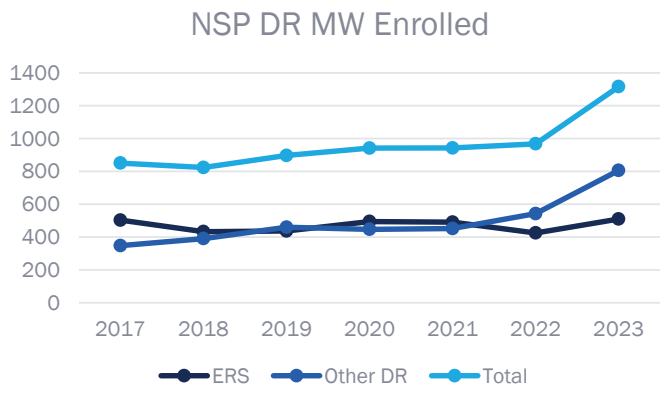
- Where wholesale markets exist, the major underlying economic principle of DR is a price signal, which moves the industry away from traditional "command-and-control" mechanisms to manage grid operations. In DR 3.0, Load Flexibility is not necessarily triggered directly by the utility or by the system operator; rather, dynamic loads can also be modified automatically via devices that react to pre-programmed price thresholds, although prices do not always trigger a DR signal. Utilities can also rely on a grid signal, such as voltage, rather than a price signal for emergencies and system peaks.
- DR can provide a variety of service benefits to customers and grid operators. Customers may even be "prosumers" who both provide and consume grid power, including volt/var control, renewable energy integration, and localized distribution system congestion management.
- Importantly, a broader definition of DR (including behavioral, EV, grid-interactive water heating, battery storage, etc.) across an 8760-time scale can unlock additional value streams (e.g., valley filling/load building and ancillary services). Lawrence Berkeley National Laboratory's landmark 2017 study put forth a novel framework for classifying Load Flexibility resources into four distinct "service types": Shape, Shed, Shift, and Shimmy. This work standardized nomenclature around these various Load Flexibility value streams, effectively replacing the historic monolithic concept of event-based DR with a more nuanced Load Flexibility framework.
- Many Load Flexibility value streams have not been established or quantified yet, though efforts are well underway, and opportunities abound. Most of the efforts across the country are nascent, with pilots showing promising results.

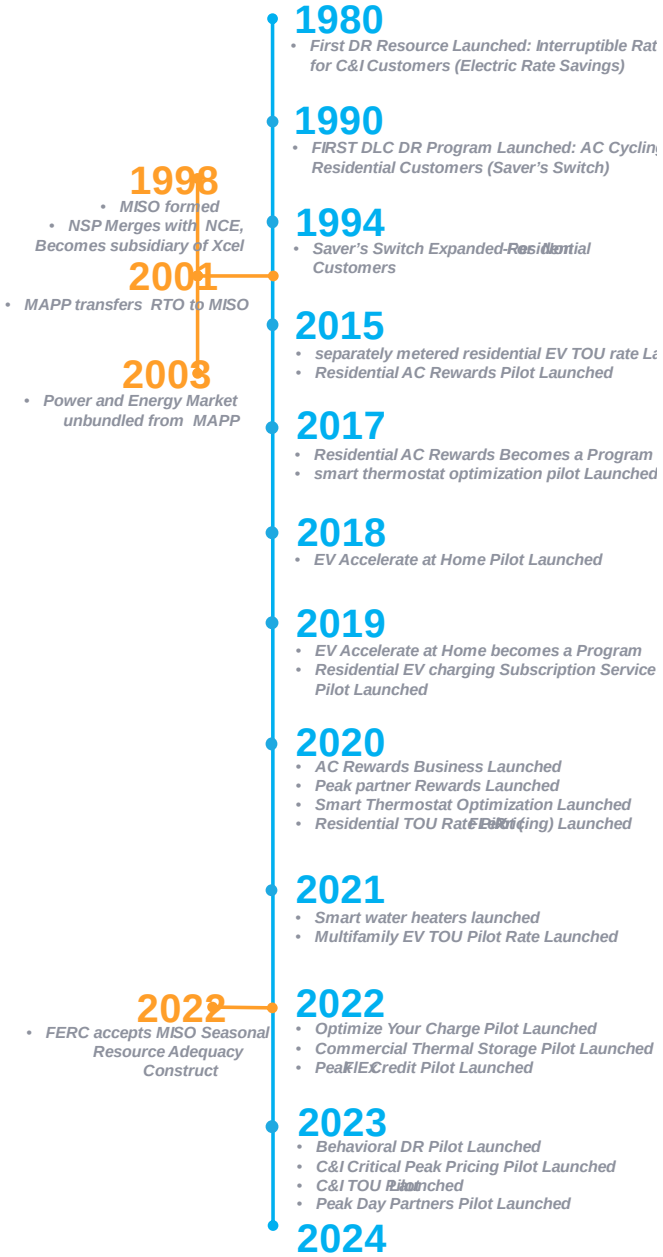
The State of DR Programs and Offerings in the Midwest

Xcel Energy: Northern States Power Company

NSP's history with DR began in 1980 with the launch of Electric Rate Savings (ERS). Over the next decade and a half, NSP launched two other flagship DR programs: Saver's Switch programs for both residential and non-residential customers. These legacy DR programs constitute over three-quarters of NSP's current DR potential. Notably, these DR 1.0 programs were developed under a different market construct (the Mid-Continent Area Power Pool, or "MAPP") than the current wholesale markets operated in the region through the Midcontinent Independent System Operator, Inc. (MISO).

Xcel Energy NSP has rapidly expanded its DR offerings in Minnesota in recent years, deploying at least one new pilot or program every year since 2017, including the launch of three new Load Flexibility pilots in 2022. Since 2017 alone, NSP acquired an additional 482 MW of capacity.[3]





NSP's current DR portfolio spans a variety of end uses and load modification strategies. Accordingly, Xcel Energy's efforts to expand its DR portfolio in Minnesota have contributed to steady inclines in flexible MW potential (see chart of MW Enrolled). These new offerings have resulted in net increases in DR potential despite declining MW enrollments in ERS (NSP's largest single source of DR potential). Per NSP's forthcoming DR Compliance Filing to the Minnesota PUC: "In total, the Company now has 14 percent of its peak demand available for demand response control across its Northern States Power Company jurisdictions. This includes active enrollment of approximately 460,000 residential and small business customers and 19,000 commercial and industrial customers in

[3] As of publication, this value has yet to be externally published. This value is forthcoming in the same docket referenced in the prior DR Compliance Filing (Northern States Power Company 2023a).

demand response programs" (see Table 2).[4] These enrollment numbers suggest that traditional DR enrollment rates may be approaching saturation. Based on findings from Brattle's 2019 Potential Study cited in NSP's last Integrative Resource Plan (IRP), opportunities to further grow NSP's traditional DR potential may be limited, as "the market for traditional cost-effective DR in MN may be approaching saturation" resulting in enrollment plateaus (Hledik et al. 2019). As of 2023, NSP achieved 1,316 MW of DR resources; exceeding the identified 2023 potential of 1,143 MW referenced in Hledik et al. 2019.[5] Thus, expanding non-traditional load flexibility is necessary to enable the subsequent growth of NSP's DR portfolio. Accordingly, NSP will need to pursue additional program offerings to exceed the MW and customer enrollment plateau that NSP may be very close to meeting. As a result, exceptional customer engagement and satisfaction will be essential to ensure existing legacy programs maintain customer enrollment.

[4] As of publication, these values have yet to be externally published. These values are forthcoming in the same docket referenced in the prior DR Compliance Filing (Northern States Power Company 2023a).

[5] Cost-effectiveness results for some newer DR resources are still pending, as many of NSP's new DR offerings are still in the pilot phase.

Table 2. Total MW Enrolled by Customer Class

Customer Class	Program	Description	Launch Year	Eligibility	Participants Enrollled (2023)	MW Enrolled (2023)	MW Enrolled: Fraction of Total (2023)
Residental	Residential DR: *Saver's Switch AC Rewards Smart Water Heaters*	Switch or smart thermostat AC direct load control program and water heater direct load control program	*Saver's Switch:* 1990 *AC Rewards:* 2015 *Smart Water Heaters*: 2021	Residential customers with central AC systems or heat pump water heaters	458,347	542	41%
	EV Optimization Pilot	Will study the management of the grid impacts of electric vehicles by working with customers to provide schedule options for their daily EV charging. The schedule options ensure charging occurs outside the Company's system peak and are designed to stagger charging times to avoid demand spikes during the off-peak period.	2022	Residential customers charging an electric vehicle at a residential address. Must use eligible equipment or drive an eligible vehicle.	1,337	2	0.2%
Commercial / Industrial	Electric Rate Savings	Demand charge discount for reducing load by at least 50 kW during control periods	1980	Business customers capable of reducing load by >50 kW	1,886	510	39%
	Peak Partner Rewards	Bill credit for reducing demand by at least 25 kW during control periods	2021	Business customers who contract to reduce demand by ≥25 kW	82	20	2%
	Commercial AC Control: *Saver's Switch AC Rewards*	Switch or smart thermostat direct load control program	*Saver's Switch:* 1994 *AC Rewards:* 2020	Commercial customers with central AC systems	16,807	138	10%
	EV Optimization Pilot	Will study the management of the grid impacts of electric vehicles by working with customers to provide schedule options for their daily EV charging. The schedule options ensure charging occurs outside the Company's system peak and are designed to stagger charging times to avoid demand spikes during the off-peak period.	2022	Busines customers charging an electric vehicle at a business address. Must use eligible equipment or drive an eligible vehicle.	8	0	0%
	Peak Flex Credit Pilot	Dispatchable, load-shedding program for commercial customers that provides additional flexibility and optionality to customers who want to design program parameters to work within their operational and business needs. This pilot provides pricing for both peak control events as well as buy-through options for economic control events and includes a tranche of load intended for third-party aggregation.	2022	Business customers capable of reducing load by 50 kW	4	4	0.3%
	Critical Peak Pricing Pilot	Pilot will study new time-varying rate design for a number of commercial and industrial customers. Features a three-part rate that incorporates energy and demand charges into a single volumetric rate. This rate also features a critical peak pricing component, where the Company calls events during times of extreme system peak. This pilot is paired with the General Time of Use Pilot above and is intended to inform the future design of commercial and industrial rates.	2023	Business customers with demand ≥50 kW over the preceding 12 months and with a load factor ≥30% over last 12 months	5	1	0.1%
	Peak Day Partners Pilot	The Peak Day Partners pilot program will offer commercial and industrial customers an incentive through an incentive bidding process, in exchange for reducing their peak load during periods when demand is high. The product purpose is to provide the Company with an additional power purchase resource to manage system requirements more efficiently during exceptional periods, and the Customer the option of receiving pricing associated with energy supply markets during such periods.	2023	Business customers capable of reducing load by 500 kW	37	99	8%
Totals	**All Programs**	**N/A**			**478,513**	**1,316**	**100%**

NSP's DR portfolio growth reflects the planning value that DR brings. Specifically, DR contributes to NSP's resource adequacy (RA) needs and helps ensure that NSP has a sufficient reserve margin (RM) for safe, reliable, and resilient operations. Grid and economic conditions over the last few years have not typically required frequent dispatch of DR resources to meet NSP's peak capacity needs. Nonetheless, NSP's current DR potential is essential to maintain the requisite RA and RM.

Additionally, NSP may be able to realize new value streams going forward, such as emergency and distributional value streams (the latter of which do not necessarily align with traditional MISO value streams). Additionally, MISO's new seasonal construct can potentially provide non-summer avoided generation capacity value for NSP. Accordingly, NSP has been expanding its winter DR capability, first by testing winter events in ERS in 2017 and later actively dispatching more frequently during the 2023/2024 winter season.

A comparison of independent system operators (ISOs)/regional transmission organizations (RTOs) reveals the regionally specific nature of DR value streams. Whereas neighboring PJM has a formal capacity market where load serving entities (LSE) can bid DR into the market, DR in MISO is used as a planning tool and for emergency response. Specifically, a LSE's DR resources can be used to meet MISO's annual capacity requirement and reserve margins (Sustainable FERC Project 2024a). These DR resources may then be dispatched in response to emergency events called by MISO. Conversely, DR is *not* dispatched or bid into MISO's day-ahead or real-time energy markets. Like MISO, CAISO also lacks a formal capacity market but has mandatory resource adequacy requirements (Sustainable FERC Project 2024b). Accordingly, other markets may offer more cost-effective DR 3.0 opportunities for their constituent LSEs than the value streams found in MISO.

An examination of capacity clearing prices and wholesale energy prices also exposes significant variation across ISOs/RTOs. For example, MISO's North/Central zones (which include NSP's operating territory) had capacity clearing prices at $15/MW-Day or lower in the 2021/2022 and 2023/2024 Planning Resource Auctions (PRA), whereas the 2022/2023 PRA clearing price was $236.66/MW-Day (15+ times higher) due to capacity shortfalls in four zones during that PRA cycle. PJM capacity prices have also experienced significant variation during that timeframe, ranging from $34.13/MW-Day in the recent 2023/2024 auction to $140/MW-Day in the 2021/2022 auction. Excluding the aberrant MISO clearing price spike in 2022/2023, PJM had higher capacity clearing prices than MISO in the past few auction cycles. CAISO, on the other hand, experienced less variation but had consistently high capacity prices over the last three years, with capacity prices ranging from $215.01/MW-Day to $227.84/MW-Day.[6] Locational Marginal Prices (LMP) for energy expose additional variation, with CAISO demonstrating notably different LMP trends than both MISO's North/Central hubs and PJM (which share more comparable LMP trends). When assessing example winter and summer days between the three ISOs/RTOs, CAISO consistently has the highest day-ahead prices, as well as the largest price swings within a given day.

Benchmarking against other utilities in the region

Based on a review of DR portfolios in the Upper Midwest, we found that NSP's DR program deployment is on par with investor-owned utilities the region. In general, we found that these portfolios reflect the value streams that are accessible given the market. Specifically, they are all summer peak-focused, and pilot activities are emergent (such as time-varying rate solutions). Across the Midwest, nascent efforts are underway to test DR applications beyond capacity in preparation for the transition to the Load Flexibility paradigm. The following two pages demonstrate how NSP's DR portfolio compares to other utilities in the Upper Midwest.

[6] CAISO reports capacity prices in $/kW-month. Values referenced in this paper have been scaled to reflect reporting units used in MISO and PJM ($/MW-day).

Load Flexibility Transition

DER National Trends

Deployment of DERs has increased nationwide in recent years and is anticipated to continue increasing in the future. The most common DERs include solar and wind, combined heat and power, energy storage solutions, load-modifiable end uses (such as smart thermostats or EVs), as well as microgrids and nanogrids. DERs are frequently grouped into three main categories: demand (e.g., EV chargers, smart thermostats paired with HVAC systems), storage (e.g., behind-the-meter storage and EV batteries), and generation (e.g., solar and wind). The various DERs have differing effects on the grid, and each presents unique DR and Load Flexibility opportunities.

Over the last three years, the US installed over 40 GW of solar PV, fueled largely by the steep and ongoing decrease in the prices of solar modules and inverters, as well as extended federal tax credits (Solar Energy Industries Association 2023).

According to Bloomberg NEF's annual battery price survey, battery prices (including both behind-the-meter and utility-grade) have also been declining for several years and experienced a 14% drop from 2022 to 2023, reaching a record low of $139/kWh due to falling raw material and component prices.

The US energy storage market installed a record 4.8 GW in 2022, with installations expected to reach almost 63 GW between 2023 and 2027 (Wood Mackenzie Power 2023). In Q3 2023, grid-scale storage deployment in the US grew by 52% over the previous year from 4.5 GW to over 6 GW. Distributed storage is expected to grow twice as fast as grid-scale (Wood Mackenzie Power and Renewables/American Clean Power 2023).

Over the last few years, EVs have emerged as a formidable DER. Due to the decreasing manufacturing costs of electric vehicle batteries, along with improvements in the driving range of electric vehicles and supportive policies from corporate, state, and federal governments (such as the Corporate Average Fuel Economy standards, Clean Vehicle Credits enacted by the Inflation Reduction Act [IRA], and the Clean Air Act), the market share of light duty EVs has increased exponentially. In 2023 alone, over 1.2 million EVs were sold in the US, representing over 8% of all light-duty vehicles. In comparison, over 4.5 million EVs have been sold in total since 2010. Myriad efforts are underway to understand EV Load Flexibility through rate-based solutions and managed charging programs (Argonne National Laboratory 2023). Efforts are springing up across the country to test the vehicle-to-grid (V2G) and vehicle-to-home (V2H) capabilities of EVs.

Building electrification goes hand-in-hand with transportation electrification. With significant potential to mitigate emissions and decarbonize energy supply chains, building electrification has been on the rise in the US. More specifically, the percentage of US homes heated with electricity has increased steadily from 1% in 1950 to 40% in 2020, and the electrification trend continued to intensify, fueled by favorable state and federal policies (Davis 2022). Between 2022 and 2023, multiple states have passed major new laws promoting clean heating through fuel switching (Minnesota Energy Conservation and Optimization Act, Illinois Climate and Equitable Jobs Act, and the Colorado SB21-246, among many others), and IRA legislation offers a suite of financial incentives to encourage individuals and businesses to invest

Each year from 2025 to 2030, the US grid is expected to add 20–90 GW of nameplate demand capacity from EV charging infrastructure and 300–540 GW of nameplate storage capacity from EV batteries, an additional 5–6 GW of flexible demand from smart thermostats, water heaters, and non-residential DERs, 20–35 GW of nameplate generation capacity from distributed solar and fuel-based generators, and 7–24 GW of nameplate storage capacity from stationary batteries.

in clean, efficient alternatives for their homes and businesses (Smedick, Golden, and Petersen 2022). For example, in 2022, heat pumps outsold fossil fuel-based heating systems in the US.

Forecasted estimates across the industry for DER penetration consistently predict the addition of more varied resources to the grid as well as the increasing complexity of resources interacting with one another. These interactions are made possible by the emergence and growth of smart grid and building technologies, ranging from smart thermostats to complex Virtual Power Plants (VPP) capable of aggregating and orchestrating multiple DERs in an automated environment.

FERC Order 2222 allowed the participation of VPPs in wholesale markets. While the implementation of the order is ongoing across the wholesale markets, as of August 2023, two out of six FERC-jurisdictional ISOs/RTOs allowed participation from VPPs that inject electricity for at least a subset of grid services. Texas also began opening the Electric Reliability Council of Texas (ERCOT) market to VPPs.

Xcel defines VPPs as: "an aggregation of controllable DERs managed at a scale that provides grid services or attributes, including energy and negative energy, ancillary services, and capacity. DERs aggregated to create a VPP could be utility or customer owned, in-front or behind the meter. DER assets in a VPP could include, but are not limited to, photovoltaic solar, energy storage, electric vehicles, and demand-responsive devices such as water heaters, air conditioning units, thermostats, and appliances. A VPP has benefits, such as the ability to deliver peak load electricity or load-following power generation on short notice. Such a VPP could replace a conventional power plant while providing higher efficiency and more flexibility, which allows the system to react better to load fluctuations. Resources that are part of a VPP may also be able to provide local grid benefits (to the extent that the resources are in close proximity to a local constraint) such as reducing loading on a distribution feeder" (Northern States Power Company 2023b).

Utilities across the country are pursuing price signals to better manage DERs—and demand in general—in the form of time-varying rates. Some states, like California, opted for a broad TOU defaulting approach, while others, like Oregon, are pursuing a targeted exploration of load-shifting capabilities of time-varying rates. Regardless of approach, across the country, time-varying rates are moving from the periphery to the mainstream of electricity pricing, fueled by the adoption of AMI technology. The arc of price responsiveness shows great promise in the ability of time-varying rates to support flexible load management (Faruqui and Tang, 2023).

The Department of Energy (DOE) Grid-Interactive Efficient Building Initiative fueled the development of roadmaps, frameworks, and pilots to test smart building technologies capable of grid integration (Office of Energy Efficiency & Renewable Energy 2023). While VPPs are not new and have been operating with commercially available technology for years, they have become an emerging solution in recent years, capable of aggregating DERs and contributing to resource adequacy at a low cost. VPPs deliver economic benefits, increase resiliency, offer carbon and other benefits, reduce T&D congestion, and empower communities. While integration of VPPs into electricity system planning, operations, and market participation has been limited to date, studies of VPPs across the

country point to their strong potential to deliver value to both the bulk power system as well as distribution system in vertically integrated and restructured energy market environments.

The growth of DERs is fundamentally reshaping the electric industry and making the operation of the grid considerably more challenging as more DERs are added. However, DERs can also offer a tremendous amount of additional flexibility for meeting load needs throughout the day, month, and year, thus opening new value streams for utilities to leverage. As such, Load Flexibility is increasingly important to ensure that the adoption of DERs and renewables is orchestrated effectively and efficiently.

From DR to Load Flexibility

In the context of growing DERs and grid-edge solutions, such as VPPs and grid-integrated buildings, the traditional event-based paradigm of DR is evolving into a Load Flexibility paradigm. Within this paradigm, electricity consumption is managed in increasingly granular units of time to address economic and system reliability conditions. California and New York were among the first states to pioneer Load Flexibility by instituting regulatory paradigms and roadmaps for integrating DERs. In California specifically, the Energy Division of the California Public Utilities Commission (CPUC) released a white paper and a proposal aiming at bringing together disparate baskets of flexible load solutions into a unified load management signal (Phillips 2022) (Madduri et al. 2022).

Other parts of the country are dipping their toes into the world of DER integration by piloting VPPs and innovative flexible load pilots. The efforts are still nascent and exploratory, seeking to properly assess the potential and ascertain value streams. We selected three distinct examples to demonstrate a cross-section of innovative flexible load initiatives across the country. For more information on these examples, see Appendix A.

Renewable Battery Connect Program
Public Service Company of Colorado

Sector
Residential/small business

Load Control Strategy
Solar Charged Battery Discharge

Dispatch Timing
Any time of year, Typically afternoons/evenings of the hottest days of the year

Participant Eligibility
Single-family homes/small businesses with solar and newly installed tesla powerwall or Solaredge home hub inverter with solaredge home battery

Enrollment
Opt-In

Participant Count
65 customers with 90 Batteries, 200 additional applications in the Queue

DR Potential
Current: 0.73 MW
Goal: 10 MW (by end of 2025)

Peak Power Rewards Program
Pacific Gas & Electric

Sector
Residential

Load Control Strategy
Battery Discharge

Dispatch Timing
Everyday 7 p.m. to 9 p.m. from August to October

Participant Eligibility
Single-family homes with Sunrun solar systems and LG Chem/SolarEdge/Tesla Powerwall battery

Enrollment
Opt-out

Participant Count
8,500 customers

DR Potential
34 MW

Multifamily Water Heater Pilot
Portland General Electric

Sector
Multifamily

Load Control Strategy
Water Heater curtailment

Dispatch Timing
Non-holiday weekdays, Timing dependent on grid needs, typically summer evenings and winter mornings/evenings

Participant Eligibility
Multifamily properties with at least 50 individually metered units and 80-gallon electric resistance water heaters

Enrollment
Opt-in

Participant Count
13,000+ switches

DR Potential
Summer: 2.4 MW Winter: 4.5 MW

Planning the Transition in Xcel Energy's service territory

Emerging Trends

According to the 2019 NSP Potential Study conducted by the Brattle Group, "NSP's cost effective opportunities to date have been constrained by limitations of the metering technologies, access to low-cost peaking capacity, a limited need for distribution capacity deferral and grid balancing services, and the relatively high cost of emerging DR technologies" (Northern States Power Company 2019, Appendix G2). However, this equation has begun to change since that study was published: AMI deployment is anticipated to be finished by the end of 2025 and a capacity shortfall is now anticipated as of 2027 (Northern States Power Company 2023c). In the short term, NSP does not foresee distribution system challenges that can be addressed by DR or Load Flexibility alone. The price signals associated with additional value streams for DR, such as ancillary services, have not historically fueled further growth of DR resources in NSP territory.

These legacy limitations and nuances historically shaped the value streams and available applications of NSP's existing DR programs. A substantial portion of the value of NSP's DR resources to date has been avoidance of load-supporting generation. As a result, the design of NSP's DR programs focused on supporting event-based peak shaving as opposed to continuous load management.

Nonetheless, the growth and proliferation of DERs, as well as the evolution of DR to Load Flexibility, is occurring in Xcel Energy's NSP service territory alongside the rest of the nation. The nuances of the service territory's forecasted generation mix, customer composition, and energy market shape a unique evolution trajectory with a distinct set of needs and potential solutions.

Minnesota's population is poised for significant growth, with the Minnesota State Demographic Center forecasting that the state will gain 850,000 new residents between 2020 and 2070, a 15% increase from 2020 levels. Steady predicted urbanization of the population will lead to a declining population in two-thirds of Minnesota's 87 counties (Minnesota State Demographic Center 2023).

Renewable resources, including wind, solar, hydropower, and biomass, generated the largest share of Minnesota's electricity in 2022. In 2022, wind provided 23% of Minnesota's total in-state electricity net generation, and solar provided 4%. Minnesota's mandatory renewable energy portfolio standard (RPS) requires that the state's electricity providers generate or procure at least 25% of their electricity retail sales from eligible renewable sources by 2025, apart from the state's largest utility, which must meet an even higher standard. Xcel Energy seeks to generate all power from carbon-free energy resources by 2050 (Xcel Energy 2023). In 2018, the state's utilities had already met the 25% requirement. There is an additional goal that 10% of statewide electricity sales come from solar power by 2030.

Minnesota, similar to the rest of the Midwest, has historically been a summer-peaking region. However, the growing adoption of renewable generation sources,[7] including solar and wind, is poised to change the value of DR. Increasing solar generation during the day is highly coincident with the summer peak and will likely reduce the value of DR during that period. At the same time, heavier reliance on renewable generation has the potential to shift net system peaks to different times of the day, thus creating potential curtailment needs at different times of the day, season, and year. DR program designs focused on existing summer peaking hours might not translate in a similar fashion to other days of the week or hours of the day in other seasons. For instance, NSP's largest residential program focuses on curtailing air conditioning load, which is not suitable for the shoulder or winter seasons and may not result in the same customer

[7] Growth in renewables is necessary to meet the Minnesota Legislature's mandate of a 100% carbon-free standard for electric utility generation and procurement by 2040.

engagement or curtailment potential during later hours in summer days. Renewable energy is intermittent, and heavier grid reliance on renewable energy sources can contribute to price volatility, which can create a need for high-value grid balancing services, such as frequency regulation, making DR a more viable solution.

While Minnesota is currently a summer peaking region, building and transportation electrification trends are projected to create peaking conditions during non-summer seasons in Minnesota and throughout the Midwest. NREL forecasts Minnesota to exceed half a million EVs by 2030. Growing transportation electrification load is poised to impact both bulk power and distribution systems, opening pathways for additional opportunities for Load Flexibility solutions. The Midwest wind resource peaks in spring and fall, while solar peaks in summer. Growth of electric heating load in the winter could create new peaks and open opportunities for winter DR.

On August 31, 2022, FERC accepted MISO's proposal to move to seasonal resource adequacy requirements rather than a single requirement based on the summer peak. MISO proposed this seasonal resource adequacy construct to address significant increases in emergency events that occur year-round, driven by factors including generation retirements, reliance on intermittent resources, outages resulting from extreme weather events, and declining excess reserve margin. MISO implemented the new seasonal resource adequacy construct in the Planning Resource Auction held in April 2023.

NSP started AMI deployment in 2022. As of September 2023, over 500,000 meters were installed, and the deployment is set to complete the rollout of the AMI infrastructure in 2025 (Northern States Power Company 2023b). AMI is a key element of the modern grid and can open the doors to the emergence of load management through time-varying rates. Like the rest of the country, Minnesota and the rest of the Midwest experienced rapid emergence of storage as well as enabling technologies, such as smart thermostats, smart appliances, and commercial load control automation tools. Notably, Xcel Energy's Grid Modernization plan includes leveraging distributed energy resource management system (DERMS) strategy and assessment in the short term and increasing focus on EV pilots, infrastructure, and energy storage in the short-to-longer term. These technologies expand the possibilities for DR to extend beyond the peak shaving service to achieve Load Flexibility. Projected future enabling technologies cost declines will likely enable increased adoption of the technologies. At the present time, however, these emerging technologies have yet to experience meaningful cost declines, integration, and communication protocols have yet to be tested and confirmed, and customer comfort has yet to be deepened. Furthermore, cost recovery avenues will need to evolve to support the integration of the enabling technologies. Cost recovery for demand management programs under the prior Conservation Improvement Program (CIP) rider was challenging.[8] However, recent revisions to Minnesota State Statutes enhance utility cost recovery for "load management activities," thereby opening the door for additional Load Flexibility opportunities. Customer adoption and engagement are important to consider as well. Integration of DERs and continuous management of demand will require a different customer engagement and incentive structure from the more traditional incentive structures aligned with the limited dispatch of DR resources.

NSP refers to traditional DR as load management and includes DR resources that achieve peak demand reductions during summer load in a similar fashion as a combustion turbine.

Non-traditional DR, which NSP refers to as demand management, includes options that allow customers to plan for and manage their demand differently by shifting load during different times of day impacted by new rate structures and new resources.

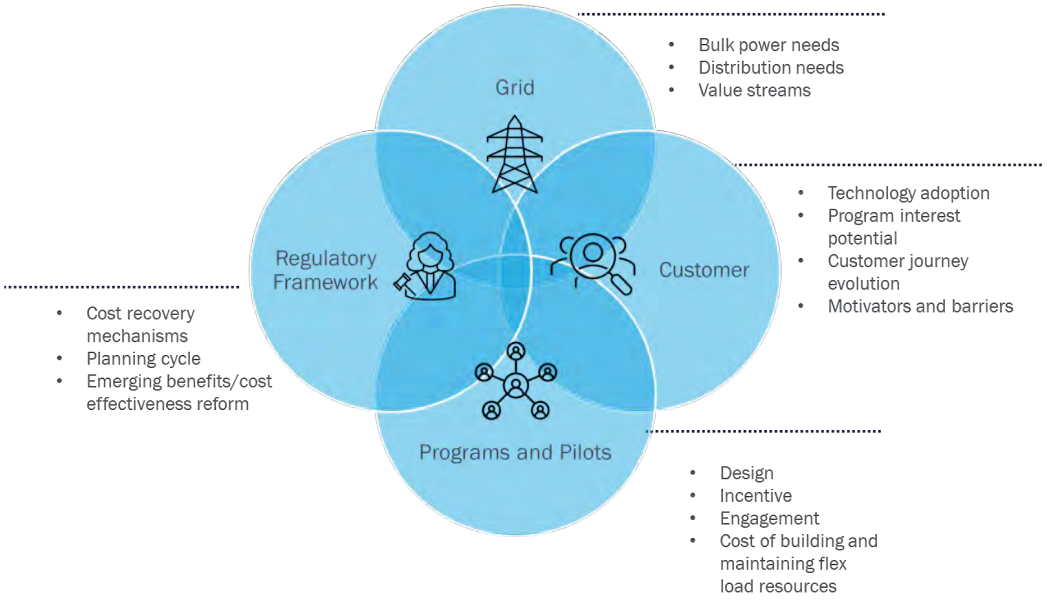
These anticipated changes in the market present an opportunity to revisit emerging challenges, opportunities, and value streams. NSP has made initial steps toward a meaningful transition to Load Flexibility by bifurcating traditional and non-

[8] Based on the 2019 IRP filings, while DSM programs were approved through CIP, prior decisions suggested that enabling technologies largely fell outside of the parameters for cost recovery through CIP (as did incentives for thermal storage capabilities associated with grid-enabled water heaters). Xcel Energy also experienced challenges with providing incentives for customers to purchase Level 2 smart chargers offering time-controlled charging.

traditional DR, as well as traditional and non-traditional value streams. NSP has also begun the process of assessing the potential, value stacking, and alignment of value streams with load and demand management needs. The market trends described above support the growing need for DR solutions that deliver benefits beyond curbing the need for capacity generation. NSP commissioned a 2019 potential study that identified a series of both common and emerging benefits from DR. These benefits included more traditional benefits, such as avoided generation capacity costs, reduced peak energy costs, and system-wide deferral of transmission and distribution upgrades, as well as additional benefits, such as geotargeted distribution capacity investment deferral, ancillary services, and load building/valley filling services. The potential study identified differential needs and opportunities for DR depending on the scenario and DR use cases—setting the foundation for pursuing further transformation of the DR paradigm. However, significant effort remains to identify, design, and implement DR solutions that prove the additional benefits under emerging generation, DER adoption, and technological advancement conditions. Furthermore, incorporating customer preferences and differential incentive mechanisms aligned with load management opportunities to ensure continuous customer engagement and participation will be important to explore and consider.

Preparing for Transformational Change

In these evolving conditions, the path forward requires a phased and thoughtful approach to assess, quantify, and deploy flexible load resources. Building out and maintaining these resources, whether managed charging, direct load control, or commercial DR offerings, can incur costs, both initially and in perpetuity, as long as the programs remain active. However, thoughtfully designed programs that carefully consider four intersecting spheres (depicted to the right) can bring immense value to both the utility and the customer. Importantly, these spheres overlap, providing points of integration as well as tension when formulating NSP's future engagement with load flexibility. For example, integrating a regulatory framework focused on cost causation with customer preferences associated with DER adoption may highlight rifts in traditional valuation molds. As a result, the intersections of these spheres are areas in which stakeholder engagement and discussion become increasingly germane to successful outcomes.



A thoughtful transition supported by careful planning to ensure sufficient capacity is available with the right characteristics—flexibility and fast response—to meet reliability needs at both bulk power and distribution levels is no small feat. Accordingly, such a transition cannot and should not happen overnight. The development of these flexible load resources should first rely upon well-established programs and offerings (and associated value streams) in support of the development of emergent pilots and initiatives to bridge the gap from short-term conditions to longer-term needs. A two-phased approach can help adequately prepare for the transition.

- Phase I: Next three to five years: *Plan and assess*. Reflects a period of initial transition, planning, assessment, and positioning DR toward a transformational shift to Load Flexibility, requiring iterative approaches rather

than deterministic outcomes. This phase will offer careful consideration of the customer journey, value streams, and relevant program designs.

- Phase II: Next five to ten years: *Transition*. Build out a flexible load resource portfolio to satisfy likely load management challenges at the distribution level, as well as at the bulk power level. Ensure that the portfolio is sufficiently adaptable to demand forecasts.

To that end, Phase I should focus on preparing to transition NSP's DR portfolio across these four spheres: grid, customer, programs and pilots, and regulatory framework.

The Grid

Anticipated Evolution

- Seasonally varying generation system needs, constraints, and value streams
- Emerging distribution system needs, constraints, and value streams
- Emerging need to balance intermittent renewable sources of generation with evolving demand for electricity

Evolving grid needs will likely:

- Shift emphasis away from DR as simply a resource needed to satisfy RA and RM planning requirements, and instead towards active, high frequency load management.
- Unlock new value streams for flexible load solutions, such as deferred/avoided distribution system upgrades and seasonally variable value, given MISO's transition to the seasonal construct.
- Open pathways for new programs and pilots to tap into the emerging value streams, both temporally and locationally. For example, the adoption of AMI infrastructure and the emergence of new enabling technologies, DERs, and aggregation mechanisms will likely create avenues for rate-based programs and EV managed charging programs that focus on load shifting and flattening. In other cases, DERs like renewables plus storage, as well as vehicle-to-grid programs, will be capable of absorbing excess energy during times of low demand and dispatching it during times of constraint.
- Increase complexity of program interactions, as well as uncertainty around the best ways to build portfolios and stack programs to achieve the greatest grid benefits. As a result, adaptability, optionality, and flexibility will be key.

Considerations

Identify how existing DR and novel Load Flexibility offerings can best fit into the seasonal MISO construct.

Identify the extent of distribution constraints and needed upgrades to assess the best pathway for Load Flexibility to deliver locational relief. Forecasting load at the distribution level will support thoughtful planning and deployment of Load Flexibility solutions. Exploring customer composition at the distribution level (e.g., mostly commercial, mostly industrial, multifamily, etc.) will support tailoring flexible load solutions to maximize impact.

Identify interventions that support balancing intermittent renewable resources and DER adoption. For example, time-varying rates and EV managed charging solutions can permanently flatten the ramp and improve load factor. Storage solutions can support grid services. Xcel Energy is already testing storage as a load management opportunity through the Thermal Energy Storage Pilot approved under the Load Flexibility Plan in Docket No. E002/M-21-101.

Quantify unlocked value streams given evolving grid needs to guide portfolio design and program prioritization.

Customer

Anticipated Evolution

- Growing penetration of enabling technologies and end-user automation solutions
- Growing presence of DERs, such as EVs and battery storage
- Customers as “prosumers” able to consume and provide grid power

Emerging grid needs described above combined with customer evolution will likely:

- Require greater customer education around continuous load management, which differs from existing participant experiences with event-based load curtailment. The educational efforts will potentially include the concept of “reverse DR” to support excess generation during certain times of the day—a counterintuitive concept to customers.
- Require differing levels of customer engagement, depending on the load flexibility approach, DER type, and/or presence of enabling technologies. Engagement can range from permanent habitual change to event-based temporary actions to changing energy-using patterns. The enabling technology will impact the level of effort and engagement for customers.
- Require re-consideration or redesign of customer incentives and rewards, given the shift to a more continuous load management framework (Faruqi et al. 2014).

- Increase the complexity of considerations and choices related to customer engagement with Load Flexibility solutions. A greater variety of Load Flexibility options—including locationally focused programs to support distribution grid needs—may require consideration of customer engagement in multiple programs (e.g., time-varying rates stacked with event-based load curtailment programs), as well as customer evolution across the portfolio given developing customer comfort with Load Flexibility concepts, adoption of DERs, and enabling technologies.

Considerations

Understand customer technology adoption trends, willingness to adopt, drivers, and preparedness to adopt load flexibility solutions. This research will allow NSP to select and phase program development and launch in alignment with market and customer adoption trends. NSP has already commissioned foundational research, including research conducted in 2014 to assess customer adoption rates and incentive levels (Faruqi et al. 2014).

Assess customer adoption potential to identify pathways for transitioning or integrating flexible load programs into the existing DR portfolio or transitioning customers from existing programs into new ones.

Review case studies across the country to assess customer preparedness to adopt Load Flexibility programs. Such a review will allow NSP to benchmark successes and identify barriers.

Understand customer knowledge, needs, and values to support incentive design allowing NSP to strategically build customer evolution pathways.

Programs and Pilots

Anticipated Evolution

- Growth of non-traditional pilots and programs to support evolving customer needs and grid services
- Shift to programs focused on continuous load management
- Increased opportunities for automation given growth of enabling technologies and DERs

Emerging grid and customer needs described above, combined with the anticipated evolution of programs and pilots, will likely:

- Require a shift in program design, customer enrollment and participation models (e.g., dual participation), and incentive levels to support continuous load management. For example, future portfolios must consider whether customers can participate in multiple programs or limit engagement to a single program and the implications for value streams.
- Require additional and refreshed program marketing and customer education.

- Require revisiting value streams and cost-effectiveness frameworks, as well as quantifying value streams associated with pilots, to better capture the full stack of program benefits, likely beyond grid services.
- Require assessing the ability of existing systems to support new program designs. Lessons learned from time-varying rate deployment stress the importance of integrating and building out required internal systems to deploy these programs for a seamless and efficient customer experience (e.g., billing, metering). This build-out is critical in advance of any opt-out (default enrollment) program design. In addition, these activities will also support continuous load management program designs at the grid edge, such as managed charging telematics metering, among others, to ensure that customer and technology communications and protocols are executed effectively as the number of events or interventions increase in frequency (e.g., summer and winter, seasonal, continuous).
- Require alignment of future processes to ensure reliability, efficient use of resources, maximization of customer benefits, and successful implementation of public policy.

Since 2019, NSP has augmented its DR portfolio to address future grid, customer, and regulatory needs. More specifically, because traditional DR programs may be approaching enrollment saturation (Hledik et al. 2019), NSP has developed non-traditional DR pilots to lay the groundwork for the load flexibility transition. These pilots include the EV Optimization pilot, Peak Flex pilot, Commercial Thermal Storage pilot, Residential Time of Use pilot, General Time of Use pilot, Critical Peak Pricing pilot, and Peak Day Partners. NSP's non-traditional DR pilots are currently offered to residential, commercial, and industrial customers to encourage load shift, shed, and shaping—which support designing programs with peak period flexibility that can respond to changing peaks due to renewables adoption, local peaks, distributional constraints, or other triggers. NSP has begun offering a range of time-varying rates (TOU, CPP), building upon the deployment of AMI infrastructure to develop a robust offering of interventions with lower customer enrollment.

Considerations

Design and develop pilots that offer customer and grid value for the future grid, including flexible peak periods to support continuous load management at a portfolio level, as well as targeted and locational programs to unlock avoided distribution cost benefits.

Implement evaluable pilots that support decisions for scale (e.g., develop program theory and logic models, demonstrate emergent technologies, determine customer journey and value, identify and document grid benefits).

Ensure that communication protocols and systems effectively build a foundation for large scale deployment of time varying rates.

Conduct customer research to determine whether customer incentives align with grid value; identify opportunities to integrate and aggregate DER values.

Identify and quantify new unlocked value streams.

Regulatory Framework

Anticipated Evolution

- Increasing regulatory pressure to expand DR MW potential
- Evolving cost-effectiveness paradigms
- Expansion of realizable DR value streams

Evolving regulatory frameworks will likely:

- Demand that NSP further expand DR MW potential in the face of climate goal mandates and evolving grid needs and capabilities.
- Allow for revised regulatory acceptance of non-traditional DR, including Load Flexibility offerings that were previously deemed not cost-effective under prior regulatory paradigms. These regulatory changes can open the floodgates for previously untapped Load Flexibility opportunities in NSP's service territory. Regulatory headwinds have already begun to shift, as marked by the recent change to Minnesota Statutes regarding rules concerning cost-effective load management programs. Going forward, NSP will be able to test and develop even more innovative non-traditional DR pilots and programs.
- Expand DR value streams, such as distributional value streams, and increase non-dispatchable renewable energy integration.

Considerations

Collaboratively work with stakeholders to revise, refine, modernize, and adapt regulatory frameworks as needed to ensure (1) the ability to flexibly adapt programs and pilots to rapidly changing technological landscape and continuously evolving needs of the customers and the grid; (2) collaborative assessment of emerging value streams from DERs and incorporating them into the cost recovery, cost-effectiveness, and other frameworks to reflect the full stack of benefits available from DERs.

Explore effective filing processes such as the load flexibility petition and/or R&D in ECO filings.

Identify and gain regulatory approval for other novel methods to incentivize customers to participate in Load Flexibility programs.

APPENDIX A. DETAILED CASE STUDIES

Public Service Company of Colorado Renewable Battery Connect Program

Load Control Strategy

Starting as a pilot offering in 2021, the Public Service Company of Colorado's (PSCo) Renewable Battery Connect Program charges and discharges residential solar-powered batteries during low and high-demand periods, respectively. Although events can be called at any time during the year, discharge events typically take place on the hottest days of the year, during the afternoon and evening. The remainder of the events target non-summer months to evaluate non-summer performance and solar time shifting. The program is limited to 60 events per year, with most of the charging events lasting around two hours and the majority of the discharge events lasting around three hours. Customers are divided into four groups to test a Randomized Control Trial to estimate baselines and load impacts associated with the program. There is a fifth group for customers located behind constrained feeders, which can allow for geotargeted load relief. This program uses both charge and discharge load control strategies, dispatching batteries to either charge (thereby utilizing excess solar capacity) or discharge to power participating homes and send excess power back to the grid (providing demand relief to the grid).

Program Implementation

The program is implemented by PSCo, which handles recruitment, event dispatch, and incentive distribution.

Program Design: Recruitment, Enrollment, and Opt-Outs

Eligible customers are recruited via solar and battery providers, as the battery equipment must be newly installed through an interconnection application with the Company. For their participation, participants receive $500 per kW of energy storage installed (up to 50% of the equipment-only cost)[9] and a $100 annual participation incentive (for five years) for participating in control events. There is no way to opt out of a given event other than unenrolling from the program altogether.

Program Design: Eligibility

Single-family residential homes and small business customers with solar systems and a newly installed Tesla Powerwall or SolarEdge Home Hub Inverter with a SolarEdge Home Battery are eligible to participate. Further, customers must have an interconnection agreement with PSCo and maintain the connection of their Tesla Battery and/or SolarEdge inverter through a cellular or high-speed internet connection.

Program Achievements: Enrollments and DR Potential

The pilot (which ended in September 2022) had 152 participants as of the pilot's end, yielding an estimated 1.7 MW of DR potential. The scaled program currently has 65 fully enrolled participants with 90 batteries, and another 200 applications are currently going through the interconnection process. Evaluated program impacts are still forthcoming. The program has a target of 1,850 participating customers and 10 MW of DR potential by the end of 2025.

[9] Income-qualified customers receive an increased incentive of $800 per kW of energy storage installed (up to 75% of the equipment-only cost).

Pacific Gas and Electric Peak Power Rewards Program

Load Control Strategy

Launched in 2023, Pacific Gas and Electric's (PG&E) Peak Power Rewards (PPR) Program discharges residential solar-paired batteries every day from 7:00 p.m. to 9:00 p.m. from August to October. This load control strategy dispatches batteries to power participating homes and to send excess power back to the grid.

Program Implementation

The program is implemented by Sunrun, which handles recruitment, remote battery programming and optimization, and incentive distribution.

Program Design: Recruitment, Enrollment, and Opt-Outs

All eligible customers are recruited via marketing materials sent from Sunrun notifying the customer that their home will be enrolled in PPR and they will receive incentives for their participation. Eligible customers are auto-enrolled in PPR and must manually opt out if they do not wish to participate in the program. PPR participants receive a $750 VISA gift card in exchange for their participation. PPR participants also receive a smart thermostat (unless they already received one through a different PG&E program). However, the smart thermostats are not dispatched during battery discharge events. Rather, the additional device serves as a participation incentive and offers another tool that customers can use to manage their load in the face of nightly events. The batteries are programmed to dispatch every day during the event season—there is no way to opt out of a given event other than unenrolling from the program altogether. Sunrun may clawback any unused funds on the VISA gift card if a participant subsequently unenrolls from the program.

Program Design: Eligibility

Single-family residential homes with Sunrun solar systems and LG Chem, SolarEdge, or Tesla Powerwall batteries are eligible to participate. Further, customers must have an interconnection agreement with PG&E and may not be enrolled in other demand response programs.

Program Achievements: Enrollments and DR Potential

Initially, the program was limited to 7,500 participants. Following low opt-out rates and rising interest in solar+storage, the program cap was met and subsequently expanded to 8,500 customers, yielding an estimated 34 MW of DR potential.[10] Evaluated program impacts are still forthcoming.

Portland General Electric Multifamily Water Heater Pilot

Utility Background

Portland General Electric (PGE) is Oregon's largest electric utility, serving the state's two largest cities (Portland and Salem) and the surrounding communities. PGE has over 900,000 retail customers within a service area of 1.9 million residents, which encompasses approximately half of Oregon's population and about 75% of Oregon's commercial and industrial activity.[11] PGE is vertically integrated, providing generation, transmission, and distribution. Figure 1 illustrates PGE's Generation Portfolio. PGE owns and operates its own hydro generation facilities; however, it also purchases some of its hydropower from the Bonneville Power Administration (BPA).

Figure 1. PGE Generation Portfolio

Source: PGE Clean Energy Plan and Integrated Resource Plan 2023

While PGE is an electric-only utility, natural gas is used abundantly in their territory and fuels much of the space and water heating in their service area. Despite the comparatively mild weather, air conditioning load has grown considerably over the last decade or so. This insurgence of mechanical air conditioning, combined with moderate levels of electric space and water heat in single-family homes[12] and high penetration of these electric end uses in multifamily buildings,[13] helps explain why PGE is a dual-peaking utility. As seen in Figure 2, PGE's winter peak is currently greater than its summer peak, but the two are expected to converge in the next decade or so (likely due to anticipated air conditioning load growth and potentially hotter summers). PGE's summer peak occurs in the late afternoon/early evening. Meanwhile, their winter season experiences two daily peaks: one in the morning and another in the late afternoon/early evening.

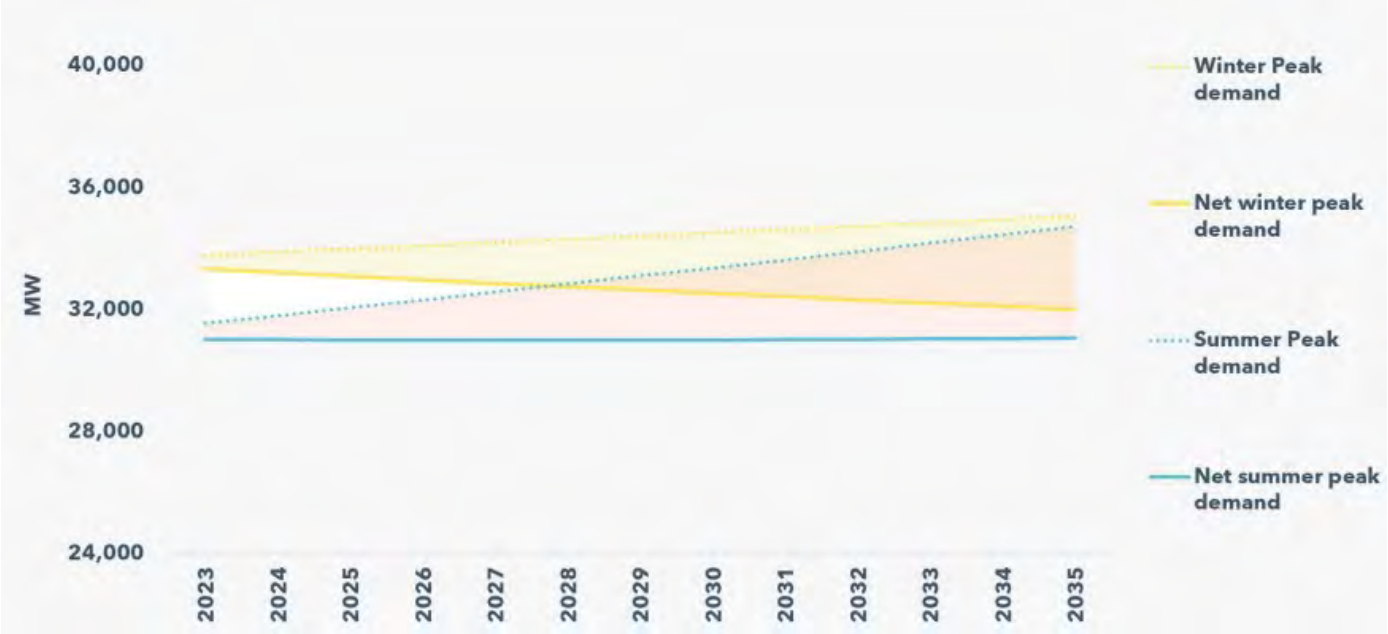
Figure 2. PGE Peak Load Forecasts



Source: PGE Clean Energy Plan and Integrated Resource Plan 2023

Program History

PGE participated in a BPA-managed NW Power Conservation Council water heater Load Flexibility study and has since grown its own multifamily program into over 10,000 units. The BPA pilot used the EcoPort predecessor (CTA-2045 + FM signals) to communicate with and dispatch single-family water heaters. Although successful, there were technological challenges with the communications technology. Specifically, they were clunkier and not standardized, and customers would often uninstall them. A subsequent PGE single-family pilot struggled to meet enrollment needs, as enrolling owner-occupants proved challenging. This single-family pilot tested various communications pathways: cellular LTE and utility mesh network. Meanwhile, PGE also set up a multifamily pilot, which has proved to be very successful, as working with multifamily property managers (who receive an annual cash incentive per enrolled water heater) has proved to be a successful enrollment strategy. The information in this section represents PGE's current Multifamily Water Heater Pilot.

Load Control Strategy

Launched in 2018, PGE's Multifamily Water Heater Pilot uses wi-fi and cellular switches to dispatch 38–50-gallon electric resistance water heaters in multifamily properties every non-holiday weekday.[14] Dispatch times depend on grid needs and are typically 5:00 p.m. to 8:00 p.m. in the summer, while winter months see both morning (typically 6:00 a.m. to 9:00 a.m.) and evening (typically 5:00 p.m. to 8:00 p.m.) dispatches. PGE will extend events by an hour or two when other [non-daily] DR programs are being called to minimize snapback [event end] peaks. Individual events are capped at eight hours, although PGE has yet to exceed five. This load control strategy effectively converts water heaters into thermal batteries, heating water when demand is low and providing load relief during daily peaks without sacrificing tenant comfort.

[14] PGE stopped installing wi-fi units in October 2019, as cellular switches are significantly more likely to maintain the connectivity needed for dispatch.

Program Implementation

The program is implemented by PGE, which handles recruitment, enrollment, and incentive distribution. PGE uses local trade allies to install the switches.

Program Design: Recruitment, Enrollment, and Opt-Outs

PGE recruits multifamily property management companies to opt their units into the pilot. In exchange, property management companies receive an annual cash incentive of $20 per connected water heater. The pilot also provides tenant incentives in the form of coupons to local businesses.[15] On installation day, a tenant may refuse entry to the contractor, or the contractor may not be able to enter the unit if there are unaccompanied minors or loose dogs, which in turn prevents the switch from being installed. These circumstances are fairly rare, as shown by the pilot installation rate of 89%. Upon installation, tenants receive educational materials that explain the pilot and voluntary opt-out instructions. The pilot has yielded a tenant opt-out rate of <1% and tenant surveys have demonstrated that most did not realize they were in a program in the first place nor that they had experienced any hot water shortages. Of the pilot's 1,000,000+ touches, <1% have resulted in cold water calls to PGE, and of those, <1% end up being at the fault of the program. If the tenant chooses to opt out, the installed device will stay in place but will no longer be in operation until a new tenant moves in.

Program Design: Eligibility

Multifamily properties with at least 50 individually metered units that have 38–50-gallon electric resistance water heaters are eligible to participate. PGE will not install retrofit control switches on units that are >20 years old. As new smart water heaters with CTA-2045 capabilities begin to penetrate the market, PGE will install EcoPort communications devices on these modern units.

Program Achievements: Enrollments and DR Potential

As of the end of 2022, PGE installed over 13,000 switches, averaging ~2,600 new installations per year. These switches are distributed across 111 properties and 32 property management companies (including 12 of the 25 largest in PGE territory). Evaluated impacts demonstrated 0.2kW per unit in summer and 0.35kW per unit in winter, resulting in an annual capacity of 2.4MW in the summer and 4.5MW in the winter.

[15] Tenant incentives are currently being reevaluated due to the closure of the local coupon company partner.

APPENDIX K – ENVIRONMENTAL REGULATIONS REVIEW

I. INTRODUCTION

This appendix provides high level discussions on environmental regulations impacting planning and operation of the Company's assets.

II. GREENHOUSE GAS AND CLIMATE LEGISLATION AND REGULATION

A. New Source Performance Standards 111(b) and (d)

On May 11, 2023 the U.S. Environmental Protection Agency (EPA) released a four-part proposal under their Clean Air Act authorities to regulate CO2 emissions from the power sector. The proposal included:

1) Repeal of the Affordable Clean Energy rule;
2) Regulations for new natural gas generating units pursuant to Clean Air Act section 111(b), hereafter referred to as 111(b);
3) Regulations for existing natural gas generation pursuant to Clean Air Act section 111(d), hereafter referred to as 111(d); and
4) Regulations for existing coal generation pursuant to section 111(d).

Xcel Energy filed comments on the proposed rule on August 8, 2023. We anticipate a final rule will be released in spring of 2024. Potential impacts of these new regulations have been incorporated into modeling efforts as a sensitivity recognizing that impacts on our existing natural gas fired units, discussed below, located at our Black Dog, and High Bridge facilities could be significant if the regulation is finalized as proposed. We provided an initial assessment of the potential impacts to our system to the Department in information request number 128 filed in docket number E002/RP-19-368 on July 28, 2023 with a supplement filed August 16, 2023.

Since the rule is in a proposed state and not yet finalized, it is uncertain how the rule will ultimately impact operation of our facilities. If the rule is finalized as currently proposed, there will be no impact from the repeal of the Affordable Clean Energy rule for any utility, as the D.C. Circuit Court vacated the rule on January 19, 2021, and remanded the rule to the EPA for further proceedings. Nor will we be adversely impacted by the regulations setting standards for existing coal generation under section 111(d) if adopted as proposed,

as all NSP coal units are scheduled to cease operation by December 31, 2030. Sherburne County Generating Plant (Sherco) Unit 3 will be our only coal unit operating in the Upper Midwest in 2030, and will technically be impacted in 2030 with a unit-specific limit based on a five-year lookback period. As long as the unit does not increase emissions of carbon dioxide (CO2) in 2030, it should be able to comply with the limit.

The Company may be impacted by the proposed regulations for new natural gas generating units and the proposed regulations for existing natural gas generation units.

The proposed rule for new gas units requires implementation of the best system of emission reduction (BSER) and includes sub-categories for low, intermediate, and base-load units. For low load units (<20 percent capacity factor), the BSER is the use of fuels (natural gas, Nos. 1 & 2 fuel oil) for meeting emission standards. For intermediate load units (capacity factor that ranges between 20 percent and a source-specific upper bound), the standards of performance for Phase 1 require highly efficient operations and for Phase 2 require meeting an emission rate equivalent to blending 30 percent hydrogen beginning in 2032. For base load units (units operating above the upper-bound threshold for intermediate load units), the standards of performance are set based on whether a unit chooses the carbon capture and sequestration (CCS) pathway or the hydrogen pathway. For CCS, the unit must meet standards based on 90 percent capture of CO2 by 2035. For hydrogen, the unit must meet a Phase 2 standard based on co-firing 30 percent hydrogen by 2032 and a Phase 3 standard based on co-firing 96 percent hydrogen by 2038. EPA has designed these two pathways – hydrogen blending or CCS – so that they achieve the same level of CO2 emission reductions by 2038.

The standard for existing gas units impacts units with a nameplate capacity greater than 300 MW and capacity factors greater than 50 percent. The proposed emission guidelines also offer the two-pathway approach of hydrogen blending or CCS on the same timeline as the new baseload unit standard described above. States are given primary responsibility in establishing compliance pathways for existing units through state plans, which are required to be submitted to EPA for approval within two years after the final rule is issued. In developing state plans, the states can consider the remaining useful life and other factors of the existing source in setting standards of performance that reflect the EPA emission guidelines. Therefore, impacts to specific plants will depend on state plans and could diverge from the emission guidelines. Given this state plan process, it is difficult to predict outcomes at this time. Depending on capacity factors, Black Dog Unit 5/2, Riverside Units 9 and 10, and High Bridge Units 7 and 8 may be affected by this standard. For modeling purposes, as a sensitivity, we have presumed that Riverside Units 9 and 10 are not affected by the rule but that Black Dog Unit 5/2, and High Bridge Units 7

and 8 are affected. The affected units have been modeled in the sensitivity with a presumed 50 percent capacity factor limitation so that the units are not required to make any modifications based on the proposed rule.

For existing coal fired steam generating units, the rule provides three sub-categories based on the planned retirement date of the generating unit. Xcel Energy expects all of our coal units to fall into the "Imminent-term" retirement category which requires a unit to permanently cease operation before January 1, 2032. This timeline is consistent with the retirement dates in our filed resource plans.

B. MN Legislation 100 by 2040

In 2023, the Minnesota Legislature passed a new law requiring utilities, including Xcel Energy, to generate or procure carbon-free energy equivalent to 100 percent of its Minnesota retail sales by 2040. The law, Minn. Stat. § 216B.1691, also requires Xcel Energy to achieve interim carbon-free standards of 80 percent by 2030 and 90 percent by 2035, and a renewable energy standard of 55 percent by 2035. The Company is positioned to achieve compliance with the new legislation under our 2024 Preferred Plan as presented here. A table demonstrating compliance with the legislation is provided in Table K-1 based on the Preferred Plan modeling outcomes filed in this IRP.

A detailed discussion of this legislation can be found in Chapter 2: Planning Landscape and in Appendix N: Standard Obligations.

Table K-1: 2024 Preferred Plan Carbon-Free Energy

	2030	2035	2040
Carbon-Free Generation (GWh)	46,515	52,681	60,162
MN Allocated CF Generation (GWh)	35,644	40,668	46,666
MN Elec Retail Sales (GWh)	35,725	39,668	44,624
Percentage Carbon Free Generation	80+%	90+%	100%
Carbon Free Standard Requirement	80%	90%	100%

The Commission has opened an Investigation docket[1] into Minnesota's Carbon Free Standard as codified in Minn. Stat. § 216B.1691, Subd. 2g. Parties, and the Commission will weigh in on a number of topics in that docket over the next couple of years. Some nuances and open questions remain to be considered in that docket, which could influence future compliance depending on implementation requirements.

[1] Docket No. E999/CI-23-151.

III. COST OF CARBON AND EXTERNALITIES

A. Regulatory Cost of Carbon

The Regulatory Cost of Carbon values established by the Commission are applied in our modeling process as a cost adder and impact the selection of resources and how they are dispatched. The CO2 regulatory cost range is applied in resource planning models as a cost faced by any fossil generation resource, affecting both the dispatch of resources and expansion plan choices. The CO2 regulatory cost range is intended as a proxy for regulatory costs that utilities and their customers may face, beginning in the year they are expected to incur these costs, so that resource planning and acquisition decisions can consider the impacts of those costs on long-term capital investments. This cost range is meant to capture regulatory costs only. Societal damages from climate change are separately addressed using the CO2 environmental cost range established under Minn. Stat. § 216B.2422, Subd. 3 and per the December 19, 2023, Commission Order in Docket Nos. E999/CI-07-1199, E999/DI-22-236, and E-999/CI-14-643 Addressing Environmental and Regulatory Costs (Environmental and Regulatory Costs Order) discussed below under MN Externality Values. This is discussed further in Appendix F: EnCompass Modeling Assumptions and Inputs.

On August 1, 2007, the Next Generation Energy Act became effective, which provided direction to the Commission to estimate how the future regulation of CO2 emissions would affect the cost of generating electricity, and directed the Commission to establish a range of these cost estimates, revise them annually, and to use the estimates "in all electricity generation resource acquisition proceedings." Table K-2 below provides a summary of historical and current cost estimates listing only the years where the Commission changed the established cost range per ton of CO2. These Cost of Carbon estimates have not been included in the North Dakota scenarios.

Table K-2: Summary of Historical and Current CO2 Cost Estimates

Year Established Range was Adjusted	Cost Range (per ton of CO2)
2007	$4.00 to $30.00
2011	$4.00 to $34.00
2012	$9.00 to $34.00
2018	$5.00 to $25
2023 (to be applied beginning in 2028)	$5.00 to $75.00

In 2018, the Commission lowered both the lower and upper bound of the regulatory cost range because the Minnesota Pollution Control Agency (MPCA) and the Minnesota Department of Commerce noted in their comments that the price of a permit to emit a ton of CO2 had declined over time, at least as measured in trading exchanges, such as the Regional Greenhouse Gas Initiative (RGGI). In 2020, the Commission did not make any adjustments to the range. The regulatory cost range was modified in 2023 with the new values being applied beginning in 2028.

The purpose of establishing a regulatory cost of carbon from the generation of electricity was to be able to use those values in various modeling scenarios as an estimate of the per ton cost impacts of potential future regulations limiting CO2 emissions. In the 2023 Minnesota State Legislative session, a bill was passed mandating that all Minnesota utilities generate or procure set amounts of electricity from carbon-free energy technologies meeting a prescribed schedule, culminating with 100 percent carbon free generation and procurement in 2040. Additionally, as discussed in the last section, the EPA has proposed standards regulating CO2 emissions from the power sector. It is the position of the Company, and other Minnesota utilities and interest groups, that this legislation obviates the need for the regulatory cost of carbon to continue, as regulations now require the Company and other utilities to comply with CO2 emission constraints which eliminates the need to model potential CO2 emission reduction requirements as a theoretical future cost of regulatory compliance. Thus, the Company – and other parties – still believe $0 should be an acceptable lower bound of the range but have conducted modeling in compliance with Commission Orders.

B. MN Externality Values

The Minnesota Public Utilities Commission ordered the use of externality values for CO2 and criteria pollutants in its order Updating Environmental Cost Values in Docket No. E999/CI-14-643 issued January 3, 2018. For the North Dakota scenarios, these values have not been included.

Values were established by the Commission for emissions of CO2 and criteria pollutants: sulfur dioxide (SO2), nitrogen oxides (NOx), particulate matter less than 2.5 microns (PM2.5), carbon monoxide (CO), and lead (Pb). CO2 values were established considering Federal Interagency Working Group (IWG) Technical Support Document[2] guidance and included costs on a per short ton basis, with a low, mid and high range provided. Values

[2] Available at: https://www.whitehouse.gov/wp-content/uploads/2021/02/TechnicalSupportDocument_SocialCostofCarbonMethaneNitrousOxide.pdf.

for the criteria pollutants were also provided on a per short ton basis for four locations: Urban, Metro Fringe, Rural and within 200 miles of the MN border. A range of low, midpoint and high values were established.

In the new 100 by 2040 legislation, Minn. Stat. § 216B.2422, Subd. 3, the Commission was directed to provisionally adopt and apply the cost of greenhouse gas emissions valuations presented in the United States Environmental Protection Agency's November 2023 Report on the Social Cost of Greenhouse Gases: Estimates Incorporating Recent Scientific Advance[3] (EPA SC-GHG) including the time horizon, global estimates of damages, and the full range of discount rates from 2.5 to 1.5 percent, with two percent as the central estimate. The Commission provisionally adopted and applied the EPA SC-GHG, for purposes of measuring environmental and socioeconomic costs under Minnesota Statutes § 216B.2422, subdivision 3., as reflected in the Environmental and Regulatory Costs Order.[4] The PVSC Base Case Greenhouse Gas (GHG) values, inclusive of carbon dioxide, methane and nitrous oxide, are based on the mid EPA SC-GHG values, with the high and low EPA SC-GHG values as sensitivities per the Environmental and Regulatory Costs Order.

While the regulatory cost of carbon is taken into consideration in modeling in the PVSC scenarios, thus affecting dispatch order, the EPA SC-GHG costs are applied post processing and do not impact dispatch order. The PVRR sensitivity does not include environmental cost adders including regulatory and externality values. All prices are converted from metric ton to short ton and to nominal dollars using two percent escalation factor. The application of these values is further discussed in Appendix F: EnCompass Modeling Assumptions and Inputs.

IV. MN ENERGY OMNIBUS: CUMULATIVE IMPACTS

In 2023, the Minnesota Legislature passed a new law, Minn. Stat. § 116.065, requiring Cumulative Impacts Analysis for Permit Decisions in Environmental Justice Areas (EJ Areas). This law will require applicants seeking air permit actions with potential to substantially impact residents of an EJ Area to conduct cumulative impacts analysis for facilities located in Anoka, Carver, Dakota, Hennepin, Ramsey, Scott, or Washington counties, Duluth and Rochester. The new state definition of Environmental Justice Area

[3] Available at: https://www.epa.gov/system/files/documents/2023-12/epa_scghg_2023_report_final.pdf
[4] ORDER ADDRESSING ENVIRONMENTAL AND REGULATORY COSTS. December 19, 2023. Docket No. E-999/CI-07-1199. Docket No. E-999/DI-22-236. Docket No. E-999/CI-14-643.

was adopted consistent with the 100 by 2040 law, in addition to a new definition of Cumulative Impacts, "the impacts of aggregated levels of past and current air, water, and land pollution in a defined geographic area to which current residents are exposed." If the Cumulative Impacts analysis finds significant adverse impacts would result from the permit action, then a community benefits agreement must be established, or permits may be denied. Additionally, community engagement in EJ Areas will be required during the process.

The full extent of these new requirements is not fully known at this time. The MPCA was given broad discretion and was directed to set new rules governing cumulative impacts analysis and community benefit agreements, which will provide a framework, guidance, and clarify the requirements of this new law. MPCA has opened a general request for comments, related information, and ideas from those affected by the rulemaking which ended October 6, 2023[5] and is early in a three-year process to gather information and draft proposed rules for public comment by May 24, 2026.[6] The Company submitted a supportive letter in response to the initial request for comments providing information on related experience in this area and will likely participate further in the rulemaking process. MPCA has updated its EJ Area Map[7] based on the new state definition, although we note a statistical adjustment is applied which is not consistent with the state definition. The Company operates several existing generation facilities in the greater metro area which will likely be subject to these new requirements when implemented. Dependent upon final MPCA interpretation and rulemaking, the impacts could be significant to permit issuance for existing and new generating facilities.

V. CONVENTIONAL POLLUTANTS & HAZARDOUS AIR POLLUTANTS

This section discusses requirements applicable to air emissions of pollutants regulated under the Clean Air Act (CAA). The four primary regulatory categories addressed are: 1) National Ambient Air Quality Standards (NAAQS), 2) Interstate transport of air pollution, 3) Visibility Impairment in National Parks and Wilderness Areas, and 4) Hazardous Air Pollutants. Each is addressed in the following sections.

---

[5] MPCA Request for Comments on Cumulative Impacts Rule, available at: https://minnesotaoah.granicusideas.com/discussions/39398-minnesota-pollution-control-agency-request-for-comments-on-cumulative-impacts-rule.

[6] MPCA Cumulative impacts rulemaking, available at: https://www.pca.state.mn.us/get-engaged/cumulative-impacts.

[7] MPCA EJ Area Map, available at: https://mpca.maps.arcgis.com/apps/MapSeries/index.html?appid=f5bf57c8dac24404b7f8ef1717f57d00#map.

A. National Ambient Air Quality Standards

The CAA requires the United States Environmental Protection Agency (EPA) to set NAAQS for air pollutants that are common in outdoor air, considered harmful to public health and the environment, and are emitted from numerous and diverse sources. NAAQS include both (1) primary standards to protect public health, including the health of sensitive populations, such as asthmatics, children and the elderly and (2) secondary standards to protect public welfare, including protection against damages to animals, crops and buildings. The EPA has established NAAQS for six pollutants: particulate matter (PM), nitrogen dioxide (NO_2), sulfur dioxide (SO_2), ozone (O_3), carbon monoxide (CO), and lead (Pb). The EPA is required to review the NAAQS every five years and revise them as appropriate to protect public health and welfare.

The CAA requires EPA to conduct periodic review of the science upon which the standards are based and revise the standards if necessary. The process begins with assessments of the updated relevant science, the latest risk/exposure information, and a policy assessment. EPA compiles this information and revises or develops new NAAQS through a public rulemaking process, if warranted.

Once EPA adopts or revises a NAAQS, states have two years to monitor the air, analyze the data and submit to EPA their recommended classification of the state into one of three categories: 1) Attainment areas (areas having monitored ambient air quality concentrations below the NAAQS), 2) Nonattainment areas (areas having monitored ambient air quality concentrations above the NAAQS), or 3) Unclassifiable areas. The EPA reviews the state's submittal and determines final area designations. When EPA designates an area in a state as Nonattainment, the state is given up to three years to develop a new State Implementation Plan (SIP) which identifies actions required to bring the area into Attainment. A SIP must include emission reduction requirements to demonstrate that air quality will attain the NAAQS within a given time period as required by the CAA.

Presently there is only one Nonattainment area in the state of Minnesota, a small nonattainment area for Lead emissions for an area surrounding Gopher Resource Corporation, a lead smelter and battery recycling company in Eagan in Dakota County. As a result, no emission reduction requirements are being imposed on Xcel Energy's Upper Midwest power plants through a state SIP due to NAAQS.

EPA has proposed changes to the PM NAAQS, lowering the level of the annual particulate matter less than or equal to 2.5 microns in diameter ($PM_{2.5}$). Sources

contributing to $PM_{2.5}$ emissions include dust (agricultural, construction and road) and fire (wildfires, prescribed fires and agricultural fires). Other lesser contributing anthropogenic sources of $PM_{2.5}$ emissions nationally include stationary fuel combustion and agricultural sources. In urban areas the largest $PM_{2.5}$-emitting sectors are mobile sources and fuel combustion. Once the proposed rule is finalized the MPCA will need to monitor the air, analyze the data and submit a proposed designation to EPA. EPA will have to review the proposal and issue a designation, then MPCA will develop a SIP to ensure compliance with the new NAAQS. This process will take many years and all Xcel Energy Upper Midwest coal units are committed to retire by 12/31/2030, making it unlikely that any additional controls will be required for NAAQS Compliance for any Xcel Energy units located in Minnesota.

The EPA recently announced (August 21, 2023) that the 2021 Ozone NAAQS reconsideration will be revisited during the 2024 Ozone NAAQS review process. We do not anticipate this process will be concluded prior to 2024.

B. Interstate Transport of Air Pollution

The CAA also requires that NAAQS SIPs include provisions that prevent sources within a state "from emitting any air pollutant in amounts which will … contribute significantly to nonattainment in, or interfere with maintenance by, any other State with respect to any" NAAQS.[8] The EPA has developed programs to reduce interstate transport of pollutants emitted by Electric Generating Units (EGUs) that are precursors to ozone and fine particles focusing on emissions of oxides of nitrogen (NO_x) as a surrogate for NO_2, and is a precursor to ozone and fine particle formation, and emissions of SO_2, which is a precursor to fine particle formation. EPA also has an obligation to ensure that air emissions from upwind states do not result in NAAQS non-attainment in downwind states. This obligation is addressed with the Cross State Air Pollution Rule and is bolstered by the Good Neighbor Plan that further reduces seasonal NO_x emissions by revising and strengthening the Group 3 CSAPR ozone seasonal NO_x allowance trading program. Each of these is described in more detail in the following sections.

1. Cross-State Air Pollution Rule

EPA designed the Cross-State Air Pollution Rule (CSAPR) as a "cap-and-trade" program that reduces overall emissions of SO_2 and NO_x from EGUs. This means that total

[8] CAA, 42 U.S.C. section 7410(a)(2)(D)(i)(I).

emissions from EGUs in a state or region are limited (the cap) and each ton of emissions allowed is represented by an emission allowance that can be transferred among EGUs (the trade). A cap-and-trade program thus reduces total emissions to the capped amount but provides flexibility for EGUs to meet their individual emission reduction requirements through installation of control equipment, purchase of emission allowances from other EGUs, or a combination of both.

CSAPR imposes emission limits on EGU's in upwind states on one or both of the following: (1) summer season NO_x emissions (to address ozone), and/or (2) annual NO_x and SO_2 emissions (to address fine particles), depending on the outcome of EPA's analysis of an upwind state's contribution to Nonattainment in downwind states. In Minnesota's case, the concern is the potential impact of fine particle emissions on Nonattainment areas in downwind states, rather than ozone. Since 2015, CSAPR has applied to Minnesota sources for fine particle precursors and to Wisconsin sources for fine particle precursors and ozone precursors. NSP-Minnesota holds sufficient emission allowances to meet CSAPR requirements, while NSP-Wisconsin has complied through operational changes and the purchase of some allowances.

EPA will continue to use CSAPR as one tool to achieve attainment of NAAQS throughout the country, even as the NAAQS are revised over time.

2. Good Neighbor Plan

On February 13, 2023, the EPA finalized a rule disapproving 19 State Implementation Plan (SIP) submissions (including Texas) and partially approving/partially disapproving two SIP submissions (Minnesota and Wisconsin) addressing the "interstate transport" or "Good Neighbor" provision of the CAA for the 2015 Ozone NAAQS. This action led to a final "Federal Implementation Plan (FIP) Addressing Regional Ozone Transport for the 2015 Ozone NAAQS" that was published in the Federal Register on June 5, 2023, referred to as the Good Neighbor Plan. The Good Neighbor Plan included Minnesota and Wisconsin in the Group 3 ozone NO_x allowance trading program, beginning with the 2023 Ozone NO_x season (May-September 2023).

On April 14, 2023, an industry coalition, including Northern States Power-MN, filed a petition for review in the 8th Circuit Court of Appeals (8th Circuit) regarding the SIP partial disapproval in Minnesota. On May 31, 2023, the coalition filed a motion to stay the SIP disapproval and on July 5, 2023, the 8th Circuit granted a Stay of the SIP Disapproval for Minnesota. This effectively means that the Good Neighbor Plan (CSAPR Group 3 ozone NO_x program) is not in effect for Minnesota during the litigation. Depending on

the litigation outcome, the Good Neighbor FIP may or may not apply in Minnesota after the resolution of the litigation.

The Good Neighbor Plan applied to Wisconsin sources from August 4-September 30, 2023 and will continue to apply in future ozone seasons. Subject sources are required to comply with the Group 3 ozone NO_x program for the entire Ozone NO_x season. NSP-Wisconsin will comply through operational changes and potentially allowance purchases. There is a possibility that the liquidity of the allowance market may tighten resulting in limited allowances being available for purchase potentially resulting in higher allowance costs in years 2030 and beyond due to dynamic budgeting and annual bank recalibrations. Regulated entities will need to monitor the markets and accommodate accordingly for compliance. Depending on the price of future allowances, dispatch order could be impacted and the need to purchase additional allowances could result in significant additional operational costs presuming that allowances are available to purchase on the open market.

These regulations have been incorporated into modeling efforts based upon estimated allowance allocations through 2029 based on information in the proposed rule. Modeling for affected units located in WI have been included in the base case scenario modeling. Modeling for units located in MN – both those owned by the Company or contracted by the Company - have been included as a sensitivity to determine the potential impacts of the rule in case it is ultimately adopted and applied in MN. Modeling efforts are further discussed in Chapter 5: Economic Modeling Framework and Appendix F.

C. Visibility Impairment in National Parks and Wilderness Areas

Visibility impairment is caused when sunlight encounters pollution particles in the air. Some light is absorbed, and other light is scattered before it reaches an observer, reducing the clarity and color of what the observer sees. The CAA established a national goal of remedying existing, and preventing future, visibility impairment from man-made air pollution in specified "Class I" areas: national parks and wilderness areas throughout the United States, including the Boundary Waters Canoe Area (BWCA) and Voyageurs National Park (VNP) in Minnesota. The visibility programs focus on reducing emissions of PM, SO_2 and NO_x as pollutants that can result in visibility impairment from EGUs.

The EPA has taken a two-step approach to implement the visibility program. The first step, "reasonably attributable visibility impairment" (RAVI), was implemented in the 1980s to address visibility impairment reasonably attributable to a specific source. In 1999, the EPA adopted the Regional Haze Rule (RHR) to address widespread, regionally

homogeneous haze that results from emissions from a multitude of sources. State environmental agencies are required to submit SIPs that develop and implement their strategy to reduce emissions that may contribute to regional haze. RHR SIPs must also include reasonable progress goals and periodic evaluation/revision cycles designed to ensure appropriate progress toward the national goal of no human-caused visibility impairment in Class I areas by 2064. These SIPs must be revised approximately every ten years to continue making reasonable progress toward reaching the 2064 national goal.

The MPCA developed, and EPA approved, Minnesota's regional haze plan for EGUs for the first ten-year planning period of the program. The MPCA's plan for Sherco Units 1 and 2 required combustion controls to reduce NO_x emissions (Over-Fire Air (OFA), combustion controls and Low- NO_x burners) and scrubber upgrades to reduce SO_2 emissions. These controls were installed and are in operation.

On December 20, 2022, the MPCA submitted a comprehensive SIP update for the second regional haze implementation period (2018-2028). The update for the second implementation period outlines significant improvements in visibility at BWCA and VNP, identifies additional emission reduction opportunities, examines the uniform rate of progress projected to 2064, and sets reasonable progress goals for 2028. The update utilizes federally enforceable conditions setting Xcel Energy unit retirement dates to satisfy emission reduction requirements:

- Sherburne County Unit 2 – by 12/31/2023 (air emission permit condition)
- Sherburne County Unit 1 – by 12/31/2026 (air emission permit condition)
- Allen S. King Unit 1 – by 12/31/2028 (Administrative Order)
- Sherburne County Unit 3 – by 12/31/2030 (Administrative Order)

The MPCA's plan update is under EPA review.

D. Hazardous Air Pollutant Emissions

1. Mercury and Air Toxics Regulation

Both state and federal regulations require reductions in Hazardous Air Pollutant (HAP) emissions, which includes emissions of mercury and air toxics, from power plants. In 2006, the Minnesota Legislature passed the Minnesota Mercury Emissions Reduction Act (MMERA) which required reductions of mercury emissions from coal fired power plants and in 2012, the EPA adopted its rule establishing National Emission Standards for Hazardous Air Pollutants (NESHAPs) from coal- and oil-fired power plants. This rule is

often referred to as the Mercury and Air Toxics Standard (MATS), and compliance was required in 2015. Mercury controls were installed and are operational on all three Sherco units and at King based on these regulations.[9]

MATS also set emission limits for acid gases and non-mercury metals. PM is a surrogate for non-mercury metal emissions and SO_2 is a surrogate for acid gas emissions. The Sherco and King plants meet these standards using control technologies and best operational practices.

In May 2020, EPA finalized the risk and technology review (RTR) for the MATS coal- and oil-fired EGU source category. *See* 85 Fed. Reg. 31,286 (May 22, 2020) (May 2020 Rule). According to the May 2020 Rule, the residual risk assessment indicated that air toxics emissions from the source category are acceptable and that the current standards provide an ample margin of safety to protect public health and prevent an adverse effect on the environment. Further, the May 2020 Rule did not identify any cost-effective controls that would achieve further emission reductions. Accordingly, the May 2020 Rule concluded that no revisions should be made to MATS. The May 2020 Rule also rescinded the Agency's 2016 finding that it was "appropriate and necessary" to regulate HAPs from coal- and oil-fired EGUs under Section 112 of the Clean Air Act via the MATS.

In January 2021, President Biden signed Executive Order 13990, titled *Protecting Public Health and the Environment and Restoring Science to Tackle the Climate Crisis* (EO 13990). EO 13990 requires agency heads to review Trump Administration actions "that were harmful to public health, damaging to the environment, unsupported by the best available science, or otherwise not in the national interest." EO 13990 contained a non-exhaustive list of the actions to be reviewed, which included the May 2020 Rule. In March 2023, EPA published a final rule that reinstated and reaffirmed the 2016 "appropriate and necessary" finding and indicated that the Agency would address the MATS RTR in a separate rulemaking. *See* 88 Fed. Reg. 13,956 (Mar. 6, 2023).

On April 24, 2023, EPA published in the *Federal Register*, at 88 Fed. Reg. 24,854, the proposed MATS Residual Risk and Technology Review that would amend the NESHAP for coal- and oil-fired EGUs. In this action, the EPA is proposing to lower the emission limit for filterable particulate matter (fPM), eliminate the total and individual non-mercury metal HAP metals emission limits, require the use of continuous emissions monitoring

[9] The CAA requires that EPA review standards such as MATS each eight years to determine if control technology has improved and if the residual emissions left after compliance with the MATS pose additional residual risk to the public. EPA recently proposed to find that, based on its review, no revisions to the MATS are required. 84 Fed. Reg. 2670 (Feb. 7, 2019).

systems (CEMS) to demonstrate compliance with the fPM standard, lower the Hg emission limit for lignite fired EGUs, and eliminate one of the two definitions of "startup" in MATS. The proposed compliance deadline for the fPM emission limit reduction and fPM CEMS is three years after the effective date referenced in the final rule at promulgation. For units that use startup definition two, they must comply with startup definition one within 180 days after the effective date referenced in the final rule at promulgation. Due to the proposed compliance dates, impacts of this action may be limited. Sherco 1 and 2 will have been retired within that compliance timeline, and King may be retired depending on the final compliance deadline. As such, impacts will be limited to Sherco Unit 3, and would include the lower fPM emission limit, the requirement to install fPM CEMS, and the elimination of startup definition two which the unit currently relies on, if the rule is finalized as proposed. Xcel Energy has worked with industry partners to develop and submit comments to further minimize the impacts of this rule on our operations.

2. Industrial Boiler Maximum Achievable Control Technology (IB MACT) Rule

In 2011, the EPA adopted emission limits for HAPs from industrial boilers and process heaters fueled with coal, biomass and liquid fuels located at major and area sources. These standards apply to biomass combustion at Bay Front Units 1 and 2 as well as to several small heating boilers located at our facilities. Compliance was required by early 2016.

EPA published a final rule revising the IB MACT rules on October 6, 2022 (IB MACT Final Rule). The IB MACT Final Rule amends the NESHAP for major source boilers and process heaters in response to three decisions by the U.S. Court of Appeals for the District of Columbia Circuit (D.C. Circuit) remanding elements of the NESHAP. The IB MACT Final Rule became effective on December 5, 2022. The rules revised emission limits for new and existing sources as well as provided rationale for the use of carbon monoxide (CO) as a surrogate for organic HAPs. All industrial boilers in the Xcel Energy Upper Midwest region that are subject to this revised IB MACT rule are able to comply with the revised requirements.

3. Stationary Combustion Turbine NESHAP (YYYY) Rule

In March 2004, EPA promulgated its NESHAP for stationary combustion turbines located at major sources of HAP emissions. The NESHAP required new or reconstructed lean premix and diffusion flame gas-fired turbines to meet a formaldehyde limit of 91 parts per billion by volume, dry basis (ppbvd) at 15 percent O_2. During the rulemaking for

the NESHAP, EPA received a petition to delist lean premix and diffusion flame gas-fired turbines, and, in April 2004, EPA issued a proposal to grant the petition and delist those two subcategories of turbines. In August 2004, EPA took final action to stay the effectiveness of the standards for those two subcategories pending the outcome of the proposed delisting. EPA ultimately did not finalize the stay after the U.S. Court of Appeals for the D.C. Circuit held that EPA only has the authority to delist entire source categories under Section 112 of the Clean Air Act—not individual subcategories.

EPA did not take action to lift the stay until its proposed RTR for the stationary combustion turbine NESHAP. As part of the proposed RTR, EPA proposed to remove the stay of the standards for new and reconstructed lean premix and diffusion flame gas-fired turbines. However, when the RTR was finalized on March 9, 2020, EPA chose not to finalize the removal of the stay to give the Agency additional time to review public comments and assess new information from a 2019 petition to delist the entire stationary combustion turbine source category.

On February 28, 2022, EPA finalized the YYYY rule to amend the NESHAP for Stationary Combustion Turbines ("YYYY Final Rule") at 40 C.F.R. Subpart YYYY. The YYYY Final Rule removes the stay of the effectiveness of the standards for new or reconstructed lean premix and diffusion flame gas-fired turbines, which was issued in 2004, shortly after the original NESHAP for stationary combustion turbines was promulgated.

As a result of the YYYY Final Rule, lean premix and diffusion flame gas-fired turbines that were constructed or reconstructed at major sources of HAP emissions after January 14, 2003, must meet the formaldehyde standard once the YYYY Final Rule becomes effective with ongoing compliance demonstrated by monitoring certain operating limitations defined in the rule or by EPA approved alternate operating limitations. The YYYY Final Rule allowed the Company to propose an alternate monitoring system for the High Bridge and Riverside combined cycle units to demonstrate that formaldehyde emission standards are continuously met through continuously monitored operating parameters and required formaldehyde emission testing to validate this demonstration. After months of correspondence, EPA Region 5 approved Xcel Energy's alternative monitoring proposal on May 22, 2023, and May 23, 2023, for High Bridge and Riverside, respectively. These alternate monitoring proposals can be further amended through completion of additional source testing and approval by EPA.

VI. WATER QUALITY REGULATIONS

A. Waters of the United States

The Clean Water Act (CWA) uses the term "Waters of the United States" (WOTUS) as those waters that are subject to the provisions of the CWA. The recent Supreme Court decision in *Sackett v. EPA*[10] (Court's decision) limited the regulatory definition of those waters subject to CWA requirements. On August 29, 2023, the EPA and the U.S. Army Corps of Engineers (Army Corps), the two federal agencies empowered with implementing the CWA, announced a final rule amending the 2023 definition of WOTUS to conform with the Court's decision.

Prior to the Court's decision, EPA and Army Corps issued regulations defining categories of surface waters considered WOTUS. One category includes wetlands that have a surface and/or subsurface hydrologic connection to a surface water regulated by the CWA. The Court's decision clarified that only wetlands with an obvious surface-only hydrologic connection could be considered WOTUS and regulated by the CWA. At present, Xcel Energy does not view this change as having a significant impact on our resource plans and/or operations.

While there has been a federal change in what types of water bodies are regulated by EPA and Army Corps, state laws protecting wetlands are unchanged. These laws frequently involve a larger number of wetlands and isolated water bodies and influence our plans and operational activities.

B. Cooling Water Intake Structures

Section 316(b) of the federal CWA (316(b) rule) requires the EPA to develop regulations governing the design, maintenance, and operation of cooling water intake structures to assure that these structures reflect the best technology available for minimizing adverse impacts to aquatic species. The regulations must address both impingement (the trapping of aquatic biota against plant intake screens) and entrainment (the protection of small aquatic organisms that pass through the intake screens into the plant cooling systems) and are implemented through National Pollutant Discharge Elimination System (NPDES) permits.

[10] Sackett v. EPA, 598 U.S. __ (2023). Docket No. 21-454. Available at https://www.supremecourt.gov/opinions/22pdf/21-454_4g15.pdf.

The EPA's 316(b) rule was finalized on August 15, 2014, requiring affected facilities to:

- Adopt one of seven options addressing impingement of biota at the entrance to cooling water intake structures, with approval by state or federal NPDES permit writers.
- Minimize entrainment of biota into the structures, as directed by the permit writer taking several factors into account.
- Implement the impingement, entrainment, and other measures as soon as practicable after the entrainment measures have been identified, with interim milestones the permit writer may set, or for new units upon commencing operations.
- Provide extensive information in permit applications, including source water physical and biological data, intake structure and system data, proposed impingement compliance methods and supporting study plans, previously conducted entrainment studies, and the operational status of the plants; and
- Provide two-year comprehensive entrainment characterization studies, technical feasibility and cost evaluation studies, benefit valuation studies, and studies of non-water quality environmental and other impacts, with peer review of the last three, for plants that withdraw more than 125 million gallons per day.

The rule does not mandate the use of closed-cycle cooling for existing facilities. However, qualifying closed-cycle systems will satisfy the final rule's impingement and likely will satisfy its entrainment requirements. The definition of qualified closed-cycle cooling has been broadened to include existing impoundments of waters of the U.S., if sufficiently documented as having been designed to provide a recirculating cooling function or if built in uplands, and to delete references to specific cycles of concentration, percentage flow reduction, and continuous flow constraints.

The final rule requires NPDES permit writers to provide copies of applications to the U.S. Fish and Wildlife Service (FWS) and National Marine Fisheries Service (NMFS), allowing these agencies to provide input within 60 days on endangered and threatened species and critical habitat potentially affected by intake structures and recommended permit conditions. If permit writers incorporate those conditions and permittees conduct all measures recommended by the Services, the permit will provide "incidental take" authorization. The FWS/NMFS biological opinion provided with the final rule states that the final rule is not likely to jeopardize listed species or destroy or adversely modify designated critical habitat.

The definition of "existing facilities" would include nuclear uprates and other repowered and significantly modified units, even if the turbine, condenser, or fuel are replaced. However, replacement units—essentially newly built, stand-alone units constructed at existing facilities regardless of change in generation capacity, cooling water flow, or use of an existing intake structure—would be considered a "new" unit and subject to closed-cycle cooling equivalent requirements.

The final rule provides a *de minimis* exception for impingement mortality requirements for very low impingement rates but cautions that Endangered Species Act (ESA)-listed species may not be taken. The rule also provides less stringent impingement standards for low-capacity utilization units.

The final rule does not dictate an ultimate compliance deadline for all facilities but requires agencies issuing NPDES permits to include terms and conditions in permits as they come up for renewal or amendment thus final compliance is tied to the timing of future permit renewals.

Xcel Energy's Upper Midwest power plants that use greater than 2 million gallons per day of surface water are required to comply with the rule. This includes Sherco, Monticello, Riverside, High Bridge, Black Dog, Allen S. King, Prairie Island, Red Wing, Wilmarth, Bay Front and French Island. Additionally, three plants may be required to reduce entrainment mortality: Monticello, Allen S. King, and Black Dog upon NPDES permit reissuance.

The Sherco plant is already a closed-cycle cooling facility and as such, will not likely be required to make significant cooling water intake structure upgrades to comply with the rule.

The Allen S. King plant will retire at the end of 2028 and is not required to make any additional system modifications under the rule's retirement exemption provision.

Monticello's newly reissued permit includes requirements for an engineering assessment of feasible 316(b) compliance alternatives for the plant's river water intake system. The studies were submitted in January 2023 and will result in an agency decision on upgrades necessary for ongoing compliance in the next permit renewal which begins in 2025.

Prairie Island's intake system was modified in the 1990's to include necessary protections for aquatic life and shellfish and continues to be compliant with the updated 316(b) requirements.

The compliance upgrades needed for Xcel Energy's RDF plants (Red Wing, Wilmarth, and French Island) are in varying stages of implementation. The Bay Front plant has submitted the required engineering studies to Wisconsin Department of Natural Resources (DNR) for review and are awaiting a final decision on any additional changes that may be required.

C. Thermal Discharge

The EPA regulates the impacts of heated cooling water discharge from power plants under CWA Section 316(a). States with authority to implement and enforce CWA programs (e.g., Minnesota, Wisconsin) have state-specific water quality criteria including thermal discharge temperature parameters to protect aquatic biota. Plants must operate in compliance with the thermal discharge temperature parameters. No changes have been made to the thermal discharge temperature parameters in Minnesota.

During permit renewals for the Monticello and Black Dog facilities, EPA Region V reviewed the previously submitted thermal studies. In light of operational changes that have occurred since the original thermal studies, the newly reissued permits for both sites require a new multi-year study of the thermal discharges from both sites. Depending on the results of each study, MPCA and EPA Region V could modify each site's thermal discharge limits in a subsequent permit action. All other plants in Minnesota are unaffected by the issues that were specific to Monticello and Black Dog.

In 2010, Wisconsin implemented new water quality standards regulating the thermal discharge temperature from facilities with state issued NPDES permits. The new requirements are being incorporated into facility permits as the permits come due for renewal.

In 2012, the Bay Front plant in northern Wisconsin was the Company's first Upper Midwest plant to receive new thermal discharge limits. Preliminary modeling of the plant discharge indicated that there could challenges to meeting the new requirements. Field monitoring of the discharge showed that the plant was complying with the new thermal discharge limits during normal operations.

Currently, French Island is not subject to compliance with the thermal discharge limits. Preliminary evaluation indicates that French Island will have challenges achieving compliance with potential future thermal discharge limits during the late summer and early fall periods of the year. The current permit issued in 2018 required a thermal monitoring plan (due in 2020) with monitoring (due in 2021). Monitoring data was submitted with the permit application in September 2022. Negotiations with the Wisconsin DNR during permit reissuance will determine what, if any, thermal limits will be required.

D. Effluent Limitation Guidelines

Over the last eight years, EPA's technology-based contaminant reduction requirements Effluent Limitation Guidelines (ELGs) have undergone two major revisions and a third revision was proposed in 2023. The ELGs apply to power plants using coal, natural gas, oil or nuclear materials as fuel and discharge treated effluent to surface waters, as well as to utility-owned landfills receiving coal combustion residuals. ELGs are implemented through permits issued to individual facilities and establish the maximum amount of a pollutant that may be discharged to a water body. The guidelines are periodically updated to reflect improvements in pollution control and reduction technologies.

For NSP, revisions issued in 2015 and 2020 largely targeted coal-fired electric generating units but also contained some provisions addressing wastewaters from combined and simple-cycle combustion turbines. These changes have been incorporated into individual NPDES permitted facilities compliance activities as appropriate.

On March 29, 2023, the EPA proposed additional changes to the ELGs (88 Fed. Register 18,824). The proposal suggested further restrictions on flue-gas desulfurization (FGD) wastewater and wet bottom-ash handling systems. The proposal offered options for ash landfill leachate and ash system process waters from systems no longer in use, referred to as "legacy wastewaters." The comment period on the proposed rulemaking ended on May 30, 2023, and the final rule is expected to be published mid-2024, at the earliest. The EPA also published a direct final rule, effective May 30, 2023, to extend the deadline for plants to opt-in to the 2028 early retirement provision promulgated in the 2020 regulation.

NSP's coal fired generating plants will not be required to make any upgrades to address compliance with the rule as proposed. Sherburne County Generating Plant is a closed-cycle facility that does not discharge any wastewaters associated with ash handling. Sherco Unit 3 landfill leachate may require pre-treatment or alternative management depending on what options are included in the final rule.

The method(s) used to dewater and dispose of wastewaters contained in the Sherco Unit 1 and Unit 2 scrubber solids ponds could change depending on EPA's final decision for managing legacy wastewaters. Under the 2020 ELG rule, the wastewater in the scrubber solids pond was prohibited from discharge to a surface water and prohibited from discharge to a local Publicly-Owned Treatment Works (POTW). Language in the preamble of the 2023 rule proposal suggests the EPA may be reconsidering the prohibitions for this category and has solicited public comments on options the EPA may consider in the final rule.

Retirement of the Allen S. King plant by the end of 2028 has been approved by the Commission.[11] As a result, the Company filed with the MPCA under the 2015 ELG rule for King Plant to be exempt from all ELG compliance obligations. This "Notice of Planned Participation" as it is referred to in the 2015 ELG Rule, exempted King Plant from making capital improvements needed to comply with the requirements of the 2015 and 2020 ELG rules. That same Notice will extend to the finalized version of the 2023 ELG rule proposal.

No other NSP electric generating facilities are affected by the changes proposed in the EPA's 2023 ELG proposal.

VII. COAL COMBUSTION RESIDUALS

Coal Combustion Residuals (CCRs), often referred to as coal ash, is residue from the combustion of coal in power plants. Two types of CCRs are fly ash and bottom ash. Fly ash is a light material with the consistency of talcum powder that is carried from the boiler with the flue gas. This material is captured by pollution control equipment and may be combined with solids generated from air quality control systems designed to reduce SO_x and NO_x emissions. Bottom ash consists of the heavier materials collected from the bottom of the boiler. CCRs are either recycled for beneficial reuse or disposed of appropriately as non-hazardous industrial waste.

Currently the CCRs resulting from the coal combustion at Sherco Units 1 and 2 are disposed of wet within a permitted, engineered, lined surface impoundment as a non-hazardous industrial waste. The fly ash generated from Sherco Unit 3 is disposed of within a permitted, engineered, lined ash landfill located on plant property. The bottom ash generated from all

[11] *In the Matter of the 2020-2034 Upper Midwest Integrated Resource Plan of Northern States Power Company d/b/a Xcel Energy*, Docket No. E002/RP-19-368, Order (April 15, 2022), at Order Point 4.

Sherco units is stored within a lined impoundment as a non-hazardous waste until it can be beneficially used as a construction material or properly disposed on site.

The fly ash from the A. S. King plant is transported for disposal at a permitted, engineered, lined commercial landfill as a non-hazardous industrial waste, while the bottom ash from this facility is beneficially utilized in the manufacture of products. Xcel Energy's operations are subject to federal and state laws that impose requirements for handling, storage, treatment, and disposal of wastes. These laws regulate CCRs as a non-hazardous waste under Subtitle D of the RCRA. While Xcel Energy's NSP-Minnesota disposal and storage facilities have been regulated by the MPCA for several decades, they became subject to regulation under EPA's CCR Rule in 2015.

EPA's CCR Rule became effective on October 19, 2015 and only applies to the Sherco and Black Dog facilities in the Company's Upper Midwest region. This rule was promulgated in response to environmental concerns regarding structural failures and releases of ash directly to the environment from large surface impoundments, allegations of inconsistent oversight by the states, and the potential for releases from unlined ash impoundments and landfills to impact drinking water sources.

The CCR rule established minimum design and operating requirements for CCR landfills and surface impoundments that are comparable to Minnesota's current requirements under State rules, site-specific permits and operating plans, with specific differences discussed in subsequent paragraphs. Under this rule, regulated landfills and surface impoundments are referred to as CCR Units.

The CCR Rule requires ongoing groundwater monitoring of each regulated CCR Unit. The rule also defines groundwater protection standards which, if exceeded, may lead to corrective action. Currently, the results from the CCR Rule groundwater monitoring program have shown no exceedances of CCR ground water protection standards (GWPS), meaning that no corrective action is required at this time.

The CCR Rule liner performance criteria are different than that established under the MPCA's state program. Consequently, the Sherco Bottom Ash clay lined impoundment, is deemed lined under the state rule but is deemed unlined under the CCR Rule. As a result, Xcel Energy replaced this impoundment with a new, permitted, engineered, lined impoundment that meets EPA and MPCA requirements. Xcel Energy had previously anticipated the need to replace this impoundment and had plans to replace it by 2023. To comply with EPA's CCR Rule requirements Xcel Energy accelerated this project to

have the new lined bottom ash impoundment in place by October 31, 2020. Closure of the existing bottom ash impoundment is scheduled to be completed as originally planned in 2025.

Coal operations ceased at the Black Dog site in April 2015. CCR discharges to the three small impoundments present at the site ceased prior to October 19, 2015. These impoundments were closed by removal on December 12, 2016. The CCR materials removed from the impoundments were disposed of in an off-site, lined landfill. The CCR rule requires the completion of groundwater monitoring at closed CCR sites. Groundwater sampling for this site has been completed and it was determined through closure verification sampling that groundwater monitoring concentrations do not exceed the groundwater protection standards; therefore, the site meets the requirements for closure of the CCR units as documented in 2019 in the CCR Monitoring Closure Verification Report.

The EPA continues to propose changes to the CCR regulations, none of which have been finalized. In one action, the EPA proposes to add a federal permit program to the CCR regulations and in a second, separate action, the EPA proposes to regulate legacy CCR surface impoundments. Both proposals are expected to create new compliance obligations for CCR units, differing from the current rules. While these changes are likely to increase the compliance cost, accurately estimating the potential costs is not feasible or useful until the final rules are issued.

VIII. MULTI-MEDIA EMERGING POLLUTANTS: PER AND POLYFLUOROALKYL SUBSTANCES (PFAS)

State and federal efforts have been accelerating in addressing per and polyfluoroalkyl substances (PFAS), an emerging chemical of concern in the last several years. Legislative and regulatory efforts are taking place to expand the current understanding of the human health and environmental risks of PFAS and to develop steps to reduce these risks. PFAS are a group of widely-used, long-lasting chemicals that breakdown very slowly over time. PFAS are found in air, water, and soil across the world. While PFAS are not directly related to the electric power industry, there may be indirect connections through the regulation of pollutants and hazardous substances. The electric power industry, like any other industry, may have processes or use materials that could potentially contain PFAS or release them into them into the environment.

It is important to emphasize PFAS regulations have the potential to significantly impact the electric power sector by increasing operating expenses, among other challenges. If

PFAS are detected in our facilities' air emissions, water supply, or soil, costly treatment or remediation measures may be required to ensure regulatory compliance. A summary is provided below describing some of the many current federal and state efforts to regulate PFAS.

A. EPA Proposal to List PFOA and PFOS as Comprehensive Environmental Response Compensation and Liability Act (CERCLA) Hazardous Substances

On August 26, 2022, EPA issued a proposal to designate two of the most widely used PFAS- perfluorooctanoic acid (PFOA) and perfluorooctanesulfonic acid (PFOS) including their salts and isomers, as hazardous substances under Comprehensive Environmental Response, Compensation, and Liability Act (CERCLA), or Superfund. The direct regulatory impact of this designation is reporting and clean-up requirements for current or historical PFOA and PFOS releases. EPA indicated in its Spring 2023 Regulatory Agenda that it intends to issue a final rule listing PFOA and PFOS as CERCLA hazardous substances in 2024.

B. EPA's Advanced Notice of Proposed Rulemaking (ANPRM) to Regulate Additional PFAS under CERCLA

On April 13, 2023, EPA issued an ANPRM requesting public input on regulating additional PFAS chemicals (except PFOA and PFOS) as CERCLA hazardous substances. The ANPRM seeks information on designating: (1) all or a subset of seven specific PFAS chemicals—perfluorobutanesulfonic acid (PFBS), perfluorohexanesulfonic acid (PFHxS), perfluorononanoic acid (PFNA), hexafluoropropylene oxide dimer acid (HFPO-DA or GenX chemicals), perfluorobutanoic acid (PFBA), perfluorohexanoic acid (PFHxA), and perfluorodecanoic acid (PFDA), and their respective salts and structural isomers; (2) precursors to PFOA, PFOS, and the previously listed seven PFAS chemicals; and (3) "categories of PFAS."

C. EPA's Toxic Substances Control Act (TSCA) PFAS Reporting Rule

On October 11, 2023, EPA published its final PFAS reporting rule under TSCA section 8(a)(7), This rule imposes a one-time reporting obligation on any entity that manufactured (and/or imported) PFAS or PFAS-containing articles at any time from January 1, 2011 through December 31, 2022. Manufacturers (and importers) are required to report information regarding the use, source, exposure, and health effects of the PFAS they manufactured and/or imported. The effective date of the Final PFAS Reporting Rule is

November 13, 2023. The window for reporting under the Final PFAS Reporting Rule will run from November 12, 2024 through May 8, 2025.

D. National Primary Drinking Water Standards (NPDWS) for PFOA and PFOS

On March 29, 2023, EPA issued a Notice of Proposed Rulemaking (NPRM) proposing NPDWS for PFOA and PFOS and issuing a preliminary regulatory determination to regulate PFBS, GenX chemicals, PFHxS, and PFNA. As proposed the NPDWS would establish a health-based, non-enforceable Maximum Contaminant Level Goal (MCLG) of zero and an enforceable Maximum Contaminant Level (MCL) of four parts per trillion (ppt) for PFOA and PFOS. For the other four PFAS chemicals, EPA proposes using a hazard index (HI) approach, which considers the four PFAS chemicals as a mixture, and setting an MCLG and MCL of 1.0 (unitless) for these compounds.

E. Minnesota PFAS Updates

The State of Minnesota issued a PFAS Blueprint to prevent PFAS pollution wherever possible, to manage PFAS pollution when prevention is not feasible or pollution has already occurred, and to clean up pollution at contaminated sites. To do this, the state has developed multiple efforts to measure and monitor PFAS in groundwater, water, and in air emissions throughout the state.

In 2023, the Minnesota Legislature took several actions to regulate or ban PFAS in firefighting foams and in certain products.

F. Wisconsin PFAS Updates

The Wisconsin Department of Natural Resources (WDNR) has been actively developing information and tools to address PFAS contamination since 2018. In 2023 the WDNR released a PFAS contamination "toolkit" to assist communities in addressing PFAS contamination in drinking water. The toolkit provides options for actions that can be taken to identify and treat PFAS-contaminated drinking water.

G. U.S. Geological Survey (USGS) Study

On June 23, 2023, the USGS released a study of PFAS concentrations in public and private drinking water supplies in the United States. Among the study's conclusions are that as much as 45 percent of drinking water samples nationwide could contain PFAS.

IX. WILDLIFE REGULATIONS ASSOCIATED WITH RENEWABLE DEVELOPMENT

A. Land-Based Wind Energy Siting Guidelines

As part of Xcel Energy's project planning process, all renewable energy projects are evaluated following the U.S. Fish and Wildlife Service (FWS) Land-based Wind Energy Guidelines (WEGs). The WEGs have a structured process that is scaled to the specific stage of a project's development. In the early stages (referred to as Tier 1 in the WEGs), screening using available data is used to identify possible impacts over a wide area and as a result is a broad, lower resolution, analysis. As a project becomes more developed with more specific information on location and possible layout, the evaluation begins to use more site-specific data from studies targeted to the specific area(s) of a project. This "Tier 2" review develops more refined information on the plants and animals that might be impacted by the project. Additional species or habitat-specific studies may be conducted based on the results of the Tier 2 studies so that specific impacts can be minimized or avoided in the final project design, construction and/or operations.

In the latter stages of development when land for a potential facility is more fully identified, the Company works with federal and state wildlife agencies to evaluate in more detail the area where the project is expected to be constructed. These meetings and correspondence ensure that important details regarding known existence of listed species, or species of state conservation concern, are considered and, if needed, protected as we begin to design the facility layout. Site-specific Tier 3 studies are designed and conducted at this stage to inform final siting impacts. These studies evaluate wildlife use of the site and delineate habitat such as native prairie, wetlands, and forest.

Once a project has been constructed and operational, Xcel Energy implements Tier 4 of the WEGs by conducting post-construction mortality monitoring to investigate the actual impacts of the facility on avian species. These one-to-two-year studies involve surveys of selected turbines to identify avian and bat mortality across all seasons. Results from these studies are used to inform if there are unusual numbers or species experiencing mortality as a result of the wind facility's operation. In some cases, additional research (Tier 5 study) is conducted to evaluate operational changes or technology that may minimize impacts. These Tier 5 studies, when needed, are typically conducted in coordination with state or federal wildlife agencies to evaluate a specific concern.

B. Endangered Species Act

FWS reviews scientific data on plants and animals across the United States to determine if listing under the Endangered Species Act (ESA) is warranted. If species are found to meet the criteria, FWS proposes and then finalizes regulations formally listing species as either "endangered" or "threatened." The "threatened" category is reserved for species that are likely to become endangered unless steps are taken to prevent the species from meeting the criteria to be endangered. The term "endangered" means any species which is in danger of extinction throughout all or a significant portion of its range.

If a facility expects to unintentionally cause harm or death to a federally listed species, an "incidental take permit" under the ESA can be sought to provide federal authorization for that potential harm to the species. The ESA process for obtaining the take authorization involves a multi-year planning process with the FWS to evaluate the potential presence of the listed species, the modes of potential harm, and the estimated number of individual deaths over the course of the facility's operating lifetime. The permit applicant also works with the FWS to develop a plan to minimize harm and a process to mitigate the estimated deaths so there is no net impact to the species population.

Within the NSP service territory there are multiple federally listed species, and the specific species that may be present varies across our region. Because there are multiple species in the NSP service territory that are listed or proposed for listing, NSP utilizes the FWS Information for Planning and Consultation (IPaC) tool to screen planned projects for potential impacts to federally listed species. Xcel Energy also works with state-level information sources to identify potential impacts to species of state conservation concern.

Xcel Energy monitors the federal and state listing processes and utilizes qualified biological consultants to ensure we identify all relevant plant, fish, mammal, and avian state and federally listed species during the development of proposed renewable projects.

C. Bald and Golden Eagle Protection Act

Eagles are protected in the United States under both the Bald and Golden Eagle Protection Act (BGEPA) and the Migratory Bird Treaty Act (MBTA). Both of these federal laws are implemented by the FWS.

Pursuant to BGEPA, FWS has regulations that formally permit the unintentional take of eagles in the United States. In 2009, following Bald and Golden Eagles being delisted from their previous endangered status under the ESA, FWS issued regulations to permit

the unintended take (or death) of eagles. The regulation has been revised twice and is currently involved in a new regulatory rulemaking. As part of FWS regulatory framework, FWS has guidance for industry on avoiding the potential for unintended take. Xcel Energy utilizes FWS guidance in project planning and when potential for eagle take is identified, we work with FWS and state wildlife agencies to address take and, if necessary, seek an Eagle Take Permit from FWS for specific projects and/or facilities.

Xcel Energy currently has two Eagle Take Permits for wind energy facilities. The Courtenay Wind facility in North Dakota has a 5-year take permit and the combined wind energy facilities of Pleasant Valley and Ben Fowke (previously Grand Meadow Wind Facility) in Minnesota are covered under a single, 5-year take permit.

With a growing Bald Eagle population in the upper Great Plains and upper Midwest, Xcel Energy continues to evaluate the risk to eagles at our existing sites as well as any newly proposed development. We work closely with the appropriate federal and state wildlife agency experts to understand the risks and potential permitting options that may be needed to address the risk of eagle take.

X. CONCLUSION

As noted in the above discussion, there are numerous proposed, pending, and existing environmental regulations which can, and do, affect the operation of our generation facilities. We are closely monitoring these regulations and compliance requirements, and we are considering the potential impacts in our planning process.

APPENDIX L – SYSTEM PLANNING INTEGRATION

I. INTRODUCTION

Achieving the goal of a sustainable, clean energy future depends upon having sufficient infrastructure to support delivery of clean electricity while maintaining customer reliability and affordability. Modernized transmission and distribution systems are critical to our ability to serve our customers in a reliable and safe manner, enable customer choice, increase renewable and carbon-free energy, effectively leverage emerging technologies, and take a holistic view of resource planning.

As we actively prepare our distribution and transmission systems for the needs of the future, we consider the need for thoughtful investments to meet our core obligation: safely and reliably delivering energy to our customers. We are also focused on adopting smarter technologies to further enable distributed energy resources (DER) on our system. Additionally, we face new challenges and opportunities for the transmission grid as traditional baseload units retire, large scale renewables significantly increase, and DERs are increasingly adopted. In some cases, such as increasing consideration of distribution-level DER impacts on the transmission grid, changes in the market and planning constructs are underway.

Recent policy changes are also driving the need to evolve resource planning. For instance, Minnesota's new carbon-free energy standard, which requires the Company to generate or procure carbon-free energy equal to 100 percent of its Minnesota retail sales by 2040, will impact resource, transmission, and distribution planning. With these recent policy changes, we are adapting our planning practices to ensure reliability and resilience, including development of substantial new transmission, which will be needed to support the transformation that is underway.

Overall, we envision building toward an integrated grid that supports the Company's clean energy transition, leveraging the strength of an interconnected system to make the best use of available resources while continuing to serve our customers with resilient and reliable power. We discuss our Integrated System Planning initiative, as well as our transmission and distribution systems, in greater detail below.

II. INTEGRATED SYSTEM PLANNING

As the Company works to achieve our carbon reduction goals, we must proactively design our energy delivery system to maintain reliability and affordability and increase sustainability as generation sources shift from legacy fossil fuel plants to renewable and

carbon-free sources. Investments the Company makes today will last for decades. It is therefore imperative that these investments are compatible with carbon-free legislation and regulation in addition to the Company's own goals. As both the transmission and distribution systems transform to deliver carbon-free electricity that meets the needs of an increasingly electrified grid, the Company must take a long-term approach to our planning and identify which projects will stack to reach our carbon-free goals while delivering reliable, affordable, and sustainable electricity to our customers.

This inherent need for long-term planning that considers the impacts of generation, transmission, and distribution on each other spurred the creation of Integrated System Planning (ISP). The purpose of ISP is to develop generation, transmission, distribution, and natural gas plans that deliver on the Company's clean energy goals while keeping bills low and enhancing the customer experience. ISP also bridges the gaps between modeling tools with human processes in addition to tackling the myriad challenges borne by the overall planning landscape, such as inflection points with technologies – like EVs and beneficial electrification – and pricing. The standing goal and charter of the ISP organization is to bring out the best in all of our infrastructure systems to meet the needs of our customers while preserving legislative requirements in concert with affordability.

A. Two Organizations, One System

By creating ISP, the Company has created two simplified, streamlined, and focused organizations: ISP and Operations. ISP focuses on planning the Company's electric and natural gas delivery systems. It takes an integrated approach to designing construction specs, conceptual design feasibility, regulatory and policy collaboration, and modeling and innovative technology integration to consider the entirety of the Company's energy delivery systems: generation, transmission, distribution, and gas. Each of these aspects of our system are linked, so consideration of how projects in one area impact another and function together must be taken into consideration when planning for our decarbonized future. Operations is focused on the execution and delivery. Once ISP has done its part, Operations takes care of crucial details such as safety; siting and land rights; project management, engineering, and construction; operations and maintenance; program implementation; and customer connections. The relationship between ISP and Operations is not linear, but cyclical, as handoff and communication processes are essential to its success.

B. ISP System Planning Cycle

The Company understands that to drive the transformation of strategic planning within the enterprise, ISP will need to institute a cross-functional planning cycle that will serve as a platform to achieve integration. To achieve this, a five-part System Planning Cycle has been developed.

- *Origination*

Origination focuses on customer needs evolution, emerging trends, technology integration, competitive advantage, and competition.

- *Integrated Planning*

Integrated Planning focuses on the alignment of origination trends into impact analysis, competitive advantages, and strategic system plans.

- *Modeling and Analytics*

Modeling and Analytics optimizes and refines strategic system plans based on enterprise outcomes centered on reliability, cost, sustainability, and customer experience.

- *Conceptual Design*

Conceptual Design develops and transforms integrated plans into conceptual designs, project value and costs, and enterprise capital plans.

- *Standards and Compliance*

Standards and Compliance develops, designs, and governs operational standards, project management, and compliance metrics and interfaces with regulators.

ISP Business Operations oversees this process and integrates ISP within the context of the enterprise, develops Management Operating Systems, and creates Success Paths for the ISP teams to achieve overall sustainability and customer goals. In addition, ISP Business Operations coordinates and supports the regulatory responsibility of ISP.

III. ALIGNING IRP AND INTEGRATED DISTRIBUTION PLAN

Order Point 9 of the Commission's latest IRP Order[1] states:

> *9. Xcel shall take steps to better align distribution and resource planning, including:*
> *A. Set the forecasts for distributed energy resources consistently in its resource plan and its Integrated Distribution Plan [IDP].*
> *B. Conduct advanced forecasting to better project the levels of distributed energy resource deployment at a feeder level, using Xcel's advanced planning tool.*
> *C. Proactively plan investments in hosting capacity and other necessary system capacity to allow distributed generation and electric vehicle additions consistent with the forecast for distributed energy resources.*
> *D. Improve non-wires alternatives analysis, including market solicitations for deferral opportunities to make sure Xcel can take advantage of distributed energy resources to address discrete distribution system costs.*
> *E. Plan for aggregated distributed energy resources to provide system value including energy/capacity during peak hours.*

In addition to the work that ISP is doing to develop infrastructure investment plans that consider generation, transmission, distribution, and gas and the impacts they have on each other, the Company is working persistently to align the IRP and the IDP. We address each part of Order Point 9 below.

A. Aligning Forecast Vintages

While forecasting plays a role in both the IRP and IDP, the processes are fundamentally different and serve disparate functions. The IRP process is a long-term (15+-year) resource planning process that has been in place for decades and is governed by established Minnesota Statutes and Rules (which result in Orders that constitute prima facie evidence in other proceedings). Similarly, transmission planning is largely governed by Federal Energy Regulatory Commission (FERC) and North American Electric Reliability Corporation (NERC) requirements and overseen by the Midcontinent Independent System Operator (MISO). In contrast, the IDP process is nascent in comparison – intended to be informational in nature – and is based on a set of planning objectives and reporting requirements that the Commission has established on a utility-by-utility basis. Additionally, the IRP forecasts include all the states in the

[1] ORDER APPROVING PLAN WITH MODIFICATIONS AND ESTABLISHING REQUIREMENTS FOR FUTURE FILINGS, Docket No. E002/RP-19-368, April 15, 2022 (IRP Order).

Company's Upper Midwest service territory, while the IDP is concerned solely with Minnesota. We discussed potential evolutions to the IDP process in our IDP filed on November 1, 2023.[2]

Another key difference between the IRP and the IDP is the time horizon and planning cycle duration and cadence. The IRP indicates size, type, and timing of resource needs over a 15-year time horizon, while the IDP shows a five-year budget of discrete projects and investments including their drivers and benefits. The five-year budget, which is used for the IDP, is built every year on the forecast from the previous fall – for example, the 2023 IDP budget was based on forecast data from Fall 2022. The reason for this is that additional steps are required to create the distribution forecast; the system-level forecasts used in the IRP cannot be directly applied to the distribution system as anticipated locations for the growth must be identified. After a location-specific distribution forecast is developed, distribution system risks, mitigations, and a 5-year budget must be developed prior to the IDP filing. This is significantly different in the IRP, where the modeling happens only three to six months in advance of the filing date every four years, meaning that the most recent and relevant forecast vintages are used. This information was presented at our IRP IDP Forecasting: Electrification and DER Workshop held with stakeholders on February 13, 2023.[3] Additional stakeholder outreach details are available in Appendix S: Stakeholder Engagement Summary.

Despite the fundamental differences between the purposes of the IRP and the IDP, there are opportunities to align some of the forecast vintages used in the creation of both. Additionally, because the distinct aspects of the Company's system – generation, transmission, and distribution – are interconnected and impact one another, we are taking distribution system additions that are selected in the IRP process into account when conducting the IDP budget forecast. We are using the same forecasts in similar ways in both the IRP and IDP to align the plans, but if a new version of a forecast comes out between the IDP forecast analysis and the IRP, it would make more sense for the IRP to use the most recent version. This issue cannot be addressed by aligning the filing date for the IRP and IDP, because, as previously mentioned, the forecast for the IDP happens at the beginning of the filing process – about one year in advance – whereas the IRP modeling happens much closer to the filing date. However, for this IRP, we were able to align several forecast vintages, as shown in Table L-1 below.

[2] Docket No. E002/M-23-452.
[3] Presentation materials were filed in Docket Nos. E002/M-21-694 and E002/RP-19-368.

Per the Commission's IRP Order we are making efforts to set the forecasts for DER consistently between our IDP and IRP.[4] Because of the modeling timeline for the IRP, finalization of the IRP models was not complete at the time of IDP submission on November 1, 2023. Table L-1 below expands on the outline of which forecast vintages were used for the various IDP and IRP forecasts that we provided in Appendix A1: System Planning of our November 1, 2023, IDP.

Table L-1: Forecast Vintage Comparison

Forecast	Vintage Reflected in IDP Corporate-Level DER Scenario Modeling	Vintage Used in IDP LoadSEER DER Scenario Modeling	Vintage Used in IRP Energy Forecast
Distributed Solar PV	June 2023[5]	June 2023	June 2023
Community Solar Gardens	August 2023[6]	August 2023[7]	August 2023
Distributed Energy Storage	September 2023	2021 IDP	Did not model in IRP
Energy Efficiency	September 2023	Embedded In 2022 Energy Sales & Demand Forecast	September 2023
Demand Response	2022	Embedded In 2022 Energy Sales & Demand Forecast	September 2023
Electric Vehicles	July 2023	2022	July 2023

B. Advanced Forecasting of DER

In our most recent IDP, the Company presented DER scenarios from our new LoadSEER tool for the first time. As we discussed in that same IDP, the Company recognized a need for and sought this new tool to aid in developing load forecast and distribution plans that would allow for enhanced analysis, as increasing penetrations of DER on the distribution system require better understanding of the conditions on that system at a more detailed level.

[4] The Commission's latest IDP Order includes a parallel Order Point; *see* July 26, 2022 Order in Docket No. E002/M-21-694, at Order Point 4.
[5] Since the IRP covers a multistate region and the IDP is focused on Minnesota, the June 2023 forecast had WI distributed solar PV added to it for the purposes of the IRP.
[6] As new information was available, it was combined with data from the August 2023 forecast.
[7] This scenario includes a forecast for solar that will meet Distributed Solar Energy Standard (DSES), Minn. Stat. § 216B.1691, subd. 2h, as added by 2023 Session Laws Chapter 60, Article 12, Section 16, and is discussed in section II.C.7.

Adoption of DER on the distribution system is location-specific, and adoption impacts are unique to each individual feeder. To better understand the potential location-specific impacts of the DER forecast scenarios on the distribution system, the forecasts we prepared for the IDP were then allocated to the distribution system using LoadSEER. The scenarios that were created and then analyzed in LoadSEER comprise various combinations of the corporate-level DER adoption forecasts in the IDP.

One output from the LoadSEER analyses was estimated distributed upgrade costs from each of the more granular adoption scenarios. For the IRP, we leveraged these estimated upgrade costs as an approximation for estimated costs to interconnect large DER resources specifically added by the Company in coming years to comply with the Distributed Solar Energy Standard (DSES)by 2030[8].

C. Investments in Hosting Capacity

Xcel Energy recognizes hosting capacity as a key element in the future of distribution system planning, and we anticipate that it has the potential to further enable DER integration by guiding future installations and identifying constrained areas. In compliance with Minn. Stat. § 216B.2425, and by order of the Commission, beginning in 2016, we have conducted and submitted an annual Hosting Capacity Program Report each year. We submitted our most recent Hosting Capacity Program Report on October 31, 2023 (2023 Hosting Capacity Program Report). These studies show hosting capacity results at the feeder and sub-feeder level, provide an indication of distribution feeder capacity for DER, and streamline interconnection studies by helping to guide projects to places on the distribution system where there may be available capacity.

There are several ongoing projects that will assist with advancing customer-sited DER, identify interconnection points on the distribution system and necessary distribution upgrades to support continued DER development, and improve our hosting capacity program for our customers. These projects include the implementation of Foundational Updates, and the subsequent implementation of the Monthly Updates use case. Increasing the HCA update cadence from quarterly to monthly will provide developers with fresher data and increase confidence in the ability of the HCA to inform the interconnection process of customer-sited DER by working to close the delay between the data cutoff date and the publication of results. More information about the timeline for implementation and prerequisite software upgrades can be found in our 2023

[8] While data was leveraged for approximating distribution upgrade costs, it is not inclusive of any costs to the transmission system for interconnecting large DERs.

Hosting Capacity Program Report filed October 31, 2023.[9] Furthermore, the implementation of the Advanced Distribution Management System (ADMS) and the ongoing implementation of AMI will provide enhanced system visibility to improve the data inputs and the analytical tools to further refine the HCA output.

In addition to these projects, as discussed in our 2023 Hosting Capacity Program Report, we have updated our methodology that improve the tool's usefulness for identifying interconnection points on the distribution system and places where upgrades to support DER development are needed. These improvements include adding the Technical Planning Study (TPS) Capacity Utilization and adding a feeder update criterion. The TPS Capacity Utilization accounts for the remaining capacity on a feeder based on the TPS and will reduce instances where the HCA map shows more capacity than is otherwise available. The updated feeder criterion will cause feeders to be updated when their normal rated capacity has been modified. Both changes, and the other changes discussed in our 2023 HCA filing, will increase the accuracy of the HCA, and help engineers more accurately identify where there is room on the system and where upgrades are needed.

HCA also serves as a valuable input prior to the interconnection process, helping customers or developers gather information about a location before an application is submitted. Interconnection studies are necessary to ensure the proposed generator can safely interconnect without adversely impacting electric delivery to surrounding customers and at what cost. With better data inputs and more analytical tools available to distribution engineers, we will be able to respond more efficiently to interconnection study requests and streamline the process for interconnecting customers. The interconnection process and associated studies will make use of the latest in technology and standards, such as IEEE-1547-2018 as amended in IEEE-1547a-2020, discussed in further detail in the section below and align with applicable regulatory guidance developed in the Interconnection and Operation of Distributed Generation Facilities proceeding (Docket No. E999/CI-16-521).

D. Improvements in Non-Wires Alternatives Analysis

We have been continually improving and expanding our NWA analysis. As discussed in Appendix F: Non-Wires Alternative Analysis of our 2023 IDP, the stacked values used in our NWA analysis are consistent with the IRP assumptions, where applicable. Given the inherent differences in timing of the two filings and the time at which we must begin our NWA analysis, however, some assumptions align with our last *approved* resource plan but do not align with the modeling assumptions that were used in

[9] Docket No. 23-466.

this plan. For example, the WACC discount rate varies slightly; this IRP uses the WACC from the latest Commission-approved capital structure in Docket No. E002/GR-21-630, but we did not have time to make that adjustment between the time of the rate case Order and when we needed to begin NWA analysis for the 2023 IDP. In addition, the National Renewable Energy Laboratory's (NREL's) 2023 Annual Technology Baseline, from which many of our technology cost assumptions are sourced, does not reflect potential tax credits for battery energy storage. Although we made an adjustment for our IRP modeling, we did not have time to incorporate that adjustment into the NWA analysis for the 2023 IDP. We will continue to evaluate our modeling assumptions and strive to match them between the IRP, the IDP, and NWA analysis whenever practicable and applicable.

We have not yet issued market solicitations for deferral opportunities, but as discussed in Appendix F of our 2023 IDP, our latest NWA analysis shows three potentially viable and cost-effective projects. All three of these potentially viable projects have in-service dates in 2028. Given that timeline, we will have another opportunity to run our NWA analysis in November 2024 as part of our annual NWA analysis update before additional steps are taken. If any of the projects remain potentially viable and cost-effective, we would then determine next steps in the next IDP Annual Update filing in November.

E. Plans for Aggregated DERs

From a resource planning perspective, we have many DR and energy efficiency programs that can be considered "aggregated" in the sense that they are designed to benefit the bulk system at times of peak system demand. It is important to note that, in this context, "aggregated" means behind the meter resources, such as customer owned DR, EE, rooftop DG solar, and customer owned batteries. This contrasts with larger DERs that are front of the meter, such as those outlined in Chapter 136, Article 4, Section 17 of Minnesota Law.[10]

As shown in Appendix F: EnCompass Modeling Assumptions and Inputs, these behind the meter resources and corresponding assumptions about their capabilities are entered in aggregate into EnCompass for consideration. For the IRP, this includes DER in all states in our Upper Midwest region, whereas the IDP only considered Minnesota. Additional information about DER can be found in Appendix E: Load and Distributed Energy Resource Forecasting and Appendix J: Distributed Energy Resources.

[10] Chapter 136 - MN Laws.

Additional discussion about Virtual Power Plants and the potential for them to deliver benefits to the bulk system, including delivering peak-load electricity can be found in Section V of Appendix X: Advanced Technologies.

IV. TRANSMISSION PLANNING

As we discuss in Appendix T: MISO Grid Congestion, while transmission planning is considered separately from resource planning, these two functions are interrelated. Transmission limitations in turn inform our resource strategy, and transmission needs are driven by multiple factors including increased customer electric demand, new or retiring generator interconnections, generation resource choices and the availability of transmission to meet the demand for these resources. Further, the interconnected nature of the transmission system means that neighboring utilities' decisions (either transmission or generation) impact the NSP System.

A. MISO and Transmission Planning

The Transmission Business Unit centrally manages Xcel Energy's transmission systems (i.e., NSPM, NSPW, Public Service Company of Colorado, and Southwestern Public Service Company) so that energy is safely and reliably transmitted from generating resources (both Company-owned and third-party-owned) to the distribution systems serving our customers. To effectively leverage the interrelation between the transmission and resource planning functions, Transmission Planning has transitioned into the ISP organization along with Resource Planning, as discussed above.

As demonstrated in the Biennial Transmission Plan[11] we – as part of the Minnesota Transmission Owners (MTO) group – submit to the Commission in odd-numbered years, we are constantly reviewing and studying our system to optimize operations and prepare for the future. We independently – and in conjunction with MISO and our neighboring utilities – analyze different futures to assess the system and determine any necessary improvements, in both short- and long-term planning horizons. Based on these analyses and subsequent implementation, between 2010 and 2018 we invested more than $3 billion in our transmission system. Much of our transmission investment over the recent past has been in implementing the CapX2020 initiative and participating in MISO 2011 Multi-Value Projects (MVP), which increased transmission capabilities in the Upper Midwest. Expanding upon these efforts, the MISO Long-Range Transmission Planning effort has developed the first of four transmission expansion portfolios with an estimated benefit to cost ratio of 2.6-3.8 for the northern portion of the MISO

[11] Docket No. E999/M-23-91.

footprint, increasing to 2.8-4.0 when considering only the zone in which NSP is located.[12] The second of these portfolios is currently under development, being analyzed against scenarios that achieve 96 percent carbon reductions across the MISO footprint, and meeting Minnesota requirements for 100 percent clean energy by 2040.[13]

MISO and the Company perform ongoing and specialized studies to evaluate necessary projects to address issues in the overall MISO system, including the NSP System.

From these studies, and our own technical study efforts in support of the Baseload Study we undertook with this Resource Plan, as discussed in Appendix T: MISO Grid Congestion, we believe significant additional transmission development will be necessary as we and other utilities retire fossil-fuel baseload generating units and add significant renewable resources to the grid to achieve our commitment to a clean energy future. We also believe changes to the current planning constructs are necessary to accurately reflect the trends underway and to ensure system stability and resilience, customer affordability, and reliability. For instance, the Company is adding additional system reliability aspects to our RFPs to ensure grid reliability and not just capacity totals are accounted for as we transition our system to carbon-free resources.

B. Ongoing MISO Studies

MISO Transmission Expansion Plan (MTEP). MISO has an annual transmission planning process which results in identification of needed transmission facilities.

MISO Generation Interconnection Studies. MISO performs generation interconnection studies to identify facilities necessary to connect new generation resources.

MISO Economic Planning Studies. As part of its planning process, MISO conducts a Market Congestion Planning Study (MCPS). The purpose of this study is to determine whether there are transmission projects that could remove transmission constraints and thus more efficiently use available generation resources. When undertaken, the MCPS results are reported as part of the annual MTEP report. During the MCPS process, projected economic and power flow models are developed which, when analyzed, determine the total production costs that are incurred to provide energy to the MISO

[12] MISO, *MTEP21 Report Addendum: Long Range Transmission Planning Trance 1 Executive Summary*. https://cdn.misoenergy.org/MTEP21%20Addendum-LRTP%20Tranche%201%20Report%20with%20Executive%20Summary625790.pdf.

[13] https://cdn.misoenergy.org/20230428%20LRTP%20Workshop%20Item%2003b%20Future%202A%20Siting%20Presentation628726.pdf.

load. Transmission constraints – the transmission elements that limit the amount of power that can be transferred between the unused, lower-cost generation and customers – are identified. Through stakeholder discussions, transmission projects are proposed that could mitigate the constraints. The costs for these proposed transmission projects are determined and compared to the amount of production cost savings that could be realized if those projects were in service. The resultant benefit to cost ratio of the projects indicates whether the proposed solutions should be considered for further evaluation for constructability and reliability analysis. Stakeholder review and comments are compiled, and a decision on whether to recommend a MCPS project be included in the upcoming MTEP report is made.

MISO Long-Range Transmission Plan (LRTP): To meet the collective goals and requirements of the MISO footprint efficiently and cost-effectively, the LRTP was initiated in 2020. This effort is expected to analyze if there are cost effective portfolios of transmission projects in the northern portion of the MISO footprint (analyzed in Tranches 1 and 2), the southern portion of the MISO footprint (analyzed in Tranche 3), and between the two areas (analyzed in Tranche 4). The first projects included in the Tranche 1 portfolio, approved in July 2022, are expected to be placed in service starting in 2028. Like the Economic Planning process, the LRTP is subject to a rigorous stakeholder process to determine the system improvements included in a portfolio while meeting minimum benefit to cost thresholds.

C. Technical Considerations

1. Seams

Seams are interconnections between different regional transmission organizations/independent system operators (RTOs/ISOs), generally within the same interconnect (i.e., PJM to MISO, both of which are in the Eastern Interconnect), and they play a role in interregional planning. To address reliability issues and inefficiencies between RTOs, MISO and neighboring regions implemented interregional planning processes beyond FERC required coordination. While this process has yet to identify areas in which interregional transmission expansion would be cost effective for both regions, this foundation of interregional cooperation spurred the creation of the MISO-SPP Joint Targeted Interconnection Queue (JTIQ) study effort, described in greater detail below.

2. *Congestion*

A thorough discussion of transmission congestion, its causes, impacts, and efforts to address it can be found in Appendix T: MISO Grid Congestion.

3. Reliability

In addition to ensuring reliability by meeting MISO resource adequacy requirements, the Company also conducts studies related to transmission grid reliability and essential reliability services, including grid strength and stability studies, and maintaining a transmission planning criterion. The primary goal of this reliability analysis is to ensure NERC compliance on the transmission system. These studies incorporate load growth, shifting generation, and any topology changes to ensure all planning criteria are met in the 10-year planning horizon.

While transmission reliability is focused on the larger MISO bulk transmission system, it is also being integrated into processes for acquiring future generation for the NSP system. Since many aspects of transmission reliability are locational in nature, it is particularly well suited for incorporation into the evaluation process for many of the Company's generation acquisition processes. These generation RFP processes allow for evaluation of locational factors, unlike the resource planning process generally unconstrained by interconnection location used in the IRP. The main way that transmission reliability is being incorporated into resource acquisition processes is by evaluating the attributes from different generation resource bids that are related to transmission reliability in addition to the conventional RFP evaluation process.

4. Interconnection Queue

The MISO Generator Interconnection Process is designed to allow generators reliable, non-discriminatory access to the electric transmission system, in a timely manner, while maintaining transmission system reliability. Recently, as the number of proposed projects in MISO has expanded significantly, this process has been mired in delays. Delay impacts are particularly evident in the Definitive Planning Process (DPP) phases, where MISO undertakes generation interconnection studies. Current studies are several months behind due to the considerable number of projects in the queue, and a generator interconnection process that allows late withdrawals from the queue. With the intention of addressing some limitations in processing generation interconnection queues, FERC issued Order 2023 in July of 2023, directing all ISOs/RTOs to file their plans to address these issues. These compliance filings are not due until after the filing

of this IRP, meaning we do not have any official updated information about MISO's plans at this time. Order 2023 includes the following provisions:[14]

- **Implement a first-ready, first-served cluster study process.** Transmission providers will conduct larger interconnection studies encompassing numerous proposed generating facilities, rather than separate studies for individual generating facilities. This approach will increase the efficiency of the interconnection process, help minimize delays, and improve cost allocation by analyzing the transmission system impacts of multiple projects at once. To ensure that ready projects can proceed through the queue in a timely manner, interconnection customers will be subject to specific requirements, including financial deposits and site control conditions, to enter and remain in the interconnection queue.
- **Speed up interconnection queue processing.** The final rule imposes firm deadlines and establishes penalties if transmission providers fail to complete interconnection studies on time, but transmission providers may appeal their penalties at the Commission. Additionally, the rule establishes a detailed affected systems study process, including uniform modeling standards and pro forma affected system agreements.
- **Incorporate technological advancements into the interconnection process.** The final rule requires transmission providers to:
    - Allow more than one generating facility to co-locate on a shared site behind a single point of interconnection and share a single interconnection request. This reform creates a more efficient standardized procedure for these types of generating facility configurations.
    - Use operating assumptions in interconnection studies that reflect the proposed charging behavior of electric storage resources.
    - Evaluate alternative transmission technologies in their cluster studies.

  Additionally, the final rule allows interconnection customers to add a generating facility to an existing interconnection request under certain circumstances without such a request being automatically deemed a material modification and establishes modeling performance standards or inverter-based resources.
- **Establish an effective date and a transition process.** Compliance filings are due 90 days after publication of the final rule in the *Federal Register*. To smooth

[14] https://www.ferc.gov/news-events/news/fact-sheet-improvements-generator-interconnection-procedures-and-agreements.

the transition to the new rule, the Commission has adopted two options that can be exercised depending on the progress of the interconnection request:

- Those interconnection customers that have been tendered facilities study agreements by the transmission provider may proceed to a transitional serial study (a facilities study) or may opt to move to the transitional cluster study.
- Those interconnection customers in the interconnection queue that have not been tendered a facilities study agreement (have not completed the system impact study) will be eligible for the transitional cluster study.

While the MISO Generation Interconnection Process already includes many of these provisions to ensure timely processes of requests, the requirement to ensure projects entering the queue are "ready projects" will reduce the stress introduced by the inclusion of less certain or speculative queue requests.

Even if the aforementioned time constraints improve with queue reforms, as generation projects progress through the DPP phases, they are sometimes assigned high transmission system upgrade costs that challenge their economic viability. These interconnection costs, which are partially due to assigned transmission system upgrades, are additional to a resource's capital cost, both of which are passed on to customers.

In the MISO footprint, costs for upgrades are directly assigned to interconnecting generators, with the exception of network upgrades at 345 kV and above, for which 10 percent of the upgrade cost are regionally cost shared. To represent these upgrade costs in our last IRP, we used $500/kW for generic wind projects and $250/kW for generic solar projects, which were based on MISO Definitive Planning Process data. In this IRP, we have not yet noted significant improvements in these costs, and have decided, for modeling parity, to use a consistent $250/kW as the estimated system upgrade cost for all generic resource options, including storage. Additionally, these allocations are currently being discussed at the Federal and Regional levels in FERC Docket No. RM21-17-000, and may change based on those discussions.

The Company is looking for more efficient and innovative ways to meet our sustainability and reliability goals, including working with MISO to amend the Generator Interconnection Process, engaging with projects that will increase transmission capacity, and making decisions that will allow us to keep and reutilize existing interconnection rights. In the Company's work with MISO, two key issues with the queue were identified: (1) constraints are being identified, but not mitigated, and (2) not all constraints are being identified.

The issue of constraints being identified but not mitigated has been attributed to the threshold at which generators are made responsible for upgrade costs. The existing MISO threshold is that a five percent or greater contribution would require a generator seeking Network Resource Interconnection Service (NRIS) to pay for an identified upgrade. For a generator seeking Energy Resource Interconnection Service (ERIS), a contribution level of 20 percent or greater is required to be assigned costs of an upgrade. This gap in cost responsibility resulted in needed upgrades being identified during System Impact Study efforts, but since contribution levels of the projects were below the thresholds, the constraints were not mitigated. This was aggravated by generators being allowed to switch the level of service requested between System Impact Study phases – if a generator seeking NRIS could not cover the costs of upgrades to maintain that level of service, they were allowed to switch to being an ERIS service request between phases to reduce their cost burden, but still impact the same constraints.

In early 2022, the Company raised this concern with MISO and initiated a stakeholder process to implement our proposed solution – lowering the ERIS contribution threshold to 10 percent. MISO facilitated the stakeholder process, but implemented a change that only partially addressed the issue. MISO's solution applies a 10 percent contribution threshold for generators requesting ERIS, but only to facilities that are 230 kV and lower. Given that lower voltage facilities are higher impedance, and therefore contribute less generation, the Company feels that this is a step in the right direction, but still does not fully address the concern. We will be monitoring the contribution of ERIS requests on 345 kV facilities to determine the impact of this partial solution.

The issue of constraints not being identified was related to how MISO was implementing the fuel type dispatch that is included in their Interconnection Process procedures. This fuel type dispatch outlined how new generation should be dispatched in the System Impact Study models based on the type of generation they represent. While implementing this dispatch, the Company identified a consistent pattern in which the dispatch of existing generation of a similar type and in a similar location to a new interconnection request is lowered to accommodate the new request. This application of generation dispatch in this model effectively resulted in a net neutral change in overall generation output from an area, and fails to identify constraints that would limit outlet capability when generators of similar type and location are generating at similar levels. The reduction of available, low-cost generation out of economic order due to transmission system limitations is the definition of congestion and economic curtailment. This has several impacts:

1) Increased congestion costs,
2) Reduction in tax incentives,
3) Reduction in revenues due to reduced production because of transmission constraints,
4) Reduction in capacity value.

The Company raised this issue with MISO staff in March 2023, recommending changes to the MISO interconnection process, either through a stakeholder process or through including specific requirements in the NSP Local Planning Criteria. These recommendations include requirements for new and existing generation of similar types, located in similar locations, to be dispatched at similar levels. This would ensure existing resources maintain their deliverability and avoid future congestion. The response received at the meeting was that MISO would take the proposal back and consider it internally, but it was not likely that resources would be committed to the proposed changes.

There are, naturally, other issues that are not related to generation interconnection that contribute to constraints going unmitigated or simply unidentified. One great concern is the priority of dispatch in the MISO market. In the MISO market, there is no consideration to interconnection service when differentiating between resources in a similar location – the decision is based purely on offer price. This means that a newer wind resource that chose ERIS due to the higher cost of NRIS can offer a lower cost into the market than an older wind resource that may have less valuable tax credits or may have exhausted their tax credits, but obtained NRIS when it interconnected. This, in effect, reduces the deliverability of the NRIS resource in favor of an ERIS resource that is only supposed to be able to utilize the transmission system on an 'as available' basis. When this treatment of resources in the MISO market is paired with the generator interconnection procedures that fail to identify and mitigate constraints, the transmission system can only be assumed to have insufficient capacity, and deliverability of resources can only be expected to decrease. In terms of resource adequacy, the situation described here also reduces the overall accredited capacity in the MISO region. NRIS resources facing congestion are being curtailed so that ERIS resources can produce. As described earlier, reduction in production leads to lower capacity accreditation for the NRIS resource, but ERIS resources are not allowed to be granted capacity credit of any kind unless they obtain NRIS or transmission service. If the current MISO processes are not corrected, these issues will only lead to higher costs to customers and unrealized value of investments.

Given the state of the MISO queue, the Company is constantly reevaluating interconnection costs and looking for creative solutions to help keep costs low for our customers. In addition to advocating for procedural changes directly with MISO, as we previously discussed, the Company is also engaged in LRTP projects and looking for ways to preserve and reutilize interconnection rights we already have.

In addition to taking the necessary steps to realize the most value from existing transmission and generation facilities, the MISO LRTP project is developing plans to ensure the backbone infrastructure is in place to enable the transition to clean energy resources in a way that is efficient and cost effective. The initial portfolio, Tranche 1, was developed to address inefficiencies of the system and to meet near term goals and mitigate existing issues. The next portfolio, Tranche 2, is under development to design a backbone transmission grid capable of achieving carbon reductions estimated at 96 percent when compared to 2005 levels by 2041 across the MISO footprint. When considering the NSP area, these projects are intended to meet the requirements set in recent legislation by 2040. While this process is not intended to resolve all issues related to integration of new generation resources, it will ensure those resources can interconnect in a more efficient manner while meeting federal, state, and local requirements and goals.

Another effort underway to ensure a more cost effective and efficient approach to generation interconnection, the JTIQ study, has developed a process and transmission portfolio to address interregional constraints limiting the ability of new generation resources to interconnect in the MISO and SPP regions. The current JTIQ portfolio includes five projects, all primarily 345 kV located along the northern portion of the MISO-SPP Seam, stretching from North Dakota to Kansas and Missouri. Due to the innovative nature of this JTIQ process, applications have been submitted to the U.S. Department of Energy requesting federal funding for portions of this transmission development.

Given the increasing limitations of the MISO queue, the Company has also been looking for opportunities outside the MISO process to meet our renewable sourcing needs. One way to do this is to preserve and utilize interconnection rights we already have, thus avoiding delays and costs associated with the interconnection process. A recent success of this endeavor is the currently under construction Sherco Solar project at the site of our Sherco Coal plant in Becker, Minnesota. Because the coal plant was connected to MISO, the Company already had interconnection rights, which would have been lost, if they were not reused by 2026. By building Sherco Solar at this site, the Company secured our interconnection rights, which benefits our customers, as there will be no interconnection costs added to the capital costs of Sherco Solar.

V. DISTRIBUTION PLANNING

The Distribution system is the final link of the electric system that delivers electricity to every home and business the Company's service area. The work performed by Distribution is essential to ensuring that the electric service our customers receive is safe, reliable, and affordable. We extend service to new customers or increase the capacity of the system to accommodate new or increased load, repair facilities damaged during severe weather to quickly restore service to customers, and perform regular maintenance and repairs on poles, wires, underground cables, metering, and transformers. Distribution is also at the forefront of working to transform the distribution grid to enhance its security, efficiency, and reliability, to safely integrate more distributed resources and support electrification, and to enable improved customer products and services.

The Distribution organization is one of the Company's business units whose investments and work directly impact the daily lives of our customers. As a result, it is important that our investments are focused on achieving the Company-wide priorities of leading the clean energy transition, keeping customer bills low, and enhancing the customer experience.

A. Overall Approach to Distribution System Planning

An important aspect of distribution planning is the process of analyzing the electric distribution system's ability to serve existing and future electricity loads by evaluating the historical and forecasted load levels and utilization rates of major system components such as substations and feeders. We see this changing as our planning processes evolve to analyzing future electricity *connections*, rather than just loads. The purpose of these assessments is to proactively plan for the future, maintain and improve resiliency, and identify existing and anticipated capacity deficiencies or constraints that will potentially result in overloads during *normal* (also called "system intact" or N-0) and *single contingency* (N-1) operating conditions. Normal operation is the condition under which all electric infrastructure equipment is fully functional. Single contingency operation is the condition under which a single element (feeder circuit or distribution substation transformer) is out of service.

B. Integrated System Planning and Distribution Planning

Achieving the goal of a sustainable, clean energy future depends upon having sufficient infrastructure to support delivery of renewable and distributed generation resources and customer reliability. Modernized transmission and distribution systems are critical to our ability to serve our customers in a reliable and safe manner, deliver growing levels

of choice, increase renewable energy, meet the challenges of emerging technologies, and take a holistic view of resource planning.

As we actively prepare our distribution system for the needs of the future, we consider the need for thoughtful investments to meet our core obligation: safely and reliably delivering energy to our customers. We are also focused on adopting smarter technologies to further enable DER on our system. Additionally, we face new challenges and opportunities for the transmission grid as traditional baseload units retire, large scale renewables significantly increase, and DERs are increasingly adopted. In some cases, such as increasing consideration of distribution-level DER impacts on the transmission grid, changes in the market and planning constructs are underway. Recent policy changes are also driving the need to evolve planning. The federal Inflation Reduction Act (IRA) and the Infrastructure Investment and Jobs Act (IIJA) have myriad avenues for acquiring funding and tax incentives, which will impact how the Company and the energy industry at large will proceed with planning, while the "100 x 40" law passed by the Minnesota Legislature contains a roadmap to 100 percent carbon-free electricity, which will also impact resource, transmission, and distribution planning. We are adapting our planning practices in the interim to ensure reliability and resilience, including development of substantial new transmission, which will be needed to support the transformation that is underway.

Overall, we envision continuing to build on our planning capabilities for an integrated grid that supports the Company's clean energy transition, leveraging the strength of an interconnected system to make the best use of available resources while continuing to serve our customers with resilient and reliable power. We also envision a highly integrated operating technology environment.

This need for long-term planning that considers the impacts of generation, transmission, and distribution on each other spurred the creation of the Integrated System Planning (ISP) business unit within the Company, which we discussed above. The purpose of ISP is to develop generation, transmission, distribution, and natural gas infrastructure investment plans that deliver on the Company's sustainability goals while keeping bills low and enhancing the customer experience. ISP also bridges the gaps between modeling tools with human processes in addition to tackling challenges of the overall planning landscape, such as inflection points with technologies – such as EVs and beneficial electrification – and pricing. The Company's, and indeed the industry's, exploration of integrated planning frameworks is nascent and will continue to evolve and improve as we make progress toward a clean energy future and our vision to be the preferred and trusted provider of the energy our customers need.

VI. CONCLUSION

Although increasing DER penetration levels will drive integrated resource planning and distribution planning closer together, there are fundamental differences in how these two planning activities assess and develop plans to meet customers' needs. Distribution planning, like Integrated Resource Planning (IRP), charts a path to meet customers' energy and capacity needs, but is more immediate and subject to emergent circumstances because distribution is the connection with customers. Unlike IRPs, five-year plans are considered long-term in a distribution context; and, IRPs are concerned with size, type, and timing, whereas the primary focus of distribution planning is location. Thus, distribution loads and resources are evaluated for each major segment of the system – on a feeder and substation-transformer basis – rather than in aggregate, like occurs with an IRP. Before a greater integration of distribution planning, transmission planning, and IRP can occur, distribution planning will need to become even more granular than it is today to address the challenges – and harness the benefits – of DER.

Our transmission and distribution systems are critical to our ability to serve our customers in a reliable and safe manner, and to deliver growing choice and increasing renewable energy. As we actively prepare our distribution system for the needs of the future, we consider the need for thoughtful investments to meet our core obligation, safely and reliably deliver energy to our customers, and adopt smarter technologies to further enable DER on our system. We recognize and will continue to respond to customer interest in increased DER.

The transmission grid is also facing new challenges and opportunities as traditional baseload units retire, large scale renewables significantly increase, and DER are increasingly adopted. In some cases, such as increasing consideration of distribution-level DER on the transmission grid, changes in the market and planning constructs are underway. Other changes are just coming into view and the planning constructs have not yet caught-up. Overall, we envision building toward an integrated grid in the future that supports the Company's clean energy transition – leveraging the strength of an interconnected system to make the best use of available resources and continue to serve our customers with resilient and reliable power.

We support the evolution of the grid, and are taking actions to evolve our planning tools and improve our foundational capabilities to support our customers' expanding energy needs and expectations. We support a shift toward more integrated system planning, where utilities assess opportunities to reduce peak demand using DER and to supply customers' energy needs from a mix of centralized and distributed generation resources.

APPENDIX M – NUCLEAR

I. INTRODUCTION

Our Preferred Plan proposes to extend the operations of our nuclear plants. The continued operation of our two nuclear plants, which have been providing carbon-free power for 50 years, is crucial to achieving our Company's and Minnesota's carbon-free goals. We are proposing to extend operations of the two units at Prairie Island Generating Plant (PINGP) for an additional 20 years, until 2053 and 2054. We are also proposing to operate the Monticello Nuclear Generating Plant (MNGP) until 2050, in line with our pending application at the Nuclear Regulatory Commission (NRC). By doing so, we can continue to provide our customers with carbon-free power while keeping costs low by making use of our existing carbon-free resources.

In this appendix, we discuss the importance of using our nuclear generation fleet to meet our environmental and resource planning objectives and Minnesota's policy goals. Further, we provide information in compliance with Order Point 23 of the Minnesota Public Utilities Commission's (MPUC) last IRP Order,[1] requiring that we file a report explaining:

A. Planned investments at the Prairie Island and Monticello, and future plans for Prairie Island.[2]

B. Any aging management issues that may arise from continued operation.

C. Expectations regarding future nuclear workforce.

D. Cyber-security issues or concerns as plants move from analog to digital systems.

E. True comprehensive cost-benefit analysis, which includes potential environmental and economic impacts to the neighboring communities—in particular, the Prairie Island Indian Community and its Treasure Island Resort & Casino.

F. Additional spent nuclear fuel generated over a 10- or 20-year period.

[1] *In Re Xcel Energy's Upper Midwest Resource Plan*, Order, Docket No. E002/RP-19-368, April 15, 2022 (IRP Order).
[2] We note that where we reference plans for PINGP or MNGP beyond 2033/2034 or 2040, respectively, such plans are preliminary and contingent upon Commission approval of the life extensions and future Certificates of Need, and NRC renewal of the plants' operating licenses. We discuss required state permits, Certificates of Need, and federal licenses further in Section IX below.

G. How fuel stored on-site will be removed during the next integrated resource plan period.

H. Which additional state permits, Certificates of Need, or federal licenses will be required.

I. The full supply chain and life-cycle carbon impacts of the ongoing nuclear generation and storage at each of the facilities.[3]

We begin with a discussion of nuclear generation's role in a carbon-free future.

A. Nuclear's Role in a Carbon-Free Future

Our nuclear generation plays a key role in our carbon free future. We could not cost-effectively achieve such significant levels of carbon reduction without nuclear generation on our system. Our nuclear plants—which total approximately 1,650 MW in baseload net capacity—comprise approximately 40 percent of our existing carbon-free generation and 30 percent of our total generation in the Upper Midwest. These plants avoid the emission of 12.5 million metric tons of carbon dioxide due to reduced consumption of fossil fuels each year, which is equivalent to removing approximately 2.8 million gas-powered cars from the roads.[4] Nuclear is particularly important as we come to rely more and more on intermittent renewable resources like wind and solar. As we add significant amounts of intermittent renewable resources, the Company's nuclear plants help ensure that our system is resilient and reliable 24 hours a day, 365 days a year.

Our Preferred Plan includes a 20-year license extension of PINGP Units 1 and 2 (expiring in 2053 and 2054) and an additional 10-year extension on the operation of MNGP (through 2050). The EnCompass modeling of our plan demonstrates both that the continued operation of PINGP and the extension of MNGP are cost effective and expected to result in customer benefits. Our Economic Modeling Framework is discussed in Chapter 5: Economic Modeling Framework, but we briefly summarize the nuclear-specific results below.

As part of our economic analysis, our three baseload scenarios are based on three nuclear retirement scenarios, shown in Table M-1 below.

[3] Addressed in Appendix Y: Life Cycle Emissions Impacts.
[4] 2022 Nuclear Energy Institute data is used for MNGP and PINGP metric tons of carbon dioxide emissions avoided. Equivalent vehicle approximation calculated from August 2023 Environmental Protection Agency vehicle emissions data (www.epa.gov).

Table M-1: Baseload Scenarios

Scenario Name and Description	Plant Retirement Dates	
	PINGP Unit 1/Unit 2	MNGP
Scenario 1 – Reference Case Maintain current planned retirement dates	2033/2034	2040
Scenario 2 – Prairie Island plant Extension Extend PINGP 20 years; maintain MNGP retirement date	2053/2054	2040
Scenario 3 – Preferred Plan – Extend All Nuclear Extend PINGP 20 years; extend MNGP 10 additional years	2053/2054	2050[5]

The baseline modeling for the three scenarios described in Table M-1 is allowed to select the most cost-effective resources to replace the nuclear plants at the time of their retirements; therefore, all three scenarios assume some amount of firm dispatchable replacement generation such as gas-fired combustion turbines (CTs) to meet capacity needs. Our analysis shows that extending operation of our nuclear plants is beneficial and the least-cost alternative when compared to other scenarios. Table M-2 summarizes the EnCompass results for each modeled scenario.

Table M-2: Scenario PVSC/PVRR Deltas from Reference Case ($2024 millions)

PVSC Production Cost	Delta in NPV ($m) 2024-2040	NPV ($m) 2024-2040	Delta in NPV ($m) 2024-2047	NPV ($m) 2024-2047	Delta in NPV ($m) 2024-2050	NPV ($m) 2024-2050
Scenario 1 PVSC	**$0**	$51,037	**$0**	$63,635	**$0**	$68,788
Scenario 2 PVSC	**($413)**	$50,624	**($437)**	$63,198	**($513)**	$68,275
Scenario 3 PVSC	**($785)**	$50,252	**($941)**	$62,695	**($1,025)**	$67,762
PVRR Production Cost	**Delta in NPV ($m) 2024-2040**	**NPV ($m) 2024-2040**	**Delta in NPV($m) 2024-2047**	**NPV ($m) 2024-2047**	**Delta in NPV ($m) 2024-2050**	**NPV ($m) 2024-2050**
Scenario 1 PVRR	**$0**	$34,678	**$0**	$44,948	**$0**	$48,927
Scenario 2 PVRR	**($97)**	$34,581	**$291**	$45,239	**$391**	$49,317
Scenario 3 PVRR	**($464)**	$34,215	**$46**	$44,994	**$239**	$49,166

[5] As part of our last approved IRP, we received approval to extend operations at MNGP for 10 years. An additional 10-year extension, as modeled in the Preferred Plan, aligns with the NRC license extension we are currently seeking for MNGP. We anticipate applying for a SLR with the NRC for an additional 20-year extension for PINGP at the end of 2026.

The Preferred Plan—which includes the extension of both our nuclear plants—is the least-cost baseload scenario. The extensions result in approximately $1 billion in PVSC savings for our customers when compared to the Reference Case. We also conducted a sensitivity analysis that reoptimizes our Preferred Plan expansion plan to achieve a 100 percent carbon-free generation fleet by 2050. The results of the analysis are summarized in Chapter 5, Economic Modeling Framework. The Preferred Plan sensitivity case results in savings of nearly $2 billion for our customers on both a PVSC and PVRR basis. Compared to existing technologies, the extension of our nuclear fleet provides an overwhelmingly cost-effective source of carbon-free energy.

We believe these results provide strong support for our Preferred Plan, Scenario 3, and demonstrate the importance of our nuclear fleet from an overall resource planning perspective.

In addition, our nuclear plants provide three crucial elements of system value, all with zero carbon emissions: accredited capacity; system stability; and portfolio diversity and reliability. We address each of these elements below.

First, MISO's new seasonal resource adequacy construct has, in essence, increased the value of our nuclear plants since our last resource plan filing, most particularly in the winter season. Under MISO's new planning reserve margin (PRM) requirements, there is currently a 27 percent reserve margin during the winter months—higher than the summer season—while the winter seasonal capacity accreditation assumptions are projected to be less than five percent for new solar resources and less than 40 percent for new wind resources. To keep our system stable and meet the PRM during all seasons, we would need incremental natural gas generation if we were to replace our nuclear generation. This would slow down our efforts to cut carbon emission and reach Minnesota's goal of carbon-free energy. Given renewables' lower seasonal accreditation values, the large amount of renewables (shown below) that would be required to added to offset the loss of our nuclear plants would likely require even more transmission than the already sizeable transmission expansion plans of MISO current build out. EnCompass modeling results show that Scenario 1—replacing the carbon-free energy from the nuclear plants (based on their current retirement dates) with other resources—would require nearly 4,700 MW of incremental generating capacity over the modeling period, in addition to the resource additions identified in our Preferred Plan. Extending the lives of both nuclear plants (Scenario 3) offsets the need for more than 896 MW of firm dispatchable capacity, 120 MW of standalone storage; 2,800 MW of wind; and 876 MW of solar through 2040.

Second, our nuclear units provide vital stability for the transmission system. To determine the transmission system impacts of the nuclear plants' retirement, we conducted a "leave-behind" study. The study is provided in full as Appendix M1: NSP Nuclear Leave Behind Study Report. The study shows that the retirement of PINGP and MNGP, all else remaining constant, would necessitate significant costs in system upgrades to mitigate the resulting thermal violations on the transmission system during peak summer months. In addition, the leave-behind analysis shows that maintaining dynamic system stability in the absence of PINGP and MNGP would require significant replacement generation and load management costs. The reinforcement costs are functionally accounted for in the modeling as capital expenditure based on the timing of retirement. More details are discussed in Appendix M1: NSP Nuclear Leave Behind Study Report.

Third, our nuclear fleet adds important diversity to our generation portfolio to maintain reliability as coal is retired from our system and to provide a hedge against not only gas price volatility but also the uncertainty of technological development, future renewable pricing, and the future of intermittent and dispatchable intermittent resource accreditation. It is also a critical piece of our reliability requirement, as it is not a fuel-limited resource, is not subject to pipeline limitations during the winter season and has a strong operating history during cold (and hot) weather events. In 2022, our nuclear fleet operated at 96 percent capacity factor while working with power marketing to flexibly operate the nuclear plants 14 times to allow for more renewable generation on the grid. To further emphasize this reliability value, our nuclear fleet operated at 100 percent capacity during a massive winter storm in December of 2022 that crossed the Dakotas, Minnesota, and Wisconsin. While this historic winter storm created crushing winter conditions including blizzards and record cold temperatures across the majority of the United States and parts of Canada, our nuclear plants continued to provide the necessary electricity to our customers to keep them warm during this heavy, intense wintery storm.

We recognize that technological developments, like energy storage, hold great promise and that reliable renewable baseload energy continues to develop, as discussed in Appendix I: Minnesota Energy Storage Systems Assessment. Like others, we are excited by storage technology and its potential to further transform our system. We are taking steps as part of this Resource Plan to ensure that we are prepared to take full advantage of better technology as we learn from our pilot programs such as the Form Energy long-duration energy storage facility pilot. As the Company continues targeted initiatives and programs to further develop and gain experience in storage technology, we recognize that this technology is not yet economically at a scale comparable to even a fraction of our nuclear fleet. For this reason, we view nuclear energy as a resource that will help facilitate our transition to even greater renewable generation and storage

opportunities in the longer term, while we continue to pursue aggressive carbon reduction in the near-term.

In addition to the economic benefits identified by EnCompass modeling, our nuclear plants provide significant state, community, and employment benefits. Our nuclear operations employ approximately 1,100 staff in and around our communities with additional contractors hired during refueling outages. The plants are also an important source of tax base for their host communities, resulting in a combined total of approximately $42 million in state and local taxes annually. In total, Xcel Energy's nuclear operations contribute approximately $1 billion in annual economic benefits throughout Minnesota.[6] These and other benefits are to be quantified as part of the University of Colorado Boulder's cost-benefit analysis (CBA), which is discussed in Section II.B below.

Our nuclear plants provide wide-ranging and substantial benefits not only to our customers but also to the environment, the State of Minnesota and the broader region, and the communities we serve. The continued operation of both plants, including an additional 10-year extension of operations at MNGP and 20-year extension of operations at PINGP, is in the public interest, is consistent with Minnesota state policy, and is necessary to achieve our carbon reduction goals at a reasonable cost.

II. TRIBAL ENGAGEMENT AND COST-BENEFIT ANALYSIS

A. Engagement with Prairie Island Indian Community and Other Local Communities

Order Point 22 of the Commission's IRP Order requires that*:* "Xcel [Energy] shall immediately begin stakeholder discussions exploring the future of the Prairie Island Nuclear Generating Plant."

Prairie Island Indian Community (PIIC or the Tribe) is an important Company partner. Xcel Energy leadership meets with the Tribe regularly to discuss key issues on legislation, strategic vision, and plant performance. Our partnership with PIIC includes engaging with the Tribe on important nuclear industry topics and Tribal objectives. For example, in 2023 we organized a tour of PINGP with the U.S. Department of Energy's Transportation Core Team, at the request of the Tribe.

[6] Nuclear Energy Institute, "The Impact of Xcel Energy's Fleet on the Minnesota Economy," April 2017.

The Company has engaged extensively with PIIC since our last IRP was approved to reach agreement on annual payments to PIIC going forward. Our goal was to ensure that PIIC, which does not receive property tax payments, would receive an annual payment comparable to other communities hosting power plants that receive property taxes from the Company. These agreements resulted in passage of a statutory amendment[7] during the 2023 legislative session, providing that:

- In addition to the annual payment of $2.5 million previously required by statute, the Company must pay $7.5 million to the PIIC for each year PINGP is in licensed operation, plus $50,000 per year for each dry cask container containing spent fuel stored at the PINGP, whether or not the plant is in operation;
- The Commission shall approve a rate schedule providing for the automatic adjustment of charges to retail electricity customers to recover these payments;
- Payments shall constitute prudent operating expenses for the Company, and shall constitute consideration for any amended settlement agreement entered into between the Company and PIIC;
- The Commission's approval of a certificate of need allowing for the additional storage of spent nuclear fuel necessary for the extended operation PINGP is effective only if the governor, on behalf of the state, and the Company enter into an agreement binding the parties to the required payments and payment recovery terms above. PIIC is an intended beneficiary of this agreement and has standing to enforce the agreement; and
- These payments may be used by PIIC for any purpose benefitting PIIC. Restrictions in prior statute regarding how many acres PIIC may acquire, and that such lands may only be used for residential purposes, are removed.

In addition, the Company has worked with PIIC to support its Net Zero Project. Through 2020 legislation,[8] which the Company supported, PIIC was appropriated $46.2 million from the Renewable Development Account to implement a Net Zero Project with the goal of developing an energy system that results in net zero emissions. PIIC has used those funds thus far to support two large projects: a 5.4 MW ground-mounted solar array on the reservation, and conversion of Treasure Island Resort & Casino's heating and cooling system to geothermal.[9] These two projects, while addressing the majority of the Tribe's greenhouse gas emissions, left PIIC without a clear financial mechanism to move Tribal housing toward the same Net Zero vision.

[7] Minn. Stat. 216B.1645, Subd. 4.
[8] Laws of Minnesota 2020, Chapter 118, Section 3. See Chapter 118 - MN Laws.
[9] See Prairie Island Net Zero Project - Prairie Island Indian Community.

In response, the Company sought ways to support the net zero goal for Tribal housing while saving Tribal members money on energy costs. As PIIC's natural gas utility, we identified the Natural Gas Innovation Act (NGIA) as a suitable mechanism because it allows gas utilities to provide support for both strategic electrification and energy efficiency—the primary measures of interest to PIIC for Tribal housing.

We have included a proposed Prairie Island Indian Community Weatherization/ Electrification Pilot in our first NGIA plan, filed in December 2023. This pilot, if approved by the Commission, will conduct home energy audits, weatherize and electrify approximately 72 PIIC homes to which the Company provides natural gas service. Most are manufactured/mobile homes. The Company will work with PIIC, PIIC's contractors, and Dakota Electric Association, with PIIC serving as the project lead to ensure a seamless experience for Tribal residents. The typical project will consist of a home energy audit to assess needs, followed by a holistic weatherization/electrification retrofit effort seeking to electrify space heating and water heating end uses, along with any other end uses that are identified as candidates. The Company has proposed utility contributions of approximately $2 million to support these activities in 2025-27. PIIC meets the definition of an Environmental Justice Area in Minnesota statute,[10] and we believe NGIA provides an innovative means to support this project in ways that go beyond what the Company could do through our normal Energy Conservation & Optimization (ECO) incentives. For further details please see our December 15, 2023 NGIA Petition, Docket No. G002/M-23-518.

Likewise, we have long-standing partnerships with the City of Red Wing, City of Monticello, Goodhue County, Wright County and the surrounding communities. Our employees live and work in these areas, and we support the communities by providing vital tax base; supporting local nonprofits through grants, volunteering, and board service; and supporting economic development. Xcel Energy leadership meets regularly with local city officials and at least semi-annually with county officials. Community breakfasts are held in both Red Wing and Monticello annually and include school administrators, local elected officials, the Sheriff, PIIC, and other members of the community. Throughout the year, we meet with various community groups and organizations to share open dialogue regarding our objectives as well as to learn about the objectives and interests of our local communities. These types of events provide an opportunity for Xcel Energy to be transparent with our strategic vision—including the future of PINGP and MNGP—and hear directly from community leaders and other stakeholders throughout the region regarding what is important to them.

[10] See Minn. Stat. § 216B.1691, subd. 1 and Minn. Stat. § 115A.03.

B. Cost-Benefit Analysis

Order Point 23.E requires that the Company conduct a: *"*[t]rue comprehensive cost-benefit analysis, which includes potential environmental and economic impacts to the neighboring communities—in particular, the Prairie Island Indian Community and its Treasure Island Resort & Casino.*"*

In response to this Order Point, the Company began by engaging directly with PIIC to determine an approach to undertaking a comprehensive cost-benefit analysis (CBA) that the Tribe would feel holistically addresses its concerns around the future of PINGP. We and the Tribe recognize that ongoing operation of the plant has both costs and benefits, and that some of those costs and benefits can be quantified in dollar terms while others can only be discussed qualitatively. The Company had several meetings with PIIC staff to discuss possible quantitative and qualitative components of the CBA, and PIIC staff conferred with the Tribal Council for its approval.

The Company and PIIC staff agreed on an approach to a CBA with four components:

- Quantitative modeling of the economic costs and benefits of different plant retirement dates (retirement in 2033/34 versus extension to 2053/54).
- Quantitative analysis of environmental externalities, i.e., the societal costs of a scenario retiring PINGP in 2033/34 and replacing its generation and capacity with other resources.
- Quantitative modeling of the economic costs and benefits of Treasure Island Resort & Casino, a large revenue generator for the Tribe and source of employment in the region.
- Qualitative narrative (developed by PIIC) on cultural, historical and other impacts that cannot be quantified.

The Tribe agreed that this approach would constitute the comprehensive view suggested by the Order. They also requested a commitment to ongoing community engagement from the Company, to help Tribal members feel more educated, better informed, and know whom to reach out to if they have questions or concerns. The Company supports this request and commits to annual meetings with the Tribe and its members as well as quarterly meetings with the Tribe's Office of Emergency Management.

1. *Quantitative Modeling of the Economic Costs and Benefits of PINGP Retirement Scenarios*

To evaluate the economic costs and benefits of PINGP retirement scenarios, the Company engaged the University of Colorado Boulder – Business Research Division (BRD) to conduct an economic analysis using the E3+ model developed by Regional Economic Models, Inc. (REMI). REMI E3+ is a software tool that comprehensively analyzes the linkages between the energy sector, the environment, and the broader economy. The result is a comprehensive evaluation of the macroeconomic and demographic impacts of initiatives related to the energy and environmental sectors.[11]

PINGP represents a large revenue generator, purchaser of goods and services from local and non-local businesses, employer, and source of 24/7 carbon-free electricity. These benefits can be quantified using standard economic models and compared across different scenarios for the future of the plant. The evaluation of the impacts of different PINGP retirement dates is currently underway. BRD is using REMI's E3+model to analyze the net economic impact of plant retirement scenarios, comparing the Baseline Scenario from the 2019 IRP (retirement of the Prairie Island units in 2033 and 2034) to an Extension Scenario (retirement of the units in 2053 and 2054) in line with our Preferred Plan. The analysis considers operating expenditures, capital expenditures, and consumer rate costs for each scenario. Regions analyzed include Goodhue County and "Rest of Minnesota." The analysis is being conducted for the years 2024 through 2060 (extending slightly beyond unit retirement in the Extension Scenario to capture decommissioning costs/benefits and modeling end effects). Data was provided by Xcel Energy for operating expenditures, capital expenditures, revenue requirements (total and by type—residential, commercial, industrial), labor, property taxes, and other key model inputs. Inputs to the REMI E3+ model come directly from our IRP modeling software EnCompass, ensuring consistency of assumptions across the two models. BRD then compares economic costs and benefits in the Extension versus the Baseline Scenario.

Given the discussions leading up to the data sharing, the timing of the availability of the EnCompass output, BRD is still in the process of completing the study. We intend to make a supplemental filing providing the full study in the coming months. As discussed above, we are working closely with the Tribe on these efforts and they are supportive of our current timeline.

[11] https://www.remi.com/model/e3/.

2. Quantitative Analysis of Environmental Externalities

The Company will use EnCompass to determine the change in emissions if the PINGP units retire and are replaced with other resources. Any increase in emissions in this scenario, relative to the Extension Scenario, will be assigned the Commission's approved CO_2 regulatory costs and externality values for greenhouse gases and criteria pollutants. The cumulative externality costs in the Extension Scenario, less those in the Baseline Scenario, represent the net societal damages incurred by retiring PINGP in 2033/2034 -- or stated another way, the societal benefit of avoiding those same emissions by continuing to operate the plant to 2053/2054.

This component of the comprehensive CBA will be included in our forthcoming supplemental filing.

3. Quantitative Modeling of the Economic Costs and Benefits of Treasure Island Resort & Casino

Treasure Island Resort & Casino (TIR&C) represents a significant revenue generator for the Tribe, funding a wide array of services provided by the Tribal government as well as per capita payments to each Tribal member. TIR&C is also a purchaser of goods and services from local and non-local businesses and a large employer in Goodhue County. As such, the economic benefits of TIR&C—and conversely, economic losses if TIR&C were to reduce operations or close—can be quantified using similar modeling techniques as for PINGP retirement scenarios.

BRD is using the E3+ REMI model to analyze the gross economic benefits associated with TIR&C operations that would be foregone should TIR&C close. Regions analyzed include Goodhue County and "Rest of Minnesota." The analysis period begins in 2018 and extends through the year 2023, for a six-year analysis that includes some years reflecting a pre-pandemic level of TIR&C operations. Data was provided to BRD by PIIC under a non-disclosure agreement, including current and projected spending, operating expenditures and capital expenditures, employment and salaries.

We intend to include the TIR&C study with our supplemental filing.

4. Qualitative Narrative on Cultural, Historical and Other Impacts of PINGP Operations

While models like REMI and EnCompass are useful tools to estimate and quantify in dollar terms some of the costs and benefits implicated in decisions about PINGP and

TIR&C, both the Company and PIIC recognize that the models cannot fully capture all of the costs and benefits. PIIC is drafting a narrative on historical and cultural values impacted by decisions around the future of PINGP. This will be included in our supplemental filing.

III. PERFORMANCE AND PLANNED INVESTMENTS

A. Operational Excellence

The future of our nuclear fleet and our carbon reduction goals depends on our ability to deliver exceptional performance at a reasonable cost. Since our 2019 Integrated Resource Plan, we continue to challenge the way we do business with the goal of improving efficiency and, therefore, cost. Xcel Energy understands that, over the past year, our performance is not at the level we desire or that we have achieved in the recent past. The Nuclear Business has evaluated its performance with the assistance of third-party consultants with expertise in both nuclear operations and leadership acumen. The leadership team has refocused the nuclear organization on leadership behaviors, standards and equipment reliability. We anticipate that the evaluation of our performance and implementation of a revised performance improvement strategy as we enter 2024 will secure and maintain our top industry performance as a leader in the commercial nuclear industry. We continue our work with the Institute of Nuclear Power Operations (INPO), Nuclear Energy Institute (NEI), and Electric Power Research Institute (EPRI) to evaluate and incorporate industry learnings and best practices to ensure continued operation on a more consistent, efficient, and safe basis.

1. Safety

Safety is a key value for Xcel Energy and imperative at our nuclear plants. The NRC Reactor Oversight Process classifies U.S. nuclear reactors into various nuclear safety "Columns," which range from 1 (best) to 5 (worst). Both MNGP and PINGP are Column 1 plants with all green safety performance indicators. And while no plant can achieve the standards of perfection imposed by the NRC at all times over its operational life, our track record demonstrates the Company's longstanding commitment to nuclear safety. Further, Xcel Energy has implemented a new approach to safety, which provides a platform for field supervisors and workers to discuss potential risk of planned work and incorporate lessons learned from past work activities. Open dialogue is encouraged between all employees to ensure every work plan is written for a successful and safe outcome. As a result, employee engagement and ownership of individual safety has improved. The Nuclear business unit documents all safety issues and identified risks

through our corrective action program, as required per 10 CFR 50 Appendix B, to ensure resolution is taken. This is also a focus for the organization during outages. For example, in 2023 during the MNGP refueling outage, 100 percent of the safety issues identified were resolved.

Additionally, employees turn to technology to reduce risk and improve safety. Notably, the Company's Nuclear Innovation Team has contributed to improving safety through the use of robotics. Throughout the nuclear fleet in 2023, 32 robotic missions were executed. In one example, a robot was used at MNGP to inspect a pipe that would have otherwise required a worker confined space entry and in another at PINGP, a drone was used to inspect a lightning arrestor, eliminating work at heights. Additionally, there have been multiple examples in 2021 and 2023 at PINGP of the Company using a submersible to inspect equipment in intake bays which would otherwise have required a diver to perform. These are just a few of the examples of how the Company and its employees are pursuing the use of technology to improve worker safety.

2. Capacity Factor and Flexible Operations

With respect to plant availability, MNGP achieved an average capacity factor of 95 percent between 2020 and 2022. Likewise, PINGP achieved a combined average capacity factor of 95 percent between 2020 and 2022, including a 99.8 percent capacity factor for Unit 1 in 2021 and a 99.9 percent capacity factor for Unit 2 in 2022. This data reflects strong performance at both plants, and the availability of our plants drives substantial customer benefits by maximizing the value of the fixed costs associated with nuclear operations. Contributing to these capacity factors was improved performance during plant refueling outages, which were completed on time and on budget. A refueling outage of less than 30 days is considered good performance in the nuclear industry. This assumes a basic refueling outage and no major projects are scheduled. For example, in 2019 and 2021, PINGP's Unit 2 achieved a 27 and 29-day refueling outage, respectively, and in 2020 and 2022, PINGP's Unit 1 achieved a 28 and 27-day refueling outage, respectively. Likewise, we have experienced some of the longest runs of uninterrupted operation in the history of our nuclear fleet, including a record-setting 670 days at PINGP Unit 1 from 2018 to 2020, and a record-setting run of 704 days on Unit 2 from 2019 to 2021. MNGP experienced a record-setting run of 705 days from 2019 to 2021.

In addition to providing the carbon-free baseload energy we have relied upon for 50 years, we are also operating our nuclear units more flexibly. Historically, our nuclear plants were generally offered into MISO as "must-run" resources that did not respond to expected inter-day fluctuations in net load. To accommodate more variable

renewables on the grid, since 2019 we have been honing our operational strategies that allow us to offer the plants into the MISO Day-Ahead market on an economic basis, allowing for MISO to schedule a portion of the plants to be more responsive to market signals and ramp output accordingly. With flexible power operations capabilities to all three nuclear units, we can safely and efficiently ramp up to approximately 280 MW– or over 15 percent – of our nuclear capacity in response to the market. In fact, the Company flexibly operated our nuclear plants 14 times in 2022 and 16 times in 2023. This capability can help us integrate more renewables on our system, while still utilizing our nuclear fleet as a carbon-free, stable, and reliable source of energy. In short, our ability to make renewables and nuclear work together helps us increase the amount of clean energy we can provide our customers.

Nuclear has proven its value as the foundation of our baseload fleet, and its carbon-free generation make it a critical part of our plan to achieve an 80 percent reduction in carbon emissions by 2030. We view flexible power operations as an expansion of nuclear's role in our fleet and in the Company's efforts to integrate substantial amounts of renewable additions during the planning period.

3. O&M and Production Costs

These safety and operational results have been achieved without increasing our production costs. In fact, both O&M and total production costs at our plants have decreased in recent years. Total actual O&M costs for our nuclear fleet between 2019 and 2023 was $186 million less than what was estimated in the 2019 IRP for O&M costs between 2019 and 2023[12]. In 2023, O&M costs totaled approximately $268 million. The Company's Nuclear O&M forecast between 2024 and 2028 ranges from approximately $274 million in 2024 to $288 million in 2028. Normal inflationary increases are contributing to the forecasted increase in O&M costs.

Between 2019 and 2023, we have consistently maintained production costs at $31.25 per megawatt-hour (MWh) or less, which is a decrease of more than 20 percent when compared to 2013 production costs.

[12] For a more like-for-like comparison of cost projections to the 2024 Preferred Plan, nuclear O&M and capital cost inputs for Scenario 7 of the 2019 IRP model were used for this comparison. Scenario 5 of the 2019 IRP was the selected scenario which modeled PINGP retiring at end of current license in 2033/2034 and MNGP license extension to 2040. The 2024 Preferred Plan models operating extensions of both plants with PINGP to 2053/2054 and MNGP to 2050. Scenario 7 of the 2019 IRP was used in this comparison because it most closely modeled the 2024 Preferred Plan with PINGP operating extension to 2043/2044 and MNGP extension to 2040.

Contributing to these results has been Xcel Energy's commitment to driving improvement through efficiency and technology initiatives, which focus on process refinement and the integration of technology to achieve efficiencies. Industry experience shows that successful nuclear organizations are highly process and outcome driven and that focused process improvement has the benefit of driving down costs while at the same time improving plant performance. Through our work with external consultants and INPO, we have been able to effectively improve upon a number of processes and personnel behaviors that has enabled the plants to achieve better results with fewer resources. We also continue to efficiently share our maintenance and operations resources between both plants and integrate these department resources as necessary to efficiently and safely maintain and operate the plants. As we move into 2024, we will continue to look for these opportunities to gain efficiencies while also using these resources to improve equipment reliability to ensure the continued safe and reliable operation of our nuclear fleet for years to come.

Notably, the Inflation Reduction Act (IRA) includes a production tax credit (PTC) for zero emission nuclear generation. As with other PTCs generated by the Company's resources, we intend to return the value of the nuclear PTCs, less any transaction costs associated with applicable tax credit transfers, to our customers in a timely manner. That said, forecasting the value of the PTCs is challenging because it is likely that the value of the PTCs will be an annual calculation based on Locational Marginal Pricing (LMP) that occurs in the market in a given calendar year.

For purposes of EnCompass modeling, we included an estimated value of nuclear PTCs in alignment with LMP assumptions used in the model and the nuclear plant dispatch resulting from the model. The value of the PTCs was added back into the model as a fixed amount. This resulted in close to $900 million total PTC amount on a NPV basis between 2024 and 2032. We assume the PTC will end in 2032,[13] hence it does not affect the cost benefit analysis of the nuclear extension scenarios.

4. Capital

We have completed a reanalysis of our long-term capital budgets for both plants, and we have made changes to our capital forecast relative to our 2019 resource plan. In 2019, we stated we were in a position to materially reduce our capital forecasts. The actual results validate that, between 2019 and 2022, we reduced our capital spend. In the

[13] IRA Section 13105 addresses a "zero-emission nuclear power production tax credit" in Section 45U of the Code (the Nuclear PTC). The Nuclear PTC is available for existing operating nuclear facilities in the taxable years after December 31, 2023 and prior to December 31, 2032.

2019 IRP, a four-year capital forecast between 2019 and 2022 was approximately $413 million. Actual capital spend during this time period was approximately $409 million. In 2023, unforeseen operational impacts resulted in higher capital expenditures of approximately $200 million (compared to the original forecast in the 2019 IRP of approximately $127 million for 2023). Contributing to the higher capital spend were emergent (i.e., unexpected) equipment reliability needs that resulted in loss of generation. Additionally contributing to the higher capital expenditures since 2019 is recently identified industry operating experience requiring PINGP to inspect and replace radial and clevis bolts on the Unit 1 reactor vessel.

In the 2019 IRP, assuming the scenario of 10-year extensions for both MNGP and PINGP (to compare the most like-for-like scenarios), we stated that between 2024 and 2028, we forecasted to spend approximately $559 million in capital. A reanalysis of our operational needs indicates an increase to that forecast of approximately $197 million between 2024 and 2028 for a total of $756 million over the next 5 years. Contributing to the increase are reliability projects that have been identified to support extended operation of both MNGP and PINGP to 2050 and 2053/2054, respectively. Some of these investments are discussed further in Section 4.B, "Planned Investments." Also contributing is a MNGP turbine digital control system upgrade due to current and near-term equipment obsolescence issues (i.e., equipment is no longer supported by vendor and maintenance is not possible or cost is not viable). In some cases, such as with a digital system, we are notified by the vendor that they will no longer support a specific version of the digital software and associated components and the risk to maintain the system becomes too high, so replacement is the most cost effective and lowest risk option. Security and facility expenses have also contributed to the cost increase. For additional investments, refer to Section 4.B.

The updates to our forecast reflect several years of work by numerous Company employees and leadership, as well as a recognition that we had to re-envision our approach to nuclear operations if our plants were going to remain competitive. The forecasts are based on a detailed, long-range capital budgeting process that was undertaken following our last Resource Plan. In fact, this effort included an analysis of operational and equipment reliability needs required by both plants in support of license extension plus 20 years, should approval be received at the state and federal levels. As part of this process, teams from nuclear engineering and capital projects assessed the condition of our plants and developed a long-range project forecast to support continued operations and aging management. These teams then worked with nuclear finance to develop budgets to support project needs, and probabilities were assigned to the various projects reflecting the likelihood each would be necessary to maintain the reliability of our plants. Just as we did in developing the 2019 IRP, we

then worked with independent consultants with expertise in nuclear operations who assessed both our budgeting process and our capital budgets in order to ensure that our forecasts were reasonable and aligned with industry norms.

We recognize that our stakeholders and the Commission will continue to monitor our performance and investments relative to our forecasts. We look forward to demonstrating that our nuclear plants can continue to drive both environmental and operational performance and benefits for our customers.

B. Planned Investments

Order Point 23.A of the Commission's IRP Order requires the Company to explain "[p]lanned investments at the Prairie Island and Monticello, and future plans for Prairie Island."

In this section, we address planned investments at PINGP and MNGP. Future plans for MNGP and PINGP are addressed specifically in section IX: Future Plans and Additional State and Federal Processes noted below. The portfolio discussed in the next sections will reach approximately 70 percent of projected capital spend in 2036, prioritizing asset management and equipment reliability as we enter the license extension period at both MNGP to 2050 and PINGP to 2053/2054.

1. Near-Term Planned Investments

In 2024 through 2028, the Company is planning for $756 million (excluding fuel reloading) in capital investments at MNGP and PINGP.

Approximately 50 percent of these projects address equipment reliability (i.e., aging management) concerns. At MNGP, several of the largest projects in the five-year capital investment plan at MNGP address equipment reliability, including:

- turbine digital control system upgrade,
- residual heat removal motor replacements
- reactor control rod drive rebuilds and replacements,
- refueling bridge upgrade
- turbine valve replacements,
- 4 kilovolt breaker replacements,
- valve packing gland replacements, and
- intake traveling screens and trash rake replacements.

At PINGP, several of the largest equipment investments in the five-year capital plan, include:

- reactor vessel baffle former bolt inspections and replacements,
- reactor vessel clevis bolt inspection and replacement,
- fuel handling crane controls replacement
- plant monitoring system upgrade,
- reactor vessel control rod position indication upgrade,
- fire protection system upgrades,
- water treatment modification,
- inverter replacements,
- nuclear instrumentation system upgrade,
- plant traveling screen replacement.

The above listed equipment reliability investments have been identified through implementation of life cycle and aging management practices. These practices consist of monitoring and managing the effects of aging on equipment through industry established methods of monitoring, detecting, and preventing. Via the application of these methods in addition to the review of industry operating experience and lessons learned, these investments have been identified as those that are important to the continued reliable and safe operation of the plant. While the listed projects do not include all of the current equipment reliability investments, they make up approximately 85 percent of all equipment reliability projects in 2024 through 2028.

The remaining 50 percent of the $756 million five-year capital budget includes:

- MNGP and PINGP SLR projects,
- dry fuel storage projects at both plants including ISFSI expansion and dry fuel storage system procurement and spent fuel loading,
- blanket capital investments such as maintenance for tools, facility infrastructure upgrades such as training center and service building rest room upgrades and HVAC replacement, and regulatory or mandated improvements resulting from inspections or other regulations,
- miscellaneous security investments such as security specific equipment and tools, IT software upgrades for the plant monitoring system and security system computer, and
- training tools and facilities.

These investments provide a supporting infrastructure to continued operation of the plant with a focus on subsequent license extension, continuing dry fuel storage, regulatory improvements, and updates to work areas and training facilities for employee comfort and support.

2. Long-Term Planned Investments

If the Company were to operate both MNGP and PINGP for 20 years beyond the end of their current Nuclear Regulatory Commission (NRC) operating licenses, we estimate approximately $2 billion (excluding fuel reloading) in total capital investments at the plants. Approximately 60 percent of these projects address equipment reliability (i.e., aging management) concerns. At MNGP, large equipment reliability investments include the following:

- traveling screen replacements,
- low pressure turbine rotor replacements,
- turbine valve refurbishments,
- Turbine controls upgrade,
- motor generator set replacement,
- generator stator connector ring replacement,
- reactor manual control system upgrade,
- transformer replacements,
- radiation waste controller upgrade,
- safety injection system cable replacements,
- main condenser nozzle replacement and reinforcement,
- Environmental Qualification (EQ) Program component upgrades (these are components that are in areas of the plant that might be exposed potentially to high temperatures and, therefore, they are tested at higher temperatures before being installed at the plant),
- system and component automation upgrades,
- digital feedwater control system upgrade,
- control rod blade replacement, and
- control rod drive rebuilds and replacements.

PINGP additionally has large equipment reliability investments planned and some of these contributing to the $2 billion include:

- low pressure turbines refurbishment and rotor replacements,
- high pressure turbine refurbishment and rotor replacement,

- turbine valve replacements,
- generator step-up transformer replacement/refurbishment,
- traveling screen refurbishments,
- cooling tower vertical support upgrade,
- digital electro-hydraulic turbine control system upgrade,
- main condenser dog bone and steam bellows replacement,
- main condenser partial tube replacements,
- feedwater heater retubing, load sequencer replacement,
- fire protection system upgrades,
- underground cable replacement,
- low voltage switchgear replacement,
- transformer replacements, breaker panel replacements,
- inverter replacements,
- system and component automation upgrades,
- piping replacement,
- buried fire protection pipe upgrades,
- neutron flux mapping system upgrade,
- containment fan coil units face replacements,
- refueling bridge replacement,
- residual heat removal heat exchanger refurbishments,
- emergency diesel generator and supporting equipment upgrades,
- area radiation monitor replacements,
- cooling water header and piping replacement, control room chiller refurbishments,
- reactor coolant pump seal replacements,
- control rod position indication system upgrade,
- control rod assembly replacement,
- nuclear instrumentation system replacement,
- heating boiler replacement,
- in-core cooling monitoring and reactor vessel level indication system upgrade, and
- radiation protection equipment upgrades.

Although these projects do not make up the entire list of future capital equipment reliability investments, they do make up approximately 89 percent of the planned equipment reliability related investments.

As previously stated, the above listed equipment reliability investments have been identified for future upgrade or replacement through implementation of life cycle and aging management practices and are important to the continued reliable and safe operation of the plant.

The remaining 40 percent of the $2 billion long term capital investments includes:

- PINGP SLR,
- dry fuel storage projects at both plants including ISFSI expansion and dry fuel storage system procurement and spent fuel loading,
- blanket capital investments such as capital maintenance for tools, facility infrastructure upgrades such as plant laboratory upgrades, and regulatory or mandated improvements resulting from inspections or other regulations,
- miscellaneous security,
- IT, and
- training tools and facilities.

IV. AGING MANAGEMENT

Order Point 23.B of the Commission's IRP Order requires the Company to explain, "[a]ny aging management issues that may arise from continued operation."

Throughout the years of operation, aging of plant equipment can occur due to varying processes or mechanisms. Varying temperatures, pressures and flowing water are all examples of mechanisms that can impact structures and components gradually over time. If unmonitored or unaddressed, these aging effects could cause a component to lose its intended function or design purpose prior to the end of its life.

Through industry aging management and life cycle management best practices and station procedures, the Company continues to monitor the reliability and health of the equipment at both plants. Through these processes, the Company has identified opportunities for equipment refurbishment, replacement, or upgrade at both MNGP and PINGP, should both facilities operate 20 years beyond the end of their current NRC licenses. The equipment reliability investments previously listed fall into the category of aging and life cycle management. The Company's aging management program (AMP) applied at both MNGP and PINGP will continue to be rigorously implemented to ensure any aging management issues are identified, addressed, and repaired in a timely manner commensurate with risk. AMPs are a collection of activities involving monitoring, detecting, and preventing. These are governed by administrative

controls and procedures that adequately manage the effects of aging on structures and components. This is a process the industry and company has implemented over the past approximately 50 years of the life of the plants and would continue over the next 10 years and 20 years at MNGP and PINGP nuclear plants, respectively.

In addition to being required per the plants' current licensing basis, as part of SLR implementation, AMPs are required by NRC regulations.[14] NUREG-2191, "Generic Aging Lessons Learned for Subsequent License Renewal (GALL-SLR) Report," provides the NRC staff's generic evaluation of plant AMPs and establishes the technical basis for their adequacy. As an SLR applicant, the Company evaluates current established AMPs and compares them to the GALL-SLR Report. A feasibility study will be performed as part of the SLR project for PINGP to determine if any major assets require replacement or refurbishment as part of the aging management program in addition to what has already been identified. This was done for MNGP's SLR application (which is a 20-year operating license extension request with the NRC) and no major investments were identified beyond what the station had already identified for equipment reliability improvements.

V. NUCLEAR WORKFORCE

Order Point 23.C of the Commission's IRP Order requires the Company to explain "[e]xpectations regarding future nuclear workforce."

Minn. Stat. § 3.8851, subd. 4 requires the Company to submit to the Commission updates periodically, with the resource plan filing, of the Worker Transition Plan (WTP) required under Minn. Stat. § 116C.772, subd. 3. The WTP is required to address the event of a shutdown of PINGP for longer than six months.

We address both requirements in this section.

A. Future Nuclear Workforce

At the Xcel Energy enterprise level, People & Organizational Health is a marquee initiative, through which we aim to have the innovative, inclusive culture and diverse, high-performing talent to lead the energy transformation within our industry. Maintaining a skilled and engaged workforce is one of the Company's top priorities as it impacts cost, performance, and safety. Specifically, continued operation of the plants requires a specialized workforce and talent pipeline. For decades, we have

[14] 10 CFR 54.

successfully and strategically managed our nuclear workforce to ensure safe, efficient plant operations.

In this section, we discuss our current nuclear workforce and how we are maintaining and planning for the future workforce needs to support continued operations of both plants.

1. Our Current Nuclear Workforce

As shown in Table M-3, 1,105 employees work at, or in support of, Xcel Energy's nuclear plants including contract security employees. The numbers in Table M-3 do not include other contract employees.

Table M-3: Xcel Energy Nuclear Workforce (As of December 2023)

	MNGP	PINGP	Corporate (Minneapolis Headquarters)	Total
Bargaining (includes contract security)	278	391	5	**674**
Non-bargaining	166	148	117	**431**
Total	**444**	**539**	**122**	**1,105**

2. Maintaining Our Nuclear Workforce: Workforce Supply, Demand, and Development

We have created a robust internal succession plan and achieved significant depth in our staffing. We also have a retention plan to ensure continuity of our bench strength. Maintaining a qualified and engaged workforce, however, remains an ongoing priority, and one that all high-performing nuclear organizations view as critical to maintenance of the industry's high standards of performance and safety. As a result, the Company must continue to create staffing pipelines that sustain the supply of qualified licensed-required positions such as operators, radiation protection technicians, and instrumentation and control technicians. Since the extended time for training to meet regulatory qualification expectations for these roles can be up to two years, these pipelines have to be in active hiring mode continuously each year. With the industry being more than 50 years old, many experienced nuclear personnel are well along in

their careers and will be in a position to retire in the next five to 10 years. The supply of possible nuclear employees is becoming more limited, so it is important that the Company maintains a robust talent pipeline through recruiting, engagement, training, and active succession planning.

We have five critical pipelines for roles within the nuclear organization:

- Chemistry
- Engineering
- Instrument & Controls
- Radiation Protection
- Reactor Operators/Senior Reactor Operators

These highly specialized roles will remain crucial to the ongoing successful operation of both plants into the coming decades. As we discuss below, our practices seek to ensure a robust talent pipeline for the near and long term.

a. Recruitment

Company-wide, Xcel Energy's talent acquisition team attends over 100 recruiting events each year, posts all jobs on hundreds of online job boards, and conducts outreach to high schools, diversity groups and chapters, workforce centers, veterans' groups, and more. For the Nuclear organization specifically, our need for highly specialized workforce requires additional, targeted recruitment practices to attract qualified candidates in a competitive labor market. Other nuclear plants in the U.S. and around the world as well as advanced nuclear companies are competing for a limited talent pool, and newer industries such as data centers often recruit similarly skilled candidates as they expand their strategic vision to advanced nuclear technologies for additional generation needs.

With one in 10 new Xcel Energy hires being veterans, we recognize the value military service brings to our workplace. In addition to Xcel Energy's enterprise-wide talent recruitment practices, the Nuclear talent acquisition team maintains relationships with the U.S. Navy, which operates nuclear-powered vessels. We use the Troops to Energy Jobs site, which connects veterans with careers in the energy industry and provides further training and support for energy jobs; Hiring our Heroes, a nationwide effort to connect veterans, service members, and military spouses with meaningful employment opportunities; and DOD Skillbridge, a program that supports transitioning service members through fellowships. We also advertise nuclear job postings on websites such

as Nukeworker and Facebook's Navy Nuke Job Finder, in addition to hundreds of other online job boards.

As the need for a skilled workforce remains for our nuclear plants, the retirement of our coal fleet, by the end of 2030, will create new opportunities for our employees at the Sherco and King plants. Over the past five years, approximately 15 coal plant employees have transferred to our nuclear plants, and we anticipate that over 300 jobs will be open at our nuclear plants in the 2027-2030 timeframe. Our Energy Supply and Nuclear leaders have been meeting with Sherco and King plant employees individually and presenting at plant employee meetings regularly to discuss opportunities at the nuclear plants. We discuss our workforce transition plan further in Appendix O: 2023 Workforce Transition Plan Summary and Appendix O1: 2023 Workforce Transition Plan.

The compensation levels necessary to recruit and retain experienced nuclear employees are increasing due to the limited number of nuclear plants in the United States and the highly competitive practices employed by other nuclear companies in pursuit of the same experienced personnel. To ensure we remain an employer of choice, a deliberate compensation philosophy is required.

A dedicated Compensation team at the Company manages overall compensation guidance and review and set salary structures and grades. Within those structures, managers set employee pay based on performance, anticipated contributions, internal equity, and their position within a salary range. When a job description or role profile is created, the compensation team identifies the relevant labor market for recruiting and retention purposes, in which workers compete for jobs and employers compete for workers. If available, we use market data to inform compensation. The nuclear industry standard compensation benchmarking survey is the Willis Towers Watson Energy survey. Xcel Energy Nuclear positions are matched to the market median, or 50th percentile. The Compensation team also leverages a membership through the Nuclear Human Resource Group (NHRG) for survey participation and industry peer benchmarking. Not all jobs have exact market matches. For these jobs, a "blended match" may be considered, which means compiling data for multiple job matches and averaging them together. The Company's compensation team also reviews all positions to balance external competitiveness with internal equity.

Some nuclear employees in Maintenance, Operations (including radiation and chemistry), and Engineering are also members of unions or are considered bargaining employees. The Company understands the important role these employees have in ensuring safe and successful operations of our nuclear facilities and, therefore, the

Company has worked to build a healthy relationship with our local unions over the years. The dedicated Compensation team described previously would be engaged in much the same way when renegotiating union contracts to ensure a fair and equitable offering for our bargaining employees.

b. Training & Retention

Employee retention is a crucial component of the future nuclear workforce. We employ a number of tools and programs to retain and engage employees, but challenges exist. Given the nuclear industry's openness in sharing issues and their resolution, plants with new performance issues are able to identify and recruit personnel who have worked at other plants who have successfully resolved issues. Our plants have performed well, which makes our employees desirable candidates to other utilities that are seeking to improve their performance, as our employees have demonstrated ability to operate successful plants. These other companies are offering signing bonuses and retention incentives to attract and retain experienced employees from other nuclear companies. We need to ensure that we are providing adequate pay, training, and opportunities to attract and retain the caliber of workers that we need to continue to operate at our current high level. Talent development, including fostering a culture of continuous improvement, is a constant focus for the Nuclear organization, and an essential element to achieve our performance objectives for our stakeholders.

We have incorporated retention provisions in our employee agreements to help attract and retain qualified personnel and have taken other steps to attract and retain the right skilled workforce at our plants; including the planned development of new, multi-skilled union positions.

To create a pipeline of leaders in Nuclear, we have a consistent, integrated, and sustained approach toward employee development. Xcel Energy has a cyclical Talent Review & Succession Planning approach. Human Resources, in partnership with Nuclear leaders, establish and communicate the strategy for developing high potential and succession candidates. This incudes identifying critical positions and identifying individuals for the succession plan. Those identified on the succession plan are made aware of their placement on the succession plan, are required to have a development plan, and engage in quarterly discussions with their leader about their plan and progress. We work to ensure that employees are involved and take ownership in their career development. Senior Reactor Operator (SRO) license classes and industry and external training and development are two important programs to develop our employees and build a leadership pipeline. We address each program below.

Senior Reactor Operator License Class

Senior Reactor Operator (SRO) licenses are valued as both a technical and leadership development strategy. Obtaining an NRC SRO license requires an Initial License Training class, which provides the extensive training needed to prepare employees to become an NRC-licensed SRO and supervise the controls of a nuclear power reactor. Approximately 50 percent of those who enter the Initial License Training class are internal to the Company, which builds and advanced our leadership pipeline. We select internal SRO candidates whom we have identified as employees who can advance through the control room supervisor position and, longer term, to other positions of management outside of operations. Through earning the license, employees gain direct line of sight to the reactor core and the grave responsibility that goes with running a nuclear power reactor. While a license is not required for all key leadership positions, it is expected that individuals with an SRO move through the organization as a benefit of their experience. Across both nuclear sites, we aim to have 76 active license holders.

Industry and External Training and Development INPO or NEI Rotation

Targeted for individuals to broaden and share experience, a rotation offers employees the opportunity to gain insight into best practices and the pursuit of excellence across the nuclear industry. Through an 18-month assignment, employees learn what excellence looks like and understand key processes. INPO also offers seminars on leadership development.

3. Conclusion

As we look to continue operations at our nuclear facilities into 2050 and beyond, a highly skilled workforce is imperative. We have the plans in place to ensure the plants are fully staffed with the skilled employees we need to operate the plants safely, reliably, and affordably into the coming decades.

B. Workforce Transition

1. Introduction

Minn. Stat. § 3.8851, subd. 4 requires the Company to submit to the Minnesota Public Utilities Commission updates periodically, with the resource plan filing, of the Worker Transition Plan (WTP) required under Minn. Stat. § 116C.772, subd. 3. The WTP is required to address the event of a shutdown of PINGP for longer than six months.

The 1995 WTP (the original filing of this plan) reported that the conditions that could lead to a short lead-time reactive worker transition due to an unplanned immediate shutdown were not typical of the scenario facing Minnesota. Minnesota's nuclear generating plants have a long history of being well-maintained resulting in safe, reliable, and economic operations. The WTP described in 1995 assumed a long lead-time, proactive approach. MNGP and PINGP continue to have strong operating records and are expected to operate until at least 2040 and 2033/2034, respectively; our Preferred Plan includes a 20-year extension of both PINGP units to 2053/2054 and an additional 10-year extension of MNGP to 2050. This update continues to assume the long lead-time proactive approach to a WTP.

2. Transition Plan Philosophy

We anticipate that MNGP will operate at least until 2040, and as part of our Preferred Plan, we are proposing an additional 10-year life extension that would continue plant operations until 2050. Also as part of our Preferred Plan, we are proposing to extend PINGP by 20 years, to 2053 and 2054 for Units 1 and 2, respectively. These extended operating periods and Xcel Energy's commitment to employees affords the opportunity to plan for employee transition resulting from a planned plant closure. Xcel Energy will continue to base staffing decisions on operational excellence and NRC requirements that may result in changed staff assignments and levels.

Our nuclear generating plants are operated by dedicated nuclear professionals, as discussed above. The extended plant licenses, the fact that many workers will reach retirement age well before the extended licenses will expire, and a strong management commitment are critical to the success of the Xcel Energy Worker Transition Plan. This strategy provides employees the opportunity to develop their skills, so they are congruent with the changing needs of the company and the marketplace.

The proactive approach to managing human resources produces a workforce that is motivated, cross-functional, and flexible. This approach greatly reduces the need for reactive planning.

Should PINGP or MNGP close, there are four transition paths available. They are:

1. Stay with Xcel Energy in a similar job/career path.
2. Stay with Xcel Energy in a different job/career path.
3. Retire.
4. Leave Xcel Energy for outside employment opportunities.

The proactive strategy for managing human resources allows employees to prepare for each path, and thus position themselves for a number of potential outcomes. The Company acknowledges that a proactive transition requires prior planning, total management support, complete understanding and support throughout all levels of the corporation and a comprehensive guiding process.

Xcel Energy values its employees and recognizes that they make the nuclear operations excellent, and we have an obligation to help employees plan for the future. The result of effective planning is a partnership that yields strong nuclear operations and satisfied employees. Approximately 1,100 MNGP, PINGP, and nuclear corporate permanent employees and skilled positions would be eliminated or restructured should either of the plants close. Providing these employees with avenues to enhance their skills prior to plant closing will make the transition to new jobs (inside or outside of Xcel Energy) easier, but not painless. Xcel Energy's objective is to structure and develop its work force to meet the challenges inherent in a competitive business environment. That objective will be accomplished by:

1. Establishing Business Plan workforce effectiveness goals.
2. Translating those goals into an effective Human Asset Plan.
3. Producing employee development plans.

3. Xcel Energy Transition Processes

The transition processes described below apply to both non-bargaining and bargaining unit employees at MNGP and PINGP. For bargaining unit employees, the transition plan is in accordance with the collective bargaining agreement and Xcel Energy programs and processes as described below.

4. Internal Placement

a. Job Opportunity Bulletin

Xcel Energy provides online notification of employment and career development opportunities in all new or replacement positions. This process, in accordance with our collective bargaining agreement, is used prior to outside hiring.

b. Leadership Essentials

Xcel Energy has a program to identify employees interested in becoming a member of the Xcel Energy management team and provides assessment and development to them.

Leadership Essentials is an on-line resource designed to help both beginning and experienced leaders learn and continue to develop various leadership skills. All union employees are invited to participate.

c. Corporate Training Programs

Xcel Energy offers employees training and development courses for skills needed to stay current in their present job and development courses to prepare them for future positions. This training covers technical, computer and business skills.

d. Apprenticeship Training Programs

An apprentice is a person engaged in training for one of the skill areas covered in the current labor agreement. Programs are State of Minnesota registered and provide on-the-job training and related instruction in all areas of the apprenticeship being served.

e. Tuition Reimbursement

The Tuition Reimbursement Program gives employees financial assistance to take courses offered by accredited schools and institutions of higher learning to complete a degree program.

f. Severance

i. The severance pay agreement for bargaining unit employees is covered in the current labor agreements with IBEW locals 160 and 949.
ii. The Company has a severance plan for non-bargaining employees which covers regular, full-time or part-time employees of the Company not covered by a current labor agreement. To be eligible for severance, certain eligibility requirements must be met.

5. Summary

The foundation for this type of worker transition program is based on the availability of long-term planning. If a premature closure of either plant were to occur, the results would be less favorable. In that case, employees would be afforded less time to prepare themselves for other employment within Xcel Energy or for careers outside of the company. No amount of prior planning can alleviate employees' personal hardships

should a valuable and efficient plant be forced to close prematurely. Such an occurrence would be highly speculative, and it would not be cost-effective to prepare contingencies based on scenarios that are not likely to occur.

6. Conclusions

1. Xcel Energy is committed to its employees. That commitment is reflected in the scope of resources available to employees. Xcel Energy will continue to invest heavily in employees' training and development so that the transition to a business environment will be proactive.
2. Xcel Energy's commitment to excellence in operations is unequivocal, as is the Company's commitment to operate MNGP and PINGP Units 1 and 2.
3. The long lead-time prior to potential plant closings affords Xcel Energy and its employees an opportunity to plan for the transition.
4. An orderly transition is possible through Business and Human Asset Planning as performed by Xcel Energy.

7. Commitments

1. Xcel Energy will continue to account for changes in the workforce through business planning and Human Asset Planning.
2. Xcel Energy will continue to work with affected unions to promote the retention and training of its highly skilled and dedicated workforce.

VI. CYBER SECURITY

Order Point 23.D of the Commission's IRP Order requires the Company to explain, "[c]yber-security issues or concerns as plants move from analog to digital systems."

The current NRC-regulated cyber security program is well established across the nuclear industry, subject to a regular inspection cycle like the many other regulated programs at the plants. The program requires a high degree of management oversight and is highly effective in maintaining plant and public safety as related to potential cyber vulnerabilities associated with digital plant systems and equipment. Digital equipment that has the potential to impact reactor power is isolated from business networks and has significant additional controls in place to meet program requirements. These additional controls are specific to the requested equipment and its function and may

include data access controls (e.g., user restrictions and password requirements); impact and risk analysis; and disaster recovery and contingency planning.

Concerns around digital systems are primarily related to maintenance costs rather than security or safety. In the context of nuclear generation, digital systems have proven highly reliable and effective when kept current. Still, their life cycle is generally shorter than the legacy analog systems they replace, and they are expensive to stay current under existing budgets and engineering processes. It is common for digital plant systems to become obsolete before upgrades can be engineered and installed, which makes maintenance problematic and expensive should failures occur.

Therefore, considering the designs of the Xcel Energy nuclear fleet, ongoing plant upgrades from analog to digital will take place discreetly, replacing specific equipment or systems to generally maintain the historical plant design as opposed to integrating many systems under common digital platforms, as would be expected in more modern plant designs. The existing NRC regulatory framework supports long-established engineering processes, to which cyber processes are linked.

VII. ADDITIONAL SPENT NUCLEAR FUEL

Order Point 23.F of the Commission's IRP Order requires the Company to explain "[a]dditional spent nuclear fuel generated over a 10- or 20-year period."

We anticipate that MNGP will discharge 800 spent fuel assemblies through 2040, or 1,600 spent fuel assemblies through 2050 if the plant is extended beyond the 10-year life extension currently approved by the Commission. At PINGP, we anticipate that continued operation over a 20-year period between 2033/2034 to 2053/2054, if approved, would result in 1,200 fuel assemblies being discharged.

VIII. TRANSPORTING STORED FUEL

Order Point 23.G of the Commission's IRP Order requires the Company to explain "[h]ow fuel stored on-site will be removed during the next integrated resource plan period."

This section examines opportunity for dry fuel storage at both MNGP and PINGP to be transported and stored off-site at a consolidated interim storage facility (CISF) or through the U.S. Department of Energy's (DOE's) Consent-Based Siting process. Two privately owned CISF designs have NRC license approvals but are delayed in the court system. While Yucca Mountain remains an unviable solution, the DOE's Consent-

Based Siting process is intended to further educate and provide transparency to potential future host communities.

A. Consolidated Interim Storage Facilities

1. Interim Storage Partners (ISP) Storage Facility

A consolidated interim storage project was initiated by Waste Control Specialists (WCS) for a site in Andrews County, Texas, adjacent to WCS's existing low-level radioactive waste and hazardous waste storage and disposal facilities. The NRC license application for this project was filed in April 2016. In April 2017, WCS asked the NRC to suspend the review of this application. Subsequently, WCS and Orano USA (formerly Areva Nuclear Materials) formed a joint venture to license the facility. In response to letters to the NRC in June and July 2018 from the joint venture, Interim Storage Partners (ISP), the NRC restarted its review of the application. A number of environmental and other organizations sought to intervene in the NRC proceeding and two organizations moved the NRC to reject the application (and the Holtec application described below), alleging that the NRC lacked the jurisdiction to consider the application. The NRC denied those latter requests and one of the organizations appealed the NRC's denial to the D.C. Circuit in December 2018.

On the NRC's motion, the Court dismissed the case in June 2019, as not ripe for judicial review. In August 2019, the Atomic Safety and Licensing Board considered the hearing requests, admitted one contention submitted by one of the petitioners, and dismissed the remaining contentions and petitioners. A subsequent Licensing Board decision dismissed the remaining contention as moot and rejected an attempt to amend. The Board also dismissed another petitioner's late-filed contention. Appeals from the Board decisions, as well as a motion to reopen the proceeding, were denied by the NRC. The NRC also rejected a late-filed contention not previously ruled on by the Board. Appeals of the NRC decisions to the D.C. Circuit were held in abeyance by the Court pending completion of the NRC proceeding. The NRC issued a license to ISP for their proposed commercial consolidated interim storage facility on September 13, 2021, but on August 25, 2023, the 5th Circuit Court of Appeals issued a ruling stating that the NRC lacks the authority to issue licenses for private, away-from-the-reactor spent fuel storage facilities.

On October 24, 2023, the NRC and ISP filed a rehearing petition before the entire Fifth Circuit, which includes 19 judges. NEI and Holtec submitted friend of the court briefs in support of the rehearing petition. Texas and the other challenger, Fasken, both filed responses in December 2023. A rehearing is awaiting court approval.

2. Holtec HI-STORE Consolidated Interim Storage Facility

Holtec International has proposed the HI-STORE Consolidated Interim Storage Facility for a site in Eddy and Lea Counties in southeastern New Mexico. Holtec filed an application with the NRC for this facility in March 2017. In response to NRC's July 2018 notice of opportunity for hearing, a number of environmental and other organizations filed petitions to intervene in the NRC proceeding. At about the same time, two organizations moved the NRC to reject the application (and the ISP application described above) alleging that the NRC lacked the jurisdiction to consider the application. After the NRC denied those requests, one of the organizations filed an appeal with the U.S. Court of Appeals for the D.C. Circuit in December 2018. On the NRC's motion, the Court dismissed the case in June 2019 as not ripe for judicial review. In May 2019, the Atomic Safety and Licensing Board issued a Memorandum and Order rejecting all the petitions to intervene filed in response to the July 2018 opportunity for hearing. Five of the six petitioners filed appeals with the NRC challenging the Licensing Board's rejection of their petitions. In April 2020, the NRC rejected all the appeals except for remanding to the Licensing Board four contentions put forward by one of the petitioners. In June and September 2020 orders, the Board denied the admission of the remanded contentions and other late-filed contentions—as well as motions to reopen the proceeding. Additionally, in June 2020, April 2021, and June 2021, four of the petitioners who were denied admission in the NRC proceeding filed appeals before the U.S. Court of Appeals for the D.C. Circuit. The Court consolidated these appeals and was holding them in abeyance pending the completion of the NRC proceedings. The NRC issued a license to Holtec on May 9, 2023, authorizing the company to receive, possess, transfer and store 500 canisters holding approximately 8,860 metric tons of commercial spent nuclear fuel for 40 years. In March 2023, New Mexico approved legislation aimed at stopping the project.

The concern by members of the New Mexico Senate Energy and Natural Resources Committee, including Senator Martin Heinrich, is that this will not be interim storage as what it is referred to by the NRC and Holtec, but rather permanent storage unless a permanent repository is legislatively approved and constructed by the DOE.

3. Conclusion

While we believe the centralized storage facilities proposed by ISP and Holtec meet all NRC regulatory requirements and would be a positive development in the management of spent nuclear fuel, we do not consider it a viable alternative to the MNGP or PINGP ISFSIs at this time due to legislative challenges.

Each consolidated interim storage facility will need to work with their respective states on permitting issues and will develop a business model for operations prior to construction. In addition, DOE has begun its own process to find a consent-based interim storage location over the next several years (as described below) and it is unclear how this will impact the two private facilities currently in licensing.

If either of these facilities become operational in the future, or should another solution become available through the DOE Consent-Based Siting Program, we would explore the possibility of shipping fuel to that site. It is unclear if this could be accomplished within the 2024-2040 IRP timeline.

B. Yucca Mountain and DOE Consent-Based Siting Program

The application to license the Yucca Mountain permanent repository remains pending before the NRC, following the unsuccessful attempt by the Obama Administration to terminate the proceeding and withdraw the application. The NRC Staff's technical and environmental reviews have been essentially completed, but the adjudicatory hearings on the application before NRC Atomic Safety and Licensing Board remain suspended—with numerous contentions submitted by Nevada and other opponents remaining to be resolved before the NRC can license the project. The Biden Administration did not seek any funding for Yucca Mountain in the FY2021 or FY2022 budgets. North Las Vegas KLAS News reported that during Senate committee hearings in June 2021, Secretary of Energy Jennifer Granholm testified that the Administration does not support Yucca Mountain as a solution for nuclear waste disposal but will begin a consent-based siting process in 2021.

In June 2023, DOE awarded 13 contracts to consortiums consisting of university, non-profit, and private-sector partners that will work with communities interested in learning more about nuclear energy and spent nuclear fuel storage with a goal of education and transparency. Communities will participate by working with DOE and these consortiums through a phased approach to determine whether and how being a host community could align to their goals. The three phases to this approach include: (1) planning and capacity building, (2) site screening and assessment, and (3) negotiation and implementation.

Xcel Energy is part of a consortium with the Prairie Island Indian Community and several others led by the Southwest Research Institute (SwRI) that was awarded a DOE contract. The consortium will collaborate with a couple of selected communities to educate and provide transparency with the intent to enter into the phased approach described above.

The DOE's Consent-Based Siting Program is in its initial stages. As an unpaid award winner for the program contract, the Company will remain actively engaged with key stakeholders throughout the entire process. Once a community has accepted a host community role, the community and DOE will need to work with respective states on permitting issues and will develop a business model for operations prior to construction. It is unclear how much can be accomplished within the 2024-2040 IRP timeline.

IX. FUTURE PLANS AND ADDITIONAL STATE AND FEDERAL PROCESSES

Order Point 23.H of the Commission's IRP Order requires the Company to explain "[w]hich additional state permits, Certificates of Need, or federal licenses will be required."

Extended plant operations beyond the existing operating license expiration date requires federal approval by the NRC. In this case, both MNGP and PINGP have already extended their operating licenses once through the License Renewal (LR) application process. The second extension is referred to as Subsequent License Renewal (SLR). The Company submitted an SLR application for MNGP on January 9, 2023, and anticipates a decision from the NRC by end of year 2024 and license issuance in 2025. PINGP has just begun development of the application and anticipates submittal before the end of 2026. The federal SLR process is for a 20-year extension.

Also required to extend plant operations beyond the existing operating license is approval from the Commission to expand spent nuclear fuel storage on site in ISFSI. For MNGP, the Company requested approval by the Commission for a 10-year ISFSI expansion through the Certificate of Need process (Minn. Stat. §116B.77- 166B.83), in alignment with the Preferred Plan from our 2019 IRP. The Commission granted the Certificate of Need, which is subject to state legislative action this coming session, with its October 17, 2023, Order.[15] For MNGP, we would seek another Certificate of Need to support the additional 10-year life extension put forth in our Preferred Plan and would likely begin that process shortly after a Commission decision on this Resource Plan.

For PINGP, the Company is filing a Certificate of Need application in the near future in MNPUC Docket No. E002/CN-24-68 for a PINGP 20-year Independent Spent Fuel Storage Installations (ISFSI) expansion in support of SLR, which would expand PINGP's operating license from 2033/2034 to 2053/2054, in alignment with our Preferred Plan.

[15] Docket No. E002/CN-21-668.

Table M-4 lists additional state and federal licenses, permits, and certificates required for an additional 10-year extension of MNGP (to 2050), and a 20-year extension of PINGP's units (to 2053 and 2054). We note that this list encompasses known requirements as this time, but it should be considered preliminary and subject to change.

Table M-4: State and Federal Requirements for Continued MNGP and PINGP Operation

Agency	Authority	Requirement And Plant	Authorized Activity
NRC	Atomic Energy Act [10 CFR Part 50]	MNGP operating license PINGP operating licenses (Unit 1 and Unit 2)	Subsequent License Renewal of +20 years. MNGP SLR currently in review with NRC. PINGP Unit 1 and Unit 2 SLR submittal anticipated in 2026.
MN PUC	Minn. Stat. §216B.243-CERTIFICATE OF NEED FOR LARGE ENERGY FACILITY Minnesota Rule Chapter 7855 – CERTIFICATE OF NEED, LARGE ENERGY FACILITY Minn. Stat. §116B.77-166B.83 – RADIOACTIVE WASTE MANAGEMENT FACILITY ATHORIZATION	MNGP and PINGP Certificate of Need to extend onsite storage of spent fuel	Continued operation of MNGP and PINGP Independent Spent Fuel Storage Installations (ISFSIs)
MPCA	Clean Water Act Section 401 [33 USC 1341]	Certification of water quality standards for both MNGP and PINGP.	Section 401 Water Quality Certification issued by the state for operation of MNGP and PINGP.
USACE	Clean Water Act Section 404 [33 USC 1344]	Regional general permit (Section 404) for both MNGP and PINGP	Maintenance dredging in front of the intake apron on the Mississippi River.
Alliance for Uniform Hazmat Transportation Procedures	49 USC 5119	Uniform Program Credentials (Hazmat permit and registration) MNGP and PINGP	Hazardous material shipment.

Agency	Authority	Requirement And Plant	Authorized Activity
Tennessee Department of Environment and Conservation (TDEC)	TDEC Rule 0400-20-10-.32	License to ship radioactive material MNGP and PINGP	Shipment of radioactive material to a licensed disposal/processing facility in Tennessee.
Utah Department of Environmental Quality (UDEQ)	Utah Administrative Code R313-26	General site access permit for radioactive waste disposal MNGP and PINGP	Delivery of radioactive waste to a land disposal facility located in Utah.
MPCA	Minnesota Rules Part 7045.0225	Hazardous waste generator license MNGP and PINGP	Authorizes facility to operate as a hazardous waste generator.
MPCA	Minnesota Statutes Chapters 115 and 116	NPDES permit MNGP and PINGP	Discharges of wastewater to waters of the state.
MPCA	Minnesota Rules Part 7007.0150	Air emission permit MNGP and PINGP	Operate air emission facility (four diesel generators, diesel fire pump, three flexible pumps, and heating boiler).
MPCA	Minnesota Rules Chapter 7150	Tank registration MNGP and PINGP	Underground storage tank registration.
MPCA	Minnesota Rules Chapter 7151	Tank registration MNGP and PINGP	Aboveground storage tank registration.
MDNR	Minnesota Statutes Chapter 103G	State dredging permit MNGP and PINGP	Maintenance dredging of sand and silt from discharge canal and intake skimmer area.
MDNR	Minnesota Statutes Chapter 103G.271	Water appropriations permit MNGP and PINGP	Groundwater withdrawals from Well #1 and Well #2.
MDNR	Minnesota Statutes Chapter 103G.272	Water appropriations permit MNGP and PINGP	Surface water withdrawals from the Mississippi River.
MDNR	Minnesota Statutes Section 97A.401	Division of Fish and Wildlife special permit MNGP and PINGP	Collection of fish for scientific purposes.

Agency	Authority	Requirement And Plant	Authorized Activity
MDNR	Minnesota Statutes Section 84D.11	Division of Ecological and Water Resources permit MNGP and PINGP	Transport of zebra mussels and other prohibited invasive species to Xcel Energy facilities or to a repair site for purposes of control, disposal, and maintenance of equipment.
City of Monticello	City of Monticello Ordinance Title V, Chapter 52	Sanitary Sewer Wastewater Discharge Agreement MNGP only	Agreement to discharge domestic sanitary waste to the City of Monticello sanitary sewer collection system.

X. CONCLUSION

Xcel Energy's nuclear fleet has provided carbon-free electricity to our Upper Midwest customers safely and reliably for decades. The continued operation of PINGP and MNGP is crucial to achieving the Company's—and our states'—policy objectives, while keeping bills low and maintaining a reliable, resilient system. We have robust plans in place to ensure operational excellence, continue our efforts to ensure spent fuel can be transported offsite, manage costs, and maintain a skilled workforce that will operate the plants over the coming decades as we continue to reduce carbon emissions.

Executive Summary

This analysis was performed to determine the steady state impacts and dynamic resources needed online as a result of retiring the Monticello Nuclear Generating Plant, Prairie Island Nuclear Generating Plant, and both the Monticello and Prairie Island Nuclear Generating Plants. Integrated System Planning (ISP) Transmission Planning engineers performed a study to evaluate the transmission system with the nuclear generation station retirements along with the planned Sherco coal generation replacement with Minnesota Energy Connection (MNEC) renewable generation and the AS King coal generation replacement with King Transmission Connection solar generation. Existing natural gas resources were turned on to replace the generation shortfalls based on the MISO dispatch of renewables in the model. This study is a reliability only look – system transfer capability and resource capacity analyses are out of the work scope of this study.

This study looks at the retirement of the nuclear generating stations without replacement of generation rights. The following Table M1-1 shows the retirement scenarios analyzed.

Table M1-1
Nuclear Generation Retired

Scenario Analyzed	Monticello Generation Retired (MW)	Prairie Island Generation Retired (MW)	Total Generation Retired (MW)
Monticello Retire	637	0	637
Prairie Island Retire	0	1150	1150
Monticello and Prairie Island Retire	637	1150	1778

The steady state analysis identified the retirement of the nuclear generation plants without replacement generation resulted in thermal overloads and voltage violations requiring system upgrades.

Based on the dynamic analysis results performed in this study, significant replacement generation is needed:

- Summer Peak Load Case, in addition to generation on in the base model, required all available gas generation on at Anson, Inver Grove, and Blue Lake (total 521 MW) as well as load reduction in the Twin Cities area.
    - Monticello Retire – 10% (537.37 MW)
    - Prairie Island Retire – 20% (1074.74 MW)
    - Monticello and Prairie Island Retire – 30% (1612.11 MW)
- Shoulder Load Average Wind Case, in addition to the generation on in the base model required additional combustion generation turned on.
    - Monticello Retire – High Bridge 7 and 9 (388MW), Riverside 7 and 9 (318 MW). Total generation addition of 706 MW.
    - Prairie Island Retire - High Bridge 7 and 9 (388MW), Riverside 7, 9, and 10 (476 MW), Blue Lake 7 and 8 (302 MW). Total generation addition of 1,166 MW.

PUBLIC DOCUMENT—NOT-PUBLIC DATA HAS BEEN EXCISED
INCLUDES TRADE SECRET AND CEII DATA
YELLOW HIGHLIGHT DENOTES PROTECTED DATA

- Monticello and Prairie Island Retire – High Bridge 7, 8, and 9 (550 MW), Riverside 7, 9, and 10 (476 MW), Blue Lake 1-4, 7, and 8 (455MW), Inver Grove 1-6 (282 MW). Total generation addition of 1763 MW.

Scenarios Analyzed

2028 Summer Shoulder Average Wind, and Summer Peak scenarios are analyzed in this study. Renewables in the NSP system are modeled at seasonal generation levels; Solar at 50% for Summer Peak, 31% for Summer Shoulder Average Wind, Wind at 15.5% for Summer Peak, 27% for Summer Shoulder Average Wind.

NSP load information is shown in following Table M1-2.

Table M1-2
NSP Load Level

Year	Season	Load Level
2028	Summer Shoulder Average Wind	6,383 MW
2028	Summer Peak	9,064 MW

Steady State Simulation Results

Steady state analysis was performed on the base case, Monticello retire case, Prairie Island retire case, and both Monticello and Prairie Island retire case for both the Summer Peak and Summer Shoulder Average Wind case. Available NSP natural gas generation was turned on to reduce the number of unsolved contingencies. The number of unique facilities with new or increased >0.5% voltage violations and thermal violations beyond the preexisting violations in the base case and associated costs to mitigate them for each case are listed in Table M1-3.

Table M1-3
Voltage and Thermal Upgrades with cost for Steady State Violations

Transient Stability Simulation Results

Transient stability analysis was performed on the base case, Monticello retire case, Prairie Island retire case, and both Monticello and Prairie Island retire case for both the Summer Peak and

PUBLIC DOCUMENT—NOT-PUBLIC DATA HAS BEEN EXCISED

Summer Shoulder Average Wind case. Available NSP natural gas generation was turned on to achieve stable dynamic response. If no additional NSP natural gas resources were available, load in the Twin Cities area was scaled down to achieve stable dynamic response.

Table M1-4
Generation and Load Adjustments with cost for Stable Dynamic Response

	Summer Peak			Summer Shoulder		
Scenario Analyzed	**Additional Generation On (MW/$)**	**Load Reduction (MW/$)**	**Total Cost ($)**	**Additional Generation On (MW)**	**Load Reduction (MW)**	**Total Cost ($)**

Without Twin Cities Load reduction for the summer peak case, and additional gas generation turned on in both summer peak and shoulder average wind case, generator rotor angles exceed +/- 300 degrees, which is indicative of the point where the generator would lose synchronization with the grid and trip offline. Example plots of Unstable and Stable Response are shown in Figure M1-1 and Figure M1-2.

Introduction

This analysis was performed to determine the steady state impacts and dynamic resources needed online as a result of separately retiring the Monticello Nuclear Generating Plant and the Prairie Island Nuclear Generating Plant. For further analysis, the retirements of both the Monticello and Prairie Island Nuclear Generating Plants simultaneously were included in the analysis. Additionally, Integrated System Planning (ISP) Transmission Planning engineers performed a study to evaluate the transmission system steady state with the nuclear generation station retirements along with the planned Sherco coal generation replacement with Minnesota Energy Connection (MNEC) renewable generation and the AS King coal generation replacement with King Transmission Connection solar generation. Existing natural gas resources were turned on to replace the generation shortfalls based on the MISO dispatch of renewables in the model. This study is a reliability only look – system transfer capability and resource capacity analyses are out of the work scope of this study.

Assumptions

This study is performed utilizing Siemens PSSE version 35.3.2 for steady state analysis and Powertech TSAT version 22.3.39 for dynamic analysis and based on the MISO Transmission Expansion Plan (MTEP) 2023 steady state models and dynamics package. MISO MTEP 2023 series, year 2028 models are selected as the starting models; no substantial load growth is assumed in this study. Sherco coal generation is replaced with Minnesota Energy Connection renewable generation at MISO renewable dispatch levels. AS King coal generation is replaced with King Transmission Connection solar generation at MISO solar dispatch levels.

Potential Limitations

Model

Sherco and King generation replacement locations and details are assumed based on the preliminary project scope, final project details may have minor differences.

Retirement of the nuclear generating stations were assumed to have no replacement generation installed. Load reduction where needed for stability was performed as a percent reduction across all loads in the Twin Cities area.

1 Models and Assumptions

1.1.1 Models Utilized

Siemens PSSE version 35.3.2 for steady state analysis and Powertech TSAT version 22.3.39 for dynamic analysis and based on the MISO MTEP 2023 steady state models and dynamics package. MISO MTEP 2023 series, year 2028 models are selected as the starting models; no substantial load growth is assumed in this study.

1.1.2 Model Development

MTEP 2023, year 2028 Summer Peak (SUM) and 2028 Shoulder Average Wind (SHAW) models are selected as the starting models. Sherco coal generation is replaced with Minnesota Energy Connection renewable generation at MISO renewable dispatch levels. AS King coal generation is replaced with King Transmission Connection solar generation at MISO solar dispatch levels.

2028 Summer Shoulder Average Wind, and Summer Peak scenarios are analyzed in this study. Renewables in the NSP system are modeled at seasonal generation levels; Solar at 50% for Summer Peak and 31% for Summer Shoulder Average Wind; Wind at 15.5% for Summer Peak and 27% for Summer Shoulder Average Wind. NSP load information is shown in Table M1-5.

Table M1-5
NSP Load Level and Thermal Generation Level

Year	Season	Load Level
2028	Summer Shoulder Average Wind	6,383 MW
2028	Summer Peak	9,064 MW

1.1.3 Modeling Assumption

MTEP 2023, year 2028 Summer Peak (SUM) and 2028 Shoulder Average Wind (SHAW) models are selected as the starting models. Sherco coal generation is replaced with Minnesota Energy Connection renewable generation at MISO renewable dispatch levels. AS King coal generation is replaced with King Transmission Connection solar generation at MISO solar dispatch levels. Analysis is performed on cases with Monticello Nuclear Generating Plant retired, Prairie Island Nuclear Generating Plant retired, and both Monticello and Prairie Island Nuclear Generating Plants retired.

2 Steady State Analysis

MISO MTEP 2023 Steady State 2033SUM and 2033SHAW models are used to conduct the steady state analysis. Steady analysis was performed on the base case, Monticello retire case, Prairie Island retire case, and both Monticello and Prairie Island retire case for both the Summer Peak and Summer Shoulder Average Wind case. Full N-1 and N-1-1 contingencies were run for LRZ 1.

Available NSP natural gas generation was turned on to reduce the number of unsolved contingencies. Robust solution in PSSE was used to allow for system adjustment of reactive devices and generation during contingency analysis to reduce the number of unsolved contingencies.

3 Stability Analysis

MISO MTEP 2023 Transient Dynamic package is used to conduct the transient stability analysis. Three phase faults with normal clearance time and single line to ground faults with a stuck breaker are tested for major 345 kV substations, transmission lines in Twin Cities and neighboring areas. Selected 345 kV bus voltages and transmission line power flow in Twin Cities and neighboring areas are monitored and plotted. The disturbances studied are listed in Table M1-6:

PROTECTED CEII DATA ENDS

Available natural gas generation was turned on iteratively to achieve stability. Where insufficient natural gas generation was available to achieve stability, scalable load in the Twin Cities was reduced by a percentage of area load until stability was achieved.

- Summer Peak Load Case, in addition to generation on in the base model, required all available generation on at Anson, Inver Grove, and Blue Lake (total 521 MW) as well as load reduction in the Twin Cities area.
  - Monticello Retire – 10% (537.37 MW)
  - Prairie Island Retire – 20% (1,074.74 MW)
  - Monticello and Prairie Island Retire – 30% (1,612.11 MW)
- Shoulder Load Average Wind Case, in addition to the generation on in the base model required additional combustion generation turned on.
  - Monticello Retire – High Bridge 7 and 9 (388 MW), River Side 7 and 9 (318 MW). Total generation addition of 706 MW.
  - Prairie Island Retire - High Bridge 7 and 9 (388 MW), River Side 7, 9, and 10 (476 MW), Blue Lake 7 and 8 (302 MW). Total generation addition of 1,166 MW.
  - Monticello and Prairie Island Retire – High Bridge 7, 8, and 9 (550 MW), Riverside 7, 9, and 10 (476 MW), Blue Lake 1-4, 7, and 8 (455 MW), Inver Grove 1-6 (282 MW). Total generation addition of 1,763 MW.

4 Analysis Results

In the steady state analysis, available NSP natural gas generation was turned on to reduce the number of unsolved contingencies. The number of unique facilities with new or increased >0.5% voltage violations and thermal violations beyond preexisting violations in the base case were

identified. Associated costs assigned based on MISO Transmission Cost Estimation Guide For MTEP23[1] for rebuild of overloaded lines to larger conductor size and assuming 5 150MVAR statcoms, situated in the vicinity of the retired nuclear units would resolve the voltage violations observed. The cost breakdown of the associated upgrades is listed in Table M1-7:

Table M1-7
Voltage and Thermal Upgrades with cost for Steady State Violations

In the dynamic analysis, available NSP natural gas generation was iteratively turned on to achieve stability. Once all available NSP natural gas was turned on, Twin Cities load was scaled down to achieve stability. Generation additions and load reduction are summarized in Table M1-8:

Table M1-8

5 Analysis Results Discussion

For the steady state results, any line with thermal violations is assumed to need an upgrade. Transformers with thermal violations are assumed to be replaced with transformer sized to carry the contingency level flows. Voltage violations are assumed to need reactive support in the form of capacitors or reactors. MISO cost estimation values are used to determine the estimated cost of upgrades as summarized in Table M1-9.

Table M1-9
Steady State Upgrade Summary

	Summer Peak			Summer Shoulder		
	Line Upgrade (miles/cost $)	**Reactive Support (MVAR/cost $)**	**Total Cost ($)**	**Line Upgrade (miles/cost $)**	**Reactive Support (MVAR/cost $)**	**Total Cost ($)**
Monticello Retire						
Prairie Island Retire						
Monticello and Prairie Island Retire						

For the dynamic results, cost was applied to the natural gas units turned on to maintain system stability assuming gas price of [redacted]. Cost was also applied to load reduction to maintain system stability in the Summer Peak load case. Costs associated with dynamic stability are summarized in Table M1-10.

Table M1-10

2028 Summer Peak Case:

Generator angular stability issues were identified at generation and load reduction levels below those indicated in Table 6 as indicated by generator angles exceeding +/- 300 degrees, which reflects the angle at which the generator would lose synchronization with the electric grid and trip offline. Indicative plot of angular instability is shown in Figure M1-3. Stable generator angle plot examples for each retirement scenario are shown in Figure M1-4, Figure M1-5, and Figure M1-6.

6 Observation

Based on the steady state results performed in this study, significant line upgrades and voltages support are needed to mitigate violations with their associated fixed costs as a result of the retirement of the nuclear units:

Table M1-11
Steady State Upgrade Cost Summary

	Summer Peak			Summer Shoulder		
	Line Upgrade (miles/cost $)	**Reactive Support (MVAR/cost $)**	**Total Cost ($)**	**Line Upgrade (miles/cost $)**	**Reactive Support (MVAR/cost $)**	**Total Cost ($)**
Monticello Retire						
Prairie Island Retire						
Monticello and Prairie Island Retire						

Based on the dynamic analysis results performed in this study, significant replacement generation is needed along with the associated annual costs of the generation:

- Summer Peak Load Case, added generation to achieve generator angular stability needed was 521 MW as well as load reduction in the Twin Cities area based on the nuclear generation being retired.
  - Monticello Retire – 10% (537.37 MW) Total Annual Cost [redacted].
  - Prairie Island Retire – 20% (1,074.74 MW) Total Annual Cost [redacted].
  - Monticello and Prairie Island Retire – 30% (1,612.11 MW) Total Annual Cost [redacted]
- Shoulder Load Average Wind Case, added generation to achieve generation angular stability based on the nuclear generation being retired.
  - Monticello Retire – Total generation addition of 706 MW Total Annual Cost [redacted]
  - Prairie Island Retire - Total generation addition of 1,166 MW Total Annual Cost [redacted]
  - Monticello and Prairie Island Retire - Total generation addition of 1,763 MW Total Annual Cost [redated]

PROTECTED CEII DATA ENDS

APPENDIX N – STANDARD OBLIGATIONS

As part of this filing, we have included Appendices N1 and N2 – the 2021 REO-RES-SES Report and the 2022 REO-RES-SES Report, respectively. These appendices detail our compliance with the verification and filing requirements for the RES, REC retirement, and Green Pricing REC requirement required by Minn. Stat. § 216B.1691, Subd. 3, and were filed in Docket Nos. E999/M-22-85, E999/PR-22-12, and E999/PR-02-1240 and Docket Nos. E999/PR-23-12 and E999-PR-02-1240, respectively. However, because of the legislative amendment to Minn. Stat. 216B.1691, the reporting requirements to Minn. Stat. 216B.1691, subd. 3 have been expanded to include additional reporting detailing, including:

> (5) the number of Minnesotans employed to construct facilities designed to meet the utility's standard obligations under this section;
> (6) efforts taken to retain and retrain workers employed at electric generating facilities that the utility has ceased operating or designated to cease operating for new positions constructing or operating facilities used to meet a utility's standard obligation;
> (7) the impacts of facilities designed to meet the utility's standard obligations under this section on environmental justice areas;
> (8) efforts made to increase the diversity of both the utility's workforce and vendors; and
> (9) for an electric utility utilizing renewable energy credits to satisfy any portion of the electric utility's obligations under this section, the following information:
> (i) the name and location of energy facilities that generated the energy associated with the credits;
> (ii) the dates when the energy associated with the credits was generated;
> (iii) the type of fuel that generated the energy associated with the credits; and
> (iv) whether the energy associated with the credits was purchased by the utility purchasing the credits.

We plan on including this information in our REO-RES-SES reports along with the other information required under Minn. Stat. § 216B.1691, Subd. 3 beginning in our next anticipated filing.

Below, we provide an overview of specific state targets and our compliance with renewable standards and carbon reduction standards.

I. STATE TARGETS

Our Upper Midwest integrated system provides service to five states, each with varying levels of renewable and/or carbon-free energy requirements and objectives. Each state's target is expressed as a percentage of electric retail sales from qualifying resources by a certain date.

Specific targets are as follows:

- North Dakota and South Dakota each have a voluntary Renewable and Recycled Energy Objective to have 10 percent renewable or recycled energy by 2015.[1]
- Michigan – as of November 2023 – has a Renewable Energy Standard (RES) that requires 50 percent renewable energy by 2030 and 60 percent by 2035; and a clean energy standard requiring 100 percent clean electricity by 2040.
- Wisconsin has a Renewable Portfolio Standard (RPS) that requires Xcel Energy to have approximately 12.9 percent renewable energy by 2015 and to maintain that percentage for each year thereafter.
- Minnesota has a renewable energy standard (RES), solar energy standard (SES), distributed solar energy standard (DSES), and a carbon-free energy standard (CFS):
    - The RES requires 30 percent renewable energy by 2020; and 55 percent by 2035.[2]
    - The SES requires 1.5 percent solar energy by 2020, 10 percent of which must be met by solar energy from PV devices with capacity of 40 kW or less.
    - The DSES requires three percent distributed solar energy by 2030.[3]
    - The CFS requires 80 percent carbon-free energy by 2030; 90 percent by 2035; and 100 percent by 2040.[4]

[1] As defined in North Dakota Century Code, 49-02-25, recycled energy means "systems producing electricity from currently unused waste heat resulting from combustion or other processes into electricity and which do not use an additional combustion process. The term does not include any system whose primary purpose is the generation of electricity unless the generation system consumes wellhead gas that would otherwise be flared, vented, or wasted." South Dakota Codified Law 49-34A-94 contains a similar definition. For North Dakota, we sell renewable energy credits and return proceeds from the sale to North Dakota customers.
[2] Minn. Stat. § 216B.1691 Subd. 2a, "Eligible energy technology standard." Eligible energy technologies are solar, wind, hydroelectric, green hydrogen, and biomass.
[3] Minn. Stat. § 216B.1691 Subd. 2h states that projects must comply with eligibility requirements to count toward the DSES. Eligibility requirements stipulate that the project must be: 10 MW or less; connected to our distribution system; located in our Minnesota service territory; and constructed/procured after August 1, 2023 using a Commission-approved competitive bidding process; etc.
[4] Minn. Stat. § 216B.1691 Subd. 2g, "Carbon-free standard".

II. RENEWABLE STANDARDS

In 2023, the Minnesota Legislature amended the requirements set forth in Minn. Stat. § 216B.1691 to include additional milestones for renewable energy (see Minn. Laws 2023, chp. 7). First, the statute requires Xcel Energy to achieve a renewable energy standard of 55 percent by 2035. Second, subd. 2h of Minn. Stat. § 216B.1691 amended the distributed solar energy standard (DSES). This amendment mandates that at least three percent of the Company's retail electric sales in Minnesota must be generated from solar energy generating systems. To be counted towards this standard, the solar generating system must have a capacity of ten megawatts or less, be connected to the distribution system, be located in our Minnesota service territory, and be constructed or procured after August 1, 2023.

We plan and operate our NSP generation and transmission facilities as an integrated system, and in the most cost-effective way possible to benefit all our customers across our five Upper Midwest jurisdictions. We also plan our system to comply with the regulations of each state in which we operate. To meet each of the renewable energy objectives in those five states, we maintain a set of banked Renewable Energy Credits (RECs) for future compliance. We maintain our REC inventory in the regional Midwest Renewable Energy Tracking System (M-RETS), which was established for compliance tracking relative to state renewable energy standards. In M-RETS, one MWh of generation from a renewable source equals one REC.

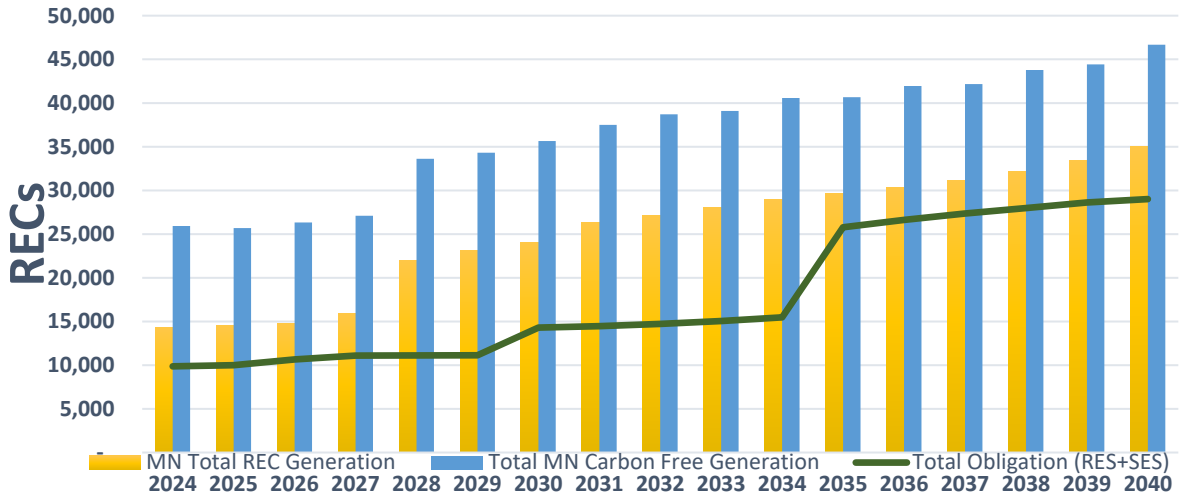
A. Renewable Energy Standard Solar Energy Standard and Compliance

The Company expects to generate a sufficient number of RECs throughout the planning period to satisfy our renewable obligations under our Preferred Plan. Figure N-1 below demonstrates our compliance through the Resource Plan planning period with the Minnesota Renewable Energy Standard and 1.5 percent Solar Energy Standard (SES). Figure N-1 also provides our total carbon-free generations.

Appendix N1: 2021 REO-RES-SES Report is the Company's most recent Minnesota biennial RES Compliance filing and was filed on June 1, 2022, in Docket Nos. E999/M-22-85, E999/PR-22-12, and E999/PR-02-1240.

Appendix N2: 2022 REO-RES-SES Report is the Company's most recent Minnesota SES Compliance filing, which was filed on Jun 1, 2023, in Docket Nos. E999/PR-23-12 and E999/PR-02-1240.

Figure N-1: State of Minnesota Annual RES and SES REC Obligation and Production



III. CARBON REDUCTION STANDARDS

As mentioned above, in 2023, the Minnesota Legislature amended the requirements set forth in Minn. Stat. § 216B.1691 to create new carbon-free energy standards (see Minn. Laws 2023, chp. 7). The new legislation requires Xcel Energy to generate or procure carbon-free energy equivalent to 100 percent of its Minnesota retail sales by 2040. The law, Minn. Stat. § 216B.1691, also requires Xcel Energy to achieve interim carbon-free standards of 80 percent by 2030, and 90 percent by 2035.

Further, both Wisconsin and Michigan's Governors recently put forward 100 percent by 2040 carbon reduction goals for their respective states' electric sector. Proceedings by those states' Public Utilities Commissions are still in the early stages and have not produced any final compliance requirements for electric utilities.

A. Carbon-Free Standards

The Company is well positioned to achieve compliance with the CFS based on our

Preferred Plan included with this IRP filing. Therefore, the assumptions used in this IRP will result in a plan that complies with the MN CFS for our system.

We note that Table N-1 does not rely on renewable energy credits (RECs), or partial carbon-free energy credits associated with market purchases to demonstrate compliance with the CFS, although it is our understanding that those represent acceptable compliance pathways per the legislation.

Table N-1: 2024 Preferred Plan Carbon-Free Energy

	2030	2035	2040
Carbon-Free Generation (GWh)	46,515	52,681	60,162
MN Allocated CF Generation (GWh)	35,644	40,668	46,666
MN Elec Retail Sales (GWh)	35,725	39,668	44,624
Carbon Free Standard Requirement	80%	90%	100%

The accounting for demonstrating compliance with the carbon-free standard is based on the ratio of the annual utility generation or procurement from carbon-free technologies allocated to Minnesota, and the annual retail electric sales in Minnesota. Compliance with the carbon-free standards is determined by the delta between carbon-free generation and the total of retail electric sales in Minnesota. For example, if a utility were to generate and procure 10,000 kWhs of carbon-free electricity in a year allocated to Minnesota and have 10,000 kWhs of MN retail sales that same year, the utility's generation/procurement would be 100 percent carbon free under the statute. If that utility were to have 12,000 kWhs of MN retail sales that year, the utility's generation/procurement to serve that load would be 83 percent carbon-free.

The Minnesota Public Utilities Commission has opened an Investigation docket[5] into the Carbon-Free Standard (CFS). Parties and the Commission will weigh in on several topics in that docket over the next couple of years, and the Minnesota Commission intends to issue several notices requesting comments on the changes made to Minn. Stat § 216B.1691. The current notice is focused on the clarification of new and amended terms added to Minn. Stat § 216B.1691, including carbon-free, partial compliance, and environmental justice areas.

RENEWABLE ENERGY CERTIFICATE RETIREMENT AND SOLAR ENERGY STANDARDS REPORTING FOR COMPLIANCE YEAR 2021
DOCKET NO. E999/PR-22-12

GREEN PRICING VERIFICATION FILING PROCESS
DOCKET NO. E999/PR-02-1240

Dear Mr. Seuffert:

Northern States Power Company, doing business as Xcel Energy, submits the attached compliance report to fulfill the verification and filing requirements for the Renewable Energy Standards (RES), Renewable Energy Credit (REC) retirement, and Green Pricing REC retirement required by Minn. Stat. § 216B.1691, Subd. 3. The Company also submits the 2021 Annual Report as required by the Minnesota Public Utilities Commission in an Order dated January 29, 2021 in Docket Nos. E-999/M-20-464 and E-999/M-13-542, Solar Energy Standards (SES).

We have provided the required information in the attached Excel spreadsheet templates. Attachment A contains RES, Green Pricing, and SES Retail Sales; RES,

Green Pricing, and SES REC Retirements; Biennial Compliance Requirements; and REC Purchases and Sales.

REC Retirement

By May 1, 2022, the Company retired approximately 8.6 million RECs, representing 30 percent of annual retail sales for calendar year 2021, using the Midwest Renewable Energy Tracking System (M-RETS). The Company is therefore in compliance with the Minnesota RES requirements identified in Minn. Stat. § 216B.1691 subd. 2(a) and the Commission's March 19, 2010 Order in Docket No. E999/CI-03-869.

In addition, by May 1, 2022, the Company retired approximately 618,000 RECs for our Green Pricing Programs. Approximately 441,000 RECs were retired for the Windsource Program, approximately 167,000 RECs were retired for Renewable*Connect, and approximately 10,000 RECs were retired for the Renewable*Connect Government Program. Details of the Company's Green Pricing Program REC retirements are included in Attachment A.3.

The required information specified in the Commission's April 17, 2014 NOTICE and the May 28, 2013 ORDER FINDING UTILITIES IN COMPLIANCE WITH MINN. STAT. § 216B.1691 AND MODIFYING BIENNIAL REPORTING PROCEDURES in Docket No. E999/M-12-958, including the RES calculations, the RECs retired and the names of the M-RETS retirement sub-accounts, is provided in Attachment A.

As noted in Attachment A.7, the Company purchased 227,740 RECs for our Windsource program.

Biennial REO-RES Compliance

Attachment A.6 to this report provides the Company's forecasted retail sales data for 2022-2025, projected generation data for this reporting period, other state RES or Objectives to which the utility is subject, actions taken to address the RES requirements, and a discussion of potential obstacles to meeting our requirements and solutions to the same.

Certified Renewable Percentage

The Company began offering the Certified Renewable Percentage (CRP) to our customers in 2019 for calendar year 2018.

Each year, the Company calculates the CRP for the preceding year, after all program participation, REC sales, REC retirements for the RES, trade margin sales, and all other data points that affect the CRP are available. After the annual CRP is calculated, the Company then retires the additional RECs to match the amount of renewable energy delivered to customers.

The 2021 CRP is calculated at 34.3 percent. The increase over the previous year is due largely to additional wind resources brought online in 2021. We estimate that the CRP will continue to increase each year as new renewable resources continue to come online. The 2021 CRP is higher than the RES obligation and therefore the Company plans to retire additional RECs for the 2021 CRP beyond what is required for the RES.

Below is an overview of the MN CRP from 2018 to 2021. The 2019 and 2020 CRPs are currently in the process of third-party verification and the Company plans to verify the 2021 CRP in Summer 2022. The 2019, 2020, and 2021 CRPs are subject to change as an outcome of the verification process.

Year	CRP Percent
2018	26.6
2019	23.3
2020	31.8
2021	34.3

Renewable*Connect Government Program

The security and privacy of customer data, including energy usage data, is a key concern for the Company. As a matter of course, the Company generally does not publicly disclose energy usage data related to an individual customer.

In previous years of the REO/RES REC filing, the customer participating in the Renewable*Connect Government Program has requested certain information related to its energy usage be considered Non-Public, but the Department of Commerce has requested the information be submitted publicly. In advance of this year's Compliance filing, the Company reached out to this customer asking if the information that it normally considers Non-Public could be submitted publicly for this year's 2021 REO/RES REC filing. The customer consented to the Company submitting the information as Public information. Notwithstanding this one-time

consent, the Company reserves the right to submit similar information as Non-Public in the future.

Summary of ongoing efforts to obtain solar energy, including a brief summary of the anticipated mix of project sizes for SES compliance.

For purposes of this Section, Solar Energy Standard (SES) compliance means the requirement set forth in Minn. Stat. § 216B.1691, Subd. 2f, whereby Xcel Energy, by the end of 2020, needs to generate or procure sufficient electricity generated by solar energy so that at least 1.5 percent of the Company's total retail electric sales in Minnesota is generated by solar energy. The additional requirement in Subd. 2f regarding the 10 percent solar carve-out requirement from systems of 40 kW (AC) or less is addressed below.

The Company has developed a large portfolio of resources and programs to provide renewable options to residential and commercial customers. Since the passage of the SES under the 2013 Energy Omnibus Bill, we have grown our utility portfolio of solar resources to expand access of solar benefits to all customers while achieving compliance in reporting year 2021. The Company expects to accumulate and exceed the amount of solar RECs (SRECs) required to satisfy the MN SES compliance requirements beginning in 2020 and continue well beyond 2034. SRECs accumulated in the REC bank beyond what is needed for compliance requirements, will be applied towards the MN state RPS obligations to avoid any REC expirations.

Progress towards the 10% carve-out for systems 40 kW_{ac} or less, including the method by which the utility will meet the carve-out.

A subset of programs from the section above can be used towards our 10 percent small solar carve out. Table 1 describes these impacts. These are further detailed in this section.

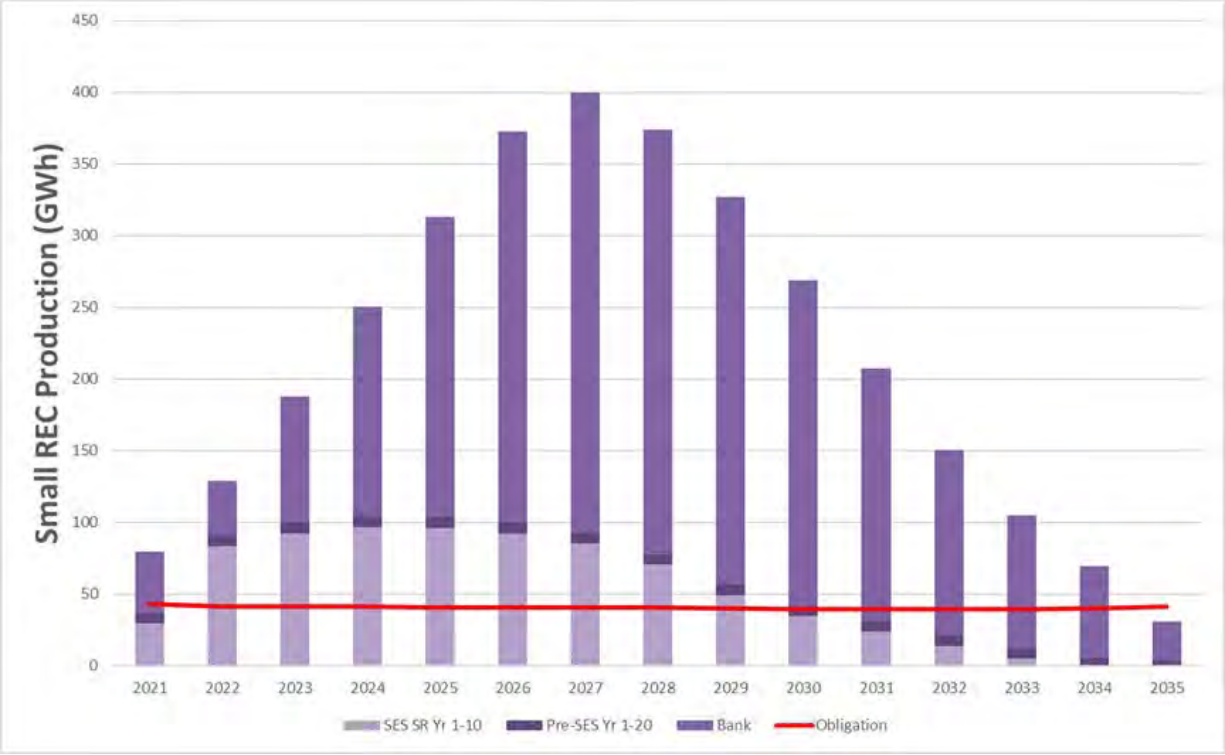
Table 1: Small Solar Carve Out – Programs

Program Name	Size	Years Available
Solar*Rewards (First Generation)	**≤40 kW (DC)***	**2010 – August 2014**
Solar*Rewards (Second Generation)	**≤ 20 kW (DC)* ≤ 40 kW (DC)***	**August 2014 – May 2018 June 2018 – May 2019**
Solar*Rewards (Third Generation)	**≤ 40 kW (AC)**	**June 2019 - 2024**
Solar*Rewards for Schools	**≤ 40 kW (AC) >40 kW – 1 MW**	**May 2022 – June 2027**
Made in Minnesota	**≤40 kW**	**2014 – 2017**

*Energy produced in DC goes through an inverter to get converted to AC. In this process there is energy loss, meaning that DC output results in a lower AC output.

Graph 1 below represents our current projection for REC compliance with the 10 percent small solar carve out. This chart shows the Company may be in compliance with the small solar carve out through 2034. However, this representation uses program assumptions, discussed below, and thus has embedded risk that the actual results could be significantly different than the forecast. The Company cannot predict what the installation rate will be for small rooftop solar.

Graph 1
Small SREC Production with Solar*Rewards
Program Extension through 2024



The chart above assumes 100 percent of Solar*Rewards funds are allocated based on estimated solar system performance and that of these projects, 75 percent of them are completed each year for the Solar*Rewards program through 2024. If actual solar installations are lower than forecasted levels, the Company may not be able to meet the small solar carve-out requirements through 2034 as projected in the chart above.

With the prospect that the Solar*Rewards program may be extended in future years, the Company believes it will have sufficient small-solar RECs to meet our obligations

without a buy-back option. If, at some time, it appears that the Company will not have sufficient RECs to meet its obligations, it may revisit the REC buy-back option.

Also, the above analysis is based on the understanding that the nameplate capacity for purposes of this statute is measured in alternating current (AC). This is consistent with the definition of capacity in Minn. Stat. § 216B.164, Subd. 2a.(c), as well as how capacity is used or interpreted under the following statutes: Minn. Stat. §§ 216B.1611, Subd.2(a), and Subd.3a(a)(1); 216B.1613; 216B.164, and Subd. 4c; 216B.1641 (b).

Discussion on the utilities' efforts to reach, by 2030, the energy goal that ten percent of the retail electric sales in Minnesota be generated by solar energy.

The 10 percent by 2030 goal is an energy goal of the state of Minnesota. We understand this question to be evaluating our current efforts to reach our proportional share of the state's energy goal.

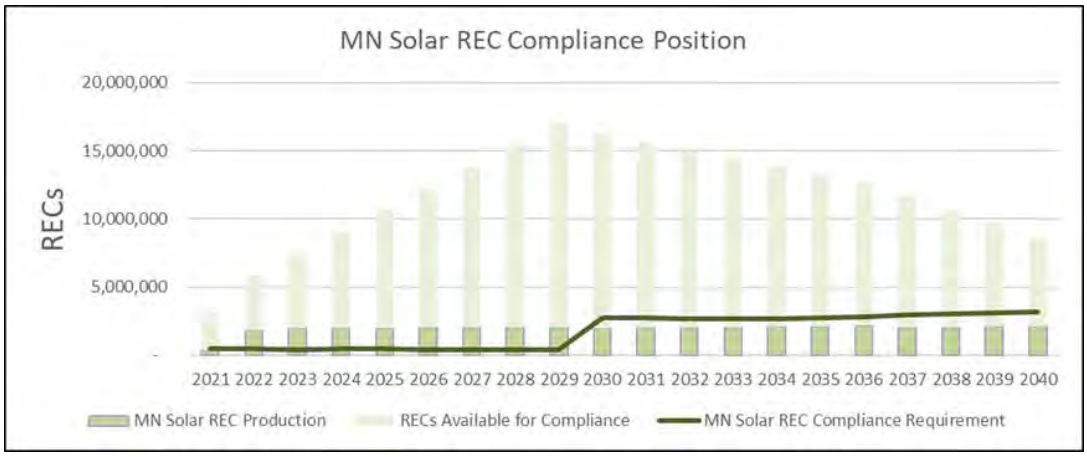
As shown in Graph 2 below, the Company forecasts that existing solar resources alone will not be sufficient to meet the 10 percent by 2030 goal. However, the Company has also proposed to add substantial amounts of solar generation to our portfolio in the coming years in our recently approved 2020-2034 Integrated Resource Plan.[1] In the Commission's Order approving the plan, it authorized the Company to procure approximately 900 MW of solar capacity coming online by the end of 2025, incremental to the proposed 460 MW solar generating facility near the Company's current Sherburne County coal generating facility's site.[2] Our plan also includes additional solar capacity build out, to replace and reuse interconnection made available when Sherco 1 and A.S. King coal units retire in the latter half of the 2020s. This capacity will provide substantial solar generation to our system and would contribute toward meeting the 10 percent SES goal into the future; in fact, by 2030, we expect over 10 percent of our generation to come from solar resources. As always, we will continually review the need for additional solar resources in our future resource plans, in order to achieve the goal long-term.

We note that there is currently significant supply chain uncertainty surrounding a recent decision by the U.S. Department of Commerce to accept an antidumping and countervailing duty trade complaint levied against solar components imported from four southeast Asian countries. In the near term, specific projects may be delayed beyond their originally envisioned timelines. However, at this time, we do not expect

[1] Docket No. E002/RP-19-368.
[2] Docket No. E002/M-20-891.

this investigation to negatively impact our long-term goals to add solar capacity to our system.

Graph 2



Attachment A contains certain portions that have been designated as Trade Secret information pursuant to Minnesota Statute § 13.37, subd. 1(b). In particular, the information designated as Trade Secret relates to specific Purchase Power Agreements (PPAs). The terms of the Commission approved PPAs require that this information be non-public. Other information marked as trade secret relates to specific production from specific customer facilities. Further, this is considered to be "non-public data" pursuant to Minn. Stat. §13.02, Subd.9, and is also "Trade Secret" information pursuant to Minn. Stat. §13.37, subd. 1(b) as it derives independent economic value, actual or potential, from not being generally known to, and not being readily ascertainable by proper means by other persons who can obtain economic value from its disclosure or use. In general, we publicly show the names of the Renewable*Connect resources because they are already publicly disclosed and therefore their identity is public, but their actual production is non-public. The names of the Windsource facilities have similarly already been publicly identified along with their capacities, but the actual production from each is not public. The smaller wind facilities generally are our retail customers and Minnesota regulations prohibit us from disclosing a customer name alone; therefore, we have treated as non-public the customer names along with their M-RETS ID that would otherwise identify them. Where we have biomass plants, because we have fewer than 15, we have treated as nonpublic the name and RECs of each. We note that the number of RECs retired from specific solar gardens is publicly provided because our solar garden tariff at tariff sheet 9-78 specifically authorizes us to make garden generation data public for each. Other REC retirement data for smaller facilities has been aggregated and de-identified.

Pursuant to Minn. Stat. § 216.17, subd. 3, we have electronically filed this document and served copies on all parties on the attached service list. If you have any questions about this information, please contact me at bria.e.shea@xcelenergy.com, or Pamela Gibbs at pamela.k.gibbs@xcelenergy.com or (612) 330-2889.

Sincerely,

/s/

BRIA E. SHEA

Renewable Energy Certificate Retirement Report for
RENEWABLE ENERGY STANDARDS and GREEN PRICING PROGRAMS

Minnesota Public Utilities Commission: Docket No. E999/PR-22-12 and Docket No. E999/M-22-85 — **Attachment 6**
Minnesota Department of Commerce: Docket No. E999/PR-02-1240 — Reporting Period: **January 1, 2021 - December 31, 2021**

Biennial Compliance reporting

Please report the following items in compliance with the PUC May 28, 2013 Order in Docket No. E999/M-12-958

RES Ordering Point

4.A. & 5.H. **The year through which the utility can maintain compliance with its current renewable portfolio***: Beyond 2040

*Include banked Renewable Energy Credits (RECs)

4.B. & 5.I. **Projected RES compliance for the current plus three (3) upcoming years.**

Year	Actual/Projected MN retail sales (MWh)	RES Req.(%)	RES Req. (MWh)	Projected Resources (MWh)	Projected Surplus/ (Deficit) (MWh)
	[NOT PUBLIC DATA BEGINS		[NOT PUBLIC DATA BEGINS		
2022		30%			
2023		30%			
2024		30%			
2025		30%			
	NOT PUBLIC DATA ENDS]				NOT PUBLIC DATA ENDS]

5.E.2 & 5.F. **Identify other State Renewable Standards or Objectives to which the utility is subject, and the percentage of renewable energy allocated to meet the renewable requirements.**

State	RES Req. (MWh)	RES Req. (%)	Percent of utility's total system renewable generation apportioned to this state (%)*
WI	858,032	12.89%	16.36%
MI	20,614	15%	0.34%
SD	214,473	10% Voluntary	5.33%
ND	0	Voluntary	5.29%

*apportionment of renewable energy should reflect each state's percentage of the utility's total system sales.

5.E.3 (i) **The status of the utility's renewable energy mix relative to the objective & standards.**

The Company's overall renewable energy mix exceeds the renewable portfolio standard (RPS) obligations for the state of Minnesota, and other states it operates in, and is sufficiently able to comply with these increasing requirements. The Company continues to increase its renewable energy mix, primarily in wind and solar, to take advantage of cost-effective resource additions and to decrease carbon emissions.

5.E.3(ii) **Efforts taken to meet the objective and standards**

In 2021, we added 650 MW of renewable generation capacity to our system and the Company continues to exceed our RES mandate for Minnesota. As approved in our most recent Upper Midwest Integrated Resource Plan, we will continue to add of renewable energy in the coming years.

5.E.3(iii) **Obstacles encountered or anticipated in meeting the objective or standards**

The annual Renewable Portfolio Standard (RPS) percentage rate and overall renewable requirement for Xcel Energy has significantly increased over the past several years. At the same time, the Company has been able to take advantage of cost-effective renewable resource additions to meet and exceed its compliance obligations.

5.E.3(iv) **Potential solutions to the obstacles**

The Company is currently positioned to meet and exceed our compliance obligations.

5.G. **List any renewable generation facilities expected to become operational during the upcoming year**

Facility Name	Type	Capacity (MW)	MISO Capacity Accreditation	Expected Comm'l Operation Date
Heartland Divide Wind II, LLC	Wind	200 MW	32 MW	April 2022
Dakota Range 1&2	Wind	300 MW	49 MW	Jan 2022
Ewington (repower)	Wind	20 MW	3 MW	Sept 2022
Northern Wind (repower)	Wind	120 MW	19 MW	Dec 2022

Note: As stated in our March 7, 2022 Letter in Docket Nos. E002/M-19-33 and E002/M-21-222, we currently expect that construction of the Elk Creek solar facility and the associated commercial operation date will likely be delayed until 2024. Therefore, we have removed Elk Creek Solar LLC from this list. We will continue to update the Commission on this project.

5.K. **Identify efforts taken to adequately protect against undesirable economic impacts on ratepayers, including, but not limited to keeping customer's bills and the utility's rates as low as practicable, given regulatory and other constraints.**

The Company continues to take advantage of opportunities as these are identified and determined to be beneficial to our customers.

SES Utilities Only

Ongoing efforts to meet SES objective and a brief summary of project mix for SES compliance.

See the "Summary of ongoing efforts to obtain solar energy, including a brief summary of the anticipated mix of project sizes for SES compliance" section within the Compliance Report on page 4.

Discussion on efforts to reach the 2030 goal that 10% of MN retail sales be generated by solar energy (Attach A, 14)

As noted in our filing, the Company already exceeds the current 1.5% requirement and we have substantial SRECs banked. We expect our REC bank to carry us through several more years of demonstrated solar compliance and provide partial fulfillment of the 10% goal. In order to increase solar generation so that we may meet the goal on an ongoing basis, the Company plans to add substantial amounts of solar generation to our portfolio in the coming years, as approved in our recent 2020-2034 Integrated Resource Plan. We will continually review the need for additional solar resources in our future resource plans, in order to achieve the goal long-term.

SES - A summary of progress toward compliance with the ten percent carve out for systems under 40 kW.

See the "Progress towards the 10% carve-out for systems 40 kWac or less, including the method by which the utility will meet the carve-out" section within the Compliance Report on page 4.

RE: RENEWABLE ENERGY OBLIGATION (REO)-RENEWABLE ENERGY STANDARD (RES) AND SOLAR ENERGY STANDARDS (SES) COMPLIANCE REPORT

RENEWABLE ENERGY CERTIFICATE RETIREMENT AND SOLAR ENERGY STANDARDS REPORTING FOR COMPLIANCE YEAR 2022
DOCKET NO. E999/PR-23-12

GREEN PRICING VERIFICATION FILING PROCESS
DOCKET NO. E999/PR-02-1240

Dear Mr. Seuffert:

Northern States Power Company, doing business as Xcel Energy, submits this compliance report to fulfill the verification and filing requirements for the Renewable Energy Standard (RES), Renewable Energy Credit (REC) retirement, and Green Pricing REC retirement required by Minn. Stat. § 216B.1691, Subd. 3. The Company also submits this as the 2022 Annual Report as required by the Minnesota Public Utilities Commission in its January 29, 2021 Order in Docket Nos. E999/M-20-464 and E999/M-13-542, Solar Energy Standards (SES).

We have provided the required information in Attachment A. Attachment A contains RES, Green Pricing, and SES Retail Sales; RES, Green Pricing, and SES REC Retirements; and REC Purchases and Sales. We note that the Commission has opened Docket No. E999/CI-23-151 to examine future reporting needs resulting from the recent changes to the RES and the newly created carbon free standard under Minn. Stat. § 216B.1691, and this report does not address these changes.

A. REC Retirement

By May 1, 2023, the Company retired approximately 8.6 million RECs, representing 30 percent of annual retail sales for calendar year 2022, using the Midwest Renewable Energy Tracking System (M-RETS). The Company is therefore in compliance with the Minnesota RES requirements identified in Minn. Stat. § 216B.1691 subd. 2(a) and the Commission's March 19, 2010 Order in Docket No. E999/CI-03-869.

In addition, by May 1, 2023, the Company retired approximately 677,000 RECs for our Green Pricing Programs. Approximately 493,000 RECs were retired for Windsource, approximately 172,000 RECs were retired for Renewable*Connect, and approximately 11,000 RECs were retired for Renewable*Connect Government. Details of the Company's Green Pricing Program REC retirements are included in Attachment A.3.

The required information specified in the Commission's April 17, 2014 Notice and the May 28, 2013 ORDER FINDING UTILITIES IN COMPLIANCE WITH MINN. STAT. § 216B.1691 AND MODIFYING BIENNIAL REPORTING PROCEDURES in Docket No. E999/M-12-958, including the RES calculations, the RECs retired and the names of the M-RETS retirement sub-accounts, is provided in Attachment A.

As noted in Attachment A.7, the Company purchased 330,000 RECs for our Windsource program.

B. Certified Renewable Percentage

The Company began offering the Certified Renewable Percentage (CRP) to our customers in reporting year 2018.

Each year, the Company calculates the CRP for the preceding year, after all program participation, REC sales, REC retirements for the RES, trade margin sales, and all other data points that affect the CRP are available. After the annual CRP is calculated, the Company then retires the additional RECs to match the amount of renewable energy delivered to customers.

The 2022 CRP is calculated at 42.55 percent compared to 34.3 percent in 2021. The increase over the previous year is due largely to additional wind resources brought online in 2022. We estimate that the CRP will continue to increase each year as additional renewable resources continue to come online. The 2022 CRP is higher than the RES obligation, and therefore the Company plans to retire additional RECs for the 2022 CRP beyond what is required for the RES.

Below is an overview of the Minnesota CRP from 2018 to 2022. All prior CRP calculations have completed the thorough process of third-party verification. The Company anticipates that the 2022 CRP will be verified by Fall of 2023.

Table 1: Annual CRP Percentages

Year	CRP Percent
2018	26.6
2019	23.3
2020	31.8
2021	34.3
2022	42.55

C. Renewable*Connect Government Program

The security and privacy of customer data, including energy usage data, is a key concern for the Company. As a matter of course, the Company generally does not publicly disclose energy usage data related to an individual customer.

In previous years of the REO/RES REC filing, the customer participating in the Renewable*Connect Government Program has requested certain information related to its energy usage be considered non-public, but the Department of Commerce has requested the information be submitted publicly. In advance of this year's Compliance filing, the Company reached out to this customer asking if the information that it normally considers non-public could be submitted publicly for this year's 2022 REO/RES REC filing. The customer consented to the Company submitting the information as public information. Notwithstanding this one-time consent, the Company reserves the right to submit similar information as non-public in the future.

D. Summary of ongoing efforts to obtain solar energy, including a brief summary of the anticipated mix of project sizes for SES compliance

For purposes of this Section, SES compliance means the requirement set forth in Minn. Stat. § 216B.1691, Subd. 2f, whereby Xcel Energy, by the end of 2020, needs to generate or procure sufficient electricity generated by solar energy so that at least 1.5 percent of the Company's total retail electric sales in Minnesota is generated by solar energy. The additional requirement in Subd. 2f regarding the 10 percent solar carve-out requirement from systems of 40 kW (AC) or less is addressed in Section E below.

The Company has developed a large portfolio of resources and programs to provide renewable options to residential and commercial customers. Since the passage of the SES in 2013, we have grown our utility portfolio of solar resources to expand access of solar benefits to all customers while achieving compliance in reporting year 2022. The Company began to satisfy the Minnesota SES compliance requirements in 2020 and expects to accumulate and exceed the amount of solar RECs (SRECs) required well beyond 2034. SRECs accumulated in the REC bank beyond what is needed for compliance requirements will be applied towards the Minnesota state RPS obligations to avoid any REC expirations.

E. Progress towards the 10 percent carve-out for systems 40 kW_{ac} or less, including the method by which the utility will meet the carve-out

A subset of programs from Section D above can be used towards our 10 percent small solar carve out. Table 2 describes these impacts. These are further detailed in this section.

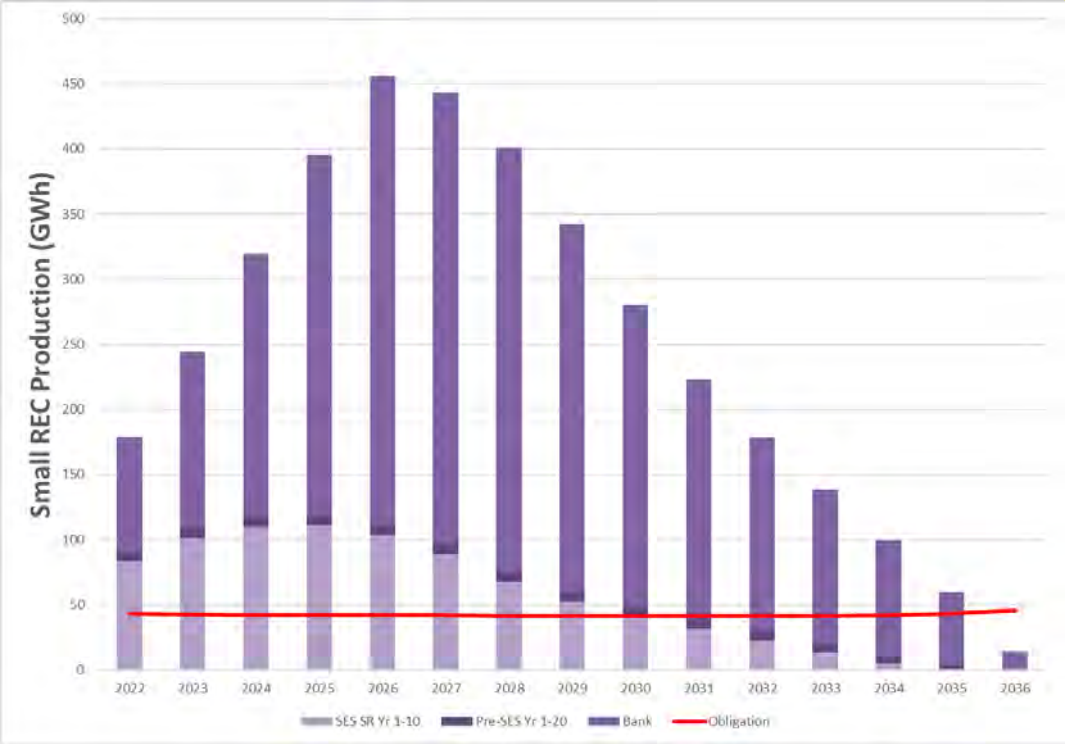
Table 2: Small Solar Carve Out – Programs

Program Name	Size	Years Available
Solar*Rewards (First Generation)	**≤40 kW (DC)***	**2010 – August 2014**
Solar*Rewards (Second Generation)	**≤ 20 kW (DC)* ≤ 40 kW (DC)***	**August 2014 – May 2018 June 2018 – May 2019**
Solar*Rewards (Third Generation)	**≤ 40 kW (AC)**	**June 2019 - 2024**
Solar*Rewards for Schools	**≤ 40 kW (AC) >40 kW – 1 MW**	**May 2022 – June 2027**
Made in Minnesota	**≤40 kW**	**2014 – 2017**

*Energy produced in DC goes through an inverter to get converted to AC. In this process there is energy loss, meaning that DC output results in a lower AC output.

Graph 1 below represents our current projection for SREC compliance with the 10 percent small solar carve out. This chart shows the Company may be in compliance with the small solar carve out through 2034. However, this representation uses program assumptions, discussed below, and thus has embedded risk that the actual results could be significantly different than the forecast. The Company cannot predict what the installation rate will be for small rooftop solar.

Graph 1
Small SREC Production with Solar*Rewards
Program Extension through 2024[1]



The chart above assumes 100 percent of Solar*Rewards funds are allocated based on estimated solar system performance and that of these projects, 75 percent of them are completed each year for the Solar*Rewards program through 2024. If actual solar installations are lower than forecasted levels, the Company may not be able to meet the small solar carve-out requirements through 2034 as projected in the chart above.

With the new legislation extending the Solar*Rewards program to future years[2], the Company believes it will have sufficient small solar RECs to meet our obligations without a buy-back option. If, at some time, it appears that the Company will not have sufficient RECs to meet its obligations, we may revisit the REC buy-back option.

[1] Following a technology transition in mid-2019, the Company REC reports to M-RETS erroneously excluded generation from new small-solar resources. The Company has rectified the issue and filed the missing RECs with M-RETs. Previously omitted RECs are included in this report.
[2] On May 24, 2023, Governor Walz signed a bill that revised Minn. Stat. § 116C.7792 to change the 2024 incentive from $5 million to $11.25 million and created a 2025 incentive in the amount of $6.25 million.

Also, the above analysis is based on the understanding that the nameplate capacity for purposes of this statute is measured in alternating current (AC). This is consistent with the definition of capacity in Minn. Stat. § 216B.164, Subd. 2a.(c), as well as how capacity is used or interpreted under the following statutes: Minn. Stat. §§ 216B.1611, Subd.2(a), and Subd.3a(a)(1); 216B.1613; 216B.164, and Subd. 4c; 216B.1641 (b).

F. Discussion on the utilities' efforts to reach, by 2030, the energy goal that ten percent of the retail electric sales in Minnesota be generated by solar energy[3]

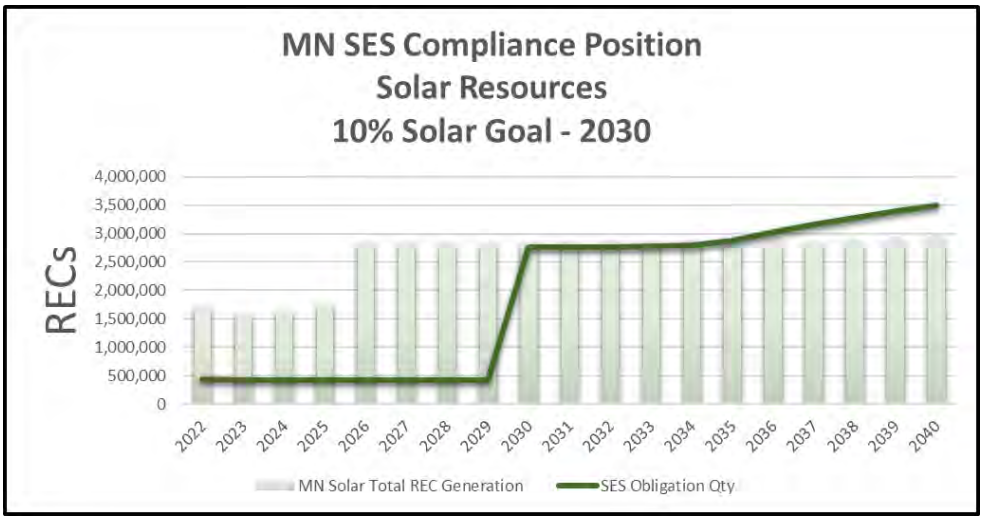
The 10 percent by 2030 goal is an energy goal of the state of Minnesota. We understand this question to be evaluating our current efforts to reach our proportional share of the state's energy goal.

As shown in Graph 2 below, the Company forecasts that the currently approved and proposed/planned solar resources will be sufficient to meet the 10 percent by 2030 goal and will furthermore be sufficient to satisfy the SES requirements through year 2035 without the use of banked RECs. However, the Company has also proposed to add substantial amounts of solar generation to our portfolio in the coming years in our recently approved 2020-2034 Integrated Resource Plan.[4] The Commission's Order approving the plan authorized the Company to procure approximately 900 MW of solar capacity coming online by the end of 2025, incremental to the recently approved Sherco Solar 1 and 2 460 MW solar generating facility near the Company's current Sherburne County coal generating facility site.[5] We recently completed an RFP that yielded 350 MW of that target, pending Commission approval, for an additional project at the Sherco site (Sherco Solar 3) and a PPA project (Apple River Solar).[6] Sherco Solar 3 – when combined with Sherco Solar 1 and 2 – will fulfill the Company's need to procure capacity to reutilize the interconnection rights made available when Sherco coal Unit 2 retires later this year. We will continue progress toward the Integrated Resource Plan's authorized solar procurement in the coming months. In total, this capacity will provide substantial solar generation to our system and would contribute toward meeting the 10 percent SES goal into the future; in fact, by 2030, we expect over 10 percent of our generation to come from solar resources. As always, we will continually review the need for additional solar resources in our future resource plans in order to achieve the goal long-term.

[3] Impacts of the changes to Minn. Stat. §§ 216B.1691, Subd. 2h. and 216B.2425, Subd. 9 will be discussed in the Company's November 1, 2023 IDP filing.
[4] Docket No. E002/RP-19-368.
[5] Docket No. E002/M-20-891.
[6] Docket No. E002/M-22-403.

We note that the solar market is currently facing significant challenges resulting from residual disruption around the U.S. Department of Commerce anti-dumping circumvention investigation of solar components imported from four southeast Asian countries, an increase in price exacerbated by inflation and increased underlying demand resulting from the passage of the Inflation Reduction Act. These issues are further discussed in our May 5, 2023 Solar Portfolio Petition filing.[7] However, at this time, we do not expect these challenges to negatively impact our long-term goals to add solar capacity to our system.

Graph 2[8]



Attachment A contains certain portions that have been designated as Trade Secret information pursuant to Minnesota Statute § 13.37, subd. 1(b). In particular, the information designated as Trade Secret relates to specific Purchase Power Agreements (PPAs). The terms of the Commission-approved PPAs require that this information be non-public. Other information marked as trade secret relates to specific production from specific customer facilities. Further, this is considered to be "non-public data" pursuant to Minn. Stat. §13.02, Subd.9, and is also "Trade Secret" information pursuant to Minn. Stat. §13.37, subd. 1(b) as it derives independent economic value, actual or potential, from not being generally known to, and not being readily

[7] *Id.*

[8] We note that Graph 2 does not show benefits from banked RECs; however, even with this conservative approach, it shows compliance through 2035. If we were to show benefits of banked RECs, we would show compliance through 2045.

ascertainable by proper means by other persons who can obtain economic value from its disclosure or use. In general, we publicly show the names of the Renewable*Connect resources because they are already publicly disclosed and therefore their identity is public, but their actual production is non-public. The names of the Windsource facilities have similarly already been publicly identified along with their capacities, but the actual production from each is not public. The smaller wind facilities generally are our retail customers and Minnesota regulations prohibit us from disclosing a customer name alone; therefore, we have treated as non-public the customer names along with their M-RETS ID that would otherwise identify them. Where we have biomass plants, because we have fewer than 15, we have treated as non-public the name and RECs of each. We note that the number of RECs retired from specific solar gardens is publicly provided because our solar garden tariff at Sheet No. 9-78 specifically authorizes us to make solar garden generation data public for each. Other REC retirement data for smaller facilities has been aggregated and de-identified.

We have electronically filed this document with the Minnesota Public Utilities Commission, and copies have been served on the parties on the attached service lists. Please contact me at rebecca.d.eilers@xcelenergy.com or 612-330-5570, or Pamela Gibbs at pamela.k.gibbs@xcelenergy.com or (612) 330-2889 if you have any questions regarding this filing.

Sincerely,

/s/

REBECCA EILERS

Annual solar generation on the utilities' system for the previous calendar year

	Number of Facilities on Utility System	Capacity	Number registered in M-RETS	Capacity registered in M-RETS	SRECs Generated
Less than 40kW	8698	84.9	111	54	83,608
Generation from eligible CSG subscriptions	917	860	917	860	1,401,119
Greater than 40kW	70	4.8	39	271	495,282

Renewable Energy Certificate Retirement Report for
RENEWABLE ENERGY STANDARDS and GREEN PRICING PROGRAMS

Minnesota Public Utilities Commission: Docket No. E999/PR-23-12 and Docket No. E999/M-23-85 — **Attachment 4**
Minnesota Department of Commerce: Docket No. E999/PR-02-1240 — Reporting Period: **January 1, 2022 - December 31, 2022**

Renewable Energy Certificate Retirements for Renewable Energy Standards and Green Pricing Programs

Renewable Energy Standard REC Retirement Account Name:	NSP-MN RES Retirement-2022 / 4741350A-A44A
Renewable Energy Standard REC Retirement Account Name:	NSP-MN SES Small Solar Retirement-2022 / 50084C28-50A9
Renewable Energy Standard REC Retirement Account Name:	NSP-MN SES Retirement-2022 / 91418AEB-E255
Green Pricing REC Retirement Account Name:	MN Renewable Connect 2022 / E2274CE8-D471
Green Pricing REC Retirement Account Name:	NSP-MN Windsource Retirement-2022 / C335B9CF-84A3

Total RECs or SRECs		8,697,052	0	43,185	388,664	1 REC = 1 MWh

APPENDIX O – 2023 WORKFORCE TRANSITION PLAN SUMMARY

Order Point 24 of the Commission's April 15, 2022, Order in Docket No. E002/RP-19-368 states:

The Commission authorizes the Executive Secretary to open a new docket regarding workers at retiring generating facilities in Minnesota, including Sherco and King.

A. *Xcel—working with the Minnesota Department of Employment and Economic Development and the Energy Transition Office; the International Brotherhood of Electrical Workers, Locals 23, 160, and 949; the Minnesota Building Trades; and the Center for Energy and Environment—shall develop a comprehensive plan for supporting transitioning workers. The plan shall consider the measures outlined in the IBEW comments dated March 17, 2020, and March 21, 2021, including skills inventories, training and education, worker placement and potential early retirement buy-out scenarios. Xcel shall file the plan with the Commission no later than December 31, 2022. The plan shall include an estimated budget for each measure, timeline for implementation, and a description of additional funding needed by DEED or the Energy Transition Office, if applicable, to implement the plan.*
B. *Beginning on December 31, 2023, and annually thereafter, Xcel shall file a detailed update on its efforts to implement the plan in coordination with CEE, DEED and the Energy Transition Office, and IBEW.*

The Company originally filed the Workforce Transition Plan as part of the Performance Based Rates Annual Report, pursuant to the Commission's February 9, 2022, Order Accepting Reporting and Setting Additional Requirements in Docket No. E002/CI-17-401. The Commission recently approved removing the Workforce Transition Plan reporting requirement from Performance Based Ratemaking at its November 2, 2023, hearing. The 2023 Workforce Transition Plan was filed with the Minnesota Public Utilities Commission in Docket Nos. E002/RP-19-368 and E002/M-22-265 on December 21, 2023, and has been included in this IRP as Attachment O1: 2023 Workforce Transition Plan.

Xcel Energy has a long and successful history of performing strategic workforce planning to support workers through a transition, creating and executing upon workforce plans, and enabling a smooth transition of our workforce. We have a highly skilled workforce, and it is our desire and intent to retain these skilled workers to the greatest extent feasible. While transition plans for impacted employees at the Sherburne County Generating Station (Sherco) and Allen S. King Generating Plant (King) facilities are still evolving, Xcel Energy continues to engage in significant and deliberate workforce transition planning efforts. The Company communicates regularly with plant

employees, IBEW local unions, and building trades unions to ensure transparency and to maintain engagement. Outlined in the Plan are planning, headcount, and cost estimates with respect to workforce transitions that will occur because of the proposed retirement of electric generating facilities. The Plan also discusses what work is being done to facilitate the workforce transition in Minnesota – including the opportunity for workers to upskill and reskill – and the employment opportunities we anticipate being available to plant workers around the time of plant closures.

RE: WORKFORCE TRANSITION PLAN – ANNUAL REPORT
IN THE MATTER OF WORKFORCE TRANSITION RELATED TO RETIRING ELECTRICITY GENERATING FACILITIES
DOCKET NO. E002/M-22-265, E002/RP-19-368

Dear Mr. Seuffert:

Northern States Power Company, doing business as Xcel Energy, files this Annual Report on workforce transition related to our retiring electricity generating facilities.

Order Point 24 in the Commission's April 15, 2022, Order approving the Company's Integrated Resource Plan reads as follows:

A. *Xcel—working with the Minnesota Department of Employment and Economic Development and the Energy Transition Office; the International Brotherhood of Electrical Workers, Locals 23, 160, and 949; the Minnesota Building Trades; and the Center for Energy and Environment—shall develop a comprehensive plan for supporting transitioning workers. The plan shall consider the measures outlined in the IBEW comments dated March 17, 2020, and March 21, 2021, including skills inventories, training and education, worker placement and potential early retirement buy-out scenarios. Xcel shall file the plan with the Commission no later than December 31, 2022. The plan shall include an estimated budget for each measure, timeline for implementation, and a description of additional funding needed by DEED or the Energy Transition Office, if applicable, to implement the plan.*
B. *Beginning on December 31, 2023, and annually thereafter, Xcel shall file a detailed update on its efforts to implement the plan in coordination with CEE, DEED, and the Energy Transition Office, and IBEW*

The Company is committed to ensuring a just transition for our workforce. We have a long and successful history of performing strategic workforce planning to support workers through a transition, creating and implementing workforce plans, and enabling a smooth transition of our workforce. We have a highly skilled workforce,

and it is our desire and intent to retain these skilled workers to the greatest extent feasible. Our Workforce Transition Plan (the Plan) reflects that intent.

The Company continues to engage in significant and deliberate workforce transition planning efforts. We have been communicating regularly with plant employees, IBEW local unions, and building trades unions to ensure transparency and to maintain engagement. This workforce transition plan highlights each step of the planning and transition process. The outcomes of each phase will be updated as workforce transition planning progresses, when plant retirement dates near, as future jobs and skills become more apparent, and as the Company evaluates existing opportunities for impacted workers across the organization.

The Plan includes cost estimates that we intend to update and refine over time, and which may inform future budgets. We will continue to work with DEED and the Energy Transition Office to explore additional funding. The Plan also includes an updated methodology for evaluating the future opportunities for impacted workers, which will more accurately reflect opportunities during the relevant transition timeframe. We look forward to continuing discussions with stakeholders and our employees in the coming years.

We have electronically filed this document with the Minnesota Public Utilities Commission, and copies have been served on the parties on the attached service list. Please contact Ashley Kehoe at ashley.r.kehoe@xcelenergy.com or me at bridget.dockter@xcelenergy.comif you have any questions regarding this filing.

Sincerely,

/s/

INTRODUCTION

BACKGROUND

Leading the clean energy transition is one of Xcel Energy's corporate priorities. We were the first major US electricity provider with a vision to serve customers with 100% carbon-free electricity by 2050 and to reduce carbon emissions company-wide by 80% from 2005 levels by 2030.

Figure 1. Building our carbon-free future.

To achieve our carbon-free future goal in Minnesota, we plan to retire our existing coal plants by 2030, expand our use of wind, solar, and battery storage systems, build on our successful energy efficiency programs and demand response options, and add new transmission infrastructure to connect more clean energy to the grid. We have a highly skilled and experienced workforce that we plan to transition to new and existing jobs across Xcel Energy. Our workforce is an important part of our clean energy vision.

WORKFORCE TRANSITION

Outlined in this Workforce Transition Plan (Plan) are planning, headcount, and cost estimates with respect to workforce transitions that will occur because of the proposed retirement of electric generating facilities. This Plan, including its information and assumptions will continue to be updated as plant transitions evolve.

The Plan was originally filed as part of the Performance Based Rates Annual Report, pursuant to the Minnesota Public Utilities Commission's (the Commission) February 9, 2022, Order Accepting Report and Setting Additional Requirements in Docket No. E002/CI-17-401 and later added to this docket for reporting through our Integrated Resource Plan (IRP). The Commission recently approved removing the Workforce Transition reporting requirement from Performance Based Ratemaking at its November 2, 2023, hearing with the understanding we will continue to report our Plan in the instant docket. At the time of this filing, a formal Order in the Performance Based Ratemaking proceeding is pending.

Xcel Energy has a long and successful history of performing strategic workforce planning to support workers through a transition, creating and executing upon workforce plans, and enabling a smooth transition of our workforce. We have a highly skilled workforce, and it is our desire and intent to retain these skilled workers to the greatest extent feasible. While transition plans for impacted employees at the Sherburne County Generating Station (Sherco) and Allen S. King Generating Plant (King) facilities are still evolving, Xcel Energy continues to engage in significant and deliberate workforce transition planning efforts. The Company communicates regularly with plant employees, IBEW local unions, and building trades unions to ensure transparency and to maintain engagement. This Plan highlights each step of the planning and transition process. The outcomes of each phase will be updated as workforce transition planning progresses, when plant retirement dates near, as future jobs and skills become more apparent, and as the Company evaluates existing opportunities for impacted workers across the organization.

STRATEGIC WORKFORCE PLANNING DEPARTMENT

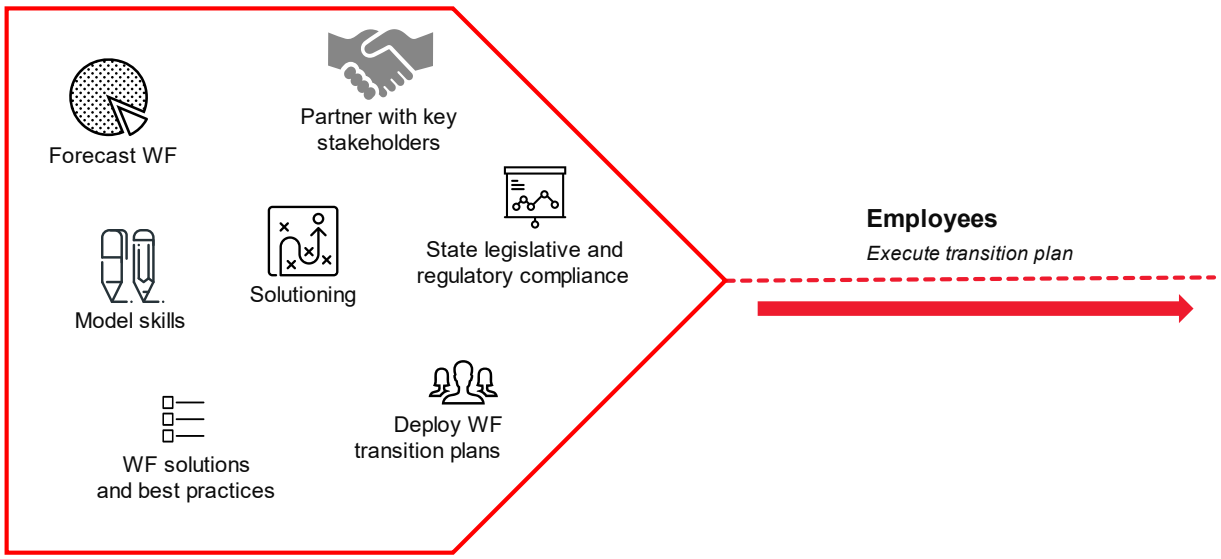
The Strategic Workforce Planning (SWP) department is housed within the Human Resource and Employee Services business area at Xcel Energy. The SWP department routinely performs workforce modeling to forecast headcount and costs, identify risks and opportunities, assess skill profiles across jobs and business areas, align the workforce to strategic priorities, and deploy workforce solutions based on data-driven insights. The SWP department holds the responsibility of creating and executing upon a workforce transition plan, in partnership and collaboration with multiple solution owners and key stakeholders.

The SWP department consists of workforce analytics consultants and analysts with a data science background and leadership consulting skills.

WORKFORCE TRANSITION PLANNING COLLABORATION

The SWP department at Xcel Energy works closely with both internal and external key stakeholders and partners to model, plan, design, and facilitate workforce transition.

Figure 2. Workforce transition planning collaboration.



Key internal partners and stakeholders include, but are not limited to:

- Human Resources and Employee Services Departments
    - Strategic Workforce Planning (SWP)
    - Workforce Relations (WFR)
    - Human Resources Business Partners (HRBPs)
    - Enterprise Learning Organization (ELO)
    - Workforce Analytics (WFA)
- Operations business areas
    - Energy Supply - Generation

    - Distribution
    - Transmission
    - Gas
- Northern States Power Minnesota (NSPM) operating company
    - Resource Planning
    - State Government Affairs
    - Community Relations

Key external partners and stakeholders include, but are not limited to:

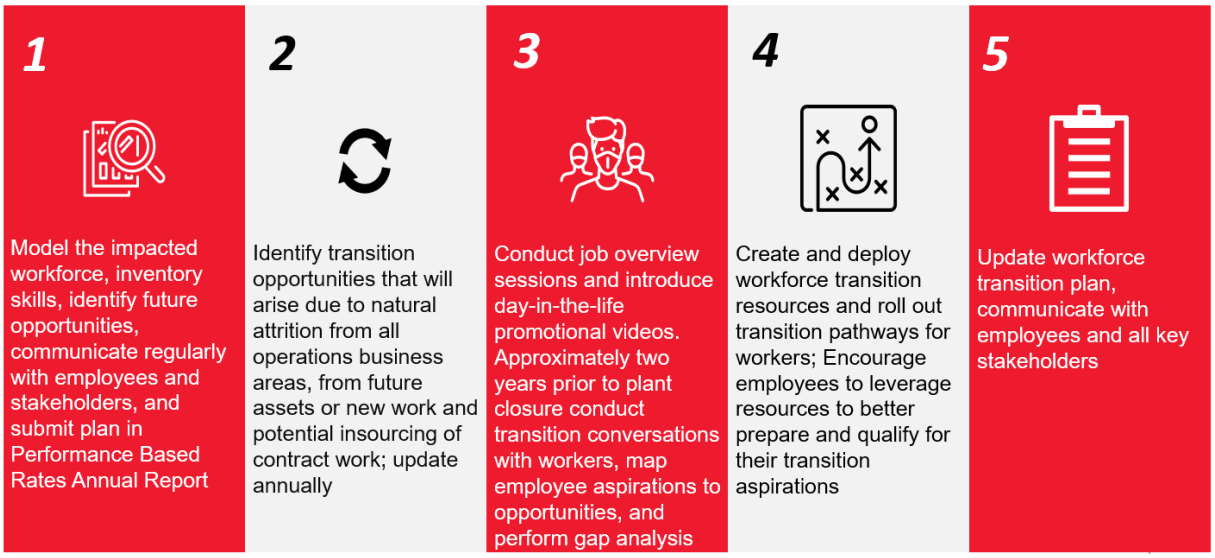
- IBEW local unions representing Xcel Energy employees,
- Minnesota building trades labor unions whose members work for Xcel Energy and its contractors,
- Center for Energy Workforce Development (CEWD),
- Minnesota State Energy Center of Excellence,
- Energy Providers Coalition for Education (EPCE) and their education partners,
- Local education partners, community colleges and universities across the state, and
- All local workforce centers across the state of Minnesota.

XCEL ENERGY MINNESOTA WORKFORCE TRANSITION PLAN

WORKFORCE TRANSITION PLANNING PROCESS PHASES

To facilitate workforce transition in Minnesota, the SWP department continues to adopt the multifaceted approach described above to enable a smooth transition at coal plants. The process of planning for workforce transition is as follows:

Figure 3. Transition workforce planning process.



PHASE 1

WORKFORCE TRANSITION PLANNING MODELING

The following estimates were derived and updated as of **September 30, 2023,** and will continue to be updated as more refined input becomes available with respect to plant retirement, future opportunities that become available, and employees' aspirations and skills.

Furthermore, both the headcount and cost estimates will be refined once each employee participates in the transition conversations (which occur approximately two years prior to plant closure) and we are able to gain greater insight into the aspirations of our workers, their skills, available local opportunities, and programs we need to build or deploy to enable a smooth transition.

WORKFORCE HEADCOUNT MODELS

Detailed workforce analysis was conducted to estimate the number of potential impacted employees at each plant and identify the solutions required to transition these employees. This analysis is completed within the SWP department and in collaboration with other data analysts within Xcel Energy's Energy Supply and Resource Planning business areas.

Table 1. Projected headcount and number of employees to transition at Sherco

Plant	**Sherco**		
Event	*2023 EOY Unit 2 Closure*	*2026 EOY Unit 1 Closure*	*2030 EOY Unit 3 Closure*
Current Headcount as of September 30, 2023	187		
Target Headcount at closure	191	170	134
Projected Headcount Without Backfilling	172	115	35
Understaffed Level Without Backfilling	(19)	(55)	(99)
Projected Headcount With Backfilling	187	170	134
Employees to Transition	0	0	134

*Notes:

- There are 36 non-operations employees and an operations target headcount of 98, totaling 134 employees needed through 2030.

Table 2. Projected headcount and number of employees to transition at King

Plant	King
Event	*2028 EOY Closure*
Current Headcount as of September 30, 2023	84
Target Headcount at Closure	73
Projected Headcount Without Backfilling	1
Understaffed Level Without Backfilling	(69)
Projected Headcount With Backfilling	72
Employees to Transition	73
Number of Employees with Retention Agreements	(11)
Remaining Employees to Transition	62

*Notes:

- The Company and the union have already reached an agreement with 11 Operators to secure their employment at the King plant up until closure. The agreement includes transfer to Operator positions at other nearby plants.
- There are five non-operations employees and an operations target headcount of 68, totaling 73 employees needed through 2028.

Definition of workforce variables used in Tables 1 & 2:

- **Event**
  Proposed early retirement dates.

- **Current Headcount**
  Number of Xcel Energy benefitted employees working at the plant as of September 30, 2023. These numbers do not include supplemental building trade workers who are employed by either Xcel Energy or by contractors.

- **Target Headcount**
  The number of employees needed to run the remaining units. Through continued collaboration with the Company's Energy Supply team, we estimated the number of Xcel Energy employees that would, at a minimum, be needed to operate the plant up to and at the time of closure.

- **Projected Headcount (without back-filling)**
  Current Headcount less projected retirement and non-retirement attrition and transfers from September 30, 2023, up to the early retirement date. "Without back-filling" assumes employees who retire or leave the organization and who are not replaced.

- **Understaffed Level (without back-filling)**
  Target Headcount less Projected Headcount; to calculate the number of employees (understaffed)/overstaffed to the minimum Target Headcount of employees needed to operate a unit if employees who retire or leave the organization are not replaced.

- **Projected Headcount (with back-filling)**
  Current Headcount less projected retirements and non-retirement attrition and transfers from September 30, 2023, up to the Event date. In our projection with back-filling, employees who retire or leave the organization are replaced up to, but not exceeding, the Target Headcount.

- **Employees to Transition**
  This is the number of employees to be retained through transfer within the plant, within other generating units, or within other business areas across the organization. This number represents the number of employees who will be transitioned due to the retirement of a facility. To the extent feasible, we do not anticipate any layoffs. Our intent is to retain our employees and redeploy them across the organization. Opportunities for these workers are outlined below in the *Phase 2, Future Opportunities for Impacted Workers* section of this report.

    - *Sherco Unit 2 Closure*
      Employees to Transition is equal to Projected Headcount (with backfilling) less Target Headcount at closure. Previously backfilled workers will flow to positions at the remaining operating units (i.e., Unit 1 and Unit 3).

  - *Sherco Unit 1 Closure*
    Employees to Transition is equal to Projected Headcount (with backfilling) less Target Headcount at closure. Previously backfilled workers will flow to positions at the remaining operating unit (i.e., Unit 3).

  - *Sherco Unit 3 Closure*
    Employees to Transition is equal to Target Headcount at closure. There is no Projected Headcount beyond 2030, which is the final unit closure date; as more information becomes available, these estimates will be updated accordingly.

  - *King Closure*
    Employees to Transition is equal to Projected Headcount (with backfilling) minus the number of employees with retention agreements.

- **Number of Employees with Retention Agreements**
  This number represents the number of employees with agreements to remain at the King Plant through closure along with transfer to nearby plants.

- **Remaining Employees to Transition**
  This number represents the number of Employees to Transition minus the number of Employees with Retention Agreements. We will need to retain some employees for demolition after closure.

The SWP department uses target headcount and attrition forecasts in the workforce planning models to estimate the number of impacted employees at each plant. Energy Supply provides the target headcount in resource planning models and Workforce Analytics provides the retirement and non-retirement attrition projection data. These estimates are early projections and will continue to be updated annually and leading up to the retirement of each unit.

- Workforce Analytics at Xcel Energy uses an actuarial-based attrition simulator to forecast company turnover, both retirement and non-retirement.

  - Non-retirement attrition percentages are based on historical Xcel Energy experience.

  - Retirement attrition percentages are based on inputs such as the employee's age, service, and selected retirement plan.

Target headcounts for the plants were derived by the plant directors at each plant location in Energy Supply. The plant directors created a workforce plan to identify the number of people they need in each job to continue safe operation of the remaining

units. These projections are estimates and may be updated as we approach retirement of these units and when resource needs are more easily identifiable.

The above tables and calculations do not include supplemental workers that the Company uses on an as-needed basis or for major overhauls of the units. Supplemental workers are provided either directly by the building trade unions or by the contractors through which we source to execute on these activities.

WORKFORCE COST MODELS

Cost models of potential transition resources have been developed that include, but are not limited to, internal technical training, internal enterprise-wide learning courses, external educational assistance, relocation, and voluntary severance/early-exit.

Based on similar transitions of other coal plants across our service territory, primary transition resources needed to transition a workforce were identified and high-level cost projections associated with the anticipated closure of our remaining coal units in Minnesota were conducted.

Table 3. Estimated cost of potential transition resources

Plant	Sherco Unit 2	Sherco Unit 1	Sherco Unit 3	King
Event	Closure	Closure	Closure	Closure
Internal Tech Training	$0	$0	$6,150,000	$1,650,000
ELO Training			$150,000	$150,000
External Industry Training	$0	$0	$160,200	$44,500
On-the-Job Training				
Tuition Reimbursement	$0	$0	$189,000	$47,250

Relocation	$0	$0	$60,000	$20,000
Severance				
Subtotal	**$0**	**$0**	**$6,709,200**	**$1,911,750**
Grand Total	**$8,620,950**			

We estimate employee transition costs of approximately $8,620,950, as reflected in Table 3. This estimate is dependent upon final closure date and is based on the total cost of the combined transition resources applied to the total number of potentially affected workers for Sherco and King, which is reported as “Employees to Transition” in Tables 1 & 2. The costs are early estimates and will continue to evolve as we learn the aspirations of our workers, as attrition projections materialize, and as we learn of new opportunities within the communities these plants reside.

The assumptions used in each transition resource line item in Table 3 are listed below:

- **Event**
  Proposed early retirement date.

- **Internal Tech Training**
  An annual cost estimate of $25,000 per worker is provided by the Internal Technical Training team and is based on existing technical training infrastructure to provide ongoing training. The duration of technical training ranges from two to four years, with an average of three years used in the cost model. The percent of employees leveraging this resource is an estimate derived from the assessment of upskilling/reskilling needs and the historical transfers during prior plant retirements in which internal technical training was leveraged to move to positions at other Xcel Energy locations. The cost estimate does not include employee wages.

- **Enterprise Learning Organization (ELO) Training**
  The cost estimate for enterprise-wide transition resources by ELO is independent of the number of impacted employees who choose to leverage the resources. The ELO cost estimate of approximately $300,000 ($150,000 per plant) is derived based on the assessment of upskilling/reskilling needs. ELO may collaborate with local education partners to build and deploy training courses.

- **External Industry Training**
  The cost estimates for external industry training (e.g., certifications, micro credentials, individual courses) are calculated based on the certificate offerings at Bismarck State College (BSC), an EPCE education partner. There are five electric- and energy-related certificates that on average require 56.4 credit hours to complete each certificate. Since some employees will choose to complete all courses in the certificate while others will elect to take several individual classes to upskill and/or reskill, we halve the average number of credit hours used in our cost modelling, rounded to 28 credit hours. Additionally, we use $300 as the approximate per-credit-hour cost for the BSC certificates, consistent with the EPCE member tuition rate at BSC. The percent of employees leveraging this resource is an estimate derived from the assessment of upskilling/reskilling needs.

- **On-the-Job Training**
  Costs are expected to be incurred for on-the-job training in remaining units or at locations to which employees transfer. The cost estimate for on-the-job training has yet to be determined and will be estimated as we near the retirement of each unit and after gathering employee aspirations through transition conversations.

- **Tuition Reimbursement**
  We use $5,250 in our tuition reimbursement cost estimates, consistent with the United States Code, Title 26 Internal Revenue Code, §127 Educational Assistance Programs. An average of three years is used in the cost model. The percent of employees leveraging this resource is an estimate derived from the assessment of upskilling/reskilling needs.

- **Relocation**
  The relocation cost of $10,000 per worker is based on prior coal unit closures. The percent of employees leveraging this resource is an estimate derived from historical relocation during prior plant retirements.

- **Severance**
  Though we do not anticipate layoffs and we are committed to transitioning and retaining our workforce, some employees may not execute upon the transition pathways; severance costs will be estimated as we near retirement of each unit. Cost estimates for severance are derived based on the collective bargaining agreements.

Sherco Unit 2: There are no costs of transition because Projected Headcount (with backfilling) does not exceed Target Headcount, as outlined in Table 1, “Employees to Transition.” Employees may need additional training related to any uniqueness of units

1 and 3, which would result in on-the-job training costs that are to be determined but will be provided as part of future updates to the workforce transition plan.

Sherco Unit 1: There are no costs of transition because Projected Headcount (with backfilling) does not exceed Target Headcount, as outlined in Table 1, "Employees to Transition." Employees may need additional training related to any uniqueness of unit 3, which would result in on-the-job training costs that are to be determined but will be provided as part of future updates to the workforce transition plan.

Cost estimates will be refined in future updates to the workforce transition plan and after transition conversations with each employee take place and we are able to gather employee transition preferences, skill gaps, and the transition supports leveraged. Transition conversations with employees will take place approximately two years prior to closure.

PHASE 2

FUTURE OPPORTUNITIES FOR IMPACTED WORKERS

The Strategic Workforce Planning (SWP) Department anticipates that many of the transition opportunities for plant employees at Sherco and King will be in the form of transfers to nearby locations. Some of these transfers will require upskilling or reskilling, while others will be parallel job transfers and not require additional training. Prior versions of this plan utilized estimates of future opportunities that spanned from current year to year of closure. This has been updated to estimating future opportunities for the two years prior to closure through two years after closure in order to more accurately reflect opportunities during the relevant transition time frame. Unlike plant closures in more remote areas of our service territories, Sherco and King are located near large metropolitan areas, which include a high number of service centers and other Xcel Energy facilities which may offer opportunities to transitioning workers.

Using natural attrition forecasts as a proxy to determine the number of opportunities that will come available across all operations areas within 50 miles of the Sherco and King plants, the following estimates are provided:

Table 4. Projected future opportunities within Xcel Energy at locations near Sherco based on attrition and retirement forecast across all operations areas for 2028-2032.

Sherco Plant		
	Total Projected Jobs 2028-2032	Average Number of Jobs Per Year
Non-Bargaining	**1,122**	**224**
Bargaining	**137**	**27**
Nearby Locations: Riverside Gen Plant, 401 Nicollet Mall, 414 Nicollet Mall, Monticello Nuclear Plant, Monticello Service Center, Albany Service Center, Montrose Service Center, Maple Grove Service Center, St Cloud Service Center		

Table 5. Projected future opportunities within Xcel Energy at locations near King based on attrition and retirement forecast across all operations areas for 2026-2030.

King Plant		
	Total Projected Jobs 2026-2030	Average Number of Jobs Per Year
Non-Bargaining	**1,342**	**268**
Bargaining	**307**	**61**
Nearby Locations: 401 Nicollet Mall, 414 Nicollet Mall, Black Dog Gen Plant, High Bridge Combined Cycle, Inver Hills Gen Plant, Maple Grove Service Center, Monticello Nuclear Plant, Monticello Service Center, Prairie Is Training Center, Prairie Is Nuclear Plant, Rice Street Service Center, Riverside Gen Plant, Wescott Lng Plant, Hydro Maintenance Bldg Wissota, Wissota Hydro Plant, Wheaton Plant		

Similar analysis is conducted for all operations business areas across the state of Minnesota:

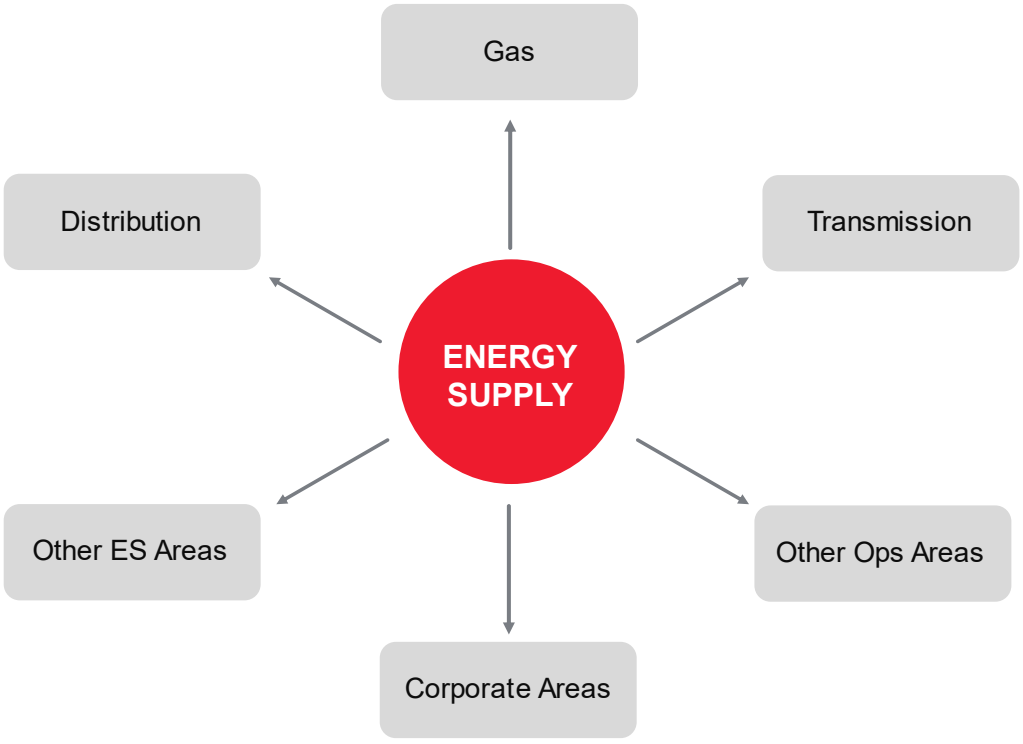
Table 6. Projected future opportunities within Xcel Energy across Minnesota based on attrition and retirement forecast for 2026-2032.

	Total Projected Jobs 2026-2032	Average Number of Jobs Per Year
Non-Bargaining	**2,415**	**345**
Bargaining	**756**	**108**

Many skills our employees at our coal generating facilities possess are transferrable to other positions across the Company. We will provide employees with information about available positions so they can identify the jobs in which they are most interested, and the skills those jobs require. Leaders across all operations business areas will welcome these skilled workers transitioning from the King and Sherco generating facilities into their organization.

Transition pathways will be created in partnership with each employee to retain, redeploy, or relocate workers based on their aspirations, availability, and in accordance with the collective bargaining agreements. Impacted workers will be able to leverage internal and external resources to upskill or reskill to transition into other positions within the Company.

Figure 4. Transition across operations.



The above tables are the greater portion of the opportunities that may be available to workers impacted by the early retirement of our coal plants. The Company continues to evaluate our resource mix and has proposed several solar projects near or on the plant sites that, if approved, may provide workers with future renewable energy jobs. The Company continues to work in partnership with our communities to draw new business and new jobs to the areas.

Providing insight to our employees about potential new jobs so they are aware of the different opportunities available is an important part of our transition efforts. To ensure employees are aware of and informed about different pathways, SWP plans in-person informational job overview sessions presented by employees who are in the positions that will become available. The goal of these sessions is to advertise potential job paths and show day-in-the-life promotional videos of jobs to explore.

To the extent practicable, Xcel Energy does not anticipate any layoffs. We have a strong track record in transitioning plant workers without layoffs. We are committed to a smooth transition as we continue the journey to achieve our clean energy goals.

We will continue to refine all opportunities and worker outcomes in future updates leading up to all retirement or conversion dates. In addition, we will build transparency and demonstrate the commitment to our workforce through updates to our employees, labor unions, and key external stakeholders impacted by these closures.

Our Employees with The Minnesota Building Trades

In recognition of the work performed at the Sherco and King Plants by workers from the Minnesota Building Trades Unions, we will continue to evaluate transition options and support the transition of long-tenured workers in partnership with key stakeholders, including trade union leadership, and leveraging resources available to impacted workers through local workforce centers and the MN Department of Employment and Economic Development (DEED). The Company will continue to identify options available to this workforce and will continue to adjust the workforce transition plan over time, gathering stakeholder feedback and providing updates to the Commission through the annual filing of this workforce transition plan.

To create a diverse pipeline of talent into energy jobs and continue supporting the building trades from whom we have long sourced temporary, contract, and construction work, Xcel Energy has partnered with the DEED to develop the Power-Up Workforce Development Program. This program will provide workforce training for clean energy-related construction work and help bring diverse candidates into the building trades. The program represents an investment in developing a diverse community of workers in the building trades, sustainable energy related construction jobs, and communities across our Minnesota service territory.

PHASE 3

TRANSITION CONVERSATIONS

Approximately two years prior to a unit retirement, transition conversations will be conducted with all employees at the impacted plant. The purpose of the transition conversation is to (1) provide greater insight into all the opportunities available to workers; (2) gather employee aspirations or transition preferences, including the jobs in which they are most interested; (3) evaluate the employee's current skills and their appetite for upskilling or reskilling; (4) determine whether they desire to relocate; and (5) address their questions or concerns about transition.

The SWP department will work collaboratively with teams across Human Resources and Employee Services to facilitate transition conversations with workers so that the Company can work in partnership with our employees and the unions on more detailed transition planning. The SWP department created a data template to capture transition preferences from transition conversations with workers and designed a real-time online form that will compile and aggregate data on the backend for further analysis.

SKILL MODELLING AND SKILL GAP ANALYSIS

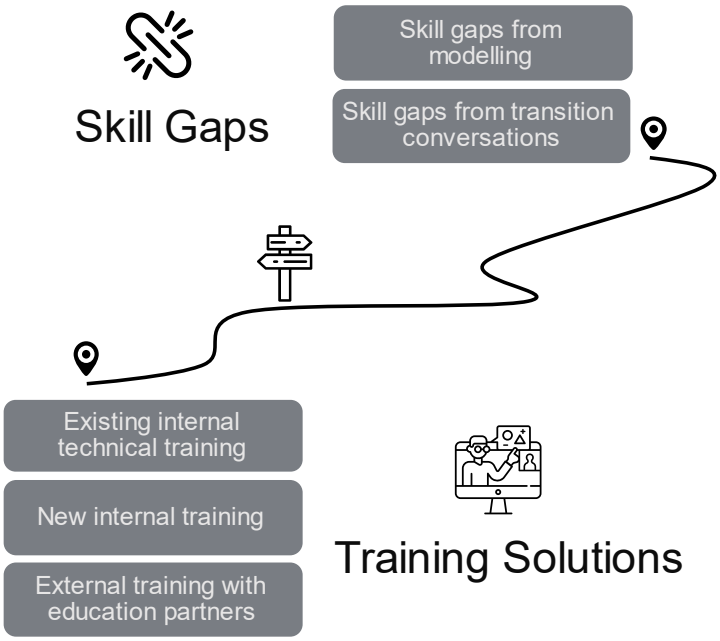
To assist in the transition of our coal plant employees by identifying skill gaps, the SWP department piloted skill inventorying and modeling for jobs at Sherco and King to help identify the skills within the positions at the plant and the skills needed to move into positions across Operations. The results of skill gap analysis will inform and guide SWP in recommending and deploying the appropriate reskilling/upskilling programs for the workers to leverage, which will enable their transition.

SWP developed bargaining job skill profiles using the Center for Energy Workforce Development (CEWD) Energy Industry Competency framework as the foundation and modified it to better fit and represent the skills and competencies of Xcel Energy jobs. The skill modelling is primarily focused on the core foundational skills that are transferable and applicable to a wide array of skilled technician jobs. With the CEWD framework used for soft skills and some technical skills, we then layered in the Xcel Energy Individual Contributor competencies to represent and capture the skills associated with each position, which aids in identifying where these skills are transferrable across Xcel Energy. Once the framework was complete, we consulted closely with job subject matter experts in Workforce Relations to go through each of the jobs to assess and rank the skills by position for both impacted positions at the coal plants and positions into which workers could potentially transition across the

organization. The outcomes were then reviewed with plant leadership for feedback and/or adjustments.

SWP has developed additional quantitative models that map skill profiles from existing plant jobs to skill profiles of potential future jobs. These models assess the degree to which existing skills match skills needed in potential future jobs, shedding light on reskilling, upskilling, and other possible training pathways for Xcel Energy employees. Using text network analysis, SWP has also developed models for assessing how suitable existing plant jobs are with potential new jobs in renewable energy as well as with existing Xcel Energy jobs.

Figure 5. Skill mapping



After transition conversations take place, we aggregate and analyze the results to identify skill gaps based on a full skill profile of the worker, the skills they brought to the position, and the skills required for the position(s) to which they prefer to transfer to. Once skill gaps are identified, solutions that currently exist in upskilling/reskilling that we might be able to leverage internally or externally are gathered. This helps identify what we may want to modify, or what we may consider if new upskilling/reskilling solutions need to be created to bridge the skill gap. We will look for the most cost-effective solutions for the benefit of the greatest population of our workforce. We may leverage our internal training organization or external education partners in doing so.

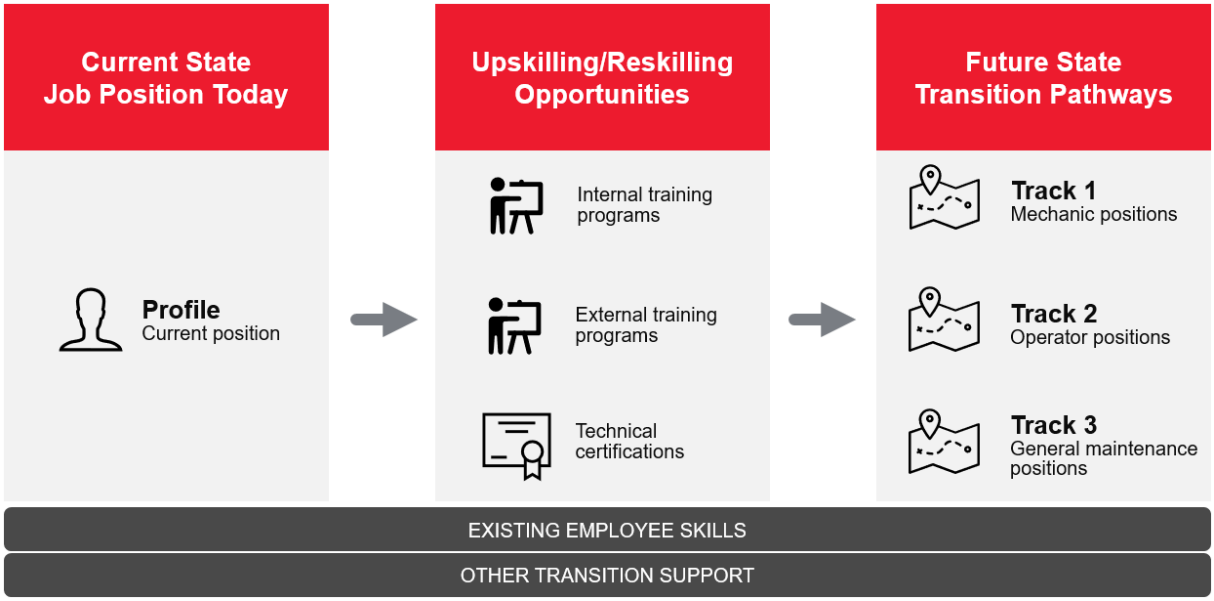
PHASE 4

TRANSITION PATHWAYS

Once skill gaps and solutions are identified, transition pathways are created for employees by leveraging existing upskilling/reskilling programs and building new upskilling/reskilling solutions with our internal and external training partners.

Transition pathways provide potential tracks for employees with the corresponding and recommended menu of options available for workers to transition, which would include upskilling/reskilling opportunities available plus other transition supports. The upskilling/reskilling opportunities include all internal training programs, external training programs, and technical certifications provided by external education institutions. The pathway will outline the resources available, and, in some cases, the timing/schedule of these trainings (if applicable). A transition track is a collection of similar future job opportunities that likely require similar skills and training. A supervisor will provide an overview of these transition tracks to each employee, offering support as their leader, answers to FAQs, and any other tools or information that may be helpful to the employee. Supervisors will receive training on how best to support their employees through the transition process itself and in providing effective coaching and feedback. It will then be up to the employee to take initiative and leverage the support offered.

Figure 6. Transition pathways.



Xcel Energy is an equal opportunity employer and will continue to operate in compliance with our collective bargaining agreements throughout this transition process. The Company endeavors to create and provide feasible workforce transition solutions to impacted workers.

For workers who may consider relocation to another position within the Company, we will work with them by looking at necessary training, the hiring process, relocation benefits, and other support, while maintaining compliance with our collective bargaining agreements. For workers who are eligible for retirement and decide to exercise that option, the HR retirement team will provide support and guidance through the retirement process.

Navigating uncertainty and change can be difficult. Xcel Energy provides numerous free resources to all employees and their family members at any time via our Employee Assistance Program (EAP), regardless of the employee's enrollment in a Company medical plan.

EAP offers information and guidance on topics including, but not limited to, managing change, handling personal crises, career counselling, educational support services, financial management and emotional well-being. Information on EAP is available to employees on the Company's intranet site, XpressNET.

PHASE 5

UPDATE WORKFORCE TRANSITION PLAN

In future annual Workforce Transition Plan filings, and leading up to the retirement of our plants, we will provide updates that use the latest information and assumptions in the headcount and cost models. Information gathered from the workforce transition conversations will be used to create the transition pathways based on the results of our skill gap analysis.

Additionally, we will continue to provide regular updates to key stakeholders, including our workforce, the IBEW Locals and other external stakeholders to continue to build upon the transparency of the phases and outcomes, commitment to our workforce, and our progress as we work to transition our Sherco and King coal plants.

APPENDIX P – 2023 SHERCO REMEDIATION REPORT SUMMARY

Order Point 20 of the most recent IRP Order[1] states:

Regarding remediation plans for the Sherco site:

A. The Commission authorizes the Executive Secretary to open a new docket on this topic.

B. Xcel shall conduct stakeholder meetings regarding the site with interested parties including the city of Becker; adjacent cities and townships including Becker Township and the city of Monticello; Sherburne and Wright counties; the Minnesota Department of Commerce, the Minnesota Department of Natural Resources, the Minnesota Pollution Control Agency, the Center for Energy and Environment, the Clean Energy Organizations, the Minnesota Energy Transition Office [footnote omitted], and labor unions. By January 1, 2023, Xcel shall file in the new docket details describing updates on the site and the stakeholder outreach and meetings.

C. Following these stakeholder meetings, by December 31, 2023, or in its next resource plan if earlier- and annually thereafter- Xcel shall submit to the Commission and to the city of Becker a detailed report describing the company's plans for the disposition of the Sherco site, equipment, and buffer property. The report shall include at least the following items:

1) A detailed description and timeline of any demolition, environmental clean-up, or similar work that will be required by the impending retirement of Sherco Unit 2.

2) To the extent possible, a description of the company's plans and a detailed timeline to decommission and demolish electric generating equipment related to Sherco Units 1 and 3.

3) A detailed description of the timeline, estimated costs, and steps necessary to remediate pollution at the Sherco site.

4) A section detailing how the company is working to ensure that plans for site remediation, economic development, or future development and maintenance of power generation, transmission, or distribution infrastructure are consistent with the community's long-range planning and vision.

5) A description of any ongoing efforts by the company to evaluate future uses for the plant site, any buffer property owned by the company, or any adjacent property, including a description of how the company is involving interested stakeholders in those efforts.

[1] ORDER APPROVING PLAN WITH MODIFICATIONS AND ESTABLISHING REQUIREMENTS FOR FUTURE FILINGS, Docket No. E002/RP-19-368, April 15, 2022 (IRP Order).

6) *An update to the Commission on the status of efforts to support the city's and regions' economic development efforts, including – to the extent possible – specific projects and investments the company is assisting the city and region in attracting.*
7) *A description of the company's efforts to work with local governments and other stakeholders to assess and account for local land use and planning impacts. Before starting any additional regulatory process to determine the final length and route of the Sherco gen-tie line, Xcel shall consult with stakeholders to discuss the plans.*
8) *Any other items the Commission or the company sees fit to include.*

If Xcel cannot obtain the necessary information at the time of each filing, the company shall submit a detailed timeline on which it anticipates it will be able to provide the city and stakeholders with additional information.

The IRP Order requires the Company to conduct stakeholder meetings and to submit to the Commission and the City of Becker an annual detailed report including a description and timeline of demolition, environmental cleanup or similar work required by the retirement of Sherburne County Generating Station (Sherco) Units 1, 2 and 3 and how those efforts are consistent with the community's long-range planning and visions; an update to the Commission on the status of efforts to support the city's and region's economic development efforts, including—to the extent possible— specific projects and investments the Company is assisting the city and region in attracting; and a description of the Company's efforts to work with local governments and other stakeholders to assess and account for local land use and planning impacts.

The report was filed with the Commission in Docket Nos. E002/RP-19-368 and E002/M-22-263 and provided to the City of Becker and interested stakeholders on December 28, 2023. A copy of the report is provided as Appendix P1: 2023 Sherco Remediation Report.

Will Seuffert
Executive Secretary
Minnesota Public Utilities Commission
121 7th Place East, Suite 350
St. Paul, MN 55101

RE: COMPLIANCE FILING
IN THE MATTER OF XCEL ENERGY'S SITE REMEDIATION PLANS FOR DECOMMISSIONING THE SHERBURNE COUNTY GENERATING STATION
DOCKET NOS. E002/M-22-263, E002/RP-19-368

Dear Mr. Seuffert:

Northern States Power Company, doing business as Xcel Energy, files this detailed annual report on Sherburne County Generating Plant (Sherco) stakeholder outreach efforts and our plans for decommissioning, remediation and demolition for the site. We have appreciated the opportunity to work with interested stakeholders in these efforts and their participation in our quarterly stakeholder outreach meetings. This report was also shared with the City of Becker and interested stakeholders.

Order Point 20 in the Commission's April 15, 2022 Order approving the Company's Integrated Resource Plan reads as follows:

> B. *Xcel shall conduct stakeholder meetings regarding the site with interested parties including the city of Becker; adjacent cities and townships including Becker Township and the city of Monticello; Sherburne and Wright counties; the Minnesota Department of Commerce, the Minnesota Department of Natural Resources, the Minnesota Pollution Control Agency, the Center for Energy and Environment, the Clean Energy Organizations, the Minnesota Energy Transition Office, 41 and labor unions. By January 1, 2023, Xcel shall file in the new docket details describing updates on the site and the stakeholder outreach and meetings.*
> C. *Following these stakeholder meetings, by December 31, 2023, or in its next resource plan if earlier- and annually thereafter- Xcel shall submit to the Commission and to*

the city of Becker a detailed report describing the company's plans for the disposition of the Sherco site, equipment, and buffer property. The report shall include at least the following items:

1) *A detailed description and timeline of any demolition, environmental clean-up, or similar work that will be required by the impending retirement of Sherco Unit 2.*
2) *To the extent possible, a description of the company's plans and a detailed timeline to decommission and demolish electric generating equipment related to Sherco Units 1 and 3.*
3) *A detailed description of the timeline, estimated costs, and steps necessary to remediate pollution at the Sherco site.*
4) *A section detailing how the company is working to ensure that plans for site remediation, economic development, or future development and maintenance of power generation, transmission, or distribution infrastructure are consistent with the community's long-range planning and vision.*
5) *A description of any ongoing efforts by the company to evaluate future uses for the plant site, any buffer property owned by the company, or any adjacent property, including a description of how the company is involving interested stakeholders in those efforts.*
6) *An update to the Commission on the status of efforts to support the city's and regions' economic development efforts, including – to the extent possible – specific projects and investments the company is assisting the city and region in attracting.*
7) *A description of the company's efforts to work with local governments and other stakeholders to assess and account for local land use and planning impacts. Before starting any additional regulatory process to determine the final length and route of the Sherco gen-tie line, Xcel shall consult with stakeholders to discuss the plans.*
8) *Any other items the Commission or the company sees fit to include.*

If Xcel cannot obtain the necessary information at the time of each filing, the company shall submit a detailed timeline on which it anticipates it will be able to provide the city and stakeholders with additional information.

Pursuant to the Order, we have included details describing our stakeholder outreach efforts; remediation, decommissioning and demolitions plans and costs; and economic development efforts in the attached report.

We have electronically filed this document with the Minnesota Public Utilities Commission, and copies have been served on the parties on the attached service list. Please contact me at monsherra.s.blank@xcelenergy.com or Patti Leaf at patricia.b.leaf@xcelenergy.com if you have any questions regarding this filing.

Sincerely,

/s/

IN THE MATTER OF XCEL ENERGY'S SITE REMEDIATION PLANS FOR DECOMMISSIONING THE SHERBURNE COUNTY GENERATING STATION

IN THE MATTER OF XCEL ENERGY'S 2020-2034 UPPER MIDWEST INTEGRATED RESOURCE PLAN

DOCKET NOS. E002/M-22-263
E002/RP-19-368

COMPLIANCE REPORT

INTRODUCTION

Northern States Power Company, doing business as Xcel Energy, submits this Annual Report on Site Remediation Plans for Decommissioning the Sherburne County Generating Plant (Sherco) in compliance with the Minnesota Public Utility Commission's (Commission) April 15, 2022, Order approving the Company's Integrated Resource Plan. (IRP Orders)[1].

Order Point 20 of the most recent IRP Order states:

Regarding remediation plans for the Sherco site:

A. The Commission authorizes the Executive Secretary to open a new docket on this topic.
B. Xcel shall conduct stakeholder meetings regarding the site with interested parties including the city of Becker; adjacent cities and townships including Becker Township and the city of Monticello; Sherburne and Wright counties; the Minnesota Department of Commerce, the Minnesota Department of Natural Resources, the Minnesota

[1] ORDER APPROVING PLAN WITH MODIFICATIONS AND ESTABLISHING REQUIREMENTS FOR FUTURE FILINGS, Docket No. E002/RP-19-368, April 15, 2022 (IRP Order).

Pollution Control Agency, the Center for Energy and Environment, the Clean Energy Organizations, the Minnesota Energy Transition Office [footnote omitted], and labor unions. By January 1, 2023, Xcel shall file in the new docket details describing updates on the site and the stakeholder outreach and meetings.

C. *Following these stakeholder meetings, by December 31, 2023, or in its next resource plan if earlier- and annually thereafter- Xcel shall submit to the Commission and to the city of Becker a detailed report describing the company's plans for the disposition of the Sherco site, equipment, and buffer property. The report shall include at least the following items:*
    1) *A detailed description and timeline of any demolition, environmental clean-up, or similar work that will be required by the impending retirement of Sherco Unit 2.*
    2) *To the extent possible, a description of the company's plans and a detailed timeline to decommission and demolish electric generating equipment related to Sherco Units 1 and 3.*
    3) *A detailed description of the timeline estimated costs, and steps necessary to remediate pollution at the Sherco site.*
    4) *A section detailing how the company is working to ensure that plans for site remediation, economic development, or future development and maintenance of power generation, transmission, or distribution infrastructure are consistent with the community's long-range planning and vision.*
    5) *A description of any ongoing efforts by the company to evaluate future uses for the plant site, any buffer property owned by the company, or any adjacent property, including a description of how the company is involving interested stakeholders in those efforts.*
    6) *An update to the Commission on the status of efforts to support the city's and regions' economic development efforts, including – to the extent possible – specific projects and investments the company is assisting the city and region in attracting.*
    7) *A description of the company's efforts to work with local governments and other stakeholders to assess and account for local land use and planning impacts. Before starting any additional regulatory process to determine the final length and route of the Sherco gen-tie line, Xcel shall consult with stakeholders to discuss the plans.*
    8) *Any other items the Commission or the company sees fit to include.*

If Xcel cannot obtain the necessary information at the time of each filing, the company shall submit a detailed timeline on which it anticipates it will be able to provide the city and stakeholders with additional information.

The IRP Order requires the Company to conduct stakeholder meetings and submit to the Commission, City of Becker, and interested stakeholders a detailed report describing the Company's plans for the disposition of the Sherco site, equipment, and buffer property.

This report is filed with the Commission in Docket Nos. E002/RP-19-368 and E002/M-22-263 and provided to the City of Becker and interested stakeholders. The report follows.

I. QUARTERLY STAKEHOLDER OUTREACH EFFORTS

As required by the Commission's 2019 IRP Order, the Company has held quarterly meetings with Sherco community stakeholders. Though no cadence was dictated in the 2019 IRP Order for these meetings, they were held quarterly to be consistent with the Allen S. King Plant Stakeholder Outreach Efforts discussed in Appendix Q which required a quarterly cadence by the IRP Order. We have invited all stakeholders noted in the IRP Order. In addition, the Company has also extended invitations to the following agencies and community groups: the Becker, Big Lake, and Monticello Chambers; Minnesota Public Utilities Commission staff; business neighbors of the Sherco Plant; legislative representatives; the Southern Minnesota Municipal Power Agency; the University of Minnesota; and the Coalition of Utility Cities. The meetings have been held virtually or as hybrid meetings and have been well attended. The meetings have provided an overview of plans and known requirements associated with the retirement of the Sherco Plant and information about future efforts and have included significant opportunity for stakeholders to provide input and ask questions regarding information presented. Stakeholders have indicated their appreciation of the meetings and for the information shared. All presentation materials have been filed in the above-noted dockets. An overview of meetings conducted in 2023 follows.

A. First Quarter 2023

The first quarter 2023 Sherco Community Stakeholder Outreach meeting was held March 3, 2023, and focused on environmental remediation requirements associated with the retirement of the facility. Representatives from the Minnesota Pollution Control Agency (MPCA) participated in this meeting and provided an overview to stakeholders on environmental regulations pertaining to industrial wastewater, solid waste, and remediation requirements including remediation and reuse projects at other sites in the state.

The Company provided an overview on other historical remediation efforts undertaken at the Riverside Combined Cycle Generating Plant, the High Bridge Combined Cycle Plant, and the Black Dog Generating Plant when each of these facilities transitioned from coal fired facilities to natural gas fired units. The Company reviewed specific remediation requirements related to the existing coal yard and holding ponds.

B. Second Quarter 2023

The second quarter outreach meeting was held June 14, 2023. An update on the construction of the Sherco Solar 1 and 2 projects was provided including timelines and site progress. As well, a progress update on Sherco Solar 3 was given, outlining the approval process and timelines and interconnection with Sherco Solar 1 and 2.

C. Third Quarter 2023

The third quarter Sherco Community Stakeholder Outreach meeting was held September 28, 2023. The Minnesota Department of Employment and Economic Development (DEED) presented a recap of the Energy Transition Summit coordinated by DEED and held in Becker on June 26, 2023.

The Company provided an update on the Minnesota Energy Connection (MNEC) Transmission Project and the Alexandria to Big Oaks Transmission Line Project. These presentations included project descriptions and timelines and other vital information.

This was followed with an update on the Sherco Solar project detailing project location, permitting requirements, and construction progress.

A plant update was provided by plant management, which was followed by a stakeholder roundtable.

D. Fourth Quarter 2023

This stakeholder meeting was held December 8, 2023, and focused on providing information regarding recent federal Infrastructure Investment Jobs Act (IIJA) grants. Details pertaining to the Form Energy long-duration energy storage pilot project at Sherco, the Heartland Hydrogen Hub, and the Sherco Hydrogen Project were shared with stakeholders. In addition, we shared information pertaining to the upcoming formation of the Company's Environmental Justice Advisory Board (EJAB).

II. DEMOLITION AND ENVIRONMENTAL REMEDIATION PLANS

At this time, the main focus of the Sherco Plant is on the continued operation of Unit 2 until the end of 2023, Unit 1 until the end of 2026, and Unit 3 until the end of 2030, when each of the units will be respectively retired. Demolition and remediation planning efforts associated with the retirement of these units are underway but are still in a formative stage, with many decisions regarding future operations at the site needing to be determined due to the retirement of Unit 3 being more than six years out. The Company is in the process of developing a Site Decommissioning Plan for all three units, which is expected to be complete by the end of first quarter 2024. We will share those plan details in a future annual report filing when they are available. This Decommissioning Plan will address any potential demolition plans across all three units. While detailed plans and timelines are currently not available to share at this time, the following information is known.

A. Unit 2 Plans

In general, remediation and demolition activities will not begin at the site until all. three units have been retired in 2030. All three units share systems that will need to be maintained for the continued operation of Units 1 and 3 until their retirement in 2026 and 2030, respectively. The Unit 2 boiler may be removed after all three units have been retired at the end of 2030, however the turbine building will remain due to the conversion and operation of the Unit 2 generator as a synchronous condenser. The Unit 1 generator will also be converted to a synchronous condenser. Further investigation is needed to determine if the boilers can safely be removed while the synchronous condensers are in operation. It is expected that the synchronous condenser for Unit 2 could begin operation as early as fourth quarter 2025 with the Unit 1 synchronous condenser expected to begin operation fourth quarter 2027.

Current efforts for the future decommissioning of Sherco Unit 2 includes inventorying materials for removal of components from the unit that will not be needed for maintaining operation of the unit for the future conversion of the Unit 2 generator to a synchronous condenser, or that are not required for the continued operation of Units 1 and 3.

Once Unit 2 has been retired, unit specific systems may be decommissioned, isolated, drained, and left in a safe state which would allow for the demolition of equipment. Systems such as Scrubber Modules, Bottom Ash, and Fly Ash Systems, will be cleaned of ash. Coal will be burned down to empty the feed systems to the unit, and the silo-feeders and coal mills will be washed down to remove coal debris. The Unit 2 cooling towers are currently scheduled for demolition in 2024.

Systems to be left in service include, but are not limited to, the electrical systems for various components, the Thickener System, Building Heat, Auxiliary Steam, Fire Protection, Station Air Service/Potable Water, Closed loop cooling, Ash Water, and other common systems needed for the continued operation of Unit 1.

Other systems are being considered for isolation at this time. Isolation is the act of disconnecting power, or other means taken, which prohibit a system from operating.

Environmental remediation requirements of retired fossil fuel fired electrical generating facilities is prescriptively regulated by local, state, and federal authorities, however, we will not be required to begin remediation efforts on Sherco Unit 2 until Units 1 and 3 have also been retired, as they share common facilities.

As noted above, environmental remediation of the site will not occur until all three units are retired. Units 1 and 2 share common coal piles and ash disposal facilities that will remain in operation until after the retirement of Unit 1 in 2026. Environmental actions which will occur specific to Sherco Unit 2 will include, but are not limited to, notice to the Environmental Protection Agency (EPA) and MPCA of pending retirement and decommissioning.

B. Units 1 and 3 Plans

Steps towards the decommissioning of Units 1 and 3 will be conducted in a path similar to the Unit 2 decommissioning, with Unit 1 retiring December 31, 2026, and Unit 3 retiring December 31, 2030. As noted above, the conversion of the Unit 1 generator to a synchronous condenser is planned and the operation of the unit as a synchronous condenser is expected to begin by the end of 2027. Evaluation of the conversion of Sherco Unit 3 turbine generator to a synchronous condenser for additional grid stabilization is currently underway.

Once Units 1 and 3 have been retired, unit specific systems may be decommissioned, isolated, drained, and left in a safe state which would allow for the demolition of equipment. Systems such as Scrubber Modules, Bottom Ash, and Fly Ash Systems, will be cleaned of ash. Coal will be burned down to empty the feed systems to the units, and the silo-feeders and coal mills will be washed down to remove coal debris.

For safety reasons, the Unit 1 cooling towers are scheduled for demolition in 2027. Aside from the demolition of the Unit 1 and Unit 2 cooling towers, there will be no other large-scale demolition at the site until at least 2031. Detailed decommissioning information will be included in a future annual report filing when it is available.

As noted above, environmental remediation requirements of retired fossil fuel fired electrical generating facilities are prescriptively regulated by local, state, and federal authorities. We will not be required to begin environmental remediation efforts at the Sherco site until all three units have been retired. Environmental actions which will occur specific to Sherco Units 1 and 3 will include, but are not limited to, notice to the EPA and MPCA of pending retirement and decommissioning. The costs for these required remediation actions are not fully known at this time as the detailed plans have not been developed. Additionally, once plans are developed, they will require review and approval by the MPCA, which may result in changes to the final closure plans. Actual timelines will be dictated by internal Xcel Energy decisions as well as MPCA review and feedback prior to agency approval under MPCA's Solid Waste and Clean Water Act programs.

C. Units 1, 2, and 3 Plans

Plans for environmental remediation and demolition at the Sherco Plant are still in development. While the coal-fired generating capacity of the plant will be fully retired by December 31, 2030, plans that potentially reuse equipment within the powerhouse and plant support systems are under consideration. As previously noted, Unit 1 and Unit 2 generators will be reutilized as synchronous condensers and the potential conversion of the Unit 3 generator to a synchronous condenser is being evaluated. The synchronous condensers will require cooling water and other support systems to operate. Also as previously noted, some existing buildings will need to remain for the operation of the synchronous condensers. In addition, the Sherco substation will continue to be utilized. Demolition of the Unit 1 and 2 stack and the Unit 3 stack will not occur until after Unit 3 is retired.

There are six (6) impoundments and one basin at Sherco that contain either ash or ash contact water. The status of these impoundments is as follows:

- Scrubber Solids Pond 1 was closed and capped in 1995 following a plan approved by the MPCA.
- Scrubber Solids Pond 2 was closed and capped in 2014 following a plan approved by the MPCA.
- Scrubber Solids Pond 3 is currently active and will continue to be utilized by Sherco Units 1 and 2 until retirement. This pond is scheduled to be permanently closed in 2035 after the pond is dewatered either by evaporation and/or a permitted discharge of treated water. Costs associated with dewatering have not been estimated but could be significant.
- Pond 4 is currently under construction. It will be used to hold only ash contact

water, not scrubber solids. There is no scheduled closure date for this pond pending site redevelopment planning.

- Bottom Ash Pond 1 ceased receiving ash in October 2020. This pond is scheduled to be permanently closed and capped by October 2025.
- Bottom Ash Pond 2 is currently active but is scheduled to be permanently closed by 2035. It is utilized by all three units.
- Recycle Basin is currently active. There is no scheduled closure date pending site redevelopment planning. The recycle basin is utilized by all three units.

Post-closure monitoring of these impoundments will be controlled by the applicable federal and state requirements.

In addition to these six impoundments and the 3 basins, there is the Unit 3 dry ash landfill on plant property. The Unit 3 dry ash landfill will continue to operate through the retirement of Unit 3 in 2030. Terms of the existing state solid waste permit and current federal rules governing coal combustion residual landfills require that the landfill be closed and permanently capped within prescribed time limits after the Company ceases placing ash in the landfill.

We are required by environmental regulations to address specific portions of the plant process systems such as the Scrubber Solids Ponds and the Unit 3 Landfill. These requirements and their associated timelines do not come into effect until the Unit 3 retirement date of December 31, 2030. The plant's National Pollutant Discharge Elimination System and Solid Waste Permits require us to submit proposed closure plans to the MPCA for review and approval approximately 180 days before the Unit 3 retirement date. The demolition of all other structures onsite including the powerhouse, river intake structure, wastewater treatment system including the river discharge structure, cooling towers, etc., will depend on the Company's plans for future use of the site. The costs for these required actions are not fully known as the plans have not been developed.

The Company is currently evaluating future uses of the electric generating facility structure. Previously submitted information regarding those plans and the estimated costs have been filed under a Remaining Lives and Five-year Depreciation Study (the Study) filed in 2020 to Docket No. E, G-002/M-19-723[2]. The following information, including the information in Table 1, was included in the Study. Please see the full report for additional details.

[2] See *In the Matter of the Petition of Northern States Power Company for Approval of the 2020 Review of Remaining Lives and Five-Year Depreciation Study,* Docket No. E,G002/D-19-723, PETITION (August 18, 2020).

As noted in the Study, when the decision is made to begin physical dismantling of the Sherco Plant, Xcel Energy will begin field dismantling activities, beginning with engineering and planning, and the removal of asbestos and other hazardous materials from the site.

A preliminary planning phase of the program will begin once it has been determined that the plant will be dismantled, and the project has been authorized to proceed. During this phase, the Company will assemble its dismantling management organization, make appropriate decisions regarding the extent of dismantling and the approach to managing the activities, and will accomplish those site preparation activities necessary to transition from a plant shutdown configuration to site dismantling. For purposes of the development of a cost estimate, it is assumed that the intent is to dismantle the entire station as a single project. Costs incurred during this preliminary phase of the program are included in the dismantling costs presented in the Study.

Xcel Energy will prepare Sherco for dismantling by performing the following activities:

- Prepare specifications that identify and describe the objectives and major work activities to be accomplished (establishing the final site configuration)
- Assemble plant documentation that may be relevant to dismantling (drawings, hazardous material reports, environmental studies, etc.)
- Select an asbestos abatement contractor (if required) and Dismantling Contractor
- Assemble and mobilize the management and oversight team responsible for the project
- Document hazardous materials location and inventory

The inventory is an essential element of the cost estimate since dismantling costs are determined by applying unit cost factors against the corresponding inventory quantities. A site-specific inventory of materials to be removed was developed using a combination of methods and can be found in the Study.

In developing an estimate, the cost of labor, equipment and material, credit for scrap, and similar costs influence the results of the estimate. The basis for the significant cost drivers can be found in the Study.

Table 1: Sherburne County Station Summary of Activity Costs (2019 Dollars)

Activities	Unit 1	Unit2	Unit 3	Common	Station	Station Total
Sherburne County Unit Rating (MWe)	680	682	876			2,238
Characterization/Temporary Service	171,000	171,000	190,000	-	604,818	1,136,818
Worker Access	642,334	642,334	703,642	-		1,988,310
Pre-Demolition Cleaning (Boiler/Precipitator/Tanks)	1,081,050	1,081,050	1,081,050	-		3,243,150
Asbestos Remediation	2,508,884	2,508,884	-	500,000		5,517,768
Equipment Removal	5,699,637	5,547,162	6,568,928	4,670,730		22,486,487
Boiler(s)	4,182,168	4,182,168	4,619,900	-		12,984,236
Turbine Generator & Condenser	609,899	609,899	686,634			1,906,432
Exhaust Gas Treatment Equipment and Structures	4,245,955	4,398,430	4,741,985			13,386,370
Structures Demolition	7,038,228	7,038,228	7,657,026	6,378,958		28,112,441
Backfill/Grade/Landscaping/Well Closure	1,656,105	1,656,105	1,814,172	4,761,036	100,000	9,987,445
Coal Yard Closure					8,264,365	8,264,365
Ash Landfills/ Ash Ponds & Landfills Including Evaporation Ponds/Ash Pond Dewatering			3,169,905	20,754,000		23,923,905
Utility Management/Oversight	1,079,289	1,079,289	1,208,276	494,016		3,860,869
Demolition Contractor Management/Supervisory/Safety Staff	1,713,520	1,713,520	1,918,305	784,319		6,129,664
Security	317,316	317,316	355,239	145,243		1,135,113
Property Taxes	-	-	-	-	-	0
Project Expenses:						
Shared Heavy Equipment/Operating Engineers	1,544,579	1,544,579	1,729,174	706,991		5,525,323
Small Tool Allowance	535,084	535,084	539,646	326,216	n/a	1,936,030
Utilities Allowance (Office Equipment etc.)					76,789	76,789
Permits					1,832,569	1,832,569
Demolition Contractors Insurance					4,312,127	4,312,127

Demolition Contractors Fee					18,327,570	18,327,570
Sub-Total						176,073,780
Contingency						26,962,844
Project Total (before scrap credit)						203,036,624
Scrap Credit	(9,982,485)	(9,982,485)	(12,096,244)	(2,619,893)	-	(34,681,107)
Project Total						168,355,517

III. ECONOMIC DEVELOPMENT EFFORTS

Representatives from the Company's Economic Development and Community Relations departments have been working closely with the City of Becker, county representatives and other interested stakeholders on economic development opportunities. Those efforts are summarized here.

The Company spearheaded the Sherco Master Planning Process in conjunction with the City of Becker and community leaders with the Company funding 100 percent of the process. The Master Planning Process is a flexible tool, which presents a vision, framework, principles, and guidelines for the development of approximately 1,800 acres of the Sherco site and adjacent parcels in Becker, MN. These efforts resulted in the development of the adopted Becker Master Plan. The Master Plan Process included representatives from Xcel Energy, City of Becker staff, and community leaders.

In addition, the company participated in the alternative urban areawide review (AUAR) process. As defined by the Minnesota Environmental Quality Board: "The alternative urban areawide review (AUAR) process is a hybrid of the environmental assessment worksheet (EAW) and environmental impact statement (EIS) review processes. Responsible governmental units (RGU) can use an AUAR as a planning tool to understand how different development scenarios will affect the environment of their community before the development occurs."[3]. The Company contributed 100% of the cost for an environmental consultant to complete an AUAR with the City of Becker as the RGU. The AUAR was adopted in February 2023 by the City of Becker.

In addition to the stakeholder outreach identified above, bi-monthly calls are held with the City of Becker, Xcel Energy Community Relations, and Xcel Energy Economic Development to update each other on various economic development projects to ensure alignment and quarterly Xcel Energy advisory meetings are held

[3] https://www.eqb.state.mn.us/content/auar-process

with local city, county, and school district leaders to share updates. These meetings have been occurring for many years and are in addition to the quarterly stakeholder outreach meetings discussed above. Historically, the updates have included plant maintenance activities, city and county construction updates, economic development project updates, and other general updates. These are casual meetings meant to keep open and direct lines of communication amongst the parties.

Annually Xcel Energy leadership invites community leaders and elected officials from Wright and Sherburne Counties and communities to an Annual Community Breakfast to provide an opportunity for attendees to ask questions and provide input on the state of the Company and provide updates and information on the Sherco Plant and Monticello Nuclear Generating Plant, both of which are located within their respective communities.

The Company is working to ensure that plans for site remediation, economic development, future development and maintenance of generation, transmission or distribution infrastructure are consistent with the community's long-range plans and vision. As indicated, the Company is working in close contact with the community about, and understands the importance of, potential economic development opportunities associated with the retirement of the Sherco Plant. Going forward, site remediation efforts will consider Xcel Energy's long-range plan for the property and large remediation projects will be discussed with the city as they arise.

Following is an update on the status of efforts to support the city's and region's economic development efforts, including a listing of specific projects and investments the company is assisting the city and region in attracting.

- As part of the 2019 IRP, transmission system studies were performed to identify any reliability needs associated with coal unit retirements. The outcome of that work was project development to convert the Unit 2 and Unit 1 generators to Synchronous Condensers after the coal units cease operation.

- The 2019 IRP order issued April 2022 confirmed the need for solar generation within the region and the customer value of reusing interconnection rights associated with the retirement of the units. The Company ran Request for Proposals in 2021 and 2022 to acquire Sherco Solar 1, 2 & 3 to reutilize the 710MW of interconnection rights associated with Unit 2. The MISO Generator Replacement application was submitted at the end of 2022 and the solar projects are on schedule to meet commercial operation dates. We are constructing the Sherco Solar Project adjacent to the Sherco site. This will be the largest solar development in the state's history, producing enough clean

energy to power approximately 150,000 homes in the Upper Midwest each year, creating nearly 1,000 union construction jobs and creating more than $350 million in local benefits (including landowner payments and state and local taxes) over the life of the project.

- Specific projects supporting the city's and regions' economic development efforts follow:

    - Joint initiatives by Sherburne County, the City of Becker and the Company have paved the way for the potential construction of a data center on approximately 350 acres of Xcel Energy-owned property. This sale, approved by the Commission in March 2023,[4] has the support of the City of Becker and Sherburne County, as it will bring jobs and much needed tax base to the community. The ultimate tax base impact can be determined once the data center's building permit has been submitted and reviewed by the County Assessor.
    - In addition to the data center project mentioned above, the Company continues to market large parcels of land to interested parties. Additional land in the City of Becker and Becker Township has been marketed for industrial development. The Company has designated approximately 1,300 acres of land surrounding the existing plant for future economic development. The City of Becker, in coordination with the Company, is currently constructing the expanded water and sewer services to much of this area, and the available acreage is being actively marketed by both the Company and the City of Becker. We are discussing these plans in the bi-monthly meetings noted above. At the March 9, 2023, MPUC agenda meeting discussing the Sherco Land Sale, we committed to including in this report the appraised value of remaining land currently being marketed. We note here that the only land currently being marketed is a 286-acre parcel located on the western portion of Sherco property which has a last appraised value of $8,770,000.
    - At the intersection of Liberty Lane and Energy Drive, Xcel Energy sold 78.73 acres to a metal recycling company, which began operations in 2019.[5] Sherburne County Tax Data shows the property had an estimated market value of $8,665,700 in 2023 resulting in annual taxes of more than $250,000.

[4] *Petition for Approval to Sell 348 Acres of Land at Sherco,* Docket No. E002/PA-22-489.
[5] *In the Matter of the Petition of Northern States Power Company for Approval to Sell 365 Acres of Sherco Land,* Docket No. E002/M-17-528.

- Stolt Land Holdings LLC purchased five acres from Xcel Energy in January 2020. According to Sherburne County Tax Data, the property had an estimated market value of $426,300 in 2023 resulting in annual taxes of more than $10,000.
- Xcel Energy is partnering with Form Energy on a long duration energy storage pilot project. This will involve the installation of an iron air 10 MW/1,000 MWh, 100-hour duration battery that is expected to be in operation by the end of 2025. This project will increase system reliability and play a role in meeting our Company-wide vision to provide our customers in all the states we operate in with 100 percent carbon-free electricity by 2050.
- Xcel Energy and the City of Becker have an agreement that the Company will pay assessments totaling $10.9 million for the benefit received from the City of Becker's sewer and infrastructure improvement projects to land owned by the company. The sewer and water projects increase the value of the land and Xcel Energy expects to recoup these costs as property is sold for economic development.

In addition, Order Point 21.C.4 requires us to discuss how we are working to ensure that our power generation, transmission, or distribution infrastructure plans are consistent with the community's long-range planning and vision. We note that there will be no impacts on the distribution infrastructure due to retirement of the units. While economic development efforts could require transmission and even distribution investments, we will incorporate anticipated load requirements into the forecast as appropriate.

IV. MN ENERGY CONNECTION

On March 9, 2023, Xcel Energy filed a Certificate of Need (CON) in Docket No. E002/CN-22-131 for an approximately 160- to 180-mile 345 kilovolt double-circuit transmission line to connect renewable energy in southwest Minnesota with the existing grid connection at the Sherco Plant. A Route Permit Application was filed in Docket No. E002/TL-22-132 on October 30, 2023. Review began on both applications fall 2023 with a decision expected in late 2024 or early 2025. If both applications are approved, we expect to begin construction in late 2025 with the project placed in service in late 2027.

In an effort to share information with the public and local officials about the MNEC Transmission Project, public meetings were held in February 2023 and June 2023.

Invitations were sent to all landowners that could potentially be affected by the route options. Initially, 150,000 landowners were notified of the CON filing, and the same list was used to inform landowners of the February 2023 open houses. In June, we reduced the list to all landowners that could be affected by the revised route options, to a total of nearly 50,000 landowners. The February meetings were held at five locations along the possible route corridor and approximately 550 members of the public attended. The June meetings were held at six different locations along the modified possible route corridor and approximately 750 members of the public attended.

At each open house, we provided to landowners, local governments, and key stakeholders information about the project, potential route options we had identified, and ways for those individuals to provide input on the land use impacts that each route option may have on their property. We also provided information about land use, easements, and right of way considerations near transmission lines as well as information about electric and magnetic fields, how route options are identified, construction practices, the upcoming regulatory proceedings, and other key issues. Xcel Energy staff was on hand at all meetings to answer questions and receive feedback from stakeholders.

Following the February 2023 open houses, the project team reviewed all comments and adjusted route options based on feedback received, as well as additional route review in order to identify route options that would lead to the least impactful route options.

In June 2023, we provided the updated route options to landowners and stakeholders and asked for additional feedback on those route options ahead of filing the Route Permit Application in October 2023. Overall, we received about 2,000 individual comments from landowners, local governments, and other officials.

In addition to public open houses, we have also met with local governments- counties, cities, and townships- throughout the project area to solicit feedback and provide information about the project. We have also met with state and federal agencies who may be involved in some aspect of the permitting process.

V. OTHER EFFORTS

The company was appointed and served on the Energy Transition Advisory Committee (ETAC) which was created in 2021 within the Department of

Employment and Economic Development (DEED). The directive of ETAC was to create a statewide energy transition plan and to advise the Governor, the Commissioner of DEED and the Legislature on energy transition issues, establish transition programs, economic initiatives, and transition policy (Minn. Stat. § 116J.5492). ETAC met through 2022, including site visits to communities impacted by the energy transition, meeting in the City of Becker on May 31, 2022. The Statewide Energy Transition Plan was filed by ETAC in December 2022. In 2023, the Legislature extended the life of ETAC until June 30, 2027, to file annual revisions to the Statewide Energy Transition Plan.

CONCLUSION

The Company takes seriously its responsibility to engage every community where we have major facilities and operations. Our commitment to our host communities and neighbors surrounding the Sherco Plant will outlive our coal operations. While the nature of our operations there will change in the years ahead, the site will continue to be important to the Company's ability to deliver reliable, safe, and affordable energy to our customers. We are glad to demonstrate that our longstanding participation in the social and economic life of the surrounding communities will continue.

We appreciate the opportunity to work with our stakeholders and neighbors and the time and talent given to us by them throughout this past year of community stakeholder meetings. We are committed to ongoing engagement with community stakeholders as the Sherco facility site transitions to cleaner energy generation and transmission.

CERTIFICATE OF SERVICE

I, Marie Horner, hereby certify that I have this day served copies of the foregoing document on the attached list of persons.

APPENDIX Q – 2023 KING REMEDIATION REPORT SUMMARY

Order Point 21 of the most recent IRP Order[1] states:

Regarding remediation plans for the King site:

A. The Commission authorizes its Executive Secretary to open a new docket on this topic.

B. Xcel shall conduct quarterly stakeholder meetings regarding the King site with interested parties including the city of Oak Park Heights, Washington County, the Department, DNR, the Energy Transition Office, PCA, the National Park Service, CEOs, CEE, the Wild Rivers Conservancy, and labor unions.

C. Following these stakeholder meetings, by December 31, 2023, or in its next resource plan if earlier- and annually thereafter- Xcel shall submit to the Commission, the city of Oak Park Heights, and interested stakeholders a detailed report describing the company's plans for the disposition of the King site, equipment, and buffer property. This report should include the following:

1) *The company's plans, estimated costs, and a detailed timeline to decommission and demolish the electric generation facility.*
2) *A detailed description of the timeline and steps necessary to remediate pollution at the King site.*
3) *A description of any ongoing efforts by the company to evaluate future uses for the plant site, any buffer property owned by the company, or any adjacent property, including a description of coordination with or involvement of the city and stakeholders in those efforts.*
4) *The status of efforts to support the region's and city's economic development efforts, including- to the extent possible- specific projects and investments the company is helping the city to attract.*
5) *An update on conservation efforts to reflect the uniqueness of the site and surrounding property located in and along the St. Croix National Scenic Riverway.*
6) *Any other items the Commission or the company sees fit to include.*

If Xcel cannot obtain the necessary information at the time of each filing, the company shall submit a detailed timeline on which it anticipates it will be able to provide the city and stakeholders with additional information.

[1] ORDER APPROVING PLAN WITH MODIFICATIONS AND ESTABLISHING REQUIREMENTS FOR FUTURE FILINGS, Docket No. E002/RP-19-368, April 15, 2022 (IRP Order).

The IRP Order requires the Company to conduct quarterly stakeholder meetings and submit to the Commission, City of Oak Park Heights, and interested stakeholders a detailed report describing the Company's plans for the disposition of the King site, equipment, and buffer property. A similar requirement was passed by the Minnesota Legislature in 2023 and can be found in Minnesota Statute Chapter 60, Article 12, Section 70 (House File 2310).

The report was filed with the Minnesota Public Utilities Commission in Docket Nos. E002/RP-19-368 and E002/M-22-264 and provided to the City of Oak Park Heights and interested stakeholders on December 28, 2023. A copy of the report is provided as Appendix Q1: 2023 King Remediation Report.

RE: COMPLIANCE FILING
IN THE MATTER OF XCEL ENERGY'S SITE REMEDIATION PLANS FOR DECOMMISSIONING THE ALLEN S. KING GENERATING STATION
DOCKET NOS. E002/M-22-264, E002/RP-19-368

Dear Mr. Seuffert:

Northern States Power Company, doing business as Xcel Energy, files this detailed annual report on our Allen S. King Generating Plant (King) quarterly stakeholder outreach efforts and our plans for decommissioning, remediation, and demolition for the site. We have appreciated the opportunity to work with interested stakeholders in these efforts and their participation in our quarterly stakeholder outreach meetings. This report was also shared with the City of Oak Park Heights and interested stakeholders.

Order Point 21 in the Commission's April 15, 2022 Order approving the Company's Integrated Resource Plan reads as follows:

B. *Xcel shall conduct quarterly stakeholder meetings regarding the King site with interested parties including the city of Oak Park Heights, Washington County, the Department, DNR, the Energy Transition Office, PCA, the National Park Service, CEOs, CEE, the Wild Rivers Conservancy, and labor unions. Xcel shall file in the new docket by January 1, 2023, details describing the stakeholder outreach and updates for the efficient demolition of the King plant and remediation of the site and impacted land.*
C. *Following these stakeholder meetings, by December 31, 2023, or in its next resource plan if earlier- and annually thereafter- Xcel shall submit to the Commission, the city of Oak Park Heights, and interested stakeholders a detailed report describing the company's plans for the disposition of the King site, equipment, and buffer property. This report should include the following:*

1) *The company's plans, estimated costs, and a detailed timeline to decommission and demolish the electric generation facility.*
2) *A detailed description of the timeline and steps necessary to remediate pollution at the King site.*
3) *A description of any ongoing efforts by the company to evaluate future uses for the plant site, any buffer property owned by the company, or any adjacent property, including a description of coordination with or involvement of the city and stakeholders in those efforts.*
4) *The status of efforts to support the region's and city's economic development efforts, including- to the extent possible- specific projects and investments the company is helping the city to attract.*
5) *An update on conservation efforts to reflect the uniqueness of the site and surrounding property located in and along the St. Croix National Scenic Riverway.*
6) *Any other items the Commission or the company sees fit to include.*

If Xcel cannot obtain the necessary information at the time of each filing, the company shall submit a detailed timeline on which it anticipates it will be able to provide the city and stakeholders with additional information.

Pursuant to the Order, we have included details describing our quarterly stakeholder outreach efforts; remediation, decommissioning and demolition plans and costs; and economic development efforts in the attached report.

We have electronically filed this document with the Minnesota Public Utilities Commission, and copies have been served on the parties on the attached service list. Please contact me at monsherra.s.blank@xcelenergy.com or Patti Leaf at patricia.b.leaf@xcelenergy.com if you have any questions regarding this filing.

Sincerely,

/s/

IN THE MATTER OF XCEL ENERGY'S SITE REMEDIATION PLANS FOR DECOMMISSIONING THE ALLEN S. KING GENERATING STATION

IN THE MATTER OF XCEL ENERGY'S 2020-2034 UPPER MIDWEST INTEGRATED RESOURCE PLAN

DOCKET NO. E002/M-22-264
E002/RP-19-368

COMPLIANCE REPORT

INTRODUCTION

Northern States Power Company, doing business as Xcel Energy, submits this Annual Report on Site Remediation Plans for Decommissioning the Allen S. King Generating Station (King) in compliance with the Minnesota Public Utilities Commission's (Commission) April 15, 2022 Order approving the Company's Integrated Resource Plan. (IRP Orders)[1].

Order Point 21 of the most recent IRP Order states:

Regarding remediation plans for the King site:

A. The Commission authorizes its Executive Secretary to open a new docket on this topic.

[1] ORDER APPROVING PLAN WITH MODIFICATIONS AND ESTABLISHING REQUIREMENTS FOR FUTURE FILINGS, Docket No. E002/RP-19-368, April 15, 2022 (IRP Order).

B. Xcel shall conduct quarterly stakeholder meetings regarding the King site with interested parties including the city of Oak Park Heights, Washington County, the Department, DNR, the Energy Transition Office, PCA, the National Park Service, CEOs, CEE, the Wild Rivers Conservancy, and labor unions.

C. Following these stakeholder meetings, by December 31, 2023, or in its next resource plan if earlier- and annually thereafter- Xcel shall submit to the Commission, the city of Oak Park Heights, and interested stakeholders a detailed report describing the company's plans for the disposition of the King site, equipment, and buffer property. This report should include the following:

1) The company's plans, estimated costs, and a detailed timeline to decommission and demolish the electric generation facility.

2) A detailed description of the timeline and steps necessary to remediate pollution at the King site.

3) A description of any ongoing efforts by the company to evaluate future uses for the plant site, any buffer property owned by the company, or any adjacent property, including a description of coordination with or involvement of the city and stakeholders in those efforts.

4) The status of efforts to support the region's and city's economic development efforts, including- to the extent possible- specific projects and investments the company is helping the city to attract.

5) An update on conservation efforts to reflect the uniqueness of the site and surrounding property located in and along the St. Croix National Scenic Riverway.

6) Any other items the Commission or the company sees fit to include.

If Xcel cannot obtain the necessary information at the time of each filing, the company shall submit a detailed timeline on which it anticipates it will be able to provide the city and stakeholders with additional information.

The IRP Order requires the Company to conduct quarterly stakeholder meetings and submit to the Commission, City of Oak Park Heights, and interested stakeholders a detailed report describing the Company's plans for the disposition of the King site, equipment, and buffer property. A similar requirement was passed by the Minnesota Legislature in 2023 and can be found in Minnesota Statute Chapter 60, Article 12, Section 70 (House File 2310).

This report is filed with the Commission in Docket Nos. E002/RP-19-368 and E002/M-22-264 and provided to the City of Oak Park Heights and interested stakeholders. The report follows.

I. QUARTERLY STAKEHOLDER OUTREACH EFFORTS

As required by the IRP Order, the Company has held quarterly meetings with King community stakeholders. The Company included all stakeholders noted in the Commission's Order and also extended invitations to the following additional agencies and community groups: Minnesota Department of Transportation; Minnesota Public Utilities Commission staff; business neighbors of the Allen S. King Plant (the King plant); the US Army Corps of Engineers; area state legislators; the Greater Stillwater Chamber of Commerce; St. Croix County, Wisconsin; and the Cities of Stillwater and Bayport. The meetings have been held virtually or as hybrid meetings and have been well attended. The meetings have provided an overview of plans and known requirements associated with the retirement of the King Plant and information about future efforts, and have included significant opportunity for stakeholders to provide input and ask questions regarding information presented. Stakeholders have indicated their appreciation of the meetings and for the information shared. All presentation materials have been filed in the above-noted dockets. An overview of meetings conducted in 2023 follows:

A. First Quarter 2023

The first quarter 2023 King Community Stakeholder Outreach meeting was held February 23, 2023, and focused on environmental remediation requirements associated with the retirement of the facility. Representatives from the Minnesota Pollution Control Agency (MPCA) participated in this meeting and provided an overview to stakeholders on environmental regulations pertaining to industrial wastewater, solid waste, and remediation requirements including remediation and reuse projects at other sites in the state.

The Company provided an overview on other historical remediation efforts undertaken at the Riverside Combined Cycle Generating Plant, the High Bridge Combined Cycle Plant, and the Black Dog Generating Plant when each of these facilities transitioned from coal fired facilities to natural gas fired units. Details were provided regarding remediation efforts for each. In addition, information regarding remediation and present-day use of the King Ash Disposal Facility was provided. We also discussed future King remediation efforts required for the existing coal yard and holding pond.

B. Second Quarter 2023

The second quarter outreach meeting was held May 8, 2023. A tour of the King Plant was provided to interested stakeholders and included an overview of the plant's history, operations, pollution control equipment, and the falcon nesting platform.

C. Third Quarter 2023

The third quarter King Community Stakeholder Outreach meeting was held in-person on September 26, 2023. The meeting provided an overview of the recently released Xcel Energy Request for Proposals (RFP) to build 650 MW of solar generation in western Wisconsin. An overview of how solar projects are typically sited, built, and operated was also given.

This presentation included an update on the King Transmission Line, which will interconnect new solar generation to the grid at the King Substation. Information pertaining to preliminary routes and detailed pictures of the transmission line upgrades were provided.

The discussion also included an update on the King substation, which will remain in use following retirement of the King Plant. It was noted that an expansion of the substation will be necessary to accommodate the new transmission line. The presentation included a discussion regarding permitting requirements associated with these projects.

A plant update was provided by plant management, which was followed by a stakeholder roundtable.

D. Fourth Quarter 2023

This stakeholder meeting was held December 15, 2023, and focused on providing information regarding recent Infrastructure Investment Jobs Act (IIJA) grants. Details pertaining to the Sherco Form Energy Long Duration Energy Storage System, the Heartland Hydrogen Hub and the Sherco Hydrogen Project were shared with stakeholders. In addition, information pertaining to the future formation of the Company's Environmental Justice Advisory Board (EJAB) was shared.

II. DECOMMISSIONING AND DEMOLITION PLANS

At this time, the main focus of the plant is on the continued operation of the King Plant until the end of 2028 when it will be retired. Xcel Energy is currently evaluating future uses of the King electric generating facility structure and property. The preliminary Site Decommissioning Plan for the King Plant is in development and is expected to be completed by December 31, 2025. This plan will address any potential demolition plans for the site and the plan details will be shared in future annual reports once they are available. As reuse of the site continues to be evaluated, the Site Decommissioning Plan will continue to be updated and communicated. While detailed plans and timelines have not yet been developed, the following information can be shared.

Current preparatory efforts for decommissioning of the unit include inventorying materials for removal of components from the unit that will not be needed. The removal of the boiler is not expected until the unit is retired, currently planned for the end of 2028. Use of the existing generator as a synchronous condenser is currently under evaluation by the Company. If the Company proceeds to convert the existing generator to a synchronous condenser, further investigation will be needed to determine if the boiler can safely be removed while a synchronous condenser is in operation. The turbine generator and building would need to remain for the operation

of a synchronous condenser. The potential demolition of all other structures onsite including the powerhouse, river intake structure, circulating water treatment system including the river discharge structure, cooling towers, pollution control buildings, etc., will depend on the Company's plans for future use of the site and, if deemed necessary, would only occur post-retirement of the unit. Stack and any building demolition deemed appropriate will also occur post-retirement. In general, components will not be removed from the site until the unit has been retired in 2028. The King substation will continue to be utilized.

Once the unit has been retired, unit specific systems may be decommissioned, isolated, drained, and left in a safe state, which would allow for the demolition of equipment. Systems such as pollution control equipment, Bottom Ash, and Fly Ash Systems, will be cleaned of ash. Coal will be burned down to empty the feed systems to the unit, and the silo-feeders will be washed down to remove coal debris. The Unit's cooling towers are being considered for demolition shortly after the unit ceases operation if there is no longer a need for cooling. Systems to be left in service could include, but are not limited to, the electrical systems for various components, Building Heat, Auxiliary Steam, Fire Protection, Station Air Service and Potable Water, Ash Water, and other systems.

Previously submitted information on the plans and estimated costs associated with demolition have been filed under a Remaining Lives and Five-year Depreciation Study (the Study) in 2020 in Docket No. E, G002/M-19-723.[2] The following information, including Table 1, was provided in the 2020 Study. Please see the full report for additional details.

A. Demolition Planning and Cost Estimates

As noted in the Study, when the decision is made to begin physical dismantling of the King Plant, Xcel Energy will begin field dismantling activities, beginning with engineering, and planning, and removal of asbestos and other hazardous materials from the station.

[2] See *In the Matter of the Petition of Northern States Power Company for Approval of the 2020 Review of Remaining Lives and Five-Year Depreciation Study,* Docket No. E,G002/D-19-723, PETITION (August 18, 2020).

A preliminary planning phase of the program will begin once it has been determined that the station will be dismantled, and the project has been authorized to proceed. During this phase, the Company will assemble its dismantling management organization, make appropriate decisions regarding the extent of dismantling and the approach to managing the activities, and will accomplish those site preparation activities necessary to transition from a plant shutdown configuration to site dismantling. For purposes of the development of a cost estimate it is assumed that the entire station will be dismantled as a single project. Expected costs to be incurred during this preliminary phase of the program are included in the dismantling costs presented in the Study.

Xcel Energy will prepare the King Plant for dismantling by performing the following activities:

- Prepare specifications that identify and describe the objectives and major work activities to be accomplished (establishing the final site configuration).
- Assemble plant documentation that may be relevant to dismantling (drawings, hazardous material reports, environmental studies, etc.).
- Select an asbestos abatement contractor (if required) and dismantling contractor.
- Assemble and mobilize the management and oversight team responsible for the project.
- Document hazardous materials location and inventory.

The inventory is an essential element of the cost estimate since dismantling costs are determined by applying unit cost factors against the corresponding inventory quantities. For the estimate, a site-specific inventory of materials to be removed was developed using a combination of methods and can be found in the Study.

In developing an estimate, the cost of labor, equipment and material, credit for scrap, and similar costs will influence the results of the estimate. The basis for the significant cost drivers can also be found in the Study.

Table 1: Allen S. King Station Summary of Activity Costs (2019 Dollars)

Activities	Unit 1	Common	Station	Station Total
Allen S. King Unit Rating (MWe)	511			511
Characterization/Temporary Service	150,000	-	201,606	351,606
Worker Access	630,789	-		630,789
Pre-Demolition Cleaning (Boiler/Precipitator/Tanks)	1,000,300	80,000		1,080,300
Asbestos/Lead Paint Remediation	4,284,988	-		4,284,988
Equipment Removal	7,865,365	1,682,890		9,548,255
Boiler(s)	3,460,641	-		3,460,641
Structures Demolition	10,016,294	2,476,372		12,492,666
Backfill/Grade/Landscaping/ Well Closure	2,605,976	977,821	113,991	3,697,788
Coal Yard Closure		10,718,358		10,718,358
Ash Landfills/ Ash Ponds & Landfills Including Evaporation Ponds		950,000		950,000
Utility Management/Oversight			3,027,199	3,027,199
Demolition Contractor Management/Supervisory/ Safety Staff			3,699,644	3,699,644
Security			776,195	776,195
Property Taxes	-	-	-	0
Project Expenses:				
Shared Heavy Equipment/Operating Engineers			3,194,695	3,194,695
Small Tool Allowance	580,281	102,742	n/a	683,023
Utilities Allowance (Office Equipment etc.)			52,508	52,508
Permits			685,566	685,566
Demolition Contractors Insurance			1,613,171	1,613,171

Demolition Contractors Fee			6,680,544	6,680,544
Sub-Total				67,627,939
Contingency				10,572,690
Project Total (before scrap credit)				78,200,628
Scrap Credit	(11,244,369)	(1,201,677)	-	(12,446,046)
Project Total				65,754,582

III. ENVIRONMENTAL REMEDIATION

Environmental remediation requirements of retired fossil fuel fired electrical generating facilities are prescriptively regulated by local, state, and federal authorities. Upon retirement of the facility, the Company will be required by environmental regulations to address specific portions of the plant process systems such as the Upper Holdup and Lower Holdup Ponds and the Coal Yard. These requirements are not triggered, and their associated timelines do not come into effect, until the King Unit retirement date of December 31, 2028. The costs for these required actions are not fully known at this time as the detailed plans have not been developed. Additionally, once plans are developed, they will require review and approval by the MPCA, which may result in changes to the final closure plans. A general timeline for the environmental remediation requirements and activities is noted in Table 2 below, however, the actual timelines will be dictated by internal Xcel Energy decisions and MPCA review and feedback prior to agency approval under MPCA's Solid Waste and Clean Water Act programs.

Table 2. King Plant Environmental Remediation Timeline*

June 30, 2025	Initiate assessment of planned coal inventory and supply/deliveries and pond operations and maintenance activities in relation to forecasted plant operations for the remaining years before unit retirement for planning purposes.
December 31, 2025	Finalize assessment including recommendations to optimize plant operations (including fuel supply and dispatch) for the remaining life of the unit.
June 30, 2026	Initiate development of coal yard burn down plan to facilitate closure work following unit retirement.

December 31, 2026	Finalize coal yard burn down plan.
January 31, 2027	Initiate coal yard burn down plan.
June 30, 2027	Initiate development of a National Pollutant Discharge Elimination System (NPDES) closure plan entailing ponds, coal yard, stormwater, and hold up and the coal yard.
June 30, 2028	File Facility Closure Notice pursuant to NPDES Permit and file recommended NPDES Closure Plan with MPCA for review and approval.
December 31, 2028	Shutdown and retire the electric generating unit to permanently cease the combustion of coal.
January 31, 2029.	Initiate closure activities in accordance with plan approved by MPCA.

* Subject to Change

A. OFFSITE SOLID WASTE LANDFILL

The King Plant Ash Disposal Facility was closed in 2011 and is currently in post-closure care. The site is maintained under a Solid Waste Permit issued by the MPCA with minimal required action including mowing, quarterly inspections, and leachate discharge monitoring. Xcel Energy maintains Financial Assurance to respond to environmental, maintenance, or emergency needs. A Water Quality Monitoring Report, describing both groundwater and leachate quality, is submitted to the MPCA quarterly. A Solid Waste Annual Report, which includes financial status (financial assurance) and a summary of the quarterly Water Quality Monitoring Reports, is provided to the MPCA annually. Continued monitoring will occur at the site, indefinitely.

Under a use agreement with the City of Oak Park Heights, the city uses the land as Oak Park Crossings Park. The Company and city work together to ensure that park uses are consistent with the permit.

IV. ECONOMIC DEVELOPMENT EFFORTS

Xcel Energy's Corporate Economic Development Team has many resources to assist communities and stakeholders with opportunities to increase economic development activity for their region. These resources include a real estate portfolio and marketing initiatives for site development; facilitation between community and prospective projects; as well as continuing work to grow an active pipeline of projects for the Xcel Energy territory. Specific support for the King Plant will be contingent upon further evaluation of future use for the facility and potential remediation efforts. Xcel Energy's Corporate Economic Development Team remains committed to assisting the City of Oak Park Heights on economic development opportunities.

Xcel Energy continues to consider future uses of the King Plant in ongoing coordination with the City of Oak Park Heights. Members of Xcel Energy's Corporate Economic Development Team have met with City of Oak Park Heights officials to discuss the Company's general economic development initiatives and future development opportunities at the plant site. These scenarios will be contingent upon continued evaluation for reuse of the Site and remediation efforts.

V. CONSERVATION EFFORTS - ST. CROIX NATIONAL SCENIC RIVERWAY

Xcel Energy has a long history of supporting conservation efforts in the St. Croix River Valley. In the early 1900s, Northern States Power owned more than 62,000 acres of undeveloped land that had been acquired for potential hydro development. Beginning in the 1960s, Company leaders expressed a desire to preserve those lands in a natural state and began discussions with the federal and state governments. These discussions resulted in the donation of approximately 52,000 acres of land along the St. Croix and Namekagon Rivers to the US Department of the Interior, and to the states of Minnesota and Wisconsin. These lands are now part of the St. Croix National Scenic Riverway. Xcel Energy is also an active supporter of the Wild Rivers Conservancy (WRC), with an Xcel Energy representative serving on the WRC's Board of Directors for the past several decades. The WRC is the nonprofit organization that supports the National Park Service (NPS) mission on the St. Croix and Namekagon Rivers.

The King Plant is located within the Lower St. Croix National Scenic Riverway (Lower St. Croix), designated by Congress due to its scenic, recreational, and geologic values. The Minnesota Department of Natural Resources (MNDNR), Wisconsin Department of Natural Resources (WDNR), and the NPS developed a Cooperative Management Plan (CMP) for the Lower St. Croix. This CMP emphasizes maintaining and enhancing the diverse character of the riverway while allowing limited planned development consistent with the historic character of the communities along the river.

As evaluation regarding decommissioning plans and future site uses for the site continues, we will continue to work with stakeholders from the NPS, the WRC, the US Army Corps of Engineers, MNDNR, WDNR and communities on both sides of the river to understand conservation goals and concerns at the King Plant site, and to ensure that those interests are considered as we determine plans for the future of the site. Xcel Energy will continue to evaluate opportunities to support or enhance the designated values of the riverway as plans develop.

VI. OTHER EFFORTS

A. Leadership in the Valley

As part of our Company's ongoing effort to engage our customers where we have plant locations, the Company regularly hosts local civic, business, and community groups for tours of our facilities. On October 12, 2023, we hosted a half-day presentation and tour of the King Plant as part of "Leadership in the Valley," an annual community leadership series sponsored by the Greater Stillwater Chamber of Commerce. A cohort of about 35 community leaders, drawn from area nonprofits, small businesses and local governments, learned about the Company's plans to decommission the King Plant as part of the Company's commitment to 100 percent carbon-free energy generation.

We discussed historic and current plant operations, reviewed our plans to build solar generation in Western Wisconsin to connect to the King Plant substation, and discussed future engineering and environmental issues that will factor into future reuse of the site. We anticipate further community outreach throughout 2024.

B. Energy Transition Advisory Committee

In addition, the company was appointed and served on the Energy Transition Advisory Committee (ETAC) which was created in 2021 within the Minnesota Department of Employment and Economic Development (DEED). The directive of ETAC was to create a statewide energy transition plan and to advise the Governor, the Commissioner of DEED and the Legislature on energy transition issues, establish transition programs, economic initiatives, and transition policy (Minn. Stat. § 116J.5492). ETAC met through 2022, including site visits to communities impacted by the energy transition. The Statewide Energy Transition Plan was filed by ETAC in December 2022. In 2023, the Legislature extended the life of ETAC until June 30, 2027, to file annual revisions to the Statewide Energy Transition Plan.

CONCLUSION

The Company takes seriously its responsibility to engage every community where we have major facilities and operations. Our commitment to our host communities and neighbors surrounding the King Plant will outlive our coal operations. While the nature of our operations there will change in the years ahead, the site will continue to be important to the Company's ability to deliver reliable, safe, affordable energy to our customers. We are glad to demonstrate that our longstanding participation in the social and economic life of St. Croix Valley communities will continue.

We appreciate the opportunity to work with our stakeholders and neighbors and the time and talent given to us by them throughout this past year of community stakeholder meetings. We are committed to ongoing engagement with community stakeholders as the King Plant site transitions to cleaner energy and transmission.

CERTIFICATE OF SERVICE

I, Marie Horner, hereby certify that I have this day served copies of the foregoing document on the attached list of persons.

Regulatory Administrator

APPENDIX R – EQUITY

Order Point 25 of the most recent IRP Order[1] states:

Xcel shall engage in community outreach and establish a stakeholder group to do the following:

A. *Design for the equitable delivery of electricity services and programs for energy-burdened customers in the company's next Resource Plan.*
B. *Create new options to improve customer access to energy efficiency and renewable energy.*
C. *Draft a plan to be submitted in Xcel's next Resource Plan to bring the racial and gender diversity of the company's workforce in line with the utility's state goals.*
D. *Design incentives to ensure that communities of low-income, Black, Indigenous, and People of Color that have disproportionately borne costs of unjust and inequitable energy decision have equitable access to programs promoting distributed generation.*
E. *Adopt practices in furtherance of procedural justice- including deeper engagement with renters; affordable rental property owners; communities of Black, Indigenous, and People of Color; and under-resources individuals- providing resources for engagement and participation, and providing financial support for impacted individuals to participate in dockets and decision - making processes.*
F. *Form an environmental justice accountability board which shall develop environmental justice-focused initiatives to be incorporated throughout the utility.*

By January 1, 2023 and annually thereafter, Xcel shall file details describing stakeholder outreach and progress in its next resource planning docket, and in a separate docket to be established by the Executive Secretary.

I. INTRODUCTION

The Commission's April 15, 2022 Order in Docket No. E002/RP-19-368 requires the Company to address equity across a broad range of areas and program issues by engaging in community outreach, establishing a stakeholder group, and forming an environmental justice accountability board. An annual report on efforts and progress is required by January 1. This report was filed in Dockets E002/M-22-266 and E002/RP-19-368 on December 29, 2023. Some of the following information is drawn from that filing.

In response to the Order, the Company has taken a number of interrelated actions to enhance equitable outcomes and broaden participation in energy decision-making.

[1] ORDER APPROVING PLAN WITH MODIFICATIONS AND ESTABLISHING REQUIREMENTS FOR FUTURE FILINGS, Docket No. E002/RP-19-368, April 15, 2022 (IRP Order).

In response to the requirement to "establish a stakeholder group," we convened the Equity Stakeholder Advisory Group (ESAG), which has met approximately monthly since September 2022. We are also in the process of convening an Environmental Justice Advisory Board (EJAB) to continue the work of ESAG and to recommend energy and environmental justice (EJ) initiatives for implementation by the Company. In addition, we have incorporated consideration of equity, energy justice, EJ, and greater community participation into a wide range of programs and dockets, including the 2021 electric rate case, this Resource Plan, resource acquisitions and requests for proposals (RFPs), our 2023 Integrated Distribution Plan (IDP), our Energy Conservation and Optimization (ECO) Triennial Plan, Natural Gas Innovation Act plan (NGIA), electric vehicle (EV) programs,[2] workforce diversification programs, social investments and charitable contributions, among others. These efforts are summarized in the sections below.

In 2022, Xcel Energy adopted an EJ Position Statement[3] committing us to consider EJ in our energy, climate, and environmental initiatives, and to strive to provide meaningful opportunities for impacted communities to participate in the process. The position statement also outlines additional Company objectives including collaboratively engaging the communities we serve, maintaining affordability and reliability, and allocating the costs and benefits of the clean energy transition equitably. We have incorporated the consideration of EJ into our strategy, business, and operational plans following the directives of our EJ Position Statement.

Company efforts are guided by the 2023 legislated definition of EJ in Minn. Stat. § 116.065,[4] as well as the definition of "environmental justice area" in that statute and in the Minnesota carbon-free electricity standard,[5] which is also reflected in the Minnesota Pollution Control Agency's (MPCA's) mapping tool.[6]

II. EQUITY STAKEHOLDER ADVISORY GROUP

In September 2022, the Company convened ESAG to advise the Company on the programs identified in the Commission's Order – i.e., equitable delivery of electricity services and programs for energy burdened customers, improved customer access to

[2] Transportation Electrification Plan as filed in the 2023 Intergraded Distribution Plan (November 1, 2023), Docket No. E002/M-23-452.
[3] See Environmental-Justice-Position-Statement.pdf (xcelenergy.com).
[4] See Minn. Stat. 116.065, Subd. 1(d) at Sec. 116.065 MN Statutes.
[5] See Minn. Stat. 216B.1691, Subd. 1(e) at Sec. 216B.1691 MN Statutes.
[6] Understanding environmental justice in Minnesota (arcgis.com).

energy efficiency and renewable energy, incentives to ensure that income-qualified and Black, Indigenous and People of Color (BIPOC) communities have equitable access to distributed generation programs, workforce diversification, and procedural justice in an attempt to broaden the ability of impacted individuals to participate in dockets and decision-making processes.[7] ESAG has met approximately monthly since it was convened. Summaries of each meeting have been filed in Docket Nos. E002/M-22-266 and E002/RP-19-368. The Company also filed in those dockets annual updates on December 22, 2022 and December 29, 2023, identifying progress in equity efforts as required by Integrated Resource Plan (IRP) Orders.[8]

A. Membership

ESAG is composed of representatives of approximately 35 community-based organizations, advocates for low-income households, EJ groups, clean energy advocates and state agencies. In developing the list of members invited to participate in ESAG, the Company worked to achieve representation from the wide diversity of racial, ethnic and cultural communities served by Xcel Energy, focusing particularly on elevating the voices of BIPOC communities. We also sought to include organizations working across the various program areas highlighted in the Commission's Order (energy burden, energy efficiency, renewable energy, and workforce), and to include both intervenor organizations who frequently participate in Commission dockets and many non-intervenors who have rarely or never participated, in order to serve the procedural justice objective of broadening participation in energy decisions.

B. Process

The first 10 ESAG meetings were facilitated by the Center for Economic Inclusion (CEI), an organization "committed to closing racial employment, income, and wealth gaps, and building racially inclusive and equitable regional economies." Founded in 2017, CEI is "dedicated exclusively to equipping public and private sector employers and policy makers to close racial employment, income, and wealth gaps and catalyze inclusive economic growth."[9] CEI led the ESAG through a systematic process that aimed to define the problem(s) to be solved; explore and identify root causes of the problem(s); and identify potential solutions and make recommendations on how Xcel Energy can address root causes of the problem(s).

[7] IRP Order Point 25.
[8] Ibid.
[9] *See* Mission — Center for Economic Inclusion.

C. ESAG Work Streams

In terms of substance, ESAG's work has focused on three core areas:

1. Reducing Energy Burden for Low-income and BIPOC Customers

Work in this area builds on the recognition that, although energy burden (the share of income spent on household energy) may be relatively low for the average Minnesotan, it is unsustainably high for some – in particular, for those Minnesotans living in areas where higher than average energy burden overlaps with high poverty, a high proportion of People of Color, and other equity metrics. ESAG's work to brainstorm and then prioritize solutions, resulted in two leading potential strategies:

a) The first identified strategy would apply an automated discount to bills for low-income customers within identified qualifying areas. Qualifying areas would be chosen based on agreed thresholds for energy burden and/or poverty. The discount would take the form of a bill credit which would be applied automatically each month to electric bills of all households in the qualifying areas. There would be no household-level income checks, so there would be no administrative burden for participating households.

b) The second identified strategy would create a package of energy efficiency program ideas. This concept grew out of a desire to expand participation in energy efficiency programs that can reduce household energy bills in a more permanent way (complementing the short-term bill relief of the automated bill discount). Many community members who qualify for assistance to make their homes more energy efficient and save money face barriers to accessing this assistance – barriers including the complexity of navigating program offerings, not owning their home, the burden of completing applications and documenting income, and sometimes distrust of the utility and/or energy efficiency implementers when the offerings seem "too good to be true." This concept seeks to combine several innovations that could work together to lower these barriers, including block-by-block weatherization/efficiency initiatives, automatic qualification, community-based navigators, and requirements/incentives for efficiency implementers to partner with community-based organizations that may have greater trust in the community.

2. Equitable Access to Renewable Energy and Distributed Generation

Work in this area builds on the recognition that existing programs for solar and other types of renewable energy have tended to benefit wealthier residents, homeowners, and businesses while providing limited access for low-income customers, renters, and BIPOC residents and businesses. ESAG is fortunate to include among its members several organizations, both non-profit and for-profit, that are pioneering new ways for low-income and BIPOC customers to participate in and receive financial, employment and other benefits from the development of solar generation. ESAG met in January 2024 to discuss a consolidated list of potential strategies for more equitable access to renewable energy, and will be prioritizing this list for further discussions in first quarter 2024.

3. Workforce Diversification

Work in this area builds on the recognition that a company's most successful ideas and outcomes result from a collaboration between people with different experiences and perspectives. While progress has been made by the Company in workforce diversification, additional efforts are needed to promote racial and gender equity in the energy workforce – both Xcel Energy's own workforce, and the broader clean energy workforce that Xcel Energy's investments and procurement relies upon. In particular, robust and coordinated efforts by a whole ecosystem of energy and workforce development organizations will be needed to ensure that the clean energy transition currently underway produces new career opportunities for a diverse workforce.

ESAG has worked on brainstorming and prioritizing workforce diversification strategies in the categories of recruitment, retention, training, and supplier diversity in contracting, procurement and RFPs. At the November 12, 2023 ESAG meeting, the Company provided an overview of our current diversity, equity and inclusion (DEI) strategies, including the Company's five pillars of Xcel Energy's strategy:

1. ***Build and maintain a diverse workforce, talent pipeline and leadership bench strength*** that reflects the communities and customers we serve.
2. ***Enhance community involvement and corporate giving programs*** to increase our support of organizations that advance DEI initiatives.
3. ***Increase data transparency, ensuring diverse workforce fair access to information*** and resources for all while striving to identify and eliminate unfair biases, stereotypes or barriers and leadership representation.

4. ***Establish targets to broaden our supplier diversity base,*** encouraging businesses owned by women or veterans or whose owners are ethnically or racially diverse to participate in procurement process.
5. ***Create an environment where employees feel safe, respected and genuinely included and empowered*** to do their best work.

As required by IRP Order,[10] the Company has developed a Workforce Diversification Plan (Plan), included here as Appendix R1: Workforce Diversification Plan. The Plan provides an overview of the Company's stated workforce diversification goals which includes established objectives, timelines and metrics. The Plan was shared with ESAG members for their review and input prior to the January 17, 2024 ESAG meeting. During that meeting, ESAG members provided feedback and recommendations to be considered in the plan. ESAG members feedback from that meeting included, among other comments:

- Encouraging consideration of additional programs such as beneficial electrification training, complementing the training areas delivered via Energy Careers Academy (ECA);
- Establishment of a training facility in the St. Paul area and/or offering transportation accommodations to increase participants' access to the Minneapolis training location for the ECA;
- A request to provide detailed information regarding diversity in various occupation fields such as labor, engineering, Xcel Energy leadership, etc.;
- To consider additional outreach via community-based organizations and workforce development non-profit organizations for recruitment purposes, and additional grant/scholarship funding options for participants not eligible for federal Pell grants.

We appreciate ESAG members' willingness to connect with us to help spread the word about our program offerings to reach a broader audience for recruitment purposes and look forward to working with ESAG members on additional routes of advertisement for these programs. Transportation support is already available for students in the ECA program in the form of bus cards, gas cards and car repairs as needed. Pertaining to additional training for electrification, we do have some program offerings through a partnership with Center for Energy and the Environment providing energy auditor training. This is discussed further below. Regarding detailed diversity information, we will be providing additional information to help address this request in our March 15, 2024 filing required by Minn. Stat. § 216C.51.

[10] IRP Order Point 25.C

Based upon ESAG feedback, we have incorporated additional outreach efforts, evaluating additional means for easing access for student participation in St. Paul, and connecting with organizations that can facilitate access to specific community members. As well, we will evaluate additional training opportunities with local higher level educational institutions to assist the training potential of employees to assist with the clean energy transition. We view our Workforce Diversification Plan as a living document which will be modified over time. Suggestions not incorporated at this time will continue to be evaluated for later inclusion as appropriate. Throughout the process, ESAG has highlighted the need to increase access, awareness, and retention of diverse workforces. Strategies pertaining to these topics are discussed in Appendix R1.

D. Updates to the Commission

In addition to the meeting summaries filed after each meeting and the 2022 and 2023 annual reports, the Company and ESAG members reported on progress to date in a November 21, 2023 Commission planning meeting on equity. Presentations were given by Commission staff, the Department of Commerce, and Xcel Energy. The Company presented an overview and progress update on ESAG work to date, followed by remarks from 11 ESAG members. Presentation materials from this meeting have been filed in Docket Nos. E002/M-22-266 and E002/RP-19-368.

E. Compensation for ESAG participants

The topic of compensation of ESAG members has been raised on several occasions, both during the formation of ESAG and during ESAG meetings. The Company's position to date on compensation is based on our reading of the Commission's order directing the Company to form ESAG, as well as the Commission's statements in approving our IRP. The Order reads,[11] "Adopt practices in furtherance of procedural justice … providing resources for engagement and participation and providing financial support for impacted individuals to participate in dockets and decision-making processes." During the February 2022 IRP hearing, intervenors asked the Commission to order compensation for intervenors participating in the stakeholder group that the Commission directed us to establish – and the Commission explicitly declined to do so. Based upon these two Commission actions – declining to order intervenor compensation when asked, but including language in the Order on financial support for "impacted individuals" – our interpretation has been that we should not compensate active intervenors, but should consider compensating "impacted individuals" who have not previously intervened in Commission dockets,

[11] See footnote 1, Order Point 25 subpart E.

and who would bring a community perspective to the discussion that would be beneficial for the Company and Commission to hear.

Based on this interpretation, when initial invitations were extended to participate in ESAG, the Company requested those invited to let the Company know if they needed compensation in order to participate in ESAG and that a compensation model would be established. This request was repeated in a subsequent email communication as well as at in-person ESAG meetings. Only one ESAG member, who represents an organization that is a frequent intervenor in Commission dockets, requested compensation. We indicated that, based on our interpretation of the Commission's order, we would not provide compensation to intervenors. Since no other members requested compensation, we have not provided compensation to any ESAG member. We also note that all ESAG meetings have taken place during the workday, and to our knowledge all current ESAG members are salaried employees of organizations that they are representing.

We provide this explanation not to suggest that the compensation issue is definitively settled for future community engagement efforts – but rather to explain how it was addressed in ESAG. Notably, the issue of potential compensation for the EJAB is still under evaluation. EJAB members have not yet been chosen but may represent "impacted individuals" who are not intervenors and may bring a crucial under-resourced and/or BIPOC community perspective to our decision-making. We are currently evaluating whether and how to provide compensation to EJAB.

III. ESTABLISHMENT OF ENVIRONMENTAL JUSTICE ADVISORY BOARD

The Commission's Orders in Docket Nos. E002/M-22-266 and E002/RP-19-368 also require the Company to form an EJAB to develop EJ-focused initiatives to be incorporated throughout the utility.[12] Prior to forming the EJAB, the Company conducted research on other organizations – utilities as well as state and federal agencies -- that have established EJ advisory boards. We shared the results of this research with ESAG and asked for their input on several points related to the formation of the EJAB, including purpose, size and composition, the application and selection process, authority and decision-making, logistics, compensation, and Xcel Energy staff and executive participation. Having incorporated the majority of ESAG's recommendations on these decisions into the process, the Company plans to launch an application process to select EJAB members, which will include broad outreach via

[12] See footnote 1, subpart 25.F.

ESAG, EJ and community-based organizations, in the first half of 2024. We will then convene a review committee to evaluate and score applications.

While the Company was ordered to establish the EJAB to focus on EJ-focused initiatives, we do not think that the scope of the EJAB should be limited to just that. We expect that the EJAB will advise the Company on potential initiatives under the broader umbrella of equity and energy justice, including carrying on the work of ESAG to explore programs to reduce energy burden, improve access to energy efficiency and renewable energy, and diversify the energy workforce.

IV. COMMUNITY OUTREACH/LISTENING SESSIONS

The Company discussed – in both our July 1, 2022 letter in Docket Nos. E002/M-22-266 and E002/RP-19-368, and our 2022 Annual Report filed in those same dockets December 22, 2022 – that the Commission's Order requires us to "engage in community outreach" as well as "establish a stakeholder group." Community outreach and the stakeholder group (ESAG) appear to be two distinct efforts in the Order. We agree they are somewhat distinct. ESAG has been a "grass tops" rather than "grass roots" advisory group – engaging mid- to senior-level staff of various community-based organizations, energy implementers, and advocacy groups – to learn from them what they believe are their communities' top priorities and how Xcel Energy could better support those priorities. These leaders' perspectives have been very valuable. Our discussions with these leaders are, however, likely a different type of discussion than might happen in grass roots community meetings where people are representing themselves, their families and friends. We have therefore proposed that another means of community engagement could be to conduct community listening sessions in a variety of under-resourced and/or BIPOC neighborhoods, focusing on hearing from the communities themselves.

We have also heard the frustration community members sometimes voice when organizations ask them to convene with no very concrete "ask" or without a specific program for them to provide their feedback on. We believe that could be the case if we had begun our implementation of the Commission's Order with community listening sessions. The challenge is to strike the right balance – presenting something sufficiently detailed and specific for community members to respond to, but at the same time not "fully baked," so that their feedback can still meaningfully influence the program design. With this in mind, we proposed in our 2022 Annual Report to conduct community listening sessions, but only after investing time in ESAG to develop concrete energy program proposals for community members to react to. At the time of that filing, we thought we would be ready to have community listening

sessions take place in 2023. While we still believe holding community listening sessions is the right approach, work in ESAG has extended beyond what we anticipated and therefore no community listening sessions were held in 2023. In addition, as ideas for the EJ Accountability Board have come into focus it seems the EJAB may itself be a mechanism for grass roots community input.

Considering this, the Company proposes to defer community listening sessions to late 2024, when ESAG's work has turned into concrete proposals for communities to react to, and once EJAB is up and running. We will evaluate at that time whether a third means of community outreach – the listening sessions – or some other means will bring us additional perspectives beyond what we have been able to gather from ESAG and EJAB.

V. OTHER COMPANY EQUITY EFFORTS

A. Distributed Energy Resources and Distribution Planning

Through our engagement with the ESAG we are identifying ways to improve our ability to provide equitable access to renewable energy. Through respective dockets, we will continue to work with stakeholders on ways to enhance our Service Quality Interactive Map, which includes electric reliability data, as well as our Hosting Capacity Map to make it easier for interested parties to access relevant metrics about our distribution system. However, one significant limitation to installing additional distributed solar generation in some areas can be a lack of available hosting capacity. For this reason, we are taking two important steps, as noted in our IDP, toward investing in proactive hosting capacity upgrades in Minnesota. First, we filed with the Department of Commerce (Docket No. E002/M-23-458) a proposed plan for hosting capacity upgrade projects using $10 million of funding, per state legislation.[13] Second, as discussed in our IDP, we have also included capital funds for proactive hosting capacity upgrades in our five-year budget. We recently filed a proposal on how the current distribution interconnection process could be modified to give queue priority to small (≤40 kW) customer-sited solar projects.[14]

[13] See our November 1, 2023, filing to the Department of Commerce (Docket No. E002/M-23-458) regarding the Distribution System Upgrade Program created by Minn. Stat. § 216C.378 as added by Minnesota Session Laws 2023, Chapter 60, Article 12, Section 38.
[14] See our November 1, 2023, filing in Docket No. E999/CI-16-521, IN THE MATTER OF UPDATING THE GENERIC STANDARDS FOR INTERCONNECTION AND OPERATION OF DISTRIBUTED GENERATION FACILITIES ESTABLISHED UNDER MINN. STAT. § 216B.1611.

B. Supplier Diversity

The Company has established an internal goal of achieving 25 percent of sourceable spend diversity with small and diverse suppliers by 2025. The Company has implemented programmatic strategies to support the goal. In addition, the internal resources provide guidance, consultation, and training on supplier diversity matters to effectively maximize the corporate utilization of small, minority, and women-owned businesses.

Utilization of small, minority and women-owned business in supply purchasing is achieved through collaborative strategic relationships with suppliers, customers, stakeholders, and public and community organizations/groups. Our goal is to achieve this by:

- Creating a competitive and quality-focused process for all parties, including a plan of action to monitor, achieve and report program activities.
- Developing new, creative, and innovative opportunities to utilize minority-owned businesses, women-owned businesses and small businesses.
- Establishing qualified supplier relationships that ensure that Xcel Energy, its customers, and shareholders realize the benefits of competitive pricing and quality materials and services.
- Establishing annual targets to increase Xcel Energy's direct and subcontracting spend with small and diverse businesses.
- Maintaining memberships and ongoing engagement with National Minority Supplier Development Council (NMSDC) and its regional affiliates, Women Business Enterprise National Council (WBENC) and its regional affiliates, National Gay & Lesbian Chamber of Commerce (NGLCC), National Veteran Owned Business Association (NaVOBA) and Disability:IN.
- Demonstrating ongoing commitment and support through outreach activities.

It is our goal to continue to drive social and economic benefits to diverse suppliers and local communities through our supply purchasing. An annual Supplier Diversity Economic Impact Report is published and posted to the corporate website.

C. Enhanced Community Involvement and Corporate Giving

Xcel Energy and its Foundation has placed an emphasis on enhanced community involvement and corporate giving programs to increase our support of organizations that advance DEI initiatives. We note below the various internal programs that have been established towards those efforts.

1. Xcel Energy Foundation

In 2022, Xcel Energy Foundation launched a new approach to grantmaking called "Energizing the Future," focusing on aligning business priorities and reflecting our DEI commitments, laying the groundwork for a stronger community impact.

Through this new approach, the Foundation has provided nearly $4 million in funding – coming from Xcel Energy's shareholders and investors, not customers – to support a mix of urban and rural Minnesota 501(c)(3) nonprofits that focus on advancing Science, Technology, Engineering, and Mathematics (STEM) Career Pathways, Environmental Sustainability and Community Vitality.

In 2023, one hundred fifty-three 501(c)(3) nonprofits received $1.96 million through our Xcel Energy Foundation grant program. Of those grants, $1.04 million went to 84 nonprofits that indicate that their mission is explicitly dedicated to advancing DEI; $806,000 was invested in 55 nonprofits that have a BIPOC and/or Multiracial leader; 82 percent of the nonprofits receiving grants have a DEI policy; 74 percent reported that their staff reflect the diversity of the people they serve; and 63 percent of people served by the nonprofits are at or below 150 percent of the federal poverty definition.

Xcel Energy and its Foundation's grantmaking is one of the many ways that we give back to our communities.

2. Xcel Energy Corporate Giving Efforts in the Community

Xcel Energy Corporate community engagement programs enhance support of DEI initiatives. These programs focus on strategic philanthropy, scholarship programs, and pro bono programs.

a. Strategic Philanthropy

- **ReConnect Rondo** (Rondo Land Bridge): $120,000 ($50,000 in 2023 from Xcel Energy/ $70,000 in 2020 from Xcel Energy)
    - Reconnect Rondo's (RCR) mission is the realization of a Rondo Land Bridge (RLB) to reconnect communities proximate to Interstate Highway 94 in the Rondo neighborhood of Saint Paul. RCR is a community development organization established to maximize opportunities for business, economic, and social development. RCR's goal is to persuasively shape policy for the RLB to create opportunities

that uplift the public health, economic, housing, and social conditions of the Rondo communities.

- **Rondo Community Land Trust:** $60,000 ($50,000 in 2023 from Xcel Energy and $10,000 in 2023 from Xcel Energy Foundation)
    - The Rondo Community Land Trust is a local nonprofit with a mission to provide and advocate for permanently affordable, sustainable housing for families and individuals with low to moderate incomes. In 1989, a land trust model was established by the Summit-University Planning Council to keep housing affordable for future generations. It expanded to support affordable commercial space and to serve all of St. Paul, and now serves as an anti-gentrification measure for local businesses.

- **2022 Carbon Offset Investment** ($150,000)
    - **Indian Land Tenure Foundation (ILTF)** ($100,000): ILTF has partnered with the Bois Forte Band of Chippewa to restore to Tribal ownership over 28,000 acres within the reservation that were allotted to individual Indian landowners, then sold to non-Indians, in the late 1800s and early 1900s. The Company's purchase of high-quality carbon offsets will enable ILTF and Bois Forte to continue their work of Tribal land reacquisition and sustainable management.
    - **Green Minneapolis** ($50,000): Green Minneapolis is the lead organization on the Twin Cities Climate Resiliency Initiative (TCCRI), aiming to plant five million urban trees over the next 20 years. One of the project benefits includes planting in underserved communities that have little access to greenspace. Tree planting has been shown to reduce energy costs over time by providing shading (reducing cooling needs), improve local air quality by filtering pollutants, improve stormwater management by intercepting rainfall, and reduce the urban heat island effect in neighborhoods with high poverty and low tree canopy cover.
    - Note that both of these projects, originally funded by a 2022 Strategic Philanthropy investment, have now been incorporated into our proposed portfolio of innovative projects for the Company's first NGIA Plan, filed December 15, 2023. Further details on our NGIA Plan can be found below.

b. Energy Conservation and Optimization Scholarship Program

Xcel Energy provided nearly $1 million in scholarships to 2-year and 4-year colleges and universities within the Company's Minnesota service territory in 2022 and 2023. In 2022, six schools received scholarship funding from Xcel Energy. Funding support was expanded to include 11 schools in 2023.

This is a component of a larger Workforce Development Program, which operates with the objective of providing resources to income qualified persons to bring them into the clean energy workforce. In 2024-2026 this Program will continue to be funded through our Energy Conservation and Optimization (ECO) program as approved by the Department of Commerce on December 1, 2023 in Docket No. E002/CIP-23-92.

The Company's goal of these scholarships is to help develop a diverse workforce by investing in income-qualified students who are enrolled in programs that may lead to careers related to energy efficiency. It is anticipated that as they enter the workforce, their backgrounds will bring unique opportunities to support the expansion of energy efficiency within income qualified and underserved markets.

c. Pro Bono Skills-Based Volunteer Program

As they focus on fulfilling their missions, nonprofit organizations may not have the staff or resources to improve their business operations or advance new initiatives. Xcel Energy employees' personal knowledge and expertise can be a powerful force to help nonprofit organizations achieve their goals and make a deeper impact. That is the premise of Xcel Energy's Pro Bono Skills-Based Volunteer Program. In 2023, 19 employees contributed consulting services to nonprofit organizations in marketing, technology, legal, finance and human resources, volunteering more than 600 hours at three nonprofits and delivering a value of nearly $116,000 to nonprofit organizations through the program.

The volunteer effort began in 2020 and was developed as a way for employees to contribute their skills through pro bono consulting services to nonprofits advancing racial equity and social justice and serving underrepresented groups in the Twin Cities.

Since 2020, this program has supported the capacity building challenges of the following Minnesota-based 501(c)(3) nonprofits focused on advancing equity: The Sanneh Foundation, Project for Pride in Living, Project DIVA, Neighborhood Development Center, WomenVenture, 30,000 Feet, Immigrant Law Center of Minnesota, and Second Harvest Heartland.

d. Employee Board Service

Xcel Energy is intentional about engaging its employees in the communities it serves. One of the many ways we ensure meaningful connection between employees and our community is through board service. In 2023, Xcel Energy employees served on the

board of directors for 39 nonprofit organizations in Minnesota who indicate that their organization is explicitly dedicated to advancing DEI.

e. United Way Contributions

Through Xcel Energy's annual giving campaign supporting local United Way chapters within our 8-state service territory, Xcel Energy employees and retirees, combined with a Company match from the Foundation, contributed $4.1 million in 2023. In Minnesota, $669,532 was raised in support of community organizations, with Company match supporting local United Way chapters. The United Way exists to fuel lasting change that will help achieve the vision of a community where all people thrive regardless of income, race, or place.

D. Request For Proposal Efforts

1. Resource Acquisition RFP Process

The Company is expected to procure a large amount of new generation in coming years through the resource acquisition RFP process as it executes the clean energy transition, and we will factor equity into that process. Many, but not all, of the acquisitions will take place through competitive resource acquisition processes, including RFPs. The Company receives proposals for future electric generation options through the RFP process, often including proposals for resources built, owned, and/or operated by third party developers as well as for resources to be built and/or owned directly by the Company. In many cases, the RFP process considers proposals for generation resources that are 3-6 years away from reaching commercial operation and may be located in any of the five states in which the Company's Upper Midwest service territory is located. These are typically somewhat early-stage procurements run by the Company for long term planning purposes to satisfy regulatory requirements.

Given the timing and breadth of the resource options that can be considered in these resource acquisition RFPs, the Company attempts to ensure that equity, energy justice, and EJ are considered for all project types – those proposed by both third parties and the Company – and all locations. Awareness is given to the details that are available for these projects at the time of RFP submittal, in other words, many of the details we have available at the time for these projects are preliminary. In the RFP process, bidders are required to respond to a set of questions pertaining to equity - such as use of diverse suppliers, use of union labor and/or prevailing wages, siting locations and community engagement, with the list continuing to grow over time.

Currently, the main equity touchpoints in the generation acquisition and resource development processes are as follows:

- Prior to RFP submittal, earlier stage development of resources may occur by developers at specific locations. Part of the development may incorporate energy justice, EJ, and equity in activities such as siting and community engagement.
- The RFP application requests information which must be submitted with the bid documents such as questions pertaining to the use of union labor and/or prevailing wages and requirements to submit information about planned use of diverse suppliers. The Company shares information regarding certified diverse suppliers to inquiring bidders and will send out additional information that developers can use to help understand and conform with equity, EJ, and energy justice requirements in RFPs as well as for their own future resource development efforts. The list of questions posed to bidders will change over time as we learn from these experiences.
- Equity is also taken into consideration during the bid evaluation process. We are currently updating and expanding how equity, energy justice, and EJ factor into the evaluation of proposals during the RFP evaluation period. One example includes the consideration of benefits from a proposed project on the local surrounding area. In recent RFPs, some data points related to local benefits have been collected from bidders in materials submitted with the proposal. However, as new information becomes available about how to define and consider this topic within the resource acquisition framework, the data collected and how it is used in the evaluation process will evolve. We intend to develop additional scoring metrics to include equity in the evaluation process.

  While equity is taken into consideration in the evaluation process, actual bid prices are not modified based upon equity. However, bids prices may be impacted, for example where tax credit adders from the Inflation Reduction Act (IRA) are applied to solar developments in income qualified communities.
- Once the RFP process has closed and projects have received approval, additional opportunities for the incorporation of equity, energy justice, and EJ are likely to arise during the project development stage pertaining to permitting, construction, and sourcing of actual materials used to construct the generation asset. As projects are approved through the required regulatory processes, subsequent sourcing efforts are undertaken by developers of the selected projects to procure specific resource components, additional labor, and other

key elements necessary for the resource to achieve commercial operation. There are additional opportunities throughout the process for equity considerations.

We expect that changes to equity considerations in the RFP process will continue to occur over time as we learn through experience and also based upon the amount and timing of future RFPs. Since the RFP process can take 1.5 to 2 years for a given RFP, followed by years of development of the actual resources selected, we expect that changes to equity considerations in our processes will continue to be implemented gradually over time based upon our experiences.

2. RFP 101 Bidder Workshop

Based on conversations with members of ESAG, it was recognized that there was a need for the sharing of basic information regarding the RFP bidding process with those new to the process. In response, Xcel Energy hosted an RFP 101 Bidder Workshop, held October 12, 2023. The intent of the workshop was to share basic information with potential interested bidders regarding the NSP bidding process for new generation resources. The hybrid workshop generated great interest with over 75 external participants. Participants indicated their appreciation of the workshop and information shared. A copy of the workshop materials was filed to Docket no. E002/M-19-368.

E. Electric Vehicle Equity Efforts

The Company is committed to ensuring that all customers have an equitable opportunity to participate in programs and offerings designed to reap the benefits of transportation electrification. In pursuit of this commitment, the Company has offered and proposed various EV equity initiatives aimed at promoting inclusivity and fostering broader access to EV offerings in Minnesota.

1. Public Charging Pilot

The Company's Public Charging Pilot, approved by the Commission in July 2019,[15] aims to expand the deployment of Level 2 and Direct Current Fast Charging chargers across the Company's service territory. Our equity-driven objectives include deploying public charging and increasing access to charging and mobility services, including access for low-income communities. Key highlights of this initiative involve our

[15] Order Dated July 17, 2019, in Docket No. E002/M-18-643

partnership with HOURCAR to develop the EV Spot Network, which is utilized by the Evie Community Carshare service. The EV Spot Network was planned and implemented through the collaborative efforts of Xcel Energy, HOURCAR, the cities of Saint Paul and Minneapolis, East Metro Strong, and the American Lung Association. Evie Carshare, launched in February 2022, enables one-way trip services that begin within a 35-square mile area of Saint Paul and Minneapolis. Financial support and event contributions have lowered HOURCAR's operational costs, leading to more affordable Evie Carshare pricing for low-income customers. As of January 2024, the Company has 80 active sites, 55 of which are EV Spot Network sites. Between February 2022 and January 2023, Evie Carshare measured 2,637 unique users; 63,145 trips; 676,141 miles traveled; and approximately 2,092 metric tons of greenhouse gas (GHG) emissions reduced. HOURCAR estimates the service saved $5.8 million in transportation costs. Based on total utilization, 38 percent was derived from BIPOC/non-white users, as well as 36 percent from very low-income users and 11 percent from BIPOC/non-white users who are also very low-income.

The Company has also proposed a range of new offerings designed to further promote the equity and accessibility of transportation electrification throughout our service territory in our November 2023 Transportation Electrification Plan (TEP).[16] A detailed summary of those program offerings follows.

2. The Home Wiring Rebate Program

In the TEP, the Company proposed a Home Wiring Rebate Program (Rebate Program) which is aimed at encouraging EV adoption by alleviating the high infrastructure costs associated with residential charging and driving engagement in managed charging programs. For residents living in Disproportionately Impacted Communities (DIC), EJ areas of concern, or those participating in energy assistance programs, the Company proposed an enhanced rebate amount that covers a higher percentage of the average installation cost. Enhanced rebate recipients are eligible for the full $1,200 rebate to cover charging station costs included in the monthly service fee, compared to $500 for a "Market-Rate" rebate. For customers also participating in the Company's EV Accelerate at Home program, any unused portion of the $1,200 can be used to help offset the ongoing monthly residential charging costs. The customer must meet the following criteria to be eligible, as follows:

[16] Transportation Electrification Plan as filed in the 2023 Integrated Distribution Plan (November 1, 2023), Docket No. E002/M-23-452

- Premise is located within a DIC, as defined, and published by the White House Council on Environmental Quality's Justice40 Initiative;[17]
- Premise is located within an EJ Area of Concern (EJ Area), as defined and published by the Minnesota Pollution Control Agency (MPCA);[18]
- Must be a current or previous participant (within the last 5 years) within the State of Minnesota's Weatherization Assistance Program, Affordable Housing Rebate Program, or Minnesota's Low-Income Renter Classification. This program supports our commitment to equity, making EV adoption more accessible and affordable for all, with tangible benefits for underserved communities.

3. Bridge Funding for Fleets and Public Charging

The Company's Bridge Funding for Fleets and Public Charging proposal,[19] included in the TEP, outlines our commitment to responsible fund stewardship, aiming to maximize the impact of projects while ensuring equitable access to transportation electrification. Based on stakeholder feedback, the Company created the Commercial EV Pilot Application Review and Scoring Framework to standardize scoring across commercial EV projects and to align with equity and accessibility priorities. The Company will review and score project applications on a rolling basis across three scoring categories: Project Scope, Customer and Project Readiness, and Equity and Accessibility. Within these reviews, 300 total points are available for each project during the scoring review, with 45 percent of the points allotted to the Project Scope category, 20 percent to Customer and Project Readiness, and 35 percent to Equity and Accessibility. Applications that score 66 percent of the points or higher will qualify to participate and move on to the design and construction phase of the Pilot participation.

The Equity and Accessibility scoring category will include an evaluation of whether the project being considered increases access to electricity as a fuel for all, increases awareness and adoption of EVs, serves disproportionately impacted or underserved customers, including income qualified communities, BIPOC communities, Tribal nations, and rural communities, and is affiliated with or promotes small or underutilized businesses. Such projects that are aligned with stakeholder interests, demonstrate their ability to increase access to electricity as a fuel for all and serve disproportionately impacted or underserved communities will receive more points.

[17] Methodology & data - Climate & Economic Justice Screening Tool (geoplatform.gov)
[18] Understanding environmental justice in Minnesota (arcgis.com)
[19] Transportation Electrification Plan as filed in the 2023 Intergraded Distribution Plan (November 1, 2023), Docket No. E002/M-23-452

This proposed scoring process plays a pivotal role in aligning proposed projects with the Company's commitment to providing equitable access to electrified transportation for customers and communities that stand to benefit the most.

4. Electric School Bus Demonstration

The TEP also included a proposal to support a demonstration to begin to study and address barriers to school bus electrification, school bus bi-directional connection to the grid, and to better understand the costs and benefits of electric school buses as grid resources. Through this demonstration, the Company proposed to partner with the Minnesota State Department of Commerce on its Electric School Bus Deployment Program, to support two V2G capable installations on sites of entities, school districts, or school bus owners and operators. The Company ensured that the proposal for the Electric School Bus Demonstration in its recent TEP was aligned with our equity efforts. One of the primary focuses of this proposed demonstration is on low-income, BIPOC students, who may be disproportionately impacted by vehicular emissions depending upon where they reside and/or due to higher rates of pre-existing health conditions, as well as rural students by ensuring that the demonstration project serves school districts in low-income, BIPOC, and/or rural communities.

To select participants, the Company will use its proposed Application Review and Scoring Process (including the Equity and Accessibility scoring category), mentioned in the above section on Bridge Funding for Fleets and Public Charging. In addition, the Company has proposed to utilize tools and resources such as the MPCA's EJ maps and the US EPA's Environmental Justice Screening Tool to evaluate equity efforts. These tools will help determine if the school district and buses operated by an operator serve a diverse set of school districts, communities, and students within our service territory, ensuring alignment with our objective to support disadvantaged communities, particularly low-income, BIPOC, and/or rural students. Additionally, we considered the proportion of students within a school district or school who receive free or reduced lunch plans to further enhance equity in the program.

5. Residential Advisory Services

The Company has proposed additional funding in the TEP for Residential Advisory Services to expand customer engagement and education opportunities. This proposal is rooted in proven effective efforts and in response to the Commission's recent

Order[20] to focus on "other non-infrastructure related pilots or programs that increase EV deployment, especially in disadvantaged communities." Education and outreach initiatives play a pivotal role in reaching and supporting disadvantaged communities by providing essential resources and information on how they can best participate in and benefit from EV offerings.

6. Partnerships to Promote Access to Transportation Electrification for Tribal Communities

Xcel Energy serves as the energy utility for two Tribes in Minnesota (Lower Sioux Indian Community and Prairie Island Indian Community) and three in Wisconsin (the Lac Courte Oreilles, Red Cliff, and Bad River Bands of Lake Superior Chippewa). We also serve one of the nation's largest urban Native populations, and partner with a broad range of Native-led non-profit organizations and businesses to serve this community's needs.

The Company is currently partnering with Native Sun Community Power Development on two U.S. Department of Energy-funded initiatives to develop EV infrastructure on Tribal Nations and travel corridors. The *Upper Midwest Inter-Tribal EV Charging Community Network* works to reduce EV barriers for Tribal members in the Upper Midwest and build EV-friendly travel corridors connecting Tribal Nations with urban centers. The *Expanding Regional EVSE Access with Tribal Nations based on Community Priorities* project is a Native-led, public-private partnership to promote EV adoption by Tribes and Tribal members in Wisconsin, Minnesota and Michigan by working with Tribes to engage their communities in EV planning and charging infrastructure development. Both projects aim to promote more equitable access to EVs and publicly accessible charging in underserved areas, helping Tribal members to benefit from reduced vehicle operating costs, reduced pollution, and other benefits of electrified transportation.

F. Energy Conservation and Optimization

The Company's 2024-2026 ECO Triennial Plan (Triennial) will provide unprecedented resources to support the underserved markets in Minnesota. It identifies a path forward to doubling the amount of financial resources committed to providing services to the income qualified market and aims to go above the minimum requirements established under Minn. Stat. §216B.241. Our three-year plan, approved in Docket No. E002/CIP-

[20] *See* ORDER ACCEPTING WITHDRAWAL OF CLEAN TRANSPORTATION PORTFOLIO SUBJECT TO CONDITIONS (August 23, 2023), Docket No. E002/M-22-432, Order Point 4C.

23-92 by the Department of Commerce on December 1, 2023, includes five program offerings in our Income-Qualified Market Segment with an energy savings target of 18.7 GWh of electricity and 97,500 dekatherms (Dth) of natural gas, impacting approximately 49,000 customers over the planning years of 2024 through 2026.

To achieve these targets, the Company is working to simplify our participation process and expand eligibility requirements to attributes that are easier for customers to verify. Further we will support our partner organizations through workforce development programming. We will also help customers pursue opportunities to replace electric resistance heating with new technologies, such as heat pumps, along with pre-weatherization support to reduce the number of homes that are deferred for weatherization services.

The design of our Triennial incorporates significant input from stakeholders engaged in serving the income qualified market who are familiar with the barriers faced by this market and provided unique insights into the opportunities to improve our program delivery. We describe the significant impacts of this portfolio below.

1. Expansion of Weatherization

The Triennial Plan expands both the number of rebates and services provided to support weatherization and efficient fuel switching, as well as the delivery channels that will be utilized to reach this market. Program awareness was identified as a barrier to participation. The Company will be incorporating additional outreach to Community Based Organizations (CBOs) to reach more customers with information through CBOs who customers trust and may have an established relationship with. Additional work is also underway to explore opportunities around geographic prequalification and weatherization measures for manufactured homes, a historically underserved market.

2. Rental Properties

Driving conservation in rental units has been a historic struggle caused primarily by the issue of the landlord/owner needing to pay for upgrades that do not necessarily provide them a direct benefit, as often renters are responsible for their own utility bills. Thus, the capital outlay required of the landlord benefits the renters and there is no direct incentive for the landlord to invest in energy efficiency improvements for the property. In properties where utilities are not paid directly by the renter, the cost is frequently incorporated into what the tenant pays for the unit, again removing the incentive to lower energy use. For rental properties with 1-4 units the Triennial

reduces the landlord/owner co-pay to $0 for many efficiency improvement measures for the income qualified rental market, thus removing that barrier. The product that delivers energy optimization support to the multi-family market (5+ units) has been expanded and simplified to better engage property managers and owners for income qualified dwellings. The offering provides a holistic approach, starting with an audit to identify opportunities throughout the building and delivers direct installation of energy efficiency measures into the dwelling units while supporting upgrades to the common spaces with significant rebates.

3. Workforce Training Efforts

The Company has engaged in a multi-faceted program to provide career development training to underserved markets while providing a pipeline of workforce resources to deliver audits and weatherization services. Working not only with our program provider, the Center for Energy and Environment (CEE), but also a multitude of community organizations, we recruit participants into formal classroom training to provide a foundational knowledge on residential energy efficiency. Once the classroom learning is complete there is an opportunity to supplement this with "hands-on" experience with actual field experience through the Company's Home Energy Squad or working with participating insulation installers. In addition to formal training, this program provides resources, including stipends and travel vouchers, to remove barriers that frequently prevent participants from engaging in this type of training. The Company's Work Force Development supported through the Triennial will also deliver the previously described (see section V.C) portfolio of scholarships supporting higher education opportunities for members of underserved markets who are pursuing careers in green energy fields.

Based on data provided by CEE, as of late 2023, 77 participants have successfully completed the four-week training program, of which 89 percent identify as Black, Indigenous, Asia, Latino/Hispanic, or other People of Color. Prior to training, 98 percent of participants had incomes below 80 percent of Area Median Income. On graduation, some participants have entered directly into employment in the sector as Energy Counselors with CEE, while others have gone on to further their training through programs like Xcel Energy's ECA Program. Sixteen participants have completed four-month internships in home energy auditing or home insulation. Several are working as Energy Auditors with CEE or Energy Conservation Specialists with Community Action Partnership of Ramsey and Washington Counties, while others have been hired as insulation installers, construction apprentices or community outreach specialists.

G. Natural Gas Innovation Act Programs

The NGIA, passed in 2021, creates a new framework for gas utilities to promote clean energy, greenhouse gas reductions, job creation and other benefits by bringing forward innovative resources that can decarbonize natural gas use in the building heating, commercial, industrial, and other sectors. The Company filed our first five-year NGIA innovation plan[21] in Minnesota on December 15, 2023. The portfolio of resources included in the plan includes renewable natural gas from a broad range of sources, power-to-hydrogen, carbon capture, a district energy project using networked geothermal ("community ground source heat pumps"), strategic electrification for commercial customers, and a weatherization/strategic electrification project for Tribal housing at Prairie Island Indian Community, as well as several research and development projects. We are working to incorporate equity and low-income considerations into our pilot programs. Five of the proposed projects in our portfolio are designed with equity in mind.

- The Prairie Island Indian Community project will work in a community defined in Minnesota statute as an EJ Area, providing larger incentives than are allowed under ECO in an effort to secure high participation by Tribal members, and helping residents weatherize and electrify housing (mostly manufactured homes) in pursuit of the Tribe's Net Zero vision.
- The Improved Forest Management carbon capture project will work with the Indian Land Tenure Foundation and Bois Forte Band of Chippewa to fund high-quality greenhouse gas reductions while supporting Tribal goals for reacquisition of lands lost to non-Indian owners in the late 1800s and early 1900s.
- The Green Minneapolis carbon capture project will work to plant trees in "urban heat island" areas with low canopy cover in Minneapolis, which tend to be areas with higher poverty and a higher proportion of People of Color. Increasing tree cover in these areas, besides sequestering carbon, will also provide shading and therefore energy savings over time.
- The Advanced Methane Leak Detection carbon capture project will deploy advanced leak detection within low-income or EJ Areas. This project will collect baseline data and enable enhanced repair approaches as applicable.
- The Community Ground Source Heat Pump project will include a site selection process after plan approval that incorporates siting within a low-income or EJ Area as a consideration within the site selection criteria.

[21] Filed in Docket Nos. G002/M-23-518 and G999/CI-21-566.

H. Federal Initiatives Supporting Equity

1. Inflation Reduction Act

The IRA, in addition to other benefits discussed in Appendix Y: Life Cycle Emissions Impacts, supports our: (1) net zero vision through expanded electrification incentives, (2) clean fuel vision through providing incentives for clean fuels, and (3) clean transportation vision by extending and modifying existing tax incentives for electric vehicle purchases. Together, these provisions present opportunities for greater cost-effective renewable deployment and increased electrification, which will ultimately drive incremental customer savings and increased emissions reductions.

The IRA ties the full value of potential tax credits to prevailing wage and apprenticeship requirements. The prevailing wage requirement requires that laborers and mechanics employed in the construction or repair of eligible facilities be paid wages at rates not less than the prevailing rates for the locality. Additional apprenticeship requirements require an increasing percentage of labor hours be performed by qualified apprentices who participate in a registered apprenticeship program. For projects beginning construction after 2023, qualified apprentices are required to perform 15 percent of labor hours. Contractors employing four or more employees must employ at least one qualified apprentice. The IRA also encourages the onshoring and manufacturing of components that go into clean energy generation. We will take steps to ensure our projects qualify for the full tax credits by ensuring those employed in construction meet prevailing wage and apprenticeship requirements.

The IRA also offers income-qualified and disadvantaged communities opportunities for Home Energy Rebates and various grants. These initiatives, made available by the Department of Energy (DOE) and the Environmental Protection Agency in 2023, enable the adoption of efficiency improvements in homes, and electrification technologies, especially for income qualified and disadvantaged communities which in turn, helps to reduce GHG emissions and help to support the clean energy transition. While utilities do not directly administer these programs, we have engaged with the agencies leading these efforts and other stakeholders to establish partnerships to maximize equitable benefits to communities within the state. For more information on the IRA, please refer to Appendix U: Inflation Reduction Act.

2. Investment and Infrastructure Jobs Act/Bipartisan Infrastructure Law Funding

The Federal government's Justice 40 Initiative requires Bipartisan Infrastructure Law (BIL) funding—also known as the Investment and Infrastructure Jobs Act (IIJA)--

applicants to include Community Benefit Plans (CBP). Xcel Energy submitted multiple grant applications to DOE for projects such as the hydrogen hub, energy storage, and grid resiliency programs which will provide significant funding to Minnesota. Each application includes a CBP outlining plans for community engagement, job creation and retention, and incorporation of Diversity, Equity, and Inclusion into these projects. The aim is to ensure that at least 40 percent of the benefits from federal funding go to disadvantaged communities.

Xcel Energy has been awarded funding for the Heartland Hydrogen Hub, Wildfire and Extreme Weather Mitigation under the Grid Resilience and Innovation Partnership (GRIP) program, Form Energy Long Duration Energy Storage under the Energy Storage Demonstrations program, and the Joint Transmission Interconnection Queue Projects and Portfolios (JTIQ) under the GRIP program. The scope of the Projects and CBPs are subject to negotiations with the DOE over the next 6-12 months. The company will commit to a formal CBP scope of work and milestones to report to the DOE over the project life cycle. This will include metrics such as community engagement, diverse supplier spend, workforce development, and other metrics we will work through with DOE.

I. Resilient Minneapolis Project

The Resilient Minneapolis Project (RMP) seeks to improve BIPOC communities' resilience to crises by installing solar/battery microgrids at three community center locations: the North Minneapolis Community Resiliency Hub, Sabathani Community Center, and the Minneapolis American Indian Center (collectively referred to as the RMP "hosts"). At each site, the Company is working with the hosts to install rooftop solar, battery energy storage systems (BESS), microgrid controls, and necessary distribution system modifications to integrate these technologies. The microgrids, when operating in "island" mode (i.e., during an electric system outage), will provide power for services critical to the communities the RMP hosts serve. Recognizing that outages are generally infrequent and brief, and the need to fully utilize RMP assets to benefit all customers, the RMP BESS systems will also be dispatched on a routine basis to provide a variety of grid services and learnings to benefit all the Company's customers.

Equity is the central driver of the RMP. The Company seeks authentic partnership and long-term investment in the three communities, who are disproportionately vulnerable to emergencies caused by climate change and other factors due to a history of discrimination and racial disparities in income, wealth, health, education, jobs and a wide range of other metrics. Providing islandable microgrids in these three locations

will enable these trusted community organizations to continue delivering critical, and in some cases lifesaving, services in the event of an electric outage – shelter, cooling, food, communications, etc. The process has not been without challenges; in the wake of some miscommunications and delays in early 2023, the Company is learning how best to partner with BIPOC organizations, and seeking to tailor the kind of support we provide to each host's distinct goals and needs.

In pursuit of the Commission's September 21, 2023, Order in this docket,[22] the Company is currently working with the hosts to develop a revised RMP proposal to invest in resilience in the host communities identified in the original proposal. Our revised proposal, due March 19, 2024, will include an explanation of how the revised proposal is in the public interest, what objectives will be achieved, and how resilience for host communities will be improved. It will also discuss how the Company plans to deploy up to $9 million of our IIJA GRIP award allocated to microgrids in BIPOC communities, matched by up to $9 million in funding from our customers, to support greater resilience for BIPOC communities.

J. Tribal Engagement Efforts

Xcel Energy provides electric and/or natural gas service to two Tribal Nations in Minnesota (Prairie Island Indian Community and Lower Sioux Community) and three in Wisconsin (the Red Cliff, Lac Courte Oreilles, and Bad River Bands of Lake Superior Chippewa). We also serve one of the nation's largest urban Native American populations in the Minneapolis/St. Paul Metro area. Some of our recent efforts to conduct outreach, coordinate our work, and build new partnerships with Tribes and Native organizations include:

- The Company has adopted an enhanced Tribal notification process for recent renewable energy, transmission, and other projects. For projects such as the Minnesota Energy Connection, Long Range Transmission Planning 4 transmission line, and Sherco Solar, we went beyond merely notifying Tribes whose current land base is in the vicinity of these projects, also using the U.S. Department of Housing and Urban Development's Tribal Directory Assessment Tool to identify all Tribes with potential cultural or ancestral ties in the counties affected by these projects. We sent notifications to the appropriate contacts – generally the Council President and Tribal Historic Preservation Office – for each of these Tribes, providing basic information about the project

[22] Order Approving Withdrawal and Requiring Filing. *In the Matter of Xcel Energy's 2021 Integrated Distribution System Plan and Request for Certification of Distributed Intelligence and the Resilient Minneapolis Project*. September 21, 2023. Docket No. E-002/M-21-694.

and offering to discuss further if the Tribe had concerns or areas/cultural sites they would like to see the Company avoid in siting/routing and construction.

- The Company has supported the Prairie Island Indian Community's (PIIC's) Net Zero Project, specifically by coordinating on the planning of a PIIC-led initiative to conduct home energy audits, weatherization, and electrification of space and water heating for PIIC residents who are Xcel Energy natural gas customers. We subsequently included this pilot project in our NGIA plan, filed December 15, 2023. If approved by the Commission, the PIIC pilot will provide significant utility contributions for weatherization and electrification, using the flexible structure of NGIA to assist PIIC as an EJ Area under state statute.

- We have been collaborating closely with the PIIC on a requirement of this Resource Plan, "true comprehensive cost-benefit analysis, which includes potential environmental and economic impacts to the neighboring communities – in particular, the Prairie Island Indian Community and its Treasure Island Resort & Casino" relative to the continued operation of the Prairie Island Nuclear Generating Plant (PINGP).[23] The Company consulted with PIIC to develop the approach to this study; hired a consultant to conduct economic modeling both for PINGP retirement scenarios and to quantify the economic benefits to the region of Treasure Island Resort & Casino; and coordinated with PIIC to create a narrative on the non-quantifiable costs and benefits. Further information about the approach to this study can be found in Appendix M: Nuclear; the study itself will be filed as a subsequent supplement to this IRP.

- In response to comments filed by Mille Lacs Band of Ojibwe (MLBO) on the Monticello Subsequent License Renewal Application and Sherco Solar 3, we reached out to coordinate with the Tribe to understand their concerns and ensure they have an opportunity to engage in archeological surveys to identify any sensitive sites (e.g. burial mounds and other cultural/historic sites) or plant resources that should be avoided during construction activities. MLBO has since sent Tribal cultural resources staff and a forester to visit the sites to evaluate any sensitive sites and conduct a red cedar tree survey.

[23] Minnesota Public Utilities Commission. ORDER APPROVING PLAN WITH MODIFICATIONS AND ESTABLISHING REQUIREMENTS FOR FUTURE FILINGS. *In the Matter of the 2020–2034 Upper Midwest Integrated Resource Plan of Northern States Power Company d/b/a Xcel Energy*. April 15, 2022. Docket No. E-002/RP-19-368. Order Point 23.E.

- The Company is collaborating with Native Sun Community Power Development on two DOE grants designed to ensure equitable access to electrified transportation on Tribal Nations and for Tribal members. This is detailed in section V.E.6 above.
- We worked with Native-owned solar developer Solar Bear LLC and MIGIZI, a non-profit organization providing career pathways for Native youth, to support a 25-kW solar array on MIGIZI's new building through the Solar*Rewards program for Income-Qualified Nonprofit Entity Systems.[24]
- As noted in section V.C.2, the Company is collaborating with the Indian Land Tenure Foundation to support an improved forest management carbon offset project on the Bois Forte Band of Chippewa reservation in northern Minnesota. The project, part of the Company's strategy to achieve net zero greenhouse gas emissions from natural gas, supports the Tribe's efforts to repurchase and responsibly manage forest lands that were lost to non-Indian ownership in the Allotment Era of the late 1800s and early 1900s. In late 2022 the Company made an initial, voluntary purchase from the project.[25] We have also included this project in our NGIA portfolio; pending Commission approval, we would purchase additional high-quality carbon offsets from the project in the coming years.
- The Company serves on the board of American Indian Opportunities Industrialization Center (AIOIC), a workforce development organization serving Native and BIPOC populations in the Twin Cities. We have collaborated with OIC on securing commercial driver's licenses for graduates of Xcel Energy's ECA, and sent Xcel Energy volunteers to speak with the OIC's Youth Employment Services program on careers in energy. We hope to develop additional energy workforce diversification projects with the OIC.
- The Minneapolis American Indian Center is one of three hosts for solar/battery microgrids that the Company is supporting through our RMP efforts as discussed in the RMP section above.
- During development of the Foxtail and Dakota Range Wind facilities, Xcel Energy voluntarily worked with Standing Rock Sioux (for Foxtail) and Sisseton Wahpeton Oyate (for Dakota Range) to conduct Tribal cultural surveys prior to final design of the facilities. We altered each site's layout to protect identified Tribal cultural resources and had Tribal monitors onsite during construction to

[24] See Minneapolis nonprofit rebuilds 'greener' after civil unrest | Finance & Commerce (finance-commerce.com).
[25] See xcelenergy.com/staticfiles/xe-responsive/Carbon_Offset_Pilot_Brochure.pdf.

facilitate management of incidental finds during construction. We worked with both Tribes' Tribal Historic Preservation Officers to ensure their newly documented resources were protected for the future via the State Historic Preservation Offices for the respective states. Neither project had a federal nexus that required formal consultation. Xcel Energy believes that protecting the cultural and archeological history of the Americas benefits all of our communities.

VI. OTHER EQUITY EFFORTS IN THE STATE IMPACTING THE COMPANY

A. MPCA Air Quality Permitting in Minnesota

The MPCA Air Quality permitting rules requires the consideration of EJ impacts for facilities located in EJ Areas. This process is undertaken by the MPCA for issuance of new, or re-issuance of or modifications to existing, air quality permits meeting the requirements. If, during the permitting process, the MPCA determines the facility is located in, or near, an EJ community the agency may reach out to impacted communities for input, or request outreach by the permittee, in this case Xcel Energy. In the existing process there are no mandatory actions the permittee must perform, only voluntary actions based on agency suggestions.

In addition, the MPCA is currently initiating a rulemaking as required under 2023 legislation,[26] addressing cumulative impacts in EJ Areas in the air quality permitting process. The MPCA has indicated that this rulemaking is expected to be a three-year process with proposed rules expected to be put on public notice in May 2026. Once rules are finalized, cumulative impacts will be taken into consideration in the air quality permitting process.

VII. CONCLUSION

The Company recognizes and embraces the need for equity across all our plans, dockets, and program offerings. We put a priority both on enhancing equitable outcomes and on broadening participation in energy decision-making. We have made notable progress in the last two years, but much work remains to be done. As noted in this appendix, we have implemented measures throughout the Company to enhance equity through community outreach efforts, the establishment of ESAG, our charitable contributions, workforce training programs, our Workforce Diversification

[26] Sec. 116.065 MN Statutes.

Plan (Appendix R1), various program offerings, ECO and NGIA plans, supplier diversity goals, and federal initiatives among others. We will continue to participate in this space and continue to advance equity in all that we do, consistent with the Company's core values.

APPENDIX R1 – WORKFORCE DIVERSIFICATION PLAN

I. XCEL ENERGY'S COMMITMENT TO DIVERSITY, EQUITY, AND INCLUSION

Xcel Energy aims to create an inclusive and equitable work culture where diversity is valued and celebrated, while taking the same approach to conducting business and serving communities. Because social sustainability is central to our business strategy, we are building a workforce that reflects the diversity within our communities. Our most successful ideas and outcomes result from collaboration between people with different experiences and perspectives. By viewing opportunities and challenges through multiple lenses, we are better able to leverage our strengths and achieve our strategic priorities.

The Xcel Energy Enterprise Diversity, Equity and Inclusion (DEI) goals were established as guidelines meant to guide and govern our efforts to introduce and maintain an equitable, inclusive and diverse perspective across all areas of our organization and processes.

Our enterprise DEI Goals are as follows:

- Talent: **Build and maintain a diverse workforce, talent pipeline** and leadership bench strength that reflects the communities and customers we serve.
- Community: **Enhance our community involvement and giving programs** to increase our support of organizations that advance DEI.
- Data Management: **Increase data utilization and transparency to better inform our internal programs, advance our DEI strategies while** increasing internal process consistency and accuracy.
- Supplier Diversity: **Establish targets to broaden our supplier diversity base**, encouraging businesses owned by women, veterans and ethnically diverse individuals to engage in our procurement processes. Our Supplier Diversity goals and actions are further articulated in Appendix R: Equity.
- Workplace Culture: **Create an environment where all employees feel safe, respected, have a sense of belonging, while being empowered** to do their best work.

II. INTERNAL EFFORTS TO SUPPORT STATED DIVERSITY GOALS

Our internal efforts towards advancing and increasing the diversity within our workforce align with a range of focus areas targeted to deliver results across different points through the employee lifecycle including development and retention, attraction and recruitment, and community engagement.

A. Workforce Development and Retention Programs

In alignment with our Talent goal, our focus expands diverse initiatives seeking to enable talent availability for specific underrepresented segments of our workforce. This is accomplished by developing and advancing internal talent with engagement and development programs seeking to create paths for advancement and development for our employees.

1. Executive Sponsorship Program

The goal of this program is to create opportunities for employee networking with executive sponsors that will allow for a more tailored development opportunity for participants, as well as to explore potential career paths throughout the Company. We utilize engagement in this program as a component of our DEI corporate scorecard along with other internal talent focused metrics.

This program promotes increased diversity in our employee base in various career paths throughout the Company and leadership ranks – an important link we have long needed to successfully build out our internal talent development pipeline. The bottom line is that diverse perspectives make us a stronger organization, and building a robust talent pipeline that reflects our communities will be a key to successfully reaching our corporate goals. As a result, the Executive Sponsorship Program has enabled numerous members of our enterprise to obtain and develop meaningful relationship opportunities with senior leaders across the organization. In 2024, we are seeking to introduce improvements to the program infrastructure in order to support a greater number of participants, and to introduce a mentorship program, that, in parallel, will support and funnel internal talent to help them advance proactively in their career.

2. Internal Scholarship Program

We employ undergraduate and graduate college students and law clerks as interns to help build a robust, diverse talent pipeline. We place high school students in positions

across our business areas through partnerships with school districts and community organizations such as Genesys Works, Cristo Rey Jesuit High School, and Girls Inc.

The students are offered the opportunity to apply for a scholarship they can utilize towards their higher education in colleges in the state of Minnesota.

In the last three years, we have awarded scholarships for BIPOC students in the state of Minnesota, selecting our recipients through our internship program (both college and high school) and the Energy Careers Academy. In 2020, we had a total of 7 recipients; increased to 16 recipients in 2021, 10 recipients in 2022 and a total of 19 recipients in 2023. The scholarship values range from $2,500 to $5,000 depending on financial needs and student-provided evidence through the application process. A board of volunteers from internal employees and other partner organizations review the applications and, led by the DEI representative, go through the exhaustive review to select the recipients.

3. Career Launch Program

Participants in Xcel Energy's Career Launch program join the Company as analysts to obtain hands-on experience towards a variety of career paths while also providing the tools to help navigate their futures at the Company. Analysts have the opportunity to select their rotations from more than 40 options that best align with their career goals. The program is designed to support the development of analysts to become strong, capable leaders with the skills and guidance necessary to jumpstart a promising career trajectory with Xcel Energy upon successful completion. Candidates are recruited from a diverse set of perspectives, backgrounds, education, and experiences to strengthen our Company's team working together to lead the clean energy transition.

4. Business Resource Groups

Change happens when people connect in new ways. In the early 2000's, we launched Business Resource Groups (BRG's) to create new avenues for development, recruitment, retention, and advancement and help to reach a broader candidate pool through BRG external offerings. Thirteen BRG's have been established to bring employees together to support common interests and to share perspectives.

Xcel Energy's BRG's are among the Company's strongest examples of how our team members support one another. Many employees dedicate time outside of work hours to create a safe environment, through BRGs, where they can exchange ideas, pursue common interests, seek equitable solutions to personal and professional challenges, and help communities succeed.

The Company's current Business Resource Groups are:

- **AAPI (Asian American and Pacific Islander Alliance)**: Encourages employees to bring their full identities to the workplace by educating the workforce regarding AAPI cultures and professional experiences, facilitating professional development and career growth, and creating a sense of unity between AAPI employees, allies and the community.
- **ABLE (Accessibility, Be an Ally, Lead, and Empower)**: Promotes accessibility and allyship, drives disability inclusion by leading at all organizational levels, and strives to empower self and others.
- **BLAX (Black Employees at Xcel Energy)**: Promotes career development, continued education, training and cultural awareness, and addresses the issues and concerns of people of color.
- **ECN (Employee Connection Network)**: Connects new and existing employees and broadens employee understanding of Xcel Energy through networking and community service opportunities.
- **GROW (Growth and Retention of Women)**: Identifies and implements innovative ideas and strategies for recruiting, developing, promoting and retaining women in non-traditional roles within the Energy Supply business area. Works with schools to increase girls' and women's awareness of such opportunities.
- **NAYGN (North American Young Generation in Nuclear)**: Provides opportunities to develop leadership and professional skills, create lifelong connections, engage and inform the public, and inspire today's nuclear technology professionals to meet the challenges of the 21st century.
- **Pride Alliance**: Advocates for the Company's leadership in diversity and inclusion by addressing issues related to sexual orientation and gender identity.
- **Tribal Wind**: Supports Native American employees through professional development resources, mentoring and networking. Strives to increase cultural understanding and awareness.
- **VETS (Veterans and Employees Together in Service)**: Sustains awareness on issues of interest to veterans and active military employees in our workforce and promotes programs and policies that support the welfare of veterans and their families.
- **WIN (Women's Interest Network)**: Strives to improve the lives of women and make Xcel Energy the workplace of choice for women. WIN programming focuses on professional development and work-life balance issues.

- **Xcelente**: Shares the Latino culture through awareness, inclusion and celebration; promotes the Company's image throughout the community; provides networking and mentoring opportunities.
- **XE WiN (Women in Nuclear)**: Explores and develops programs that help all employees working within our nuclear organization to expand their leadership skills, network and create positive visibility for the nuclear industry within the communities we serve.
- **YPN (Young Professionals Network)**: Provides a community where individuals at the start of their career can discuss career aspirations and challenges, share knowledge and ideas, and build meaningful relationships with co-workers with whom they may not normally interact.

5. Military and Veteran Outreach

We continue to build partnerships and support activities that maintain our visibility as a preferred employer for veterans and those currently serving in the National Guard or Reserves. Veterans made up 9 percent of our new hires in 2022. Xcel Energy attended more than 45 job fairs and events for veterans to seek out new hires and participated in the Department of Defense SkillBridge program and the Hiring our Heroes Corporate Fellowship Program. Approximately 10 percent of current employees are veterans. Many are actively involved in our VETS BRG, volunteer to help with recruitment, and mentor current veteran employees.

In 2023, Xcel Energy was again named a 5-Star Employer through the VETS Indexes Employer Awards that recognizes organizations that do the most to hire, retain, promote and support veterans. In 2022, we were recognized as a Military Times' Best for Vets employer for the eighth consecutive year, a Military Friendly Employer, a Disabled American Veterans (DAV) Patriot Employer, and we received the HIRE Vets Medallion Award for our exceptional commitment to hiring veterans.

6. Training and Employee Resources.

Leaders and employees are encouraged to increase their knowledge and awareness around DEI. The Company offers the following resources to support this:

- **Unconscious Bias and Microinequities Training**: All new hires receive training on how to avoid bias, and ongoing training is incorporated into all of our talent processes, including hiring, performance management, investment decisions and succession planning.

- **Leader Inclusion and Diversity Conversation Starter Guide**: We encourage employees to tackle tough issues and discuss timely events related to inclusion and diversity. The guide aids leaders in creating a safe environment and initiating those conversations.
- **Online Resources**: Our online DEI resource hub was created by employees to help increase awareness and provide help on different topics. Leaders are also provided with unique online resources designed to help them lead inclusively.

B. Attraction and Recruitment

We understand the need and critical role the development of a diverse talent pool plays when seeking to build a diverse workforce. We at Xcel Energy have a series of initiatives that are focused on supporting our progress towards enabling access to diverse talent to build a pathway reflective of the communities we serve:

1. Energy Careers Academy

To create a pipeline of trained candidates ready to fill job openings, Xcel Energy helped launch the Energy Careers Academy in fall 2022, along with the Minnesota State Community and Technical College and Minnesota State Energy Center of Excellence. The academy seeks to open doors to historically underserved populations and prepare them for a career field that offers stable, well-paying jobs. The program provides training in electrical linework and natural gas utility construction and service. Students receive hands-on instruction at Xcel Energy's training facilities and gain exposure to Company employees and leaders, including hiring managers. Energy-related educational programs are typically offered at technical schools in rural locations, but the Academy aims to enroll students in the Twin Cities area, helping remove a potential barrier for urban students. Minnesota State and Technical College is responsible for curriculum, accreditation, and instruction while the Minnesota State Energy Center of Excellence provides general program support and oversight. The three partners plan to increase program options including higher-credit diploma programs.

This program provides 9-month electrical line worker certification and 6-month gas utility construction/service worker accredited training to create a diverse pipeline for careers in these fields. The electrical line worker certificate program began in August 2022 and the gas worker training is expected to begin in 2024. The electrical line worker program is provided in Northeast Minneapolis. Gas worker training will be in Hugo, due to the specialized gas training facility there, but planning is underway to provide transportation if needed. Financial aid is available through Pell Grants and other scholarship opportunities. Students enrolled in the program also receive college and

career readiness training and follow-up services throughout the length of the program. Throughout the program, students will have regular interactions with recruiters and hiring leaders from Xcel Energy and other utilities. Prior to graduation, students will be made aware of various job openings with Xcel Energy and other utilities and supported throughout the application process.

Support provided for Energy Careers Academy students includes:

- Informational sessions with Minnesota utility providers looking to hire students into Line worker apprenticeship programs,
- Mock interview sessions and resume workshops led by the Xcel Energy Talent Acquisition team and Minnesota State Community and Technical College,
- Personnel resources to complete additional education requirement such as commercial driver's license (CDL) permit test preparation, and
- Partnering with local nonprofits to provide funding for students to complete the CDL licensing test.

In 2023, the Energy Careers Academy graduated 11 students and Xcel Energy offered post-graduation placement to 8 of those students. These graduates, all from diverse backgrounds, were placed within our Line worker apprenticeship programs with close support of our internal talent teams. We initiated our second cohort of students in August of 2023, with 50 percent of the 12 individuals being ethnically diverse, and the first female student.

With the incorporation of the ESAG input, our team will continue to assess and evaluate potential improvements to the program to ensure accessibility by all community members. Specific ideas received highlight the need to support St. Paul community members and their access to the training site in Minneapolis, and the benefit of creating additional partnerships with organizations that represent a certain subgroup within our community where access to the program may need additional support (i.e. DACA etc.).

2. Power Up Initiative

Xcel Energy is proud to sponsor the Power Up initiative, a workforce development program which helps prepare underrepresented populations for careers in the utility construction trades. Xcel Energy and the Minnesota Department of Employment and Economic Development (DEED) have partnered with seven different organizations - Avivo, Emerge, Building Strong Communities, Career Solutions, Native Sun Community Power Development, Summit Academy, and Central Minnesota Jobs and Training, to bring two cohorts of 80 people through this workforce development program.

The program focuses on preparing enrollees for unique and challenging careers by teaching them skills such as interview techniques, resume writing, and professional presence as well as introductory tours of different jobsites. The program also allows enrollees to experience a "day in the life" of personnel in the energy construction trades.

The program is currently in its first phase of deployment. The first cohort is demographically diverse and includes women, people of color, indigenous people, and people with disabilities all from differing economic backgrounds. Once completed, these individuals will be well prepared to pursue careers in the energy construction trades. The main target of this program is consistent with our efforts of pipeline diversification and enabling access for our communities to career pathways within the utility industry.

All resources and details of the program are publicly available in the official website: Xcel Energy Power Up Program / Minnesota Department of Employment and Economic Development (mn.gov).

3. College and Highschool Internships

In partnership with the City of Minneapolis, Xcel Energy was one of the founding organizations offering high school students from the cities access to internship positions that allow them to experience valuable workplace exposure that ultimately enables potential access to a diverse range of career paths.

This High School internship program targets students in diverse communities that also meet income requirements to participate. Students are allowed to select internship opportunities and go through the interview process with their potential employer. Students must be 16 years of age and older to participate in the program. Current partners for funneling our internship pipeline are: Step Up (Minneapolis, MN), Right Track (St. Paul), Denver Public Schools (Denver, CO), Summer Earn and Learn (Amarillo, TX), Cristo Rey Jesuit High School (Minneapolis, MN), and Wisconsin Youth Apprenticeships (Eau Claire, WI).

For the last three years, our internship program has provided relevant opportunities for students from the cities of Minneapolis and St Paul. Table R1-1 below showcases the metrics of the breakdown of our students:

Table R1-1: Internship Metrics

Conversion from Intern to Full-time Employee	2020	2021	2022
	27	35	48

Intern Hires - Gender Diversity	2020	2021	2022
Female	25.9%	48.6%	33.3%
Male	74.1%	51.4%	66.7%

Intern Hires - Ethnic Diversity	2020	2021	2022
Minority	37.0%	40.0%	39.6%
Non-Minority	63.0%	60.0%	60.4%

4. Career Fairs and Partnerships with Diverse Professional Organizations

We understand the need for diverse talent across all areas and functions of our organization, and because of that we aim to strategically identify opportunities to partner with organizations leading the charge at enabling access to these talent pools. Some of these partners are:

- National and Regional Partners:
  - People of Color Career Fair,
  - National Black MBA National Conference,
  - National Society of Black Engineers National Conference
  - Society of Women Engineers National Conference
  - Sabathani Community Center Career Resource Fair
  - Genesys Works Career Fair
  - MN Center for Energy & Environment Quarterly Recruitment/info sessions
  - St. Paul Area Chamber Career Connect Day

- College Chapter Partnerships:
  - Society of Hispanic Professional Engineers
    - University of Minnesota Twin Cities
    - University of Denver
    - Colorado School of Mines
    - University of Wisconsin Madison
    - University of St. Thomas
    - West Texas A&M
  - National Society of Black Engineers Chapter Partnerships

- University of Minnesota Twin Cities
- University of Minnesota Duluth
- University of Denver

As we initiate the new year and identify the key priorities for 2024, our team will be exploring deepening these partnerships and leveraging synergies with our BRGs, community-based organizations and talent partners to enhance and diversify the talent pool across all levels of the organization.

C. Community Engagement and Advancement

We recognize the importance of accessing talent and building the talent pool as early as possible. To this end, we work consistently with Community Based Organizations (CBOs) to partner and find ways to work with students at different points of their journey in order to provide early exposure and access to career paths in energy. We participate in the following outreach efforts.

1. Edina Career Tech Ed Community Advisory Board

Edina Public Schools developed a Design Team to look at how grades 6-12 Edina Public Schools courses could be aligned to create a pathway leading to a micro-credential, certification, internship, apprenticeship, or higher level of education study. This group of community partners and local businesses meets on a quarterly basis to discuss the work of subcommittees focused on enhancing Career and Technical Education programming in Edina Public Schools.

2. Metro State Class 310

Xcel Energy was the featured employer for Metro State Class 310 in 2021. This class is designed to give diverse students the opportunity to engage with a Twin Cities business over the course of the semester. Students are introduced to human resource leaders, connect with BRG members for a culture day, and participate in a mock interview event. Students will usually participate in a tour of the business but did not participate in 2021 because of Covid restrictions.

3. Careers in Energy Week

The Company invites students from Minneapolis Public Schools and surrounding districts to participate in Careers in Energy Week which includes plant tours, career panels and access to the Careers in Energy trailer.

For 2023, Careers in Energy Week was celebrated from October 16-20. The celebration was proclaimed by the Governor of Minnesota, Tim Walz. Throughout the week, utility companies within the state of Minnesota visited the communities they serve to highlight and promote energy careers. Xcel Energy had the opportunity to host the following events:

- Oct. 16: A staff engineer representative from Xcel Energy's Renewable Energy department went to Mahtomedi Middle School to speak about Renewable Energy, and how it pertained to their Electrically Powered City Project.
- Oct. 17: Xcel Energy attended the St. Paul Area Chamber's Career Connect Day. The Career Connect Day was an opportunity for St. Paul youth to explore various careers in several different sectors. Xcel Energy's main promotion was Energy Careers Academy (ECA). Xcel Energy brought several graduates from ECA, as well as members of the Talent Acquisition and Inclusion and Diversity teams to the event.
- Oct. 20: Xcel Energy hosted a teacher externship at the High Bridge facility in St. Paul. Teachers from various areas of the Minnesota metro area attended to learn about various offerings and opportunities Xcel Energy offers for youth, as well as creating pipelines with schools for further collaboration.

4. Pro Bono Program

As they focus on fulfilling their missions, nonprofit organizations may not have the staff or resources to improve their business operations or advance new initiatives. Xcel Energy employees' personal knowledge and expertise can be a powerful force for change to help nonprofit organizations achieve their goals and make a deeper impact. That's the premise of Xcel Energy's Pro Bono Skills-Based Volunteer Program. This growing program offers our employees the opportunity to help these organizations and share their talents, grow as leaders and build relationships with their colleagues.

In 2022, 18 employees contributed consulting services in marketing, technology, legal, finance and human resources, volunteering more than 590 hours at three nonprofits and delivering a value of nearly $116,000 through the program. The volunteer effort, which began in 2020, provides a way for employees to contribute their skills through pro bono consulting services to nonprofits serving underrepresented groups in the Twin Cities. Most of the work is virtual, involving three to six hours a week. Because of its success, the program was expanded in 2023 to our corporate offices located in Colorado, North Dakota, South Dakota, Texas and Wisconsin.

5. American Association of Blacks in Energy Minnesota

Xcel Energy was instrumental in creating the newest chapter of the American Association of Blacks in Energy (AABE) in 2022. Its mission supports African American community job training and placement, supplier diversity, legislative change and scholarships. AABE encourages industry and community leaders to collaborate and ensure that all stakeholders have a seat at the table in Minnesota. Xcel Energy employees have been instrumental in volunteering their time to assist with event planning, maintaining the chapter's social media pages and the coordination of chapter meetings as well as taking on various leadership roles.

In the Fall of 2023, Xcel Energy employees assisted in the planning and execution of AABE Minnesota's first inaugural golf tournament to raise college scholarship funds for BIPOC students participating in STEM programs and graduating in 2024. As we enter 2024, we will incorporate AABE into our strategic partners that will contribute to build a diverse pipeline for talent at all levels of the organization.

D. Strategic Partnership: Center of Energy Workforce Development

The Center for Energy Workforce Development (CEWD) is a non-profit consortium of energy companies, contractors, associations, unions, educators, and business partners working together to ensure a skilled, diverse workforce pipeline to meet future industry needs. CEWD's coordinated approach to workforce development has united electric, natural gas, and nuclear firms since 2006. In 2021, in response to the need for expanded collaboration, they expanded their umbrella to include the workforce development needs of those working in the fields of renewables, electric vehicle infrastructure, and energy storage.

CEWD represents more than 140 energy companies. Additionally, they have established partnerships with, and support from, the American Gas Association, American Public Gas Association, American Public Power Association, Distribution Contractors Association, Edison Electric Institute, Electric Power Research Institute, National Rural Electric Cooperative Association, and Nuclear Energy Institute.

Xcel Energy is one of several energy companies that are part of the Minnesota Energy Consortia. Through this partnership, we have helped enable programs focused on building diversity within the Energy Careers pipeline for the state. In partnership and collaboration with CEWD, we have also helped create the DEI Roadmap for Industry Change[1] as a resource and tool for the energy industry professionals and organizations,

[1] CEWD_DEI-Report-View-Printable.pdf).

seeking to create an equitable, more diverse and inclusive workforce that can help address the needs of the future. This tool focuses on offering details on current industry trends but also actionable steps for organizations in different focus areas:

- To Ensure More Diverse, Equitable, and Inclusive Energy Workplaces
- To Increase Diversity in the Energy Workforce
- To Develop a Diverse Talent Pool
- To Retain Diverse Talent in the Energy Workforce
- To Expand Diversity in C-Suite Roles

In addition, several resources are available to provide guidance and additional information on the work with CEWD Minnesota Consortia:

- The Minnesota Consortia Website: Minnesota | CEWD
- The DEI Roadmap for Change: DE&I Roadmap for Change | CEWD
- Energy Careers pathway and resources: Home - Get Into Energy

In 2024, our team will continue to strengthen the relationship with CEWD and the Minnesota Consortia seeking to drive greater impact by leveraging internal efforts and the established DEI Roadmap for change, alongside other local industry partners.

III. CREATING SUSTAINABILITY FOR INTERNAL DIVERSIFICATION EFFORTS

A. One Xcel Energy Way: DEI Rally Room

Xcel Energy has incorporated a new internal process to drive operational excellence focused on identifying requirements to help achieve desired performance for a specific function. As part of the internal implementation aligned to our workforce development efforts, the organization officially kicked off a designated DEI Rally Room.

A Rally Room is a command center that brings leaders and teams together (cross-functional as required) to rally and manage around a key objective and theme (corporate priorities). Ultimately, the teams visualize what work is needed, establish responsibilities, support each other, and deliver to achieve the desired results. This effort is designed to be highly visual, focusing on clearly displaying information on how we are addressing a specific priority, including problem definitions, what "good" looks like, goals, key metrics, performance trends, specific problem areas, action items and current status. In summary, collaboration, planning, visual management, operating

reviews, problem solving and defining standards for sustainability are paramount aspects of the Rally Room.

1. Goals of the Diversity, Equity, and Inclusion Rally Room

In 2023, the Company identified and established a set of opportunities which then translated into work packages to allow for the introduction of improvements, new processes and positive changes seeking to create a sustainable infrastructure for the existing and potential new talent programs at Xcel Energy.

The first six months of the project allowed us to deliver the following accomplishments:

- Problem definition and identification.
- Focus groups and internal data analysis with employees and BRGs.
- Engagement of leaders and business units to drive alignment.
- Prioritization of focus areas and initiatives for 2024 tactical implementation plan.
- Connection point with the Equity Stakeholder Advisory Group to receive and incorporate feedback as part of the analysis phase.

The overall focus areas of the Rally Room aligned with specific tactical implementation plans are:

- Attraction and Recruitment: Focus on improving the employee attraction and recruitment experience by improving the key elements that inform and shape the strategy of these activities within the talent organization.
- Retention and Development: Improve existing programs and introduce new strategies focused on increasing employee satisfaction scores, and overall education towards building a culture of inclusion.
- Inclusion and Belonging: Improve employee sentiment associated with these Inclusion index components that have been consistently in a downward trend for the last three years.
- Operations and Field Employees: Improve overall employee experience focusing on main detractors based on employee feedback and existing internal data trends.
- Culture and wellbeing for employees: Improvement of overall employee experience and connection to our collective culture.
- Middle Management and Business Leaders: Focus on education, development, and support of leaders impacting our employee experience and overall enterprise culture.

B. Current State and Measuring Progress

At Xcel Energy, our focus towards advancing talent and supporting the communities that we serve has become an internal imperative with accountability that we are seeking to advance and mature. We recognize our opportunities to continue effectively diversifying and building a diverse workforce inclusive of all members of our communities, and with the Rally Room project we are actively focusing on making progress.

In alignment with this effort, we are utilizing internal existing data points to evaluate potential solutions to advance and ensure progress is not only reported but measured. Through different channels, we publicly share our workforce demographics data to ensure alignment and foster conversations that can drive advancement with both internal and external partners. As shown in the table below, our reporting for internal demographics includes both gender and ethnicity, which allows for further assessment of opportunities and pathways for recruitment and retention:

Table R1-2: Xcel Energy Minnesota Internal Workforce Demographics[2]

	Female	Minority	Black	Hispanic	Asian	Native Hawaiian/ Pac Islander	American Indian/ Alaska Native	Two or More
Minnesota Workforce Demographics	21.39%	9.87%	2.80%	2.39%	2.87%	0.04%	0.35%	1.41%

- Workforce Representation Data: 2022 Sustainability Report – Diversity_Equity_Inclusion_SR.pdf (xcelenergy.com)
- Workforce Representation Data: EEO1 annual report - EEO-1-Employer-Information-Report.pdf (xcelenergy.com)
- Additional Data summary: Sustainability Report Data - Sustainability_Data_Summary_SR.pdf (xcelenergy.com)
- Additional Workforce data: Global Reporting Standards Content Index - GENERAL STANDARD DISCLOSURES (xcelenergy.com)

We constantly evaluate and assess the internal representation and diversity data, with the goal of measuring progress as well as utilizing additional leading indicators that can

[2] As of 12/31/2023.

help us evaluate potential trends and points of advancement. Based on the existing market availability from the most recent census, or the estimated amount of people available and aligned with our internal job codes, and current data points, we focus on finding strategic ways to partner and develop access points for talent that can contribute to a healthy and diverse expansion of our talent pool.

The Rally Room initiative and its focus on data driven processes with One Xcel Energy Way, as well as measurement of key performance indicators to track progress, have introduced a new way for our organization to define and track our goals with a focus on periodically measuring the indicators that can support our progress. Some of these indicators are:

- Recruitment metrics (talent pipeline metrics, recruitment event driven metrics, candidates' metrics).
- Retention metrics (internal talent mobility and advancement, BRG engagement and participation, volunteering metrics).
- Employee engagement and participation (twice a year employee survey focused on employee satisfaction and belonging).

With the intention of driving progress on these metrics, the upcoming year for the Rally Room will include the tactical implementation of initiatives aligned with the identified work packages, the internal reporting and assessment of metrics for these initiatives, as well as consistent points of evaluation throughout the year to assess progress.

APPENDIX S – STAKEHOLDER ENGAGEMENT SUMMARY

I. INTRODUCTION

In preparation for the development of this Integrated Resource Plan (IRP), numerous stakeholder outreach efforts were made as required from the Commission's last IRP Order.[1] We appreciated the opportunity to host multiple informational and technical workshops and to connect with our stakeholders. The workshops offered provided stakeholders with details about the Company's IRP process, allowed us to obtain stakeholder feedback and input, and respond to stakeholder questions. We appreciated our stakeholders' participation in the various workshop offerings, as well as their questions, feedback and input, which were taken into consideration in this IRP and will be taken into consideration in development of future IRPs. In addition to workshops specific to IRP planning, additional outreach efforts were made regarding remediation efforts at the Allen S. King Generating Plant (A.S. King) and the Sherburne County Generating Plant (Sherco); equity efforts through the formation of our Equity Stakeholder Advisory Group (ESAG); with the Prairie Island Nuclear Generating Plant (Prairie Island) community; with the Clean Energy Organizations (CEO's) regarding legislated community solar garden mandates and how the new 3 percent legislation dovetails with those mandates. The Company is committed to engaging all interested stakeholders and the general public in the development of our IRP.

Stakeholder workshops pertaining to the IRP itself were offered to address multiple IRP Order Points.[2] In addition, quarterly stakeholder outreach meetings were held with the A.S. King and the Sherco communities as required by Order Points 20 and 21. Details of these meetings are included in Appendices Q and R. Outreach to the Prairie Island stakeholders was conducted as required by Order Point 22 and is detailed in Appendix M: Nuclear. Order Point 25 required the Company to establish a stakeholder group to address equity efforts including the establishment of an environmental justice accountability board. The results of these efforts are detailed in Appendix R: Equity.

We discuss here our IRP stakeholder engagement efforts associated with the Order Points, input received from stakeholders during those efforts, and how the Company has incorporated or addressed the input received, as appropriate.

The Company agrees that stakeholder engagement can help generate new ideas and enhance collaboration around our integrated resource plans. The stakeholder discussions we have facilitated have been useful for the Company to gain a better,

[1] Docket No. E002/RP-19-368 (hereafter, 2019 IRP).
[2] 2019 IRP at Order Points 10, 12, 14, and 15.

more holistic understanding of different stakeholder priorities and policy drivers that we can consider in our system resource planning. We appreciate our stakeholders' participation in these workshops.

In the remainder of this section, we provide:

- Workshop series overview
- Workshop summaries and IRP/Integrated Distribution Plan (IDP) workshop Survey Results
- Additional Outreach Efforts.

II. WORKSHOP SERIES OVERVIEW

The Commission's IRP Orders required the Company to conduct outreach efforts on storage options, including solar generation and battery storage; the role of hydrogen and clean fuel alternatives including full supply-chain and life-cycle carbon impacts; development of a modeling construct for solar-powered generations connected to the company's distribution grid; and regarding forecasting of electric adoption rates.[3] Based on the amount of material we wanted to share with stakeholders, the Company held five workshops, which included presentations from the Company's staff, questions and input from attendees, and time for open discussion. The series of workshops was held beginning September 2022 and ran through August 2023, with workshops being held virtually, in-person, or as hybrid meetings. Additional meetings, outside of the workshop series, were held regarding the development of a modeling construct and solar bundles. A separate RFP 101 Workshop, not required by Orders, was held on our Request for Proposal (RFP) process. These meetings are summarized below.

The overall duration of all the IRP workshops combined was more than 16.5 hours. We recognize that this was a significant amount of time for stakeholders, and we appreciate their time participating and input. Table S-1 includes a matrix of the IRP Order Points requiring stakeholder outreach and the corresponding workshops held. Table S-2 includes a listing of additional outreach conducted.

[3] IRP Orders at Order Points 10, 12, and 15.

Table S-1
IRP Order Points and Workshops Held

Order Point	Addressed in Workshop
IRP Overview (directed by IDP Order Point 6.1)	IRP/IDP 101 Workshop: September 26 and 27, 2022
IRP Order Point 9.d: Improve non-wires alternatives analysis, including market solicitations for deferral opportunities to make sure Xcel can take advantage of distributed energy resources to address discrete distribution system costs.	Planning the Grid of the Future Part 2 Workshop: June 12, 2023
IRP Order Point 10: In its next resource plan Xcel shall, either through its Integrated Distribution System Plan proceedings or through another stakeholder process, develop and/or improve its forecasts of the adoption rate for the following technologies, to be used in Xcel's base case scenario and its overall demand forecast.	
(A) Adoption of light-, medium-, and heavy-duty electric vehicles	Forecasting: Electrification and DER Workshop: February 13, 2023
(B) Adoption of electric space heating.	Forecasting: Electrification and DER Workshop: February 13, 2023
(C) Adoption of electric water heating.	Forecasting: Electrification and DER Workshop: February 13, 2023
(D) Electrification of other end uses.	Forecasting: Electrification and DER Workshop: February 13, 2023
(E) Increased potential for demand response and load flexibility from an increase in electrification of the technologies in A-D.	Resource Modeling Workshop: August 8, 2023
(F) Adoption of solar-powered generators- including generators sited by customers, community solar gardens organized under Minn. Stat §216B.1641, and generators that are neither sited by customers nor related to community solar gardens.	Resource Modeling Workshop: August 8, 2023
IRP Order Point 12: Xcel shall include in its next resource plan a deeper analysis of:	
(1) storage options, including options combining solar generation and battery storage and	Resource Modeling Workshop: August 8, 2023
(2) the role of hydrogen and clean fuel alternatives in Xcel's resource mix. In preparation, Xcel shall work with stakeholders to develop a fair basis for comparing the full supply-chain and life-cycle carbon impacts of the generation and storage resource options under consideration to help the Commission evaluate the "adverse socioeconomic effects and adverse effects upon the environment" of each option, pursuant to Minn. R. 7843.0500, subp. 3.C.	Policy, Planning and Technology Workshop: November 15, 2022 Resource Modeling Workshop: August 8, 2023
IRP Order Point 15: Xcel shall work with stakeholders to develop a modeling construct that enables Xcel, as part of its next resource plan, to model solar-powered generators connected to the company's distribution grid as a resource. Xcel and stakeholders shall address the following factors in developing the modeling construct:	
A. Using a "bundled" approach as is used to model energy efficiency and demand response.	Resource Modeling Workshop: August 8, 2023
B. The costs borne by the utility and the costs borne by the customer.	Resource Modeling Workshop: August 8, 2023
C. Cost effectiveness tests.	Resource Modeling Workshop: August 8, 2023
IRP Order Point 16: In its next resource plan, Xcel shall account for local clean energy goals, in aggregate, in forecasting and modeling. In particular, the plan should include consideration of local community generation goals for distributed generation.	Policy, Planning and Technology Workshop: November 15, 2022 Resource Modeling Workshop: August 8, 2023

Table S-2
Additional IRP Stakeholder Outreach Efforts

IRP Order Point 15: Xcel shall work with stakeholders to develop a modeling construct that enables Xcel, as part of its next resource plan, to model solar-powered generators connected to the company's distribution grid as a resource.	Meetings held with Clean Energy Organizations: July 20, 2023 October 24, 2023
IRP RFP 101	October 12, 2023
Modeling Assumptions Discussion	Department of Commerce: October 2, 2023 Public Utility Commission Staff: October 9, 2023

To better accommodate stakeholders' schedules and increase participation rates, a survey was sent to stakeholders to solicit information pertaining to their preferred meeting format. Responses indicated that 66 percent of stakeholders preferred meetings held virtually, yet 66 percent also indicated that meetings held in-person were more effective. A variety of meeting workshop options were held over the series, with all in-person workshops later in the series being offered as hybrid workshops.

Invitations were filed in Docket No. E002/RP-19-368 and emailed to those who have requested to be on our "Interested Parties List." As discussed below, four workshops covered topics related to both the IRP and the IDP.[4] At every workshop, we referenced the "Interested Parties List" and provided direction on how stakeholders could be added to the list. Approximately 500 stakeholders on our Interested Parties List received email invitations for each workshop. Based on the number of direct e-mail invitations alone, which does not include attendees that may have been alerted to the workshop via docket submissions, participation rates ranged from five percent to 11 percent, or approximately 25-55 participants. Participants could submit questions during the registration process and were also provided ample opportunity to ask questions and provide feedback and input during each workshop. Consistent with the Commission's July 23, 2020 Order in Docket No. E002/M-19-666, workshops were open to any interested person.[5] We filed the Company's presentation in Docket No. E002/RP-19-368 after each workshop.

Conservatively speaking, we estimate that the Company's employees dedicated over 700 labor hours to the development and delivery of these workshops. We recognize the benefit and the importance of connecting with our stakeholders and receiving their input and feedback on our planning processes. The in-person and virtual workshops each held their own benefits. The in-person workshops allowed the Company to

[4] Docket No. E002/M-23-452 (hereafter, 2023 IDP). IDP workshop materials and summaries were filed in the 2021 IDP docket (Docket No. E002/M-21-694).
[5] Order Point 5 states, "Xcel must allow any interested person to participate in stakeholder engagement meetings regarding its IDP and HCA."

connect one-on-one with our stakeholders, while the virtual sessions provided participants easier access to the workshops and minimized travel requirements.

The workshop series began with a general overview on the IRP process, and each following workshop became more detailed and technical in nature. We found that once the information became more specific, the number of stakeholders attending each consecutive workshop decreased, but the feedback we received and questions that were asked also became more specific.

After the completion of the workshop series, we conducted a survey of the stakeholders that attended any of the IDP or IRP workshops to obtain their feedback on the workshop series structure, content, and the IDP/IRP stakeholder process. The results of that survey are included below.

III. WORKSHOP SUMMARIES

In this section, we provide a summary of each stakeholder workshop. For each workshop summary in this section, we provide:

- Workshop logistics.
- Approximate number of external stakeholders in attendance.
- IRP Order Points covered[6] as well as IDP Order Points covered where appropriate.
- An overview of the workshop content and presentations. We note that each workshop presentation was filed in the instant docket.
- A discussion of stakeholder questions/input received and how we are considering or have incorporated input.

A. Workshop 1: IDP/IRP 101

- **Logistics**: Virtual: September 26, 2022 and In-Person: September 27, 2022
- **Attendance**: 54 total participants – 49 virtual; 5 in-person
- **IDP Order Point**: *6.a – Integrated Distribution Planning 101*

1. Workshop 1 Overview

This workshop was held in response to IDP Orders. A summary is included here in that it provided a general overview of both the IRP and IDP planning processes. To be

[6] Order Points listed come from the April 15, 2022 Order unless otherwise noted.

inclusive and reach a broader audience, this workshop was held twice – once virtually during business hours and again, in-person during the evening at the Wilder Foundation located in St. Paul. Both workshops used the same presentation. Forty-nine stakeholders participated virtually, and five attended the in-person workshop.

The intent of this workshop was to share information about Xcel Energy's IRP and IDP processes and to receive input from the general public. The workshop included a high-level overview of both the IRP and IDP, a summary of the regulatory processes for each, the Company's internal planning processes for each, and where alignment and/or differences exist between the two plans.

The presentation began with an overview of the Company's service territory; customers; priorities; and our clean energy goals. This was followed by an overview of the IRP process, which included a discussion of statutory requirements and the internal and external processes involved. It was conveyed that the intent of the IRP process is to identify the best set of resources to meet customer needs, which requires a balancing of four core objectives: reliability, cost, environmental considerations, and risk. This was followed with a high-level overview of the IRP modeling process, including an overview of the EnCompass Power Planning Software utilized.

The IRP discussion was followed by an overview of the IDP process. This included a discussion on the objectives and filing process; an overview of the transmission and distribution systems; the internal planning process, inclusive of how the load forecast is developed; risk analysis that is conducted on the distribution system using the forecast; and mitigation plan development, non-wires alternatives (NWA) analysis, and project prioritization in the budgeting process.

The presentation also discussed how the IDP and IRP planning processes interact and their respective timelines.

2. Workshop 1 Stakeholder Questions and Input

- Several clarifying questions were asked by participants.
- We received input regarding integration of the IRP and IDP, encouraging the optimization of investments across the two plans rather than independently. This feedback aligns with stakeholder input in our most recent IRP and IDP dockets, and with the Commission's most recent IRP and IDP Orders, which require the Company to "take steps to better align distribution and resource planning."[7]

[7] *See* April 15, 2022 Order in Docket No. E002/RP-19-368 (IRP Order), at Order Point 9.

We agree that integrated planning is increasingly important. At the workshop, we explained that the different scales, timelines, and cadences of the planning processes present some challenges to full alignment. However, we are continually seeking to improve alignment and have addressed this topic further in Appendix L: System Planning Integration of this IRP and our 2023 IDP filing.[8] We were able to align several of the forecast vintages between this IRP and our 2023 IDP filing; however, as noted in Table L-1: Forecast Vintage Comparison in Appendix L, some updates were made to those vintages, as new information was available.

B. Workshop 2: Policy, Planning, and Technology

- **Logistics**: Hybrid (In-Person and Via Conference Call): November 15, 2022
- **Attendance**: Approximately 50 total participants – 30-40 virtual; 14 in-person
- **IRP Order Point**: 12.2 *Xcel shall include in its next resource plan a deeper analysis of the role of hydrogen and clean fuel alternative in Xcel's resource mix. In preparation, Xcel shall work with stakeholders to develop a fair basis for comparing the full supply-chain and life-cycle carbon impacts of the generation and storage resource adverse effects upon the environment.*
- **IRP Order Point: 16**-*In its next resource plan, Xcel shall account for local clean energy goals, in aggregate, in forecasting and modeling. In particular, the plan should include consideration of local community generation goals for distributed generation.*

This workshop addressed requirements from the Commission's IDP Order Point.[9]

1. Workshop 2 Overview

In order to encourage interaction and dialogue, this meeting was held in-person with a call-in number provided. Fourteen stakeholders attended in person, with approximately 30 to 40 stakeholders attending virtually. The presentation was subsequently filed in the instant docket.

The intention of the workshop was to share information about: federal, state, and local policies, goals and regulations; Xcel Energy's corporate goals and technological advancements; and to discuss how they will impact Xcel Energy's resource planning and distribution planning processes. In addition, we sought to obtain input from stakeholders on how they thought we should incorporate these policies, goals, and regulations.

[8] Docket No. E002/M-23-452. *See* Appendix A1.
[9] IDP Order at Order Point 6.

The workshop presentation reviewed our key inputs to our planning process: Xcel Energy's goals; policies and regulations including an overview of the Good Neighbor Rule, the Inflation Reduction Act (IRA), the Infrastructure Investment and Jobs Act (IIJA), the Energy Conservation and Optimization Act (ECO), and the Natural Gas Innovation Act (NGIA); community clean energy goals; Xcel Energy's Equity Stakeholder Advisory Group (ESAG); lifecycle greenhouse gas emissions considerations; advanced grid technologies; and new generation and storage resource options.

2. Workshop 2 Stakeholder Questions and Input

- Several clarifying questions were asked by participants.
- We specifically requested participants to submit ideas for alternate lifecycle carbon emission assessments for us to consider in relation to Order Point 12 of the IRP Order. No suggestions have been received to date.
- We were asked how we plan to incorporate local clean energy goals into IDP forecasting. We indicated that a survey had been sent to communities asking for information pertaining to their clean energy goals. The information will be used in our planning.
- We were also asked if there is a back-up plan in case new technologies do not materialize. We responded that this is precisely why we look at a wide variety of resource options and that there is sufficient time in the planning horizon to pivot if a new technology does not materialize as originally intended.
- We were asked if we were considering new nuclear generation. We responded that we are investigating new nuclear technologies and their costs and benefits to the system, but that there is currently a moratorium on new nuclear in Minnesota.
- We were encouraged to evaluate a higher penetration rate of demand side management, and we indicated that we would look at it in the 2024 IRP along with the impacts of advanced rate making. These evaluations have been addressed in Appendix J: Distributed Energy Resources.

C. Workshop 3: Forecasting: Electrification and Distributed Energy Resources

- **Logistics**: Virtual: February 13, 2023
- **Attendance**: 46 total participants
- **IRP Order Point**: 10.(a)-(d)- *In its next resource plan Xcel shall, either through its Integrated Distribution System Plan proceedings or through another stakeholder process, develop and/or improve its forecasts of the adoption rate for the following technologies, to be used in Xcel's base case scenario and its overall demand forecast.*

A. Adoption of light-, medium-, and heavy-duty electric vehicles.
B. Adoption of electric space heating
C. Adoption of electric water heating.
D. Electrification of other end uses.

This workshop also addressed requirements of our Integrated Distribution Plan Order Point.[10]

1. Workshop 3 Overview

The intent of the workshop was to share information with our stakeholders regarding the forecast processes relied on in the IRP and IDP and to receive their feedback. We discussed:

- The forecasting process in general;
- Detailed information on our forecasting methodologies for electric vehicles (EV), solar photovoltaics (PV), demand response (DR) and load flexibility, beneficial electrification, and energy efficiency; and
- The timing of the various forecasts and how they impact both the IRP and IDP process and consistency between the plans.

The workshop presentation provided specific information on our load and demand forecasts; discussed forecast methodologies and assumptions for technologies including EVs, distributed solar, end-use/building electrification, and batteries; as well as DR and energy efficiency. We also discussed how these forecasts are utilized in both the resource planning and distribution planning processes. This workshop provided ample opportunity for participants to ask questions and to provide feedback on the forecast process utilized in the Company's IRP and IDP process.

2. Workshop 3 Stakeholder Questions and Input

- Several clarifying questions were received from stakeholders.
- We were asked if we are considering dynamic pricing to encourage DR. We indicated that we have on-going dynamic pricing pilots, but that dynamic pricing has not been incorporated into the current forecast. If dynamic pricing is approved, it will be incorporated into the forecast.
- A stakeholder inquired if we consider climate change impacts on weather in the forecasting process. We indicated that while we are not specifically doing this to date, we rely on historical weather normal averages. As the weather changes, it

[10] IDP Order, at Order Point 6.

will be reflected in the forecast going forward. We noted we are also concerned about trying to predict impacts of global climate change on weather and are evaluating ways to incorporate those impacts into the forecast.

- Regarding EV forecasting, we were asked if we conducted a very high EV adoption scenario that surpasses 20 percent by 2030. We explained that we have not conducted this scenario, as it would require every new vehicle purchase in Minnesota to be an EV, taking into consideration the retirement rate of non-EVs. We will continue to monitor the total new vehicles trends.
- We were asked if we would consider the High Electrification Scenario to reflect the impacts of our current and future EV programs or if we see our programs receiving adoption rates somewhere between the Mid and High scenarios. We explained that the high adoption EV scenarios that we evaluate are more aspirational. While our programs encourage higher EV adoption levels, there are numerous external factors that impact whether the higher adoption scenario is realized. The most critical aspect is price parity of EVs with internal combustion engine vehicles. Our forecasting model incorporates price parity and historical adoption trends. Once actuals start to show this growth, the model will incorporate that change.
- We were asked if we have done any work on price sensitivity of EV demand, DR for EVs, and if there are any areas of study for the overlap of Time of Use (TOU) rates and DR. We were also asked if DR participation rates increase or decrease when the customer is on a TOU rate. We responded as follows:
    - Regarding DR, a finding that came out of the measurement and verification study indicates that there was not a change in usage. It was also noted that in the second year, TOU rate impacts tend to be concentrated to a small number of customers but for those customers, the impacts had a large effect.
    - Regarding EVs, we have been operating residential managed charging programs and pilots involving EV-specific TOU rates, and bill credit incentives to encourage EV charging to occur during off-peak system hours. Off-peak hours are from midnight to 6 am, Monday-Friday. We have seen significant sensitivity to on/off peak times, with roughly 90 percent of all charging activity from program and pilot participants taking place during off-peak hours.
- We received a suggestion that we present any building electrification scenarios in terms of the percentage of sector-specific end use that is served by electricity (e.g., 20 percent of residential space heating is electric by 2030). We are considering this feedback but note that building end-use electrification forecasting is still emerging.

- Stakeholders shared feedback on our distributed generation (DG) forecasts and how distribution system constraints are reflected in our forecasts. In response to participant questions on this topic, we indicated that our community solar garden (CSG) forecast is limited by available substation capacity, but our rooftop solar forecast is unconstrained. Stakeholders indicated a desire to see a forecasting scenario that accounts for interconnection constraints, and a scenario that assumes no constraints. In our 2023 IDP, partly in response to this feedback, we reflected the unconstrained scenario in all of our solar LoadSEER modeling because it provides a better indication of where system upgrades and investments may be required.

D. Workshop 4: Planning the Grid of the Future Part 2

- **Logistics**: Virtual: June, 12 2023
- **Attendance**: 26 total participants
- **IRP Order Point**: 9.d- *Xcel shall takes steps to better align distribution and resource planning including: improve non-wires alternatives analysis, including market solicitations for deferral opportunities to make sure Xcel can take advantage of distributed energy resources to address discrete distribution system costs.*

This workshop also addressed requirements from the Commission's IDP Order.[11]

1. Workshop 4 Overview

This was the second part of a two-part workshop, with the first part held on May 22, 2023. Part 1 addressed only IDP Order Points and thus is not summarized here. At this workshop, the Company covered grid investment plans, including synergies with hosting capacity, NWA analysis, and the use of weighted average cost of capital (WACC) versus societal discount rates.

The presentation started with an overview of 2023 legislation that impacts the IDP planning process, followed by a brief overview of the IDP planning process. Next, the Company reviewed the mitigation planning process, budgeting process and how projects are prioritized, EV grid investments, and hosting capacity investments. Lastly, we talked through the NWA screening analysis process inclusive of avoided revenue requirements (ARR), stacked values and WACC versus societal discount rates applied.

[11] IDP Order, at Order Points 3 and 6.

This workshop provided ample opportunity for participants to ask questions and to provide feedback to be considered in our plans. In an attempt to obtain more input from stakeholders, this workshop employed the use of Microsoft Teams Polls (Polls). During the workshop, we posed eight questions to participants and received response rates of four percent to 27 percent. Questions posed and responses received were posted to the docket along with the slide deck.

2. Workshop 4 Stakeholder Questions and Input

Stakeholder questions and discussion focused primarily on NWA analysis and DER hosting capacity, with a few additional questions surrounding our budgeting process and forecasting.

- Several clarifying questions were asked by participants.
- Regarding NWA analysis, a stakeholder asked if mandated projects could be considered for NWAs. We responded that this may be possible if a mandated project, in which we are required by a local jurisdiction to move our facilities, includes a capacity component. In our 2023 IDP, we discussed the types of projects that would lend themselves to non-traditional solutions.
- We were also asked if we would consider conducting NWA analysis for projects below the $2 million threshold set in the Commission's IDP Filing Requirements.[12] We indicated that we think $2 million remains an appropriate threshold.
- A stakeholder expressed surprise at the results of the NWA analysis conducted using the weighted average cost of capital (WACC) versus the societal discount rate but opined that the societal discount rate was most appropriate to capture the societal value of an NWA as opposed to building a large generation plant. We clarified that an NWA would not be offsetting a generation plant but would be an alternative to traditional poles and wires upgrades. The NWA analysis considers a wide variety of technology, in front of the meter and behind the meter.
- A stakeholder asked if we have thought about supply set-up for a solar plus storage owner and if we have thought about how NWA contracts will be structured to meet special needs. We indicated that we are evaluating how specific contracts could be structured.
- Regarding hosting capacity and DER, we were asked how important hosting capacity is for meeting local goals for electrification and local solar and if we

[12] See December 8, 2022 Order in Docket Nos. E002/M-21-694 and E002/M-17-897, Xcel Energy IDP Filing Requirement 3.E.1.

would consider adding the hosting capacity layer to the Service Reliability and Service Quality Map so that applicants can view relative hosting capacity by geography and census tract. We indicated that right now, this information is contained in two separate maps and that a side-by-side comparison can be conducted to obtain the desired information. However, we are considering combining this information into one map in the future.

- A question was posed if there are any areas that can be considered a priority area for where DERs could be sited with lower interconnection costs, which would guide the development of DERs. We explained that the hosting capacity map is the best tool to guide DER development; the green areas of the hosting capacity map will have comparatively lower interconnection upgrade costs.
- A stakeholder asked if we had considered dynamic curtailment as a way to address a limitation identified in an interconnection study. We indicated that this is also known as flexible interconnection, and it is something we are trying to study more as the data becomes available. We are currently involved in a study about this with the Electric Power Research Institute (EPRI). We were also asked if we can incorporate state and local goals around electrification. We indicated that we are required to consider local goals as part of the IRP, and this year, we sent a survey to community members asking them about their clean energy goals to ascertain that we will be able to help communities meet their goals. The survey is discussed in Appendix V: Community Goals and was also addressed in the 2023 IDP.
- We were asked to provide more detail in our upcoming filing on how the "as funds allow" portion of the budget is calculated, including an explanation regarding where that funding comes from. In the 2023 IDP filing, we discussed how our budgets are developed each year using a "bottoms-up" approach.

Lastly, we were asked if we would be willing to share a draft copy of the IDP before it is officially filed, if we will be providing a preview before filings, and if we could provide the stakeholder workshop report to the Interested Parties List. We responded that we intended to hold an IDP preview workshop for stakeholders in September 2023, and that we would send a copy of the stakeholder workshop report to the Interested Parties List via email upon filing. We also indicated that stakeholders are also welcome to comment on our IDP after it is filed. A copy of the stakeholder workshop report was sent to all participants of any of the IDP workshops on August 1, 2023 and the IDP Preview was held September 19, 2023.

3. Poll Input

In an effort to obtain more input from stakeholders, this workshop employed the use of Microsoft Teams Polls (Polls.) This application allowed us to present questions to participants to generate more input on specific topics. We also posed open-ended questions to generate conversation. Participation in the Polls was not mandatory. During the workshop, we posed eight questions to participants and received response rates of 4 percent to 27 percent. See Table S-3 below for questions and a summary of responses:

Table S-3
Planning the Grid of the Future (Part 2) – Polls Questions and Responses

Question	Summary of Responses
1) What do you recommend that we do to proactively prepare for EV adoption?	Stakeholders suggested partnering with EV providers to gauges sales in the region, appliance disaggregation, load hosting capacity analysis, load control to disable charged when load is needed for grid support, proactively upgrade transformers, time of use rates for all customer classes, and upgrading the grid to prepare.
2) How should we identify and prioritize locations for the Hosting Capacity Program?	Stakeholders identified equity, looking at locations with known capacity constraints, planned locations for public EV charging stations, upgrading communities who are hosting many megawatts of CSG and larger DG installations, and having a common understanding of what grid access means. We will consider these ideas in our plan for the distributed energy resources system upgrade program, which we must file with the Minnesota Department of Commerce by November 1, 2023. (See Docket No. E002/M-23-458.)
3) Ideas on alternative methods to allocate costs of distribution system upgrades?	One stakeholder responded, noting an emerging approach in some states to charge the first DG applicant for a part of the upgrade with the expectation that the next DG applicants would pay their prorated share going forward. We will consider this in the forthcoming IDP. (We discussed this approach in Appendix I of the 2023 IDP.)
4) Is our ARR split methodology a fair approach to cost-sharing NWAs?	All five respondents indicated that they were not sure.
5) Should Xcel Energy continue to conduct NWA analysis using both the WACC and societal discount rates?	Five respondents thought it was appropriate to continue to utilize both methodologies and three were not sure.
6) What is your prioritization of the NWA roadmap items?	The weighted results indicated the LoadSEER enhancements were most important and 8760 NWA analysis, potential stacked value additions and automation of efficiency improvements all tied for second.
7) Do you agree with the direction of our planning process?	Three somewhat agreed, two were neutral and two somewhat disagreed.
8) Are there other ways participants you would like provide input on the IDP process?	One respondent indicated that they would like to see more discussion around the use of Flexible DER Interconnections using Dynamic System Ratings. Another participant indicated that they would like to have the opportunity to speak with Xcel Energy engineers one on one. In our view, the series of six workshops provided covering the IDP process has provided ample opportunity for stakeholders to ask detailed, specific questions of the Company's engineers who presented and were available throughout the duration of the workshops to receive feedback and answer questions.

E. Workshop 5: Resource Modeling

- **Logistics**: Hybrid (In-Person and Via Conference Call): August 8, 2023
- **Attendance**: 41 total participants 9 in-person and 32 virtual participants
- **IRP Order Point**: 3(c)- *Xcel shall analyze this likely need [for firm dispatchable resources] based on up-to-date system-wide modeling, including corrected modeling of wind fleet variability and of exchanges with MISO, in order to –*
  1) *establish the capacity, energy, resource adequacy, energy availability, ancillary service, and reliability needs, and*
  2) *quantify and compare the contribution of the electric system attributes from the different resource options considered to meet the identified grid needs.* And
- **IRP Order Point** 10(e) and (f)- *In its next resource plan Xcel shall, either through its Integrated Distribution System Plan proceedings or through another stakeholder process, develop and/or improve its forecasts of the adoption rate for the following technologies, to be used in Xcel's base case scenario and its overall demand forecast. (E) Increased potential for demand response and load flexibility from an increase in electrification of the technologies in A–D. (F) Adoption of distributed solar-powered generators—including generators sited by customers, community solar gardens organized under Minn. Stat. § 216B.1641, and generators that are neither sited by customers nor related to community solar gardens.* And
- **IRP Order Point:** *12- Xcel shall include in its next resource plan a deeper analysis of (1) storage options, including options combining solar generation and battery storage, and (2) the role of hydrogen and clean fuel alternatives in Xcel's resource mix. In preparation, Xcel shall work with stakeholders to develop a fair basis for comparing the full supply-chain and life-cycle carbon impacts of the generation and storage resource options under consideration to help the Commission evaluate the "adverse socioeconomic effects and adverse effects upon the environment" of each option, pursuant to Minn. R. 7843-0500, subp. 3.C.* And
- **IRP Order Point:** *15- Xcel shall work with stakeholders to develop a modeling construct that enables Xcel, as part of its next resource plan, to model solar-powered generators connected to the company's distribution grid as a resource. Xcel and stakeholders shall address the following factors in developing the modeling construct:*
  A. Using a "bundled" approach as is used to model energy efficiency and demand response.
  B. The costs borne by the utility and the costs borne by the customer.
  C. Cost effectiveness tests.
  D. Other topics as identified by stakeholders.

  Xcel shall include improved load flexibility and demand response modeling methodologies prospectively, including in its next resource plan.
- **IRP Order Point:** *16- In its next resource plan, Xcel shall account for local clean energy goals, in aggregate, in forecasting and modeling. In particular, the plan should include consideration of local community generation goals for distributed generation.*

1. Workshop 5 Overview

At this workshop, the Company shared information regarding several aspects of our modeling approaches for the next IRP. The workshop included an overview of our EnCompass modeling process and objectives as well as our planned approach for modeling inputs- including generation and demand-side resources- and new analysis approaches used in the IRP.

The presentation started with an overview of the Xcel Energy IRP process including a refresher on IRP goals and objectives and modeling tools employed; a discussion of statutes and rules governing the process; and how equity fits into the process. This was followed by a presentation of the economic modeling framework steps taken, and what we plan to include in the 2024-2040 IRP baseload scenarios which was followed by a discussion of examples of sensitivities that will be run to help address portfolio risk and to ultimately inform the preferred plan. A listing of generic resource technology and changes from the last IRP were discussed. Information pertaining to options inclusive of cost and performance data sources and how profiles of generic wind and solar will be developed; key renewable and battery input assumptions; impacts of new tax credits and interconnection costs; alignment of the IRP and IDP and sensitivities used; incorporation of demand response and energy efficiency bundles; and details of the Energy Conservation and Optimization Plan were shared. The presentation wrapped up with a discussion of new factors and approaches to be incorporated such as the recent 100 by 2040 legislation, Community Solar Garden and DG solar requirements, new environmental regulations; and changes to the MISO construct. This was followed by an overview of the Lifecycle Emissions Analysis that was undertaken and results noted.

This workshop provided ample opportunity for participants to ask questions and to provide feedback to be considered in our plans. As with prior workshops, we used Polls to draw out stakeholder input. During the workshop, we posed five questions to participants and received response rates of 29 percent to 68 percent. Questions posed and responses received were posted to the docket along with the slide deck.

2. Workshop 5 Stakeholder Questions and Input

Stakeholder questions and discussion focused primarily on NWA analysis and DER hosting capacity, with a few additional questions surrounding our budgeting process and forecasting.

- Several clarifying questions were asked by participants.
- Several stakeholders made comments pertaining to incorporation of equity into the process with emphasis on clean energy benefits and accessibility.

We indicated that we are still working through the incorporation of equity into the process and that we would appreciate feedback on this. It was also indicated that the IRP process focusses on need versus resources and that equity considerations are easier to incorporate into the actual selection process. We have established the Equity Stakeholder Advisory Group (ESAG) and have received input from members. As well, we will be forming an Environmental Justice Accountability Board (EJAB) and will be discussing equity matters with that group going forward.

- A request was made that the cost/benefit analysis for Prairie Island (required in Order Point 23.E of the Commission's order approving the Company's prior IRP) be clearly connected to the assumptions used in IRP modeling. The Company will ensure this is the case by providing the EnCompass model outputs to the contractor we have engaged to run cost/benefit analysis modeling scenarios using the REMI E3+ model; in essence, the EnCompass outputs will be the inputs to REMI, ensuring consistency in assumptions. For further details see Appendix M: Nuclear.
- One stakeholder indicated their concern about the inclusion of advanced nuclear technology and also wondered if we were considering virtual power plants in the plan. Virtual Power Plants have been incorporated into our planning evaluations detailed in Appendix X: Advanced Technologies.
- Questions regarding usage of green hydrogen were asked- if we would be producing our green hydrogen, purchasing it off the market or selling excess to the market. We indicated that we are still in the planning stages of producing green hydrogen- with the thought being that we would likely produce it for our own consumption but that if excess were available we could consider selling that.
- We were encouraged to not model sources on 100 percent natural gas when they may eventually operate on hydrogen and to not keep these two fuel sources separate.
- We were asked how we intended to incorporate proposed EPA greenhouse gas rules (NSPS 111(b) and (d)) into modeling. We indicated that we intend to include the proposed rules in our analysis. This rule has been incorporated into the environmental policy sensitivity, limiting operation of impacted existing combined cycle units to a capacity factor less than or equal to 50 percent and limiting new combustion turbines to a capacity factor of 20 percent.
- A stakeholder noted that the DG standard is not 1-10MW but simply 10 MW.
- A stakeholder inquired if we intended to have additional conversations with stakeholders regarding the DG modeling construct. We indicated that we have held meetings with stakeholders on this and that future meetings were expected. A summary of these conversations follows below.

- Regarding Order Point 15, a stakeholder wanted to note that the 3 percent solar carve out is a floor and not a ceiling. The comment was noted.
- It was asked if the model could go beyond the 3 percent. We indicated that we are still assessing this and that the impact on affordability would need to be considered.
- We were asked why DG was not included for the generic resources as base load. We indicated that the theory is for the base model to be the middle of the road scenario with sensitivities evaluated to determine what level of renewables can be achieved.
- It was noted that in the last IRP there wasn't addition of wind until 2026 and we were asked if that could also happen on the solar side. We indicated that we would consider that.

3. Poll Input

As with the prior workshop, we again used Polls in Microsoft Teams and also used OpinionX to obtain stakeholder input. We also asked open-ended questions to prompt discussion. During the workshop, we posed five questions to participants and received response rates of 12 percent to 63 percent. See Table S-4 below for questions and a summary of responses:

Table S-4
Resource Modeling – Polls Questions and Responses

Question	Summary of Responses	
1) How would you weight the following core planning objectives? (Distribute 100 total points across the 5 categories) Environmental, Cost, Reliability, Risk, Other	1. Environmental 2. Reliability 3. Cost 4. Risk 5. Other: Unidentified 6. Other: Equity distribution of Cost/Benefits 7. Other: Socioeconomic	785 Points 775 Points 680 Points 515 Points 35 Points 15 Points 5 Points
2) Please rank the following in order of importance as they pertain to addressing equity: 1) Involvement in decision making opportunities 2) Access to renewable distributed generation 3) Affordability 4) Job/Workforce Opportunities 5) Decreased exposure to environmental impacts 6) Energy efficiency program accessibility	1. Affordability 2. Decreased Exposure to Environmental Impacts 3. Energy Efficiency Program Accessibility 4. Job/Workforce opportunities 5. Involvement in Decision Making Opportunities 6. Access to Renewable Distributed Generation	130 Points 110 Points 101 Points 93 Points 84 Points 65 Points
3) What additional metrics would help us evaluate these core planning principles?	Responses included: protecting life; level of DER adoption and distribution-level interconnection; equity; people; EV adoption; resiliency; updated capacity factoring; factoring in long term	

Question	Summary of Responses
	perspective and looking at cutting emissions and future benefits; land use; baseload vs. dispatch generations; affordability; extreme weather events; and growing income disparity
4) What types of additional Demand Response, otherwise known as load flexibility, do you envision?	Responses included: EVs as energy source; time of use rates; EV flexibility; behind the meter; microgrids; batteries as an aggregate resource; EV's and other behind the meter storage; large scale batteries as technology permits; distribution resources and microgrids for further distribution build out; third party aggregators of DR and Virtual Power Plants; and electric heating using Bitcoin mining.
5) Rank the policy and planning changes in the order you think they will have the most impact on our plans: 1) 100 x 40 2) MN CSG and DG Solar Programs 3) Federal Incentive Programs 4) MISO Resource Adequacy Changes 5) EPA Power Plant Regulations	1. MN 100x40 92 Points 2. MISO Resource Adequacy Changes 69 Points 3. Federal Incentive Programs 67 Points 3. EPA Power Plant Regulations 67 Points 5. MN CSG & DG Solar Programs 50 Points

F. IRP Workshop Survey Results

After the conclusion of the IRP and IDP workshop series, we requested feedback on the series through an online survey. We sent the survey to everyone who participated in one or more of the IRP and IDP workshops. The intent of the survey was to obtain feedback on the workshops in order to inform future efforts. The survey included questions pertaining to duration, frequency, location, satisfaction and if the level of information shared was appropriate. Also, we requested feedback on how we could improve stakeholder efforts going forward and if there was support for similar workshops in the future. Of the nearly 160 emails sent requesting a response to the survey, we received six responses, or a response rate of approximately four percent. Those that did respond indicated that:

- They found the duration of the workshops was just right.
- The workshops were informative and helpful.
- They felt they had a better understanding of the process after participation.
- Regarding venue location, one participant suggested that the workshops be held in a location other than downtown Minneapolis, and one indicated that the venue location affected their decision to attend in person.
- Regarding the level of detail that was provided, the majority of respondents found the level of detail "just right." One respondent indicated that they found that the information was often very technical and that while they found they were offered ample opportunity to ask questions and provide feedback, it was difficult to be able to do so while absorbing the information and suggested a more basic conversation. On the other hand, one respondent felt the information shared was too simplified.

- All but one respondent found that the IRP process was about what they expected- with one finding it more complex than expected. Three indicated agreement with our planning process and the other three did not respond to this question. No additional information was offered.
- Four respondents indicated satisfaction with the stakeholder process and two did not. One that did not agree indicated they felt that it would be helpful to have an even more basic explanation of some of the topics covered so that they are accessible to those working on these matters for the first time. The other expressed appreciation for all the effort put into the workshops but suggested the sharing of the presentation prior to the workshop for review by registrants so that they could be better prepared to ask questions.
- Five respondents indicated that they felt they had sufficient opportunity to offer input during the workshops. The one that indicated they didn't have sufficient opportunity pointed to the poll questions being simplified on complex topics and felt that workshop leaders were guiding the answers.
- Two respondents provided feedback on how we could improve the stakeholder process going forward. One suggested sharing an even more basic explanation of the topics for those new to the work. The other suggested the pre-sharing of slides and holding smaller group discussions instead of broader discussions.
- All supported the Company hosting a series of workshops again in the future.

We appreciate the valuable feedback provided by the six survey respondents and will consider the feedback received in future workshops.

IV. ADDITIONAL OUTREACH EFFORTS

A. CSG and 3 Percent Solar Mandate Discussions with CEO's

1. July 20, 2023 meeting

On July 20, 2023, a roundtable discussion was organized by Xcel Energy with members of the Clean Energy Organizations[13] (CEO's) to gather feedback on potential impacts to the distributed solar modeling constructs, discussed in Order Point 15, by recent legislation requiring three percent of retail electric sales in Minnesota be generated from solar systems constructed or procured after August 1, 2023 by 2030.[14] The CEO's indicated that they do not expect any changes to the Order Point 15 distributed solar

[13] Representatives from Vote Solar, The Institute for Local Self-Reliance and Fresh Energy participated in the discussion.
[14] Minn. Stat. § 216B.1691, Subd. 2h, amendment effective January 1, 2024.

modeling constructs resulting from the new 3 percent mandate. Their interpretation is that the 3 percent requirement will likely occur in front of the meter while solar bundling will likely occur behind the meter. We agree with this interpretation and will proceed to develop a solar bundle modeling construct in addition to incorporating the 3 percent requirement into our Resource Plan.

2. October 24, 2023 meeting

On October 23, 2023, a second roundtable discussion was organized by Xcel Energy with members of the Clean Energy Organizations[15] (CEO's) to further discuss the distributed generation (DG) solar bundle modeling construct, as directed in Order Point 15. This discussion was geared solely towards new selectable DG solar bundles not already included in the base case, and bundles above and beyond the 2023 Community Solar Garden (CSG) and three percent legislation. The Company presented details regarding the DG solar modeling framework presented by the Institute for Local Self-Reliance (ISLR) in the last IRP and the parties had an extensive discussion about updated model assumptions. The parties agreed using assumptions in the 2023 National Renewable Energy Laboratory (NREL) ATB, where applicable, was reasonable. In addition, solar bundle sizing, bundle pricing impacted by lending rates, and representative operation and maintenance costs were discussed. The suggestion was made that the cost benefit tests be consistent with the National Standard Practice Manual for Benefit-Cost Analysis of Distributed Energy Resources.

B. Modeling Assumption Discussions

1. Department of Commerce Modeling Assumption Discussion

On October 2, 2023, the Company met virtually with representatives from the Department of Commerce (DOC) to share our IRP modelling assumptions and to receive feedback and input on the assumptions. We also addressed a set of questions sent prior to the meeting by the DOC. These questions addressed seasonal modeling, the MISO construct, resource acquisition, scenarios, modeling assumptions and pricing assumptions.

2. Public Utilities Commission Staff Modeling Assumption Discussion

As well, the Company met virtually with MN Public Utilities Commission Staff on October 9, 2023 to discuss our IRP modelling assumptions and to receive their

[15] Representatives from Vote Solar, Sierra Club, Fresh Energy and MN Center for Environmental Advocacy participated in the discussion.

feedback and input. We discussed the MISO construct, various scenarios, optimization of EnCompass modeling for seasonal impacts, major assumption changes such as MISO accreditation, IRA assumptions, policy changes, long term duration storage, distributed generation modeling, forecasts and local clean energy goals.

C. RFP 101 Workshop

On October 12, 2023, the Company hosted a Request for Proposal (RFP) 101 Workshop. The idea for this workshop arose from Xcel Energy's Equity Stakeholder Advisory Group (ESAG) engagement meetings. As part of a broader discussion in ESAG on diversifying the energy workforce, we heard from ESAG members that the Company should take steps to increase participation of Black, Indigenous and People of Color (BIPOC) organizations in the RFP bidding process. The intent of this workshop was to share general information about the NSP RFP bidding process for new generation resources to interested bidders. As well, we also hoped to learn information that could help our design of future RFPs and further ensure a fair and competitive process.

The Workshop focused on RFPs for generation resources that serve the bulk NSP system, such as utility scale generation sources or large distributed generation. The workshop did not cover rooftop distributed generation or Community Solar Gardens or any specific RFPs.

The workshop invitation was submitted to the IRP docket, to our MN DER distribution list comprised of 2,908 individuals, to our "RFP Renewables Release List" comprised of an additional 90 individuals, and to our ESAG distribution list. This workshop generated significant interest with 88 external participants attending the workshop.

V. CONCLUSION

We appreciate stakeholders' participation in these workshops, for input received and questions asked. We recognize that the scheduled time for the entire series of workshops was more than 16.5 hours, which is an extensive time commitment for stakeholders. The Company hopes that participants found the workshops informative, useful, and an effective way to provide us their input and feedback. We took great effort to ensure that stakeholders had every opportunity to ask questions and provide feedback. Based on feedback obtained at workshops and through survey results the stakeholder workshop series was successful in that stakeholders found it informative and were supportive of Xcel Energy hosting a series of workshops again in the future.

From the Company's perspective we found it successful in that we were able to receive valuable input from our stakeholders.

Where feasible, we have incorporated specific stakeholder input into the IRP process, as noted above in the workshop summaries. We are tracking all input that has not been incorporated directly and we will continue to consider and, where feasible, incorporate this feedback in the future.

We are committed to continuing to deliver reliable, affordable, and clean energy to our customers. This commitment requires a rigorous planning process that reflects the input and priorities of stakeholders, including the Commission, our customers, and the communities we serve.

We appreciate the interest and desire for our stakeholders to be involved and help shape the future of our system, their willingness to participate in these workshops and provide us their input.

APPENDIX T – MISO GRID CONGESTION

I. INTRODUCTION

Congestion is a complex issue that requires careful planning, management and coordinated efforts from multiple stakeholders. Here we provide an overview of the problem of congestion as it relates to resource planning and outline the steps, we are taking to address it. Though we cannot address congestion alone, we are looking for solutions to address congestion for our customers' benefit and furthering policy objectives. We have engaged in multiple efforts to find and mitigate transmission constraints. While many of our investments target physical improvements to constraints impacting our system, we are also reviewing regional policies to ensure adequate measures are in place to avoid future congestion impacts.

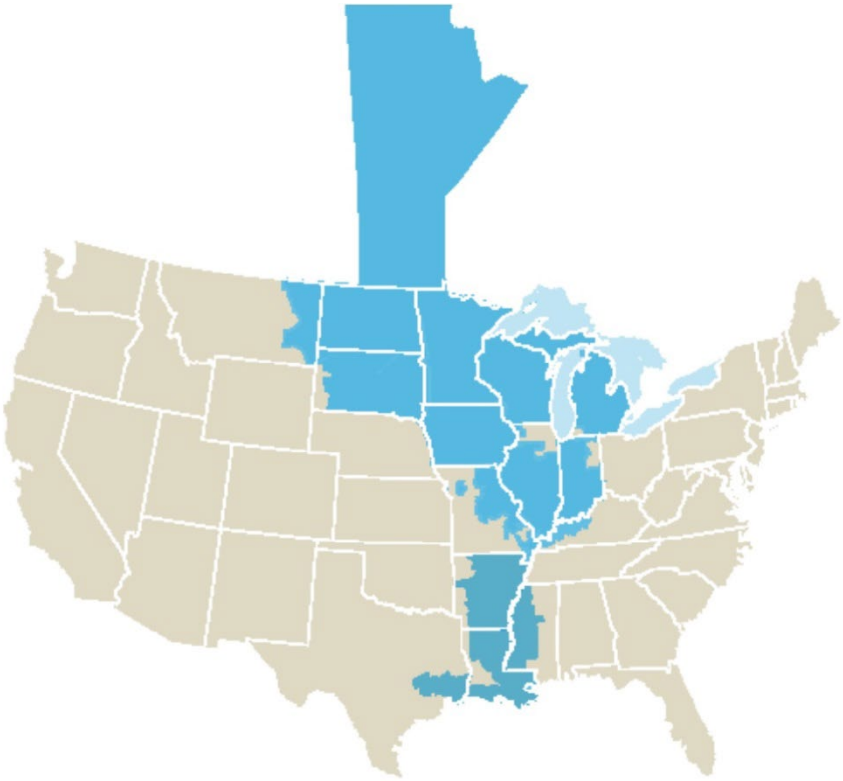
II. DEFINING GRID CONGESTION

The grid is facing new challenges as traditional baseload units retire, large scale renewables deployment increases, and Distributed Energy Resources (DER) are increasingly adopted. Sustainable, clean energy depends upon the necessary infrastructure to support the delivery of electricity from remote renewable resources to more heavily populated load centers. The Xcel Energy operating companies NSP-Minnesota and NSP-Wisconsin, operate an integrated transmission system (the NSP System) that comprises more than 8,400 miles of transmission and sub transmission facilities operating at voltages between 23.7 kilovolts (kV) and 500 kV, and approximately 550 transmission and distribution substations. The NSP System is within the Midcontinent Independent System Operator (MISO) footprint and serves retail customer loads in Minnesota, North Dakota, South Dakota, Wisconsin and Michigan.

A fundamental responsibility of transmission system operators is to ensure reliable operation of the transmission system. The Mid-continent Independent System Operator (MISO) is the regional transmission organization (RTO) which operates the transmission system and an energy market in parts of 15 states and the Canadian province of Manitoba. As an RTO, MISO is responsible for planning and operating the transmission system within its footprint in a reliable manner. MISO also provides operational oversight and control, market operations, and oversees planning of the transmission systems of its member Transmission Owners (TOs). MISO has 48 TO

members with more than 65,800 miles of transmission lines that are under MISO's functional control.[1] MISO's members also include 128 non-TOs such as independent power producers and exempt wholesale generators, municipals, cooperatives, transmission dependent electric utilities, and power marketers and brokers.[2] A map of MISO's geographic footprint is provided in Figure T-1 below.

Figure T-1: MISO Footprint



MISO is responsible for managing the flow of electricity on the transmission system. MISO does this by balancing the generation and consumption of electricity and ensuring the reliability of the electric grid. MISO accomplishes this as part of its duties as an Independent System Operator (ISO) by not only scheduling and dispatching

[1] *See* MISO, *Fact Sheet* (updated Mar. 2023), *available at* https://www.misoenergy.org/about/media-center/corporate-fact-sheet/.
[2] A complete membership list of MISO members by stakeholder group is available at: https://www.misoenergy.org/Library/Repository/Communication%20Material/Corporate/Current%20Members%20by%20Sector.pdf.

generators, but also operating a day ahead and real-time energy market system for electricity which is designed to provide pricing signals that encourage the efficient use of generation resources and transmission capacity.

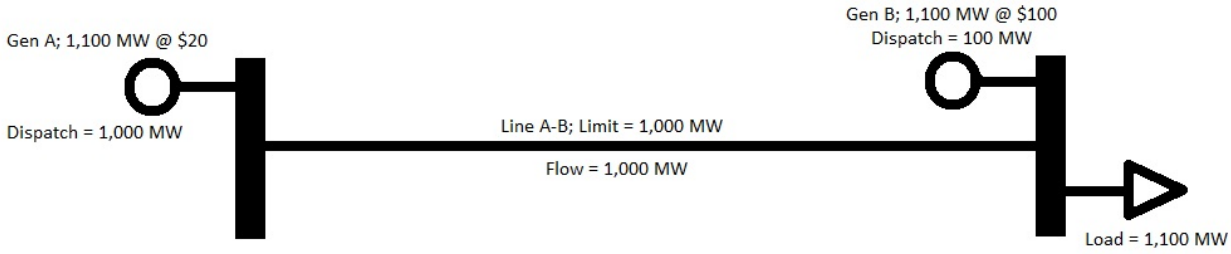
Limits on transmission facilities can prevent MISO from dispatching the most efficient generation resources during all hours of the year, thereby increasing wholesale energy costs. Transmission constraints are the physical limits on the amount of electricity flow the system is allowed to carry in order to ensure safe and reliable operation. Transmission constraints occur at different points on the transmission system, such as transmission lines, substations, or in specific regions. Regardless of the source, these constraints result in bottlenecks in the transmission system, and higher costs for electricity delivery.

These transmission constraints create inefficiencies in the wholesale energy market and increase costs through shadow prices. Locational marginal prices (LMPs) are economic indicators used to reflect the value of electricity at specific locations within the grid. MISO calculates LMPs for over 2,000 nodes. LMPs include marginal energy costs (i.e., cost of generating the last megawatt-hour MWh of energy in order to balance supply and demand in the market) as well as congestion costs and transmission losses. Collections of nodes are often represented by zones or hubs that provide a summary of regional prices and a benchmark for forward trading of power. When there is congestion in the transmission system, shadow prices signal the congestion cost savings for increasing a given transmission path by 1 Megawatt (MW). Shadow prices are used throughout the industry to determine which transmission paths or flowgates are the most congested and are used by the market model to set LMPs at different nodes throughout the system. The price of electricity is not uniform across the grid due to constraints and losses. Ignoring the effect of transmission losses, when no transmission constraints are restricting economic dispatch, all marginal prices at all points would be identical. If there is a constraint, the marginal prices on two sides of the constraint will differ. The difference in price is an economic measure of congestion.

Transmission congestion refers to the economic impacts on the users of electricity that result from operation of the system within these limits. Congestion occurs when demand for electricity in a particular region exceeds supply, and there is insufficient transmission capacity to move the least costs generation to customers. Once the system is overloaded, cheaper generation cannot be dispatched, and more expensive generation is used to serve load. Higher cost generators from areas without transmission constraints must be used to meet customer demand, thereby raising the price of electricity.

Figure T-2 is an illustration of how congestion affects the energy used and pricing in a single moment of time. The illustration assumes an energy need of 1,100 MW that could be supplied by two potential generators, one at a charge of $20 per MW and one at $100 per MW.

Figure T-2: Congestion Illustration



In this theoretical intact system, Generator A could serve the entire 1,100 MW needed, but cannot do so because of the 1,000 MW limit on Line A-B. Instead, Generator A's dispatch is limited to 1,000 MW and Generator B will be called on to deliver the 100 MW balance. If Generator A were able to deliver the entire 1,100 MW it can generate, the energy cost would be $22,000 assuming no energy is lost during transmission. Due to system constraints, the total cost to deliver the 1,100 MW rises to $30,000 because 100 MW cannot be delivered, and replacement energy is required (1,000 MW X $20 for Generator A plus 100 MW X $100 for Generator B). In short, the congestion causes the overall cost of energy to increase $8,000 or 36 percent based on this simplified example. When there is no congestion, the lowest cost generator, regardless of fuel source, is the one that serves load.

Managing congestion is critical to minimizing costs associated with electricity production and transmission and enabling further investments in renewable energy. LMPs play a crucial role in managing grid congestion and optimizing the operation of the electricity market by using economic indicators to manage the flow of electricity. However, congestion also represents increased prices for our customers. By addressing the causes of congestion directly we can work to mitigate its impact on electricity prices.

III. CAUSES AND IMPACTS OF GRID CONGESTION

Generally, we see congestion on the transmission system because of the increasing demands for electricity, both in terms of load, and the changing generation mix of its supply. Integrating new renewable generation can lead to congestion on the MISO system, causing transmission constraints as the system may lack the flexibility to accommodate further resources without physical improvements. The existing transmission infrastructure may be outdated, in need of significant upgrades, or unable to accommodate additional generation leading to congestion as energy must find alternative pathways to get to customers. Further, policy may also contribute to congestion through unintended impacts. While there are many causes of congestion, its impact on higher prices for our customers must be accounted for in our system planning.

Across our footprint we are experiencing significant growth in energy demand, prompting us to seek innovative solutions to meet the increasing electricity needs of our customers. One prominent approach has been an escalating reliance on wind and solar generation. With its abundant wind resources and the growing solar potential, the upper Midwest is emerging as a leader in renewable energy deployment. Wind farms are becoming a common sight across the region and solar installations, ranging from rooftop arrays to large-scale solar farms, are proliferating, harnessing the region's sunlight. By harnessing wind, solar and other forms of renewable energy, we are striving to meet the surging energy demand while achieving a greener and more sustainable energy future.

The growth in renewable generation may both increase and decrease the need for new transmission. As legacy units retire, they are often being replaced by wind and solar generation, but the fuel sources for these resources are often locationally dependent. Regions with favorable conditions, and abundant resources are not often located near load centers. Historically, transmission lines delivered power from large scale base load generators to population centers. The infrastructure needed to support the dispersed replacement generation for retiring baseload units is continuously growing.

While there are abundant levels of wind, solar, and even biomass in the Upper Midwest, often they are located in more remote locations. Siting renewables in these remote locations requires new or upgraded transmission to efficiently deliver energy to load centers. More remote areas lack the necessary transmission infrastructure for large scale renewable projects due to their lower population density, and lower historical electricity

demand as they were not historically prioritized with for extensive transmission infrastructure development in the past. As a result, the existing transmission system does not always have the capacity to accommodate the additional power generated by large renewable energy projects.

Further, in addition to the physical constraints mentioned, fuel costs can increase congestion impacts. Congestion costs can be exacerbated by high natural gas prices due to natural gas fueled generation generally being dispatched to offset congested renewables due to the natural gas generation's flexibility and distance to the load.

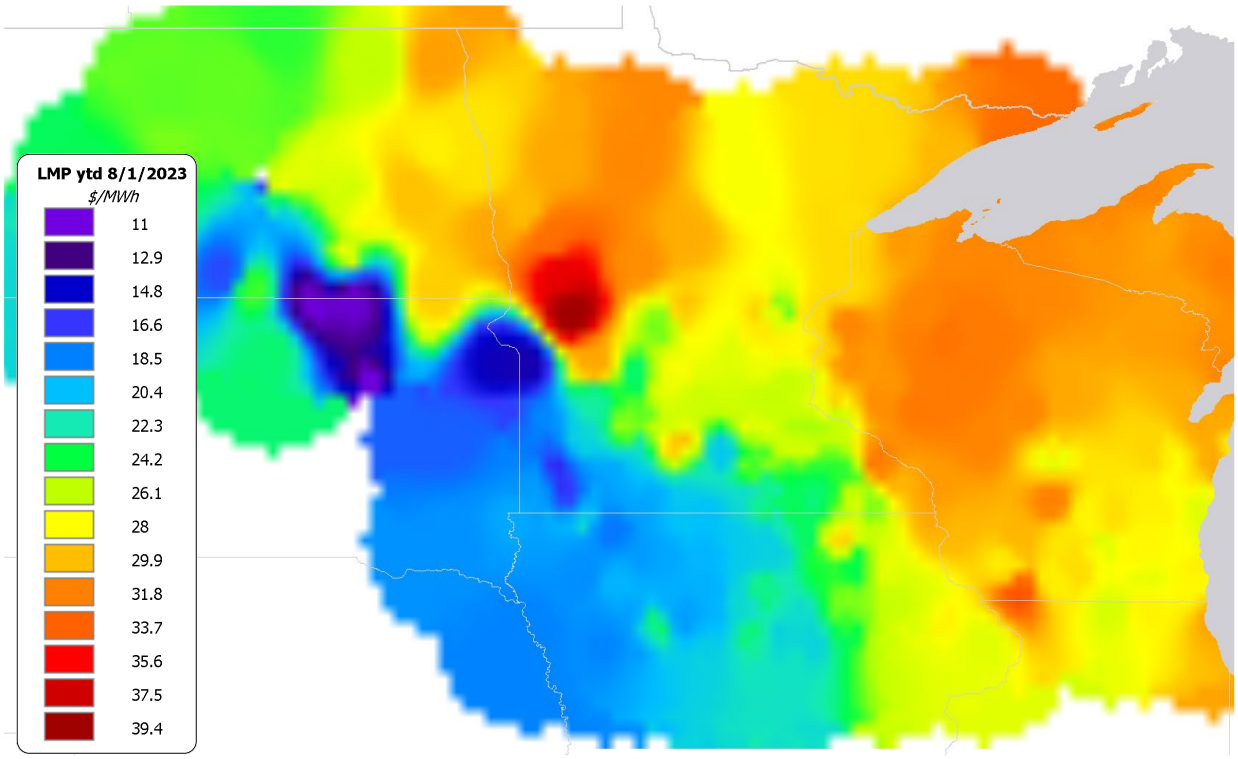
Finally, as mentioned, policy may also contribute to congestion through unintended impacts. We identified congestion impacts that resulted in increased costs to customers as part of the MISO Generator Interconnection Process. One of the ways in which MISO exercises its role of managing the flow of electricity is by analyzing transmission service requests by parties looking to use the transmission system. The MISO Generator Interconnection Process is used to analyze interconnection requests for new generators connecting to MISO facilities to ensure the reliability of the transmission system and ensure the deliverability of new and existing network resources.

In our work with MISO and stakeholders, we found that the MISO Generator Interconnection Process had resulted in increased costs to customers though the thresholds in which generators were made responsible for upgrade costs, and how the dispatch of resources in the Interconnection Process study were being implemented. The MISO thresholds at the time the issue was identified were that a 5 percent or greater contribution would require a generator seeking Network Resource Interconnection Service (NRIS) to pay for an identified upgrade. For a generator seeking Energy Resource Interconnection Service (ERIS), a contribution level of 20 percent or greater was required to be assigned the costs of an upgrade. This resulted in needed upgrades being identified during the System Impact Study efforts, but due to contribution levels being below the thresholds, these constraints were not being mitigated.

Over time we have seen increasing congestion on the MISO system. As a visual representation, we can examine historical congestion through examining the average LMPs on MISO system. Figure T-3 shows LMPs on the MISO system in our area year to date as of August 1, 2023.[3]

[3] Hitachi Energy Velocity Suite simple average, LMPs on the MISO system in our area year to date as of August 1, 2023.

Figure T-3: MISO Historical LMP Averages



Areas which are dark blue to purple show low average LMPs and represent the market signal an abundance of generation and a lack of load while orange to dark red signal an abundance of load, and lack of generation. Regions with a drastic price difference in a relatively short distance are highly congested areas signaling constraints on the system.

Currently, wind generation from the western part of MISO flows toward the load centers in the east, such as the Twin Cities Metro area and load centers beyond the transmission interconnection between Minnesota and Wisconsin. The existing west-to-east transmission capacity is at times operating at its limit. The transmission interface across the Minnesota-Wisconsin border is currently stability-limited and trying to force additional renewable energy through these lines could result in voltage collapses in Northern Wisconsin that would destabilize the grid. This forces us into curtailing wind

energy at its source in the west as it is operationally and economically inefficient to utilize the inexpensive and clean energy to which we have access.

Table T-1 below shows congestion and curtailment information for 2022 and 2023. These are the official curtailment values and reflect the curtailment billed to the Company. The months where the curtailment data was not available, we used the MWh derived in our monthly curtailment estimate calculation. The costs for these months were the MWh from our estimate, multiplied by the average monthly cost of curtailment.

Table T-1: Congestion and Curtailment Costs for 2022 and 2023

[PROTECTED DATA BEGINS

PROTECTED DATA ENDS]

The monthly costs (listed as negative values) of recent congestion impacts are provided in Table T-1 in the column titled Total Impact. Monthly Total Impact is the sum of the Congestion and Curtailment costs, offset by Financial Transmission Right (FTR) revenue. Curtailment and Congestion are considered negative and Financial Transmission Right (FTR)s are considered revenue positive in the calculation.

While curtailment and congestion costs are dependent on transmission outages and wind levels, overall, these numbers show higher costs than we have experienced in the in recent history. This increasing curtailment is the result of several various aspects of system operations, but a common factor is that the Upper Midwest MISO transmission system has become oversubscribed and unable to support all the wind generation that

has recently gone into service. For instance, in 2022 wind generation went into service before the completion of transmission upgrades required for the generation to interconnect were complete, causing several transmission outages. In other words, there was more wind generation installed in the western subregion of MISO than could be delivered to meet customer demand throughout the MISO footprint. Without additional transmission development, and steps to mitigate these impacts, we will more frequently encounter this problem as we add more renewable generation to our system.

Beginning in June 2020 the NSP system began to see a significant increase in congestion costs in MISO settlements, exhibiting another step increase in April 2021. For 2023 through June, congestion costs have fallen off to some degree as compared to 2022; however, there remains significant volatility as observed in April 2023 and may increase moving forward in 2023 and 2024. Therefore, to better align the 2024 forecast with costs expected for congestion, we have updated our MISO cost and revenue forecast to include data inclusive of results observed for April 2021 through June 2023 which are annualized to provide the forecast for 2024. Figure T-4 shows NSP congestion costs from January 2019 to June 2023.

Figure T-4: NSP Congestion Costs

[PROTECTED DATA BEGINS

PROTECTED DATA ENDS]

IV. EFFORTS TO ADDRESS CONGESTION

Managing congestion is crucial for minimizing production and transmission costs and facilitating investments in renewable energy. A strong transmission system ensures

continued reliable and affordable service, and the ability to meet state and regional energy policy goals, and support for a diverse generation mix, including renewable energy.

Congestion costs are directly affected by transmission investment. If transmission investment removes a constraint to relieve congestion, then the investment will reduce congestion costs to customers. The congestion costs avoided are a direct measure of the economic benefit from, or value of, this investment. However, projects must be measured to ensure the value of the investment exceeds the costs.

Upgrading or replacing aging infrastructure helps ensure the safe and efficient transmission of electricity, however constructing transmission lines can be technically complex, expensive, and time consuming. Developing or upgrading transmission infrastructure requires significant planning and coordination, obtaining all necessary permits and regulatory approvals. As a project's scale increases, so do the permitting and environmental considerations. Anticipated benefits, by themselves, may or may not be sufficiently large and recurrent to warrant the investment and reducing congestion costs is not the only economic benefit that might justify a transmission investment. Robust analysis is needed to determine which projects to pursue.

The MISO Transmission Expansion Plan (MTEP) is a comprehensive process undertaken by MISO to assess, plan and propose transmission system improvements within its operational footprint. MTEP aims to ensure reliability, efficiency, and the cost effectiveness of the electrical transmission infrastructure within the MISO region through identifying needs, developing scenarios, studying alternatives, performing cost benefit analysis, and conducting stakeholder engagement. The MTEP process aims to address congestion and level the playing field for all generators to deliver their energy based on supply and demand. This in turn ensures that the energy market operates in the most efficient and cost-effective manner.

MISO adheres to the planning principles outlined in FERC Order No. 890 and 1000 in developing the MTEP. These FERC Orders require an open and transparent regional transmission planning process and include the requirement to plan for public policy and for coordinated inter-regional planning and cost allocation. Consistent with these FERC directives, the MTEP process seeks to ensure the reliable operation of the transmission system, support the achievement of state and federal energy policy requirements, and enable a competitive energy market to benefit all customers. Xcel Energy plays an active part in the entirety of the MTEP process including the futures development and model development, and validation.

The development of the MTEP typically starts in June every other year and is an 18-month overlapping cycle of model building, stakeholder input, reliability analysis, economic analysis, resource assessments, and drafting of the MTEP report. As part of the process MISO usually performs a Market Congestion Planning Study (MCPS). The 2016 MCPS was an example of how transmission can produce lower APC as this study resulted in the development of our Huntley-Wilmarth 345 kV line Market Efficiency Project (MEP). The Huntley to Wilmarth 345 kV project alleviated the observed congestion at the Minnesota/Iowa border. Though we acquired new right-of-way to construct the 345 kV circuit on the approved route, approximately 40 percent of the line was constructed as a double circuit with the existing Wilmarth-Lakefield Jct. 345 kV line.

The last MCPS was performed in 2019, with the 2020, 2021, 2022, and 2023 MCPS Studies being eliminated to open resources for Long-Range Transmission Planning (LRTP)—which is MISO's largest ever undertaking to update and modernize the transmission system. The LRTPs are a comprehensive planning effort outlining the transmission infrastructure needs and tests expansion plans for the MISO region to accommodate widespread changes in the electric landscape due to changing technology and customer needs. The scale and pace of these changes have required prompt attention to develop the most efficient, cost-effective investments to ensure grid reliability in the future. The LRTP initiative is MISO's response to the current and future resource evolution that has and continues to affect the bulk electric system.

The LRTP projects are sorted into various tranches depending on their priority. Tranche 1 resulted in a $10.3 billion transmission portfolio that was approved by the MISO Board of Directors in July 2022. The projects in the Upper Midwest represent about $3 billion in total investment; with Xcel Energy's assigned projects representing about $1.2 billion of the total Upper Midwest investment. The MISO LRTP Tranche 1 projects in Minnesota utilize the existing 345 kV second circuit capabilities where possible, which will increase the overall ability to transfer power across the system while limiting environmental and landowner impacts. We have also submitted additional projects as part of MISO LRTP Tranche 2 portfolio currently in development. As Tranche 2 projects are announced, we will continue to engage in transmission development, and look forward to developing approved projects to enhance the capacity of the grid.

While Xcel Energy regularly participates in MISO to address congestion and expand capacity, we additionally study congestion with our project partners, or on our own.

For instance, Xcel Energy, as part of Grid North Partners[4] conducted a study to identify the root causes of congestion from July 2020 to July 2022. The study identified 94 facilities in and around Minnesota causing congestion in Minnesota. The second circuit on the Brookings County - Lyon County and Helena-Hampton transmission lines, along with five other projects to upgrade facilities were submitted in MISO's MTEP to mitigate some of this congestion. A total of 17 facilities were able to be upgraded at low cost (under $1 million) and another five upgrades we found (under $10 million) to mitigate congestion. Much of the congestion observed is due to high-wind weather patterns with much longer duration than the typical 4-hour batteries available as a non-transmission alternative.

Also, as a result of the study, Xcel Energy initiated an out-of-cycle request to MISO for completing the second 345 kV circuit from Brookings County - Lyon County and Helena-Hampton for the existing CAPX Brookings-TC facility. In addition, though not a Market Efficiency Project per se, Xcel Energy recently initiated two projects, the MN Energy Connection and the King Connection, which are designed to utilize existing transmission access rights and will enable further renewable investment. The MISO interconnection queue has many new interconnection requests seeking to connect to a system that is already congested. Reusing existing transmission rights through the MN Energy Connection and King Connection Projects allows Xcel Energy to interconnect additional MWs through its existing transmission rights, avoiding lengthy delays often related to MISO queue interconnection studies.

In addition to these larger transmission projects, Xcel Energy has been developing multiple market participant-funded transmission projects to address congestion. These projects aim to enhance the reliability, efficiency, and capacity of the electric transmission grid by addressing constraints. For instance, we converted the bifurcated 115 kV line from High Bridge to Rogers Lake to a double circuit 115 kV line to alleviate congestion on the High Bridge Generating Plant. Additionally, we constructed new breaker positions at High Bridge and Rogers Lake to accommodate the second 115 kV circuit to remove the bifurcation ties at both ends of the High Bridge – Rogers Lake 115 kV line while adding breaker positions at both substations.

[4] Grid North Partners include DPC, OTP, MP, MRES, CMMPA, RPU, SMMPA, WPPI, Xcel Energy and GRE.

Xcel Energy performed its own internal analysis to determine small projects designed to address constraints and remove system limiters on congested lines. The projects listed in Table T-3 focus on substation equipment and sag limits in Southwest Minnesota.

Table T-2: Xcel Energy Congestion Projects

Substation	Chisago County (CHI)
Scope	Replace primary and secondary 115 kV bus 1 differential relays for TR05 and TR06
Property Units	(4) Control System
ISD	8/1/2022
Substation	Inver Hills (IVH)
Scope	Replace busbar
Property Units	(1) Conductor
ISD	3/1/2023
Substation	Kohlman Lake (KOL)
Scope	Replace meter on breaker 5P106
Property Units	(1) Control System
ISD	8/1/2022
Substation	Prairie (PRA)
Scope	Replace meter on breaker 5G8
Property Units	(1) Control System
ISD	8/1/2022
Substation	Scott County (SCO)
Scope	Replace busbar
Property Units	(1) Conductor
ISD	3/1/2023
Substation	Wilmarth (WLM)
Scope	Replace bushing current transformers on breaker 5S11, and switches 8S26B1, 8S25B, 8S25A, 8S26B1
Property Units	(1) Circuit Breaker (BCT) (4) Switches
ISD	3/1/2023
Substation	Riverside (RIV)
Scope	Replace switches 5M330B, 5M331B, 5M329A, 5M330A, 5M329B, 5M331A, aux current transformers on 5M304 and 5M305, and two sections of busbar

Property Units	(6) Switches (2) Device, Potential (2) Conductor
ISD	3/1/2023
Substation	Red Rock (RRK)
Scope	Replace bushing current transformers on breaker K2, switches K2B1, 946B, K2B2, 946A, and meters on 946 and K2
Property Units	(1) Circuit Breaker (BCT) (4) Switches (2) Control Systems
ISD	3/1/2023

We are working with the Grid North Partners' Tech Team to further identify simple system upgrades (≤ $1M cost) to improve transmission line ratings.

Xcel Energy has been monitoring congestion and curtailment on a weekly basis to find new issues as they arise and determine whether a permanent solution is warranted or if the congestion is related to temporary system conditions. For example, Xcel Energy Transmission Operations takes both system reliability and curtailment and congestion cost impact into consideration when scheduling transmission outages. Also, we started an internal study process to determine any transmission system reconfigurations on the underlying transmission system able to positively impact the bulk transmission system and congestion. We confirmed our first system reconfiguration project in Southwest Minnesota to help alleviate congestion in the area.[5] Finally, we implemented a process to study reconfiguration requests from outside entities. These requests are looked at to determine effectiveness, duration, and impact on the transmission system. Reliability is the primary determinant to whether a reconfiguration request is approved. MISO is working on setting up their process which Xcel Energy will participate in.

Lastly, policy can contribute to congestion. As mentioned, we found that the MISO Generator Interconnection Process had resulted in increased costs to customers through the thresholds in which generators were made responsible for upgrade costs, and how the dispatch of resources in the Interconnection Process study were being implemented. After working with MISO and stakeholders, a 10 percent rather than

[5] This request was reversed after several months due to a policy issue with MISO and SPP. In October MISO and SPP began coordinating their Day Ahead studies to recognize some of each other's flow gates which will help reduce SPP flows on the system. SPP previously did not recognize MISO flow gates and set a dispatch that could negatively impact MISO's dispatch. Xcel Energy Transmission Operations takes both system reliability and curtailment and congestion cost impact into consideration when scheduling transmission outages.

20 percent contribution threshold for generators requesting ERIS was implemented for facilities 230 kV and lower. This represents a step in the right direction and will alleviate some future congestion related impacts going forward, however we will continue monitoring the contribution of ERIS requests on 345 kV facilities to determine the impact. Due to this policy change, new wind coming online in the future will likely contribute less to congestion than previous projects due to triggering more transmission upgrades before the project goes online.

V. NON-TRANSMISSION SOLUTIONS

As stated, the growth in renewable generation may both increase and decrease the need for new transmission. While in cases it can cause new congestion issues, in others places new generation near load centers may help alleviate congestion impacts.

Using regional LMPs as part of generation planning offers a nuanced approach to mitigating congestion impacts. By closely examining the MISO Historical LMP Averages, such as depicted in Figure T-3, planners can identify areas where the cost of electricity delivery is significantly higher due to congestion. These high-cost areas often indicate a mismatch between local generation and demand. Incorporating this LMP data into generation planning allows for strategic placement of new generation assets, particularly near load centers marked by high LMPs. This targeted approach not only optimizes the use of existing transmission infrastructure but also minimizes the need for costly upgrades. Moreover, it provides a financial incentive for developers to invest in regions where their generation capacity can be most effectively utilized. By aligning generation planning with regional LMPs, utilities can make data-driven decisions that contribute to a more efficient, reliable, and cost-effective grid, thereby alleviating both current and future congestion-related impacts.

Finally utilizing DER or increasing energy storage technology on the load-side of a constraint, will also have a similar effect in reducing congestion costs. Investment in energy storage technology such as batteries can help alleviate grid congestion by allowing excess generation to be stored for later use. This can reduce the amount of electricity that needs to be transmitted over congested lines.

VI. CONCLUSION

Transmission congestion is a significant challenge. Addressing congestion is important for ensuring the reliable and affordable delivery of electricity to consumers. By

expanding transmission capacity, improving coordination between transmission system operators, periodically reexamining policies, investing in generation and storage technology, we can do our part to help alleviate grid congestion and ensure reliable delivery of electricity to Xcel Energy customers.

APPENDIX U – INFLATION REDUCTION ACT

I. MAXIMIZING INFLATION REDUCTION ACT (IRA) BENEFITS

The Inflation Reduction Act (IRA) aligns with our vision to reduce carbon emissions from the electricity we generate and deliver to our customers by enabling economic investments in carbon-free resources. The availability of tax credits, the expanded types of clean energy technologies that qualify, and the quicker ability to monetize the tax credits through transferability accelerates our ability to achieve our clean energy and carbon-free goals—with greater certainty.

The IRA provides the opportunity to transfer Production Tax Credits (PTCs) and Investment Tax Credits (ITCs) to unrelated taxpayers for cash. Eligible credits include PTCs and ITCs earned after 2022, including PTCs from projects placed in service before 2022. However, tax credits carried forward from years prior to 2022 are not eligible for transferability. Consideration paid in exchange for transferred tax credits is not includible in gross income and is not deductible by the transferee.

The Company's 2024 IRP leverages significant incentives from the IRA. Below is a summary of the tax credits available for our supply side resources included in our resource plan.

Tax Credits Considered for Supply Side Resources

- **PTC extension (Sec. 13101)** The IRA extends the existing PTC to projects for production of electricity from renewable sources such as wind, biomass, hydropower, and other resources. The IRA also made solar eligible for the PTC. Eligible projects must begin construction before January 1, 2025. However, after 2024, the technology neutral provisions in the IRA (discussed below) take over and continue with essentially the same PTC provisions through at least 2032. The base credit is set to $0.03/kW, adjusted for inflation. The full credit is five times the base credit. In order to qualify for the full credit, the project must meet certain prevailing wage and apprenticeship requirements. The credit is increased by 10 percent if the project meets certain domestic content requirements and by another 10 percent if located in an energy community. Eligible energy communities include (1) brownfield sites, (2) census tracts or adjoining census tracts where coal units were retired after 2009, or (3) a statistical area with above average unemployment and significant coal, oil, or natural gas employment or where coal, oil, or natural gas contributes significantly to local tax revenues.

- **Technology neutral PTC – new §45Y (Sec. 13701)** The IRA adds a new technology-neutral tax credit for production of clean electricity. This credit replaces the existing PTC for electricity generated from renewable sources (extended in Section 13101 through 2024). Eligible facilities are those generating electricity for which the greenhouse gas emissions rate is not greater than zero. To qualify, the facilities must be placed in service after December 31, 2024. The base credit is $0.03/kW adjusted for inflation. The full credit is five times the base credit and is earned if certain prevailing wage and apprenticeship requirements are met. The credit is increased by 10 percent for projects meeting certain domestic content and increased by 10 percent if located in an energy community. Credits phase-out the later of (a) 2032 or (b) when U.S. greenhouse gas emissions from electricity are 25 percent of 2022 emissions or lower. The full credit is given during the first year after the phase out year, with a reduction to a 75 percent credit in second year after the phase out year, and a 50 percent credit in third year after the phase out year. No credit will be given in the fourth year after the phase out year.

- **ITC extension (Sec. 13102)** The IRA extends and modifies the existing ITC for investments in renewable energy projects. With the technology neutral provisions, the ITC is now available for projects that begin construction through at least 2023. ITC eligible projects include fuel cell, solar, geothermal, small wind, energy storage, biogas, microgrid controllers, and combined heat and power properties. For the energy storage ITC, the battery no longer has to be co-located with renewables. Similar to the PTC, in order to qualify for the full 30 percent ITC, the project must meet certain prevailing wage and apprenticeship requirements. The credit is increased by 10-percentage points if the project meets certain domestic content requirements, and it can also be increased by 10-percentage points if it is located in an energy community for a total credit rate of up to 50 percent.

- **Technology neutral ITC – new §48E (Sec. 13702)** The IRA adds a new technology-neutral tax credit for investment in facilities that generate clean electricity. This credit replaces the existing ITC for facilities generating electricity from renewable sources (extended in Section 13202 through 2024). To be eligible to receive the credit, the facility must generate electricity with a greenhouse gas emissions rate that is not greater than zero or be a qualified energy storage technology. The base credit is equal to 6 percent of qualified investment (basis). The full credit is 30 percent, which is five times the base credit. The full credit is earned if the facility meets certain prevailing wage and apprenticeship requirements. The credit is further increased by 10-percentage points for

facilities meeting certain domestic content requirements, and it can also be increased by 10-percentage points if the project is located in an energy community. Total credit rate is 50 percent if both domestic content and energy community requirements are met. Phase-out starts the later of (a) 2032 or (b) when U.S. greenhouse gas emissions from electricity are 25 percent of 2022 emissions or lower.

- **Zero emission nuclear PTC – new §45U (Sec. 13105**) The IRA introduced a new PTC for production of electricity from a qualified nuclear power facility. This credit is effective for production during 2024-2032. The full credit rate is 1.5 cents/kilowatt hour. The credit is reduced as the market price of wholesale electricity increases. The credit starts phasing out as wholesale electricity prices rise above $25 per megawatt-hour and fully phases out at $43.75 per megawatt-hour. In order to qualify for the full credit rate, the facility must satisfy the previously discussed prevailing wage requirements.

- **Clean hydrogen – new §45V (Sec. 13204)** The IRA introduced a new 10-year PTC for clean hydrogen production. Facilities that begin construction after 2022 and before 2033 qualify. The PTC is computed per kg of clean hydrogen produced multiplied by the applicable amount. The applicable amount is 60 cents (base rate) or $3 (full rate) multiplied by the applicable percentage. The applicable percentage depends on the greenhouse gas emissions associated with the production based on the following schedule:
  - 0 percent if lifecycle emissions are over 4 kg of CO2 per kg of clean hydrogen produced
  - 20 percent if lifecycle emissions are 2.5-4 kg of CO2 per kg of clean hydrogen produced
  - 25 percent if lifecycle emissions are 1.5-2.49 kg of CO2 per kg of clean hydrogen produced
  - 33.4 percent if lifecycle emissions are 0.45-1.49 kg of CO2 per kg of clean hydrogen produced
  - 100 percent if lifecycle emissions are less than 0.45 kg of CO2 per kg of clean hydrogen produced

For example, 100kg of clean hydrogen produced at $3 full rate utilizing less than 0.45kg CO2 per clean hydrogen produced will generate $300 in clean hydrogen PTCs. The facility must satisfy the previously discussed prevailing wage/apprenticeship requirements to claim the full credit. Both wind PTC and clean hydrogen PTC can

be claimed with respect to the wind electricity generated. Both the zero-emission nuclear PTC and the clean hydrogen PTC can also be claimed with respect to the nuclear energy electricity generated. However, the clean hydrogen PTC is not allowed if the facility includes carbon capture equipment qualifying for carbon capture credit. Direct pay of this tax credit is available during the first five years of the PTC period. Direct Pay allows the project owner to receive a cash payment from the IRS for the full value of the tax credit in lieu of the tax credit. This PTC is also eligible for tax credit transferability (discussed previously) after the period in which direct pay is available. In addition, electing ITCs in lieu of PTCs is also available.

Tax credits for forecasted DG Solar are not modeled in our plan since they are tariffed. Tax Credits impacting Demand Side Resources are discussed more fully in our recently filed Integrated Distribution Plan filing.

We make every effort to identify and evaluate every opportunity for tax credits, low-interest loans, and other types of federal funding that can reduce the costs of our projects. Our Preferred Plan provides an estimated $700 million in savings between 2024 and 2029, and over $5 billion between 2030 and 2040, for a total of 5.7 billion in estimated savings from the IRA.[1]

We assume the full base credit in our modeling for future generic resource additions. We do not assume bonuses for domestic content or energy community. Most of our acquisitions must follow a competitive bidding process, and therefore, it is more difficult to control location, domestic content, prevailing wage, and various other factors. For our build own transfers and self-build projects, we pass on 100 percent of realized tax credits (net of transaction costs) to our customers. For power purchase agreements, which compete in most of our request for proposals, we do not know the percentage of tax credits passed through in terms of lower rates. However, we assume that the availability of these tax credits allows bidders in our competitive processes to lower their prices from what they would otherwise charge.

[1] Estimated PTC/ITC amount are based on the preferred plan with PVSC dispatch results assuming the NREL 2023 ATB assumed tax credit schedule and qualifying for full tax credits. Actual earned tax credits might differ from these estimates due to curtailment and other conditions.

APPENDIX V – COMMUNITY GOALS

I. INTRODUCTION

An increasing number of Minnesota communities served by the Company have adopted energy, climate, and broader sustainability goals. We are supportive of our communities and aim to help them achieve their energy goals whenever possible. We must balance those community goals in light of our system resource planning process, which charts the course for the size, type, and timing of our system resources and must ensure safe and reliable energy while keeping bills low and complying with applicable laws and regulations, including statewide energy standards.

Our communities' targets vary, but often include goals for increasing the community's share of renewable generation, share of carbon-free generation, energy efficiency goals, and carbon or greenhouse gas reduction goals (usually a percent reduction below a specified baseline year by a specified target year; in some cases, net zero by 2050, with interim milestones). Some communities are also incorporating goals for electric vehicle (EV) adoption or other forms of beneficial electrification and building efficiency into their plans or as elements of broader sustainability or Climate Action Plans. Finally, in addition to a goal to use more renewable energy, some communities have adopted a subsidiary goal that some specified amount of that renewable generation should come from local distributed resources (i.e., small-scale generation connected to the distribution system and sited within jurisdictional boundaries).

Order Point 16 of the Commission's 2019 IRP Order states:[1]

> *"In its next resource plan, Xcel shall account for local clean energy goals, in aggregate, in forecasting and modeling. In particular, the plan should include consideration of local community generation goals for distributed generation."*

In response to this Order Point as well as stakeholder and Commission feedback on our 2021 Integrated Distribution Plan (IDP) and our 2019 IRP, in early 2023, we conducted a survey of the local jurisdictions we serve in Minnesota. Our community relations managers sent the survey via email to 415 cities, townships, and counties in Minnesota. The goal of the survey was to gather complete, detailed information on our communities' goals and specific plans so that we could aggregate and analyze the data in comparison to our forecasts and sensitivities in this Resource Plan. This was necessary not only to attempt to gather a complete picture and holistic representation of our communities' goals, but also because of the widely varying nature of our

[1] ORDER APPROVING PLAN WITH MODIFICATIONS AND ESTABLISHING REQUIREMENTS FOR FUTURE FILINGS, Docket No. E002/RP-19-368, April 15, 2022 (IRP Order).

communities' goals. For example, some community carbon reduction goals use different baseline years. Some goals apply to municipal operations, while others may include residential building energy use. Some communities may have different geographic requirements or carbon accounting approaches. In addition, we understand that some communities may set goals that are intentionally aspirational.

II. SURVEY RESPONSES AND RESULTS

Due to the nature of goal setting in the clean energy landscape, the details and plans vary greatly. For instance, some of our larger cities have very detailed, measurable goals with entire departments devoted to them and complex processes and maps documenting their progress. Other smaller cities have high level vague goals that are no less important to those cities but have fewer resources devoted to them, and therefore have much fewer measurable details and less information to support them. Accordingly, it is hard to summarize such widely varying information from our communities, especially if measurable goals are absent. Due to the wide variation in details, the high-level nature of many plans, and the lack of specific implementation plans and measurable goals, we were not able to confidently aggregate the data and utilize it directly for resource plan modeling purposes, which creates challenges when it comes to system modeling. However, at a high level, below is what we learned from the survey respondents:

Table V-1: Summary of Survey Responses

Survey Responses	Number of Respondents
Invitations Sent	415
Responses	120
Respondents with Goal or Plan[2]	38
Respondents without a Goal or Plan	82
Anonymous respondents with a Goal or Plan	11[3]

Table V-2: Community Goals Summary

Goal Category	Number of Communities	Highest Goal (% by Year)
Distributed Generation	12	30% by 2030
Renewable Energy	18	100% by 2040
Electric Vehicle Adoption	15	100% by 2038
Building Electrification	5	100% by 2038
Carbon Reduction	17	100% by 2028

[2] *Response to Survey Question: "Does your city have a plan that includes at least one of the following: distributed generation, renewable energy, electric vehicle adoption, building electrification (i.e., converting natural gas heating and/or appliances to electric), or carbon reduction from electricity?"*

[3] These 11 respondents that did not identify their community are encompassed in the 38 who had a goal or plan.

In some cases, we were able to supplement the information provided by the survey respondent by reviewing the community's plan document(s) or website. However, due to the limited number of communities that had specific implementation plans and measurable goals, the data we received was not sufficient for us to confidently utilize it for resource plan modeling purposes. Despite this, we believe that our decarbonization and clean energy plans at the system level will meet most communities' goals. In the remainder of this Appendix, we discuss the various ways we support our communities and their clean energy goals, before addressing how our Resource Plan aligns with the themes of community goals identified through our survey and supplemental research. Additionally, we note where our voluntary programs can help our customers and communities achieve their individual objectives.

III. SUPPORT FOR OUR COMMUNITIES AND CLEAN ENERGY GOALS

Xcel Energy has a long history of supporting the communities we serve, and we always want to work with our customers and communities in support of their energy goals. Examples of our partnerships and programs in support of community goals include:

- **Community Relations Managers and Account Managers**. Each community we serve has a Community Relations Manager dedicated to building and maintaining positive relationships and collaborations with municipalities and their residents. Community Relations Managers are a community's first call when exploring new or expanded clean energy and sustainability goals.[4] Dedicated Account Managers help customers – including municipalities – explore program and service options, including renewables, energy efficiency, demand response, rate structures, and more.
- **Partners in Energy (PiE)**. Through the PiE program, the Company provides communities in Minnesota and Wisconsin – as well as Colorado – with no-cost services to develop an energy plan and assistance with implementing that plan. Each community has its own unique energy needs and priorities, and PiE tailors its services to complement each community's vision. Support can include workshop facilitation, outreach support, establishing baselines, scenario planning, documentation, education and outreach, tracking and reporting, and more. There are 38 communities in Minnesota and six in Wisconsin that have participated in or are currently participating in the PiE program.[5] After communities have completed the program, free ongoing support is available. This service includes

[4] https://mn.my.xcelenergy.com/s/community/managers.
[5] https://xcelenergycommunities.com/.

regular meetings, outreach support to promote their energy goals, and energy data tracking.

- **Community Energy Reports**. We provide data and analysis for enrolled communities and municipalities to track their energy and sustainability goals.[6]
- **Renewable Energy Programs**. Our voluntary renewable energy programs – including Renewable*Connect, Renewable*Connect Flex, and net energy metering – were designed to help customers and communities reach their clean energy goals faster.
- **Electric Vehicle Programs**. We have existing, and are developing new, electric vehicle programs to enable fleet electrification, public charging, and more. We have partnered with cities on community charging hubs and offer residential charging programs for customers, which can help cities reach their stated EV penetration goals.
- **Certified Renewable Percentage**. Through our Certified Renewable Percentage offering, retail customers can take credit for the renewable energy portion of electricity delivered through our regular energy mix.[7]
- **Customized support for sustainability initiatives**. In addition to working closely with our communities on energy goals, we partner with our communities when they have non-energy-related sustainability initiatives. For example, we are providing tree clippings from our vegetation management work to the City of Minneapolis in support of the City's biochar program.

In addition to leading the clean energy transition for all our customers – we are committed to working closely with our communities to help them achieve their sustainability goals. While our Resource Plan charts the course to provide Minnesota customers with 100 percent carbon-free energy by 2040, our many voluntary programs and supportive partnerships can help communities achieve specific goals.

IV. MEETING COMMUNITIES' GOALS

A. Clean Energy and Carbon Reduction

Our Preferred Plan complies with Minnesota's 100 percent carbon-free energy standard, which requires the Company to generate or procure carbon-free energy

[6] https://www.xcelenergy.com/community_energy_reports.
[7] Certified Renewable Percentage is currently available in Minnesota and Wisconsin. *See* https://my.xcelenergy.com/s/energy-portfolio/power-generation/certified-renewable-percentage.

equal to 100 percent of its Minnesota retail sales by 2040. Our Preferred Plan achieves 92 percent carbon reduction by 2040, from 2005 levels.

Communities' decarbonization goals vary, and some go beyond the electric sector, encompassing economy-wide emissions. Based on the information received in response to the survey, we believe that the carbon reductions in our Preferred Plan would accomplish most communities' goals, for those that indicated measurable, community-wide renewable or clean energy goals and/or an electric sector carbon reduction goal.

B. Renewable Energy

Our Preferred Plan exceeds Minnesota's 55 percent Renewable Energy Standard (RES) by 2030. Of all the plans that we reviewed, only four had measurable community-wide, system renewable energy goals. Based on the information we received about these four communities from survey respondents, we believe that Minnesota's statewide RES – and therefore our Preferred Plan – aligns with three communities' renewable energy goals – the Cities of Falcon Heights, Maplewood, and Minneapolis.

As noted above, through our Certified Renewable Percentage offering, retail customers can count the renewable energy portion of electricity delivered through our regular energy mix toward their energy goals. In Minnesota, the third-party verified Certified Renewable Percentage was 42.6 percent in 2022, and we anticipate it will continue to increase as the amount of renewable energy on our system increases.

Several jurisdictions that responded to the survey have indicated a goal of 100 percent renewable energy community-wide and/or for their municipal operations. No scenario modeled as part of this Resource Plan – including the Preferred Plan, as discussed in Chapter 5 – achieves 100 percent renewable energy within the planning period. For our communities with a goal of 100 percent renewable energy community-wide (and any customer with renewable energy-specific goals), voluntary renewable energy programs – including Renewable*Connect, Renewable*Connect Flex and net energy metering – can enable customers to claim up to 100 percent renewable energy accurately (i.e., the customer retains the Renewable Energy Credits).

C. Distributed Generation

The IRP Reference Case scenario reflects full compliance with Minnesota's new distributed solar energy standard (DSES), which requires the Company to generate or procure energy from distributed solar equal to three percent of its Minnesota retail sales

by 2030; we estimate that complying with the DSES will require approximately 500 MW of new distributed solar by 2030. The Reference Case also assumes that community solar garden (CSG) deployment reaches its statutory limit. Therefore, our Reference Case – and our Preferred Plan – assumes approximately 2,682 MW of incremental distributed solar through the planning period.[8] We also modeled sensitivities that assume higher levels of "natural" DG adoption – i.e., higher adoption absent any additional incentive payments or other direct actions by Xcel Energy. Finally, we modeled DG solar bundles as a selectable resource option, meaning offering EnCompass choices of different amounts of DG Solar installations for the Company actively procure, similarly to how we procure utility-scale solar. As discussed in Chapter 5: Economic Modeling Framework and Appendix J Distributed Energy Resources, DG bundles selected in the special study may possibly present future opportunities to help achieve community goals.

The IRP process identifies the size, type, and timing of our system's resource needs; it does not identify the location of the resources. As noted above, survey respondents provided data surrounding their distributed generation goals. We believe our Preferred Plan aligns with most of those goals, although we caveat again that the IRP process does not identify resource locations.

D. Electrification and Electric Vehicles

Our High Load modeling sensitivity includes the High EV forecast and High Beneficial Electrification (BE) forecast. The High EV forecast reflects an assumption equal to nearly 670,000 EVs on the road by 2030 and 2 million by 2040, reflecting 20 and 56 percent of registered vehicles in Minnesota, respectively.

Regarding electrification, some jurisdictions indicated goals for building decarbonization. Our High load sensitivity assumes beneficial electrification that exceeds the base forecast. Known electrification projects would be reflected in the base forecast scenario. Quantifying the potential impact of electrification targets for direct use in forecasting and modeling (i.e., converting goals to kW or kWh) is challenging. Given that only a small number of communities have indicated electrification goals, we believe that our High beneficial electrification forecast – which is system-wide – would encompass those goals. Under the High load sensitivity, new load from BE would comprise about 3.5 percent of total energy requirements.

[8] This number includes CSGs, rooftop solar, and the DSES.

V. CONCLUSION

We emphasize again that we are supportive of our communities' clean energy and sustainability goals and aim to help them achieve their objectives. We encourage our communities to work with their Community Relations Manager to discuss their objectives and ways we may be able to help.

We serve 415 cities, townships, and counties across Minnesota, and our integrated Upper Midwest system provides electricity to customers and communities across five states. We are committed to responsible system planning and investments that ensure safe, reliable, affordable electricity for all the communities and jurisdictions we serve. While some customers and communities may have different priorities; indeed, most communities responding to our survey indicated that they did *not* have clean energy-related plans or goals, we are always eager to work with our customers and communities to find ways to help them meet their energy goals while minimizing cross-subsidization.

APPENDIX W – RDF PLANTS

I. INTRODUCTION

The Company is committed to supplying safe, reliable, and affordable energy to our customers while advancing our renewable energy objectives. Xcel Energy's Red Wing, Wilmarth, and French Island Waste-to-Energy Generating Plants are a key component of this strategy by providing a reliable source of baseload power that contributes to the Company's ability to provide reliable renewable energy to Minnesota customers. Unlike other forms of renewable energy, waste-to-energy generating plants can operate around the clock, supplying a consistent source of dispatchable power.

As part of this Resource Plan, the Company extended the life and operations of our Red Wing, Mankato, and French Island renewable Refuse Derived Fuel (RDF) plants. As noted in Appendix H: Resource Options, these plants were slated for retirement in 2027. With this Resource Plan, the Company is extending the operating lives of these plants to 2037, 2037, and 2040 respectively. These plants not only add significant value to our system and help us achieve our renewable energy goals with reliable power, but also provide value to the local communities they serve, including providing: (1) diversification of renewable energy sources; (2) landfill avoided costs and greenhouse gas emissions reductions; (3) encouragement of waste reduction and recycling; (4) green jobs and economic growth; and (5) lower comparative costs thanks to negotiated tipping fees. For these reasons, these plants are a valued resource in not only the Company's generating fleet, but to the communities these plants serve.

Here, the Company provides an overview of the specific operational characteristics of the Red Wing, Wilmarth, and French Island Waste-to-Energy Generating Plants followed by an overview of the environmental and economic benefits of using RDF as a fuel source.

II. XCEL ENERGY'S RDF PLANTS PROFILES

A. Red Wing Waste-to-Energy Generating Plant located in Red Wing, MN

Figure W-1: Red Wing Waste-to-Energy Generating Plant

The Red Wing Waste-to-Energy Generating Plant is in Red Wing, Minnesota. The Red Wing Waste-to-Energy Generating Plant is an integral part of the Ramsey and Washington Counties' Solid Waste program, as well as the Solid Waste programs of the local community and Goodhue County. From 1987 to 2022, the plant burned almost 6,700,000 tons of RDF, which is equivalent to an amount of municipal solid waste (MSW) the size of a football field piled 1.2 miles high that would otherwise have to be put in landfills. Annually, the plant produces enough electricity to power 50 percent of homes within the City of Red Wing.

The two RDF units at the plant are a 24/7 operation and have a capacity of 23 MW total. The two boilers combined burn an average of 200,000 - 220,000 tons of RDF per year depending on preventive maintenance and project schedules. The RDF storage capacity at the site is about 1,000 tons in an existing storage barn. Relevant plant statistics include:

Capacity:	23 MW total
Maximum and Optimal Capacity Factors:	*86%*
Capital and Operating Costs:	*Approx. $5M O&M and $ 2M Capital per year*
Lifetime:	*December 31, 2027*
Decommissioning Costs:	*$ 15.5M*

The facility operates with 28 employees. Plant employees regularly conduct tours for various local clubs, schools, professional organizations, county employees, and elected officials. Recently, the plant has partnered with various community businesses and the Red Wing High School to provide internship opportunities for students through Learn and Earn programs.

B. Wilmarth Waste-to-Energy Generating Plant located in Mankato, MN

Figure W-2: Wilmarth Waste-to-Energy Generating Plant

The Wilmarth Waste-to-Energy Generating Plant is in Mankato, Minnesota. The Wilmarth Waste-to-Energy Generating Plant is an integral part of the Ramsey and Washington Counties' Solid Waste program, as well as the solid waste programs of their local communities. RDF suppliers include Ramsey and Washington Counties, Minnesota Waste Processing Company (portions of Blue Earth, Nicollet, Le Sueur,

and Sibley Counties), and Prairieland (a joint venture of Faribault and Martin Counties). The facility incinerates approximately 2,800 pounds per year of pharmaceutical waste for 13 nearby cities and counties, saving thousands of dollars in disposal costs.

The two RDF units at the plant are a 24/7 operation and have a capacity of 20 MW total. From 1987 to 2022, the plant burned approximately 5,900,000 tons of RDF, which is equivalent to the amount of MSW the size of a football field piled 1.06 miles high. The two boilers combined burn an average of 170,000 – 190,000 tons of RDF per year depending on preventive maintenance and project schedules. The RDF storage capacity at the site is about 1,000 tons in an existing storage barn. Relevant plant statistics include:

Capacity:	20 MW total
Maximum and Optimal Capacity Factors:	*86%*
Capital and Operating Costs:	*Approx. $5M O&M and $ 2M Capital per year*
Lifetime:	*December 31, 2027*
Decommissioning Costs:	*$ 15.9M*

The facility operates with 27 employees. Plant employees regularly conduct tours for various local clubs, schools, professional organizations, county employees, and elected officials.

C. French Island Waste-to-Energy Generating Plant located in La Crosse, WI

Figure W-3: French Island Waste-to-Energy Generating Plant

The French Island Waste-to-Energy Generating Plant is in La Crosse, Wisconsin. French Island is an integral part of the La Crosse County Solid Waste program. Bottom ash, the coarse, granular, incombustible by-product of RDF combustion that is collected from the bottom of furnaces, is beneficially disposed of in the La Crosse County landfill as daily cover. To date, the plant has disposed of and recovered energy from over 2.6 million tons of wood waste and railroad ties and nearly 1.8 million tons of RDF thereby keeping it out of the La Crosse County landfill. Our partnership has saved about 40 percent of the landfill's airspace annually since 1988. The county and the plant have also partnered on ferrous and non-ferrous recycling. The plant recycles over 1,000 tons of ferrous metal and over 250 tons of non-ferrous metals annually.

Unique to the plant is the French Island Resource Recovery Facility, which allows it to accept MSW directly. French Island's Resource Recovery Facility has the capacity to process about 100,000 tons of MSW each year. Processing of the MSW removes non-combustible materials from the waste, then chops and shreds it into a uniformly sized fluffy product known as RDF that is blown into the boilers and burned with wood waste.

The two generating units at the plant are a 24/7 operation and have a capacity of 18 MW total. The French Island Waste-to-Energy Generating Plant Unit 1 and Unit 2 boilers use RDF, unmodified wood waste, and railroad ties as their primary fuels. The two boilers combined burn an average of 55,000 tons of RDF per year and 55,000 – 65,000 tons of wood waste and railroad ties per year. From 1987 to 2022, the plant burned almost 1.8 million tons of RDF, which is equivalent to an amount of MSW the size of a football field piled 0.32 miles high. Relevant plant metrics include:

Capacity:	18 MW Total
Maximum and Optimal Capacity Factors:	*55%*
Capital and Operating Costs: Approx.	*$5M O&M and $2M Capital*
Lifetime:	*June 30, 2030*
Decommissioning Costs:	*$17.0M*

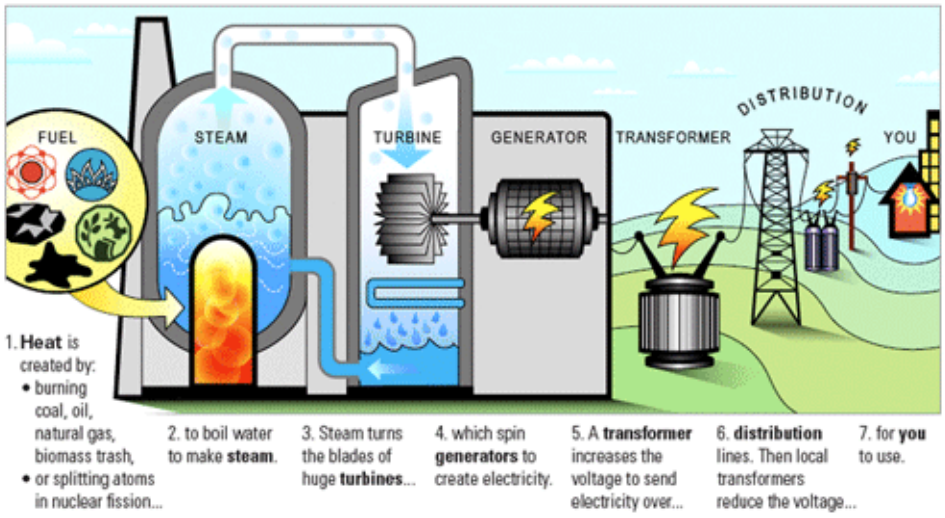
The French Island Waste-to-Energy Generating Facility operates with 31 employees. Recently, plant employees began providing educational outreach about the safe disposal of lithium-ion batteries to help keep them out of the waste stream. Plant employees regularly conduct tours for hundreds of people annually, including local clubs, schools, professional organizations, engineering firms, environmental students, county employees, and elected officials.

Capital improvements for the plants over the next five years will primarily be focused on reliability and environmental compliance. Examples of reliability improvements include boiler section replacements, fuel and ash conveyor rotating assembly replacements, and steam turbine blade replacements. Examples of environmental compliance projects include baghouse bag replacements and continuous emission monitoring analyzer replacements.

III. OPERATIONAL CHARACTERISTICS

The Company's waste-to-energy plants use the same basic principles common to all thermal generators. The process starts with combustion of RDF in a boiler. This combustion releases heat, which is used to boil water. Second, the steam is directed to flow through the blades in the steam turbine. Third, the high-pressure steam spins the turbine blades, converting thermal energy into mechanical energy. The spinning turbine is connected to a shaft in the generator. Fourth, as the turbine spins, the shaft in the generator turns a magnet surrounded by coils of copper wire. This induces the flow of electrons, generating electricity that can then be fed into the grid. This process is outlined in Figure W-4 below.

Figure W-4: Process of Converting RDF into Electricity by Way of Combustion



Though this general process is common to all thermal plants, we discuss the specifics of the plants boiler and combustion systems, emissions controls, and environmental monitoring of the Company's waste-to-energy generating plants below.

A. Boiler and Combustion System

The Red Wing Waste-to-Energy Generating Plant was built in the late 1940's as a coal-fired facility. Unit 1 began commercial operation in October 1949 and Unit 2 began commercial operation in November 1949. The plant was converted from coal to RDF in 1987. Both of Red Wing's units consist of a 40's vintage Foster Wheeler designed refuse derived fuel-fired boiler, which supplies steam to a tandem compound, single flow condensing General Electric steam turbines. The nameplate capacity of each steam turbine is 11.5 MW. The boilers are designed as a natural circulation boiler with a balanced draft furnace and basket style air heater. They can achieve a design rating of 125,000 pounds per hour steam flow at 625 pounds per square inch outlet pressure and 825 degrees Fahrenheit superheater outlet temperature. Cooling water for Unit 1 and Unit 2 is supplied to the condenser from the Mississippi River.

The Wilmarth Waste-to-Energy Generating Plant was built in the late 1940's as a coal-fired facility. Unit 1 began commercial operation in 1948, while Unit 2 began commercial operation in 1951. Wilmarth's two units were converted to burn RDF in 1987. Both units consist of a natural circulation boiler designed by Babcock and Wilcox for 125,000 pounds per hour steam flow at 675 pounds per square inch outlet pressure and 825 degrees Fahrenheit. The boilers also have a balanced draft furnace, and basket

style air preheater. The boilers supply steam to two Allis Chalmers steam turbines. Both steam turbines are tandem compound, single flow condensing units with a nameplate rating of 10 MW. Cooling water for Unit 1 and Unit 2 is supplied to the condenser from the Minnesota River.

The French Island Waste-to-Energy Generating Plant was built in the 1940's as a coal-fired facility. Unit 1 began commercial operation in 1940, while Unit 2 began commercial operation in 1948. Both were converted to burn oil in the early 1970's. When oil became too costly, alternative fuels needed to be used. Unit 2 was converted to burn waste wood and RDF in a balanced draft Fluidized Bed Combustion Boiler in the early 1980's, with Unit 1 following in 1987. There are also two oil-fired combustion turbines on-site to meet peak generation demands that have a combined capacity of 159 MW in the winter.

French Island's Unit 1 consists of a refuse derived fuel-fired fluidized bed boiler designed by Energy Products of Idaho for 150,000 pounds per hour steam flow at 450 pounds per square inch outlet pressure and 750 degrees Fahrenheit superheater outlet temperature. Unit 2 consists of a refuse derived fuel-fired fluidized bed boiler designed by Edgemoor Ironworks for 150,000 pounds per hour steam flow at 450 pounds per square inch outlet pressure and 750 degrees Fahrenheit superheater outlet temperature. Both boilers have a balanced draft furnace and a tubular air preheater. They also supply steam to two Allis Chalmers steam turbines. Both steam turbines are tandem compound, single flow condensing units with a normal capacity of 8 MW. Cooling water for Unit 1 and Unit 2 is supplied to the condenser from the Mississippi River.

The Company's waste-to-energy plants have a comprehensive safety and maintenance program, which includes regular inspections of critical components, ongoing maintenance and repair activities, and a comprehensive training program for operators and maintenance personnel. In addition, the plants have several safety features and systems in place to ensure safe and reliable operation.

B. Emission Controls

The Red Wing, Wilmarth, and French Island Waste-to-Energy Generating Plants have received several periodic updates to ensure that they exceed the compliance requirements of all applicable environmental regulations. The plants utilize one or more of the following emissions control systems:

- Flue gas desulfurization systems, which remove sulfur dioxide from the flue gas using a wet or dry scrubbing process.
- Selective non-catalytic reduction (SNCR) systems, which reduce nitrogen oxide emissions by injecting ammonia or urea into the combustion chamber.
- Baghouse filters, which capture particulate matter (such as ash) from flue gas.
- Activated carbon injection systems, which capture mercury and other hazardous air pollutants in the flue gas.
- Continuous emissions monitoring systems, which measure the levels of various pollutants in the flue gas.

The Red Wing Waste-to-Energy Generating Plant employs a combination duct scrubber and baghouse to effectively reduce emissions from burning RDF. The scrubber treats the flue gas with a water spray and dry lime, while the baghouse traps particulate matter, including mercury, dioxins, and metals, by forcing flue gas streams through large, microfiber filter bags.

The Wilmarth Waste-to-Energy Generating Plant employs a combination scrubber and baghouse to effectively reduce emissions from burning RDF. The scrubber treats the flue gas with a water spray and lime slurry while the baghouse traps particulate matter, including mercury, dioxins, and metals, by forcing flue gas streams through large, microfiber filter bags.

The French Island Waste-to-Energy Generating Plant also uses a duct scrubbing system using dry lime injection to help further decrease emissions of sulfur dioxide and hydrogen chloride. Bag houses efficiently collect particulate matter, including mercury, dioxins, and metals such as lead and cadmium, to minimize their release to the air. A selective non-catalytic reduction system on both boilers helps reduce emissions of nitrogen oxides and an activated carbon injection system helps to further reduce emissions of mercury and dioxins/furans.

C. Environmental Monitoring

The Red Wing, Wilmarth, and French Island Waste-to-Energy Generating Plants have several environmental monitoring programs in place to ensure that they operate in compliance with all applicable environmental regulations. These programs include:

- Water Quality Monitoring, which measures thermal limitations of the water discharged from the facilities.

- Annual Air Performance Monitoring, with stack testing for metals as part of their environmental permits with pollution control.
- Quarterly ash testing.

In addition, we conduct continuous air quality monitoring, which monitors the levels of various pollutants (such as carbon dioxide, nitrogen oxide, sulfur dioxide, and particulate matter) of the flue gas leaving the facilities. We've outlined the results of the most recent testing in Table W-1 below.

Table W-1: 2022 Waste-to-Energy Generation Plant Emissions Profiles

OpCo	Plant	Unit	Year	CO_2 MT/MWh*	CO_2 Lbs./MWh*	NOx Lbs./MWh	SO_2 Lbs./MWh
NSP-M	Red Wing	1&2	2022	0.85	1887	5.27	5.59
NSP-M	Wilmarth	1&2	2022	0.66	1470	5.45	5.69
NSP-W	French Island	1&2	2022	0.54	1196	9.67	1.36

* Biogenic CO_2 emissions are excluded for both the MT/MWh and lbs./MWh.

The Company takes great care to ensure that the RDF incinerated at our facilities does not contain unacceptable waste and is reliable for use in our waste-to-energy power plants. The RDF undergoes rigorous testing to ensure that it meets our fuel specifications, and the plants work closely with waste processors and haulers to ensure that RDF is processed in a way that is safe and sustainable.

IV. BENEFITS OF RDF PLANTS

The Company's waste-to-energy generating plants utilize renewable RDF. RDF is produced from MSW that has been processed and shredded. MSW consists of most waste discarded by society that is no longer needed or recyclable. Our waste-to-energy generating plants process a significant amount of MSW (either as RDF or directly as MSW) that would otherwise be sent to landfills, thereby reducing the amount of waste that needs to be landfilled and the associated environmental risks. When RDF is combusted, there is typically a 90 percent reduction in volume and 75 percent in weight.

Our plants utilize solid waste derived from non-recyclable waste, the use of which supports a circular economy by turning waste to energy, increasing the recycling of steel and nonferrous metals, and reducing greenhouse gas emissions. The Company's waste-

to-energy generating plants are a valuable part of our generation fleet, and can help address challenges of energy security, climate change, and waste management, making them an important part of a sustainable energy system now, and into the future.

A. Diversification of Energy Sources

The Company's waste-to-energy generating plants contribute to diversification by providing a source of renewable energy that is independent of weather conditions. This reliable source of renewable energy is increasingly important as we continue to transition to higher levels of variable renewable penetration to meet Company and state policy objectives. -RDF acts as a complimentary fuel to solar or wind, as these resources are intermittent. Possessing a reliable source of renewable energy will help to address the issue of intermittency, and through fuel diversity enhances the overall stability of the system. Overall, the Company's waste-to-energy generating plants play a key role in diversifying our energy mix to maintain reliability and improve the sustainability of our system.

B. Landfill Avoided Costs and Greenhouse Gas Emissions Reduction

The Company's waste-to-energy generating plants reduce greenhouse gas emissions by diverting waste from landfills and by supplying advanced pollution control technologies thus contributing to the generation of renewable energy and earning renewable energy credits (RECs). As mentioned previously, RDF plants can process a significant amount of MSW that would otherwise be sent to landfills. This results in avoided landfill development cost, and greenhouse gas emission reductions.

Xcel Energy's waste-to-energy generating plants significantly reduce the volume of waste that would otherwise go to landfills. By diverting waste towards energy conversion, this saves airspace at and prolongs the life of the landfill. This reduces the need for new landfills or expansion of existing sites, resulting in costs savings from avoided landfill development. Though the costs of landfill development may vary depending on the costs for land, construction of infrastructure, managing the landfills, and varying soil conditions, using estimates from existing landfills, we estimate our waste-to-energy generating plants have avoided more than $2.6 million per year in total, as shown in Table W-2.

Table W-2: Estimated Avoid Costs by Landfill

Avoid Costs by Landfill	Annualized
LaCrosse County	$ 332,547
Ponderosa (Blue Earth Co.)	$ 162,133
Pine Bend	$ 2,044,597
City of Red Wind	$ 82,733
Prairieland	$ 44,235
Total Avoided Costs	**$ 2,666,244 per year**

Using these numbers, we estimate the Company's Red Wing, Wilmarth, and French Island Waste-to-Energy Generating Plants have provided a combined adjusted total avoided cost of over $91 million over their operating lives. We expect similar annual avoided costs of approximately $ 2.6 million going forward. While the Company does not realize any portion of these savings, they represent significant value to the plant host communities in terms of avoided cost.

Further, our Red Wing, Wilmarth, and French Island Waste-to-Energy Generating Plants reduce greenhouse gas emissions over the landfill alternative. In our resource planning efforts, generally EnCompass evaluates all the costs to our system of (in this case) operating or retiring the plants, including accounting for the plants' own emissions. However, EnCompass does not account for the emissions that would occur from alternate waste disposal if the plants close. Landfills produce methane, a potent greenhouse gas, and other gases, as waste decomposes. By diverting waste from landfills, waste-to-energy generating plants reduce the overall amount of methane released into the atmosphere.

The Company partnered with the State University of New York at Buffalo to conduct an analysis of greenhouse gas emissions from our waste-to-energy generating plants compared to the landfill alternative. A lifecycle comparison of the two scenarios—operating the plants through 2050 versus closing them and disposing of the waste some other way—was conducted in which the resulting CO_2 equivalent emissions were compared with the emissions of methane, converted to CO_2 equivalent terms using global warming potential. We provide the University at Buffalo's study as Appendix W1: University at Buffalo Waste-to-Energy Report.

As explained in Appendix W1, overall, our waste-to-energy plants provide a net greenhouse gas emissions reduction over the landfill alternative. The study estimates that continued operation of Xcel Energy's Red Wing, Wilmarth, and French Island

Waste-to-Energy Generating Plants from 2023 – 2050 would provide a social cost of carbon savings of $16 million versus the alternative of landfilling the waste.[1]

C. Encouragement of Waste Reduction and Recycling

Based on the findings of the study, the following recommendations were made to further reduce the climate impact of the Company's waste-to-energy facilities:

- Recycling efforts, including pre-combustion sorting of MSW streams and post-combustion sorting of ash, should be expanded.
- Establishing and/or expanding partnerships with the intention of securing a waste feedstock with elevated biogenic fraction should be pursued, especially given external composting efforts that remove food waste from MSW.
- Given the low impact of transportation and supplemental fuel on net GHG emissions, emission reduction effort should focus on the waste stream and MSW incineration.
- Identifying steam customers would displace additional emissions from facility footprints.

Our waste-to-energy facilities are part of the solution for addressing waste management. The Red Wing, Wilmarth, and French Island Waste-to-Energy Generating Plants are not only an important contribution to our generating fleet but are instrumental to meeting the Minnesota Pollution Control Agency (MPCA)'s Solid Waste Management Policy Plans.

The MPCA's waste hierarchy prioritizes waste management strategies to minimize environmental impact. At the top of the hierarchy is waste prevention, which aims to reduce waste generation at the source. This is followed by reuse, which encourages the use of products in their original form rather than disposing of them. Recycling comes next, focusing on converting waste materials into new products. Composting is also a part of this tier, turning organic waste into valuable soil amendments. Composting is followed by waste-to-energy conversion, which is preferable to both the landfill with methane collection and straight landfill alternatives.

We have included the waste hierarchy in Figure W-5. This hierarchy serves as a guideline for individuals, businesses, and policymakers to make more sustainable choices in waste management.

[1] Assuming a 28 times global warming potential for methane. If a 35 times global warming potential is assumed for methane, the carbon savings increases to $73 million.

Figure W-5: MPCA Waste Hierarchy

Waste-to-energy conversion is considered preferable to landfilling for several reasons including the noted energy recovery, but also waste diversion and volume reduction, greenhouse gas emissions reduction, supporting better waste management practices, and supplying green jobs and economic growth. While waste-to-energy conversion of RDF itself is not directly involved in recycling, its utilization does contribute to sustainable waste management practices and indirectly supports recycling efforts.

In fact, studies suggest communities with waste-to-energy plants have a recycling rate approximately five percent higher than the national average.[2]

MSW is a nonhomogeneous product that contains noncombustible materials. Some noncombustible material in MSW can be reclaimed and recycled. The processing of RDF typically involves four main steps. First, the MSW is collected and transported to a resource recovery facility where it is unloaded and sorted. Second, MSW is pre-processed to remove non-combustible materials such as metals, glass, and stones. In the stages of processing following the separation of ferrous metals, disc screening and air classification are used to separate combustible materials. At this state of the process, aluminum beverage cans and other aluminum materials are removed by eddy current separation. The remaining waste is then shredded and screened. Third, the shredded waste is further separated into various components, including RDF, which is a high-energy content fuel consisting of combustible materials such as paper, cardboard, plastics, and textiles. Finally, near the end of the process line, a shredder is used to further reduce and size the RDF product. A second magnet at this location is again used to remove additional ferrous metals before the RDF is ready to be burned.

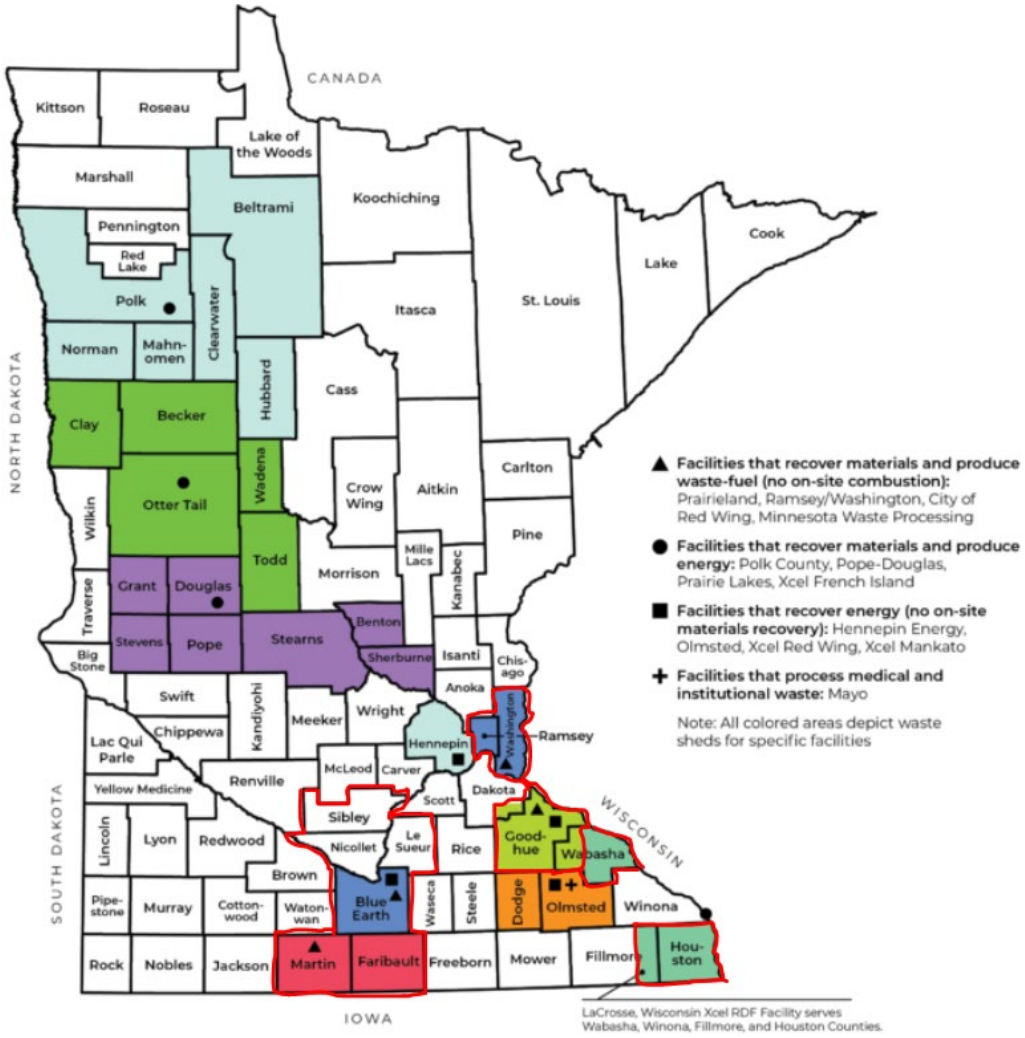
Through multiple points in the MSW to RDF process, and further in RDF processing, ferrous materials are recovered for recycling. This helps catch recyclable materials that were mistakenly discarded. By incorporating RDF as part of the waste management strategy, recycling efforts are complemented by maximizing resource use and minimizing waste disposal, moving waste management up the waste hierarchy.

The Company's waste-to-energy generating plants are an integral component of the MPCA's Metropolitan Solid Waste Management Policy Plan for 2016 – 2036.[3] The MPCA's Metropolitan Solid Waste Management Policy Plan establishes a framework for managing waste in the seven-county metro through setting regional objectives and strategies by setting goals for source reduction, recycling, and organic recovery; using existing resource recovery facility capacity; and minimizing land disposal. While the Metropolitan Solid Waste Management Policy Plan is a 20-year plan, counties and solid waste management districts outside the seven-county metro area must prepare and implement detailed solid waste management plans every 10 years. Figure W-6 below shows Minnesota counties that rely on Minnesota Resource Recovery Facilities within Minnesota. Outlined by a red line are portions of 13 Minnesota counties that are served by the Company's waste-to-energy plants.

[2] Berenyi, E. B. (2009). *Recycling and Waste-to-Energy: Are They Compatible? 2009 Update*. Westport, CT: Governmental Advisory Associates, Inc. https://www.ecomaine.org/wp-content/uploads/2020/06/Berenyi-GAA-2009.pdf

[3] *See* https://www.pca.state.mn.us/sites/default/files/w-sw7-21.pdf.

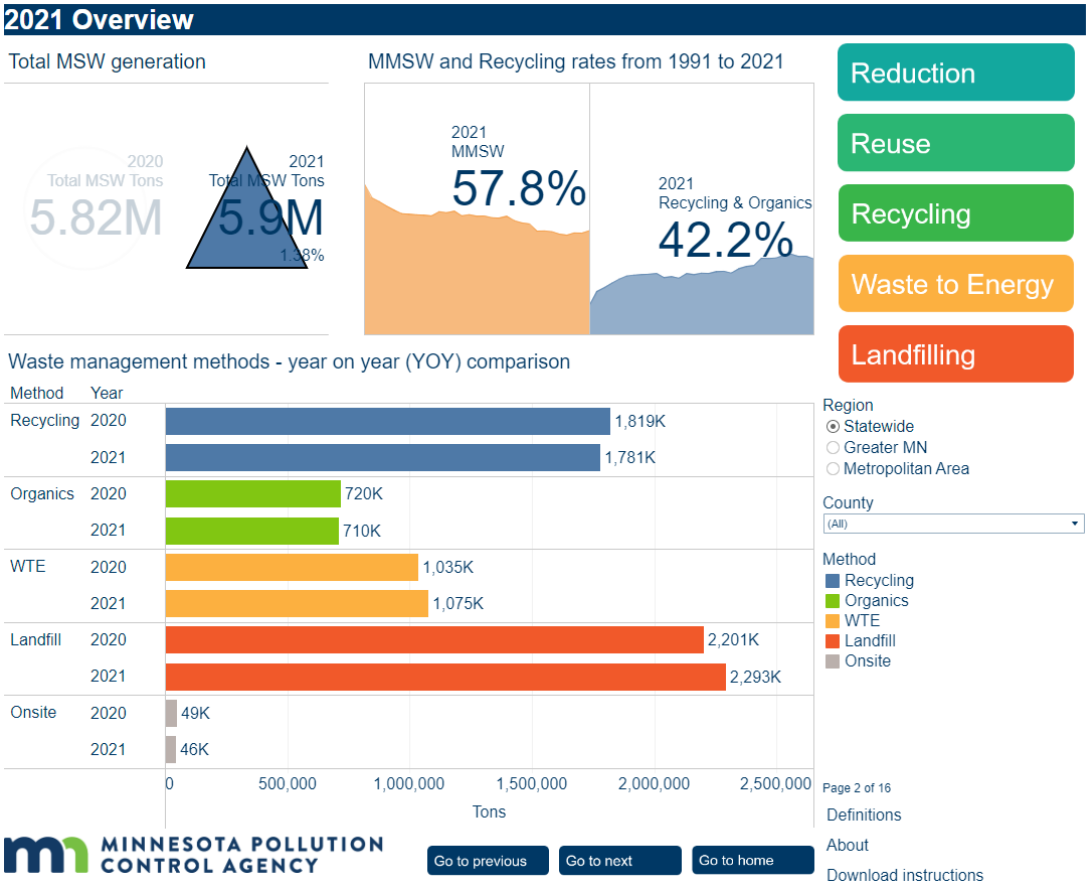
Figure W-6: Minnesota Counties Served by RDF and Waste-to-Energy Generating Plants[4]



The MPCA annually publishes a report summarizing information submitted by all 87 counties and the Western Lake Superior Sanitary District Regarding Select Committee on Recycling and Environment (SCORE) Activities detailing trends in waste generation, management and disposal. Figure W-7 shows the dashboard data from the report. Data from the report helps the MPCA and local units of government develop policy and plans to manage waste in a manner that protects the environment and human health.[5]

[4] Adapted from Minnesota Resource Recovery Association; *see* http://mnresourcerecovery.com/index.php/mrra-facilities/.
[5] *See* https://www.pca.state.mn.us/air-water-land-climate/understanding-solid-waste.

Figure W-7: MPCA 2021 SCORE Report Data for Minnesota Waste Management[6]



According to the SCORE report, in calendar year 2021 in Minnesota, MSW increased year-over-year by 1.4 percent; while the combined recycling and organics rate is 42.2 percent in 2021, which represents a 1.9 percent year-over-year decline from 2020.

In 2021, the Company's waste-to-energy plants converted 6.5 percent (378,461 tons) of Minnesota's total Mixed Municipal Solid Waste (approximately 5.9 million tons) into electricity. Red Wing and Wilmarth Waste-to-Energy Generating Plants together contributed approximately 35 percent of Minnesota's total waste-to-energy conversion. Overall, waste from portions of 13 Minnesota counties is converted to electricity at the Company's waste-to-energy generating plants.

[6] Available at https://public.tableau.com/app/profile/mpca.data.services/viz/2021SCOREReport/2021SCOREreport?:tabs=n.

We are taking steps to further address the recommendations noted in the University at Buffalo's study in a number of ways. For example, we are exploring ways to increase recycling in the waste-to-energy production stream – from evaluating cost sharing of an eddy current investment with our RDF providers to increase their recycling rates for non-ferrous materials, to evaluating using an ash drum magnet to further increase our own ferrous recovery within our plants. We are implementing win-win community service programs, such as free disposal of storm damaged trees to increase the biogenic fraction of our fuel. We are also interested in reducing transportation emissions, and we are in the early stages of evaluating a hydrogen-powered trucking option.

RDF contributes to a circular economy by ensuring that the maximum value is extracted from waste materials. By recovering energy from such waste, RDF helps close the loop by preventing valuable resources from being wasted and contributing to overall sustainability goals. While co-generation or district heating customers would further reduce global warming for the sites because it would decrease methane consumption for building heating, our plants are generally far from large loads. This means the capital investments of such projects are not justified.

D. Green Jobs and Economic Growth

The Company's Red Wing, Wilmarth, and French Island Waste-to-Energy Generating Plants provide several economic benefits to the communities where they are located. The waste-to-energy plants provide stable, well-paying employment opportunities for local workers, helping to stimulate economic growth, and improve quality of life in their community.

Furthermore, the plants supply employment and economic benefits through supporting the local waste streams that supply RDF at our waste-to-energy plants. The Company contracts with various suppliers and municipalities to procure RDF or MSW. RDF suppliers include:

- Recycling and Energy Board made up of Ramsey and Washington Counties.
- Prairieland (a joint venture of Faribault/Martin Counties, which also receives some waste from Truman County).
- The City of Red Wing, Minnesota, (which takes waste from Goodhue County).
- Minnesota Waste Processing Company (a private company that takes waste from portions of Blue Earth, Le Sueur, Sibley, and Nicollet Counties).

Fuel Supply contract negotiations for our next 10-year term have been limited to our largest fuel provider, the Renewable & Energy Center (R&E) representing Washington

and Ramsey Counties. Recently, we executed a letter of intent with the Recycling and Energy Board to negotiate in good faith a new 10-year agreement. The maintenance fees and volumes of fuel per year are part of ongoing negotiations. However, once these are understood, we will be reaching out to our other three fuel providers for similar conversations.

The continued operation of local MSW to RDF processing plants support waste recycling steams which require technical expertise, and supply employment opportunities for local workers. By locally sourcing RDF, we are supporting local jobs and businesses, and supplying a market for waste haulers and processors. This supports local economies and creates jobs in the communities where we operate, furthering economic development and improving the quality of life in the community. In 2021, the Company's waste-to-energy plants supported 200 local jobs. Annually, the sites contribute $2 million of tax revenue and spend approximately $3.5 million on goods and services in the community.

In addition to supplying employment opportunities, the Company's waste-to-energy plants help to enhance the overall environmental quality of their communities through reducing the amount of waste that goes into landfills, thereby helping to reduce greenhouse gas emissions and other potential environmental pollutants. The sites ease community fears of ground water contamination from nearby landfills and have also reduced local landfill footprints by 26 million cubic yards from 1987 to 2020. These environmental benefits further contribute to economic growth and social well-being of the communities that they serve.

E. Lower Comparative Costs

The Company's Red Wing, Wilmarth, and French Island Waste-to-Energy Generating Plants charge maintenance fees to help offset the costs of their operation and cover the costs of any needed plant improvements. The maintenance fee refers to the fee charged to waste management companies for disposing of their waste at the generating plant. In other words, it is the cost associated with maintaining the plants so that the waste providers can continue processing and delivering RDF. The maintenance fee serves as a revenue source for the waste-to-energy plants and helps cover the operational and maintenance costs associated with waste management and energy recovery processes.

The maintenance fee is lower than the tipping fee to dispose of unprocessed MSW into a landfill, so this arrangement is financially advantageous to both parties. The Company receives invoices from RDF suppliers which contain two components. The first is the maintenance fee, which is a credit to the Company that offsets the higher plant maintenance costs resulting from the nature of burning RDF and needed plant

improvements. The second is a fuel charge component, which is paid by the Company to the suppliers for the RDF burned at the plants.

The fuel charge fee is typically based on the weight or volume of waste delivered to the facility. The maintenance fee is dependent on several factors, including the location, size of the plant, local regulations, waste composition, and market conditions. These fees are negotiated through contracts between the Company and the waste management companies servicing the specific waste-to-energy generating plants. In 2021, each plant collected the following maintenance fees:

Red Wing	$ 4,402,799
Wilmarth	$ 3,163,474
French Island	$ 2,750,679

It is worth noting that maintenance fees can vary widely and may be influenced by factors such as transportation costs, labor expenses, needed capital investments, chemical costs, plant specifics, and the overall competitiveness of the waste management industry in proximity to the plant.

We refund to electric customers the maintenance fee revenues we collect at the Red Wing and Wilmarth plants (with the caveat that we forecast the maintenance fees when determining the amount of the credit in our rate cases). The credit/refund gets credited back in base rates.

V. CONCLUSION AND SUMMARY OF KEY POINTS

The use of RDF as a fuel source at the Red Wing, Wilmarth, and French Island Waste-to-Energy Generating Plants provide significant environmental and economic benefits. Extending the operating lives of the Red Wing, Wilmarth, and French Island is in the best interest of our customers, our employees, and the communities we serve. We have detailed a plan for the continued safe, reliable operation of these facilities, and we are committed to ensuring that the facilities continue to operate in compliance with all applicable regulations and in a manner that supports sustainable waste management practices.

Current and Future Life Cycle Greenhouse Gas Emissions Modeling for Xcel Energy Waste-to-Energy Facilities

Spring 2023

Report Completed by:

University at Buffalo, The State University of New York

Disclaimer: This is an academic study completed by researchers at the State University of New York's University at Buffalo, in partnership with Xcel Energy, Inc. Findings are those of the independent research team and may or may not align with the positions and views of the company.

Executive Summary:

Researchers from the University at Buffalo (The State University of New York) completed a life cycle assessment study to quantify greenhouse gas emissions associated with Xcel Energy, Inc. waste-to-energy (WTE) facilities at Red Wing, Wilmarth, and French Island. The study is novel and has added industrial relevance because it considers actual input data for each of the three facilities, provided to the research team by Xcel engineers and scientists. Importantly, comparisons are made between emissions associated with the in-use WTE facilities and landfill alternatives that would be most likely to accept the waste if the incineration facilities did not exist. Emissions for both the in-use and alternative scenarios were modeled from 2019 to 2050, considering expected changes in the respective regional waste management sectors as well as increasingly carbon-neutral electricity production portfolios. Finally, the study considered two different global warming potential (GWP) values for methane, 28 and 35, accounting for the gradually increasing warming impact of methane relative to carbon dioxide. Data from the United States Environmental Protection Agency's Waste Reduction Model (WARM) was used to quantify equivalent CO_2 emissions for all scenarios.

2019-2050 Cumulative Emissions Results: Landfill comparisons highlight the climate benefits of WTE, as 5 of the 6 modeled scenarios show reduced (10 – 58%) cumulative GHG emissions from 2019 to 2050 for WTE compared to landfilling. The 6th scenario (Red Wing, methane GWP = 28) shows similar emissions for both options (2% fewer emissions for landfilling). Given the study's reliance on real inputs, the research team believes that this work serves as a strong endorsement of the climate benefits of WTE compared to landfilling alternatives.

2019 Facility-Level Data: The analysis found that, for 2019, a year considered to be representative of typical operation for all three facilities, GHG emissions for the three Xcel facilities are most substantially caused by the waste combustion process. Compared to this, combustion of supplemental and transportation fuels are not substantial emissions sources. While the masses recycled by the three facilities are small (1-4% of the incoming waste streams, by mass, is recycled), the displaced GHG emissions from this pre-combustion sorting are substantial (negative emissions equaling 11-18% of total facility emissions). The opportunity to sort MSW streams before processing is unique to WTE and should be expanded, as reasonably possible. Displaced emissions due to electricity generation account for about 25% of total facility emissions for Red Wing and Wilmarth, and about 50% for French Island owing to that facility's substantial biogenic waste component.

Recommendations: Based on the findings of this study, the following recommendations are made to further reduce the climate impact of Xcel's WTE facilities:

- Recycling efforts, including pre-combustion sorting of MSW streams and post-combustion sorting of ash, should be expanded.
- Establishing and/or expanding partnerships with the intention of securing a waste feedstock with elevated biogenic fraction should be pursued, especially given external composting efforts that remove food waste from MSW.
- Given the low impact of transportation and supplemental fuel on net GHG emissions, emission reduction effort should focus on the waste stream and MSW incineration.
- Identifying steam customers would displace additional emissions from facility footprints.

Introduction:

The United States (US) generates waste at a rate of 4.5 to 5.0 pounds per day per person (lb/day/person) (US EPA, 2023a). About 35% of this municipal solid waste (MSW) is recycled or composted, leaving nearly 3 lb/day/person for disposal in landfills or waste-to-energy (WTE) facilities – totaling about 170 million tons per year in the US (US EPA, 2023a). It is estimated that US residents waste about 1 lb/day of food, only about 5-6% of which is composted (US EPA, 2023a). Organics collection for post-consumer composting requires sorting at the consumer-level, which, while growing in popularity, remains quite limited across the US. In other words, there is a significant amount of curbside and industrial waste that must be managed in a landfill or a WTE facility – other options do not exist for these types of waste without significant changes in existing waste management infrastructure, including sorting technology. It is notable that WTE facilities are better able to support some degree of pre-processing sorting than landfills, with many already having associated infrastructure in place.

While US society is increasingly aware of its elevated consumption and correspondingly high waste generation rates, from 1990 to 2018, per capita US waste generation was mostly stagnant, fluctuating between 4.4 and 4.8 lb/day (US EPA, 2023a). In 2018, based on mass, landfills are more than four times more popular than WTE for MSW in the US, accounting for about 50% of total waste handled, compared to 12% for WTE. As a contrasting example, Taiwan processes a substantial fraction of its waste in WTE facilities (Chen, 2018; Tsai *et al*., 2006; Tsai *et al*., 2020). Among developed countries, the US is unusually dependent upon landfills. The state of Minnesota has a higher reliance on WTE than much of the rest of the US, but it still only processes about 30% of its MSW in WTE facilities.

In the US, landfilling is, relatively, convenient and inexpensive. There are over 2,500 landfills in the US, compared to only 75 WTE facilities (in 25 states) (US EPA, 2023b; US EPA, 2023c). Factors limiting WTE industry growth, according to the US Environmental Protection Agency (EPA), include no need to conserve space (i.e., the US is a large country), WTE's complicated design and operation, and its elevated capital costs relative to alternative waste management options. Additionally, EPA reports general public opposition to WTE, due in part to an outdated, although previously justified, belief associating WTE facilities with harmful air pollution (US EPA, 2023c). From 1990 to 2005, due to EPA's Maximum Available Control Technology standards, national emissions of particulate matter and mercury from MSW facilities, as examples of representative air pollutants, dropped by 96%. Other significant reductions are well-documented for polychlorinated dibenzo-p-dioxins and dibenzofurans (> 99% reduction, nationally). MN air pollution control standards are even more stringent than federal policies. In other words, strict permits have allowed air pollutant emissions to be maintained well-below regulated levels. Moreover, space and cost issues should not be deciding factors in choosing between waste management technologies – an updated approach is required.

Given the increasing need to address global climate change, resulting from across the board rising greenhouse gas (GHG) concentrations (including both methane [CH_4] and carbon dioxide [CO_2]) and an increasing US focus on reducing methane emissions (see: Global Methane Pledge, US Methane Emissions Reduction Action Plan, New York State Climate Scoping Plan, etc.) due to the substantial difference in Global Warming Potential (GWP) between methane (a landfill product) and CO_2 (a WTE/combustion product), this work proposes that climate implications must be used to inform decision making associated with final management options for waste disposal (The White House, 2021; Climate & Clean Air Coalition, 2023; NYS, 2023).

The decomposition process for biogenic waste in landfills (i.e., waste that originates from plants and plant products in which carbon content was fixed by photosynthesis) in anaerobic conditions generates methane, a fuel and a potent greenhouse gas. If captured, this biologically produced methane can be converted into renewable natural gas and used to displace other gas directly or for electricity production, thereby displacing emissions from fossil fuel combustion. If released, however, the methane is 28 (100-yr Global Warming Potential, GWP) or 86 (20-yr GWP) times as problematic as the equal mass of CO_2. Note that while 28 is the currently favored GWP applied for methane in federal documentation, there is an increasing number of legislators, scientists, and scientific bodies reporting the higher, 20-yr GWP because of methane's short lifetime in the atmosphere (approximately 12 years, compared to approximately 100 years for CO_2). In this report, conservative values of 28 and a slightly elevated 35, based on anticipated increases in GWP levels, are applied. Anthropogenic carbon-based products, often associated with materials produced from fossil fuels and including long-lived plastic materials, and metals contribute minimally to excess GHG emissions at landfills but, of course, would be better handled via upstream recycling.

Currently, state-of-the-art MSW landfills capture up to about 65% of generated methane throughout their estimated 100-year lifetimes, meaning that even in a best-case-scenario, much of the produced methane is released to the atmosphere. Lower values have been reported, including 48% average landfill gas collection efficiency in a recent paper analyzing 396 operating US landfills (Themelis and Bourtsalas, 2021). Those landfills that do collect the gas can flare it (i.e., convert the high GWP CH_4 into low GWP CO_2 through combustion), use it as an energy source, or sell it as "green" natural gas. With that said, many landfills have no existing methane collection system associated with their processing, openly releasing CH_4 into the atmosphere. Flaring also

requires supplemental fuel consumption and can generate air pollution, including nitrogen oxides. For landfills without flaring, other air emissions are minimal, but soil and groundwater pollution can be problematic.

Many modeled case studies exist for GHG emissions from both landfills and WTE, considered separately. Often, these are prepared in support of municipality waste management plans. More recently, several studies that quantitatively compare GHGs from the two facility types using models were completed (Aracil *et al*., 2018; Monni, 2012; Woon and Lo, 2013). Results from these analyses consistently disagree, however, and there remains a lack of clarity in the literature about the role ultimate waste disposal options play in reducing GHG emissions. This is due to, at least, variable assumptions regarding waste composition, steam generation, and methane capture rate for landfills and waste composition, steam generation, and transportation distances for WTE. Clarifying the analysis through the use of actual data provided by Xcel is expected to improve accuracy and relevance, providing a better roadmap for others grappling with challenging waste management decisions.

This study, therefore, compares overall GHG emissions from 3 Xcel Energy, Inc. (referred to as "Xcel" from here on) WTE facilities located in Minnesota (MN) and Wisconsin (WI) to the landfills to which the waste would have otherwise been sent. It considers business as usual (using actual 2019 data provided by Xcel) to a scenario in which the WTE facility did not exist and waste was instead disposed of in the landfills near respective waste sources. It also considers temporal variability, forecasting GHG emissions implications to 2050. The goal is to quantify how equivalent CO_2 emissions compare for landfills and WTE, using real inputs. The complete life cycle assessment considers waste source and type, transportation to disposal sites, emissions displaced via electricity generation and methane capture, and residual production/disposal.

Methodology:

Three Xcel WTE facilities were considered throughout this study, described throughout this report as Red Wing, Wilmarth, and French Island. The Red Wing Generating Powerplant is located in Red Wing, MN and is rated at 23 MW of electricity. The Wilmarth Generating Plant is located in Mankato, MN and is rated at 20 MW. The facility was originally constructed as a coal-fired powerplant and was converted to burn MSW in the late 1980s. The French Island Generating Plant is located in La Crosse, WI and was retrofitted to burn refuse-derived fuel (RDF) in 1987. The facility is smaller than the other two plants with a rating of 18 MW and is unique because a significant amount (nearly 50%) of its incoming waste stream is wood, associated with municipal tree waste collection, scrap rail ties, and industrial waste wood sources.

While forecasting into the future was completed as a portion of this study, the initial year of data provided by Xcel was 2019 for all considered facilities. Xcel considered this data set to be representative of a typical operating year, since 2019 is the most recent year wholly unaffected by the impact of the COVID-19 pandemic. Provided data included waste location, waste composition, transportation method, upstream recycling weights and compositions, energy generated, supplemental fuel consumed, and residue produced during the WTE process. Additionally, Xcel made recommendations about the landfill (or compost) alternative sites that would be used if the WTE facilities did not exist. In every case where it was possible, assumptions were made in a conservative (i.e., landfill-friendly) manner for data generation and other model inputs.

GHG Emission Factors: For both landfilling and WTE, as well as displaced emissions associated with recycling, GHG emission factors (positive or negative) were calculated using values and data associated with the EPA's most current Waste Reduction Model (WARM) (US EPA, 2020). While

all calculations were completed using Microsoft Excel software, the original input emission factors were extracted from WARM documentation describing how model inputs were developed (US EPA, 2020). These values were modified by the research team to remove the transportation component, as this value was calculated independently (i.e., using data inputs provided by Xcel).

WARM values were also updated to reflect a methane 100-yr global warming potential (GWP) of 28 or 35, and a lifetime landfill gas collection efficiency of 60%. The value of 28 was selected to reflect recent changes made by US EPA and other national and international climate organizations to more accurately reflect current knowledge of the role of methane as a GHG; 35 represents expected continued growth of this value. As noted earlier, the 20-yr GWP for methane, 86, is *not* considered in this report. This is done partially for consistency with state and federal reporting norms, and partially to maintain conservative (i.e., landfill-friendly) assumptions. An assumed landfill methane recovery rate of 60% is intended to represent an above average (although not state-of-the-art) landfill performance for methane capture, as discussed in the section above.

For GHG emission factors associated with the transportation sector, US EPA AP-42 emission factors were considered (US EPA, 2023d). These are conservative values reported using units of CO_2 per mile per kilogram for specific vehicle types. For GHG emissions associated with supplemental fuel use, 30% efficiency was assumed for natural gas boilers at the WTE plants.

Waste Location and Composition: For all facilities, Xcel provided detailed records describing waste composition (based on past waste audits for all facilities) and locations from which, and methods by which, the waste was collected and transported to the three WTE facilities. To match waste categories considered by US EPA's WARM, waste was categorized as fossil fuel-derived carbon (represented by Mixed Plastics), biogenic carbon (represented by Mixed Organics), wood

(represented by Branches), and residue (either Bulky Waste Residue or Process Residue rejected before incineration).

For the French Island alternative scenario, it was assumed that not all waste would be landfilled if the facility did not exist – a difference from Red Wing and Wilmarth. Specifically, wood waste was assumed to be distributed across incineration (~50%), animal bedding, mulch, and compost (~34%), and landfilling (~16%) to better capture likely alternatives for this material. Rail ties are uniformly burned, so removing the French Island facility would shift that waste source to another incinerator; likely at a much further distance. In the interest of conservative assumptions (i.e., this would increase GHG emissions for the alternative scenario) and because the exact alternative WTE facility could not be identified, this additional transport was not factored into alternative calculations.

To quantify transportation emissions, route distances for waste transportation vehicles were calculated based on data provided by Xcel, including the primary county from which waste was collected. Reasonable distances from waste collection site to WTE facility or landfill were calculated, assuming round-trip transportation. CO_2 emission factors for diesel fuel sources were extracted from EPA's AP-42 reporting and applied based on weight being transported and distances traveled for both landfill and WTE scenarios (US EPA, 2023d).

Upstream recycling was applied to waste streams before processing in the WTE facilities. While methods and extent of recycling vary for each of the three facilities, negative emissions associated with recycling that would have otherwise *not* been applied in landfill scenarios were included in ultimate calculations. Note that this recycling is not the standard, curbside-sorted municipal recycling that most in the US are familiar with. Rather, to the greatest extent possible, Xcel and their fuel providers apply a sorting process to remove recyclables from the curbside *trash*

stream for energy/cost recovery and to protect their WTE systems, making the "no recycling in landfill scenario" assumption reasonable. Recycling data provided by Xcel categorized extracted materials as Ferrous Metal, Non-Ferrous Metal, Bulky Metal, White Goods, Scrap Tires, Electronics, or Mixed Metals, directly corresponding to materials categories included in WARM.

Emissions Forecasting: As noted previously, data provided to the research team by Xcel relates to facility operations in 2019. However, forecasts to 2050 were generated by assuming a few specific scenario changes.

- Consistent with internal Xcel documentation and assumptions, displaced emissions due to generated electricity (for both WTE and landfill scenarios, where relevant) are projected to decline to zero between 2019 and 2050 (a scenario representative of the transition to a carbon-free electricity grid). Xcel provided the projected annual carbon intensities of its electrical generation for the years between 2019 and 2050. Note that this carbon-free scenario is also consistent with new state-level carbon reduction goals coming online throughout the US, including the Scoping Plan for New York State which aims for zero-carbon electricity in 2050 (New York State, 2023).
- A composting facility and eventual anaerobic digester system will come online in MN (Newport Food Scraps Program), removing 30,000 tons of biogenic waste from the Red Wing (~20,000 ton) and Wilmarth (~10,000 ton) facilities (Rischar, 2020). It is assumed that the waste removal will begin shortly (2023) and proceed evenly until reaching maximum amounts in 2028. While the specific impacts of this compost facility addition remain to be determined, assumptions applied in this regard were again determined to be

conservative because removal of organics from the waste stream is expected to substantially decrease modeled GHG emissions of the landfill alternatives.

- Major changes are projected to the operation of the French Island facility. It is assumed that wood waste at French Island will be restricted in the coming years, and that the facility will switch to 24 hours a day, 7 days a week operation in 2030 (from 24/5 today), increasing total handled weight through an increase in MSW being burned.
- Consistent with reported plans, it is assumed that the alternative French Island landfill will cease to generate electricity in the coming years.

Results:

Results and corresponding discussions below are provided on a facility-by-facility basis, with comparisons to modeled landfilling alternatives using 2019 input data. Projections to 2050 are also used to compare the WTE facilities to landfilling. The objective is not to compare the facilities to one another, but rather to compare each facility, individually, to its respective alternative and forecasted scenarios described above.

2019 Waste Composition: Table 1 describes the waste composition and total weights for the three Xcel facilities. The Red Wing facility handles about 50% more weight than Wilmarth and more than 100% more weight than French Island. With that said, waste composition, including recycling rate and bio/fossil ratio, for Red Wing and Wilmarth are similar in spite of the total mass difference. Anecdotally, these two facilities also appear to be comparable to other WTE facilities in the US, especially those processing significant MSW, as opposed to wood or industrial waste.

Table 1. Waste composition and total mass handled for Xcel WTE facilities in 2019

Facility	Total Weight Handled (ton)	Biogenic Waste	Anthropogenic Waste	Recycling	Residue	Wood
Wilmarth	211,371	50%	32%	3%	15%	0%
Red Wing	305,344	47%	32%	4%	18%	0%
French Island	137,188	24%	18%	1%	12%	45%

French Island is quite different from the other facilities because nearly 50% of the waste it processes is wood, consisting of municipal tree scraps, rail ties, and a small fraction of industrial wood waste. Including this in the bio/fossil ratio calculations puts the facility at nearly 70% biogenic waste. Although the GHG implications of wood are quite different from other organic

materials, especially in the landfilling scenario, as discussed in sections below, this value remains impressive. Note that while the sources of wood waste at French Island are variable, it was assumed that "Branches" was the best representation in the WARM model for this waste – all were categorized the same way. Because recycling is not relevant for wood, recycling rates at French Island are notably lower than at the other two facilities. For the same reasons, the residue rate is lower for French Island.

The biogenic fraction of total processed waste is an important metric for WTE facilities, as it represents the fraction of waste and resulting carbon emissions that can be considered biogenic (with GWP = 0). Since the residue value includes both post-combustion and pre-combustion weights, stack testing is used by Xcel to estimate the biogenic fractions, which Xcel reports to be 0.55, 0.55, and 0.74 for Wilmarth, Red Wing, and French Island, respectively.

Lifecycle Emissions for Xcel's WTE Facilities: Figure 1 describes categorized GHG emissions for the 3 Xcel facilities based on 2019 data. Note that, because methane emissions have only minor relevance for the WTE facilities, this is not distributed across the two considered GWP scenarios – only consideration of the 28 scenario is described here to better improve clarity. With that said, these small differences with CH_4 GWP are quantified and described in Table 2, which follows in the section below.

Negative emissions are associated with "Displaced" and "Recycled" categories. "Displaced" refers to avoided emissions associated with the electricity that is produced by the WTE facilities. This research assumed that the produced electricity from the WTE systems, in 2019, would displace electricity that would have otherwise been produced using average efficiency combined cycle natural gas systems. WTE facilities provide dispatchable base load generation,

which if not available, would need to be replaced by generation with similar capabilities (i.e., natural gas generation under the current grid system). This is more conservative than assuming that coal generation or less efficient simple cycle gas combustion turbines would be displaced. In projections to 2050, Xcel's average grid intensities are used instead of any individual electricity generation type, acknowledging a planned transition to zero carbon electricity by 2050 and associated unknowns of technology deployment in later years.

"Recycled" refers to emissions savings associated with recovery and recycling of metals and other materials from the waste stream before incineration. This recycling goes beyond the traditional municipal recycling programs for the areas from which waste is collected for these facilities, recovering recycled content from the streams that are associated with household/industrial MSW (i.e., the "trash" tote instead of the "recycling" tote). The Red Wing facility has a more robust recycling system upstream of its WTE facility, resulting in disproportionately more recycling than at the other facilities. Note that while the masses recycled are fairly small (1-4% of the incoming waste streams), the GHG impacts are significant (negative emissions equaling 11-18% of total facility emissions).

All three Xcel facilities have net positive emissions, aligning (not linearly) with the amount of waste handled. Positive emissions categories include transportation, combustion, residue, and supplemental fuel.

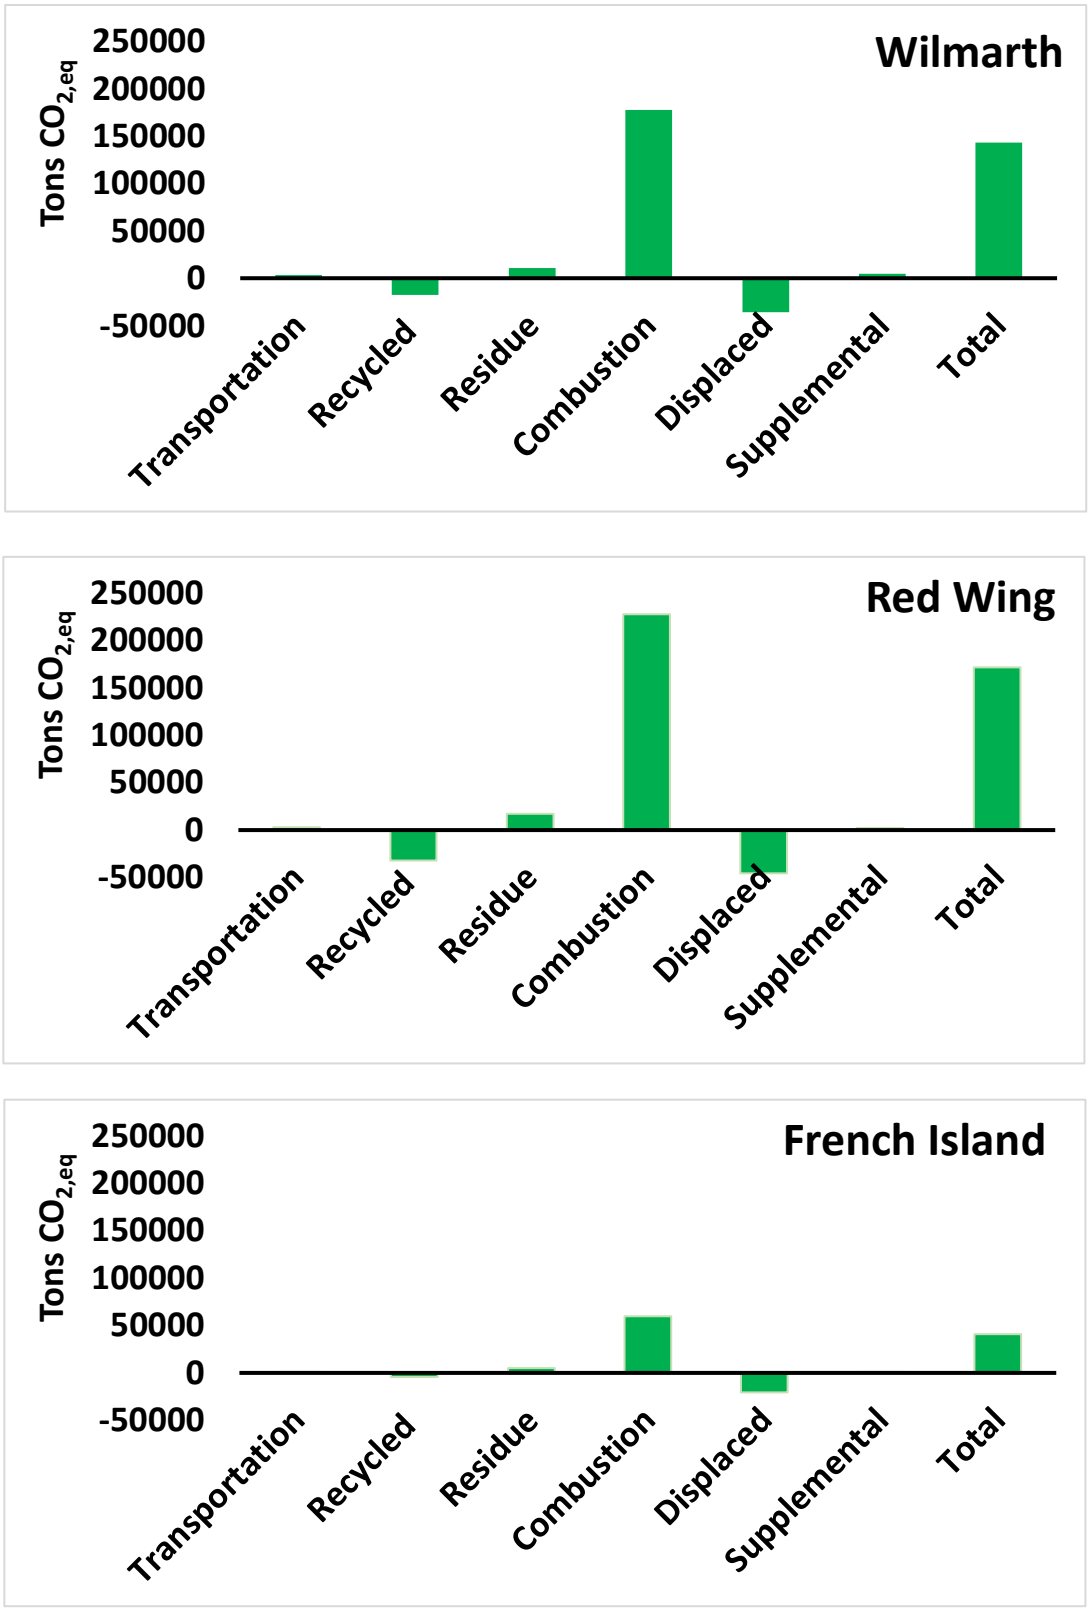

Figure 1. Lifecycle GHG emissions based on 2019 data for Xcel WTE facilities at Wilmarth, Red Wing, and French Island. Total emissions represents the sum of the six considered emissions categories.

Role of Recycling: Recycling has substantial negative impacts on total GHG emissions for all three WTE facilities. Expansion of recycling, should it be economically and logistically feasible, is recommended for two purposes: (1) displacing more emissions via materials recovery, and (2) reducing anthropogenic carbon content in the RDF streams. As noted earlier, WTE facilities are uniquely positioned, relative to other end-of-life management options, to buildout the infrastructure required for recycling. For the three considered Xcel facilities, which all have some of the infrastructure in place already, it is recommended that the company consider expanding upstream sorting capabilities even further. Plastic is particularly problematic at WTE facilities. It burns hot, creating process/engineering control challenges, and it has a high GHG emissions factor (> 3 tons $CO_{2,eq}$/ton) for combustion processes (US EPA, 2020). Plastic is not currently being removed in the recycling streams for the Xcel WTE facilities. As such, it is recommended that Xcel investigate the possibility of working with so-called "Dirty Materials Recovery Facilities (MRFs)" to source waste feedstocks and expand their already-impressive upstream recycling potential. Dirty MRFs apply recycling to residential waste streams, recovering valuable materials for reuse while simultaneously increasing the biogenic fraction of the residual waste. As discussed later in this report, from a climate perspective, this process helps WTE facilities that benefit from high biogenic fractions and hurts landfills that do not benefit from them. The use of these facilities in the recycling sector, while still new, is growing, and partnerships/expansions for Xcel may be justified based on data reported here.

Role of Biogenic Materials: The significant amount of biogenic material at the French Island site reduces its overall emissions relative to mass burned. In most sources, biogenic carbon is considered to have a GWP of zero (or close to zero) when combusted; the WARM model assumes

zero for biogenic CO_2 (US EPA, 2020). The justification is, simply, that the material was produced by photosynthesis, removing CO_2 from the atmosphere, so a combustion process that releases that CO_2 back into the atmosphere on a carbon-for-carbon basis has net zero impact. While the kinetics are a bit more variable (e.g., plants grown seasonally vs. instantaneous combustion), it is widely accepted that burning biogenic carbon has no GHG impact – WARM applies this value (GWP = 0) for mixed organic waste. Wood, while biogenic, is a bit more complicated. Trees are not seasonal plants, instead requiring decades (or in some cases centuries) to fix the carbon that makes up their structures. As such, WARM applies a small positive emissions factor for burning these materials – 0.07 ton $CO_{2,eq}$ / ton waste – which, when compared to anthropogenic carbon (> 3 ton $CO_{2,eq}$ / ton mixed plastics, for example), is quite small (US EPA, 2020). This value is determined on a lifecycle basis, but it is noted that many state/federal policies do not consider a full lifecycle and instead apply a value of zero. Because this work is using WARM inputs and making conservative assumptions, the full lifecycle value is used. The combination of 45% wood waste and 24% non-wood biogenic carbon, results in low emissions per unit mass burned at French Island. It is reiterated here that expanded upstream recycling for RDF inputs at any of the facilities would *increase* biogenic fractions further, lowering GHG emissions per unit mass burned.

Role of Transportation and Supplemental Fuel Emissions: Independent of facility, transportation emissions make up a small fraction of total emissions. This is independent of vehicle type (18-wheel truck, standard waste truck, train, etc.) and distance traveled. These results suggest that climate impacts of the combustion process vastly outweigh transportation concerns and are particularly important because they support that waste collection for incineration processes can be accomplished over a wider swath of land without significantly impacting overall GHGs released.

The argument can be used to support the *expansion* of WTE use for end-of-life materials management, also potentially overcoming dated concerns about capital costs and space requirements for landfills discussed earlier (US EPA, 2023c). Like transportation, supplemental fuel consumption has little overall impact on the three facilities' total emissions.

2019 WTE vs. Landfill Alternative Comparisons: Table 2 describes differences in 2019 GHG emissions totals for the existing WTE scenarios and landfilling alternatives.

Table 2. 2019 total GHG emissions for the three Xcel facilities and two methane GWPs, with comparison to landfill alternative scenarios.

Facility	Methane GWP	2019 Actual Emissions (ton $CO_{2,eq}$)	2019 Alternative Emissions (ton $CO_{2,eq}$)
Wilmarth	28	143,122	202,753
	35	145,520	263,033
Red Wing	28	171,240	235,447
	35	175,376	310,198
French Island	28	40,700	22,594
	35	41,810	25,028

For Red Wing and Wilmarth, the actual emissions from the WTE facilities are notably lower than the landfill-based alternatives in both GWP scenarios. This is attributed to multiple factors: (1) pre-combustion recycling at the WTE facilities (and not at the landfills) displaces emissions, (2) landfill alternatives for these two facilities do not generate power on-site (both utilize flaring), and (3) most importantly, methane emissions from the landfills' handling of biogenic materials are substantial and have a high GWP relative to WTE CO_2 emissions.

The 2019 scenario is different for French Island, where the alternative emissions are lower than the existing WTE emissions. As the composition of MSW-based fuel sources are comparable, the difference must be largely attributed to the substantial content of wood at French Island. As

discussed earlier, wood, a biogenic carbon material, has slightly positive emissions values associated with its combustion. These same emissions will apply in the alternative scenario for the rail ties that are assumed to still be combusted. However, the remainder of the wood is treated as compost, animal bedding/mulch, or landfill in the alternative scenario. Because of significant carbon storage capacity and less methane generation relative to other biogenic carbon materials, WARM attributes *negative* emissions values to all of these end-of-life options – including landfilling – lowering total GHG emissions for the alternative scenarios (US EPA, 2020). From this perspective, while the wood has minimal impact on the total WTE emissions (i.e., emission factor close to zero), it actually penalizes the French Island facility relative to the alternative scenario (i.e., emission factor less than zero). Carbon storage is a challenging parameter to model, and there is disagreement in the literature regarding its significance (Morris, 2016). For example, it is curious that calculations based purely on climate impact suggest it is *favorable* to landfill all wood that is generated. Most are not likely to assume this, but the carbon storage value of this material suggests a landfill is the preferred destination. So, while use of WARM in this study was necessary to provide consistency with GHG inventory methodology, these considerations must be noted and taken into consideration. The French Island alternative landfill currently generates electricity, reducing the impact of methane emissions by adding a displaced emissions component to the calculations (landfill alternatives for Wilmarth and Red Wing only flare methane).

WTE emissions exhibit little to no sensitivity to methane GWP. Apart from a small amount of landfilled residue (much of which has limited carbon content), inputs into the WTE calculations are independent of this value. Landfill alternative emissions, on the other hand, change by up to about 30% with the rising GWP. This is, of course, expected given the primary GHG emissions source associated with landfills is methane generation and release into the environment. At present,

there is a national push to reduce methane emissions. This is largely attributed to methane's shorter lifetime and higher impact in the atmosphere, as discussed in the introduction. Because ambient methane concentrations are low relative to CO_2, its unit impact is magnified. More specifically, band gap saturation continues to reduce the relative impact of a unit mass CO_2 emission into the atmosphere (Archer, 2011). For this reason, the GWP of methane, which is, by definition, a comparison to the relative and decreasing impact of CO_2, continues to grow from 20 in the mid 2000s, to 25 in the mid 2010s, and now 28 in the early 2020s. Growth is expected to continue, justifying use of the GWP = 35 value in this work, so this sensitivity impact is an especially relevant conversation topic for comparing waste management options that do (landfills) or do not (WTE) generate methane.

Emissions Forecasting to 2050: Figures 2 (CH_4 GWP = 28) and 3 (CH_4 GWP = 35) show emissions projections to 2050 for all three facilities (i.e., "In-Use"), modeled landfill-based alternatives, and both GWPs. These calculations assume that methane GWP is fixed (28 or 35) and not changing with time.

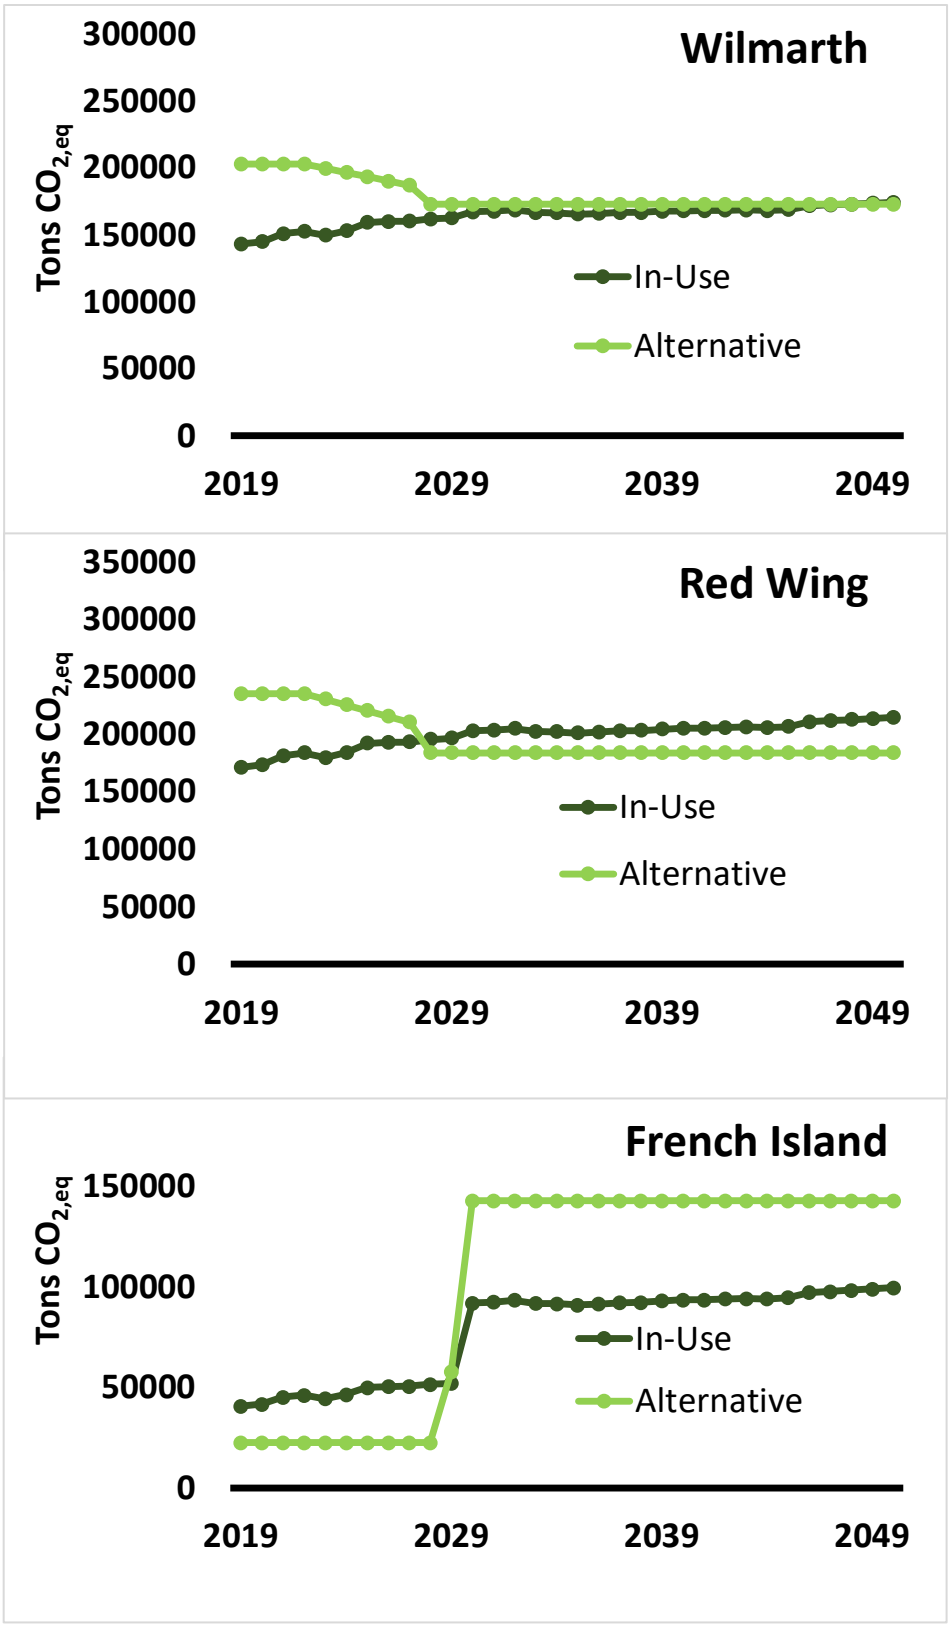

Figure 2. For CH_4 GWP = 28, emissions comparisons for facilities. Note the variable y-axis scale. "In-Use" refers to the existing WTE scenario, while "Alternative" corresponds to landfilling alternatives.

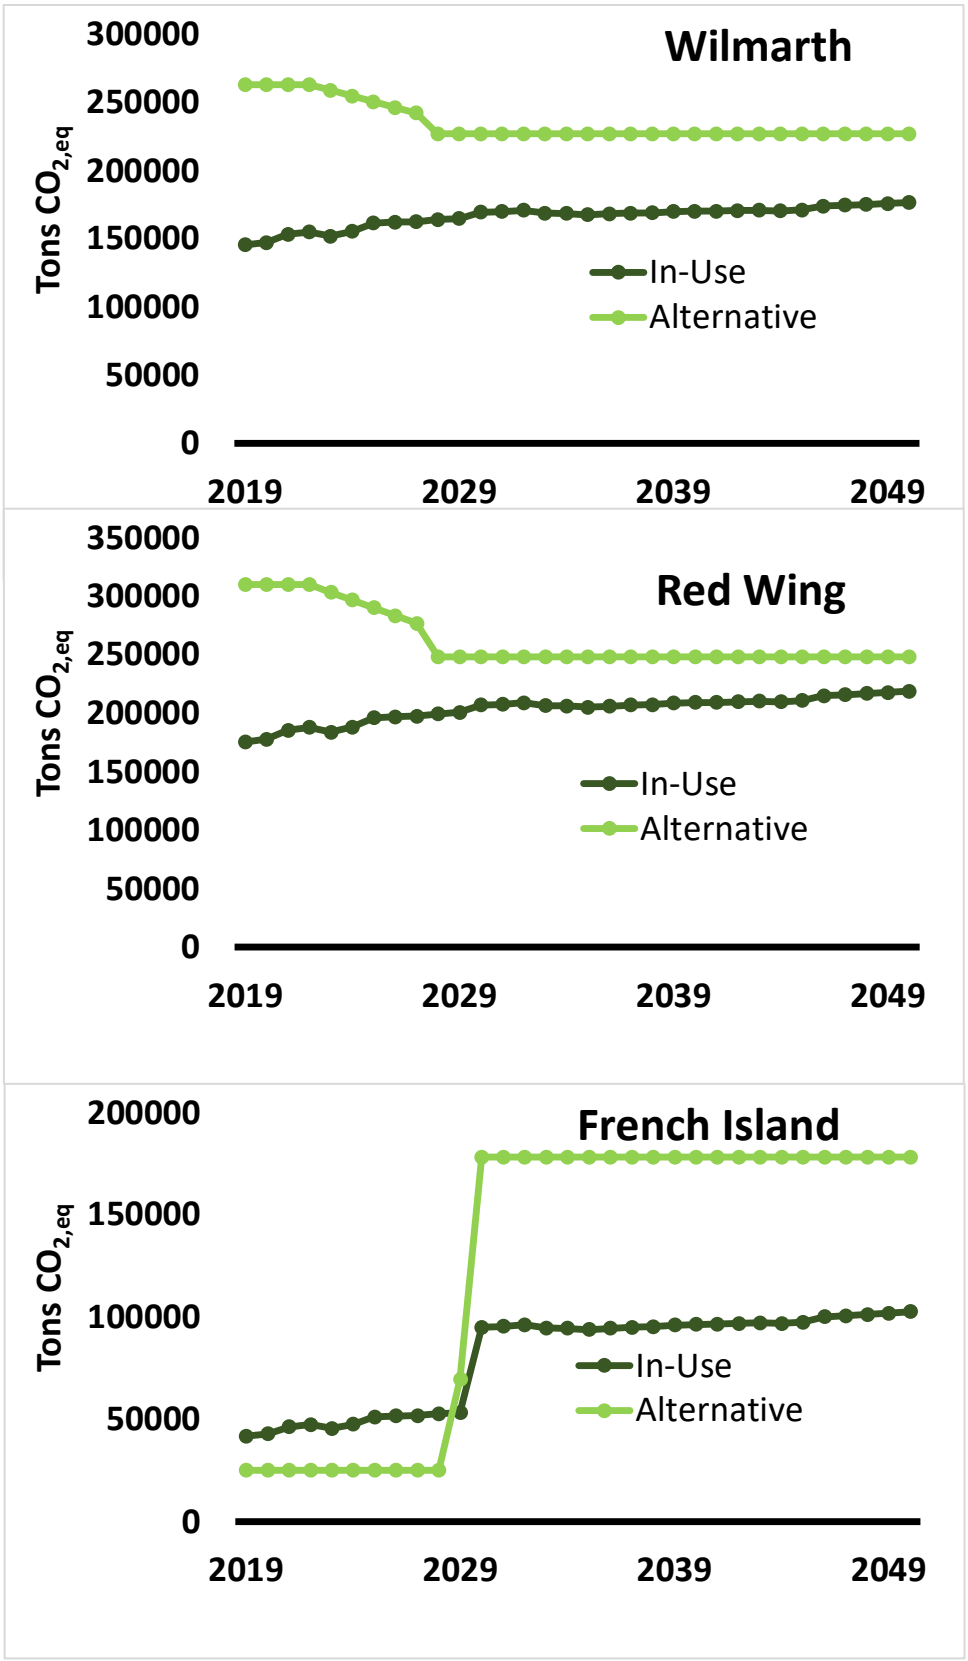

Figure 3. For CH_4 GWP = 35, emissions comparisons for facilities. Note the variable y-axis scale. "In-Use" refers to the existing WTE scenario, while "Alternative" corresponds to landfilling alternatives.

For all facilities, WTE emissions increase gradually with time in the "in-use" scenarios since, as noted, it is conservatively assumed that the value of displaced emissions due to electricity generation will decrease with time due to an increasing fraction of renewables on the overall electricity grid. In other words, WTE facilities are predicted to displace fewer GHG emissions, resulting in increased overall GHG emissions values in coming years. As the Wilmarth and Red Wing landfill alternatives in 2019 do *not* generate electricity, this gradual increase is not observed for those scenarios. The French Island landfill alternative is scheduled to stop generating electricity in the near future, so it too is not substantially impacted by this change.

From 2023-2028, Wilmarth and Red Wing landfill alternatives see substantial drops in GHG emissions. This is due to the removal of 30,000 tons of food scraps, (5,000 tons starting in 2023 and increasing by 5,000 tons for 6 years) which are expected to be composted at a nearby facility (Newport Food Scraps Program). Landfill methane is primarily generated from rapidly decomposing biogenic carbon sources, like food scraps. This reduction, which is less than 10% of the total waste anticipated, has an outsized impact because of the significant GHG effect attributed to organics. Removal of this waste from the WTE facilities, on the other hand, has negligible impact on GHG emissions because (1) transportation impacts are small and (2) food waste is biogenic carbon, which has an emission factor of 0 in the WTE scenarios. In other words, this change does not result in substantial change on total WTE GHG emissions, but it does cause the landfilling alternatives for both facilities to generate less.

Rising emissions in the alternative scenarios for French Island are dramatic. An elbow can be seen in the curve, attributed to two different factors. First, the initial rise is due to a planned transition away from electricity generation at the alternative landfill, removing the displaced emissions component for the alternative scenario to cause an increase in overall emissions. The

second change, which has almost twice as much impact, is from a proposed increase in mass processed (40%) at the facility along with a change in composition (replace wood with RDF). These changes are consistent with possible Xcel plans for this facility. Note that the increase in mass and change in composition will increase overall GHG emissions attributed to the facility, but as the forecasting model shows, it will substantially increase emissions in the alternative landfill-based scenarios. This is because, as Wilmarth and Red Wing data show, GHG emissions are lower for mixed MSW being burned versus landfilled, especially when the non-wood biogenic fraction is substantial. WARM assumes that wood is a means of carbon storage/sequestration in landfills, while the biogenic component of MSW is a primary methane source (US EPA, 2020). This is especially true in the landfilling scenario, where the negative carbon storage value associated with wood is a dramatic shift from the positive numbers linked to other biogenic waste (or, for that matter, the '0' value associated with anthropogenic materials like mixed plastics).

In the forecasting scenarios, total GHG emissions through 2050 were calculated for the different scenarios considered. Overall differences over this period between WTE and landfilling alternatives were calculated and are reported in Table 3. Positive "savings" and GHG reductions imply less total GHG emissions from the WTE process compared to landfilling; a negative reduction indicates that the landfilling generates less total GHG emissions than WTE.

Table 3. Total GHG differences (summed emissions from 2019 to 2050) for WTE compared to landfill alternative scenarios.

Facility	Methane GWP	Emissions Savings (ton $CO_{2,eq}$)	GHG Reductions vs. Landfill
Wilmarth	28	512,946	10%
	35	2,211,770	42%
Red Wing	28	-102,067	-2%
	35	1,896,148	29%
French Island	28	788,017	32%
	35	1,492,820	58%

Role of Methane GWP in Forecasting: The influence of methane GWP is significant for landfill emissions modeling. These presumed increases in GWP will have little impact on Xcel's carbon reporting and overall emissions (Table 2) compared to, say, their planned decreases in carbon intensity of electricity generation, but the GWP changes will dramatically shift the conversations around recommended end-of-life materials management. This is most clearly observed for Red Wing, where the 28 GWP scenario for methane indicates that landfilling is slightly more favorable for reducing cumulative emissions through 2050 than WTE, while the 35 GWP scenario shows the opposite. This finding should be interpreted as, when forecasting through 2050, WTE is expected to perform similar to or better than landfilling alternatives, depending on the extent to which methane GWP changes. Given the conservative nature of assumptions used and the general external trends to specifically target methane emissions reductions, these results are believed to be favorable for the WTE industry.

Role of Displaced Emissions in Forecasting: While the displaced emissions from electricity generation are impactful (i.e., in Figure 1), removing their influence does not substantially decrease the climate value of the WTE technology. In this work, the contribution of displaced emissions drops to zero by 2050. Because most of the landfills considered (all of the landfills considered after 2030) do not increase generation of electricity, this change would be expected to disproportionately impact WTE. While this is true, the total savings over the period 2019 to 2050 in all scenarios (but for the 28 GWP Red Wing case) are in favor of WTE in spite of this change. This is a surprising finding, especially given that the alternative landfills in this study are not generating electricity currently (Red Wing and Wilmarth alternatives) or in the near future (French

Island alternative). It is, of course, consistent with Figure 1 in that the released emissions due to combustion dominate the footprint of the WTE facilities.

Role of External Sources in Forecasting: Finally, the relative climate impact of these Xcel facilities is closely linked to decision making that falls outside of their immediate control. The opening of a local compost facility and eventual anaerobic digestor has substantial impact on *both* WTE and landfilling, even if the carbon accounting for Xcel will not change significantly. Again, such rules will not dramatically shift WTE GHG emissions, but widespread changes to the composition of the waste-based fuel source will *dramatically* shift the climate impact of alternatives. The waste management industry is highly dynamic, and upstream decision making associated with the sector as a whole can have downstream, potentially unexpected, consequences. Composting and anaerobic digestion are increasingly popular across the US, but their growing relevance has an immediate impact on *other* end-of-life destinations for waste, namely WTE and landfilling facilities who must now grapple with, potentially, dramatically different feed streams.

Design decisions associated with alternative landfills (e.g., installing/removing electricity generating capacity) can swing scenario modeling, as observed with the French Island alternatives. To this end, technologies like upstream recycling, waste steam displacement for heating (if customers are available), unique waste sourcing/partnerships, and more, which can be more directly controlled by Xcel and provide substantial emissions reductions for their own carbon accounting, have increased importance. Efforts to reduce plastics in the waste feedstock would be particularly impactful from a WTE GHG emissions perspective.

Conclusions and Recommendations:

Results from this study highlight the climate benefits of WTE, as 5 of the 6 modeled scenarios show substantially (10 – 58%) reduced cumulative GHG emissions from 2019 to 2050 for WTE compared to landfilling alternatives. The 6th scenario (Red Wing, methane GWP = 28) shows similar emissions for both options (2% fewer emissions for the landfill alternative). This study considered actual waste composition and mass, transportation, electricity, and supplemental fuel inputs, making it less reliant on models than much of the research efforts published in the peer-reviewed literature to date. As such, the research team believes it serves as a strong endorsement of the climate benefits of WTE compared to landfilling alternatives.

Specific recommendations from this work include the following:

- Increased emphasis on pre-combustion sorting for recycling. This is a unique advantage for WTE, and improved recycling is expected to decrease cumulative GHG emissions and, potentially, generate income.
- Increased emphasis on post-combustion sorting for recycling, including added eddy current separation for isolating non-ferrous metals. Similar to pre-combustion sorting, this is expected to decrease GHG footprints, decrease masses being sent to landfills, and, potentially, be a revenue stream.
- Xcel should explore opportunities to exert more control over their MSW streams. This is highlighted by the modeled benefits of reduced wood combustion at French Island, in favor of MSW. For Red Wing and Wilmarth, specific partnerships aimed at increasing the biogenic fraction of waste being burned (either through more biogenic content or less

anthropogenic content) are shown in these results to be favorable from a climate perspective.

- GHG reduction efforts should focus on the waste combustion process, as opposed to diesel (transportation) or natural gas (supplemental fuel) combustion processes.
- If the customers exist, the sale of residual steam to neighboring facilities currently generating their own (i.e., through combustion of natural gas) should be investigated as a possible way to further displace GHG emissions.

Greenhouse Gas Emissions Associated with Xcel Energy Waste-to-Energy Facilities, Compared to Landfilling

Dr. John D. Atkinson [1], Dr. Michael Shelly [2], et al.

[1] Department of Civil, Structural, and Environmental Engineering, State University of New York at Buffalo, NY

[2] RENEW Institute, State University of New York at Buffalo, NY

Motivation

- Waste generation (lbs per person, per day) increased 63% since 1960; approximately stable since 2010 [1]
  - Population Growth = Growth in total waste to be managed
- Waste that cannot be composted or recycled **must** be processed in waste-to-energy (WTE) facilities or landfills
  - 75% of non-recycled/composted US waste is landfilled
- Material end-of-life decisions often based on cost and public opinion; Need to consider climate and sustainability
- Climate projections state immediate need to reduce CH_4 emissions, due to short lifetime and high warming potential
  - Landfills release CH_4; WTE releases CO_2

Objectives

- For Xcel WTE facilities, determine Greenhouse Gas (GHG) performance relative to actual landfilling alternatives
- Quantify total CO_2-eqs for each scenario by considering:
  - Transportation Emissions
  - Waste Composition
  - Processing Emissions, including Recycling, Landfill Type
  - Displaced Emissions from Electricity Generation
- Forecast future emissions considering changes in displaced emission impact, composting, and landfill updates

Methodology

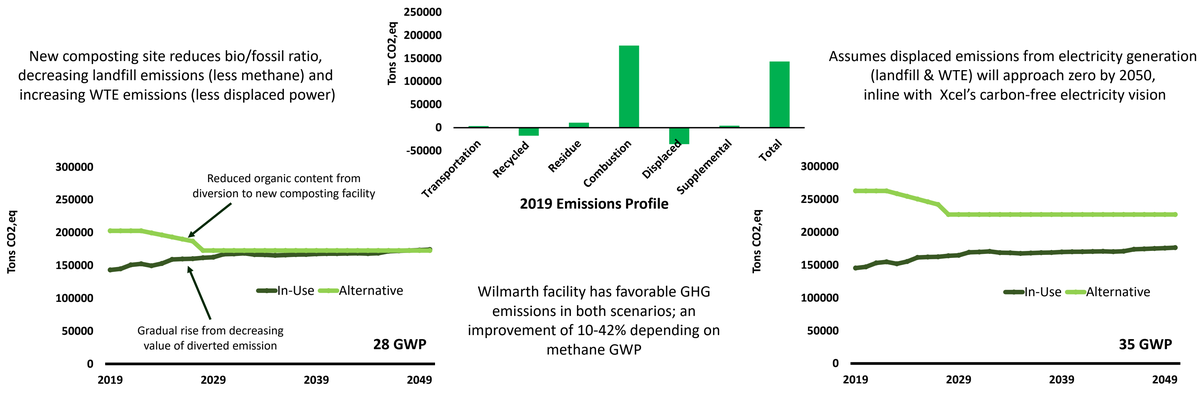
- Modeled waste from actual waste at Xcel Energy's Wilmarth (MN), Red Wing (MN), and French Island (WI) facilities:
  - Biogenic Waste (modeled as *mixed biogenic waste*)
  - Anthropogenic Waste (modeled as *mixed plastics*)
  - Wood (including rail ties and mixed wood waste, modeled as *branches*, only French Island)
  - Recyclables (including *ferrous, non-ferrous, bulky, e-waste, white goods, and tires*)
  - Processing Residue (landfilled)

Facility	Anthropogenic	Biogenic	Wood	Residue	Recycled
Wilmarth	32%	50%	0%	15%	3%
Red Wing	32%	47%	0%	18%	4%
French Island	18%	24%	45%	12%	1%

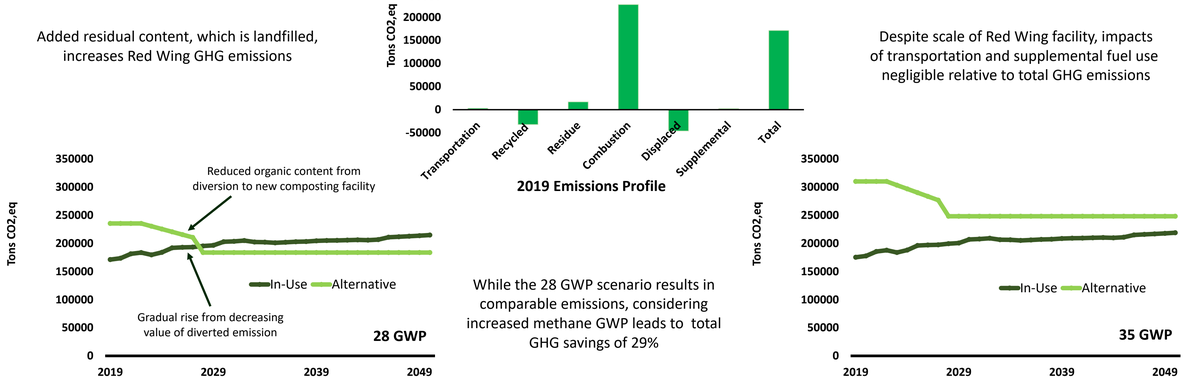
- Emission outputs modeled using emissions factors from USEPA Waste Reduction Model [2]
- Assume lifetime landfill gas capture efficiency = 60%; landfill emissions linked to full life cycle
- Assume displaced emissions initially from less natural gas electricity, at 60% efficiency; phasing out to zero displaced emissions by 2050 from growing renewable electricity
- Assume French Island facility will expand to 24/7 operation and replace wood waste with MSW in 2030
- Consider methane global warming potentials of 28 and 35 [3]

Current Emissions and Future Projections

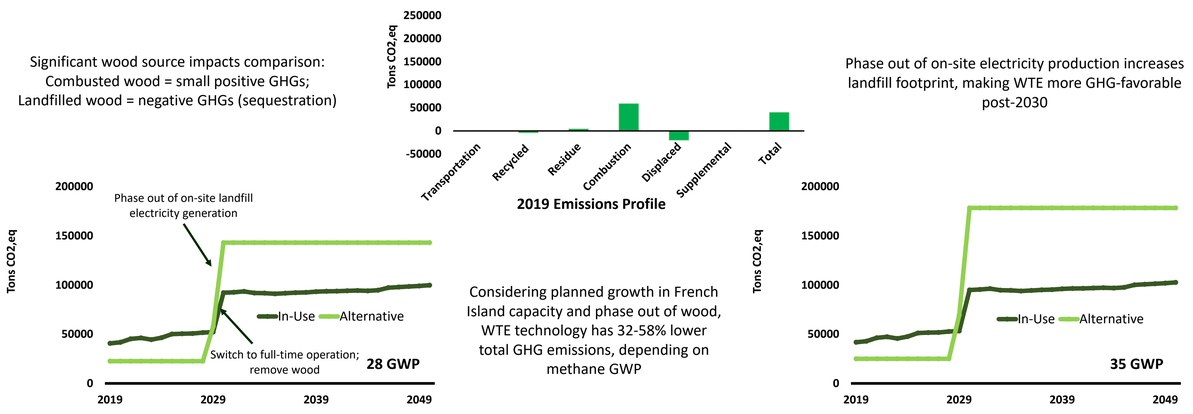
Wilmarth



Red Wing



French Island



Total Emissions Savings by 2050

Facility	Methane GWP	Emissions Savings (ton CO_2 eq)	Global Warming Savings vs Landfill
Wilmarth	28	512,946	+10%
Wilmarth	35	2,211,770	+42%
Red Wing	28	-102,067	-2%
Red Wing	35	1,896,148	+29%
French Island	28	788,017	+32%
French Island	35	1,492,820	+58%

- WTE emissions savings largely attributed to high impact of methane, which is expected to grow with time
- Even with **conservative** and **defensible** assumptions, WTE emissions generally lower that landfill

Conclusions

- Transportation emissions represent a small (<3%) contribution to total emissions, for all scenarios
- Opportunity to sort recycling before WTE handling lowers total emissions (11-18%) for WTE option
- Wood waste challenging, owing to boundary conditions and differences in emissions from burning, landfilling
- WTE remains favorable even as displaced emissions approach zero (i.e., 2050 assumptions)
- Increasing relevance and impact of CH_4 shown to increase the importance of WTE in waste handling portfolio
- Landfill type has significant impact – on-site electricity generation needed for landfill to be competitive with WTE
- Co-generation or waste heat recovery and expanded recycling programs recommended to reduce carbon footprint of facilities further

APPENDIX X – ADVANCED TECHNOLOGIES

I. INTRODUCTION

On June 14, 2022, in compliance with Order Point 11,[1] the Company submitted our COMPLIANCE FILING: ADVANCED TECHNOLOGY in Docket No. E002/RP-19-368, which discussed the Company's dedication to our role in advancing emerging technology as part of our 2050 vision, and to realizing benefits of advanced technologies for our customers. This appendix expands upon and provides updates about many of the topics addressed in that compliance filing, and addresses part of Order Point 12:

> *Xcel shall include in its next resource plan a deeper analysis of (1) storage options, including options combining solar generation and battery storage, and (2) the role of hydrogen and clean fuel alternatives in Xcel's resource mix.*

The balance of Order Point 12 – a discussion of supply-chain and life-cycle carbon impacts of the generation and storage resources – can be found in Appendix Y: Life Cycle Emissions Impacts.

Xcel Energy has a Company-wide vision to provide our customers in all the states we operate in with 100 percent carbon-free electricity by 2050. This vision directly aligns with the State of Minnesota's policy goals and statutes, including the state's latest standard requiring utilities to achieve 100 percent carbon-free energy by 2040. Our Preferred Plan achieves compliance with Minnesota's carbon-free energy standard and sets us on the path to realizing our 2050 carbon-free vision.

The Company recognizes that advanced and evolving technologies will play a critical role in helping us eliminate the remaining carbon emissions from our system while maintaining safe, affordable, and reliable electric service at times when renewable energy output is low. As such, we are dedicated to supporting emerging and advanced technologies that can help us meet our corporate and our states' energy goals while providing benefits to our customers. Such advanced technologies include (1) storage options, including options combining solar generation and battery storage, (2) virtual power plants (VPPs), (3) hydrogen and clean fuel alternatives, and (4) small modular nuclear reactors (SMRs) and other advanced and emerging nuclear technologies. Each

[1] Within 60 days, Xcel shall file a report discussing the work it is doing to support the integration of advanced technologies (including, but not limited to, hydrogen fuel and utility scale energy storage) into its system.

of these advanced and emerging technologies has the potential to play a key role in helping the Company achieve our carbon free goals, and we will continue looking for ways to support the integration of advanced technologies into our system to help accelerate the clean energy transition.

II. PRIORITIZING ADVANCED TECHNOLOGY

While "leading the clean energy transition" has long been one of Xcel Energy's strategic priorities, the nature of that leadership itself continues to evolve as we reduce carbon emissions, retire legacy generation assets, and add more renewable energy to our system. As a company, we are also evolving to meet the new and changing needs of our customers, communities, and stakeholders.

The Company has implemented the Carbon-Free 2050 (CF2050) initiative, which develops the strategy for and deployment of technology solutions for the carbon-free goals in generation. CF2050 leverages capabilities across the Company, including individuals from policy, energy supply, finance, resource planning, regulatory, and innovation. The CF2050 meets regularly to track and identify opportunities in the clean energy transition that are being enabled by policy and emerging technology. For example, recent actions by the federal government for grant funding and tax credits may significantly reduce the cost of hydrogen produced from clean resources. The Company tracks these and other federal initiatives with help from CF2050 and other channels.

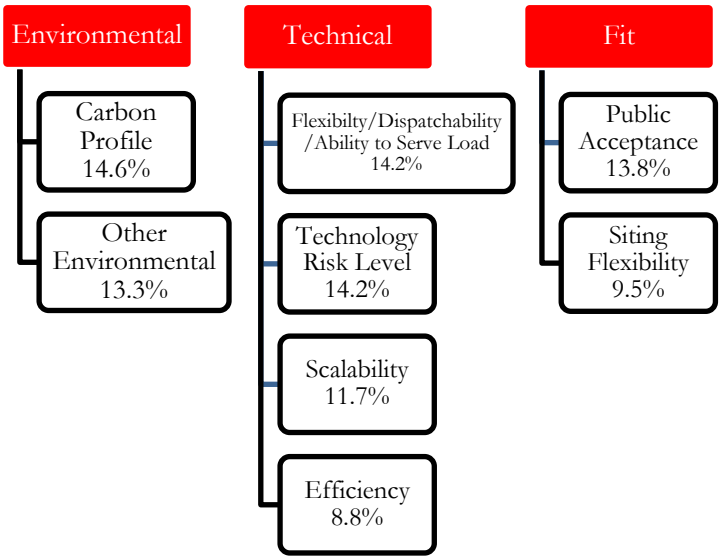
The CF2050 initiative is responsible for tracking, assessing, promoting, and prioritizing emerging technologies that have the potential to help the Company achieve our carbon-free electricity vision.

- Tracking refers to efforts to identify new technologies and developers, hold introductory meetings, and record the information using channels from our investment pipeline, Electric Power Research Institute (EPRI), and networking with accelerators, national labs, and other means.
- The task of assessing technologies is led by a dedicated group within the Company that is also part of the CF2050 initiative. The process determines the viability of a technology, its maturity, projected cost, ability to scale, and in some cases demonstrating the technology on our system. These activities also benefit from information from our investment pipeline, EPRI, research institutions, and collaboration with industry associations.

- Promoting technologies that may help achieve our net-zero energy provider goals includes sponsoring EPRI research initiatives, applying for grant funding that can further our goals, and investing in venture capital funds that serve the utility industry (e.g., Energy Impact Partners).

Prioritizing technology is a semiquantitative process that emerges from a technology assessment designed to rank technologies, identify policy mechanisms for support, and determine strategies that account for customers, carbon goals, and our investors. We rank technologies by having subject matter experts (policy, finance, and technology) score technologies on the criteria of "environmental", "technical", and "fit" (see Figure X-1). The rankings are then used to determine the next steps based on policy support and strategy.

Figure X-1: Emerging Technology Prioritization Criteria



The Company is constantly evaluating advanced and emerging technologies for attractive and potentially viable options. Through our evaluations of myriad technologies, the Company has identified three categories that will likely be key in helping achieve our carbon-free electricity vision. These categories are detailed in Table X-1 below.

Table X-1: CF2050 Emerging Technology Categories

Category	Description
Zero-Carbon Generation	• Advanced and emerging renewable generation: geothermal, new solar panel technology, power from waste streams, … • Advanced nuclear: small modular reactors, molten salt/metal reactors, fusion, … • Carbon capture fossil generation: combine cycle gas with carbon capture.
Clean Fuels	• Renewable natural gas from various sources. • Clean hydrogen from water electrolysis powered by renewables or nuclear OR form hydrocarbon reforming with carbon capture. • Other molecules from renewable sources: ammonia, methanol, …
Storage	• Battery: lithium, iron-air, calcium-antimony, … • Thermal: water, solid media (bricks, rocks, sand,…), molten salt, … • Chemical (clean): hydrogen, ammonia, … • Mechanical: pumped hydro, compressed/liquid air, flywheel, …

III. INDUSTRY COLLABORATION AND OPPORTUNITIES

As discussed in our June 2022 filing, in addition to our internal efforts, we work with various coalitions, nonprofits, and research organizations to gain a deeper understanding of the emerging technology landscape and to help move promising technologies toward commercial viability, with the aim of putting these new technologies to work for our customers and communities. Our sponsorship and collaboration with the EPRI is one that has played an important role in helping us keep abreast of technological innovations in the areas of grid modernization, reliability, integrated planning, solar integration, advanced generation, battery storage, and distributed energy resources (DER) interconnection. We participate in several EPRI research programs, including the Low-Carbon Resources Initiative (LCRI) – which is led by EPRI – and GTI Energy.

LCRI is a five-year, focused research and development initiative that is committed to creating the pathways needed to advance low-carbon technologies for large-scale deployment. The goal is to create risk-informed understanding of options and technologies for enabling a clean energy future from 2030 and beyond through global partnerships and demonstrations, applied engineering developments, and technology acceleration of the most promising options.[2] We also sponsor and support

[2] *See* https://www.epri.com/research/sectors/lcri.

Incubatenergy, which is a startup incubator that EPRI organizes and offers emerging technology developers opportunities to engage, demonstrate, and learn with utility industry collaborations.

Further, we are the lead electric utility on the steering committee of the Carbon-Free Technology Initiative (CFTI), a partnership between investor-owned utilities (through the Edison Electric Institute), the Clean Air Task Force, and other nonprofits and industry stakeholders. CFTI seeks to "achieve net-zero emissions in the U.S. electricity sector by promoting policies to ensure the commercial availability of affordable, carbon-free, 24/7 power technologies by the early 2030s."[3] Through CFTI, we recommend policies that would increase federal funding for energy innovation R&D and create dedicated programs and initiatives at the U.S. Department of Energy (DOE) focused on technologies like advanced renewables, long-duration energy storage, advanced geothermal, zero-carbon fuels, advanced nuclear, and carbon capture. CFTI was instrumental in the Bipartisan Infrastructure Law (Infrastructure Investment and Jobs Act or BIL), which – among other things – created the new DOE Office of Clean Energy Demonstrations (OCED).[4]

OCED is tasked with implementing several multibillion-dollar demonstration programs funded through the BIL and, importantly, partnering with the private sector. We support OCED's mission and see a host of opportunities in the programs and projects created by the BIL, which include projects to support long duration energy storage, carbon capture, hydrogen, advanced nuclear reactors, energy storage, grid reliability and resiliency, and more. We will continue to work with DOE, including OCED and other offices, and will evaluate all funding and partnership opportunities as they become available.

In addition, in April of 2023, Breakthrough Energy Catalyst (Catalyst) agreed to commit $20 million in contingent grant funding to support our long duration energy storage pilots with Form Energy, to be split between Minnesota and Colorado. With this grant, Breakthrough Energy will be a valuable partner in technology demonstrations we are developing. Additionally, Catalyst is accepting project proposals for a range of technologies until December 31, 2027. We will continue to evaluate pilots and projects that we may submit to Catalyst's request for proposals (RFP) to drive commercialization of new technologies while improving the economics of demonstration projects and pilots.[5]

[3] *See* https://www.carbonfreetech.org/.
[4] *See* https://www.energy.gov/office-clean-energy-demonstrations.
[5] U.S. Request for Proposals https://www.breakthroughenergy.org/catalyst-us-rfp.

Xcel Energy also uses shareholder resources to invest in strategic venture capital funds that are serving the utility industry. They include Energy Impact Partners, Energize Ventures, Buoyant Ventures, and MSP Equity. These funds provide thought leadership, access to promising new technologies, and the ability for the Company to invest in this ecosystem at a reduced risk position. Energy Impact Partners in particular, is a leader in the field and invests directly in hardware solutions.

We also look forward to working collaboratively with emerging technology companies to evaluate and potentially to develop new pilot projects. As part of our process in vetting and evaluating new technologies and industry collaborations, we work to ensure that any potential technologies we intend to implement exceed our high threshold for operational viability, system benefits, cost effectiveness, customer benefits, and stakeholder acceptance. Further, external funders such as DOE or Breakthrough Energy also require their own rigorous application and due diligence processes before awarding funding. Such due diligence and high standards would be reflected in a subsequent proposal to the Commission.

IV. BATTERY STORAGE

As previously stated, Xcel Energy has a Company-wide vision to provide our customers in all states we operate in with 100 percent carbon-free electricity by 2050. This vision directly aligns with the State of Minnesota's policy goals and statutes, including the state's latest standard requiring utilities to achieve 100 percent carbon-free energy by 2040, and we are on track to achieve the new clean energy standard. We recognize that advanced and evolving technologies, including energy storage, will play a critical role in helping us eliminate the remaining carbon emissions from our system while maintaining safe, affordable, and reliable electric service at times when renewable energy output is low. As such, we are dedicated to supporting emerging technologies that can help us meet the Company's and the state's energy goals while providing benefits to our customers. Battery technologies continue to advance, and the Company is actively monitoring the industry and evaluating new battery technologies, such as the 10 MW/1,000 MWh, long-duration energy storage system pilot project at Sherco, which the Commission approved on August 1, 2023.[6] Long-duration energy storage will be especially crucial in futures with high penetrations of variable renewable energy, and batteries that can store multiple days' worth of electricity are in development with encouraging early-stage results.

[6] Docket No. E002/M-23-119

Applications for grid-scale battery storage are typically categorized by the dispatchable duration, or just duration, the storage asset can provide at its nameplate capacity rating. Thus, a four-hour, 10 MW lithium-ion battery can dispatch 10 MW of electricity for four hours but *could* alternately dispatch 5 MW of electricity for eight hours. The two main categories for storage are short duration – approximately four hours or less – and long duration – anything over eight hours. The concept of long duration storage and its applications are still emerging, which provides some reasoning for the broad range of duration ranging from eight to 100 hours and beyond. Short duration storage serves applications in load management including peaking, frequency modulation, mitigation of renewable curtailment, and uninterrupted power. Long duration energy storage (LDES) is under consideration to be paired with renewable generation to provide reliability, firm capacity, seasonal storage, and mitigation of curtailment. We classify storage by the principal types of energy: battery (electrochemical), thermal, mechanical, and chemical. There are several technologies employed or being developed for grid-scale battery storage applications as described below.

A. Battery Energy Storage System (BESS)

BESSes are rechargeable batteries that can store and distribute energy from different sources (grid, solar power, etc.). They can be used for myriad purposes, such as balancing the electric grid, providing backup power, and improving grid stability. BESSes are the most direct way to store electricity for both short and long duration applications. Lithium-based batteries, the most dominant type, are used in shorter duration applications (0-4 hours) for peak demand response and grid services. Lithium battery manufacturing is the most mature which has made it the primary technology for batteries today. Lithium-based batteries have the highest energy density of all batteries and consequently they are the primary technology for transportation and mobility. This presents a possible bottleneck on the lithium supply chain and has driven some innovation around lithium chemistries and considering repurposing used electric vehicle batteries for grid applications.

Grid batteries, however, can be deployed in a way to reduce the need for the high energy density of lithium batteries which has sprouted a vibrant ecosystem of new battery chemistries and designs like flow batteries. The common themes of these technologies are earth-abundant materials, reducing safety risks relative to lithium batteries, and targeting longer-duration use cases. The iron-air battery is a great example, where technology developers like Form Energy offer a product that can provide 100 hours of dispatch duration. Lead-acid, sodium, calcium-antimony, vanadium, organic, and BESSes are other battery types being pursued by the industry.

B. Thermal Energy Storage (TES)

One of the simplest, lowest-cost, and most versatile solutions for energy storage is to use heat. It is both a mature technology and one that is undergoing substantial innovation. TES solutions can use hot water, molten salt, rocks, bricks, concrete, graphite, and sand as the medium that stores heat. TES requires an energy conversion device that is most often a steam turbine, but photovoltaic and thermoelectric devices are also being employed in newer technologies.

TES can be used in several ways to benefit our customers. For example, coal plants can be converted into heat batteries when the coal boiler is replaced with a TES system. The plant is charged by renewables and can be used to reduce curtailment, congestion, and power generation from "spinning mass". Steam turbines, grid connection infrastructure, and other aspects of the plant can be kept in service, maximizing their economic investment. As a converted heat battery plant needs essentially the same workforce as a coal plant and can provide a similar tax base, it can be an excellent solution to enable a stable, just energy transition. TES can also serve our customers who have steam or industrial process heat contracts with the Company, and are interested in decarbonizing their operations.

TES for heat and power is still an emerging solution and needs time for demonstrations and pilots to prove out the concept and develop best practices. For example, the Company conducted an extensive assessment using molten salt as a solution to "repower" coal plants as thermal batteries. Molten salt was selected because it was considered commercially mature. While molten salt has some commercial deployment, costs of the salt medium and insights from operators of the technology suggested a simpler solution would be more beneficial. Thus, the results of the assessment indicate the Company should continue to pursue TES, but with a different technology. While there is currently no standout technology alternative, small commercial deployments using bricks, rocks, sand, or even water are emerging. The Company will continue to monitor these developments and their potential to add benefit for our customers.

C. The Company's Role in Advancing Battery Technologies

The Company is advancing the prevalence of utility scale battery technologies on our grid through a partnership with Form Energy and through our acquisition processes. We are additionally looking to continue utilizing customer-owned batteries to support the grid, as discussed in Section IV of this appendix.

1. Form Energy

On August 1, 2023, the Commission approved our petition for a long-duration energy storage system pilot project at Sherco, using Form Energy's cutting-edge iron-air battery storage technology.[7] The Pilot – which will be a 10 MW/1,000 MWh, fully integrated modular energy storage system offering 100-hour (multi-day) duration that can deliver grid-scale reliable capacity year-round – is on track to meet the planned in-service date of before the end of 2025. The expected life of Form Energy's energy storage system is 10 years.

This Pilot proposes to gain experience and insights related to the operation of energy storage systems on our grid. Specifically, we hope to better understand the value of energy storage systems with:

- Dispatching during extended renewable droughts;
- Controlling frequency or voltage;
- Mitigating transmission congestion;
- Providing emergency power supplies during outages;
- Reducing curtailment of existing renewable energy generators;
- Reducing peak power costs; and
- Reducing carbon emissions by facilitating the efficient integration of new renewables.

Beyond these Pilot learnings, we hope to help advance a more just energy transition by siting the project in a community directly impacted by the clean energy transition.

Iron-air batteries offer distinct economic and technical benefits when compared to lithium-ion battery technologies. For example, the duration of its output is far greater than is available from lithium-ion batteries, a characteristic that is needed to ensure reliability during extended renewable energy droughts. Additionally, the battery's technology is based on iron—which is extremely prevalent—as opposed to rare-earth elements.

The Company proposed developing the Pilot at the Sherco facility site to further support the Becker community's economic transition, support new solar resources, and qualify for the ITC bonus credit, which will further reduce costs to customers. Under the Inflation Reduction Act (IRA), the Pilot will not only qualify for the standard 30 percent investment tax credit (ITC), but also an additional 10 percent bonus for being

[7] Docket No. E002/M-23-119.

developed at our Sherco facility site, which qualifies as an "energy community." Form Energy's commitment to meeting domestic content requirements may also qualify the Pilot for an additional 10 percent bonus.

To further reduce project costs, we pursued competitive grants from DOE and others. The Company was awarded a grant of up to $70 million in funding from the DOE for Xcel Energy's two long-duration energy storage pilot projects with Form Energy, including the Commission-approved Pilot at the Sherco site. The DOE grant is contingent on negotiation and project logistics; therefore, the specific amount to be directed to the Pilot at Sherco is still yet to be determined. However, we will continue to update the record in Docket No. 23-119 as more details are made available. We are pleased that this grant will help keep bills low for customers as we lead the clean energy transition and deploy innovative new technologies that will provide reliable, low-cost renewable energy to our customers.

2. Firm Dispatchable Resources

On May 14, 2023, the Company issued a Notice Petition in compliance with the Commission's April 15, 2022, Order, regarding the Company's 2020-2034 IRP. The Notice Petition initiated a competitive resource acquisition process seeking proposals for up to 800 MW of Firm Dispatchable Resources in accordance with the IRP order and the Xcel-Bid Contested Case/Track 2 bidding process. As part of the IRP Order, the Commission found that the Company more likely than not needs up to 800 MW of firm dispatchable resources to provide capacity and energy to the Company's system. The firm dispatchable resources will assist the Company in achieving state and Company decarbonization goals. The resources acquired through this process will also provide several attributes, such as availability over extended durations, support for system restoration, and renewable integration in addition to the 800 MW of capacity and energy.

Assessing individual resource attributes has become an increasingly vital component of resource planning as capacity adequacy decouples from energy and other attributes. As we transition to a system with greater shares of variable renewable resources and fewer baseload resources, it is essential that new firm dispatchable resource additions be evaluated with respect to a broader set of attributes required to ensure the grid is stable, reliable, flexible, and has sufficient energy to serve customers in every hour of every day. To ensure sufficient availability, we request that the Commission require that proposals include data on the ability to provide energy adequacy over long duration events.

3. Acquisition Process

To increase the amount of battery storage on our system, the Company has included storage as a parameter in our last two RFPs. The 2022 RFP was unique in its breadth and scope.[8] The first of its kind in NSP, the RFP sought distribution- and transmission-interconnected projects, as well as solar and solar-plus-storage hybrids, and evaluated all projects against the same criteria to solicit the best value projects for our customers. While the response was robust, due to market conditions and through negotiations with counterparties, only two projects – neither of which included storage – were viable and ultimately chosen. However, the Company is committed to including storage in our resource mix and will likely look to include storage in our future RFPs across our jurisdictions.

V. VIRTUAL POWER PLANTS

Our electric grid is becoming more complex and increasingly will need to leverage DER. The use of the term "Virtual Power Plant" (VPP) has become more prominent in the energy industry over the past few years as the number of distributed and connected energy resources has increased. Today, the Company in fact operates its DR programs much like a VPP, and has recently launched its Renewable Battery Connect program in Colorado, which is specifically identified as a VPP.[9] The Company is in the process of developing and deploying a similar program in Minnesota.

A. What is a Virtual Power Plant?

While there is no uniform definition across the industry, the Company shares our interpretation of VPPs here. The Company considers a VPP to be:

> An aggregation of controllable DERs managed at a scale that provides grid services or attributes, including energy and negative energy, ancillary services, and capacity. DERs aggregated to create a VPP could be utility or customer owned, in-front of or behind the meter. DER assets in a VPP could include, but are not limited to, photovoltaic solar, energy storage, electric vehicles, and demand-responsive devices such as water heaters, air conditioning units, thermostats, and appliances. A VPP has benefits, such as the ability to deliver peak load electricity or load-following power generation on short notice.

[8] Docket No. 22-403.
[9] See SolarEdge joins Xcel Energy's virtual power plant incentive program in Colorado, PV Magazine, available at: https://pv-magazine-usa.com/2023/08/24/solaredge-joins-xcel-energys-virtual-power-plant-incentive-program-in-colorado/.

> Such a VPP could replace a conventional power plant while providing higher efficiency and more flexibility, which allows the system to react better to load fluctuations. Resources that are part of a VPP may also be able to provide local grid benefits (to the extent that the resources are in close proximity to a local constraint) such as reducing loading on a distribution feeder.

The "virtual" component of the term indicates that the resources that compose a VPP are not a singular piece of infrastructure, such as a traditional power plant. Instead, the observed and desired outcome of the VPP results from the aggregation of many heterogeneous and geographically diverse resources (typically aggregated through a software control platform). The net performance observed by the aggregation is what we consider to be the impact of the VPP. As noted in the above definition, VPPs can provide different types of products and solve different system needs. Therefore, it is important that design and requirements for VPPs be tailored to specific grid use cases, such as reducing bulk system peak demand or targeting locational constraints.

In the IDP, the Commission defined DER as "*supply and demand side resources that can be used throughout an electric distribution system to meet energy and reliability needs of customers; can be installed on either the customer or utility side of the electric meter.*' *This definition may include, but is not limited to, distributed generation, energy storage, electric vehicles, demand side management, demand response, and energy efficiency.*" The Company can contemplate VPP scenarios that could include all or some of the DER resources the Commission has defined.

DER assets aggregated to create a VPP could be utility or customer-owned, or in-front of or behind the meter. Such assets could include, but are not limited to, photovoltaic solar, energy storage, electric vehicles, and demand-responsive devices, such as water heaters, air conditioning units, thermostats, and appliances. A VPP has benefits, such as delivering peak-load electricity or load-following power generation on short notice. Such a VPP could replace a conventional power plant while possibly providing higher efficiency and more flexibility, allowing the system to react more robustly and quickly to load fluctuations. Resources that are part of a VPP may also be able to provide local grid benefits (to the extent that the resources are located close to a local constraint), such as reducing loading on a distribution feeder.

B. Demand Response Programs

The Company currently operates our demand response programs much like a VPP, as our customer-sited resources are aggregated to react to specific management calls. Examples of existing aggregated resources include Electric Rate Savings, AC Rewards, and Saver's Switch, as well as pay-for-performance programs such as Peak Partner

Rewards. In addition, the Company expects to launch a specific VPP program – as part of our Demand Response portfolio in 2024 – like our Renewable Battery Connect program in our Colorado Service Territory. We provide additional details regarding the pilot below.

C. Distributed Energy Resources Management System (DERMS)

The Company considers the popularity of the VPP term to be associated with emerging applications such as DERMS, which are more sophisticated management systems that provide greater capabilities to enable a broader set of DER aggregation scenarios. They include but are not limited to, combining multiple technology types in an aggregation, establishing platforms and protocols that provide more interoperability and ease of execution, more beneficial groupings of DER, and more flexible settings and scheduling that can be adjusted to reflect changing system conditions.

The purpose of a DERMS is to enhance the integration and utilization of DER to meet the needs of the grid, customers, the market, and regulatory entities. A DERMS would serve to enable the growing interactions between customers and the distribution grid, and our journey to utilize and manage DER will occur over the next decade. A phased implementation approach for DERMS enables the Company to meet policy, regulatory, customer, and business needs. This also balances our investment pacing with the technology launch and performance validation. We are also anticipating FERC Order 2222 to drive new business requirements, new operational dynamics between distribution and transmission, and potential market implications between retail and wholesale markets. We expect DERMS to be a part of the solution to meet FERC Order 2222. The deployment of DERMS is an emerging approach to connect and manage DER on the utility system. As penetration levels of DER increase on our system, there is an increasing need to have more visibility and active management and coordination with DER to maintain a secure, reliable, and resilient distribution system.

Technology vendors provide DERMS software, which help provide underlying logic and or capabilities that allow utilities to manage a group of DERs to better support distribution or bulk system needs. A DERMS would interact with other systems, such as ADMS and devices in the field through two-way communication including, but not limited to, FAN, AMI, and the internet. DERMS can be viewed as a system that can aggregate and group DER in ways that provide more value to the grid and to customers who participate in programs that support the grid, such as APP programs. Potential use cases could involve leveraging energy storage to reduce peak usage or integrating more renewables, or managed charging scenarios for electric vehicles. More sophisticated DER forecasting capabilities may help us evaluate how to integrate higher levels for

DER as adoption increases, particularly for larger DER on the distribution system. Additionally, DERMS would help enable the centralized control and optimal dispatch of flexible interconnections and would aid Operations in the coordination and management of NWAs.

There is a timing balance of whether technology systems are mature enough to meet evolving and growing system needs, but the Company believes the implementation of DERMS is a necessary step to integrate higher levels of DER. Currently, we are examining DERMS capabilities in the market and will explore vendor capabilities in more detail through at least the first half of 2024. The Company is working with Electric Power Research Institute (EPRI) on a research project to gain feedback on the Company's proposed use cases, develop an overall conceptual control and communication system architecture, and determine overall system capabilities and interfaces with our planning and operational systems (such as ADMS). EPRI has been working with utilities to understand DERMS for over a decade, and we are excited to leverage their expertise to develop an overall DERMS roadmap. All this research will help support our technology assessment and the results are also expected to expand industry knowledge on leveraging DER to serve the needs of the grid and the customer. More work also needs to be done to understand some of the new fulfillment requirements for a DERMS system, including understanding start-up requirements, resource and training needs, and ongoing operational teams needed to support DERMS once in operation.

To support the goals for increasing DER and electrification, balancing DERMS deployment and infrastructure investment is critical. For example, the Company anticipates using DERMS and leveraging DER flexibility to extend utilization of existing grid infrastructure. However, the ability to reach long-term goals will also depend on infrastructure investments.

D. Battery Connect

The Residential Battery Connect Demand Response Pilot (marketed to customers as Renewable Battery Connect) ran in Xcel Energy's Colorado service territory between March 2021 and September 2022. The Pilot provided an incentive to customers who agreed to let Xcel Energy control the functionality of their battery storage systems. The primary objectives of the Pilot, which is a VPP program, included understanding battery performance on days with and without intervention from the Pilot, exploring the demand management capabilities of battery storage systems, and gathering feedback from participants about the Pilot.

Participants in the Pilot had solar panels and battery storage systems installed at their residences, which were generally charged in the morning from solar energy. The batteries were discharged during peak usage periods in the afternoon to lessen the demand of energy from the grid. When the batteries were forced to be dispatched, they provided an incremental increase in charging or discharging, even if the batteries were already engaged in those activities. Additionally, discharge events did not necessarily leave our customers without any remaining battery energy. In fact, there were many event days when customers were able to utilize their batteries after the discharge event was complete.

The Pilot was successful in achieving its objectives of obtaining analysis in 1) customer interest and satisfaction, 2) assessment of the battery baseline, and 3) evaluation of battery performance. Customer interest and satisfaction were primarily evaluated using respondent surveys and Pilot stakeholder interviews. Overall, most respondents were satisfied with the enrollment for the Pilot, had a high satisfaction (94 percent) rate with the Pilot overall, and would recommend the program to family and friends. More details about the learnings and takeaways from the Pilot can be found in our forthcoming 2024-26 Colorado DSM Triennial plan.[10]

Because of the Pilot's success, the Company is looking to bring the program to Minnesota through a modification of our Energy Optimization and Conservation 2024-2026 Triennial Plan. The Company intends to pair these rebates with our Solar-Powered Storage Incentive Program (Storage Program) filed with the Department on November 1, 2023.[11] Using the Colorado program as a proxy, the Company estimates that about 10 percent of customers with batteries will participate in the Storage Program. Additionally, the Company has found that a typical customer battery can provide about 1kW of load relief for the duration of an event. It is worth noting that there are more batteries in the Company's Colorado territory than there are in the Company's Minnesota territory (about 1,800 vs. 500), and as such the impact of a battery demand response program in Minnesota will likely be negligible during the short-term planning period of this IRP.

VI. HYDROGEN

A versatile fuel for energy production and storage, hydrogen is expected to play a strategic role in the energy transition. Clean hydrogen can be produced in one of two ways. The most common way clean hydrogen is produced is through chemical reforming from

[10] Docket No. 23A-0589EG.
[11] Docket No. E002/M-23-459.

natural gas (steam methane reforming or autothermal processes) when carbon capture is also employed. The other way clean hydrogen can be produced is by using electricity that was generated with carbon-free resources (renewables, nuclear) to split water with (a process known as "electrolysis"). Electrolysis is the method that the Company is focused on exploring for use on our system when paired with renewable and nuclear energies.

Hydrogen can be used to produce electricity through combustion in gas turbines (alone or blended with natural gas), fuel cells (not combustion), and other devices. Hydrogen can also be blended with natural gas to help decarbonize the heating of homes and businesses. It can help decarbonize the manufacture of chemicals, fuels, plastics, steel, and other industries that are referred to as 'hard to decarbonize', as it can replace traditional, emissions producing fuels that are used to power these processes.

Hydrogen can also be used to store energy through using renewable energy that exceeds the instantaneous system load – and would therefore otherwise be curtailed or create congestion on the transmission system – to make clean hydrogen. However, hydrogen stores energy less efficiently than natural gas (although substantially more than current battery technologies), so there are challenges to storing and transporting surplus amounts. Therefore, converting hydrogen into ammonia is being explored as a possible solution to address the storage and transportation challenges. This is accomplished by reacting the hydrogen with nitrogen extracted from the air to ammonia. This ammonia can be more efficiently and cost effectively stored and transported. That ammonia could be used by the fertilizer industry; alternate uses by other industries are in research and development as well.

The Company is invested in developing this advancing technology to serve our customers and help meet Company and state decarbonization goals. The federal government has provided several opportunities for grants using clean hydrogen, which we have successfully pursued and discuss below, and the Inflation Reduction Act provides for a $3 per kilogram production tax credit for clean hydrogen. Hydrogen was modeled as part of a special study, which is discussed in Chapter 5: Economic Modeling Framework, with assumptions outlined in Appendix F: EnCompass Modeling Assumptions and Inputs.

A. Heartland Hydrogen Hub/MN Hydrogen Vision

Xcel Energy applied for funding through the DOE's Office of Energy Efficiency and Renewable Energy (EERE) Regional Clean Hydrogen Hubs initiative. The application was filed by the Energy & Environmental Research Center (EERC) with Xcel Energy as one of the hub partners. The DOE reviewed applications and notification of awards were announced in October 2023. The Heartland Hydrogen Hub (HH2H) was selected for an award of up to $925 million dollars, subject to contract negotiations with the

DOE and between HH2H partners. The diversity of hydrogen supply in our proposal, including utilizing wind, solar, and nuclear, as well as the potential to utilize hydrogen in the Minnesota agricultural sector as ammonia and as a fuel in the power sector, were strengths in the application.

Xcel Energy's proposed two 'nodes' (as described in the application) for hydrogen production and use in the hub application. The first node takes advantage of the large amount of wind energy in southwestern Minnesota and eastern South Dakota, which are often curtailed, due to constraints on the transmission system. The Company's plan is to use this congested, low-cost wind to produce green hydrogen. The hydrogen would be sold to a Minnesota ethanol producer. The hydrogen would be converted to ammonia and then combined with captured CO2 (from the ethanol production) converted to urea fertilizer and sold to local MN farm coops. This area is heavily agricultural and uses large quantities of anhydrous ammonia and solid urea for fertilizer and commodity farming.

The second node of the hub utilizes the combined wind, solar and nuclear (Monticello Nuclear Generating Plant) resources to produced green hydrogen at strategic locations within Xcel Energy's MN territory. The locations, determined during the early detailed planning of the hub, will optimize connection to the clean energy resources, as well as proximity to various offtake options.

The HH2h timeline spans over 10 years and proposes investments, by Xcel Energy, of up to $2 Billion dollars. Project detailed design will begin after award negotiations – which are a staged process – are complete. There are four successive funding phases through 2035. The DOE will review and evaluate deliverables in each phase. Based on these evaluations, the DOE will decide whether each hub can advance to the next phase. With multiple hydrogen production and end-use initiatives included in the Heartland Hydrogen Hub, the Company expects to receive a large portion of the federal award. The total amount, how it's distributed across projects and timing will depend on additional negotiations and the outcomes of the normal regulatory process.

VII. NEXT GENERATION NUCLEAR TECHNOLOGIES

Nuclear power is a clean source of energy because it does not produce carbon dioxide and other air pollutants. Nuclear generating plants are operated such that the output is nearly constant, and several are currently licensed by the Nuclear Regulatory Commission for 80 years of operation. This makes it a strategic supply of reliable power to serve as base load capacity. The cost of nuclear power is high compared to other generating technologies, but the long lifetime of plants and the reliable, constant power are substantial benefits. The Company has organized a task force, that includes

members of the CF2050 initiative, evaluating emerging trends in the nuclear energy industry in both fission and fusion.

A. Fission Based Technologies and Small Modular Nuclear Reactors

Small Modular Nuclear Reactors (SMRs) are a popular technology in the nuclear space. These scaled-down – between 50 to 300 MW – employ the familiar nuclear fission process (splitting atoms to generate heat for steam turbines) employed by the Company's Prairie Island and Monticello nuclear generating stations. A new (or repowered) SMR facility would typically have three to ten SMRs, instead of the one or two large reactors found at traditional light water nuclear sites. An advantage of SMRs over traditional nuclear plants is that SMRs can lower the cost of nuclear power by increasing the number of factory-built components that can be used, thereby enabling more efficient construction. Because they are also designed to be dispatchable, they are also more flexible than traditional nuclear plants– as the operating utility can choose how many to turn on and when – and can therefore better integrate with wind and solar generation. Additionally, because of their size, SMRs can be located on sites that would not support traditional nuclear units, brownfield industrial sites, and sites closer to electric demand centers.

Two approaches to fission-based SMRs have emerged which can be summarized as Generation (Gen.) III+ and Gen. IV. Gen. III+ are reactor designs that emerged in the early 1990s that are in use today but have been scaled down to the SMR size. The advantage of this approach lies in the speed of adoption of a known technology and obtaining approval by the Nuclear Regulatory Commission (NRC). Gen IV reactor designs apply novel concepts in fuel use, coolants, and "fast" reactors that provide benefits in safety and fuel management.

Nuclear fission has challenges with public acceptance, permitting with NRC, and fuel supply and disposal. A significant endeavor to increase safety in all SMR designs is essential to convince the public that nuclear power should be considered for investment. It is expected in the industry that the NRC will become more efficient in processing permits based on signals from policymakers in this ecosystem. The challenges with fuel lie both in the supply chain and with spent fuel. Currently, some nuclear fuel is supplied by companies in Russia and the Ukraine. Also, Gen IV reactors are being designed with new types of fuel that will require development of a supply chain. Spent fuel will always require long-term storage. However, the Gen IV reactors are designed to use fuel more efficiently that produces a waste product with lower hazards. Fuel recycling is not allowed in the US but changes to that policy could also unlock substantial benefits for nuclear fission.

In 2023, several utility companies in the U.S. announced planning phases that include SMRs being deployed in the 2030s as part of their carbon-free plans. These utilities include PacifiCorp, Idaho Power, Duke Energy Carolinas, Duke Energy Progress, and the Tennessee Valley Authority.

B. Fusion Based Technologies

Nuclear fusion is the same process that occurs in our Sun and all stars. Fusion happens when two atoms combine to form a new, single atom. For electricity producing purposes, two atoms of hydrogen will be fused to produce helium and heat, the latter being a byproduct of the process, which can be used to power steam turbines to produce electricity.

The expectation with nuclear fusion is that it will be safer than fission, as the requisite fuel is safer to handle, and the process does not produce long-lived radioactive waste. However, the technology for nuclear fusion is a challenge, as containing the nuclear fusion reaction is as akin to containing a very small star. A solution to this hurdle has been sought since the 1950s, and recently, due to increased investment and innovation, some breakthroughs have occurred. In late 2022, DOE announced that sustained nuclear fusion was achieved at the National Ignition Facility housed at Lawrence Livermore National Laboratory. On July 30, 2023, the National Ignition Facility achieved another fusion ignition breakthrough, producing a higher yield in net energy gains than what was achieved in December of 2022. Also in 2022, a few other key milestones were announced by leading fusion energy developers that indicates progress in the field. All the progress is centered on sustaining and containing fusion, yet a significant amount of work is needed to engineer a system that can extract the produced energy once it can be sustained and contained. Commercially viable fusion energy may be decades away from reality, but the recent progress in this field and the technology's potential for clean energy warrant giving fusion attention and support.

C. The Company's Role in Advancing Next Generation Nuclear Technologies

A buildout of advanced nuclear plants provides many opportunities to provide new, reliable baseload generation, as well as challenges to building these first-of-a-kind plants, including ensuring adequate supply chains for major components and equipment and reliable fuel availability. The DOE has aggressively supported and provided funding for the development of advanced nuclear technologies, with a goal of ensuring that the U.S. remains the global leader in the industry. The biggest program to date is the Advanced Reactor Demonstration Program (ARDP), which announced awards in 2020

(i.e., 50 percent cost-share funding). The ARDP was originally designed as a seven-year program; currently the reactors that received the demonstration awards are expected to be online by 2030.

In addition to ARDP, the IRA, which was signed into law in August 2022, directs new federal spending toward reducing carbon emissions. It contains new tax credits that provide incentives for utilities to build and operate advanced nuclear plants. The clean electricity production tax credit (PTC) or investment tax credit (ITC) is available for any new plant that produces zero greenhouse gas emissions placed into service after December 31, 2024. Advanced nuclear plants, with reliable, clean, and zero-carbon generation, qualify for this technology-neutral PTC or ITC. For more detail on each tax credit, see the full text of the IRA.

The Company has engaged in activities to ensure we are prepared to learn from advanced nuclear projects that will benefit our customers and help the Company reach state and corporate decarbonization goals, one of which was the Utah Associated Municipal Power Systems (UAMPS) and NuScale Power's Carbon Free Power Project (CFPP). Unfortunately, UAMPS and NuScale made the decision to end the project because the small number of municipal power systems that intended to invest in the project did not need the full power output the plant would have provided, yet they would have been responsible for covering the full cost of commissioning the project. This placed significant financial risk on those municipal power systems that remained, and this risk outweighed the reward for them. Additionally, the project was facing increased costs and challenging market dynamics.

While it is disappointing that the project was terminated, the work associated with the project has brought the industry closer to the next generation of nuclear energy being available. The Company was excited to be part of the project in a non-ownership, consulting, and advising role, as it placed us at the cutting edge of new nuclear technologies. As the Company continues to pursue our carbon-free electricity vision and the standards set forth by the State of Minnesota, we are committed to evaluating emerging clean energy technologies that hold potential to provide safe, reliable, and affordable electricity on a 24/7 basis. While the CFPP has ended, this is not the end of new nuclear initiatives, as nuclear will remain an important part of the clean energy future. We will continue to follow advanced nuclear technologies, including SMRs, and evaluate the role they may play within our larger energy portfolio in the future, including how they can complement renewable resources, like solar and wind.

VIII. SUMMARY OF TECHNOLOGY STATUS

As we have discussed in this appendix, the advanced technologies the Company is monitoring are in various stages of development, with some being ready to provide value to our system and customers and others needing extensive research and development. Table X-2 below summarizes the status of each technology discussed in this appendix.

Table X-2: Status of Advanced Technologies

Technology	Feasibility
BESS	Being deployed on our system.
TES	Emerging solution. Needs time for demonstrations and pilots to prove out the concept and develop best practices.
VPP	The Company currently offers demand response programs and is looking to add more VPP programs. A DERMS system is needed to enhance integration and utilization.
Hydrogen	The Company received Federal funding for the development of the Heartland Hub, subject to contract negotiations with the DOE.
Fission and SMR	Several utilities have expressed plans to utilize SMRs on their systems. The technology is ready, but faces policy challenges.
Fusion	Commercially viable fusion is likely decades away.

IX. CONCLUSION

The integration of battery storage, VPPs, hydrogen, and next generation nuclear technologies onto our system has the potential to provide our customers with safe, reliable, and cost-effective benefits while helping the Company and the State of Minnesota achieve decarbonization goals. While each of these technologies are in different stages of development, the Company is committed to working with industry partners in the exploration and ultimate integration of these existing and emerging technologies to accelerate the clean energy transition.

APPENDIX Y – LIFE CYCLE EMISSIONS IMPACTS

I. INTRODUCTION

Order Point 12 of the Commission's April 15, 2022 Order in Docket No. E002/RP-19-368 requires the Company in its next Resource Plan to work with stakeholders to develop a fair basis for comparing the full supply-chain and life-cycle carbon impacts of the generation and storage options to help the Commission evaluate the "adverse socioeconomic effects and adverse effects upon the environment" of each resource option under consideration, pursuant to Minn. R. 7843.0500, subp. 3.C. Further, Order Point 23.I. requires a discussion of the full supply chain and life cycle carbon impacts of the ongoing nuclear generation and storage at each facility.

A thorough analysis of life cycle carbon impacts allows for a fair comparison between different electricity generation and storage technologies. Focusing solely on the operational phase of electricity generation can overlook significant carbon emissions associated with other stages of the technology's life cycle. Understanding the complete carbon footprint of a technology involves considering emissions not only during electricity generation but also throughout the entire supply chain, including raw material extraction, manufacturing, transportation, and end-of-life. By examining the carbon impacts throughout the life cycle of different electric generation alternatives, we can obtain a comprehensive assessment of the environmental footprint. This enables us to make informed decisions, foster innovation, and more effectively address climate change.

We conducted a literature review to gather data and insights on the full supply-chain and life cycle carbon impacts of different generation and storage technologies. Further, this review explores the specific case of nuclear generation and storage to evaluate its life cycle carbon impacts. When conducting a comprehensive review, it is important to understand the variety of assumptions, methodologies, and scopes in the literature studies to ensure that potential bias and limitations of the studies are considered. Moreover, the available body of literature is less robust for emerging technologies.

At our November 15, 2022 stakeholder workshop, we discussed our approach to life cycle analysis and received no feedback or suggestions for alternative approaches.[1]

[1] This approach also aligns with the discussion during the Commission's February 8, 2022 Deliberations. *See* Transcript at pp. 113-115.

Table Y-1 summarizes the scope and background of the studies reviewed.

Table Y-1: Studies Reviewed

Study	Publication Date	Technology Scope	Notes
NREL Life Cycle GHG Emissions from Electricity Generation	September 2021	Renewables; Storage; Non-Renewable, Thermal with Carbon-Capture	Reviewed and harmonized hundreds of GHG life cycle assessments
IPCC WGIII AR5 Energy Systems	2014	Renewables; Storage; Non-Renewable, Thermal with Carbon-Capture	Comparative life cycle GHG emissions
CARB-GREET Technical Support Document	2018	Renewables; Non-Renewable	Summary of carbon intensities – one-time emissions associated with manufacturing and construction are excluded
UW-Madison – Life Cycle Air Emissions from Utility-Scale Energy Storage Facilities	2003	Utility-Scale Storage	Life cycle GHG emissions from utility-scale advanced battery energy storage systems including manufacturing and operation
Hydrogen Council – Hydrogen Decarbonization Pathways	January 2021	Hydrogen	Analysis of the full life cycle of blue hydrogen combustion with a 95 percent capture efficiency used as a conservative assumption as a representative scenario for green hydrogen is not available
Life Cycle Greenhouse Gas Emissions of Nuclear Electricity Generation - Systematic Review and Harmonization, Ethan S. Warner (NREL), Garvin A. Heath	2012	Nuclear	Systematic review and harmonization of life cycle assessment literature of nuclear electricity generation technologies

The studies show that renewable energy sources generally exhibit much lower life cycle emissions compared to fossil fuel-based technologies. The reviewed literature also suggests that nuclear power, with carbon emissions comparable to renewable resources, can contribute to reducing carbon emissions when compared to fossil fuel-based alternatives. Finally, the studies on energy storage technologies show significantly less emissions than any fossil resource when paired with renewable resources or other carbon-free energy sources. It is important to note that the carbon emissions associated with storage technologies are heavily dependent on the source and carbon intensity of the energy stored.

II. LIFE CYCLE CARBON EMISSION INTENSITIES OF GENERATION RESOURCE OPTIONS IN REVIEWED LITERATURE

A. National Renewable Energy Laboratory (NREL)[2]

NREL's "Life Cycle Greenhouse Gas Emissions from Electricity Generation: 2021 Update" reviews and harmonizes hundreds of greenhouse gas (GHG) life cycle assessments (LCAs) for electricity generation technologies to reduce uncertainty around estimates and increase the value of these assessments to the policymaking and research communities. The harmonized data shows that life cycle GHG emissions from solar, wind, and nuclear are considerably lower and less variable than from unabated natural gas and coal, even when including one-time upstream emissions associated with manufacturing and construction in addition to fuel cycle.

B. Intergovernmental Panel on Climate Change (IPCC)

In the IPCC's 2014 Fifth Assessment Report (AR5), the Working Group III (WGIII) assessed literature on the scientific, technological, environmental, economic, and social aspects of mitigation of climate change since 2007, when the Fourth Assessment Report (AR4) was released.[4] "Chapter 7: Energy Systems" includes a comparative life cycle GHG emissions from electricity supplied by commercially available technologies (fossil fuels, renewable, and nuclear power) and projected emissions of future commercial plants of currently pre-commercial technologies (fossil systems with carbon capture and storage [CCS] and ocean energy).[5] Subsequent IPCC reports have not included a life cycle analysis of GHG emissions for energy systems. Figure Y-2 below shows distributions of life cycle emissions with harmonization of literature values for WGIII AR5 (blue) and the full range of published values for Special Report on Renewable Energy Sources and Climate Change Mitigation (SRREN) (gray) for comparison. In this analysis, life cycle includes manufacturing and fuel cycle.

C. California Air Resources Board (CARB)

The California Air Resources Board's Greenhouse Gases, Regulated Emissions, and Energy Use in Transportation (GREET) Technical Support Document includes a summary of carbon intensities by electric generation type from Argonne National Laboratory (ANL).[7] GREET's initial use was for the transportation sector, however, it also contains robust information to calculate the carbon intensity of electricity. Its use case has been expanding to other sectors. A summary of carbon intensities by generation type are shown in Table Y-2 below. One-time emissions associated with manufacturing and construction are excluded in this analysis. These emissions are generally of similar magnitude across technologies and much smaller than emissions from ongoing operations and thus are not as essential to inform comparison.

Table Y-2: Summary of Carbon Intensities for California Average Grid Electricity Used as a Transportation Fuel in California[8,9]

	Electricity Resources Mix	Energy Inputs, Btu/MMBtu	Feedstock Production		Power Generation	
			Emission Factor, gCO2e/MMBtu	Contribution to CI, gCO2e/MMBtu	Emission Factor, gCO2e/MMBtu	Contribution to CI, gCO2e/MMBtu
Residual Oil	0.15%	4,714	14,820	69.86	253,578	402.28
Natural Gas	50.87%[10]	1,130,708	13,824	15,631	123,600	67,249
Coal	4.13%	127,364	5,515	702.39	289,776	12,807
Biomass	2.25%	106,711	2,242	239.22	8,713	210.13
Nuclear	9.18%	98,167	3,625	355.84	0	0
Hydro	11.87%	126,907	0	0	0	0
Geothermal	4.38%	46,805	0	0	26,669	1,248
Wind	9.06%	96,886	0	0	0	0
Solar PV	8.11%	86,771	0	0	0	0
Subtotal	100%			16,998		81,916
Tailpipe Emissions				0		0

[7] California Air Resources Board, "CA-GREET3.0 Lookup Table Pathways, Technical Support Documentation." August 13, 2018. Available at https://ww2.arb.ca.gov/sites/default/files/classic/fuels/lcfs/ca-greet/lut-doc.pdf.
[8] *Id.* at Table E.2.
[9] Values may not round to sum due to rounding.
[10] In the CA-GREET3.0 model, all undefined energy resources are assumed to be from natural gas. This value represents the sum of the reported natural gas used in the electricity mix (36.48%) and the undefined energy categories (14.39%), as the total share of natural gas (50.87%) in the CA Electricity Resources Mix.

	Electricity Resources Mix	Energy Inputs, Btu/MMBtu	Feedstock Production		Power Generation	
			Emission Factor, gCO2e/MMBtu	Contribution to CI, gCO2e/MMBtu	Emission Factor, gCO2e/MMBtu	Contribution to CI, gCO2e/MMBtu
Total CI, gCO2e/MMBtu			**98,914**			
Total CI, GCO2e/MJ			**93.75**			

D. Utility-Scale Energy Storage Life Cycle Carbon Emissions

The U.S. Department of Energy (DOE) funded a study from the University of Wisconsin-Madison on life cycle emissions from utility scale storage.[11] Life cycle carbon emissions, including manufacturing and operation, from utility-scale advanced Vanadium-Redox and Polysulphide battery energy storage systems (BESS) along with pumped hydro and compressed air storage evaluated in this study are summarized in Table Y-3.

Table Y-3: Life Cycle GHG Emission for Utility-Scale Energy Storage Systems[12]

Parameter	Pumped Hydro Storage (PHS)	Compressed Air Energy Storage (CAES)	Vanadium-Redox Battery Energy Storage System (BESS)	Polysulphide BESS
Estimated Plant Life (years)	60	40	20	20
Estimated Capacity Factor (%)	20	20	20	20
Generation Emission Multiplier (Energy Ratio)	1.35	0.735	1.33	1.54
Construction and O&M Related Emission Rate (kg CO_2e/MWh)	6	4	40	33
Fuel Related Emissions Rate (kg CO_2e/MWh)	0	288	0	0

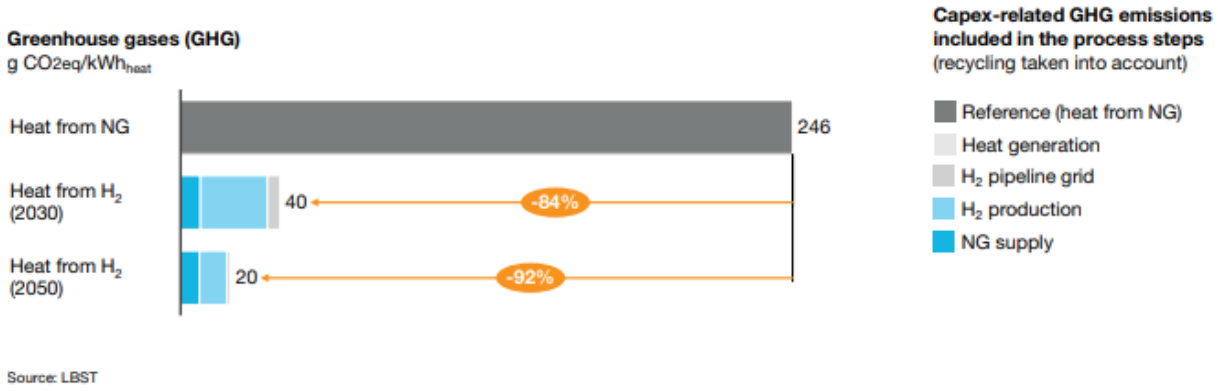
[11] Paul Denholm and Gerald L. Kulcinski, University of Wisconsin, Madison, WI. "Life-Cycle Air Emissions from Utility-Scale Energy Storage Facilities: Comparative Analysis and Policy Implications." Available at https://www.sandia.gov/ess-ssl/EESAT/2003_papers/Denholm.pdf.
[12] *Id.* at p. 1.

CAES is a hybrid storage/generation system that requires natural gas fuel. As such, for carbon emissions unrelated to stored electricity, CAES exhibits the highest emissions among the considered storage options. BESS involve energy-intensive manufacturing resulting in a higher construction and operations-related carbon emission rate as compared to other storage systems. When paired with renewable energy resource, BESS rank second in terms of carbon emissions. PHS paired with renewable energy resources has the lowest carbon emissions because of long-lasting components, among other factors.

E. Life Cycle Assessment of Hydrogen Decarbonization Pathways

The Hydrogen Council's report on decarbonization pathways provides an analysis of the full life cycle of blue hydrogen combustion with a 95 percent capture efficiency used as a conservative assumption as a representative scenario for green hydrogen since green hydrogen is not available.[13] This analysis considered use of blue hydrogen in a heating boiler but is appropriate for consideration to assessing impacts from combustion turbines as simple cycle combustion turbines have similar efficiencies. As shown below in Figure Y-3, the GHG emission intensity per kWh produced using hydrogen is estimated to be over 80 percent lower than the fossil fuel reference (natural gas used in boiler or furnace) by 2030. In the future, the emissions intensity of low-carbon hydrogen will be driven by the Inflation Reduction Act (IRA) Production Tax Credit (PTC) threshold of 4kg CO2e/kg H2 production.

Figure Y-3: Industrial Heat from Blue Hydrogen in Northern Europe[14]



[13] Hydrogen Council, "Hydrogen decarbonization pathways, A life-cycle assessment." January 2021. Available at https://hydrogencouncil.com/wp-content/uploads/2021/04/Hydrogen-Council-Report_Decarbonization-Pathways_Part-1-Lifecycle-Assessment.pdf.
[14] *Id.* at Exhibit 7.

III. NUCLEAR FUEL STORAGE

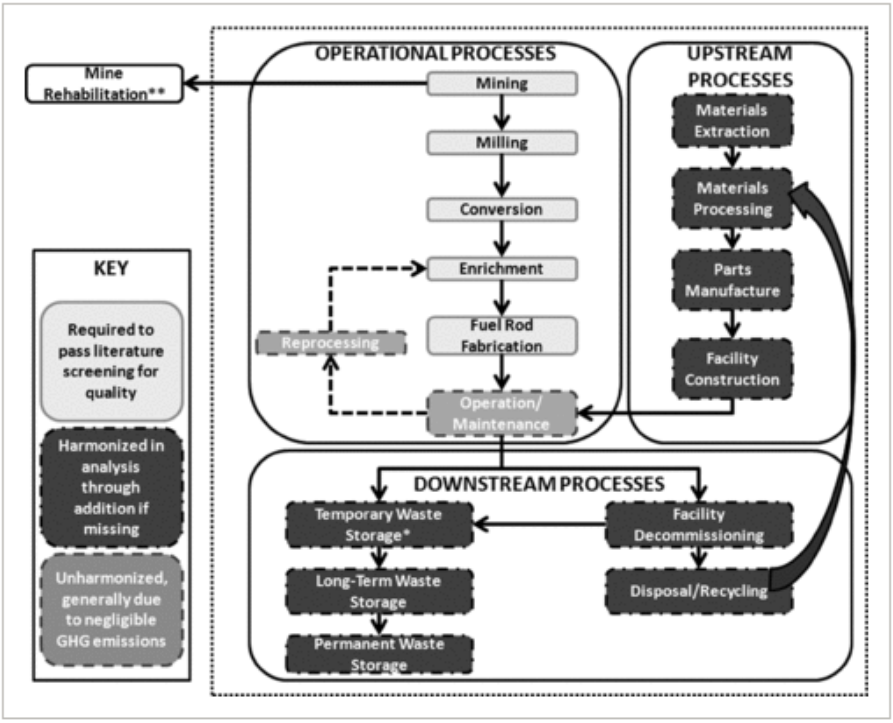
The DOE, Office of Energy Efficiency and Renewable Energy, funded a systematic review and harmonizaton of LCA literature of nuclear electricity generation technologies to examine and reduce, if possible, the variability in life cycle GHG estimates to better inform decision making.[15] Results were included in NREL's "Life Cycle Greenhouse Gas Emissions from Electricity Generation: 2021 Update" described above.

Figure Y-4 below illustrates the life cycle of electricity generated from nuclear power, as defined in this study. The dotted box defines the system boundary achieved through harmonization. The life cycle phases are grouped into three aggregate categories:

- Upstream processes: One-time processes occuring prior to operation – includes facility construction and material supplies.
- Operational processes: GHGs continuously emitted during generation of electricity – includes uranium mining and rehabilitation, milling, conversion, enrichment, fuel rod fabrication, transportation, facility operation and maintenance, and reprocessing.
- Downstream processes: Processes that occur after the facility retires – includes facility decommissioning; nonradioactive waste disposal/recycling; and temporary, long-term, and permanent spent fuel storage.

[15] Life Cycle Greenhouse Gas Emissions of Nuclear Electricity Generation - Systematic Review and Harmonization, Ethan S. Warner (NREL), Garvin A. Heath. Available at https://doi.org/10.1111/j.1530-9290.2012.00472.x.

Figure Y-4: LCA Harmonization System Boundaries (dotted line box) for Nuclear Power Electricity Generation[16]

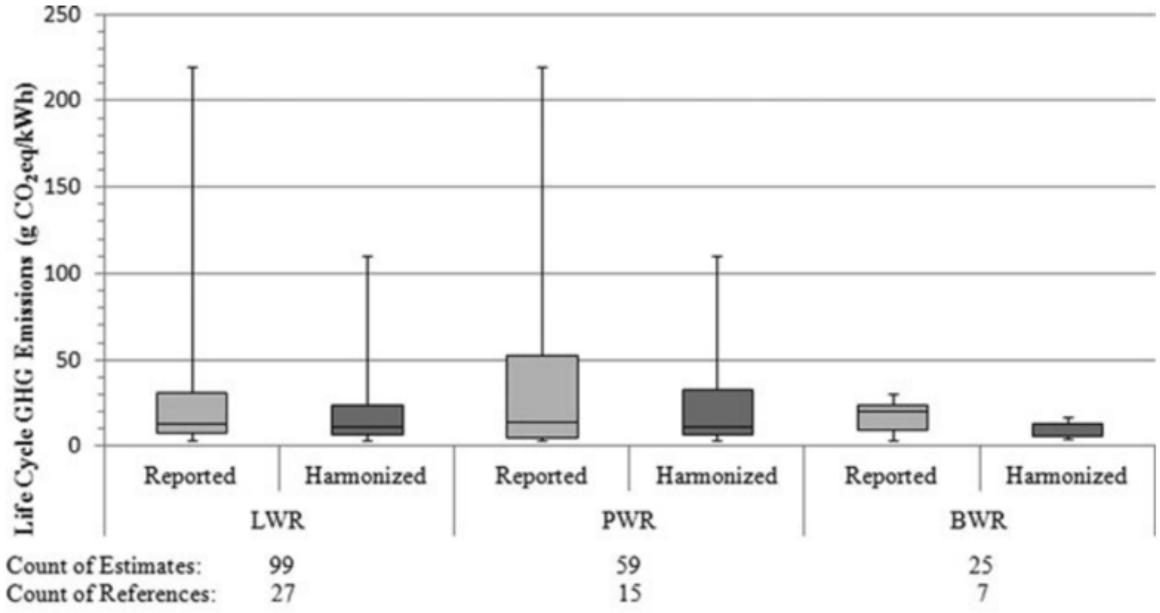


*Applies only to highly radioactive waste.
** Occurs once, but its impact on electrcity generaton is tempered by fuel demand.

Figure Y-5 below displays published and harmonized life cycle GHG emissions by nuclear reactor type. Whiskers represent minimums and maximums. Boxes represent 25th percentile, median estimate and 75th percentile. As shown on Figure Y-5, harmonized life cycle GHG emissions from PWRs and BWRs (including fuel storage), such as those operating at the Prairie Island and Monticello nuclear plants, are well below fossil fuel-based electricity generation sources summarized in Section IV.

[16] *Id* at Figure 1.

Figure Y-5: Nuclear Life Cycle GHG Emissions[17]



*LWR = light water reactor; PWR = pressurized water reactor; BWR = boiling water reactor

While the study reports results for LWRs, PWRs, and BWRs, the discussion focuses on the broader LWR category. Life cycle emissions of PWR and BWR systems employing similar performance characteristics (e.g., lifetime, thermal efficiency, and capacity factor) showed minimal differences from LWRs. For LWRs, "operational processes contribute a majority of life cycle GHG emissions (78 percent). Life cycle GHG emissions for upstream processes and downstream processes make up 14 percent and 8 percent of published estimates of total life cycle GHG emissions, respectively."[18] Several recommendations for further study were given, including more detailed assumptions for electricity use and waste storage; however, it was noted that consequential analyses are unlikely to fundamentally change the comparison of nuclear power to fossil fuel-based electricity generation sources.

IV. CONCLUSION

As shown in Table Y-4 below, the literature reviewed provides valuable insights into the full supply-chain and life cycle carbon impacts of energy generation and storage resource options.

[17] *Id* at Figure 2.
[18] *Id.* at p. S82.

Table Y-4: Literature Review Summary of Resource Life Cycle Carbon Intensities

Life Cycle Carbon Intensity	NREL Study[19]	IPCC AR5[20]	GREET[21]	UW-Madison	H2 Council
Resource	**gCO2e/kWh**	**gCO2e/kWh**	**gCO2e/kWh[22]**	**gCO2e/kWh**	**gCO2e/kWh**
Natural Gas (avg.)	486	490	422	-	-
Nuclear[23]	13	12	1.2	-	-
Biomass	52	230	29	-	-
Wind	13	11	0	-	-
Solar PV	43	48	0	-	-
Hydropower	21	24	0	-	-
Battery Storage[24]	33	-	-	33-40	-
Low-C Hydrogen[25]	38[26]	-	-	-	20-40

Renewable energy sources and storage paired with renewable generation generally exhibit much lower life cycle emissions compared to fossil fuel-based technologies. Nuclear power is often considered a low-carbon energy option due to its minimal carbon emissions during the operational phase; the life cycle carbon impacts of nuclear power depend on several factors, including uranium mining, fuel processing, plant construction, and waste management. In conclusion, our literature review suggests that nuclear power can contribute to reducing carbon emissions when compared to fossil fuel-based alternatives.

[19] Median results shown.
[20] Median results shown.
[21] GREET default assumptions do not include the imbedded one-time emissions from manufacturing and construction of equipment.
[22] Life cycle GHG emission from each type of generation converted from values provided in Table Y-2 to a per KWh basis using the conversion of 293.07 kWh/MMBtu from example equations.
[23] Nuclear life cycle in NREL and IPCC studies includes temporary, long-term, and permanent waste storage; GREET includes fuel production.
[24] Available studies are not as robust for these emerging technologies. Generally, the carbon intensity (CI) of storage is dependent on the associated electricity generation, and the CI of low-carbon hydrogen in the future will be driven by the IRA PTC threshold of 4kg CO2e/kg H2 production.

[26] Value from one 2005 fuel cell study.

APPENDIX Z – NON-TECHNICAL SUMMARY

I. INTRODUCTION

The 2024-2040 Upper Midwest Integrated Resource Plan (the 2024 Plan or Preferred Plan) builds on the strong foundation of cost-effective carbon reduction that we have been working toward since our Commission approved 2019 Plan. The 2024 Plan documents how the Company will provide for the capacity and energy needs of our customers over the course of the planning period. It is comprised of a portfolio of forward-looking projects and resources designed to continue providing safe, reliable, and affordable service to our customers while continuing our ambitious carbon-reduction strategy, even as we forecast significant increases in customer load from electrification and other sources.

Here, we provide an overview of our 2024 Plan. The 2024 Plan demonstrates that we are well positioned to meet our customers' needs over the next fifteen years in a reliable, environmentally responsible, and cost-conscious manner. Specifically, the 2024 Plan models an 88 percent reduction in carbon emissions by 2030; $464 million in Present Value of Revenue Requirements (PVRR) savings by 2040; $785 million in Present Value of Societal Cost (PVSC) savings by 2040 and over $1 billion by 2050; results in sufficient firm dispatchable resource additions to ensure reliability; and leads to less than a one percent average annual increase in rates based on generic market pricing of new generation.

The Company has been thoughtfully planning and executing the transition of our power supply portfolio for more than a decade, rapidly decarbonizing, maintaining a reliable transmission system, and providing customers with affordable electricity rates. These benefits build off the progress made in our last resource plan (2019 Plan). Following Commission approval of the 2019 Plan, the Company has taken a number of steps needed to transform our energy system into one that will provide cleaner energy to our customers, while remaining safe, reliable, and affordable.

Since our 2019 Plan, we have achieved several notable accomplishments. First, we successfully retired Sherco Unit 2. Second, we have added additional dry cask storage at our Monticello Nuclear Generating Plant. This addition will enable the facility to continue providing carbon-free, reliable baseload power. Third, we have started the construction of Sherco Solar 1, 2, and 3. These projects will add a combined capacity of 710 MWs of solar energy. Fourth, we have initiated a long-duration energy storage pilot. This pilot will test a new 10 MW long duration iron-air storage technology.

Lastly, the Company has also initiated proceedings to construct transmission lines for replacement generation at both Sherco and King, which will allow for the cost-effective integration of thousands of megawatts of additional renewable resources on our existing system.

Building on our ongoing efforts to transform our energy system, and based on extensive collaboration with our stakeholders, the key components of our Preferred Plan include:

- Adding thousands of megawatts of additional renewable resources to our system, including customer-sited DERs;
- Integrating and investing in energy storage systems, including adding short-duration storage systems to our fleet;
- Extending the life of our nuclear fleet;
- Ensuring reliability through additional firm dispatchable generation; and
- Continuing to increase Energy Efficiency and Demand Response resources to help reduce overall system demand.

The 2024 Plan leverages existing grid connections and proven technologies, as well as emerging technologies like battery storage to provide a balanced mix of resources while preserving our fundamental commitment to reliability at nominal cost to customers. The 2024 Plan demonstrates how the Company's power supply strategy reflects the value of our customers, balances the priorities of a carbon-free future against reliability and affordability, and supports Minnesota's energy priorities.

II. CHANGING PLANNING LANDSCAPE

The 2024 Plan builds on our previous 2019 Plan and extends our resource planning to 2040. Over the last several years, the Company has witnessed a number of changes and developments that have impacted our planning process. Several of these developments, such as policy changes at the federal and state level, present greater opportunities to meet our carbon-reduction goals. Others, such as MISO's adoption of a seasonal resource adequacy construct, are directed at different policy ends like ensuring that we and other utilities continue to maintain a reliable system. Collectively, these changes provide different considerations that the Company needed to navigate as we developed our Preferred Plan.

Some of the key planning developments over the planning period that impact our resource needs and operations, include changes in:

- Market Constructs,
- Federal and State Policies,
- Community & Employee Considerations,
- Customer Preferences, and
- Supply & Technology Trends.

First, we note the change in resource adequacy in regional market constructs leading from an annual resource accreditation to seasonal resource accreditation. The new seasonal construct is designed to address significant increases in emergency events that occur year-round, driven by factors including generation retirements, reliance on intermittent resources, seasonal variations, outages resulting from extreme weather events, and declining excess reserve margin. The 2024 Plan has incorporated the seasonal construct into the planning process and modeling, allowing for more precise planning and resource allocation based on the specific needs and resource availability of each season. Modeling tools have been adjusted, and our models have become more complex because they now have to ensure sufficient capacity across system peaks in all four seasons as opposed to the single peak hour in a year. We have also adjusted our long-term planning assumptions because our models use trends or averages from several years of data in order to accurately predict what will happen in the future. However, we only have one year of data for existing generation assets to use when figuring out how much capacity we will need for each season.

Second, the impacts of evolving environmental regulations and diverse regional and state policies will continue to require us to be responsive to new policy directives. Federal incentives for decarbonization in both utility generation as well as residential use are driving an enormous increase in the renewable market. The Inflation Reduction Act (IRA)—the largest climate investment ever by the US government—is expected to more than triple US clean energy production in less than 10 years, which would result in about 40 percent of the country's energy coming from renewable sources such as wind, solar and energy storage by 2030. However, carbon-free energy requirements are not exclusive to federal policy. As noted, state policy goals also influence our planning. Minnesota enacted new legislation requiring utilities serve 100 percent of their state retail load with carbon free energy by 2040. Besides the new carbon-free goal, Minnesota has seen other significant legislative developments since our 2019 Plan that impact how we conduct our resource planning. In particular, the cost of carbon, distributed solar energy standard, the updated renewable energy standard, and new carbon-free energy standard each impact our 2024 Plan. We see similar 100 x 2040 goals in Wisconsin and Michigan.

Third, community and employee considerations are impacting our planning process by causing us to rethink how we make decisions. We have taken efforts to engage and elicit community and stakeholder feedback and incorporate that feedback into how we do business, such as working to enhance equitable outcomes and broaden participation in energy decision-making by the communities we serve. We also know that our decarbonization goals impact the communities we work in and serve. We are also committed to transitioning our system while proactively working with the communities where plants are located and the employees who work in those plants.

Fourth, our planning recognizes customer preferences. The NSP System continues to serve a diverse mix of customers with varied interests and preferences. While most customers continue to prioritize affordability, we have seen increasing interest in customer choice around how and from where they consume energy, sustainability, carbon reduction, and other clean energy objectives. We are taking these interests into consideration in planning our resource mix for the future, recognizing and incorporating the energy preferences of our municipal, commercial and industrial, and residential customers through program development and offerings.

Finally, we are planning and incorporating technology and supply trends around generation and energy storage. The 2024 Plan assumes that wind and solar capital costs will continue to decline. We also expect technological advancements to continue to improve capacity factors, as tracking and PV module technologies have continued to improve and inverter loading ratios have increased with falling capital costs. We continue to monitor industry activity around other emerging technologies that may contribute to achievement of our goals.

At the same time, the planning for, and managing of, the integrated NSP System requires us to balance the needs and policy goals of all stakeholders and jurisdictions we serve. It is important to recognize that not all states we serve have the same energy policies and environmental goals. We believe that proactive leadership in the face of new and proposed environmental regulation, customer expectations, emerging technologies, and changes to the NSP System will allow us to both meet our customer and stakeholder goals as we affirmatively address these trends rather than being shaped by them.

III. MINIMUM SYSTEM NEEDS

Our planning process requires that we identify the minimum number of resources our system will need throughout the planning period. This provides a baseline upon which

we have developed the Reference Case, our modeling scenarios, and our Preferred Plan.

Our forecast begins with the capacity or peak demand, which indicates the total generating capacity (in MWs) needed to meet our customers' needs during the highest demand hour each year. We also evaluate the total energy (in MWhs) that we anticipate our customers will use annually. The peak demand and total energy requirements together guide us in identifying the best generating resources to meet customer needs. We include a "reserve margin" as prescribed by MISO to account for potential uncertainties in resource availability or demand level. By subtracting the resources, we currently have or expect to have from this "reserve margin," we can identify our net surplus or need. Each of these components are illustrated below in Figure Z-1:

Figure Z-1: Net Resource Need/Surplus Calculation

Customer Needs Forecast
Plus MISO Reserve Margin
Equals **Total Capacity Obligation**
Minus Demand Response Capability
Minus Generation Capacity (measured by seasonal accredited capacity)
Minus Generation Adjustments
Equals **Net Resource Need/Surplus**

We anticipate a net surplus through 2026 and a deficiency thereafter, starting first in the spring and summer of 2027. From this point, our modeling underlying our resource planning identifies the best combination to meet any net resource deficiencies and the resulting energy mix.

A. Reference Case Expansion Plan and Energy Mix

We incorporate all the relevant elements into the EnCompass modeling tool, which allows us to explore how we best meet our customer and policy requirements under a variety of conditions and at a reasonable cost. We work with internal and external subject matter experts to develop starting assumptions that reflect their expert opinion of likely future conditions. We then test the robustness of the plan through sensitivity analysis and special studies by individually changing key assumptions and re-running the plans under these changed assumptions.

IV. THE PREFFERRED PLAN

Our Preferred Plan continues to deliver on our obligations to provide safe, reliable, and affordable service to our customers while furthering our ambitious carbon-reduction strategy. Specifically, our 2024 Plan was developed to respond to emerging load growth that we anticipate, while providing a reliable and affordable system that furthers our carbon reduction goals. The result is a plan that will add thousands of megawatts of additional renewable resources, retire emitting baseload generation, and add flexible, dispatchable generation and storage resources to support the shift to renewables. We will also extend the lives of our carbon-free baseload nuclear generators.

A. Planning Objectives.

The 2024 Plan was developed to address the planning landscape in which we operate based on three key considerations: (1) load growth, (2) reliability; and (3) affordability. Each planning objective is addressed below.

1. Load Growth

The last several decades of our industry can be characterized as a period of relatively flat annual growth for electric consumption. However, we anticipate that the period of slow consumption growth is ending, and we expect to see the demand for our service increase at a greater pace. While further improvements in energy efficiency and demand response capabilities will continue to provide substantial value to our customers, we anticipate that emerging uses of electricity will result in greater consumption growth than we have needed to plan for in recent years. Specifically, our base case forecasts now anticipate average annual growth rates of 1.8 percent in our peak demand and 2 percent for our energy forecast over the 2024-2040 planning period. This is a marked divergence from what we have anticipated in the past. This expected growth in demand from electrification coincides with our aggressive goals to decarbonize our system.

2. Reliability

This anticipated increase in the growth of electricity consumption comes amid renewed attention to the reliability of the electric system. The foundational service we provide to our customers is safe and reliable electricity, and we must be prepared to meet our customers' energy demands twenty-four hours a day, 365 days a year. The closing of our (and other utilities') baseload coal units and substantial additions

of intermittent renewable resources has and will continue to provide many benefits to our customers and communities. Because of these retirements and changing resource accreditation methodologies, overreliance on the market creates substantial risk of high prices and the possibility that sufficient resources simply will not be available when they are needed.

To address these risks while continuing to optimize the cost-effectiveness of our fleet, we used a modified analysis to develop our 2024 Plan, and we did not allow our model to rely on the MISO market to meet our capacity obligations. We did, however, set those capacity obligations using MISO's coincident peak and planning reserve margin (PRM), and we allowed the model to benefit from access to the MISO market to optimize the dispatch of resources to serve our customers. This two-step analysis results in an expansion plan that takes advantage of the potential cost savings of participating in the MISO market, while not being reliant on the MISO market to meet our resource needs. In addition, by continuing to plan to MISO's coincident peak and PRM, our analytical approach ensures that we are not adding resources that are not necessary to meet our customers' needs.

In addition to planning to meet our planning obligations without reliance on MISO, we have taken steps to further refine our energy adequacy analysis. We conducted an energy adequacy back casting analysis to ensure our system has the reliable energy it needs to serve all customers at every hour, of every day. Further, we examined the inertial floor of our system to assess how the grid would perform in the absence of traditional baseload generation. Our studies go beyond traditional EnCompass modeling to verify the need for firm dispatchable resources and inertia to ensure reliable service for our customers.

3. Affordability

We understand the importance of keeping the cost of our service reasonable for our customers and providing cost-effective solutions for our energy needs. That is why we plan our expansion with stakeholders in mind with an expansion plan that can be implemented at reasonable cost to our customers. Our average residential customer's electricity bill has remained below the national average, and our goal continues to be that our customers will experience average annual bill increases that are below the rate of inflation. In order to keep costs low for our customer, we took care to leverage additional policy incentives that will benefit our customers. In particular, the passage of federal tax incentives that lowers costs, saving customers a projected $5.7 billion in tax credits in renewable savings over the course of the expansion plan.

B. Preferred Plan

As stated, proactive investments to maintain a reliable and resilient regional power grid are necessary as more low-cost renewable energy is brought online, existing power plants are retired, electrification continues to grow, and extreme weather events become more frequent. The 2024 Plan is designed to accelerate our carbon-reduction efforts while maintaining a safe, reliable, and affordable system for our customers and communities throughout the planning period.

Key Components of our Preferred Plan include adding thousands of megawatts of additional renewable resources to our system and incrementally retiring emitting baseload generation, while also incorporating flexible, dispatchable generation to enable grid reliability throughout this transition. We propose extending operations of our carbon-free nuclear units and extending operations of our Refuse Derived Fuel (RDF) waste to energy generating plants. Finally we are supporting the beneficial electrification of certain end uses and enabling demand flexibility, which will help to reduce carbon emissions in other sectors while also allowing for load shifting to help integrate more renewables.

Figure Z-2 below outlines the proposed timing, type, and size of resource additions comprising our Preferred Plan.

Figure Z-2: Preferred Plan Resource Additions (MW)

	2025	2026	2027	2028	2029	2030	2031	2032	2033	2034	2035	2036	2037	2038	2039	2040

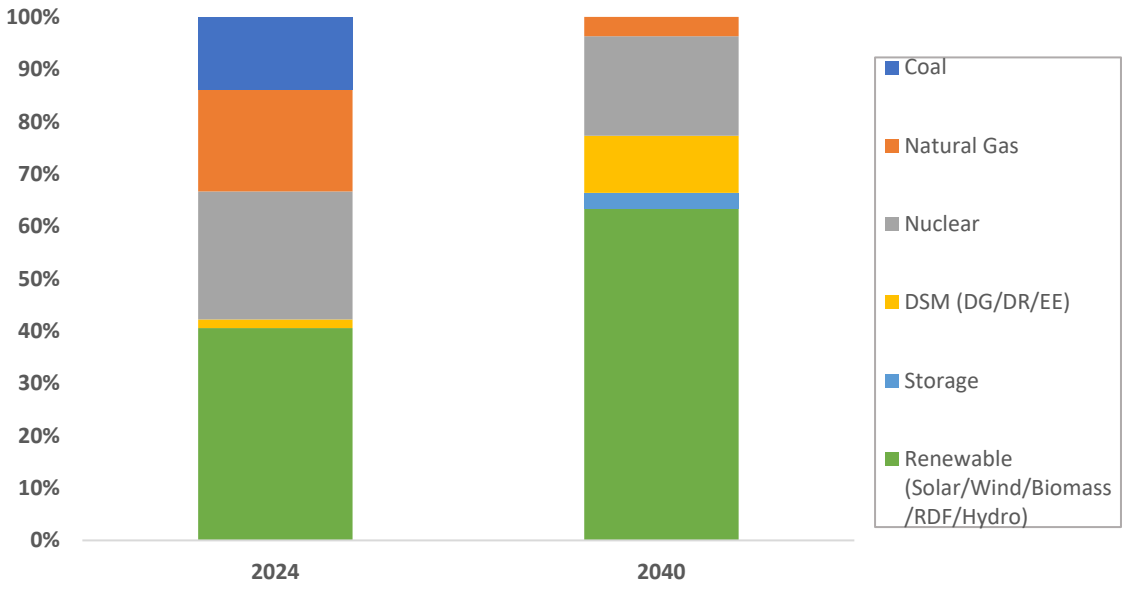
Our Preferred Plan outlined above would result in the energy mix shown in Figure Z-3 below.

Figure Z-3: NSP System 2024 and 2040 Preferred Plan Energy Mix



C. Action Plans

1. Five-Year Plan (2024-2030)

Our 2024 Plan does not identify any incremental capacity needs until 2027. However, from 2027 through 2030, our Preferred Plan contemplates adding over 6,000 MWs of incremental generation. Below, we discuss the near-term actions by resource type that underly expansion plan, recognizing that the resource additions may need to be smoothed during the implementation process to create a portfolio of projects that can be constructed effectively within the constraints of the market for equipment and labor.

a. Wind

Our 2024 Plan proposes to add 3,200 MWs of wind additions through 2030. 2,800 MWs of the 3,200 MWs near-term wind total is attached to the MN Energy Connection Sherco Generation tie line, which was proposed in our 2019 Plan. We are pursuing 1200 MWs of this wind through the recently approved MN Development Transfer Resource Acquisition Process. We expect to begin further procurement activities and the proceedings through a Commission approved bidding process in the next year. The remaining 400 MWs of generation is generic and non-location specific.

b. Solar

Our 2024 Plan adds 400 MWs of solar using the King Interconnection in 2030. Beyond these additions, we do not include any new utility scale solar projects between 2024 through 2030, other than those already approved by the Commission and included in our Base Case. On the distributed solar side, we have incorporated forecasted growth into our 2024 Plan using the maximum possible level of non-legacy community solar gardens and levels of three percent distributed solar energy standard solar.

c. Firm Dispatchable

Our 2024 Plan calls for 2,244 MWs of firm dispatchable resources by 2030. These resources are split between 748 MWs in 2027, 748 MWs in 2028, and 748 MWs in 2030. Approximately 374 MWs of the 2028 need is located on our re-optimized Sherco Generation tie line and is pending regulatory approvals from the Commission. The rest of the firm dispatchable additions are generic.

We have already opened a proceeding before the Minnesota Commission to consider up to 800 MWs of firm dispatchable resources.[1] The 800 MWs are included in the 2,244 MWs proposed in our 2024 Plan, however our modeling for this plan identifies a need exceeding 800 MWs of firm dispatchable resources. As part of the proceeding, the Company has submitted three proposals totaling in excess of 800 MWs. Third party providers have also submitted proposals.

d. Battery Energy Storage Systems

We plan to add approximately 600 MWs of storage by 2030. The 600 MWs of storage is comprised of a modeled 480 MWs of generic storage in 2027, and 120 MWs as part of our re-optimized Sherco Generation tie line in 2029. We expect to solicit these resources as part of a request for proposals under a commission approved bidding process.

e. Nuclear Extension

In order to support the extension of our nuclear generation plants to at least 2050, steps will need to be taken in the near future. We plan on filing a certificate of need with the Commission on February 7, 2024, for additional dry fuel storage to support

[1] Docket No. E002/CN-23-212.

continued operation of Prairie Island through 2053/2054. We plan to submit our application in 2026 with the Nuclear Regulatory Commission to extend the Prairie Island Nuclear Generating Plant operating license from 2033/2034 to 2053/2054.

With respect to Monticello, we plan to begin construction of the concrete pad at Monticello in 2026. Shortly after a Commission decision on the 2024 Plan, we will also seek another certificate of need for the dry fuel storage necessary to support the additional 10-year life extension of Monticello.

Throughout the planning process, we continue to collaborate with the Prairie Island Indian Community, the City of Red Wing, the City of Monticello, Goodhue County, Wright County, and other community interests to ensure transparency and continuous partnership.

f. Refuse Derived Fuel Waste to Energy Extension

Finally, all three of our renewable RDF waste to energy generating plants are slated for retirement in 2027, and we plan to extend the life and operations of our Red Wing, Mankato, and French Island RDF plants to 2037, 2037, and 2040 respectively. These plants not only add significant value to our system and help us achieve our renewable energy goals with reliable power, but also provide value to the local communities they serve. We plan to address the extension of these plants in our upcoming annual remaining lives filing.

2. Long-Term Plan

In addition to our immediate five-year action plan, our 2024 Plan relies on model-selected resources in the 2031-2040 period that we envision could be part of our energy future including that include:

- Adding an additional 1,100 MWs of incremental utility-scale solar;
- Adding an additional 5,200 MWs of incremental wind and repowering existing wind resources when economical;
- Adding an additional 1,500 MWs of incremental Battery Energy Storage Systems;
- Adding approximately 1,347 MWs of incremental firm peaking resources;
- Developing additional regional transmission infrastructure;
- Growing our DR portfolio to approximately 1,385 MW by 2040; and
- Continuing plans to achieve average annual energy savings, through our energy efficiency programs between 2031-2040.

Our 2024 Plan presents a pathway to achieve Minnesota's 100 percent carbon free by 2040 law. While these modeled additions project what our system would look like in 2040, we note that ingenuity, new technologies, and transmission will be necessary in order to ensure we can achieve our longer-term goals of 100 percent carbon-free electricity across the NSP system by 2050.

While our 2024 Plan examines the generation side of the equation, the Company is working on creating a long-term Vision study to examine the 2040 and 2050 timeframes to determine what transmission investments might be needed to achieve a 100 percent carbon free energy plan. The study will include a comprehensive look at load growth, including varying electrification and adoption rates, generation profiles and locational data, and finally, transmission needed to accommodate the future carbon goals. We look forward to leveraging these studies to inform our planning as they become available.

V. ECONOMIC MODELING FRAMEWORK.

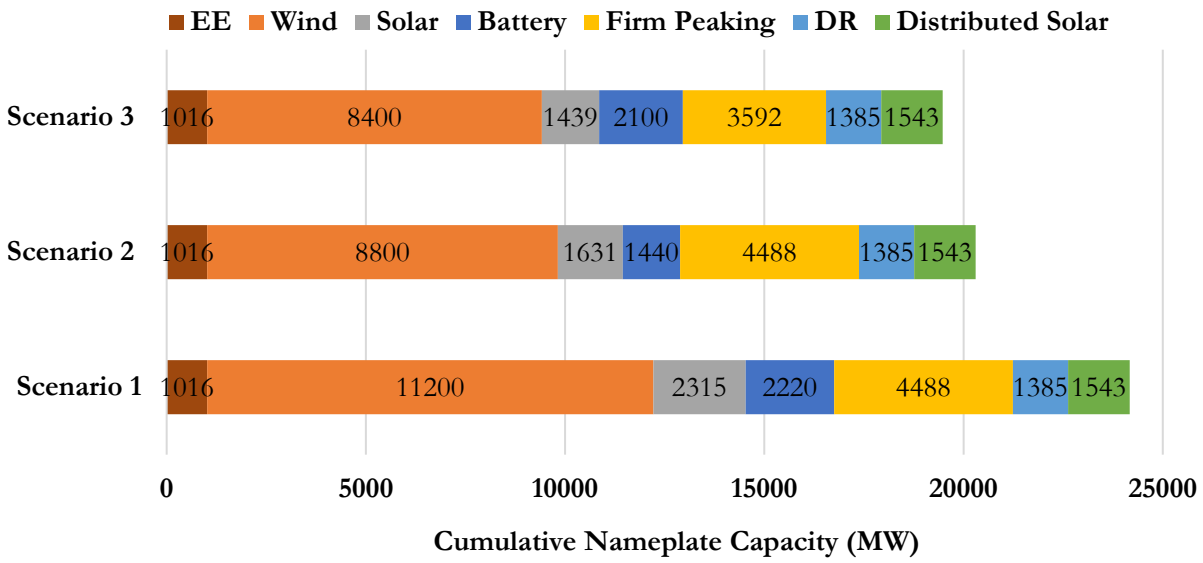
To develop the 2024 Plan, we use a modeling tool called Encompass. EnCompass is a software tool that estimates the costs of various resource expansion plan options, evaluates specific capacity alternatives, and measures the potential risks of new environmental legislation and other policy scenarios. This tool allows us to assess different scenarios under a variety of possible futures to help us meet customer and policy requirements cost-effectively under various conditions. We create starting assumptions with the help of internal and external experts, reflecting likely future conditions. We test the robustness of the plans through sensitivity analysis.

Starting with our Reference Case, we created scenarios that examine different potential life extensions and retirement dates for our nuclear units and the resulting new resources needed to meet customers' needs, achieve our policy goals and obligations, and maintain affordable rates. The scenarios include analysis of:

- Scenario 1: Reference Case; Retire Prairie Island in 2033/34, Monticello in 2040 (updates all baseline resources, including Wheaton and Blue Lake repowers, RDF extension, Inver Hills extension);
- Scenario 2: Prairie Island Extension; Retire Prairie Island in 2053/54, Monticello in 2040; and
- Scenario 3: Extend All Nuclear; Retire Prairie Island in 2053/2054, Monticello in 2050.

After identifying the scenarios, we used EnCompass to identify the expansion plans for each of the three primary scenarios, and their resulting cost and emissions impacts. Completing baseload scenario runs, as described above, allows us to examine scenario outcomes side-by-side, to evaluate their benefits and drawbacks. Among other factors, we examine the resource expansion profile and carbon emissions outcomes, present value costs, and several indicators of risk for each scenario. The cumulative expansion plan additions through the planning period for the three scenarios are shown below in Figure Z-4.

Figure Z-4: Expansion Plans by Scenario (MW, Cumulative Nameplate Capacity Resource Additions by Resource Type, 2024-2040)



As shown above in Figure Z-4, Scenario 3 results in fewer additions of firm peaking and wind capacity relative to both Scenarios 1 and 2. The extension of the nuclear units offset additions of other resources need for capacity and energy. While Scenario 2 includes the same amount of cumulative firm peaking resources through 2040, those additions are delayed by the extension of Prairie Island, and few firm peaking resources are needed over the 20-year life extension. Moreover, the nuclear extensions provide a certain and stable source of energy to our system as we transition our generation fleet.

The cost impact of the three scenarios is shown below in Table Z-1. The table shows the net present value (NPV) delta of modeled costs compared to Scenario 1 (the

Reference Scenario), with negative values representing customer savings relative to the Reference Scenario.[2]

Table Z-1: Scenario PVSC/PVRR Deltas from Reference Case ($2024 millions)

PVSC Production Cost	Delta in NPV ($m) 2024-2040	NPV ($m) 2024-2040	Delta in NPV ($m) 2024-2047	NPV ($m) 2024-2047	Delta in NPV ($m) 2024-2050	NPV ($m) 2024-2050
Scenario 1 PVSC	$0	**$51,037**	$0	**$63,635**	$0	**$68,788**
Scenario 2 PVSC	($413)	**$50,624**	($437)	**$63,198**	($513)	**$68,275**
Scenario 3 PVSC	($785)	**$50,252**	($941)	**$62,695**	($1,025)	**$67,762**
PVRR Production Cost	**Delta in NPV ($m) 2024-2040**	**NPV ($m) 2024-2040**	**Delta in NPV ($m) 2024-2047**	**NPV ($m) 2024-2047**	**Delta in NPV ($m) 2024-2050**	**NPV ($m) 2024-2050**
Scenario 1 PVRR	$0	**$34,678**	$0	**$44,948**	$0	**$48,927**
Scenario 2 PVRR	($97)	**$34,581**	$291	**$45,239**	$391	**$49,317**
Scenario 3 PVRR	($464)	**$34,215**	$46	**$44,994**	$239	**$49,166**

The Scenario 3 plan was the lowest cost plan in terms of PVSC in all time periods assessed. As our nuclear plants provide a source of carbon-free energy to our system, extension of these resource results in overwhelming benefits due to the avoidance of carbon emissions from other resources. It also is the lowest cost plan in terms of PVRR through 2040, and nearly breakeven through 2047 compared to the Reference Case. The only outlier is when PVRR is assessed through 2050, which shows Scenario 3 adds $239 million in NPV compared to the Reference Case. We note, however, that the replacement capacity added at the end of the expansion plan to replace Prairie Island in Scenario 2 and Prairie Island and Monticello in Scenario 3, significantly impacts overall cost.

Given current technologies, the model makes significant additions of firm dispatchable resources in the late 2040s in anticipation of the retirement of the nuclear fleet. Under the PVRR assumptions, no cost is included on the emissions from these resource additions. We expect technological advancements will provide resource options that are not currently available when the plants near the end of their extended lives. Therefore, the significant firm dispatchable additions in the late 2040s may not

[2] Note that these PVRR and PVSC deltas shown depict NPV for 2024-2040.

provide a reliable indication of the costs that far out in time. As a result, we provide cost comparisons over three different time horizons. The most relevant of these horizons—through 2040, when resource and cost assumptions are most known—shows the extension of our nuclear fleet provides significant economic benefits even when the benefits of avoided emission are not included.

A final step in our analysis process evaluated the performance of the baseload study plans under different sensitivities. A summary of examined sensitivities is presented in Table Z-2 below.

Table Z-2: Sensitivities

Category	Scenario Descriptions
Standard	PVSC – Base, i.e., with Mid Reg Cost ($40) >2028 + Mid Draft EPA <2028 + (Draft EPA - Reg Cost) starting in 2028
	PVRR – Base, i.e., no carbon cost and environmental externality
Sensitivities on All Three Nuclear Scenarios	
Fuel prices	High Fuel/Market Price
	Low Fuel/Market Price
Load	High Load
	Low Load
Technology cost	High Technology Cost
	Low Technology Cost
	Edison MISO Market Prices for wind and solar
Cost of carbon	High Reg Cost ($75) >2028 + High Draft EPA <2028 + (Draft EPA - Reg Cost) starting in 2028
	Low Reg Cost ($5) >2028 + Low Draft EPA <2028 + (Draft EPA - Reg Cost) starting in 2028
	Draft EPA - High ($0 Reg Cost)
	Draft EPA - Mid ($0 Reg Cost)
	Draft EPA - Low ($0 Reg Cost)
Market Access	Market access off in dispatch runs
Environmental Policy	Good Neighbor Rule applied in both Minnesota and Wisconsin + EPA Rule 111
Combination	High technology cost + high load
	Low technology cost + low load
Carbon Free 100x50	Carbon constraint to reach 100x50 carbon free goal

The PVRR and PVSC for each sensitivity consistently shows the Preferred Plan, Scenario 3, as yielding the most customer benefits on a PVSC basis across nearly all sensitivities. Based on these analyses, we believe our Preferred Plan meets all our key planning objectives, balances outcomes and costs, and provides us with the strategic flexibility to address the planning landscape.

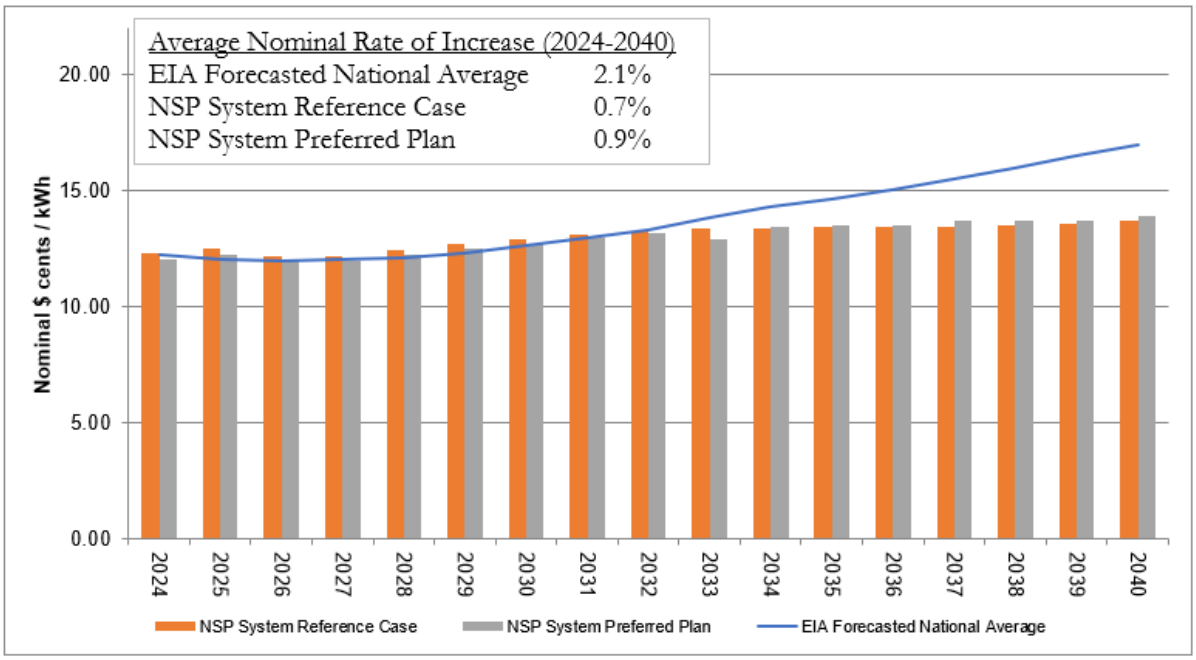
VI. RATE IMPACTS

Resource plans, among other things, are evaluated in part on their ability to keep the customers' bills and the utility's rates as low as practicable, given regulatory and other constraints. Our analysis of the present rate and bill impacts of our Preferred Plan shows that while the Preferred Plan's rate impact is higher than the reference case, it is lower than the national average forecasted by the Energy Information Administration.

Our Preferred Plan results in an estimated average annual increase in revenue requirements less than the Base Case and just over 1 percent overall. With our Preferred Plan, we can achieve significant CO_2 emissions reductions, with cost impacts that are roughly half of the expected national average increase in electricity prices. Both the Base Case and The Plan are designed to meet the Company's clean energy goals, and state policy objectives.

As shown in this report, our Preferred Plan maintains affordability and reliability while continuing our trend of carbon reduction benefits relative to our Base Case. See Figure Z-5 below.

Figure Z-5 Preferred Plan Average Rate Impact for the NSP System



We have been adding cost-effective renewable resources to our system to reduce emissions. We believe that our Preferred Plan keeps customers' bills and rates as low as practicable while continuing our transition to a carbon-free system. As we continue our transition to a carbon-free system, we remain committed to being the energy provider of choice for our customers, and keeping rates low is a key part of that commitment.

VII. CONCLUSION

The backbone of resource planning is ensuring we have the right resources in place to keep the lights on for our customers and to be ready to accommodate customer load growth reliably and in a timely fashion. We continue to take measured and thoughtful action to balance the key factors of load growth, reliability, and affordability to ensure our customers receive the greatest value both now and over time, and that the fundamentals of our electric business remain sound.

The Company has led the clean energy transition for nearly two decades. We share the state's vision to deliver 100 percent clean energy in Minnesota by 2040. By planning ahead and charting an orderly, gradual transition of our generation fleet, we believe we can achieve our stated goals while managing impacts to host communities and

employees, preserving the reliability and stability of our system, and maintaining affordability for our customers.

We have presented a Preferred Plan that seeks to (1) maintain or improve the adequacy and reliability of utility service; (2) keep the customers' bills and our rates as low as practicable, given constraints; (3) minimize adverse socio-economic effects and adverse effects upon the environment; (4) enhance our ability to respond to changes in the financial, social, and technological factors affecting our operations; and (5) limit the risk of adverse effects from financial, social, and technological factors outside of our control. For these reasons and as discussed throughout our 2024 Plan filing, we believe our Preferred Plan is in the public interest and merits the Commission's approval.

RE: ELECTRIC UTILITY ANNUAL REPORT
DOCKET NO. E999/M-23-11

Dear Ms. Sell:

Northern States Power Company, doing business as Xcel Energy, submits the enclosed 2022 Electric Utility Annual Report required under Minn. Rule 7610.0130. Our Annual Report consists of the enclosed pages as well as individually uploaded live spreadsheets.

Private and Trade Secret Data Justification
Please note that this report contains Trade Secret information protected by the Minnesota Data Practices Act, including private data—including names, addresses, and usage—for our largest electric customers. That information has economic value, actual or potential, from not being generally known to, and not being readily ascertainable by proper means by other persons and is subject to efforts by the Company to protect the information from public disclosure. Xcel Energy maintains this information as a trade secret based on its economic value from not being generally known and not being readily ascertainable by proper means by other persons who can obtain economic value from its disclosure or use. For this reason, we ask that the data be treated as non-public data pursuant to Minn. Stat. § 13.37, subd. 1(b).

The forecast purchase and resale energy information has economic value to Xcel Energy, its customers, suppliers, and competitors. Because Xcel Energy competes for purchased energy, fuel and transportation services in a competitive marketplace,

disclosure would directly harm Xcel Energy by making its delivered supply costs less competitive. For this reason, pursuant to Minn. Stat. § 13.37, subd. 2, we have removed this data from the public version of our filing.

We have electronically filed this document with the Minnesota Public Utilities Commission. Please feel free to contact Gail Baranko at (612) 330-6935 or gail.baranko@xcelenergy.com or Christine Schwartz at (612) 330-6193 or Christine.E.Schwartz@xcelenergy.com if you have any questions regarding this report.

Sincerely,

/s/

GAIL A. BARANKO
REGULATORY MANAGER

7610.0320 - Forecast Methodology

NSP Electric – Minnesota Annual Report
Peak Demand and Annual Electric Consumption Forecast

OVERALL METHODOLOGICAL FRAMEWORK

Xcel Energy prepares its forecast by major customer class and jurisdiction, using a variety of statistical and econometric techniques. The NSP System serves five jurisdictions. Minnesota, North Dakota and South Dakota are served by Northern States Power Company (NSPM). Wisconsin and Michigan are served by Northern States Power Company, a Wisconsin corporation (NSPW). The NSPM and NSPW Systems operate as an integrated system. The forecast is referred to as the 2023v1.0 Forecast (completed in March 2023).

SPECIFIC ANALYTICAL TECHNIQUES

1. Econometric Analysis. Xcel Energy used econometric analysis to develop jurisdictional MWh sales forecasts at the customer meter for the following sectors (exceptions to this are noted in bullet 2):
    a. Residential without Space Heating;
    b. Residential with Space Heating;
    c. Small Commercial and Industrial;
    d. Large Commercial and Industrial (Minnesota only);
    e. Public Street and Highway Lighting (Minnesota only);
    f. Sales to Public Authorities (Minnesota only).

    Xcel Energy also used econometric analysis to develop the total system MW peak demand forecast.
2. Trend analysis was used for all other sectors, which includes Large Commercial and Industrial, Public Street and Highway Lighting, Other Sales to Public Authorities for all jurisdictions except Minnesota; and Interdepartmental sales for all jurisdictions.
3. Loss Factor Methodology. Loss factors by jurisdiction were used to convert the sales forecasts into system energy requirements (at the generator).
4. Judgment. Judgment is inherent to the development of any forecast. Whenever possible, Xcel Energy used quantitative models to structure its judgment in the forecasting process.

The sales forecasts are estimates of MWh levels measured at the customer meter. They do not include line or other losses. The various jurisdictional class forecasts were summed to yield the total system sales forecast. Native energy requirements are measured at the generator and include line and other losses. Xcel Energy created the native energy requirements based on the sales forecasts. A system loss factor for each jurisdiction, developed based on average historical losses, is applied to the sales forecast to calculate total losses. The sum of the MWh sales and the MWh losses equals the native energy requirements. The native energy requirements, along with peak producing weather and binary variables, then were used as independent variables within an econometric model to forecast MW peak demand for the Xcel Energy North System.

MODELS USED

1. ***Residential Econometric Models.*** Sales to Residential customers represent 31.5% of NSP System electric sales in 2022. Residential sales are divided into with space heating and without space heating customer classes for each NSPM jurisdiction. NSPW jurisdictions only have a total Residential customer class. Regression models using historical data are developed for each Residential sector. A variety of independent variables were used in the models, including:
    - Real Personal Income or Real Personal Income per Capita for the respective jurisdiction;
    - Average price (reported revenues/reported sales) for the respective jurisdiction;
    - Gross Metro Product for the respective jurisdiction;
    - Total population for the respective jurisdiction;
    - Average price of West Texas Intermediate crude oil;
    - Actual heating (HDD) and temperature humidity index (THI) degree days;
    - Number of customers;
    - Number of monthly billing days;
    - Month specific binary variables;
    - Other binary and or trend variables;
2. ***Small Commercial and Industrial Econometric Models.*** The small commercial and industrial sector represents 42.75% of NSP System electric sales in 2022. The models are econometric regressions using historical data. The models include a combination of variables, including the following:
    - Number of small commercial and industrial customers;
    - Gross State/Metro Product for respective jurisdiction;
    - Employment for respective jurisdiction;
    - Actual heating (HDD) and temperature humidity index (THI) degree days;
    - Number of monthly billing days.
    - Month specific binary variables
    - Other binary and or trend variables.
3. ***Large Commercial and Industrial Econometric Model.*** Sales to the large commercial and industrial sector represent 25.2% of NSP System electric sales in 2022. The regression model uses historical data and the following explanatory variables:
    - Industrial Production Index;
    - Number of monthly billing days.
    - Month specific binary variables;
    - Other binary variables.
4. ***Others.*** Sales to the "Others" sector represent 0.6% of NSP System electric sales in 2022. This sector includes Public Street and Highway Lighting (PSHL), Sales to Public Authorities (OSPA) and Interdepartmental (IDS) sales. Regression models are used to estimate sales for the PSHL and OSPA classes (Minnesota only), using historical data and a combination of variables, including the following:
    - Population for the respective jurisdiction;
    - Gross Metro Product for the respective jurisdiction;
    - Number of monthly billing days;

- Month specific binary variables;
- Other binary and or trend variables.

5. ***Municipals.*** As of 2014 there are no longer any municipal customers for whom NSP or NSPW provides firm service.
6. ***Peak Demand Model.*** An econometric model was used to develop the base peak demand forecast for the entire planning period. The model includes a combination of variables, including the following:
    - Weather normalized native energy requirements adjusted for the impacts of historical DSM programs and without adjustments for future DSM, future distributed solar generation behind the customer's meter, and future electric vehicle charging;
    - Peak producing weather by month weighted by customer counts;
    - Binary variables.

METHODOLOGY STRENGTHS AND WEAKNESSES

The strength of the process Xcel Energy used for this forecast is the richness of the information obtained during the analysis. Xcel Energy's econometric forecasting models are based on sound economic and statistical theory. Historical modeling and forecast drivers are based on economic and demographic variables that are easily measured and analyzed. The use of models by class and jurisdiction gives greater insight into how the NSP System is growing, thereby providing better information for decisions to be made in the areas of generation, transmission, marketing, conservation, and load management.

With respect to accuracy, forecasts of this duration are inherently uncertain. Planners and decision makers must be keenly aware of the inherent risk that accompanies long-term forecasts. They must also develop plans that are robust over a wide range of future outcomes.

MODELING DATA

Xcel Energy uses internal and external data sources to create its MWh sales and MW peak demand forecast.

Historical MWh sales are taken from Xcel Energy's internal company records, fed by its billing system. Historical coincident net peak demand data is obtained through company records. The load management estimates are added to the net peak demand to derive the base peak demand.

Monthly weather data is collected for the Minneapolis/St. Paul, Fargo, Sioux Falls, and Eau Claire metropolitan areas. The heating degree-days and THI degree-days are calculated internally based on this weather data.

Economic and demographic data is obtained from the Bureau of Labor Statistics, U.S. Department of Commerce, and the Bureau of Economic Analysis. Typically, they are accessed from IHS Markit, and reflect the most recent values of those series at the time of modeling.

DEMAND-SIDE MANAGEMENT PROGRAMS

The Company sponsors demand-side management ("DSM") programs in the Minnesota and South Dakota jurisdictions. There are no Company-sponsored DSM programs in the North Dakota, Michigan, or Wisconsin jurisdictions. For Minnesota and South Dakota, the regression model results for the Residential and Commercial and Industrial classes are reduced to account for the expected impacts of DSM programs.

The DSM methodology utilizes a transparent method for projecting the impacts of energy efficiency and load management on sales forecasts. There are three distinct steps to this process:

- Collect and calculate historical and current effects of DSM on observed sales;
- Project the forecast using observed data with the impact of DSM removed (i.e. increase historical sales to show hypothetical case without DSM);
- Adjust the forecast to show the impact of all planned DSM in future years.

The first step involves collecting data involving any measure that would cause an impact on the time period utilized in the sales forecast. In this model, we use the time period from 2008 to December 2022 and therefore the historical DSM would include any measure that results in decreased sales in any (or all) years from 2008 through December 2022. Since the vast majority of DSM measures have a lifetime greater than one year (exceptions include but are not limited to behavioral energy savings programs), the impact on sales will include the year that a measure is installed as well as any years that follow until the measure has reached the end of its useful life. For example, a residential lighting measure that was installed in 2008 and has a life of 6 years will result in a sales reduction from 2008 to 2013 (6 full calendar years). Though a measure may be installed in June of 2008 and would persist until May of 2013, the Company believes that the simplifying case in which all measures are installed for the entire calendar year is sufficient.

Due to the wide variation of measures available to customers, the Company sums the savings for each year by DSM program to optimize the level of detail and depth of history included in the model. Achievement data are from the approved Conservation Improvement Program (CIP) Status Reports filed annually for each year since 1996.

The Company's Saver's Switch program results in short-term interruptions of service designed to reduce system capacity requirements rather than permanent reductions in energy use, so it is not considered here.

Adjustments equivalent to those made to sales have also been made to the historical monthly energy and peak demand used in the peak demand regression model and to the resulting peak demand forecast.

BEHIND-THE-METER DISTRIBUTED SOLAR GENERATION

In response to the establishment of a Solar Energy Standard (SES) by the Minnesota Legislature an increased emphasis has been placed on distributed solar generation. A forecast of the expected behind-the-meter solar generation impact on demand and energy has been developed based on new programs designed to meet goals established for the SES. Impacts of customer sited behind-the-meter solar installations on the NSP system were

extracted from this forecast and used to develop adjustments to reduce the class level sales for Minnesota and the NSP System peak demand forecast. This process of adjusting the sales and peak demand forecasts for behind-the-meter solar generation is similar to the adjustments made for DSM programs. There are three distinct steps to this process:

- Collect and calculate historical and current effects of behind-the-meter solar generation on observed sales and peak demand;
- Project the forecast using observed data with the impact of behind-the-meter removed (i.e. increase historical sales to show hypothetical case without behind-the-meter solar generation);
- Adjust the forecast to show the impact of all current and planned behind-the-meter solar generation in future years.

Xcel has calculated and metered the historical impact of distributed solar generation on customer sales and peak demands.

Once the total impact of DSM in effect and distributed solar generation is calculated for each year, a hypothetical sales data set is created. This series consists of the observed sales from 2008 through December 2022 plus the effective DSM calculated for all DSM measures installed in that year as well is achieved savings from programs in prior years that are still within the useful measure life, plus the historical distributed solar generation.

In the second step, the hypothetical sales data is used to generate a sales forecast that has entirely excluded the impacts of Company-sponsored DSM and distributed solar generation. It is important to note that customer-initiated DSM or DSM due to codes and standards (naturally occurring DSM) is not calculated as part of the CIP. The methodology to account for codes and standards changes is described below.

In the third step, once the sales forecast based on hypothetical sales has been generated, the Company adjusts the forecast to account for future DSM and future distributed solar generation. The forecast of future distributed solar generation is developed by Xcel Energy's Load Research Department. A monthly forecast of the impact of new DSM programs (excluding Saver's Switch) is developed by Xcel Energy's DSM Regulatory Strategy and Planning Department. The future DSM sales volumes are combined with the continuing impacts of historical DSM measures and future solar generation and used to reduce the class level sales forecasts that result from the regression modeling process to determine the DSM and solar-adjusted sales. Impacts from all program installations through December 2022 are assumed to be imbedded in the historical data, so only new program installations and the continuing impact of historical programs are included in the DSM-solar generation adjustment. The source for Company-sponsored DSM adjustments is based on the CIP Plan in effect at the time of the forecast.

PLUG-IN ELECTRIC VEHICLE CHARGING

The residential sales and peak demand forecasts also are adjusted to account for the use of plug-in electric vehicle charging. The penetration of electric vehicles in Xcel Energy's service territory has been increasing over the past few years and is expected to continue increasing. Because this trend of increasing electric vehicle penetration is expected to continue, the Residential sales forecasts have been adjusted for to account for future

electricity usage from home charging of electric vehicles. In addition, the Small Commercial and Industrial and Large Commercial and Industrial sales forecasts have been adjusted to account for future electricity usage from the charging of medium-duty and heavy-duty electric vehicles. The forecast adjustment for the monthly consumption of electricity for electric vehicle charging is based on a model that incorporates the stock of electric vehicles, electricity consumption per vehicle, an adoption rate for this technology, and financial incentives.

Because the peak demand forecast was developed with an energy forecast that had the adjustments for electric vehicle charging removed, the peak demand forecast includes a post-modeling adjustment to account for future electric vehicle charging impacts at the system peak. The peak demand forecast adjustment is based on monthly electric vehicle energy consumption, daily consumption profile, and the time of day the monthly peak hour occurs.

The electric vehicle assumptions for the expected MWh sales impacts and MW peak demand impacts were developed by Xcel Energy's Risk Management department.

DATA ADJUSTMENTS AND ASSUMPTIONS

1. Weather Adjustments. Xcel Energy adjusted its monthly weather data to reflect billing schedules. Therefore, the monthly weather data corresponds exactly with the billing month schedule.
2. Economic Adjustments. All price data and related economic series were deflated to 2012 constant dollars.
3. Large Customer Adjustments. The large commercial and industrial sales model results have been adjusted to account for announced changes in operations for large customers.
4. Demand Forecast Wholesale Adjustment. An adjustment to account for terminating firm wholesale customer contracts was incorporated into the development of the peak demand forecast. Estimated historical coincident peak demand and energy for all firm wholesale customers were removed from the regression model data to create a consistent data series for retail demand and energy.
5. COVID Pandemic Assumptions. The COVID-19 pandemic has had an impact on Xcel Energy sales. The Residential class experienced an increase in sales resulting from an increase in working-from-home and social distancing measures. Over the next few years Residential sales are expected to experience declining sales growth, in part due to more employees return to the workplace. Residential regression models use the Google Mobility Index to explain the historical change in consumption due to COVID-19. Conversely, the Small Commercial and Industrial and Large Commercial and Industrial customer classes have experienced a sharp decline in sales resulting from pandemic related economic weakness and business shutdowns. Recovery from this downturn is expected with Small Commercial and Industrial and Large Commercial and Industrial sales growth over the next few years. This recovery is driven by the economic explanatory variables in the Commercial and Industrial regression models. The COVID-19 pandemic impacts on the peak demand forecast are driven by the energy forecast.

ASSUMPTIONS AND SPECIAL INFORMATION

Xcel Energy believes that its process is a reasonable and workable one to use as a guide for its future energy and load requirements. The underlying assumptions used to prepare Xcel Energy's median forecast are as follows:

1. Demographic Assumption. Population or household projections are essential in the development of the long-range forecast. The forecasts of customers are derived from population and household projections provided by IHS Markit, Inc., and reviewed by Xcel Energy staff. Xcel Energy customer growth mirrors demographic growth over the forecast period.
2. Weather Assumption. Xcel Energy assumed "normal" weather in the forecast horizon. Normal weather is defined as the average weather pattern over the 20-year period from 2003-2022. The variability of weather is an important source of uncertainty. Xcel Energy's energy forecasts are based on the assumption that the normal weather conditions will prevail in the forecast horizon. Weather-related demand uncertainties are not treated explicitly in this forecast.
3. Loss Factor Assumptions. The loss factors are important to convert the sales forecast to energy requirements. Xcel Energy uses a historical average loss factor for each jurisdiction, and assumes it will not change in the future.

FORECAST COORDINATION

Xcel Energy reports its energy and peak demand forecasts to the Midwest ISO (MISO). MISO then combines the forecasts of all its member utilities. Xcel Energy also reports its forecast to the Public Service Commission of Wisconsin as part of its Strategic Energy Assessment (SEA) process. In this process, the Wisconsin portion of the total Xcel Energy System load is combined with other Wisconsin electric utilities to form a statewide Wisconsin forecast.

7610.0410 – Future Facility Additions
7610.0420 – Future Facility Retirements

The Company's most recent, completed, Resource Plan (Docket No. E002/RP-19-368) was approved by Minnesota Public Utilities Commission (MPUC or the Commission) through an Order issued April 15, 2022. The Alternate Preferred Plan, filed June 25, 2021, was approved for the purposes of planning.

The Order to close the 2020-2034 Upper Midwest Resource Plan docket identified the Company shall:

- Retire the AS King Generating Station in 2028 and the Sherco County Generation Station Unit 3 in 2030.
- Acquire an average of 780 GWh energy efficiency, annually.
- Acquire 400 MW of additional Demand Response by 2023, consistent with the previous IRP order.
- Repower existing resources as needed for black start purposes.
- Acquire, by 2026, 1300 MW of solar resources to replace the capacity following the retirement of Sherburne County Generation Station Unit 2, prioritizing the use of associated interconnection rights, some of which could be fulfilled by the Company's pending proposal for a 460 MW solar installation near the existing Sherco site ("Sherco Solar").
- Between 2027-2032 add an additional 600 MW solar and 2,150 MW wind powered generation at Sherco, and an additional approximately 600 MW to reutilize the A.S. King interconnection rights.
- Commence the Certificate of Need and route permitting proceedings for 345 kV transmission lines extending from both Sherburne County Generation site and AS King Generation site. This transmission is intended to develop new energy resources and be connected to the MISO transmission grid through the existing interconnection points.
- Submit the next resource plan by February 1, 2024.

The 2020 Review of Remaining Lives (Docket No. E,G002/D-19-723) – an annual review of the remaining lives depreciation of its electric and gas production and gas storage facilities service lives and salvage rates – updated the Remaining Life forecast for all Northern States Power Company – Minnesota (NSPM) units. This remaining life is associated with Financial End of Life for rate making purposes. Projections for the 2023-2033 timeframe are listed below. This is a tentative schedule, subject to change, pending the

outcome of future Annual Review of Remaining Lives filings and the next Resource Plan filing.

Projected Plant Retirements*			
Year	**Unit/Site**	**Size (MW)*** **	**Fuel Type**
2022	Sherco Unit 2**	765	Coal
2023	Blue Lake Units 1 thru 4	160	Oil
2025	Sherco Unit 1	765	Coal
2026	Inver Hills	281	Natural Gas
2027	Red Wing	23	Refused Derived Fuel (RDF)
2027	Wilmarth	25	Refused Derived Fuel (RDF)
2027	St. Croix Falls	23.2	Hydro
2029	AS King	511	Coal
2030	Sherco Unit 3	525	Coal
2030	Wheaton	250	Oil/Natural Gas
2030	French Island 1-2	15	Municipal Solid Waste
2030	French Island 3-4	160	Oil
2030	Monticello****	646	Nuclear
2031	Black Dog 2,5	298	Natural Gas
2033	Prairie Island 1	566	Nuclear

Notes:
* Years indicated represent the financial end-of-life as identified in the above referenced Remaining Lives docket. Financial end-of-life dates may be adjusted to coincide with the MISO Planning Year, ending May 31st.
** While Sherco 2 will reach its financial end of life at the end of 2022, the plant will be available to provide capacity in 2023.
*** Size represents nameplate or contracted value of the resource.
**** Per the Order in the Resource Plan, the Company is pursuing a 10-year life extension.

The following list outlines current Power Purchase Agreements (PPA) and their scheduled termination dates.

Projected PPA Retirements			
Year	**Unit/Site**	**Size (MW)*** **	**Fuel Type**
2023	Renewable PPAs	86	Renewable
2024	St. Paul CoGen	24	Biomass
2024	Renewable PPAs	61	Renewable
2025	Renewable PPAs	25	Renewable
2025	Manitoba Hydro	500	Hydro
2025	Manitoba Hydro – Diversity Agreement	350	Hydro
2025	Invenergy	358	Natural Gas
2026	Mankato 1	375	Natural Gas
2026	Renewable PPAs	23	Renewable
2027	LS Power	245	Natural Gas
2028	Renewable PPAs	147	Renewable
2029	Renewable PPAs	53	Renewable
2030	Renewable PPAs	28	Renewable
2031	Renewable PPAs	108	Renewable
2032	Renewable PPAs	472	Renewable
2033	Renewable PPAs	150	Renewable

Xcel Energy proposes to fulfill future electric generating resource needs through our resource planning process and subsequent resource acquisition processes. The specific generation technology, location of future generation facilities, and mix of utility-owned, PPAs, and other resources are subject to approval by the Commission.

RESIDENTIAL SERVICE Section No. 5
RATE CODE A00, A01, A03 31st Revised Sheet No. 1

AVAILABILITY
Available to any residential customer for domestic purposes only in a single private residence and qualifying farm customers.

DETERMINATION OF CUSTOMER BILLS
Customer bills shall reflect energy charges (if applicable) based on customer's kWh usage, plus a customer charge (if applicable), plus demand charges (if applicable) based on customer's kW billing demand as defined below. Bills may be subject to a minimum charge based on the monthly customer charge and / or certain monthly or annual demand charges. Bills also include applicable riders, adjustments, surcharges, voltage discounts, and energy credits. Details regarding the specific charges applicable to this service are listed below.

RATE

	Standard	Electric Space Heating	
Customer Charge per Month – Water Heating (A00)	$0.00	N/A	
– Overhead (A01)	$8.00	$10.00	
– Underground (A03)	$10.00	$12.00	
Energy Charge per kWh			
June - September	$0.10301	$0.10301	R
Other Months	$0.08803	$0.05988	R

In addition, customer bills under this rate are subject to the following adjustments and/or charges.

FUEL CLAUSE
Bills are subject to the adjustments provided for in the Fuel Clause Rider.

RESOURCE ADJUSTMENT
Bills are subject to the adjustments provided for in the Conservation Improvement Program Adjustment Rider, the State Energy Policy Rate Rider, the Renewable Development Fund Rider, the Transmission Cost Recovery Rider, the Renewable Energy Standard Rider and the Mercury Cost Recovery Rider.

ENVIRONMENTAL IMPROVEMENT RIDER
Bills are subject to the adjustments provided for in the Environmental Improvement Rider.

MONTHLY MINIMUM CHARGE
Customer Charge.

Energy discount is available to qualified low income customers under this schedule subject to the provisions contained in the Low Income Energy Discount Rider.

DEFINITION OF PEAK PERIODS
The on peak period is defined as those hours between 9:00 a.m. and 9:00 p.m. Monday through Friday, except the following holidays: New Year's Day, Good Friday, Memorial Day, Independence Day, Labor Day, Thanksgiving Day, and Christmas Day. When a designated holiday occurs on Saturday, the preceding Friday will be designated a holiday. When a designated holiday occurs on Sunday, the following Monday will be designated a holiday. The off peak period is defined as all other hours. Definition of on peak and off peak period is subject to change with change in Company's system operating characteristics.

OPTIONAL TRIAL SERVICE
Customers may elect time of day service for a trial period of three months. If a customer chooses to return to non-time of day service after the trial period, the customer will pay a charge of $20.00 for removal of time of day metering equipment.

MINNESOTA ELECTRIC RATE BOOK - MPUC NO. 2

RESIDENTIAL TIME OF USE PILOT PROGRAM Section No. 5
SERVICE 1st Revised Sheet No. 4.1
RATE CODE A72, A74

PILOT PROGRAM DESIGN
This is an experimental rate design for the residential Time of Use Pilot Program to be applied for two years from the effective date of this rate schedule. Participating customers will have received Residential Service without electric space heating prior to the Pilot, and may elect a return to the Residential Service rate schedule following the Pilot.

AVAILABILITY
A maximum of 10,000 customers will be selected to receive service with this rate schedule. The Company will determine pilot participants that receive service through the Hiawatha West, Midtown, or Westgate substations. Pilot participants will not include customers that are on net metering service or have other interconnected distributed generation on their premise, or customers that also receive Energy Controlled (Non-Demand Metered) Service, Residential Electric Vehicle Service, Limited Off-Peak Service, or customers that are medical equipment-dependent. Pilot participants may elect to opt out of participation in this Pilot for a specific premise.

DETERMINATION OF CUSTOMER BILLS
Customer bills shall reflect energy charges (if applicable) based on customer's kWh usage, plus a customer charge (if applicable), plus demand charges (if applicable) based on customer's kW billing demand as defined below. Bills may be subject to a minimum charge based on the monthly customer charge and / or certain monthly or annual demand charges. Bills also include applicable riders, adjustments, surcharges, voltage discounts, and energy credits. Bill Protection may also apply. Details regarding the specific charges applicable to this service and Bill Protection are listed below.

RATE CODE A72, A74

RESOURCE ADJUSTMENT
Bills are subject to the adjustments provided for in the Conservation Improvement Program Adjustment Rider, the State Energy Policy Rate Rider, the Renewable Development Fund Rider, the Transmission Cost Recovery Rider, the Renewable Energy Standard Rider and the Mercury Cost Recovery Rider.

ENVIRONMENTAL IMPROVEMENT RIDER
Bills are subject to the adjustments provided for in the Environmental Improvement Rider.

MONTHLY MINIMUM CHARGE
Customer Charge.

SURCHARGE
In certain communities, bills are subject to surcharges provided for in a Surcharge Rider.

LOW INCOME ENERGY DISCOUNT RIDER
Bills are subject to the adjustment provided for in the Low Income Energy Discount Rider.

The following are terms and conditions for service under this tariff. D D

LATE PAYMENT CHARGE
Any unpaid balance over $10.00 is subject to a 1.5% late payment charge or $1.00, whichever is greater, after the date due. The charge may be assessed as provided for in the General Rules and Regulations, Section 3.5.

LOW INCOME ENERGY DISCOUNT
Energy discount is available to qualified low income customers under this schedule subject to the provisions contained in the Low Income Energy Discount Rider.

BILL PROTECTION
Billing charges considered for bill protection will include customer and energy charges, fuel cost charges and if applicable, the Residential Controlled Air Conditioning and Water Heating Rider discounts. Bill protection will be considered only for customers that have been pilot participants at the same residential location for 12 months from the effective date of this rate schedule, based on the first 12 months of participation in the pilot program. Any Pilot program billing charge in excess of 10 percent of the corresponding billing charge that would have been applied had the customer not been a pilot participant will be credited to the customer's account, including any applicable taxes. The bill protection in this paragraph will terminate after the first 12 months of participation in the pilot program.

Customers that have received LIHEAP assistance within the 12 months prior to participation in the pilot program will have bill protection determined monthly for the first 12 months of pilot participation for any billing charges in excess of the corresponding billing charge that would have been applied had the customer not been a pilot participant. This will be determined on a monthly basis for the first 12 months of pilot participation. For the second 12 months of pilot participation, the bill protection will continue to be provided for these LIHEAP assistance customers for billing charges in excess of 10 percent of the corresponding billing charge on an annual basis for the second 12 months of pilot participation. Customers that start to receive LIHEAP assistance after their participation in the pilot has begun will receive monthly bill protection up to the first 12 month anniversary of the pilot, and shall receive annual bill protection for the second 12 month period of the pilot. Customers who opt out or leave the pilot area will forego the annual protection otherwise offered for this second 12 month period.

DEFINITION OF PEAK PERIODS
The On-Peak period is defined as those hours between 3:00 p.m. and 8:00 p.m. Monday through Friday, except the following holidays: New Year's Day, Good Friday, Memorial Day, Independence Day, Labor Day, Thanksgiving Day, and Christmas Day. When a designated holiday occurs on Saturday, the preceding Friday will be designated a holiday. When a designated holiday occurs on Sunday, the following Monday will be designated a holiday. The Mid-Peak period is defined as all hours not defined as On-Peak or Off-Peak periods. The Off-Peak period is defined as those hours between midnight (12:00 a.m.) and 6:00 a.m. every day.

RESIDENTIAL CONTROLLED AIR CONDITIONING AND WATER HEATING RIDER
Customers that received service with the Residential Controlled Air Conditioning and Water Heating Rider in combination with Residential Service prior to participation in the pilot will have a revised discount for Company controlled central air conditioning or electric water heating that is specific to the pilot program. The controlled air conditioning discount is a monthly $10 credit applied during the billing months of June through September. The controlled electric water heating discount is a monthly $2 credit during each billing month. Pilot customers will receive these revised credits in place of percent discounts and are subject to all other terms of the Residential Controlled Air Conditioning and Water Heating Rider.

TERMS AND CONDITIONS OF SERVICE

1. This schedule is also subject to provisions contained in Rules for Application of Residential Rates.

N
N

Northern States Power Company, a Minnesota corporation
Minneapolis, Minnesota 55401
MINNESOTA ELECTRIC RATE BOOK - MPUC NO. 2

RESIDENTIAL ELECTRIC VEHICLE SERVICE Section No. 5
RATE CODE A08 19th Revised Sheet No. 5

AVAILABILITY
Available to residential customers for service only to electric vehicle loads including battery charging and accessory usage. The customer must complete Company-approved documentation verifying possession, through ownership or lease, of an electric vehicle as defined in Section 169.011, subdivision 26a of Minnesota law.

CHARACTER OF SERVICE
Single-phase 60-Hertz service at approximately 120 or 120/240 volts will be provided hereunder. Three-phase service or other service upgrade requests will be provided in accordance with Company service regulations.

RENEWABLE ENERGY SUPPLY OPTION
Customers have the option to elect all or a portion of the supply of electricity under this schedule from renewable energy resources. The renewable energy supply option is available subject to the provisions contained in the Voluntary Renewable and High-Efficiency Energy Purchase (Windsource Program) Rider, or other available rate schedule for voluntary renewable energy supply that is applicable.

DETERMINATION OF CUSTOMER BILLS
Customer bills shall reflect energy charges (if applicable) based on customer's kWh usage, plus a customer charge (if applicable), plus demand charges (if applicable) based on customer's kW billing demand as defined below. Bills may be subject to a minimum charge based on the monthly customer charge and / or certain monthly or annual demand charges. Bills also include applicable riders, adjustments, surcharges, voltage discounts, and energy credits. Details regarding the specific charges applicable to this service are listed below.

RATE

Customer Charge per Month	$4.95	
On-Peak Period Energy Charge per kWh		
June - September	$0.20497	R
Other Months	$0.16508	R
Off-Peak Period Energy Charge per kWh	$0.04170	R

In addition, customer bills under this rate are subject to the following adjustments and/or charges.

FUEL CLAUSE
Bills are subject to the adjustments provided for in the Fuel Clause Rider.

RESOURCE ADJUSTMENT
Bills are subject to the adjustments provided for in the Conservation Improvement Program Adjustment Rider, the State Energy Policy Rate Rider, the Renewable Development Fund Rider, the Transmission Cost Recovery Rider, the Renewable Energy Standard Rider and the Mercury Cost Recovery Rider.

SURCHARGE
In certain communities, bills are subject to surcharges provided for in a Surcharge Rider.

LATE PAYMENT CHARGE
Any unpaid balance over $10.00 is subject to a 1.5% late payment charge or $1.00, whichever is greater, after the date due. The charge may be assessed as provided for in the General Rules and Regulations, Section 3.5.

DEFINITION OF PEAK PERIODS
The on-peak period is defined as those hours between 9:00 a.m. and 9:00 p.m. Monday through Friday, except the following holidays: New Year's Day, Good Friday, Memorial Day, Independence Day, Labor Day, Thanksgiving Day, and Christmas Day. When a designated holiday occurs on Saturday, the preceding Friday will be designated a holiday. When a designated holiday occurs on Sunday, the following Monday will be designated a holiday. The off-peak period is defined as all other hours. Definition of on-peak and off-peak period is subject to change with change in Company's system operating characteristics.

COMMUNICATION COSTS
The Company will maintain separate accounting of the information, education, advertising and promotion costs associated with electric vehicles as provided in Minn. Stat. §216B.1614, subd.2, paragraph (c) 2 by deferring the costs to a tracker account, and will petition the Minnesota Public Utilities Commission to recover the qualifying costs.

TERMS AND CONDITIONS OF SERVICE
1. Residential Electric Vehicle Service shall be separately served and metered and must at no time be connected to facilities serving customer's other loads. Metering may be installed as a sub-meter behind the customer’s main meter, in which case consumption under this rate schedule will be subtracted from the main meter for purposes of billing customer’s non-Electric Vehicle electricity usage.
2. The customer shall supply, at no expense to the Company, a suitable location for meters and associated equipment used for billing. Installations must conform to the Company’s specifications.
3. Company may require customer to provide access for Company-owned equipment for the recording and wireless communication of energy usage.
4. The rate contemplates that this service will utilize existing facilities with no additional major expenditures. Customer shall reimburse Company for any expenditure for facilities necessary to serve this load which would not otherwise be required to serve customer's load.
5. This schedule is also subject to provisions contained in Rules for Application of Residential Rates.
6. Customers that elect the Windsource program in calendar year 2015 for at least three (3) 100 kWh blocks or their entire usage on this schedule may receive a one-time $25 bill credit or gift card of the same value.

ELECTRIC VEHICLE HOME SERVICE Section No. 5
RATE CODE A80, A81 6th Revised Sheet No. 7

AVAILABILITY
Available to Residential Service customers for service only to electric vehicle loads including battery charging and accessory usage. Bundled service includes Company installed and provided charging equipment. Pre-Pay Option service is available to customers electing to pay Company for the installed cost of charging equipment prior to beginning service with this tariff. Customers electing Pre-Pay Option service are separately invoiced at the time of installation. Installation-Only Service is available for customers who have purchased a compatible EV charger before the launch date of the Electric Vehicle Home Service. The customer must complete Company-approved documentation verifying possession, through ownership or lease, of an electric vehicle as defined in Section 169.011, subdivision 26a of Minnesota law. N

Enrollment in the Residential Electric Vehicle Pilot Service previously available under these rate codes is no longer available.

CONTRACT
Customers must contract for this service through an Electric Vehicle Home Service/Voluntary Electric Vehicle Charger Service Customer Service Agreement with the Company. The contract period will be as long as the customer wishes to use the equipment.

Customers who initially contracted for the Residential Electric Vehicle Pilot Service through an Electric Vehicle Pilot Electric Service Agreement can still take service under that agreement through the end of the 24-month initial term. At the end of that agreement, the customer can continue service by contracting through the service through an Electric Vehicle Home Service/Voluntary Electric Vehicle Charger Service Customer Service Agreement or terminate their service at no cost to them. N

CHARACTER OF SERVICE
Single-phase 60-Hertz service at approximately 120 or 120/240 volts will be provided hereunder. Three-phase service or other service upgrade requests will be provided in accordance with Company service regulations.

RENEWABLE ENERGY SUPPLY OPTION
Customers have the option to elect all or a portion of the supply of electricity under this schedule from renewable energy resources. The renewable energy supply option is available subject to the provisions contained in the Voluntary Renewable*Connect Pilot Program (Windsource Program) Rider, or other available rate schedule for voluntary renewable energy supply that is applicable. DETERMINATION OF CUSTOMER BILLS
Customer bills shall reflect energy charges (if applicable) based on customer's kWh usage, plus a customer charge (if applicable), plus demand charges (if applicable) based on customer's kW billing demand as defined below. Bills may be subject to a minimum charge based on the monthly customer charge and / or certain monthly or annual demand charges. Bills also include applicable riders, adjustments, surcharges, voltage discounts, and energy credits. Details regarding the specific charges applicable to this service are listed below.

RATE

	Residential	Commercial & Industrial
Customer Charge	$4.95	$4.95
Energy Charge per kWh	$0.04487	$0.04487
Optional		
June - September	$0.10301	$0.09256
Other Months	$0.04487	$0.04487

OPTIONAL ENERGY CHARGE
This option is available to customers with heat pump installations for non-interruptible service during June through September billing months.

INTERIM RATE ADJUSTMENT N
An 8.92% Interim Rate Surcharge will be applied to Residential rate components and a 13.52% Interim Rate Surcharge will be applied to Commercial rate components specified in the "Interim Rate Surcharge Rider" to service provided beginning January 1, 2022. N N N

In addition, customer bills under this rate are subject to the following adjustments and/or charges.

FUEL CLAUSE
Bills are subject to the adjustments provided for in the Fuel Clause Rider.

RESOURCE ADJUSTMENT
Bills are subject to the adjustments provided for in the Conservation Improvement Program Adjustment Rider, the State Energy Policy Rate Rider, the Renewable Development Fund Rider, the Transmission Cost Recovery Rider, the Renewable Energy Standard Rider and the Mercury Cost Recovery Rider.

ENVIRONMENTAL IMPROVEMENT RIDER
Bills are subject to the adjustments provided for in the Environmental Improvement Rider.

MONTHLY MINIMUM CHARGE
Customer Charge.

SURCHARGE
In certain communities, bills are subject to surcharges provided for in a Surcharge Rider.

The following are terms and conditions for service under this tariff. D D

LATE PAYMENT CHARGE
Any unpaid balance over $10.00 is subject to a 1.5% late payment charge or $1.00, whichever is greater, after the date due. The charge may be assessed as provided for in the General Rules and Regulations, Section 3.5.

TERMS AND CONDITIONS OF SERVICE

1. The controllable load shall be permanently wired, separately served and metered, and at no time connected to facilities serving customer's firm load.

2. The duration and frequency of interruptions shall be at the discretion of Company. Interruption will normally occur at such times:
   a. When Company is required to use generation equipment or to purchase power that results in production costs in excess of $70 per MWh,
   b. When Company expects to establish an annual system peak demand, or
   c. At such times when, in Company's opinion, the reliability of the system is endangered.

3. Customer selecting Energy Controlled Service (Non-Demand Metered) must have a Company approved electric space heating system and must remain on this service for a minimum term of one year.

4. Customer selecting Energy Controlled Service (Non-Demand Metered) must be prepared for interruptions that will last longer than 12 hours per occurrence. Company shall not be liable for any loss or damage caused by or resulting from any interruption of service.

5. Electricity must be the primary source of energy for dual fuel space heating installations. Customer must have available alternative energy sources capable of supplying up to 30% of the annual heating needs during any heating season.

6. Customer's water heating system served under this rate must be designed and sized to be capable of providing customer's hot water needs for the full duration of the potential interruption periods.

In certain communities, bills are subject to surcharges provided for in a Surcharge Rider.

LATE PAYMENT CHARGE
Any unpaid balance over $10.00 is subject to a 1.5% late payment charge or $1.00, whichever is greater, after the date due. The charge may be assessed as provided for in the General Rules and Regulations, Section 3.5.

TERMS AND CONDITIONS OF SERVICE

1. Limited Off Peak Service shall be separately served and metered and must at no time be connected to facilities serving customer's other loads.

2. Company will not be liable for any loss or damage caused by or resulting from any interruption of service.

3. Customer selecting Limited Off Peak Service must remain on this service for a minimum term of one year, unless customer transfers to another interruptible service rate.

4. Customer has the option of directly controlling own load or allowing Company load control. If customer chooses Company load control, customer must:
   a. Provide a load-break switch or circuit breaker equipped with electronic trip and close circuits allowing for remote operation of customer's switch or circuit breaker by Company,
   b. Wire the trip and close circuits into a connection point designated by Company to allow installation of remote control equipment by Company, and
   c. Provide a continuous 120 volt AC power source at the connection point for operation of Company's remote control equipment.

5. A charge of $0.360 per kWh shall be applied to non-authorized energy used outside of the energized time period specified in this tariff. If this energy use occurs during three or more billing months, the Company reserves the right to remove customer from Limited Off Peak Service. R

6. The rate contemplates that this service will utilize existing facilities with no additional major expenditures. Customer shall reimburse Company for any expenditures for facilities necessary to serve this load which would not otherwise be required to serve customer's load.

RULES FOR APPLICATION OF RESIDENTIAL RATES

Section No. 5
9th Revised Sheet No. 13

1. The Residential Service, Residential Time of Day Service and Residential Time of Use Pilot Program are the only rates available to residential customers for domestic purposes in a single private residence. Energy Controlled Service (Non-Demand Metered), Limited Off Peak Service, Voluntary Electric Vehicle Charger Service, Electric Vehicle Home Service, Residential Electric Vehicle Pilot Service, Residential Electric Vehicle Subscription Pilot Service and Automatic Protective Lighting Service rate schedules are also available to qualifying residential customers. C C

2. Normal service under the Residential Service, Residential Time of Day Service and Residential Time of Use Pilot Program rate schedules is single phase service rendered through one meter. Three phase service or service through more than one meter will be provided upon a one-time payment of an amount to reimburse Company for the additional investment. If customer is served through more than one meter, each meter will be separately billed.

3. Electric space heating charges are applicable only when customer's electric space heating equipment is used as customer's primary heating source.

4. Underground service charges will apply where the underground facilities are owned by Company, and Company has not been fully reimbursed for the added cost of such underground facilities.

5. Standby and Supplementary Service is available for any residential customer subject to the provisions in the General Rules and Regulations, Section 2.4. The Company's meter will be ratcheted to measure the flow of power and energy from Company to customer only.

6. A customer using electric service for domestic and non-domestic purposes jointly may combine such use through one meter on such rates as are available to general service customers.

7. The Residential Service and Residential Time of Day Service rate schedules are available to farm installations which were served on the separate Farm Service rate schedule prior to its cancellation on November 1, 1988. Residential Service and Residential Time of Day Service to these qualifying farm customers is limited to 120/240 volts single phase service rendered through one meter. Motors and other equipment which interfere with service to neighboring customers and all transformer type welding machines larger than 25 kilovolt-amperes are not permitted as part of this service.

MINNESOTA ELECTRIC RATE BOOK - MPUC NO. 2

RESIDENTIAL OPTIMIZE CHARGE
Section No. 5
Original Sheet No. 16

AVAILABILITY
This Pilot is applicable for three years from the original effective date of this rate schedule. N

Available to residential customers under the Residential (A01,A03), Residential Time of Day (A02, A04), Residential Time of Use Pilot Program (A72, A74), Residential Electric Vehicle Service (A08), Electric Vehicle Home Service (A80, A81), Voluntary Electric Vehicle Charger Service (A76, A77), Residential Electric Vehicle Subscription (A82 and A84) for customers who own or lease light duty electric vehicles (EVs) and charge them at a home address that receives electricity from Northern States Power Company.

Participating customers agree to utilize the charging schedule they select during the enrollment process to shift EV charging into hours that are better for the power grid, while still meeting driving requirements, and agree to share essential enrollment and charging data with Xcel Energy.

BILL CREDIT
The Pilot is available to residential electric customers who own or lease a light-duty electric vehicle (EV). Participating customers will receive a yearly $50 Bill Credit.

TERMS AND CONDITIONS OF SERVICE

1. Eligibility

1.1 Residential customers meeting the following criteria are eligible to participate in the Pilot:
- Own or lease an EV;
- Have an active Xcel Energy account that receives electric service in Minnesota under an eligible rate;
- Be a residential customer and charge an electric vehicle at the customer's home address in Minnesota;
- Use eligible charging equipment or drive an eligible vehicle;
- Complete a Pilot application and be selected by Xcel Energy to participate in the Pilot (Participation in the Pilot will be determined by Xcel Energy, in its sole discretion);

For a participating customer, failure to meet any of the above eligibility requirements at any time will void any obligation Xcel Energy has to provide the Bill Credit, and Xcel Energy may immediately terminate the customer's participation in the Pilot. N

(Continued on Sheet 16.1)

Northern States Power Company, a Minnesota corporation
Minneapolis, Minnesota 55401
MINNESOTA ELECTRIC RATE BOOK - MPUC NO. 2

RESIDENTIAL OPTIMIZE CHARGE (continued)
Section No. 5
Original Sheet No. 16.1

1. Customer Communications

2.1 Customer consents to receive communications from Xcel Energy relating to the Pilot in electronic or text-based form and sent to Customer's email address or phone provided during enrollment.

3. Compliance with Terms and Conditions

3.1 Xcel Energy reserves the right to refuse payment if the customer violates Pilot terms and conditions.

4. Pilot Requirements

4.1 Provide accurate and complete information as part of participation in the Pilot; Xcel Energy is not responsible for any harm caused by the customer or customer misstatements, misrepresentations, or failure to provide accurate and complete information.
4.2 If required by the Pilot Vendor (selected by Xcel Energy), the customer will: download any Vendor software application required for Pilot participation; install any Vendor hardware required for Pilot participation; comply with any Vendor terms and conditions; and meet any other requirements of the Vendor related to Pilot participation.
4.3 For customers relying on the use of a networked charging station for participation, the charging station must be connected to the Vendor's network via the customer's home Wi-Fi network and be able to maintain on-going and stable connection throughout the Pilot.
4.3.1 Customers driving eligible vehicles may supply their charging data through one of the Company's Pilot Vendors listed at www.xcelenergy.com. If customer is relying on the built-in telematics of their EV for participation in the Pilot, their EV must be connected to the Pilot Vendor; and
4.4 Customers agree to these Pilot Terms and to participate in the Pilot as set forth in these Pilot Requirements.

5. Sharing of Xcel Energy Customer Information

5.1 Xcel Energy will provide Vendors with data ("Customer Information"), including, but not limited to, one or more of the following: name, address, vehicle identification number (VIN), charging station serial number, and e-mail address, for the purposes of allowing the Vendor to carry-out services in relation to this Pilot. Upon enrolling, Vendors will share information about the customer's charging ("Charging Data") with Xcel Energy that includes but is not limited to when the customer plug-ins and charges the EV, how much energy is used in charging the EV, the state of charge of the vehicle before and after plugging in, and the use of a charging schedule.
5.2 Vendors will be required to follow all applicable rules and requirements for data sharing as defined by Minnesota Public Utilities Commission rulings.
5.3 Xcel Energy may share this data directly with service providers performing services on behalf of Xcel Energy, and will use this data to validate the customer's eligibility to participate in the Pilot, to study and evaluate the benefits that the Pilot provides to the power grid, in connection with proceedings before the Minnesota Public Utilities Commission, to design future EV and demand management programs, to support power grid planning and management, to share aggregated and anonymized findings, and to inform Program operations.

MINNESOTA ELECTRIC RATE BOOK - MPUC NO. 2

RESIDENTIAL OPTIMIZE CHARGE (Continued)
Section No. 5
Original Sheet No. 16.2

5.4 Customers will be able to opt-out of sharing non-essential data.
5.5 If the Customer withdraws from the Pilot or if the Pilot is discontinued by Xcel Energy, Xcel Energy and Manufacturers will cease the sharing of Xcel Energy Customer Information and Charging Data without reasonable delay.

N

6. Schedule Determination and Use

6.1 During enrollment, a customer will select a charging schedule from a set of options presented to the customer by Xcel Energy that will be used for the EV home charging under the Pilot. The charging schedule is based on the customer's charging needs and the customer's answers to questions during the enrollment process. Customers who believe the charging schedule options presented will not meet the customer's charging needs can email Xcel Energy at electricvehicles@xcelenergy.com to discuss potential adjustment to the charging schedule.
6.2 Xcel Energy recommends automatically limiting EV charging to the hours allowed by entering the charging schedule into the EV charging station or into the EV smart application; however, a customer may implement the charging schedule in any manner that is suitable to the customer.
6.3 The customer may override the recommended charging schedule, without penalty, whenever it is necessary to meet the customer's driving requirements. The customer must, however, maintain the minimum threshold set forth in paragraph 7.1.

7. Participation Details

7.1 In order to remain enrolled in the Pilot, 25% of the participating EV charging sessions must be conducted during the customer-selected charging schedule. Xcel Energy will review participation on a quarterly basis and assess compliance for each full year of participation measured from the Enrollment Date. Xcel Energy will remove a customer from the Pilot if it has determined, at its sole discretion, that the customer did not meet this participation level.

8. Pilot Term and Withdrawal

N

8.1 Customer may withdraw from the Pilot at any time without penalty.
8.2 Xcel Energy may discontinue the Pilot at any time for any reason. Xcel Energy will make best efforts to provide Pilot participants a discontinuation notice at least thirty (30) days prior to such termination date.
8.3 Customer will notify Xcel Energy by emailing electricvehicles@xcelenergy.com in the event the customer wishes to unenroll from the Pilot, if the ownership of the EV enrolled in the Pilot changes, or if the customer moves out of Xcel Energy's Minnesota service territory.
8.4 If Xcel Energy becomes aware that the enrolled EV has changed ownership or that the customer has moved outside of Xcel Energy's Minnesota service territory, without first being informed by the customer, it will be deemed by Xcel Energy as a Customer-initiated termination of this Agreement.
8.5 If the customer terminates this Agreement prior to October 1 of any year that the Pilot continues, or if Xcel Energy terminates this Agreement because of the customer's failure to honor the terms of this Agreement at any time, or upon discovery of any tampering with vehicle equipment, then Xcel Energy shall have the right to terminate this Agreement immediately and discontinue payment of the Bill Credit.

9. Limitations

9.1 Pilot terms are subject to change any time. Please visit www.xcelenergy.com to determine whether any Pilot changes have occurred. Any material changes will be communicated the customer by e-mail using the e-mail address provided.
9.2 If customer enrolls more than one eligible vehicle or charging station, they will receive a Bill Credit for each vehicle and charging station enrolled. A single EV and charging station can only be enrolled to participate once—the same vehicle and charging station cannot be registered by multiple accounts.
9.3 Xcel Energy reserves the right to modify all Pilot incentives based on future performance, Pilot modifications, technology upgrades, and changes to Xcel Energy's electrical distribution system. Any such changes will be communicated to Customer by e-mail using the e-mail address provided by the Customer at least thirty (30) days prior to deployment of such changes.
9.4 Customer agrees not to tamper with vehicle, vehicle data, charging station, charging station data, or any hardware related to the Pilot and to reasonably attempt to restrict access by others attempting to tamper with the vehicle, vehicle data, charging station, charging station data, or Pilot-related hardware (as applicable). If Xcel Energy or its Vendors identify any evidence of tampering, the customer will be removed from the Pilot. The customer agrees to protect and hold harmless Xcel Energy from any and all claims, damages and liability caused by the customer's fault or negligence, or customer's failure to comply. If Xcel Energy is made a party (without fault on its part) to any lawsuit or arbitration started by or against the customer, they agree to protect and hold Xcel Energy harmless, and to pay all costs, expenses and reasonable attorneys' fees incurred or paid by Xcel Energy in connection with that lawsuit or arbitration. Customer agrees to pay all costs, expenses and reasonable attorneys' fees that Xcel Energy may incur or pay in enforcing this agreement.

Northern States Power Company, a Minnesota corporation
Minneapolis, Minnesota 55401
MINNESOTA ELECTRIC RATE BOOK - MPUC NO. 2

RESIDENTIAL OPTIMIZE CHARGE (Continued)
Section No. 5
Original Sheet No. 16.4

9.5 Participation in the Pilot is entirely voluntary. Xcel Energy and vendor do not assume any responsibility for customer's EV, the inability to use or unavailability of the EV, or any damages to or incurred by the customer EV or charging station which may result from participation in the Pilot. In no event, whether based on contract, indemnity, warranty, tort (including negligence), strict liability or otherwise, shall Xcel Energy or vendor be liable to the customer for special, indirect, exemplary, punitive, incidental, or consequential damages whatsoever including, without limitation, loss of profits or revenue, and in no event shall Xcel Energy's or Vendor's liability on any claim of any kind, or from any loss or damage arising out of or in connection with or resulting from the pilot, these pilot terms, or from performance or breach thereof, exceed the total amount of the participation reward. N

10. Requirements

10.1 Customer agrees to maintain services needed to participate in the Pilot at no expense to Xcel Energy. These services may include but are not limited to subscription services with the Manufacturer of the enrolled vehicle to allow communication between the Manufacturer and the EV. Depending on the EV and the Manufacturer, this may require the Customer to activate and/or pay for a subscription. For further information, please communicate with the EV Manufacturer. This is applicable for customers that provide their Charging Data through one of the Vehicle Vendors listed at xcelenergy.com.

10.2 Customer agrees to maintain a functioning high-speed internet connection that allows the charging station to gather Charging Data at no expense to Xcel Energy. This is applicable for customers that provide their Charging Data to Xcel Energy through one of the Charging Station Vendors listed at xcelenergy.com.

10.3 Customer is responsible for maintaining in working order home EV charging or electrical equipment and the participating EV.

10.4 Customer is responsible for downloading any Vendor software application required for Pilot participation.

10.5 Customer responsible for installing any hardware from the Vendor that is required for Pilot participation.

11. Governing Law; Disputes.

11.1 The Customer and Xcel Energy agree that all disputes arising out of these Pilot Terms or the Pilot shall be subject to this section. The internal laws of the State of Minnesota, without regard to conflicts of law's provisions, govern the Pilot and these Pilot Terms and any action brought with respect to the Pilot Terms or the Pilot shall be brought in the courts located in Minneapolis, Minnesota.

AVAILABILITY
Standard service (i.e., alternating current) is available to any non-residential customer for single or three phase electric service. Direct Current service is only available in Minneapolis and St. Paul to the extent now used.

DETERMINATION OF CUSTOMER BILLS
Customer bills shall reflect energy charges (if applicable) based on customer's kWh usage, plus a customer charge (if applicable), plus demand charges (if applicable) based on customer's kW billing demand as defined below. Bills may be subject to a minimum charge based on the monthly customer charge and / or certain monthly or annual demand charges. Bills also include applicable riders, adjustments, surcharges, voltage discounts, and energy credits. Details regarding the specific charges applicable to this service are listed below.

RATE

Customer Charge per Month – Unmetered (A09)	$8.00	
– Metered (A10)	$10.00	
– Water Heating (A11)	$0.00	
– Direct Current (A13)	$10.00	
Energy Charge per kWh		
June - September	$0.09256	R
Other Months	$0.07757	R
Demand Charge (Direct Current Only) per Month per kW of Connected Load	$3.61	R

In addition, customer bills under this rate are subject to the following adjustments and/or charges.

FUEL CLAUSE
Bills are subject to the adjustments provided for in the Fuel Clause Rider.

RESOURCE ADJUSTMENT
Bills are subject to the adjustments provided for in the Conservation Improvement Program Adjustment Rider, the State Energy Policy Rate Rider, the Renewable Development Fund Rider, the Transmission Cost Recovery Rider, the Renewable Energy Standard Rider and the Mercury Cost Recovery Rider.

ENVIRONMENTAL IMPROVEMENT RIDER
Bills are subject to the adjustments provided for in the Environmental Improvement Rider.

MONTHLY MINIMUM CHARGE
Customer Charge, or Customer Charge plus Demand Charge if served at Direct Current.

SURCHARGE
In certain communities, bills are subject to surcharges provided for in a Surcharge Rider.

LOW INCOME ENERGY DISCOUNT RIDER
Bills are subject to the adjustment provided for in the Low Income Energy Discount Rider.

The following are terms and conditions for service under this tariff. D
D

LATE PAYMENT CHARGE D
Any unpaid balance over $10.00 is subject to a 1.5% late payment charge or $1.00, whichever is greater, after the date due. The charge may be assessed as provided for in the General Rules and Regulations, Section 3.5.

TERMS AND CONDITIONS OF SERVICE FOR ALTERNATING CURRENT CUSTOMERS
Company shall install a demand meter for a customer when:

1. Customer's connected load is estimated to be 20 kW or greater,
2. Customer is served single phase and has a service entrance capacity greater than 200 amperes,
3. Customer is served three phase at 120/208 or 120/240 volts and has a service entrance capacity greater than 200 amperes,
4. Customer is served three phase at 240/480 or 277/480 volts and has a service entrance capacity greater than 100 amperes, or
5. Customer's average monthly kWh use for four consecutive months exceeds 3,500 kWh.

If a demand meter is installed in accordance with the above, the customer may remain on the Small General Service schedule as long as customer's maximum demand is less than 25 kW. When the customer achieves an actual maximum demand of 25 kW or greater, the customer will be placed on the General Service schedule in the next billing month. A customer with a billing demand of less than 25 kW for 12 consecutive months will be given the option of returning to the Small General Service schedule.

DETERMINATION OF CONNECTED LOAD FOR DIRECT CURRENT SERVICE
The nameplate rating shall be the basis of determining the connected load and shall be assumed to be one kW for each hp of nameplate rating. In any case, where there is reasonable doubt as to correctness of manufacturer's rating or where insufficient or no rating exists, the Company may fix the rating by test. For billing purposes, the demand shall be rounded to the nearest 0.1 kW.

LATE PAYMENT CHARGE
Any unpaid balance over $10.00 is subject to a 1.5% late payment charge or $1.00, whichever is greater, after the date due. The charge may be assessed as provided for in the General Rules and Regulations, Section 3.5.

DEFINITION OF PEAK PERIODS
The on peak period is defined as those hours between 9:00 a.m. and 9:00 p.m. Monday through Friday, except the following holidays: New Year's Day, Good Friday, Memorial Day, Independence Day, Labor Day, Thanksgiving Day, and Christmas Day. When a designated holiday occurs on Saturday, the preceding Friday will be designated a holiday. When a designated holiday occurs on Sunday, the following Monday will be designated a holiday. The off peak period is defined as all other hours. Definition of on peak and off peak period is subject to change with change in Company's system operating characteristics.

OPTIONAL TRIAL SERVICE
Customers may elect time of day service for a trial period of three months. If a customer chooses to return to non-time of day service after the trial period, the customer will pay a charge of $25.00 for removal of time of day metering equipment.

TERMS AND CONDITIONS OF SERVICE
1. Customer selecting the above time of day rate schedule will remain on this rate for a period of not less than 12 months. While served under this schedule, the Small General Service rate is unavailable.

2. Company shall install a demand meter for a customer when:
   a. Customer's connected load is estimated to be 20 kW or greater,
   b. Customer is served single phase and has a service entrance capacity greater than 200 amperes,
   c. Customer is served three phase at 120/208 or 120/240 volts and has a service entrance capacity greater than 200 amperes,
   d. Customer is served three phase at 240/480 or 277/480 volts and has a service entrance capacity greater than 100 amperes, or
   e. Customer's average monthly kWh use for four consecutive months exceeds 3,500 kWh.

   If a demand meter is installed in accordance with the above, the customer may remain on the Small General Time of Day Service schedule as long as customer's maximum demand is less than 25 kW. When the customer achieves an actual maximum demand of 25 kW or greater, the customer will be placed on the General Time of Day Service schedule in the next billing month. A customer with a billing

TERMS AND CONDITIONS OF SERVICE (Continued)

demand of less than 25 kW for 12 consecutive months will be given the option of returning to the Small General Time of Day Service schedule.

3. Optional Metering Service: Optional metering is available subject to the provisions in the General Rules and Regulations, Section 1.5, for the following applications:

   a. Kilowatt-hour Metered Service: For applications where a non-time of day meter is used, the time of day metering charge will be waived and the applicable lower monthly Customer Charge shall apply.

   b. Unmetered Service: For applications where no metering is installed, the applicable lower monthly Customer Charge shall apply. If requested by Company, the customer agrees to receive one or more combined bills for all their unmetered service locations. For purposes of applying the appropriate customer service charge, one customer service charge shall be applied for every point of delivery. A point of delivery shall be any location where a meter would otherwise be required under this schedule.

   c. Low Wattage Unmetered Service: For applications where customer owns and operates multiple electronic devices in at least 500 locations within Company's Minnesota electric service area. Such electronic devices are: 1) individually located at each point of delivery, 2) rated at less than 400 Watts, and 3) operated with a continuous and constant load level year round. Each individual electronic device must not in any way interfere with Company operations and service to adjacent customers. This optional metering service is not applicable to electric service for traffic signals, civil defense, or lighting. Company reserves the right to evaluate customer requests for this optional metering service to determine eligibility.

      The monthly fixed charge under this optional metering service shall be $0.30 per device for devices with a rating of 100 Watts or less. For devices with a rating over 100 Watts but less than 400 Watts, the monthly fixed charge shall be $1.20 per device. R

      In place of metered usage for each device, customer will be billed for the predetermined energy usage in kWh per device. The energy charge shall equal the sum of the predetermined energy usage for customer's low wattage devices in service for the billing month multiplied by the Constant Hourly Energy Charge applicable for the billing month.

      Customer shall contract for this optional metering service through an electric service agreement with Company.

SURCHARGE
In certain communities, bills are subject to surcharges provided for in a Surcharge Rider.

LOW INCOME ENERGY DISCOUNT RIDER
Bills are subject to the adjustment provided for in the Low Income Energy Discount Rider.

The following are terms and conditions for service under this tariff.

LATE PAYMENT CHARGE
Any unpaid balance over $10.00 is subject to a 1.5% late payment charge or $1.00, whichever is greater, after the date due. The charge may be assessed as provided for in the General Rules and Regulations, Section 3.5.

DETERMINATION OF DEMAND
The adjusted demand in kW for billing purposes shall be determined by dividing the maximum actual demand in kW by the power factor expressed in percent but not more than a 90% power factor and multiplying the quotient so obtained by 90% and rounding to the nearest whole kW. In no month shall the demand to be billed be considered as less than current month's adjusted demand in kW or 50% of the greatest monthly adjusted demand in kW during the preceding 11 months. In no month shall the billing demand be greater than the value in kW determined by dividing the kWh sales for the billing month by 100 hours per month.

The greatest monthly adjusted demand in kW during the preceding 11 months shall not include the additional demand which may result from customer's use of standby capacity contracted for under the Standby Service Rider.

MAXIMUM DEMAND
The maximum actual demand in kW shall be the greatest 15 minute load during the month for which bill is rendered.

POWER FACTOR
For three phase customers with services above 200 amperes or above 480 volts, the power factor for the month shall be determined by permanently installed metering equipment. For all single phase customers and three phase customers with services 200 amperes or less, a power factor of 90% will be assumed.

GENERAL SERVICE (Continued) Section No. 5
RATE CODE A14 5th Revised Sheet No. 28.1

TERMS AND CONDITIONS OF SERVICE

1. Alternating current service is provided at the following nominal voltage:
   a. Secondary Voltage: Single or three phase from 208 volts up to but not including 2,400 volts,
   b. Primary Voltage: Three phase from 2,400 volts up to but not including 69,000 volts,
   c. Transmission Transformed Voltage: Three phase from 2,400 volts up to but not including 69,000 volts, where service is provided at the Company's disconnecting means of a distribution substation transformer, or
   d. Transmission Voltage: Three phase at 69,000 volts or higher.

   Service voltage available in any given case is dependent upon voltage and capacity of Company lines in vicinity of customer's premises.

2. Transmission Transformed Service is available only to customers served by an exclusively dedicated distribution feeder. Customer will be responsible for the cost of all facilities necessary to interconnect at the Company's disconnecting means of a distribution substation transformer.

3. Transmission Service is available at transmission voltage, subject to the terms and conditions contained in the Company's General Rules and Regulations, Section 5.1(B).

4. Customer selecting General Service will remain on this rate for a period of not less than 12 months.

5. If a customer has a billing demand of less than 25 kW for 12 consecutive months, the customer will be given the option of returning to the Small General Service schedule.

In addition, customer bills under this rate are subject to the following adjustments and/or charges.

FUEL CLAUSE
Bills are subject to the adjustments provided for in the Fuel Clause Rider.

RESOURCE ADJUSTMENT
Bills are subject to the adjustments provided for in the Conservation Improvement Program Adjustment Rider, the State Energy Policy Rate Rider, the Renewable Development Fund Rider, the Transmission Cost Recovery Rider, the Renewable Energy Standard Rider and the Mercury Cost Recovery Rider.

ENVIRONMENTAL IMPROVEMENT RIDER
Bills are subject to the adjustments provided for in the Environmental Improvement Rider.

SURCHARGE
In certain communities, bills are subject to surcharges provided for in a Surcharge Rider.

LOW INCOME ENERGY DISCOUNT RIDER
Bills are subject to the adjustment provided for in the Low Income Energy Discount Rider.

The following are terms and conditions for service under this tariff.

LATE PAYMENT CHARGE
Any unpaid balance over $10.00 is subject to a 1.5% late payment charge or $1.00, whichever is greater, after the date due. The charge may be assessed as provided for in the General Rules and Regulations, Section 3.5.

DEFINITION OF PEAK PERIODS
The on peak period is defined as those hours between 9:00 a.m. and 9:00 p.m. Monday through Friday, except the following holidays: New Year's Day, Good Friday, Memorial Day, Independence Day, Labor Day, Thanksgiving Day, and Christmas Day. When a designated holiday occurs on Saturday, the preceding Friday will be designated a holiday. When a designated holiday occurs on Sunday, the following Monday will be designated a holiday. The off peak period is defined as all other hours. Definition of on peak and off peak period is subject to change with change in Company's system operating characteristics.

MINNESOTA ELECTRIC RATE BOOK - MPUC NO. 2

GENERAL TIME OF DAY SERVICE (Continued) Section No. 5
RATE CODE A15, A17, A19 8th Revised Sheet No. 31

DETERMINATION OF ON PEAK PERIOD DEMAND
The actual on peak period demand in kW shall be the greatest 15-minute load for the on peak period during the month for which the bill is rendered. The adjusted demand in kW for billing purposes shall be determined by dividing the actual on peak demand by the power factor expressed in percent but not more than 90%, multiplying the quotient so obtained by 90%, and rounding to the nearest whole kW. In no month shall the on peak period demand to be billed be considered as less than the current month's adjusted on peak period demand in kW, or 50% of the greatest monthly adjusted on peak period demand in kW during the preceding 11 months. In no month shall the on peak billing demand be greater than the value in kW determined by dividing the kWh sales for the billing month by 100 hours per month.

The greatest monthly adjusted on peak period demand in kW during the preceding 11 months shall not include the additional demand which may result from customer's use of standby capacity contracted for under the Standby Service Rider.

DETERMINATION OF OFF PEAK PERIOD DEMAND IN EXCESS OF ON PEAK PERIOD DEMAND
The actual off peak period demand in kilowatts shall be the greatest 15-minute load for the off peak period during the month for which the bill is rendered rounded to the nearest whole kW. In no month shall the off peak period demand for billing purposes be considered as less than the current month's actual off peak period demand in kW, or 50% of the greatest monthly actual off peak period demand in kW during the preceding 11 months.

The greatest monthly adjusted off peak period demand in kW during the preceding 11 months shall not include the additional demand which may result from customer's use of standby capacity contracted for under the Standby Service Rider.

The off peak period demand in excess of on peak period demand in kW to be billed shall be determined by subtracting the billing on peak period demand from the actual off peak period demand as defined above only the off peak period demand is greater.

POWER FACTOR
For three phase customers with services above 200 amperes, or above 480 volts, the power factor for the month shall be determined by permanently installed metering equipment. For all single phase customers and three phase customers with services 200 amperes or less, a power factor of 90% will be assumed.

MINNESOTA ELECTRIC RATE BOOK - MPUC NO. 2

GENERAL TIME OF DAY SERVICE (Continued) Section No. 5
RATE CODE A15, A17, A19 6th Revised Sheet No. 32

COMPETITIVE SERVICE
Competitive Service is available under this schedule subject to the provisions contained in the Competitive Response Rider.

STANDBY SERVICE
Standby Service is available under this schedule subject to the provisions contained in the Standby Service Rider.

MINIMUM DEMAND TO BE BILLED
The monthly minimum on peak period billing demand shall not be less than provided above.

SPLIT SERVICE
When approved by Company, customer's service may be split between General Service and General Time of Day Service rates. Only Company approved storage space cooling and storage space heating equipment qualifies for the General Time of Day Service portion of a split service installation. The thermal storage equipment shall be permanently wired, separately served and metered, and at no time connected to the general service portion of the split service installation. Each portion of customer's split service installation will be considered separately for all other rate application purposes.

OPTIONAL TRIAL SERVICE
Customers may elect time of day service for a trial period of three months. If a customer chooses to return to non-time of day service after the trial period, the customer will pay a charge of $35.00 for removal of time of day metering equipment.

TERMS AND CONDITIONS OF SERVICE
1. Alternating current service is provided at the following nominal voltages:
   a. Secondary Voltage: Single or three phase from 208 volts up to but not including 2,400 volts,
   b. Primary Voltage: Three phase from 2,400 volts up to but not including 69,000 volts,
   c. Transmission Transformed Voltage: Three phase from 2,400 volts up to but not including 69,000 volts, where service is provided at the Company's disconnecting means of a distribution substation transformer, or
   d. Transmission Voltage: Three phase at 69,000 volts or higher.

   Service voltage available in any given case is dependent upon voltage and capacity of Company lines in vicinity of customer's premises.

MINNESOTA ELECTRIC RATE BOOK - MPUC NO. 2

GENERAL TIME OF DAY SERVICE (Continued) Section No. 5
RATE CODE A15, A17, A19 5th Revised Sheet No. 32.1

TERMS AND CONDITIONS OF SERVICE (Continued)

2. Transmission Transformed Service is available only to customers served by an exclusively dedicated distribution feeder. Customer will be responsible for the cost of all facilities necessary to interconnect at the Company's disconnecting means of a distribution substation transformer.

3. Transmission Service is available at transmission voltage, subject to the terms and conditions contained in the Company's General Rules and Regulations, Section 5.1(B).

4. Customer selecting the above time of day rate schedule will remain on this rate for a period of not less than 12 months.

5. If a customer has a billing demand of less than 25 kW for 12 consecutive months, the customer will be given the option of returning to the Small General Time of Day Service schedule.

6. Optional Metering Service: Optional metering is available subject to the provisions in the General Rules and Regulations, Section 1.5, for the following applications:
   a. Kilowatt-hour Metered Service: For applications where a non-time of day meter is used, the time of day metering charge will be waived and the applicable lower monthly Customer Charge shall apply.
   b. Unmetered Service: This rate is for applications where no metering is installed and the applicable lower monthly Customer Charge shall apply. If requested by Company, the customer agrees to receive one or more combined bills for all their unmetered service locations. For purposes of applying the appropriate customer service charge, one customer service charge shall be applied for every point of delivery. A point of delivery shall be any location where a meter would otherwise be required under this schedule.

AVAILABILITY

Available to any non-residential customer for general service who agrees to control demand to a predetermined level whenever required by Company and where customer is not required to be on a time-of-day rate schedule. Once the customer's total 15-minute measured demands (Firm plus Controllable) are equal to or greater than 1000 kW for at least 4 of the past 12 consecutive months, the customer will be transferred to the Peak Controlled Time of Day service. Availability is restricted to customers with a minimum Controllable demand of 50 kW. Waivers to certain controllable load requirements, cancellation charges and notice requirements are in effect through December 31, 2020 or the end of the COVID-19 peacetime emergency as declared by the Governor, whichever is later. N N N

DETERMINATION OF CUSTOMER BILLS

Customer bills shall reflect energy charges (if applicable) based on customer's kWh usage, plus a customer charge (if applicable), plus demand charges (if applicable) based on customer's kW billing demand as defined below. Bills may be subject to a minimum charge based on the monthly customer charge and / or certain monthly or annual demand charges. Bills also include applicable riders, adjustments, surcharges, voltage discounts, and energy credits. Details regarding the specific charges applicable to this service are listed below.

RATE

Customer Charge per Month	$55.00	
Service at Secondary Voltage		
Energy Charge per kWh	$0.03407	
Energy Charge Credit per Month per kWh		
All kWh in Excess of 400 Hours	$0.01518	
Times the Sum of All Billing Demands		
Demand Charge per Month per kW	Tier 1	Tier 2
Firm Demand		
June - September	$14.79	$14.79
Other Months	$10.49	$10.49
Controllable Demand (Jan-Dec)		
Level A: < 65% PF	Not Available	$8.88
Level B: ≥ 65% and < 85% PF	$7.15	$7.86
Level C: ≥ 85% PF	$6.56	$7.34
Short Notice Rider	$6.09	Not Available

	January – December	
Voltage Discounts per Month	Per kW	Per kWh
Primary Voltage	$0.80	$0.00105
Transmission Transformed Voltage	$1.55	$0.00267
Transmission Voltage	$2.35	$0.00277

D

In addition, customer bills under this rate are subject to the following adjustments and/or charges.

FUEL CLAUSE
Bills are subject to the adjustments provided for in the Fuel Clause Rider.

RESOURCE ADJUSTMENT
Bills are subject to the adjustments provided for in the Conservation Improvement Program Adjustment Rider, the State Energy Policy Rate Rider, the Renewable Development Fund Rider, the Transmission Cost Recovery Rider, the Renewable Energy Standard Rider and the Mercury Cost Recovery Rider.

ENVIRONMENTAL IMPROVEMENT RIDER
Bills are subject to the adjustments provided for in the Environmental Improvement Rider.

SURCHARGE
In certain communities, bills are subject to surcharges provided for in a Surcharge Rider.

LOW INCOME ENERGY DISCOUNT RIDER
Bills are subject to the adjustment provided for in the Low Income Energy Discount Rider.

LATE PAYMENT CHARGE
Any unpaid balance over $10.00 is subject to a 1.5% late payment charge or $1.00, whichever is greater, after the date due. The charge may be assessed as provided for in the General Rules and Regulations, Section 3.5.

DEFINITION OF PERFORMANCE FACTOR (PF)
Performance factor is defined in percentage terms as the average of the July and August calendar month unadjusted maximum Controllable Demand occurring from 1:00 p.m. to 7:00 p.m. on weekdays, or which has been permanently shifted out of normal control period times, divided by the unadjusted maximum annual Controllable Demand. Customers claiming permanent load shifts must provide verification to Company, based on NSP's established criteria.

DETERMINATION OF DEMAND
Maximum Actual Demand in kW shall be the greatest 15-minute load during the billing month.

Adjusted Demand in kW for billing purposes shall be determined by dividing the Maximum Actual Demand in kW by the power factor expressed in percent but not more than a 90% power factor and multiplying the quotient so obtained by 90% and rounding to the nearest whole kW.
